

Current Transducer LXSR series

*I*_{PN} **= 6, 15, 25 A**

Ref: LXSR 6-NPS, LXSR 15-NPS, LXSR 25-NPS

For the electronic measurement of current: DC, AC, pulsed..., with galvanic separation between the primary and the secondary circuit.

Features

- Closed loop multi-range current transducer
- Voltage output
- Unipolar supply voltage
- Compact design for PCB mounting.

Advantages

- Very low offset drift
- Very good dv/dt immunity
- LTSR footprint compatible
- Reference pin with two modes: Ref IN and Ref OUT
- Extended measuring range for unipolar measurement.

Applications

- AC variable speed and servo motor drives
- Static converters for DC motor drives
- Battery supplied applications
- Uninterruptible Power Supplies (UPS)
- Switched Mode Power Supplies (SMPS)
- Power supplies for welding applications
- Solar inverters.

Standards

- IEC 61800-1: 1997
- IEC 61800-2: 2015
- IEC 61800-3: 2004
- IEC 61800-5-1: 2007
- IEC 62109-1: 2010
- IEC 62477-1: 2012
- UL 508:2013

Application Domain

Industrial.

N°97.P2.09.000.0, N°97.P2.15.000.0, N°97.P2.19.000.0

11July2018/Version 2

LEM reserves the right to carry out modifications on its transducers, in order to improve them, without prior notice

Absolute maximum ratings

Parameter	Symbol	Unit	Value
Maximum supply voltage	$U_{\rm C\;max}$	V	7
Maximum primary conductor temperature	$T_{\rm B\;max}$	°C	110
Maximum primary current	$I_{\rm P\;max}$	А	20 × I _{PN}
Maximum electrostatic discharge voltage	$U_{\rm ESD\;max}$	kV	4

Stresses above these ratings may cause permanent damage. Exposure to absolute maximum ratings for extended periods may degrade reliability.

- UL 508 STANDARD FOR INDUSTRIAL CONTROL EQUIPMENT Date 2013

Ratings

Parameter	Symbol	Unit	Value
Primary involved potential		V AC/DC	600
Max surrounding air temperature	T_{A}	°C	105
Primary current	I _P	A	According to series primary currents
Secondary supply voltage	$U_{\rm C}$	V DC	7
Output voltage	$V_{\sf out}$	V	0 to 5

Conditions of acceptability

When installed in the end-use equipment, consideration shall be given to the following:

- 1 These devices must be mounted in a suitable end-use enclosure.
- 2 The terminals have not been evaluated for field wiring.
- 3 The LES, LESR, LKSR, LPSR, LXS and LXSR Series shall be used in a pollution degree 2 environment or better.
- 4 Low voltage circuits are intended to be powered by a circuit derived from an isolating source (such as a transformer, optical isolator, limiting impedance or electro-mechanical relay) and having no direct connection back to the primary circuit (other than through the grounding means).
- 5 These devices are intended to be mounted on the printed wiring board of the end-use equipment (with a minimum CTI of 100).
- 6 LES, LESR, LKSR and LPSR Series: based on results of temperature tests, in the end-use application, a maximum of 110°C cannot be exceeded on the primary jumper.

Marking

Only those products bearing the UL or UR Mark should be considered to be Listed or Recognized and covered under UL's Follow-Up Service. Always look for the Mark on the product.

Performance parameters definition

Ampere-turns and amperes

The transducer is sensitive to the primary current linkage $\varTheta_{\rm P}$ (also called ampere-turns).

 $\Theta_{\mathsf{P}} = N_{\mathsf{P}} \cdot I_{\mathsf{P}} \text{ (At)}$

Where $N_{\rm p}$ is the number of primary turn (depending on the connection of the primary jumpers)

Caution: As most applications will use the transducer with only one single primary turn ($N_{\rm p}$ = 1), much of this datasheet is written in terms of primary current instead of current linkages. However, the ampere-turns (At) unit is used to emphasis that current linkages are intended and applicable.

Transducer simplified model

The static model of the transducer at temperature T_A is:

 $I_{\rm S} = G \cdot \Theta_{\rm P} + \varepsilon$ In which $\varepsilon =$

$$I_{OE} + I_{OT}(T_{A}) + \varepsilon_{G} \cdot \Theta_{P} \cdot G + \varepsilon_{L} (\Theta_{P \max}) \cdot \Theta_{P \max} \cdot G + TCG \cdot (T_{A} - 25) \cdot \Theta_{P} \cdot G$$

With:	$\begin{split} \Theta_{\rm P} &= N_{\rm P} \cdot I_{\rm P} \\ \Theta_{\rm P max} \\ I_{\rm S} \\ I_{\rm O E} \\ I_{\rm O T} (T_{\rm A}) \\ G \end{split}$: primary current linkage (At) : max primary current linkage applied to the transducer : secondary current (A) : ambient operating temperature (°C) : electrical offset current (A) : temperature variation of I_o at temperature T_A (°C) : sensitivity of the transducer (V/At)
	TCG	: temperature coefficient of G
	$arepsilon_{G} \ arepsilon_{L}(arepsilon_{Pmax})$: sensitivity error : linearity error for ${\cal O}_{\rm Pmax}$

This model is valid for primary ampere-turns $\varTheta_{\rm p}$ between – $\varTheta_{\rm p_{max}}$ and + $\varTheta_{\rm p_{max}}$ only.

Sensitivity and linearity

To measure sensitivity and linearity, the primary current (DC) is cycled from 0 to $I_{\rm p}$, then to $-I_{\rm p}$ and back to 0 (equally spaced $I_{\rm p}/10$ steps). The sensitivity *G* is defined as the slope of the linear regression line for a cycle between $\pm I_{\rm PN}$.

The linearity error $\varepsilon_{\rm L}$ is the maximum positive or negative difference between the measured points and the linear regression line, expressed in % of $I_{\rm PN}$.

Magnetic offset

The magnetic offset current I_{OM} is the consequence of a current on the primary side ("memory effect" of the transducer's ferromagnetic parts). It is measured using the following primary current cycle. I_{OM} depends on the current value I_{P1} (I_{P1} > I_{PM}).

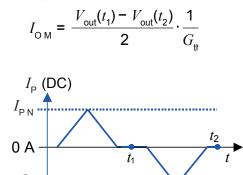

Figure 20: Current cycle used to measure magnetic and electrical offset (transducer supplied)

Performance parameters definition

Electrical offset

The electrical offset voltage V_{OE} can either be measured when The overall accuracy at 25 °C X_G is the error in the $-I_{\text{PN}}$... $+I_{\text{PN}}$ the ferro-magnetic parts of the transducer are:

- completely demagnetized, which is difficult to realize,
- or in a known magnetization state, like in the current cycle shown in figure 20.

Using the current cycle shown in figure 20, the electrical offset is:

$$V_{0E} = \frac{V_{out}(t_1) + V_{out}(t_2)}{2}$$

The temperature variation V_{0T} of the electrical offset voltage $V_{\rm O\;E}$ is the variation of the electrical offset from 25 °C to the considered temperature:

$$V_{0T}(T) = V_{0E}(T) - V_{0E}(25^{\circ} \text{ C})$$

Note: the transducer has to be demagnetized prior to the application of the current cycle (for example with a demagnetization tunnel).

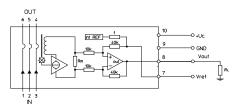

Figure 21: Test connection

Overall accuracy

range, relative to the rated value I_{PN} . It includes:

- the electrical offset V_{OF}
- the sensitivity error ε_{a}

the linearity error ε_{L} (to I_{PN})

Response and reaction times

The response time t_r and the reaction time t_{ra} are shown in figure 22

Both depend on the primary current di/dt. They are measured at nominal ampere-turns.

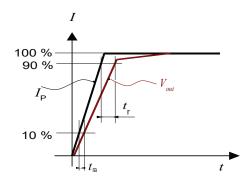

Figure 22: Response time t_r and reaction time t_{ra}

Application information

Filtering and decoupling

Supply voltage U_c

The transducer has internal decoupling capacitors, but in the case of a power supply with high impedance, it is highly recommended to provide local decoupling (100 nF or more, located close to the transducer) as it may reduce disturbance on transducer output $V_{\rm out}$ and reference $V_{\rm ref}$ due to high varying primary current. The transducer power supply rejection ratio is low at high frequency.

Output V_{out}

The output V_{out} has a very low output impedance of typically 1 Ohm; it can drive capacitive loads of up to 100 nF directly. Adding series resistance R*f* of several tenths of Ohms allows much larger capacitive loads Cf (higher than 1 µF). Empirical evaluation may be necessary to obtain optimum results. The minimum load resistance on V_{out} is 1 kOhm.

Total Primary Resistance

The primary resistance is $0.72 \text{ m}\Omega$ per conductor.

In the following table, examples of primary resistance according to the number of primary turns.

Number of primary turns	Primary Nominal RMS current	Output voltage V _{out}	Primary resistance R _P [mΩ]	Recommended connections				
1	±I _{PN}	$V_{\rm ref}$ ±0.625	0.24	IN	10 0- 1	9 	8 0 3	OUT
2	± $I_{_{\rm PN}}/2$	$V_{\rm ref}$ ±0.625	1.08	IN	10 0 1	9 0 2	80 0 3	OUT
3	±I _{PN} /3	$V_{\rm ref}$ ±0.625	2.16	IN	10 0 1	9 0 2	80 9 3	OUT

Reference V_{ref}

Like the output V_{out} , the V_{ref} has a very low output impedance of typically 1 Ohm; it can drive capacitive loads of up to 100 nF directly. Adding series resistance *R*f of several tenths of Ohms allows much larger capacitive loads Cf (higher than 1 μ F). Empirical evaluation may be necessary to obtain optimum results. The minimum load resistance on V_{ref} is 10 kOhms.

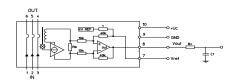

Figure 23: filtered V_{out} connection

External reference voltage

The REF pin can be used either as a reference voltage output or as a reference voltage input.

When used in reference voltage output, the internal reference voltage V_{ref} is used by the transducer as the reference point for bipolar measurements.

The internal reference voltage output accuracy is defined in the electrical parameter data.

When used in reference voltage input, an external reference voltage is connected to the REF pin.

In this case, the maximun allowable reference voltage range is 0.5 V - 2.75 V.

The REF pin must be able to source or sink an input current of 1.5 mA maximum.

If the reference voltage is not used, the REF pin should be left unconnected.

The following graphs show how the measuring range of each transducer version depends on the external reference voltage value $V_{\rm ref}$.

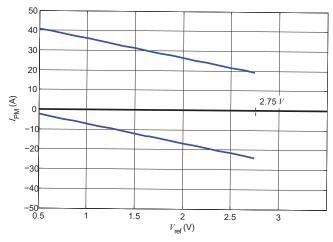

Figure 24: Measuring range versus external $V_{\rm ref}$

Upper limit: $I_{\rm P}$ = -9.6 * $V_{\rm ref}$ + 45.6 ($V_{\rm ref}$ = 0.5 ... 2.75 V)

Lower limit: $I_{\rm P}$ = -9.6 * $V_{\rm ref}$ + 2.4 ($V_{\rm ref}$ = 0.5 ... 2.75 V)

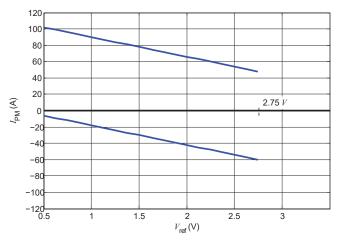

Figure 25: Measuring range versus external V_{ref}

Upper limit: $I_p = -24 * V_{ref} + 114$ Lower limit: $I_p = -24 * V_{ref} + 6$ $(V_{ref} = 0.5 \dots 2.75 \text{ V})$ $(V_{ref} = 0 \dots 2.75 \text{ V})$

External reference voltage

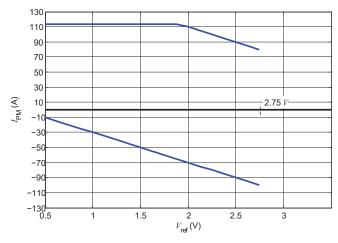

Figure 26: Measuring range versus external V_{ref} LXSR 25-NP

Upper limit: $I_{\rm p} = -40 * V_{\rm ref} + 190 (V_{\rm ref} = 1.85 \dots 2.75 \text{ V})$ Upper limit: $I_{\rm p} = 113 (V_{\rm ref} = 0 \dots 1.85 \text{ V})$ Lower limit: $I_{\rm p} = -40 * V_{\rm ref} + 10 (V_{\rm ref} = 0 \dots 2.75 \text{ V})$

Example with V_{ref} = 1.65 V:

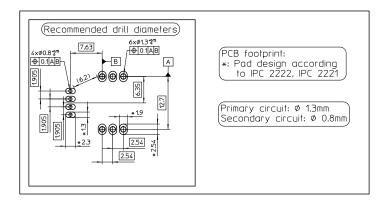

- The 6 A version has a measuring range from −13.44 A to +29.76 A
- The 15 A version has a measuring range from −33.6 A to +74.4 A
- The 25 A version has a measuring range from -56 A to +113 A

Example with Vref = 0.5 V:

- The 6 A version has a measuring range from -2.4 A to +40.8 A
- The 15 A version has a measuring range from -6 A to +102 A
- The 25 A version has a measuring range from -10 A to +113 A

- Maximum PCB thickness
- Wave soldering profile No clean process only
- 1.3 mm for primary pin0.8 mm for secondary pin2.4 mmmaximum 260 °C for 10 s

Safety

This transducer must be used in limited-energy secondary circuits according to IEC 61010-1.

This transducer must be used in electric/electronic equipment with respect to applicable standards and safety requirements in accordance with the manufacturer's operating instructions.

Caution, risk of electrical shock

When operating the transducer, certain parts of the module can carry hazardous voltage (eg. primary busbar, power supply). Ignoring this warning can lead to injury and/or cause serious damage. This transducer is a build-in device, whose conducting parts must be inaccessible after installation. A protective housing or additional shield could be used. Main supply must be able to be disconnected.

Definition of typical, minimum and maximum values

Minimum and maximum values for specified limiting and safety conditions have to be understood as such as well as values shown in "typical" graphs. On the other hand, measured values are part of a statistical distribution that can be specified by an interval with upper and lower limits and a probability for measured values to lie within this interval.

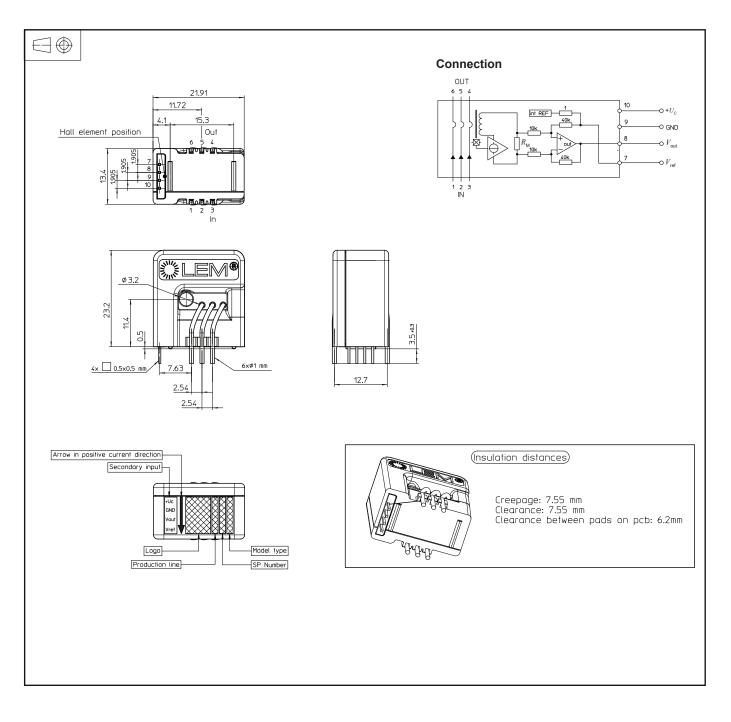

Unless otherwise stated (e.g. "100 % tested"), the LEM definition for such intervals designated with "min" and "max" is that the probability for values of samples to lie in this interval is 99.73 %.

For a normal (Gaussian) distribution, this corresponds to an interval between -3 sigma and +3 sigma. If "typical" values are not obviously mean or average values, those values are defined to delimit intervals with a probability of 68.27 %, corresponding to an interval between -sigma and +sigma for a normal distribution.

Typical, minimum and maximum values are determined during the initial characterization of the product.

Dimensions (in mm)

Packaging information

Standard delivery in cardboard: $L \times W \times H$: 315 × 200 × 120 mm Each carboard contains 200 parts, placed into 4 Polystyrene-made trays of 50 parts each one. Both trays and carboard are ESD-compliant. The typical weight of the cardboard is 2.5 Kg.
