NOTES

1. Coil operating power

Pure DC current should be applied to the coil. The wave form should be rectangular. If it includes ripple, the ripple factor should be less than 5%. However, check it with the actual circuit since the characteristics may be slightly different.

2. Coil connection

When connecting coils, refer to the wiring diagram to prevent mis-operation or malfunction.

3. External magnetic field

Since TQ-relay is highly sensitive polarized relay, its characteristics will be affected by a strong external magnetic field. Avoid using relays under that condition.

4. Cleaning

In automatic cleaning, cleaning with the boiling method is recommended. Avoid ultrasonic cleaning for relays. It is recommended that a fluorinated hydrocarbon or other alcoholic solvents be used.

Trichlene and chloroethene can be used for cleaning.

5. Packing direction

Relays are packed in a tube with the orientation stripe (PIN No. 1) toward the gray stopper.

6. Automatic insertion

To maintain the internal function of the relay, the chucking pressure should not exceed the values below.

Chucking pressure in the direction A:

500 g or less*

Chucking pressure in the direction B:

1 kg or less

Mounting pressure in the direction C:

1 kg or less

*Avoid chucking the center of the relay.

7. Soldering

Preheat according to the following conditions.

Temperature	100°C 212°F or less
Time	Within 1 minute

Soldering should be done at 250°C 482°F within 5 sec.

8. Others

1) If in error the relay has been dropped, the appearance and characteristics should be checked before use without fail.

2) Latching relays are shipped from the factory in the reset state. A shock to the relay during shipping or installation may cause it to change to the set state. Therefore, it is recommended the relay be used in a circuit which initializes the relay to the required state (set or reset) whenever the power is turned on.
