Introduction

Information about the operating instructions

This manual contains important advice, notes and information about the DriveControl 20/54 in all phases of its lifecycle:

• Transport, assembly and start-up
• Safe operation, maintenance and troubleshooting, disposal
• Accessories

Validity of the manual

The manual describes the DriveControl 20/54 as it is delivered by Interroll. In addition to this manual, special contractual agreements and technical documents apply to special versions.

The manual is part of the product

➢ For trouble-free, safe operation and warranty claims, read the manual and follow the instructions before handling the DriveControl 20/54.
➢ Keep the manual near to the DriveControl 20/54.
➢ Pass the manual on to any subsequent operator or occupant of the DriveControl 20/54.
➢ Interroll does not accept any liability for malfunctions or defects due to non-observance of this manual.
➢ If you have any questions after reading the operation manual, feel free to contact our customer service. See the last page for your local contact.

Warnings in this manual

The warnings in this document refer to risks which may arise while using the DriveControl 20/54. For relevant warnings, see “Safety”, page 4 and the warnings at the beginning of each chapter.

There are three categories of danger. The following signal words are used in the document as required:

• Danger
• Warning
• Caution

<table>
<thead>
<tr>
<th>Signal word</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Danger</td>
<td>Indicates a hazardous situation which, if not avoided, will result in death or serious injury.</td>
</tr>
<tr>
<td>Warning</td>
<td>Indicates a hazardous situation which, if not avoided, could result in death or serious injury.</td>
</tr>
<tr>
<td>Caution</td>
<td>Indicates a hazardous situation which, if not avoided, may result in minor or moderate injury.</td>
</tr>
</tbody>
</table>

This symbol marks safety instructions.

This symbol marks useful and important information.
- This symbol marks the steps that have to be carried out.
Safety

General safety instructions

The DriveControl 20/54 is designed according to the technical state of the art and is reliable in operation, once distributed. However, risks may still arise.

• Risks of physical injury to the user or bystanders.
• Adverse effects of the DriveControl and other material.

Disregarding the warnings in this manual may lead to serious injury.

➢ Always read the entire operating and safety instructions before starting to work with the DriveControl and follow the information contained herein in full.
➢ Only instructed and qualified persons may work with the DriveControl.
➢ Always keep this user manual at hand when working on the DriveControl so that you can consult it quickly if required.
➢ Always comply with relevant national safety regulations.
➢ If you have any questions after reading this user manual, feel free to contact our customer service. See the last page for contact information.

Intended use

The DriveControl 20/54 may only be used for industrial applications and in an industrial environment to control a RollerDrive EC310. It must be integrated in a conveyor module or a conveying system. Any other use is not permitted.

Any changes that affect the safety of the product are not allowed.

The DriveControl 20/54 may only be used within the given operation limits.

Unintended use

Applications not according to the intended use of the DriveControl 20/54 require approval from Interroll.

Qualified persons

Qualified persons are persons who read and understand the manual and, taking national regulations into account, can competently execute incidental work.

Only instructed and qualified persons may work with the DriveControl, taking the following into account:

• the relevant manuals and diagrams,
• the warning and safety instructions in this manual,
• the system specific regulations and requirements,
• national or local regulations and requirements for safety and accident prevention.
Safety

Dangers

The following list informs you about the various types of danger or damage that may occur while working with the DriveControl 20/54.

**Persons**
- Maintenance or repair work must only be executed by authorized and qualified persons in accordance with the applicable regulations.
- Before using the DriveControl, ensure that no unauthorized persons are near the conveyor.

**Electricity**
- Only operate the DriveControl with control voltage complying with the requirements of EN 60401-1, PELV.
- Only perform installation and maintenance work after you have switched off the power.
- Ensure that the power cannot be turned on accidentally.

**Working environment**
- Do not use the DriveControl in explosive environments.
- Always remove materials and objects which are not required from the work area.

**Malfunctioning during operation**
- Regularly check the DriveControl for visible damage.
- In case of fumes, turn off the power at once and ensure that it cannot be turned on accidentally.
- Contact qualified personnel immediately to find the source the malfunction.

**Maintenance**
- As the product is maintenance free, you only need to check the DriveControl regularly for visible damage and that all leads and screws are still tightened.

**Accidental motor starts**
- Exercise caution when installing or maintaining the DriveControl 20/54, or when it requires troubleshooting, since a start signal may accidently be triggered and a connected motor could unintentionally start.

**Interfaces to other devices**

By assembling the DriveControl in a conveyor module, further hazards may occur. These hazards are not part of this manual and have to be analyzed during the design, installation and startup of the conveyor module.

- After assembling the DriveControl in a conveyor module, check the whole system for a new potential dangerous spot before switching on the conveyor.
Safety

Operating modes

Normal mode
Operation of the installed device at the end customer’s as a component in a conveyor in a complete system.

Special mode
All operating modes which are required to guarantee and maintain safe and normal operation.

Product information

Product description

The DriveControl 20/54 is intended to control the speed and rotation direction of the RollerDrive EC310.

Functions

- **Regenerative braking**: As soon as the start signal to the DriveControl is switched off, the electrical motor of the RollerDrives acts as a generator and feeds back energy into the DriveControl. The DriveControl has a built in brake chopper (load resistor) to limit the regenerative current and the voltage rise to a safe limit.

- **Diagnostics**: LEDs indicate the operating condition of the DriveControl and the RollerDrive and the operating voltage (see "Meaning of the LEDs", page 11). An error signal can also be output.

Energy feedback

When the speed of a rotating RollerDrive is abruptly reduced (e.g. by taking away or reducing the start signal at the DriveControl), the RollerDrive briefly rotates further (depending on the weight of the conveyed goods being stopped) and thus functions as a generator. The voltage generated in this way increases supply voltage of the RollerDrive. This increased voltage is partly fed to the DC supply (to max. 30 V) and partly converted to heat via a brake chopper resistance on the DriveControl. The regenerated power is then available for other consumers. The more precisely 24 V are complied to in the voltage supply the greater the voltage range in which the DC network can be fed back to.

Temperature protection

The brake chopper resistor is temperature-controlled. If because of specific application properties (e.g. high conveying weight or high conveying speed) the brake chopper resistance is frequently switched, the DriveControl switches off when it becomes too hot (approx. 90 °C inner temperature). During active temperature protection, this state is indicated by the LEDs and no start signal is transmitted any more to the RollerDrive. When the DriveControl has cooled down the RollerDrive restarts automatically when a signal is present. Cooling down is quicker when the DriveControl has been mounted on a flat surface, optimally on metal.

**NOTICE**

DriveControl defect from overheating

- Do not implement a voltage reset when temperature protection is active.

Lock period for signal modifications

The following signals are protected by the firmware to ensure functionality with flank-instable or bouncing levels. This means that after a signal has been modified the next signal modification is processed after 20 ms only.

- DIP switches SPEED A, SPEED B, SPEED C, SPEED D, DIR
- Inputs RollerDrive error, SPEED A, SPEED B, SPEED C, DIR
**Speed settings**

The speed of the RollerDrive can be set with the DriveControl in two ways:
- internally via four DIP switches with 15 levels (handled with priority and enables finer setting levels)
- externally via three digital inputs with eight levels (speed modifications are also possible in running operation, whereby a form of ramp function can be implemented with corresponding switching of a PLC)

This speed setting is converted to an analogue control voltage by the DriveControl and output by the RollerDrive as a reference setting. This reference setting is independent of the RollerDrive gears and their diameter.

For setting speed, see "Operation", page 24.

The acceleration and braking behaviour of the RollerDrive is defined by its own moment of inertia, the gears used, the conveying speed, the moment of inertia of the connected roller drives, the selected torque transmission and the goods transported.

Product information

Scope of delivery

DriveControl 20

The scope of delivery of the DriveControl 20 contains the following parts:

- DriveControl
- Mating plug for power supply (WAGO 734-102/xxx-xxx)
- Mating plug for inputs/outputs (WAGO 733-107/xxx-xxx)
- Spare tool for power supply mating plug (black)
- Spare tool for inputs/outputs mating plug (yellow)

DriveControl 54

The scope of delivery of the DriveControl 54 contains the following parts:

- DriveControl

Transport

- Every DriveControl is packaged in its own cardboard box.

> **CAUTION**

There is a risk of injury if transported incorrectly

- Only qualified and authorized persons should transport the product.
- Follow the instructions below.

- Do not stack more than four cardboard boxes on top of each other.
- Check that the DriveControls are correctly fixed prior to transport.
- Avoid serious impacts during transport.
- Check every DriveControl for visible damage and completeness (mating plugs and spare tools) following transport (see "Scope of delivery", page 10).
- In the event of damage, take photos of the damaged parts.
- Report any damage caused by transport immediately to the transport company and Interroll to retain the right to claim for compensation.
- Do not expose the DriveControls to serious fluctuations in temperature as this could lead to condensation.

Storage

> **CAUTION**

Risk of injury due to improper storage

- Do not stack more than four cardboard boxes on top of each other.

- Check each DriveControl for damage after storage.
Assembly

Warning notices concerning assembly

**NOTICE**

Risk of damage leading to failure or shortened life expectancy of the DriveControl
- Follow the instructions below.

- Do not drop or mishandle the DriveControl to avoid internal damage.
- Check each DriveControl visually for damage before assembly.

Warning notices for the electrical installation

**NOTICE**

Risk of damage to the DriveControl
- Observe the following safety information.

- All electrical work should only be performed by qualified and authorized persons.
- Disconnect the power before installing, removing or rewiring the DriveControl.
- Ensure that both during operation and in case of errors no hazardous voltage can access the connections or the housing.
- Do not apply AC current to the RollerDrive or DriveControl at any time, as this will cause irreparable damage to the device.
- Do not use earth connection as protective conductor (PE).
- Do not apply too much tension or pressure stress to the motor connector. Bending the cables at the connector can cause damage to the cable insulation, which could result in failure of the DriveControl or the RollerDrive.
- Only use cables dimensioned sufficiently for the application.
- Ensure that current load at each terminal or terminal block does not exceed 10 A.
- Ensure that the switching power supply unit supplying the DriveControl supplies a nominal DC voltage of 24 V with maximum deviation of ±8 %.
- Ensure that the RollerDrive, the DriveControl and the voltage source are connected to the conveyor frame or supporting structure so that they are properly earthed. Incorrect earthing can result in the build-up of static charge, causing the motor or DriveControl to malfunction or fail prematurely.
- Only use the specified mating plug (see "Inputs and outputs", page 18) and the spare tool supplied.
- Only activate the operating voltage when all conductors are connected.
**DriveControl DC-20/DC-54**

**Assembly**

**Installing the DriveControl 20/54 in a conveyor system**
- Locate a flat surface for mounting the DriveControl.
- Use the DriveControl as a template and mark the centre of both mounting holes. For the distance between the holes, see "Dimensions", page 13.
- Drill two ø 5.6 - 6 mm (0.22 - 0.24 in) mounting holes at the marked spots.
- Fasten the DriveControl.
- Ensure that the housing is not distorted.

**Electrical installation**

The DriveControl is equipped with an internal, non-replaceable fuse intended exclusively for device protection. Protection of the supply cables must be ensured by the operator.

### DriveControl 20

Required conductors:

<table>
<thead>
<tr>
<th>Connection</th>
<th>Conductor cross-section</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inputs/outputs</td>
<td>fine-strand: 0.08 to 0.5 mm$^2$</td>
</tr>
<tr>
<td></td>
<td>fine-strand with end-splice: 0.25 to 0.34 mm$^2$</td>
</tr>
<tr>
<td></td>
<td>AWG: 28 to 20</td>
</tr>
<tr>
<td></td>
<td>Stripped length: 5 to 6 mm</td>
</tr>
<tr>
<td>Power supply</td>
<td>fine-strand, H05(07) V-K: 1,5 mm$^2$</td>

<tr>
<td></td>
<td>(optionally with end-splice according to DIN 46228/1)</td>
</tr>
<tr>
<td></td>
<td>AWG: 16</td>
</tr>
<tr>
<td></td>
<td>Stripped length: 6 to 7 mm</td>
</tr>
</tbody>
</table>

- Prepare wire ends according to the recommendations of the contact manufacturer.
- Insert the input/output wires into the mating plug with the yellow spare tool (see "Inputs and outputs", page 18).
- Insert the power supply wires into the mating plug with the black spare tool.
- Insert the mating plug into the DriveControl.
- If necessary, set the DIP switches according to requirements (see "Operation", page 24).
- Insert the plug of the RollerDrive so that with the DriveControl the "RD" labelling can be read and the "EC310" labelling is to the rear, i.e. cannot be read.
DriveControl DC-20/DC-54

Assembly

DriveControl 54

Required conductors:

<table>
<thead>
<tr>
<th>Connection</th>
<th>Conductor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inputs/outputs</td>
<td>fine-strand: 0.08 to 0.5 mm²</td>
</tr>
<tr>
<td></td>
<td>fine-strand with end-splice: 0.25 mm²</td>

<td></td>
<td>(optionally with end-splice according to DIN 46228/1)</td>
</tr>
<tr>
<td></td>
<td>AWG: 16</td>
</tr>
<tr>
<td></td>
<td>Stripped length: 8 mm</td>
</tr>
</tbody>
</table>

- Prepare wire ends according to the recommendations of the contact manufacturer.
- Unscrew the two yellow cover screws of the connection area.
- Open the cable bushings to the connection area according to the cables used.
- Route the cable through.
- Connect the conductors for inputs and outputs (for inputs and outputs see "DriveControl 54", page 19). For this purpose push the white slide to the right (in the direction of the cable bushes), insert the conductor and push the slide back.
- Connect the conductors for operating voltage (for connections see "DriveControl 54", page 19). For this purpose push the white button downwards and insert the conductor.
- Enable cable strain relief.
- If necessary, set the DIP switches according to requirements (see "Operation", page 24).
- Close the cover and fasten both screws.
- Visually inspect the connection area to ensure that IP54 protection exists.
- Insert the plug of the RollerDrive so that with the DriveControl the "RD" labelling can be read and the "EC310" labelling is to the rear, i.e. cannot be read.
Inputs and outputs

Connection RollerDrive: 8 mm snap-in, 5 poles, contact configuration according to DIN EN 61076-2

1. +24 V DC
2. Output for rotation direction
3. Earth
4. Input for fault
5. Output for speed

Power supply connection

Mating plug: WAGO 734-102/xxx-xxx

1. +24 V DC
2. GND (Earth)

The power supply connection is double in order to connect the power supply from the most convenient side during installation. Both connections are directly interconnected internally. The power supply can be implemented with a DriveControl so that a maximum of two DriveControls can be connected in sequence.

Connection of inputs/outputs

Mating plug: WAGO 733-107/xxx-xxx

1. COMMON GND (Common signal earth)
2. 24 V EXT (Power supply for signal ERROR)
3. ERROR (Output for fault)
4. DIR (Rotation direction)
5. SPEED C (Input for speed setting)
6. SPEED B (Input for speed setting)
7. SPEED A (Input for speed setting)
DriveControl 54

Connection RollerDrive: 8 mm snap-in, 5 poles, contact configuration according to DIN EN 61076-2

1. +24 V DC
2. Output for rotation direction
3. Earth
4. Input for fault
5. Output for speed

Connection of inputs/outputs

1. COMMON GND (common signal earth)
2. 24 V EXT (Power supply for signal ERROR)
3. ERROR (Output for fault)
4. DIR (Rotation direction)
5. SPEED C (Input for speed setting)
6. SPEED B (Input for speed setting)
7. SPEED A (Input for speed setting)

Power supply connection

1. GND (Earth)
2. +24 V DC
3. GND (Earth)
4. +24 V DC

The power supply connection is double. Both connections are directly interconnected internally. The power supply can be implemented with a DriveControl so that a maximum of two DriveControls can be connected in sequence.

The electrical data of each connection are specified in the appendix (see "Electrical data of connections", page 29).
Wiring diagrams

The signals SPEED A, SPEED B, SPEED C, DIR and ERROR are completely electrically isolated from the operating voltage via optocouplers. The output signal ERROR additionally requires the external voltage 24 V EXT. The common earth connection of signals SPEED A, SPEED B, SPEED C, DIR and ERROR is COMMON GND.

If electrical isolation is not required, the 24 V connections (power supply) can be connected with 24 V EXT (inputs/outputs) and GND (power supply) can be connected with COMMON GND (inputs/outputs).

![Basic circuit diagram]

1. Operating voltage of power supply unit (conductor min. 1.5 mm²)
2. Further DriveControl (conductor min. 1.5 mm²)

The dotted conductors are only used if electrical isolation is not required between the inputs/outputs and the operating voltage.
DriveControl DC-20/DC-54

Assembly

Minimum circuit

• This switching enables the specification of the nominal values for speed and rotation direction via the internal DIP switches.
• The error signal is not used, faults are only displayed via the red LED.
• Start and stop can be controlled by changing the level at the SPEED A connection.
• The DriveControl or RollerDrive must not be switched on or off via the activation or deactivation of the DriveControl power supply; this may only be implemented via the start signal (SPEED A, B, C).
**Error signal connection**

To evaluate the error signal, the input 24 V EXT must be supplied with a voltage of 24 V DC.

- Connect input 24 V EXT with the operating voltage.

The error signal of a maximum of six DriveControls can be linked via series switching. The logic level "no error" is hereby reduced by 1.1 V per DriveControl.

- Connect output ERROR of the previous DriveControl with the input 24 V EXT of the following DriveControl.

When operating voltage is disconnected, the ERROR output switches to the error condition. This ensures correct display of faults when the error signal of several DriveControl has been linked and the operating voltage of a DriveControl is switched off or if a cable defect (e.g. loosened contact, cable rupture) occurs.

When operating voltage is switched on, the error signal is active until the internal microcontroller assumes control. If no error exists, the error signal is cancelled approx. 400 ms after activating the operating voltage.
Initial startup and operation

Commissioning

Pre-commissioning checks

- Ensure that the DriveControl has been correctly fastened to the profile and that all screws have been correctly tightened.
- Ensure that there are no additional areas of danger caused by interfaces to other components.
- Ensure that the wiring is in accordance with the specification and legal directives.
- Check all protection devices.
- Ensure that no personnel stand in hazardous areas near the conveyor.

Pre-commissioning checks

- Check the DriveControl for visible damage.
- Check the DIP switch settings (see "DIP switches", page 12).
- Check all protection devices.
- Clearly specify and monitor the way goods are placed on the conveyor.
- Ensure that the RollerDrive is not blocked.
- Ensure that no personnel stand in hazardous areas near the conveyor.
DriveControl DC-20/DC-54

Initial startup and operation

Operation

⚠️ CAUTION

Accidental start-up of the RollerDrive
Danger of crushing of limbs and damage to conveying goods
➢ Before switching on the operating voltage, ensure that no unauthorized persons are near the conveyor.

Ambient conditions during operation see "Technical Data", page 11

Internal speed setting at the DriveControl

Precondition: The external inputs SPEED A, B, C are logically inactive.
➢ Set the required speed with the DIP switches (see table).
➢ Switch one of the inputs SPEED A, B, C to logical active to start the RollerDrive.
   The RollerDrive rotates with the set speed.
➢ To stop the RollerDrive, switch all inputs SPEED A, B, C to logical inactive.

<td>Corresponding to the signals at the inputs SPEED A, B, C</td>
</tr>
</tbody>
</table>
External speed setting via digital inputs

Precondition: All DIP switches SPEED A, B, C, D are switched to OFF.

- Switch the external inputs SPEED A, B, C to logically active or inactive according to the table below to start the RollerDrive with the required speed.
- To modify the speed, correspondingly modify the signals at the inputs SPEED A, B, C.
- To stop the RollerDrive, switch all inputs SPEED A, B, C to logical inactive.

The internal speed setting has priority. If during external speed setting one or several internal DIP switches are switched from SPEED A, B, C, D to ON, the RollerDrive rotates with this internally set speed, independent of signals from the external inputs. When all internal DIP switches SPEED A, B, C, D are set to OFF, the RollerDrive rotates again with the speed set via the external inputs.

Maintenance and cleaning

Warnings concerning maintenance and cleaning

⚠️ CAUTION

Risk of injury due to improper handling or accidental motor starts
- Maintenance work and cleaning may only be executed by qualified and authorized persons.
- Only perform maintenance work after switching off the power. Ensure that the DriveControl cannot be turned on accidentally.
- Set up signs indicating maintenance work.

Maintenance

Inspecting the DriveControl
The DriveControl itself is maintenance-free. For avoidance of faults however, regular inspection of the connections and fixings is required.
- As part of the regular control and maintenance work on the conveyor, ensure that the screws of the DriveControl are still tight and that the cables are still laid properly and connected to the terminals.

Replacing the DriveControl
If a DriveControl is damaged, it has to be replaced.
- Install a new DriveControl (see "Abandonment", page 28 and see "Installing the DriveControl 20/54 in a conveyor system", page 16).

Cleaning

Dust and dirt in combination with humidity may bridge the electric circuit. Therefore, in a dirty environment, periodic cleaning will help to avoid short-circuits which could damage the DriveControl.

⚠️ CAUTION

Risk of damage to the DriveControl due to incorrect cleaning
- Do not immerse the DriveControl in liquids.
- Do not use cleaning agents.

- Clean away dust and soiling if necessary.
- For more thorough cleaning, disconnect the DriveControl from the power supply, remove (see "Abandonment", page 28), and wipe over with a damp cloth.
Troubleshooting

The error signal is switched with the following faults:

- RollerDrive error
- RollerDrive is not connected
- Fuse defective
- Permissible operating voltage range has been exceeded or fallen below
- Operating voltage reverse connected
- Chopper resistance overheated

<table>

</thead>
</table>
| DriveControl does not function or functions incorrectly | No power supply                                    | ➢ Check whether the output voltage of the power supply is within the specified voltage range.  
                                                                 |                                                    | ➢ Inspect the connections and correct if necessary. |
| Wrong position of the DIP switches           |                                                    | ➢ Check and if necessary correct the position of the DIP switches (see "DIP switches", page 12). |
| DriveControl defective or damaged            | Internal fuse triggered or defective.               | ➢ Replace the DriveControl.                                          |

Symptom Possible cause Help
DriveControl does not function or functions incorrectly No power supply ➢ Check whether the output voltage of the power supply is within the specified voltage range.  
➢ Inspect the connections and correct if necessary.
Wrong position of the DIP switches ➢ Check and if necessary correct the position of the DIP switches (see "DIP switches", page 12).
DriveControl defective or damaged Internal fuse triggered or defective. ➢ Replace the DriveControl.
Abandonment and disposal

Abandonment

⚠️ CAUTION

Risk of injury due to improper handling

➤ Abandonment may only be executed by qualified and authorized persons.
➤ Only abandon the DriveControl after switching off the power. Ensure that the DriveControl cannot be turned on accidentally.

➤ Disconnect all cables from the DriveControl.
➤ Unscrew the screws attaching the DriveControl to the conveyor frame.
➤ Extract the DriveControl from the conveyor frame.

Disposal

The operator is responsible for the proper disposal of the DriveControl. In doing so, industry-specific and local provisions must be observed for the disposal of the DriveControl and its packaging.

</tbody>
</table>

The error signal can be linked by connecting the output error of a previous DriveControl with the 24 V input of a subsequent DriveControl. The logic level with "no error" is hereby reduced by 1.1 V per DriveControl.

Inputs SPEED A, SPEED B, SPEED C and DIR (pin 4 - 7)

|  |
|-------------------|--|
| **Properties**    | debounced, electrically isolated |
| **Reverse polarity protection** | max. 30 V DC |
| **Overvoltage protection** | max. 30 V DC permanent, absence of harmonic waves |
| **Dielectric strength** | max. 500 V$_{\text{eff}}$ 1 min, 50 Hz |
| **Logic level low** | 0 to 1 V DC logical 0 = L = inactive |
| **Input current low** | max. 0.1 mA |
| **Logic level high** | 18 to 26 V DC logical 1 = H = active |
| **Input current high** | 2.5 to 4.5 mA |

Installation Declaration
in accordance with the EC Machinery Directive 2006/42/EC, Appendix II B

The manufacturer:

Interroll Engineering GmbH
Hoeferhof 16
D - 42929 Wermelskirchen
Germany

hereby declares with sole responsibility that the product range

- DriveControl 20
- DriveControl 54

is not a ready-to-use machine as defined by the EC Machinery Directive and, therefore, does not fully comply with the requirements of this directive. The commissioning of these modules is not permitted until conformity of the entire machine/system in which they are installed has been declared in compliance with the EC Machinery Directive and the EMC directive.

The health and safety requirements as stated in Appendix I have been applied.
The special technical documents as stated in Appendix VII B have been compiled and will be sent to the responsible authority if necessary.

Person authorized to compile the technical documents: Georg Malina,
Interroll Engineering GmbH, Hoeferhof 16, D - 42929 Wermelskirchen

Applied EC directives:

- Machinery Directive 2006/42/EC
- RoHS Directive 2002/95/EC

Applied harmonized standards:

- EN ISO 12100 Parts 1 and 2 "Safety of machinery - Basic concepts, general principles for design" - Part 1: "Basic terminology, methodology" - Part 2: "Technical principles"

Wermelskirchen, 31st March 2010

Armin Lindholm
(Managing Director)

(This declaration can be obtained at www.interroll.com, if needed.)
