45.2.46 gPTP Presentation Time Capture Register (GCPT)

The GCPT register indicates the captured presentation time.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	CPTV[31:16]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CPTV[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.50 GCPT register contents

Bit Position	Bit Name	Function
b31 to b0	CPTV[31:0]	Presentation Time Capture Presentation time value

CPTV[31:0] Presentation Time Capture Bits

These bits indicate the AVTP presentation time captured in response to a capture event. Read the time value from these bits and clear the presentation time capture interrupt flag bit (GIS.PTCF) before triggering a next capture.

Whether capturing a correct value was possible can be confirmed by following the procedure below.

1. Read these bits.
2. Read the presentation time overrun interrupt flag bit (GIS.PTOF).
3. Read these bits again.
4. Check whether the presentation time overrun interrupt flag bit (GIS.PTOF) is set to 1 and whether the value read from these bits has changed. If either of the two conditions is met, a correct value has not been captured.

   [Conditions for Changing]

   The bits are set to H’00000000 when the operating mode is not operation mode.

   When a capture event occurs, the bits are updated with the AVTP presentation time value at the time of the event.

45.2.47 gPTP Timer Capture Register i (GCTi) (i = 0 to 2)

The GCTi registers form an 80-bit register that captures the gPTP timer value.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	CTV[31+32*i:16+32*i]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CTV[15+32*i:32*i]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.51 GCTi register contents

Bit Position	Bit Name	Function
b31 to b0	CTV[31+32*i:32*i]	gPTP Timer Capture Value Captured timer value

CTV[79:0] gPTP Timer Capture Value Bits

These 80 bits consist of GCT0.CTV[31:0], GCT1.CTV[63:32] and GCT2.CTV[79:64], which together indicate captured timer values.

When B’00 (value of the gPTP timer) or B'01 (corrected gPTP timer value) is selected by the timer capture source select bits in the gPTP configuration control register (GCCR.TCSS), the corresponding 80-bit values are stored in GCT0.CTV[31:0], GCT1.CTV[63:32], and GCT2.CTV[79:64].

When B’10 (AVTP presentation time) is selected by the timer capture source select bit (GCCR.TCSS), the corresponding 32-bit values are stored in GCT0.CTV[31:0].

Actual writing of the timer value specified by the timer capture source select bits (GCCR.TCSS) proceeds when B’11 (timer capture request) is written to the timer control request bits in the gPTP configuration control register (GCCR.TCR).

Do not read the value while the value of the timer control request bits (GCCR.TCR) is B’11, because this indicates that storage is still in progress.

When operating mode is not operation mode, the bits are set to H’00000000.

45.2.48 gPTP Capture Event Control Register (GCEC)

The GCEC register sets the capture event.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	SCS[1:0]		—	—	—	DEN	—	—	—	CES
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W

Table 45.52 GCEC register contents

Bit Position	Bit Name	Function
b31 to b27	—	Reserved These bits are read as 0. The write value should be 0.
b26 to b16	DRC[10:0]	Division Ratio Setting
b15 to b10	—	Reserved These bits are read as 0. The write value should be 0.
b9, b8	SCS[1:0]	Serial Sound Interface Channel Select 00: Serial sound interface channel 0 01: Serial sound interface channel 1 10: Serial sound interface channel 2 11: Serial sound interface channel 3
b7 to b5	—	Reserved These bits are read as 0. The write value should be 0.
b4	DEN	Divider Operation Enable 0: Divider operation is disabled. 1: Divider operation is enabled.
b3 to b1	—	Reserved These bits are read as 0. The write value should be 0.
b0	CES	Capture Event Select 0: External capture event (AVB_CAPTURE pin) 1: Output from the divider

CAUTION

Set the bits following the procedure described below. For pin control, see section 41., Ports.

<1> Change the capture event from an external capture event (AVB_CAPTURE pin) to output from the divider.

1. Perform pin control to disable the AVB_CAPTURE pin function.
2. Make the setting for the serial sound interface.
3. Set GCEC.CES to 1.
4. Set a desired value in GCEC.SCS and GCES.DRC.
5. Set GCEC.DEN to 1.

<2> Change the capture event from output from the divider to the external capture event (AVB_CAPTURE pin).

1. Set GCEC.DEN to 0.
2. Wait for 2 cycles of output from the divider specified by GCEC.SCS and GCES.DRC.
3. Set GCEC.CES to 0.
4. Perform pin control to enable the AVB_CAPTURE pin function.

<3> Switch SCS or DRC while output from the divider is selected as the capture event.

1. Set GCEC.DEN to 0.
2. Wait for 2 cycles of output from the divider specified by GCEC.SCS and GCES.DRC.
3. Set a desired value in GCEC.SCS and GCES.DRC.
4. Set GCEC.DEN to 1.

DRC[10:0] Division Ratio Setting Bits

These bits set the division ratio which is used in dividing the SSIWS signal supplied from the serial sound interface by the divider.

The division ratio is “the value set in these bits + 1”.

SCS[1:0] Serial Sound Interface Channel Select Bits

These bits select the channel of the serial sound interface which supplies the SSIWS signal to the divider.

CAUTION

The frequency of the SSIWS signal of the selected channel must be equal to or smaller than a quarter of the clock frequency set by the gPTP clock select bits (CCC.CSEL).

DEN Divider Operation Enable Bit

This bit sets the operating state of the divider.

Change the settings of GCEC.DRC, GCEC.SCS, GCEC.CES, and serial sound interface after setting this bit to 0.

Do not set this bit to 1 while GCEC.CES is set to 0.

CES Capture Event Select Bit

This bit sets the supply source of the capture event.

The capture event is detected on the rising edge of the signal selected by this bit.

CAUTION

When the external capture event (AVB_CAPTURE pin) is selected, the AVB_CAPTURE pin should be held high for at least two cycles of the clock specified by the gPTP clock select bits (CCC.CSEL) to generate an external capture event.

When output from the divider is selected, perform pin control to disable the AVB_CAPTURE

pin function. For pin control, see section 41., Ports.

45.2.49 E-MAC Mode Register (ECMR)

ECMR is used to specify the operating mode of the E-MAC. The settings in this register are normally made in the initialization process following a reset.

The operating mode settings must not be changed while transmission or reception is enabled (i.e. while the RE or TE bit in this register is 1).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.53 ECMR register contents (1/2)

Bit Position	Bit Name	Function
b31 to b27	—	Reserved These bits are read as 0. The write value should be 0.
b26	TRCCM	Counter Clear Mode 0: Writing to a counter register leads to the register being cleared to 0. 1: Reading from a counter register leads to the register being cleared to 0.
b25, b24	—	Reserved These bits are read as 0. The write value should be 0.
b23	RCSC	Checksum Calculation 0: Checksums are not automatically calculated. 1: Checksums are automatically calculated.
b22	—	Reserved This bit is read as 0. The write value should be 0.
b21	DPAD	Data Padding 0: Padding to make up 60 bytes is inserted in data for transmission when fewer than 60 bytes are to be transmitted. 1: Padding is not inserted in data for transmission when fewer than 60 bytes are to be transmitted and the data are transmitted without being changed.
b20	RZPF	PAUSE Frame Reception with Time = 0 0: Reception of PAUSE frames with the TIME parameter value 0 is disabled. 1: Reception of PAUSE frames with the TIME parameter value 0 is enabled.
b19	ZPF	PAUSE Frame Usage with TIME = 0 Enable 0: Control in response to and for the sending of PAUSE frames with the TIME parameter value 0 is disabled. 1: Control in response to and for the sending of PAUSE frames with the TIME parameter value is 0 is enabled.
b18	PFR	PAUSE Frame Receive Mode 0: PAUSE frames are not transferred to the AVB-DMAC. 1: PAUSE frames are transferred to the AVB-DMAC.
b17	RXF	Operating Mode for Flow Control in Reception 0: Detection of PAUSE frames is disabled. 1: Flow control for the receiving port is enabled.

Table 45.53 ECMR register contents (2/2)

Bit Position	Bit Name	Function
b16	TXF	Operating Mode for Flow Control in Transmission 0: Flow control for the transmitting port is disabled (PAUSE frames are not automatically transmitted). 1: Flow control for the transmitting port is enabled (PAUSE frames are automatically transmitted as required).
b15 to b7	—	Reserved These bits are read as 0. The write value should be 0.
b6	RE	Reception Enable 0: Reception is disabled. 1: Reception is enabled.
b5	TE	Transmission Enable 0: Transmission is disabled. 1: Transmission is enabled.
b4 to b2	—	Reserved These bits are read as 0. The write value should be 0.
b1	DM	Full-duplex Transfer Enable 0: Disables full-duplex transfer. 1: Enables full-duplex transfer.
b0	PRM	Promiscuous Mode 0: Normal operation 1: Promiscuous mode operation

TRCCM Counter Clear Mode Bit

This bit sets the method for clearing the counter register. Refer to the descriptions of the counter registers.

RCSC Checksum Calculation Bit

Setting this bit to 1 enables automatic calculation of checksums for data in received frames.

Only the data field of an Ethernet frame is in the scope of checksum calculation. Specifically, the checksum is calculated from the data field, which follows the length/type field and is followed by the CRC field. Calculation only involves 16-bit addition; it does not involve bit inversion.

DPAD Data Padding Control Bit

This bit specifies padding or non-padding of data when less than 60 bytes are to be transmitted.

When this bit is set to 1, data are transmitted without padding; when it is set to 0, data are padded to make up 60-byte units for transmission.

RZPF (PAUSE Frame Reception with Time = 0) Bit

When the RZPF bit is set to 0, received PAUSE frames with the Timer value 0 are discarded.

When the RZPF bit is set to 1, release from the transmission wait state follows reception of a PAUSE frame with the Timer value 0.

ZPF (PAUSE Frame Usage with TIME = 0 Enable) Bit

When the ZPF bit is set to 0, the next frame to be transmitted is not transmitted until the time specified by the Timer value has elapsed.

Received PAUSE frames with the Timer value 0 are discarded.

When the ZPF bit is set to 1, if the amount of data in the reception FIFO becomes less than the setting of the receive FIFO critical level bits (RCR.RFCL) before the time specified by the Timer value elapses, a PAUSE frame with a Timer value of 0 is automatically transmitted. If the interface is in the transmission wait state, it is released from that state on receiving a PAUSE frame with a Timer value of 0.

PFR PAUSE Frame Receive Mode Bit

This bit specifies whether PAUSE frames are transferred to the AVB-DMAC.

RXF (Operating Mode for Flow Control in Reception) Bit

When the RXF bit is set to 1 and a PAUSE frame is received, a next frame to be transmitted is not transmitted until the time indicated by the Timer value in the PAUSE frame has elapsed. However, the transmission of a current frame is continued. The number of received PAUSE frames is also counted. For details, see section 45.2.57, PAUSE Frame Receive Counter (PFRCR).

Setting this bit to 0 disables PAUSE frame detection.

TXF (Operating Mode for Flow Control in Transmission) Bit

The TXF bit enables or disables flow control in transmission by the port.

Setting this bit to 0 disables PAUSE frame detection.

RE Reception Enable Bit

If this bit is switched from reception being enabled (RE = 1) to reception being disabled (RE = 0) while a frame is being received, reception will continue until reception of that frame is completed.

TE Transmission Enable Bit

If this bit is switched from transmission being enabled (TE = 1) to transmission being disabled (TE = 0) while a frame is being transmitted, transmission will continue until transmission of that frame is completed.

DM Full-Duplex Transfer Enable Bit

This bit enables or disables full-duplex transfer.

PRM Promiscuous Mode Bit

Setting the PRM bit enables all Ethernet frames to be received. All Ethernet frames means all receivable frames, irrespective of differences or enabled/disabled status (destination address, broadcast address, multicast bit, etc.).

45.2.50 Receive Frame Length Register (RFLR)

The RFLR register specifies the maximum length (in bytes) of frames that can be received by this LSI. Settings in this register must not be changed while reception is enabled (while the RE bit in the E-MAC mode register (EMCR) is 1).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RFL[17:16]	
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	RFL[15:0]

Table 45.54 RFLR register contents

Bit Position	Bit Name	Function
b31 to b18	—	Reserved These bits are read as 0. The write value should be 0.
b17 to b0	RFL[17:0]	Receive Frame Length H'00000 to H'005EE: 1,518 bytes H'005EF: 1,519 bytes H'005F0: 1,520 bytes : : H'007FF: 2,047 bytes H'00800: 2,048 bytes : : H'01000: 4,096 bytes : : H'10000: 65,535 bytes : : H'20000 to H'3FFFF: 131,072 bytes

RFL[17:0] Receive Frame Length Bits

Frame data described here refers to all fields from the destination address up to the CRC data. Frame contents from the destination address up to the data are actually transferred to memory. CRC data are not included in the transfer. When more data than the specified number of bytes are received, the portion of data that exceeds the specified value is discarded.

45.2.51 E-MAC Status Register (ECSR)

The ECSR register indicates the state of the E-MAC. The CPU can be notified of the state. For bits associated with interrupts, the interrupt can be enabled or disabled by the corresponding bit in the E-MAC Interrupt Permission Register (ECSIPR) described in section 45.2.52, E-MAC Interrupt Permission Register (ECSIPR).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Table 45.55 ECSR register contents

Bit Position	Bit Name	Function
b31 to b5	—	Reserved These bits are read as 0. The write value should be 0.
b4	PFROI	PAUSE Frame Retransmit Retry Over 0: PAUSE frame retransmit retry count does not exceed the upper limit. 1: PAUSE frame retransmit retry count exceeds the upper limit.
b3 to b1	—	Reserved These bits are read as 0. The write value should be 0.
b0	ICD	Illegal Carrier Detection 0: PHY-LSI has not detected an illegal carrier on the line. 1: PHY-LSI has detected an illegal carrier on the line.

PFROI PAUSE Frame Retransmit Retry Over Bit

This bit indicates that retransmission count has exceeded the retransmit upper limit set in the PAUSE frame retransmission count register (TPAUSER) during PAUSE frame retransmission when the flow control is enabled.

Writing 1 to this bit clears it to 0.

ICD Illegal Carrier Detection Bit

This bit indicates that the PHY-LSI has detected an illegal carrier on the line. If a change in the signal input from the PHY-LSI occurs in a period shorter than the software recognition period, the correct information may not be obtained. Refer to the timing specification for the PHY-LSI used.

Writing 1 to this bit clears it to 0.

45.2.52 E-MAC Interrupt Permission Register (ECSIPR)

The ECSIPR register enables or disables the states indicated by the ECSR register as interrupt sources. Each effective bit disables or enables interrupts corresponding to the bits in ECSR.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 45.56 ECSIPR register contents

Bit Position	Bit Name	Function
b31 to b5	—	Reserved These bits are read as 0. The write value should be 0.
b4	PFROIP	PAUSE Frame Retransmit Interrupt Enable 0: Interrupts on setting of the PFROI bit is disabled. 1: Interrupts on setting of the PFROI bit is enabled.
b3 to b1	—	Reserved These bits are read as 0. The write value should be 0.
b0	ICDIP	Illegal Carrier Detect Interrupt Enable 0: Interrupts on setting of the ICD bit is disabled. 1: Interrupt on setting of the ICD bit is enabled.

PFROIP PAUSE Frame Retransmit Interrupt Enable Bit

Setting this bit to 1 selects interrupt generation on setting of the PAUSE frame retransmit retry over bit (ECSR.PFROI) in the E-MAC status register to 1.

ICDIP Illegal Carrier Detect Interrupt Enable Bit

Setting this bit to 1 selects interrupt generation on setting of the illegal carrier detection bit (ECSR.ICD) in the E-MAC status register to 1.

45.2.53 PHY Interface Register (PIR)

The PIR register provides a means of access to the PHY-LSI internal registers via the MII.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 45.57 PIR register contents

Bit Position	Bit Name	Function
b31 to b4	—	Reserved These bits are read as 0. The write value should be 0.
b3	MDI	MII Management Data-In Indicates the level of the ET_MDIO pin.
b2	MDO	MII Management Data-Out Holds data for output from the ET_MDIO pin.
b1	MMD	MII Management Mode 0: Read direction is specified. 1: Write direction is specified.
b0	MDC	MII Management Data Clock The value set in this bit is output from the ET_MDC pin, which supplies the management data clock for the MII.

MDI MII Management Data-In Bit

This bit indicates the level of the ET_MDIO pin.

MDO MII Management Data-Out Bit

This bit holds data for output from the ET_MDIO pin.

The ET_MDIO pin outputs a value set in this bit when the MMD bit is set to 1 (to specify writing as the direction). Data are not output while the MMD bit is set to 0 (to specify reading as the direction).

MMD MII Management Mode Bit

This bit specifies the direction for data through MDIO (reading or writing).

MDC MII Management Data Clock Bit

Values set in this bit are output on the ET_MDC pin to supply the MII with the management data clock. For the method of access to the MII registers, see section 45.3.12, Connection to PHY-LSI.

45.2.54 Automatic PAUSE Frame Register (APR)

The APR register is used to set the value for the TIME parameter of automatically transmitted PAUSE frames. When a PAUSE frame is automatically transmitted, the value set in this register is used as its TIME parameter.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0. The write value should be 0.
b15 to b0	AP[15:0]	Automatic PAUSE These bits set the TIME parameter value of an automatic PAUSE frame.*1 H'0000: — H'0001: 512 × 1 bit-period H'0002: 512 × 2 bit-period : : H'FFFF: 512 × 65535 bit-period Note 1. A bit-period changes relative to the transfer speed as follows. 100Mbps: 1 bit-period = 10 ns 10Mbps: 1 bit-period = 100 ns

AP[15:0] Automatic PAUSE Bit

These bits set the value of the TIME parameter in automatically transmitted PAUSE frames. The unit for the setting is 512-bit periods.

Set these bits to a value other than H'0000 when the flow control in transmission (PAUSE frame transmission) is enabled (ECMR.TXF = 1).

45.2.55 Manual PAUSE Frame Register (MPR)

The MPR register is used to set the value for the TIME parameter of manually generated PAUSE frames. When a PAUSE frame is manually transmitted, the value set in this register is used as its TIME parameter.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.59 MPR register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0. The write value should be 0.
b15 to b0	MP[15:0]	Manual PAUSE These bits set the TIME parameter value of a manual PAUSE frame.*1 H'0000: — H'0001: 512 × 1 bit-period H'0002: 512 × 2 bit-period : : H'FFFF: 512 × 65535 bit-period Note 1. A bit-period changes relative to the transfer speed as follows. 100Mbps: 1 bit-period = 10 ns 10Mbps: 1 bit-period = 100 ns

MP[15:0] Manual PAUSE Bits

These bits set the value of the TIME parameter in manually generated PAUSE frames.

The unit for the setting is 512 bit periods.

45.2.56 PAUSE Frame Transmit Counter (PFTCR)

The PFTCR register is a counter that indicates the number of times PAUSE frames have been transmitted.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.60 PFTCR register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0.
b15 to b0	PFTXC[15:0]	PAUSE Frame Transmit Counter Counter for counting the number of transmitted PAUSE frames

PFTXC[15:0] PAUSE Frame Transmit Counter Bits

These bits indicate the total number of PAUSE frames that have been transmitted (both manually and automatically).

The bits are cleared to 0 when they are read.

If counting up and clearing of the counter coincide, clearing the counter takes priority.

45.2.57 PAUSE Frame Receive Counter (PFRCR)

The RFRCR register is a counter that indicates the number of times PAUSE frames have been received.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 45.61 RFRCR register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0.
b15 to b0	PFRXC[15:0]	PAUSE Frame Receive Counter Counter for counting the number of received PAUSE frames

PFRXC[15:0] PAUSE Frame Receive Counter Bits

These bits indicate the number of PAUSE frames that have been received when flow control in reception is enabled (the RXF bit in ECMR = 1).

The bits are cleared to 0 when they are read.

If counting up and clearing the counter coincide, clearing the counter takes priority.

45.2.58 Automatic PAUSE Frame Retransmission Count Register (TPAUSER)

The TPAUSER register sets the upper limit of automatic PAUSE frame retransmission count.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 45.62 TPAUSER register contents

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0.
b15 to b0	TPAUSE[15:0]	Automatic PAUSE Frame Retransmission Count Upper Limit H'0000: No limitation H'0001: Once : : H'FFFF: 65535 times

TPAUSE[15:0] Automatic PAUSE Frame Retransmission Count Upper Limit Bits

The bits set the upper limit of automatic PAUSE frame retransmission count.

The setting in the bits must not be changed while transmission is enabled (EMCR.TE = 1).

45.2.59 MAC Address High Register (MAHR)

The MAHR register specifies the 32 higher-order bits of the 48-bit MAC address. The settings in this register are normally made in the initialization process after a reset.

The settings in this register must not be changed while transmission or reception is enabled.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.63 MAHR register contents

Bit Position	Bit Name	Function
b31 to b0	MA[47:16]	MAC Address Bits 47 to 16 These bits are used to set the 32 higher-order bits of the MAC address.

MA[47:16] MAC Address Bits 47 to 16

These bits are used to set the 32 higher-order bits of the MAC address.

For example, if the MAC address is 01-23-45-67-89-AB (hexadecimal), set H'0123 4567 in the MAHR register.

45.2.60 MAC Address Low Register (MALR)

The MALR register specifies the 16 lower-order bits of the 48-bit MAC address. The settings in this register are normally made in the initialization process after a reset.

The settings in this register must not be changed while transmission or reception is enabled.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit Position	Bit Name	Function
b31 to b16	—	Reserved These bits are read as 0. The write value should be 0.
b15 to b0	MA[15:0]	MAC Address Bits 15 to 0 These bits are used to set the 16 lower-order bits of the MAC address.

MA[15:0] MAC Address Bits 15 to 0

These bits are used to set the 16 lower-order bits of the MAC address.

For example, if the MAC address is 01-23-45-67-89-AB (hexadecimal), set H'89AB in the MALR register.

45.2.61 CRC Error Frame Receive Counter Register (CEFCR)

The CEFCR register is a counter that indicates the number of times frames with CRC errors were received. Counting up stops when the value in this register reaches H'FFFF FFFF.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.65 CEFCR register contents

Bit Position	Bit Name	Function
b31 to b0	CEFC[31:0]	CRC Error Frame Counter These bits indicate the number of CRC error frames received.

CEFC[31:0] CRC Error Frame Counter Bits

These bits indicate the number of received frames having CRC errors.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

45.2.62 Frame Receive Error Counter Register (FRECR)

The FRECR register is a counter that indicates the number of frames for which receive errors were generated by input on the ET_RXER pin from the PHY-LSI. Counting up stops when the value in this register reaches H'FFFF FFFF.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.66 FRECR register contents

Bit Position	Bit Name	Function
b31 to 0	FREC[31:0]	Frame Receive Error Counter These bits indicate the number of errors during frame reception.

FREC[31:0] Frame Receive Error Counter Bits

These bits indicate the number of errors during frame reception.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

45.2.63 Too-Short Frame Receive Counter Register (TSFRCR)

The TSFRCR register is a counter that indicates the number of received frames that were fewer than 64 bytes in length. Counting stops when the value in this register reaches H'FFFF FFFF.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TSFRC[31:16]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 45.67 TSFRCR register contents

Bit Position	Bit Name	Function
b31 to b0	TSFRC[31:0]	Too-Short Frame Receive Counter These bits indicate the number of frames received with a length of less than 64 bytes.

TSFRC[31:0] Too-Short Frame Receive Counter Bits

These bits indicate the number of received frames that were fewer than 64 bytes in length.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

45.2.64 Too-Long Frame Receive Counter Register (TLFRCR)

The TLFRCR register is a counter that indicates the number of received frames that were longer than the value specified in the receive frame length register (RFLR). Counting up stops when the value in the TLFRCR register reaches H'FFFF FFFF.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TLFC[31:16]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 45.68 TLFRCR register contents

Bit Position	Bit Name	Function
b31 to b0	TLFC[31:0]	Too-Long Frame Receive Counter These bits indicate the number of frames received with a length exceeding the value in RFLR.

TLFC[31:0] Too-Long Frame Receive Counter Bits

These bits indicate the number of received frames that were longer than the value in RFLR.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

45.2.65 Residual-Bit Frame Receive Counter Register (RFCR)

The RFCR register is a counter that indicates the number of received frames containing “residual bits” (trailing bits not making up an 8-bit unit). Counting up stops when the value in this register reaches H’FFFF FFFF.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.69 RFCR register contents

Bit Position	Bit Name	Function
b31 to b0	RFC[31:0]	Residual-Bit Frame Receive Counter These bits indicate the number of received frames containing residual bits.

RFC[31:0] Residual-Bit Frame Receive Counter Bits

These bits indicate the number of received frames containing residual bits.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

45.2.66 Multicast Address Frame Receive Counter Register (MAFCR)

The MAFCR register is a counter that indicates the number of received frames for which a multicast address was specified. Counting up stops when the value in this register reaches H'FFFF FFFF.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.70 MAFCR register contents

Bit Position	Bit Name	Function
b31 to b0	MAFC[31:0]	Multicast Address Frame Counter These bits indicate the number of multicast frames that have been received.

MAFC[31:0] Multicast Address Frame Counter Bits

These bits indicate the number of multicast frames that have been received.

The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1.

When TRCCM = 0, they are cleared to 0 by the writing of any value to this register.

45.3 Operation

The EthernetAVB consists of the following functional units:

- DMA transfer controller (AVB-DMAC): Handles DMA transfer between the data storage areas for reception and transmission in the on-chip RAM and the reception and transmission FIFO buffers
- MAC controller (E-MAC): Handles transfer between the reception and transmission FIFO buffers and the MII

Using its direct memory access (DMA) function, the AVB-DMAC handles DMA transfer of frame data between the destinations for storing Ethernet frame data for transmission and reception in the on-chip RAM and the FIFO buffers for reception and transmission. Data cannot be directly read from or written to the FIFO buffers.

To handle DMA transfer, the AVB-DMAC requires information that includes the addresses for storage of data for transmission and received data. These data are referred to as descriptors. The AVB-DMAC reads data for transmission from the storage area for data to be transmitted according to the information in descriptors and writes received data to the storage area for received data accompanied by information in descriptors. The descriptors are placed in the on-chip RAM. Arranging multiple descriptors in descriptor lists allows the continuous reception or transmission of multiple Ethernet frames.

The E-MAC supports an MII, which provides an interface format for the externally connected PHY-LSI. The E-MAC constructs Ethernet frames from data written to the transmission FIFO and transmits these frames to the MII. It also performs CRC checking of Ethernet frames received from the MII and writes the frames to the reception FIFO.

45.3.1 AVB-DMAC Operating Modes

Figure 45.5 illustrates the operating modes of the AVB-DMAC.

Transitions of AVB-DMAC operating mode are under the control of the items listed below.

- CPU operating mode (power-on reset)
- Configuration of the operating mode configuration bits (CCC.OPC) in the AVB-DMAC mode register

The current operating mode can be determined by reading the operating mode status bits in the AVB-DMAC status register (CSR.OPS).

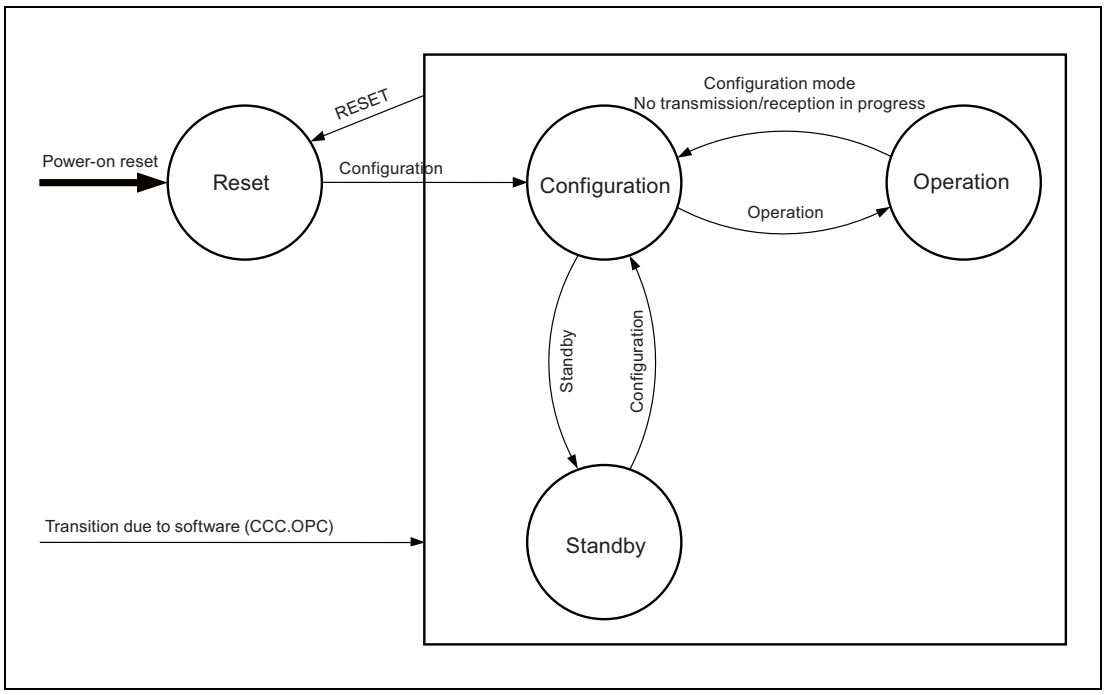

Figure 45.5 Operating Mode of AVB-DMAC

45.3.1.1 Operating Modes

(1) Reset mode

After a power-on reset, the AVB-DMAC enters reset mode.
In reset mode, only the AVB-DMAC operating mode control function is controllable and other functions are all stopped. This mode is designed for reduced power when the Ethernet function is not necessary.

(2) Configuration mode

In configuration mode, various settings for the AVB-DMAC can be made.
The operation of most functions is stopped and all status registers are initialized to their reset values.
The E-MAC functions in this mode.

(3) Operation mode

In operation mode, all functions of the AVB-DMAC can operate.
Ethernet communications can only proceed in this mode.

(4) Standby mode

In standby mode, only the operating mode control function and E-MAC can be used. Other functions cannot be used.

45.3.1.2 How to Set the Operating Mode

Set the operating mode configuration bits in the AVB-DMAC status register (CSR.OPC) to select the operating mode. Furthermore, the current operating mode can be checked by reading the operating mode status bits in the AVB-DMAC status register (CSR.OPS).

Transitions other than from operation mode to configuration mode are made after the value is written to the operating mode configuration bits (CCC.OPC) (Figure 45.6).

For transitions from operation mode to configuration mode, follow the procedure in Figure 45.7 because any transmission and reception in progress will be executed before the transition to configuration mode.

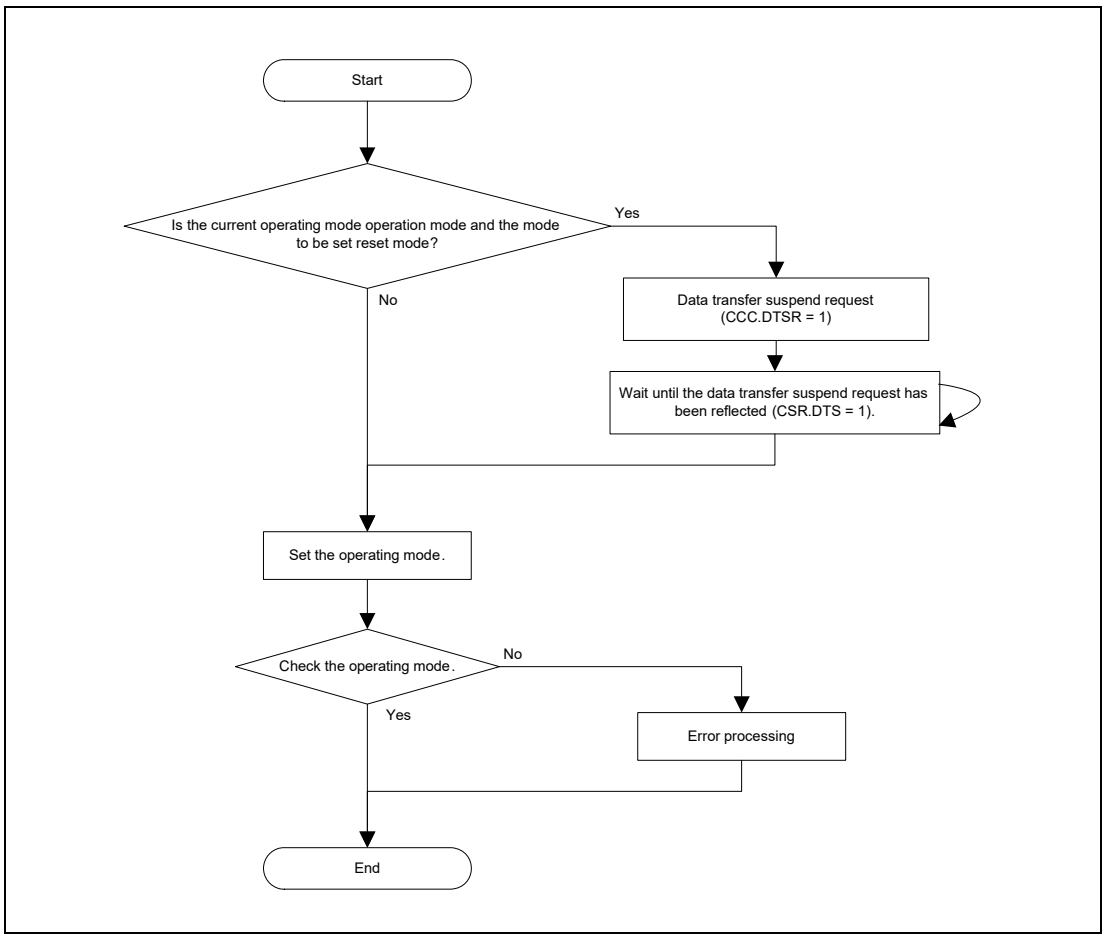

Figure 45.6 Flow for Transitions of Operating Mode (Other than from Operation Mode to Configuration Mode)

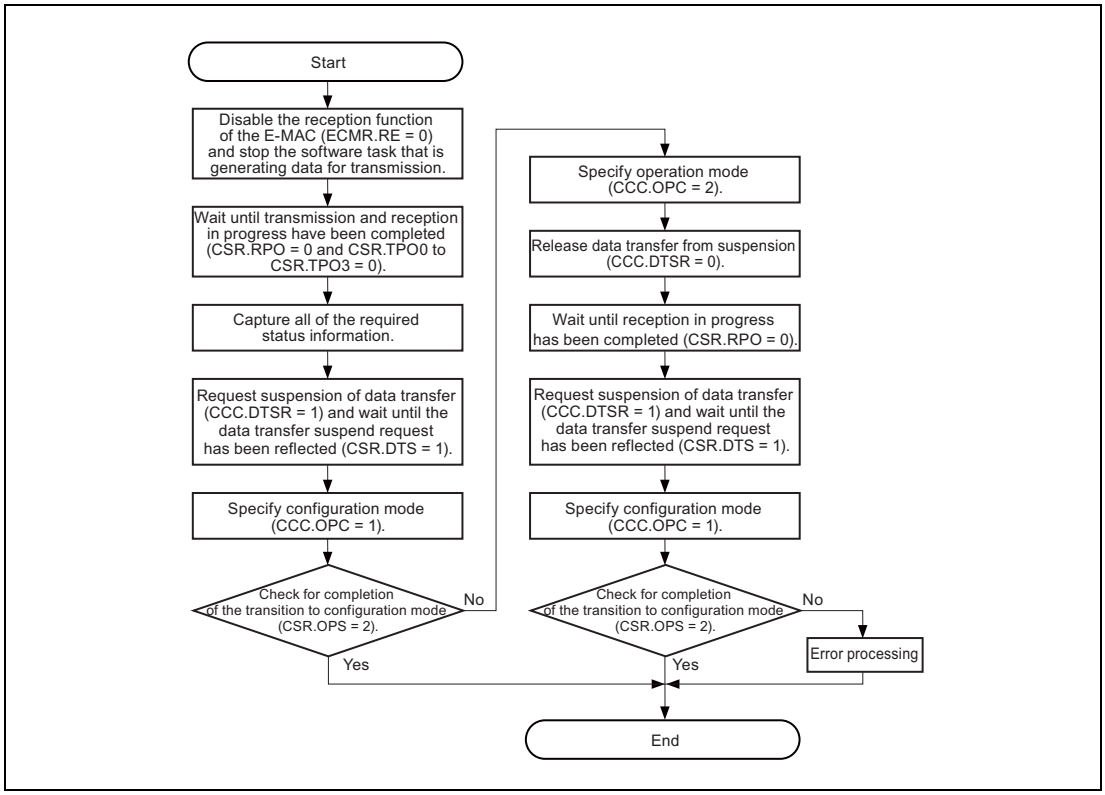

Figure 45.7 Flow for Transitions of Operating Mode (from Operation Mode to Configuration Mode)

In the transition from operation mode to configuration mode, the AVB-DMAC executes the following operations before the transition is completed. Read the operating mode status bits in the AVB-DMAC status register (CSR.OPS) to check that the transition to configuration mode has been completed.

- If the transfer of a frame between the reception FIFO and on-chip RAM is in progress, this is completed
  (other received frames remaining in the FIFO and any frames that are subsequently received by the E-MAC are discarded).
- If the transfer of a frame is in progress between the transmission FIFO and on-chip RAM, this is completed
  (frames for transmission remaining in the on-chip RAM will not be transmitted).
- All frames for transmission in the transmission FIFO are transferred to the E-MAC.

Notes:

When the operating mode shifts to configuration mode, all status registers are cleared.

We recommend following the procedure below in the case of this transition.

1. Disable reception.
2. Since reception actually stopping after being disabled requires time, wait for an interval equivalent to that for reception of a maximum length packet.
3. Stop the software task that is generating data for transmission.
4. Wait until the receive process status bit (CSR.RPO) and the transmit process status bits (CSR.TPO0 to 3) in the AVB-DMAC status register are set to 0.
5. Capture all of the required status information.

6. Set the operating mode configuration bits in the AVB-DMAC mode register (CCC.OPC) to initiate the transition to configuration mode.

45.3.1.3 Operating Mode Transitions Due to Hardware

The following hardware factors can also initiate transitions of the AVB-DMAC operating mode.

(1) Power-on reset

Resetting of the LSI chip leads to resetting of the entire EthernetAVB module. The operating mode shifts to reset mode.

45.3.2 Common Control for Transmission and Reception

45.3.2.1 Initialization Procedure

Figure 45.8 shows the overall initialization procedure in outline.

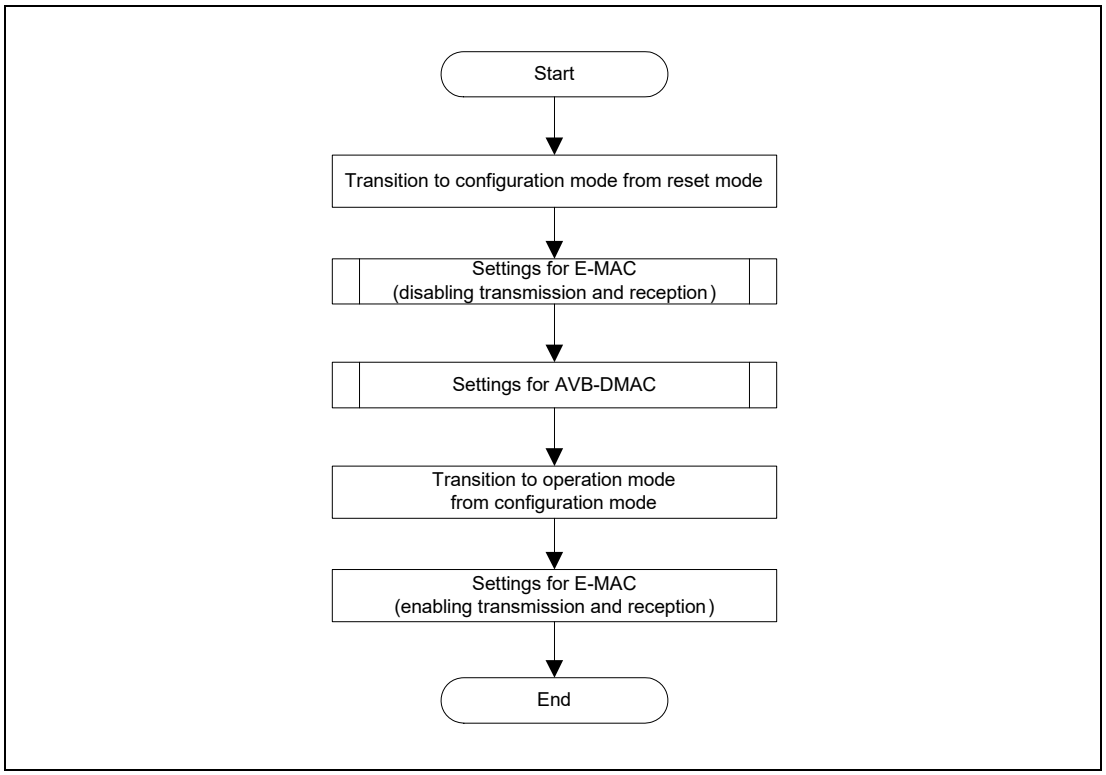

Figure 45.8 Outline of the Initialization Procedure

(1) Initializing the Receiver Section

Before starting reception, follow the procedure below.

Set the operating mode to operation mode or standby mode, and do not enable reception until the settings for the AVB-DMAC are completed.

- Set the operating mode to configuration mode.
- Set AVB filtering for network control frames and AVB stream frames to suit the specifications of the product the chip will be used in.
- Create a descriptor chain for each queue to be used.
- Set the base address for the descriptor table in the descriptor base address table register (DBAT).
- Specify the maximum frame length with the receive frame length upper limit register (RFLR).
- Specify whether padding is to be used with the receive padding configuration register (RPC).
- Set the unread frame counter for each queue with unread frame counter registers 0 to 4.

(2) Initializing the Transmitter Section

Figure 45.9 illustrates initialization of the transmitter section.

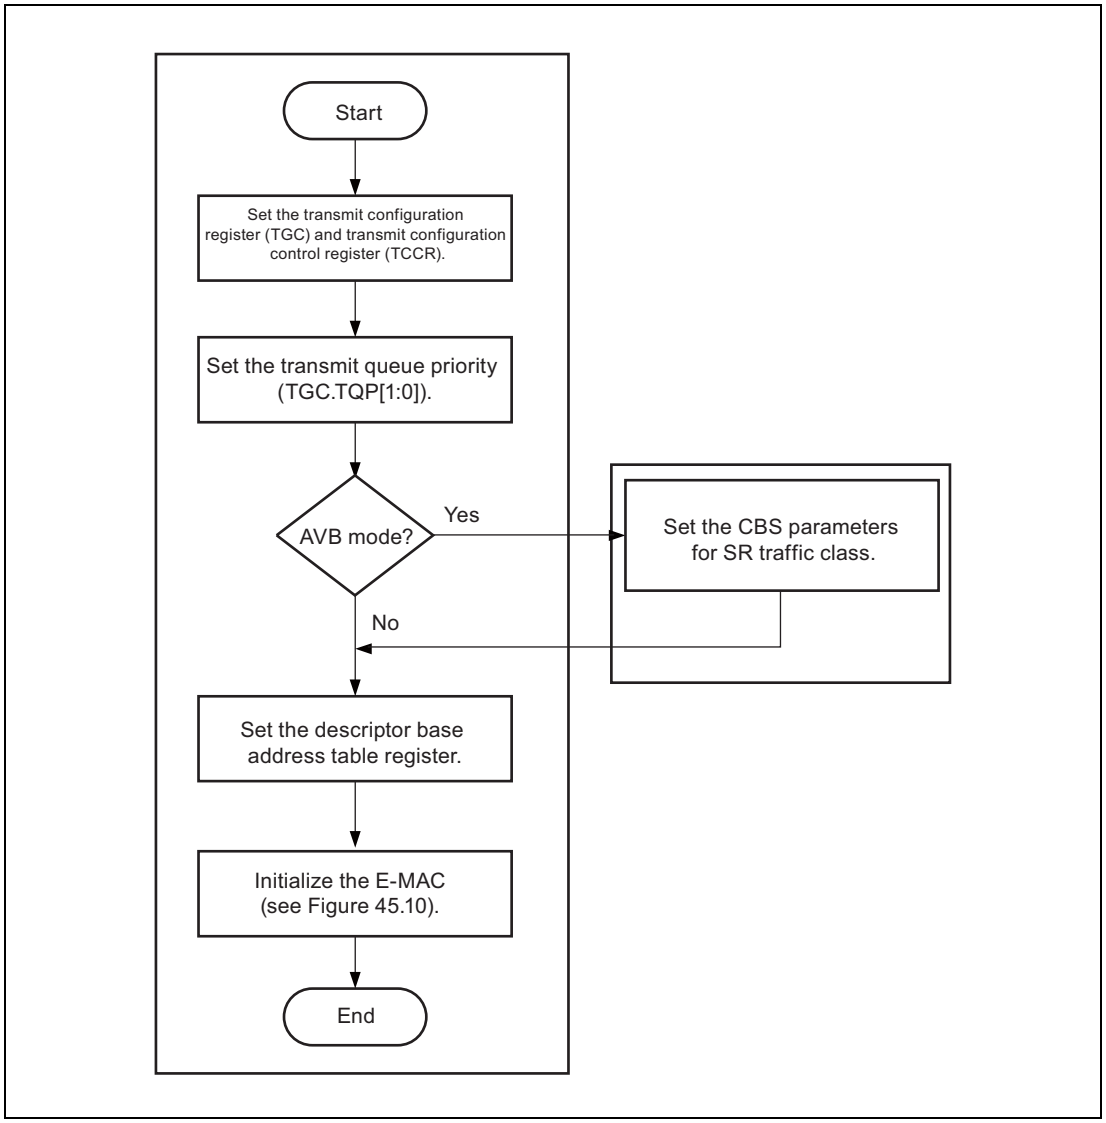

Figure 45.9 Procedure for Initializing the Transmitter Section

(3) Initializing the E-MAC Section

Figure 45.10 illustrates initialization of the E-MAC section.

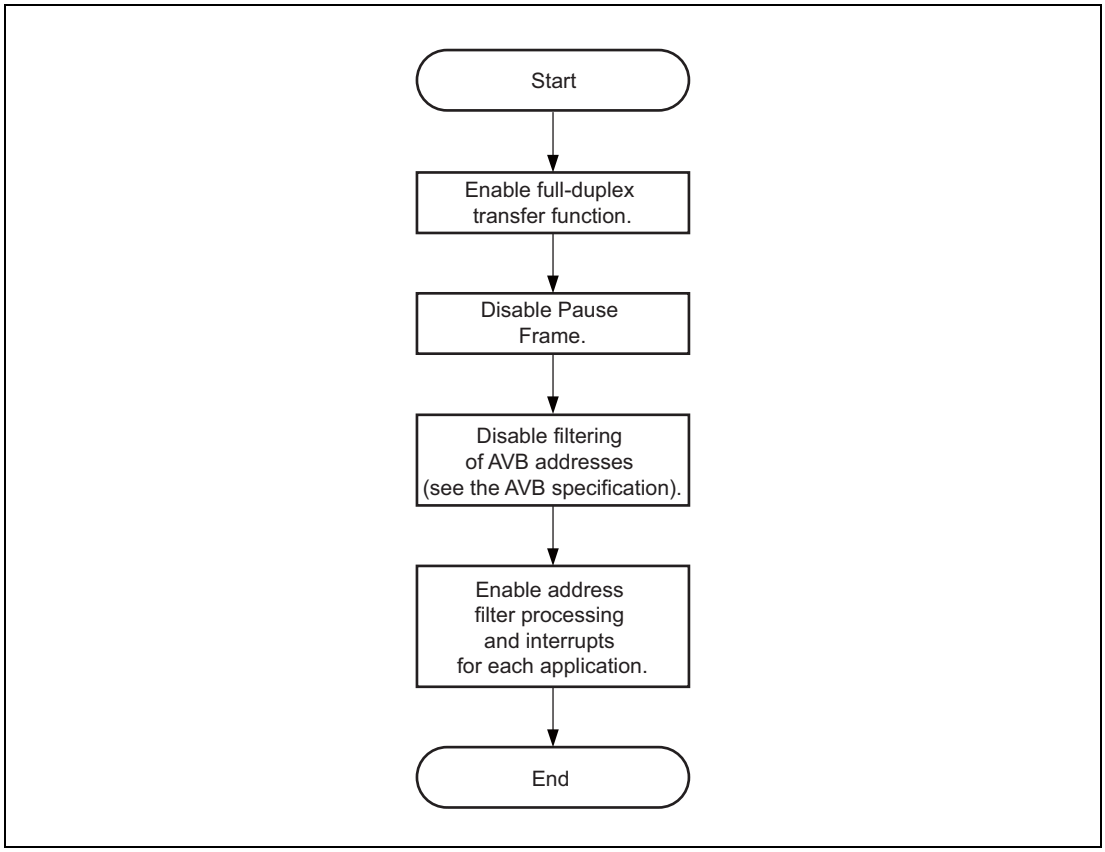

Figure 45.10 Procedure for Initializing the E-MAC Section

(4) Initialization of the AVB-DMAC Unit

Figure 45.11 illustrates initialization of the AVB-DMAC unit.

For a description of how to set up the descriptors and the CBS, see section 45.3.3, Descriptors, and section 45.3.6, CBS (Credit-Based Shaping).

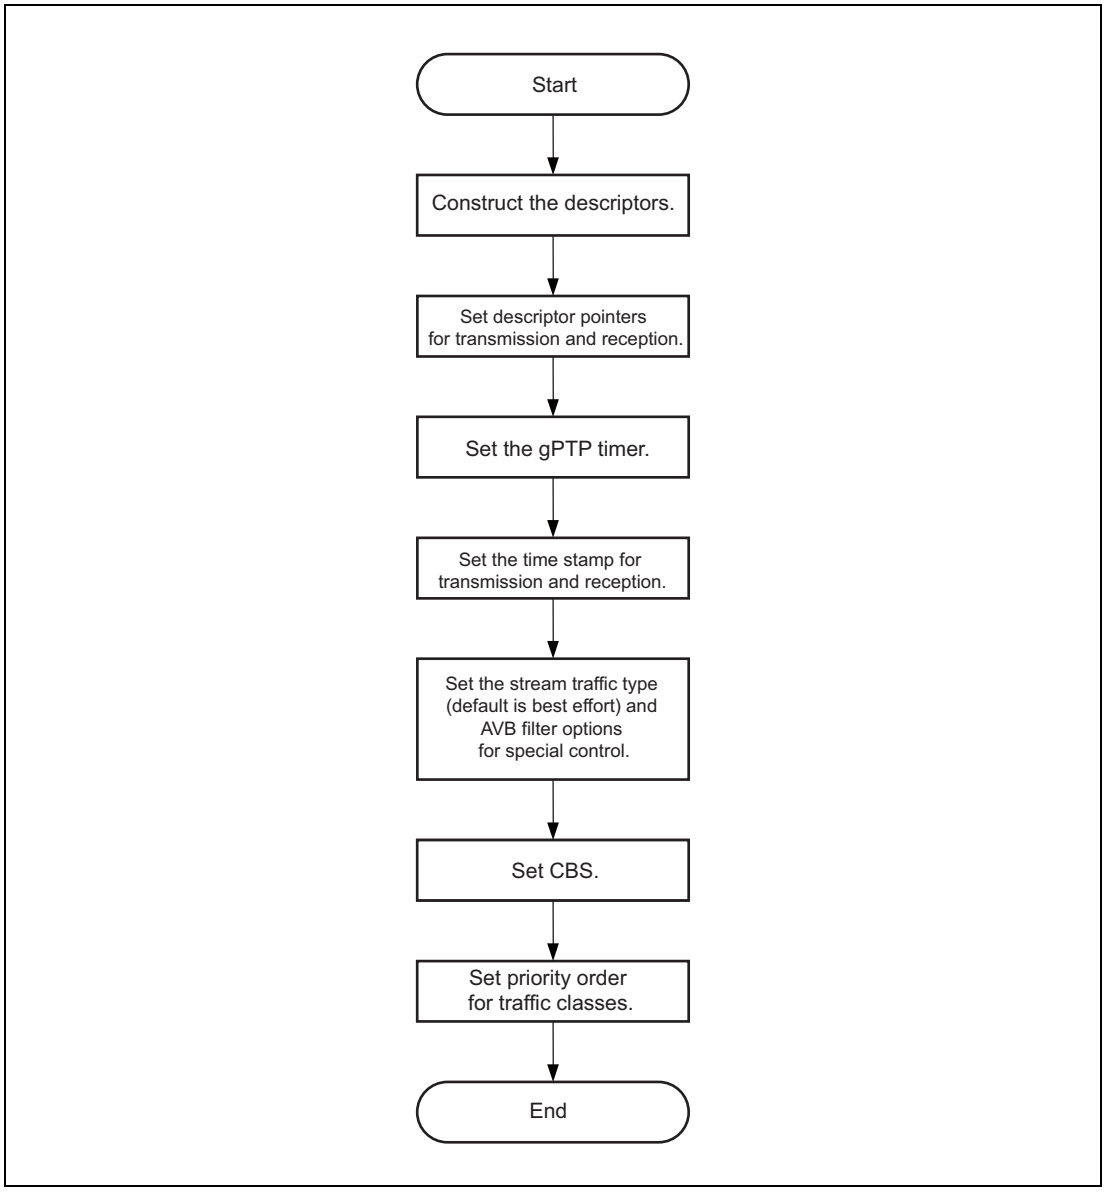

Figure 45.11 Procedure for Initializing the AVB-DMAC Unit

45.3.2.2 Scheduling Reception and Transmission

The EthernetAVB normally has independent buses for transmission and reception. Furthermore, the four processes of fetching, storing, transmission and reception are basically independent of one another. Fetching and storing, however, share the same bus master so cannot be executed simultaneously. Access to the bus master is controlled by the scheduler.

Figure 45.12 is a schematic view of EthernetAVB operations in transmission and reception.

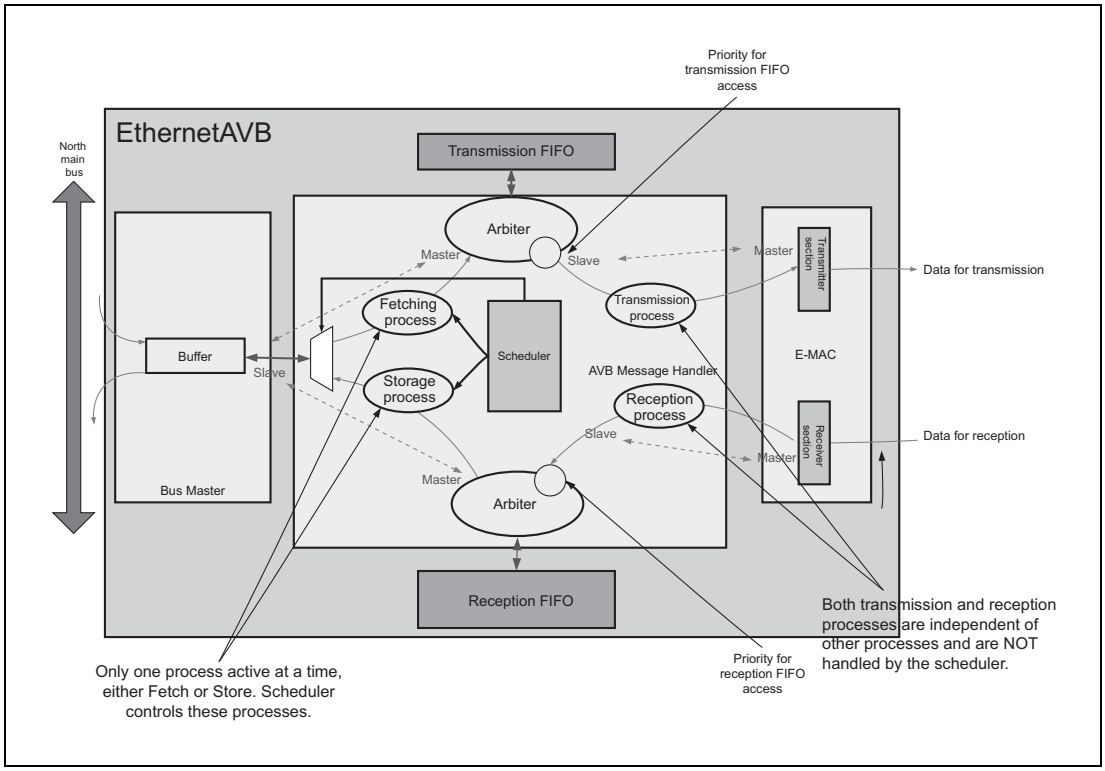

Figure 45.12 Schematic View of EthernetAVB Operations in Transmission and Reception

Storing and fetching are alternately performed. When the number of frames held by the reception FIFO reaches the warning level, storing takes precedence over fetching.

(1) Relationship between Transmission Queue Numbers and Traffic Classes

In fetching, the relationships between the transmission queues and traffic classes are fixed, so the priority specified by the transmit queue priority bits in the transmit configuration register (TGC.TQP) has no effect.

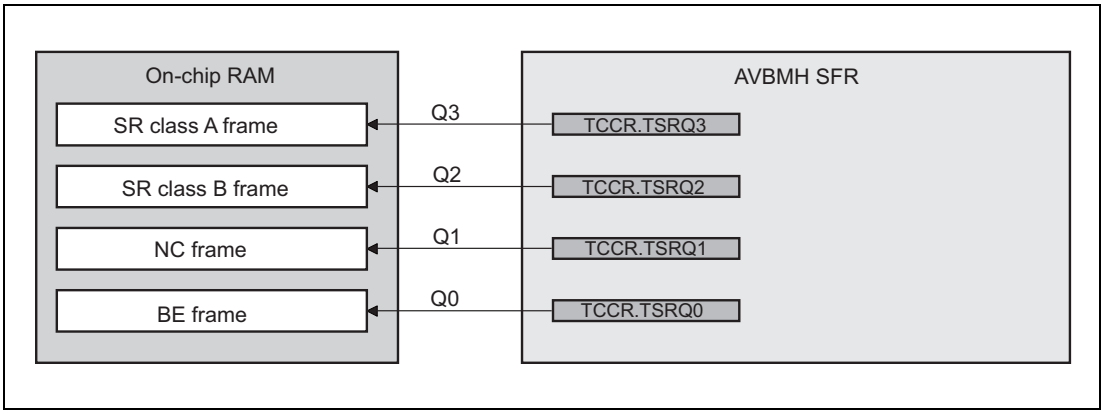

Figure 45.13 Class Associations of Queues for the Scheduler

In fetching, the credit values for stream classes A and B are not taken into account. Behavior depends on the setting of the transfer FIFO size configuration bits in the transfer configuration registers (TGC.TBDt).

When the transmit queue priority bits in the transmit configuration register (TGC.TQP) are B’00 or B'01, the priority order is Q3 → Q 2 → Q1 → Q0.

When the transmit queue priority bits in the transmit configuration register (TGC.TQP) are B’11, the priority order is Q1 → Q3 → Q2 → Q0.

45.3.2.3 Checking Integrity

The EthernetAVB is capable of detecting and identifying errors produced in the processing of Ethernet frames and in the transfer of frame data for transmission and reception.

(1) Items for Monitoring in Both Reception and Transmission

(a) Errors in access to the on-chip RAM for reading of descriptors

- The error type bits (ESR.ET) are set to B'0000, and the queue number being processed is set to the error queue number bits (ESR.EQN).
- The same descriptor may be processed again because the current descriptor address (CDARq.CDA) was not changed.
- If this problem occurs in a divided frame, the sequence may be broken.

In reception

- The received frame will be lost.
- The same problem will occur for the next frame of data received for the same queue.

In transmission

- The transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.
- The frame will be lost from the transmission FIFO.

(b) Illegal configuration of a descriptor

- The error type bits (ESR.ET) are set to B'0010, and the queue number being processed is set to the error queue number bits (ESR.EQN).
- The same descriptor may be processed again because the current descriptor address (CDARq.CDA) was not changed.
- If this problem occurs in a divided frame, the sequence may be broken.

In reception

- The received frame will be lost.
- The same problem will occur for the next frame of data received for the same queue.

In transmission

- The transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.
- The frame will be lost from the transmission FIFO.

(c) Errors in access to the on-chip RAM for writing of descriptors

- The error type bits (ESR.ET) are set to B'0001, and the queue number being processed is set to the error queue number bits (ESR.EQN).
- As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) are updated.

- As DESCR.DT was not updated, hardware and software synchronization may have been lost.

(2) Items for Monitoring in Reception

(a) Errors in access to the on-chip RAM for writing of data or time stamps

- The error type bits (ESR.ET) are set to B'0101, and the queue number being processed is set to the error queue number bits (ESR.EQN).
- As in the case where no error occurs, the current descriptor address (CDARq.CDA) is updated.
- DESCR.EI is set to 1 to indicate error detection.
- This problem occurring in a divided frame may break the descriptor sequence, making the queue unusable.

(b) Overflow of the Reception FIFO

- The reception FIFO full interrupt status bit (RIS2.RFFF) is set to 1.
- The received frames are all invalidated. The frames stored in the reception FIFO must be discarded according to the following procedure.

1. Stop reception and enter configuration mode according to the flow shown in **Figure 45.7, Flow for Transitions of Operating Mode (from Operation Mode to Configuration Mode)**.
2. Discard all the unprocessed received data stored in the on-chip RAM.

(3) Items for Monitoring in Transmission

(a) Errors in Access for Reading Data from the on-chip RAM

- The error type bits (ESR.ET) are set to B'0100, and the queue number being processed is set to the error queue number bits (ESR.EQN).
- Data that have already been fetched are discarded from the transmission FIFO.
- When an error of this type occurs during processing of an FSINGLE or FEND descriptor:
  As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated. Fetching resumes after the error frame.
- When an error of this type occurs during processing of an FSTART or FMID descriptor:
  - The current descriptor address (CDARq.CDA) is not updated.
  - The transmit start bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.

(b) Overflow of the Transmission FIFO

- The error type bits (ESR.ET) are set to B'1010, and the queue number being processed is set to the error queue number bits (ESR.EQN).
- As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated. Fetching resumes after the error frame.
- The frame will be discarded from the FIFO.

(c) Frame size error during transmission

- The error type bits (ESR.ET) are set to B'1001, and the queue number being processed is set to the error queue number bits (ESR.EQN).
- As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated. Fetching resumes after the error frame.

A transmit frame size error is detected when the size setting in one or more (in the case of a divided frame) descriptors for frame transmission is more than 1996 bytes. Such frames are cut out and transmitted.

45.3.3 Descriptors

45.3.3.1 Data Representation in On-chip RAM

The AVB-DMAC transfers data for transmission and received data to and from the application software via the on-chip RAM.

Control structures referred to as descriptors and the frame data referred to as descriptor data area are allocated to the on-chip RAM. Dividing into a control area and data area allows the flexible allocation of frame data to the on-chip RAM.

Figure 45.14 shows an example of the memory maps for descriptors and the descriptor data area in the on-chip RAM.

A descriptor consists of its type (DESCR.DT), which controls the descriptor functions, a descriptor pointer (DESCR.DPTR) indicating the start address for storage of the frame data in the descriptor area, and the data size field (DESCR.DS), indicating the amount of frame data. Post-processing interrupt generation can be set up for each descriptor. Enabling and disabling of the interrupt is controlled by the descriptor interrupt enable bits (DESCR.DIE).

The descriptor may also hold information related to content. This information does not affect general descriptor functions. It provides information other than the frame data proper, such as on the state of reception.

For details, see section 45.3.4.2, Setting Up Reception Descriptors, and section 45.3.5.2, Setting Up Transmission Descriptors.

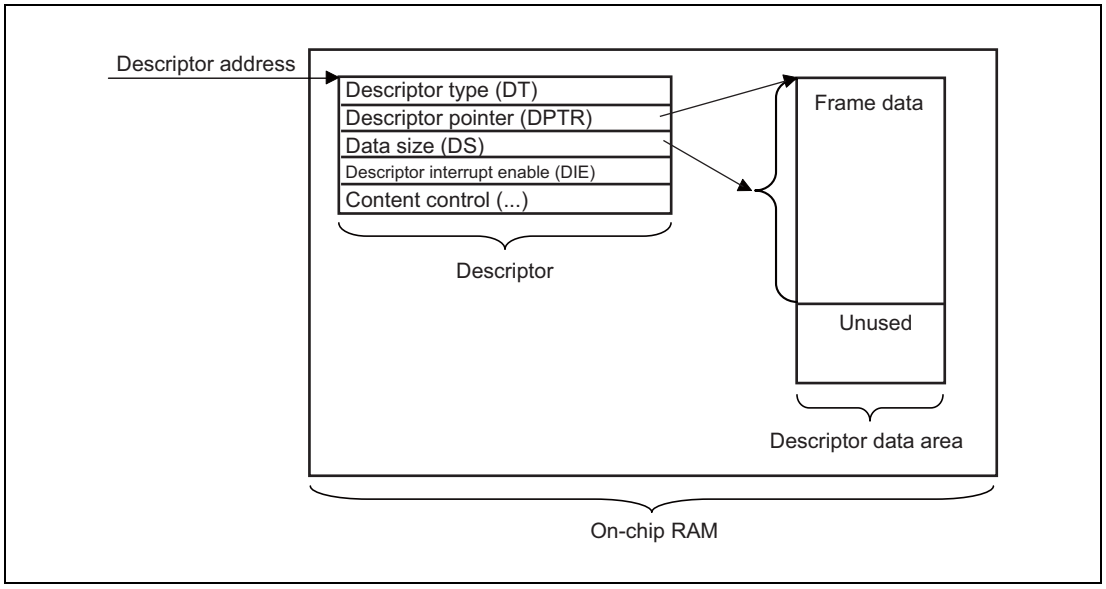

Figure 45.14 Example of On-chip RAM Memory Map

The descriptor must be aligned with a 32-bit boundary in the on-chip RAM.

Descriptors are generally configured of 64 bits, but are configured of 160 bits when reception and storage of gPTP time stamps is enabled.

The frame data must also be aligned with a 32-bit boundary in the on-chip RAM.

The amount of data in the frame is defined by the data size bits (DESCR.DS). In reception, these bits indicate the upper limit on the size of frames to be received. If the data size is not aligned with a 32-bit boundary, the bytes to the next 32-bit boundary in the data area will be an unused area.

45.3.3.2 Using Descriptor Chains in Queues

Transmission and reception descriptors in the on-chip RAM are grouped into queues. Each queue handles frames so that they are transmitted in order of priority and received separately. A queue is capable of controlling one or more frames. Accordingly, multiple descriptors can be assigned to one queue. A combination of multiple descriptors is referred to as a descriptor chain.

For a descriptor chain, the three general descriptor types listed below are defined. For details on these descriptor types, see section 45.3.3.6, Descriptor Type.

- Descriptors that define frame data
- Descriptors that control the descriptor chain itself (e.g. LINK, EOS).
- Descriptors that arbitrate access by hardware or software

Figure 45.15 shows the two basic topologies for descriptor chains. In the simplified examples in the figure, all descriptors allocated to the chain are stored in the array.

- For a linear descriptor chain, the last descriptor in the array is a control descriptor indicating the end of the descriptors (e.g. EEMPTY).
- For a cyclic descriptor chain, the last descriptor in the array is a control descriptor that returns to the first descriptor in the array (e.g. LINK).

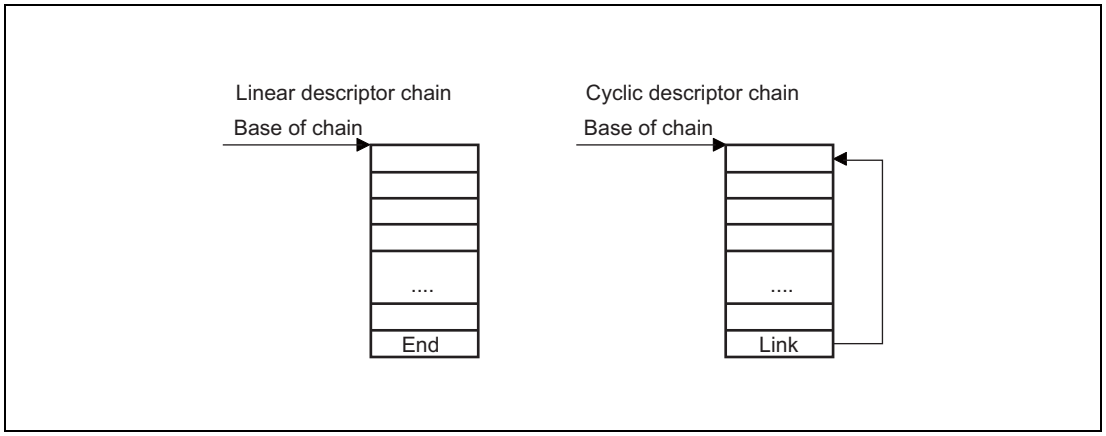

Figure 45.15 Outline of the Basic Descriptor Chains

The relationship between queues and descriptor chains is defined by the base addresses of chains. A queue is connected to one descriptor chain over one round of processing. There is also a method of switching to a different chain while in operation mode.

There are no restrictions on the number of link descriptors and their locations within the chain. The last descriptor of a designed chain determines the topology.

Which chain structure is to be used or which topology is suitable depends on the application. A description of how to design descriptor chains to suit various applications is given in section 45.3.4.2, Setting Up Reception Descriptors. Procedure for Setting Reception Descriptors, and section 45.3.5.2, Setting Up Transmission Descriptors.

45.3.3.3 Descriptor Base Address Table

The base address table in the on-chip RAM contains the address of the first descriptor of all chains to be handled by the respective queues.

Entries 0 to 3 are used to access transmission queues 0 to 3. Subsequent entries are used to access reception queues. Entry 4 thus corresponds to reception queue 0.

The configuration of entries in the base address table is the same as the configuration of link descriptors. We recommend using the descriptor type (DESCR.DT) LINKFIX. Processing of this link descriptor does not change it, so it does not require updating. The first descriptor of a chain performs hardware and software synchronization. If the application requires hardware and software synchronization for the base addresses, use the descriptor type (DESCR.DT) LINK.

The CPU is only capable of using LINKFIX and LINK as descriptor types (DESCR.DT) of descriptors in the base address table.

Set the location of the base address table in the on-chip RAM in the descriptor base address table register (DBAT).

Figure 45.16 shows an example of a base address table for controlling four transmission and three reception queues. The boxes to the right of the table represent descriptor chains with the desired topologies.

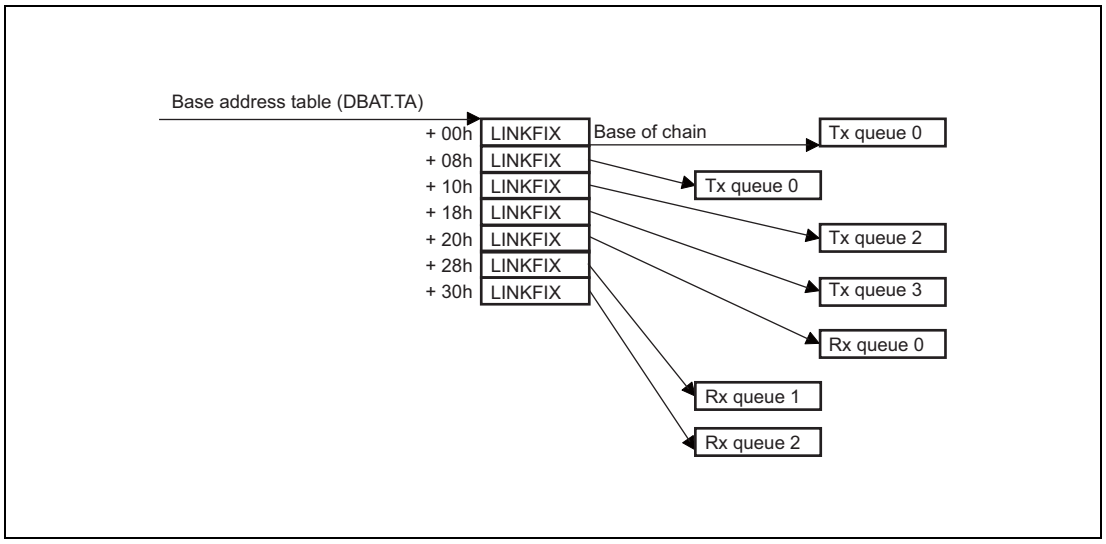

Figure 45.16 Example of a Base Address Table for Reception and Transmission Queues

CAUTION

The size of the descriptors in the base address table is always eight bytes even if the queue itself includes extended descriptors.

45.3.3.4 Descriptor Chain Processing

When a descriptor is currently being processed or the queue for a descriptor is active, the current descriptor is a descriptor to be processed. The current descriptor address for use by a queue q can be checked in the current descriptor address register q (CDARq).

Current descriptors are:

- set in the descriptor base table address bits (DBAT.TA) +8*q for all q queues when the operating mode shifts to operation mode.
- set in the descriptor base table address bits (DBAT.TA) +8*q when a base address load request is issued for a queue q by setting the corresponding bit (DLR.LBAq) in the descriptor base address load request register (DLR).
- set in DESCR.DPTR for a link descriptor (LINK, LINKFIX) to be processed.
- incremented by the size of the descriptors (8 bytes for normal descriptors and 20 bytes for extended descriptors) after a descriptor has been processed. In this case, the AVB-DMAC updates the descriptor type and informs the CPU that the descriptor has been processed.

In other cases (for illegal descriptor processing and so on), the current descriptor address register q (CDARq) is not updated.

45.3.3.5 Descriptor Interrupts

A descriptor is able to issue a descriptor interrupt on completion of its processing. The setting of the descriptor interrupt enable bits (DESCR.DIE) in each descriptor can disable the descriptor interrupts or select the specific descriptor interrupt to be generated.

The descriptor interrupt is a common resource that is shared between reception and transmission queues.

Figure 45.17 illustrates the way in which the AVB-DMAC generates descriptor interrupts (or sets bits in the descriptor interrupt status register (DIS.DPFi)). Processing of a descriptor with the value i in the descriptor interrupt enable bits (DESCR.DIE) leads to the corresponding bit in the descriptor interrupt status register (DIS.DPFi) being set.

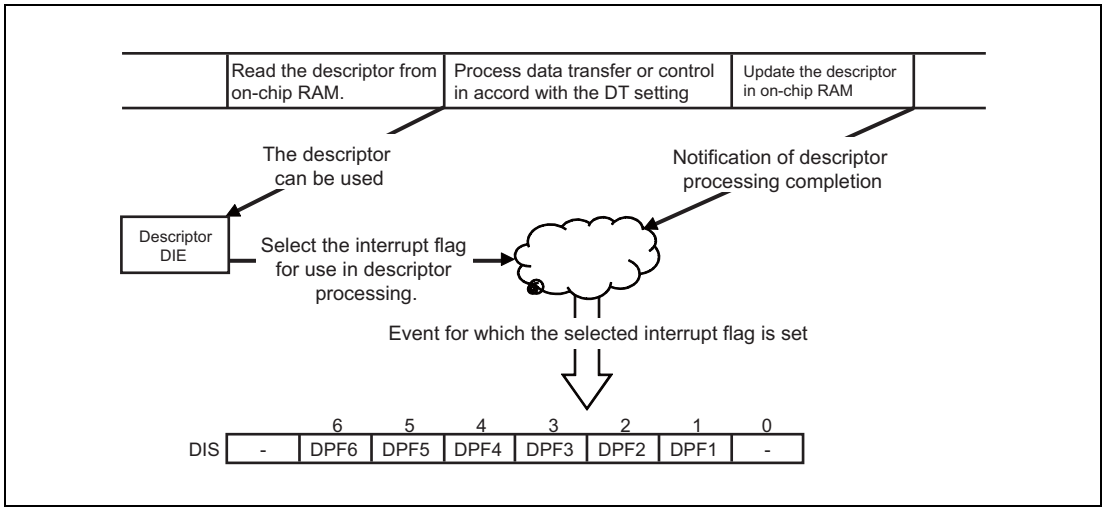

Figure 45.17 Method of Descriptor Interrupt Generation

45.3.3.6 Descriptor Type

The descriptor types (indicated by the DESCR.DT bits) supported by the AVB-DMAC fall into the following three categories.

- Definitions of frame data
- Control of descriptor chains
- Hardware and software arbitration

Table 45.71 is a summary of the descriptor types available for the AVB-DMAC. Entries under “Name” are the names of the descriptor types and the values under “DT” are the corresponding values to be set in the descriptor type field (DESCR.DT). A given descriptor may be handled differently according to whether it is in a transmission or reception queue, so the transmission and reception columns list the scopes of control and processing of the descriptor types.

The abbreviations defined below are used in the transmission and reception columns.

Definition of SW:

- The descriptor is processed by software.
- Software has access to and may modify the descriptor and descriptor data area.
- This descriptor cannot be changed by hardware (AVB-DMAC).

Definition of HW:

- The descriptor is processed by hardware (AVB-DMAC).
- Software must modify neither the descriptor nor the descriptor data area.
- Hardware (AVB-DMAC) processes this descriptor and subsequently changes the descriptor type.

Invalid:

This descriptor type is not used in transfer in the given direction (transmission or reception).

Do not write this value to the descriptor type (DESCR.DT) field for transfer in the given direction.

Hardware does not process these descriptor types in the cases listed as invalid. The current descriptor address (CDARq.CDA) will not be changed when processing of a queue for the given direction arrives at a descriptor with this type setting.

Table 45.71 Summary of Descriptor Types

Name	DT	Description	Reception	Transmission
Frame data				
FSTART	5	Frame Start The descriptor points to valid data for a frame. The frame starts with the given data and continues with that indicated by the next descriptor.	SW	HW
FMID	4	Frame Middle The descriptor points to valid data for a frame. The frame started with a previous descriptor and continues to the data indicated by the next descriptor.	SW	HW
FEND	6	Frame End The descriptor points to valid data for a frame. The frame continues from the previous descriptor and ends with the data indicated by in this descriptor.	SW	HW
FSINGLE	7	Frame Single The descriptor points to valid data for a complete frame.	SW	HW
Chain control				
LINK	8	Link Defines the descriptor in the next chain.	HW	HW
LINKFIX	9	Fixed Link Defines the descriptor in the next chain. Unlike the case of Link, it is not rewritten by hardware after descriptor processing.	SW	SW
EOS	10	End Of Set Controls division of the chain.	HW	HW
HW/SW arbitration				
FEMPTY	12	Frame Empty A descriptor related to frame data but not containing valid data for a frame	HW	SW
FEMPTY_IS	13	Frame Empty Incremental Start A descriptor related to frame data but not containing valid data for a frame DESCR.DPTR sets the base address of an "incremental data area" in the on-chip RAM.	HW	Invalid
FEMPTY_IC	14	Frame Empty Incremental Continue A descriptor related to frame data but not containing valid data for a frame Data indicated by the pointer are for storage in an incremental data area in the on-chip RAM.	HW	Invalid
FEMPTY_ND	15	Frame Empty No Data Storage A descriptor related to frame data but not containing valid data for a frame The descriptor is processed in the same way as FEMPTY but data are not stored in the on-chip RAM.	HW	Invalid
LEMPTY	2	Link Empty A link descriptor for processing by the AVB-DMAC	SW	SW
EEMPTY	3	EOS Empty An EOS descriptor for processing by the AVB-DMAC	SW	SW
DT0	0	Reserved	Invalid	Invalid
DT1	1	Reserved	Invalid	Invalid
DT11	11	Reserved	Invalid	Invalid

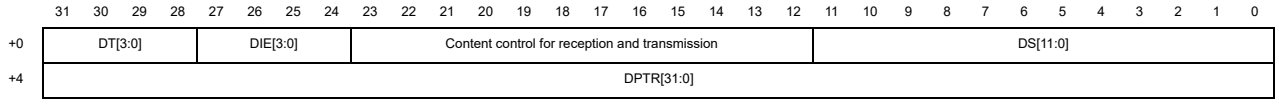
(1) Layout of General Descriptors in the On-chip RAM

The AVB-DMAC updates processed descriptors in the on-chip RAM. The field to be changed in a descriptor being updated depends upon whether the direction is transmission or reception and the queue mode. Other fields will not be changed. There are no restrictions on the values set in unused descriptor fields (indicated by "—" in the figure).

(2) Frame Data Descriptors

The allocation of bits in the frame data descriptors (FSTART, FMID, FEND, and FSINGLE) is shown below.

- Normal descriptor (usable in both reception and transmission)



- Extended descriptor (usable only in reception)

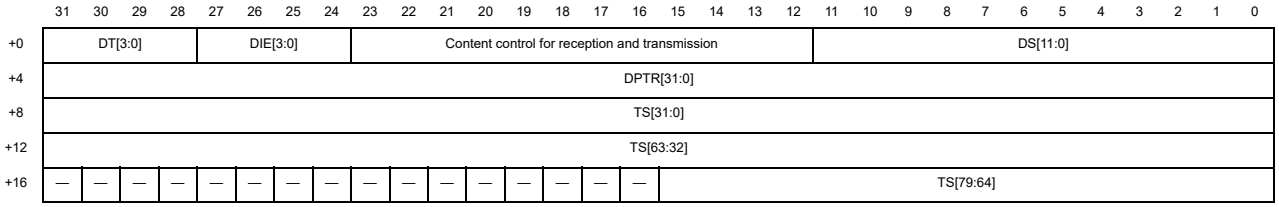


Table 45.72 Contents of Frame Data Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 5: FSTART 4: FMID 6: FEND 7: FSINGLE For details, see section 45.3.4.2, Setting Up Reception Descriptors, and section 45.3.5.2, Setting Up Transmission Descriptors.
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).
—	Content Control For details, see section 45.3.4.2, Setting Up Reception Descriptors, and section 45.3.5.2, Setting Up Transmission Descriptors.
DS[11:0]	Data Size Size of the data area/frame data for the descriptor (in bytes) The specifiable data lengths are as follows (when a frame is divided into parts, the total size of the frame should be within the ranges below). Transmission: 1 ≤ DS ≤ 1996 Reception: 1 ≤ DS ≤ 2000
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor Register an address on a 32-bit boundary.
TS[79:0]	Time Stamp Time stamp of the received frame (only available in extended descriptors)

CAUTION

Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

H'0000 is written to the reserved bits in an extended descriptor (bits 31 to 16 in DESCR) when the time stamp is stored.

(3) Hardware/Software Arbitration Descriptors (Only for Reception)

The allocation of bits in the descriptors for hardware/software arbitration (FEMPTY, FEMPTY_IS, FEMPTY_IC, and FEMPTY_ND) is shown below.

- Normal descriptor

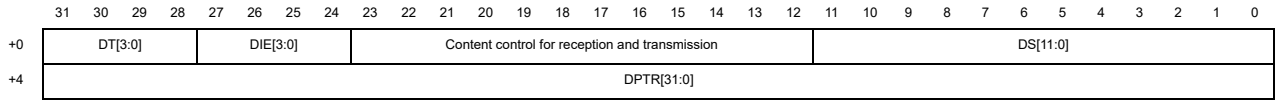

Table 45.73 Contents of Hardware/Software Arbitration Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 12: FEMPTY 13: FEMPTY_IS 14: FEMPTY_IC 15: FEMPTY_ND For details, see **Table 45.71, Summary of Descriptor Types**.
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).
—	Content Control For details, see section 45.3.4.2, Setting Up Reception Descriptors, and section 45.3.5.2, Setting Up Transmission Descriptors.
DS[11:0]	Data Size Size of the data area/frame data for the descriptor (in bytes)
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the descriptor Register an address on a 32-bit boundary.

CAUTIONS

Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

When an extended descriptor is used, a 12-byte unused area is added.

In an FEMPTY descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), data size (DS), and descriptor pointer (DPTR) fields are used.

In an FEMPTY_IS descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and descriptor pointer (DPTR) fields are used.

In an FEMPTY_IC descriptor, the descriptor type (DT) and descriptor interrupt enable (DIE) are used.

In an FEMPTY_ND descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and data size (DS) are used.

(4) Link Descriptors

The allocation of bits in the link descriptors (LINK and LINKFIX) is shown below.

- Normal descriptor

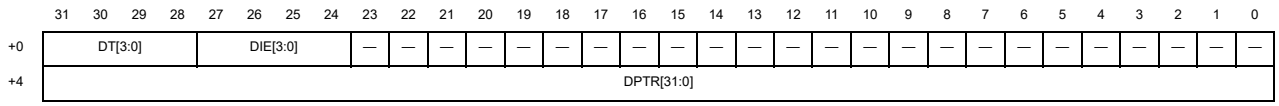

Table 45.74 Contents of Link Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 8: LINK 9: LINKFIX For details, see **Table 45.71, Summary of Descriptor Types**.
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).
—	Content Control For details, see section 45.3.4.2, Setting Up Reception Descriptors, and section 45.3.5.2, Setting Up Transmission Descriptors.
DPTR[31:0]	Descriptor Pointer Pointer to the data area for the next descriptor Register an address on a 32-bit boundary.

CAUTION

Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR). When an extended descriptor is used, a 12-byte unused area is added.

(5) Other Descriptors

The allocation of bits in the other descriptors (EOS, FEMPTY (only for transmission), LEMPTY, and EEMPTY) is shown below.

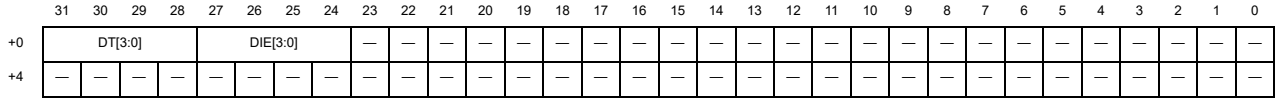

Table 45.75 Contents of Other Descriptors (DESCR)

Bit Name	Function
DT[3:0]	Descriptor Type 10: EOS 12: FEMPTY (only for transmission) 2: LEMPTY 3: EEMPTY For details, see **Table 45.71, Summary of Descriptor Types**.
DIE[3:0]	Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFi).

CAUTION

When an extended descriptor is used, a 12-byte unused area is added.

(6) How to Use Frame Data Descriptors

The descriptor data area size field (DESCR.DS) can specify up to 2048 bytes of Ethernet frame data per data area. Settings higher than 2048 (bytes) cannot be made.

In general, Ethernet frames are not of uniform length. The AVB-DMAC is capable of dividing frame data into multiple descriptors in order to minimize the memory capacity for frame data. This function allows processing of frames that are longer than the limit for descriptor data areas. Division can also be applied to frames on the basis of their data structures.

To handle both frames divided up into multiple data areas and descriptors for complete single frames, four types (DESCR.DT) FSTART, FEND, FMID, and FSINGLE are defined.

Figure 45.18 shows the mapping of frame data by frame data descriptors. The descriptor data areas are allocated to the on-chip RAM. For frames that require division into four or more data areas, additional FMID descriptors can be added as required.

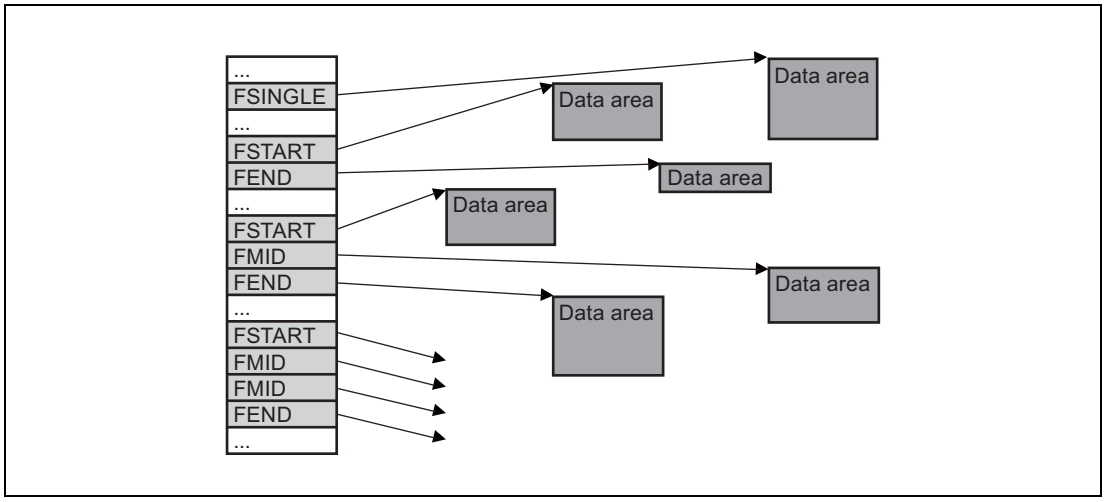

Figure 45.18 Mapping of Frame Data

For reception, set the descriptor data areas to the maximum size (i.e. give DESCR.DS its maximum value). The AVB-DMAC will store received frame data in the given area. If a received frame has more data than the maximum size, the AVB-DMAC will divide the data up.

For transmission, set the frame data size to the actual data size. The AVB-DMAC modifies the descriptor type (DESCR.DT) to FEMPTY after processing the relevant descriptor. The data size (DESCR.DS) and descriptor pointer (DESCR.PTR) fields retain their settings.

A descriptor data area including unused space produces an empty space between data areas. In reception, an "incremental data area" can be used to prevent empty spaces. For incremental data areas, see section 45.3.4.3 (2) Incremental Data Areas.

As well as reducing the memory capacity taken up by the descriptor area in the on-chip RAM, division into frames can be used to identify different sections of data (e.g. for separating a header and data).

(7) How to Use Chain Control Descriptors

(a) Link Descriptors

The link descriptors can be used to set up cyclic descriptor chains (for details, see section 45.3.3.2, Using Descriptor Chains in Queues).

After a LINK descriptor is processed, its descriptor type (DESCR.DT) is changed to LEMPTY. The descriptor pointer (DESCR.PTR) retains its setting.

After processing of a LINKFIX descriptor, the descriptor type (DESCR.DT) is not updated. Software can change the descriptor type (DESCR.DT), descriptor interrupt enable (DESCR.DIE), and descriptor pointer (DESCR.DPTR). Take care, however, to check the current descriptor address register (CDARq.CDA) before changing the descriptor pointer (DESCR.DPTR).

(b) EOS Descriptor

Use the EOS descriptor to divide a descriptor chain into various segments. The queue can continue even after an EOS descriptor.

In transmission, the response to an EOS descriptor is clearing of the transmit start request bit in the transmit configuration control register (TCCR.TSRQq) to 0.

In reception, the response is generation of a receive queue full interrupt (RIS2.QFFr), although if the frame currently being received is being divided for storage (received data being stored in FMID- or FEND-type frames), the data are not completely stored.

(8) How to Use Hardware and Software Arbitration Descriptors

In hardware processing of descriptors, the empty descriptor types (FEMPTY, LEMPTY, and EEMPTY) are defined to distinguish various descriptors. For software, they can be used to initiate checking for empty spaces, etc.

(a) FEMPTY, FEMPTY_IS, FEMPTY_IC, and FEMPTY_ND

These descriptor types (DESCR.DT) are used for descriptors that do not contain effective data. Of these, only FEMPTY is used in transmission.

These descriptor pointers (DESCR.DPTR) indicate the descriptor data area.

(b) LEMPTY

This descriptor type (DESCR.DT) is assigned to LINK descriptors after they have been processed.

The descriptor pointer (DESCR.DPTR) of an LEMPTY descriptor still points to the linked descriptor.

(c) EEMPTY

This descriptor type (DESCR.DT) is assigned to EOS descriptors after they have been processed.

The descriptor pointer (DESCR.DPTR) of an EEMPTY descriptor is not used, and thus points to nothing.

(9) Relationship between Descriptor Access by Hardware and Software

In the EthernetAVB, the allocation of descriptor types (DESCR.DT) to the on-chip RAM can be used. This makes it possible to minimize access to the EthernetAVB registers via the CPU, leading to higher performance.

- Each descriptor type in the set is exclusively for processing by hardware or software, depending on the direction of transfer (see Table 45.71).
- Software must not change a descriptor assigned to hardware processing (the hardware does not change descriptors assigned to software processing).

In the case of software processing, the software must process the information in the descriptor and the corresponding frame data before changing the descriptor type. If a descriptor type for hardware is set in DESCR.DT, the software should not change any part of the descriptor or of the corresponding frame data.

45.3.3.7 Optimization of Bus Performance when Using Descriptors

The following items are recommended as ways to ensure the optimal use of data structures in the on-chip RAM.

They are not requirements, but using a different approach may increase the load on the system bus within the LSI chip.

- Register descriptors with 64-bit alignment (this does not apply to extended descriptors).
- While in operation mode, use LINKFIX instead of LINK whenever a descriptor need not be changed. Hardware modifies the descriptor type (DESCR.DT) fields of LINK descriptors.
- Restrict frame data to a maximum size of 128 bytes.
- Minimize parallelism of processing to the descriptor chains.
  This helps in arranging the different segments exclusively for access by software or hardware by dividing the chains so as to be allocated to different on-chip RAM pages.
- Minimize the number of divided frames. This can reduce the overhead of descriptor handling.

45.3.4 Control in Reception

The point of the AVB-DMAC is to transfer data between the E-MAC and on-chip RAM without intervention by the CPU.

Create descriptors that define the amounts of frame data to be stored and the locations. After the E-MAC receives a frame, it stores the received frame data and the conditions of reception as the MAC state. If the descriptor is extended, the time stamp is also stored. For a description of how to set up descriptors for use in reception, see section 45.3.4.2, Setting Up Reception Descriptors.

The AVB-DMAC filters received frames to separate them into various classifications (separation filtering). More specifically, this is done to separate received frames into the various reception queues and to set the priorities of different classes of received frames. For more on separation filtering, see section 45.3.4.1 (1) Separation Filtering.

Figure 45.19 shows the reception data bus and the selection of queues for use in reception.

Each frame received from the E-MAC is stored in the reception FIFO; in parallel with this, the frame is analyzed to identify its type and the target queue number. After the E-MAC completes reception, the target queue number is generated and stored in the reception FIFO. A reception flag is applied to each reception queue in the on-chip RAM, and the unread frame counter (UFC) is also applied to each reception queue.

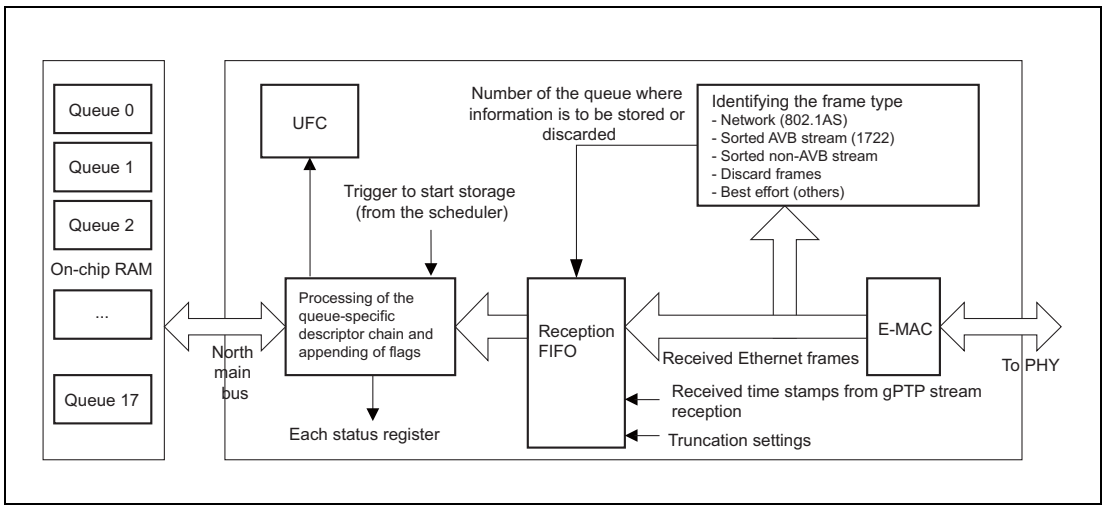

Figure 45.19 Mechanism of General Reception Queue Selection

45.3.4.1 Reception Queues

The AVB-DMAC applies its separation filtering mechanism to select the reception queue for storing a received frame. The AVB-DMAC stores all received frames in the on-chip RAM.

There are two conditions for the AVB-DMAC to discard a received frame.

- Detection of an error during reception by the E-MAC
  - Whether error frames are discarded or stored in reception queue 0 (best effort) can be set by the error frame enable bit in the receive configuration register (RCR.EFFS). If error frames are to be stored (RCR.EFFE = 1), they are always stored in queue 0 (best effort). In this case, parameters of each queue (e.g. truncation) may not match. If the storage of time stamps for reception queue 0 (best effort) is enabled (the time stamp enable bit in the receive configuration register RCR.ETS0 = 1), time stamps are stored even for error frames.
- Non-matching determination conditions of the separation filter
  - Whether non-matching frames are discarded or stored in reception queue 0 (best effort) can be set by the stream filtering select bit in the receive configuration register (RCR.ESF).

The flowchart in Figure 45.20 shows how the AVB-DMAC selects the reception queue in accord with the frame type, including judgment by the separation filter. Selection of the queue starts when the E-MAC completes frame reception. The result is storage of the frame in the proper queue or the frame being discarded.

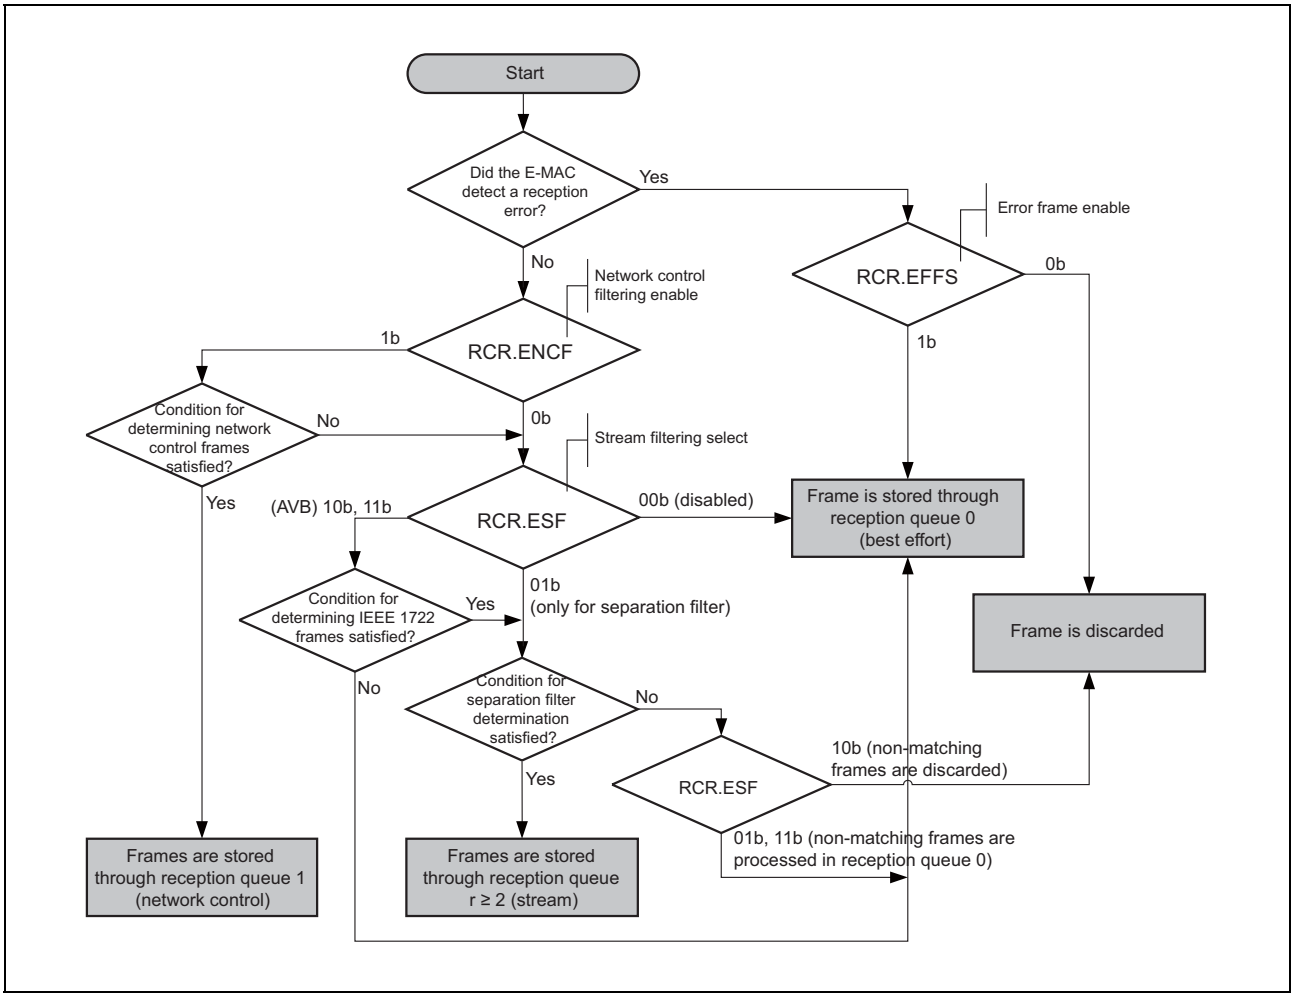

Figure 45.20 Flow of Reception Queue Selection

Notes on the description of entries in the flowchart

- “Condition for determining network control frames”
  The Ethernet destination address (DA) is 01:80:C2:00:00:0E, and
  The Ethernet type (ET) is 88:F7.
- “Condition for determining IEEE 1722 frames”
  The Ethernet destination address (DA) is in the range from 91:E0:F0:00:00:00 to 91:E0:F0:00:FE:FF,
  The VLAN tagged TPID (tag protocol identifier) field (VL) is 81:00, and
  The Ethernet type (ET) is 22:F0.
- “Condition for separation filter determination”
  See section 45.3.4.1 (1) Separation Filtering.

Figure 45.21 shows the allocation of data in Ethernet frames used for determination of Network Control frame and IEEE1722 frame. The preambles of Ethernet frames are not taken into account.

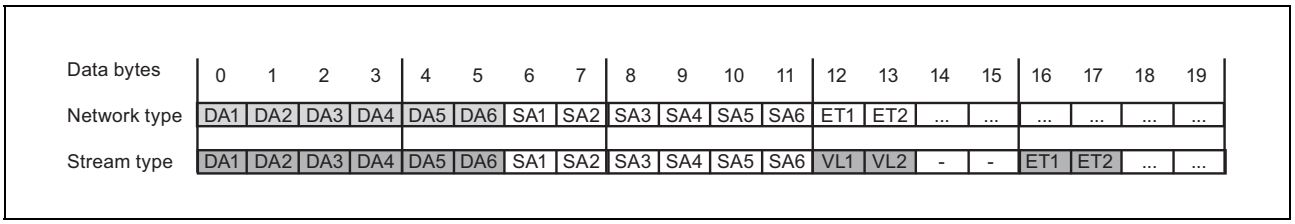

Figure 45.21 Data Allocation of Ethernet Frames Used in Frame Determination

(1) Separation Filtering

Separation filtering involves the checking of 64 bits (eight successive bytes) in received Ethernet frames. The setting for the first byte (i.e. the setting of the separation filter offset configuration register (SFO.FBP)), selects the part of frames to be used in separation filtering. There is also a common filter mask (set in the separation filter mask configuration register (SFMi.CFM)) that can filter less than the number of bytes and mask particular bits.

Examples

To use only the first byte from the top in separation filter, set separation filter mask configuration register 0 (SFM0.CFM) to H’0000 00FF and separation filter mask configuration register 1 (SFM1.CFM) to H’0000 0000.

To use seven bytes from the top in separation filter, set separation filter mask configuration register 0 (SFM0.CFM) to H’FFFF FFFF and separation filter mask configuration register 1 (SFM1.CFM) to H’00FF FFFF.

CAUTION

If bits are set to 0 in the separation filter mask, in order to match with the pattern, the bits at the corresponding positions of the pattern must also be set to 0. Only when "the received frame data & the separation filter mask register (SFMi.CFM) = the separation filter pattern register (SFPi.FPs)", it is judged that the bits match with the pattern.

Figure 45.22 shows separation filtering. The selected data from a received frame (Rx_Frame[63:0]) are masked by the common filter mask. This value is compared with all filter patterns. The AVB-DMAC selects the queue having the smallest queue number from among the matched filter patterns.

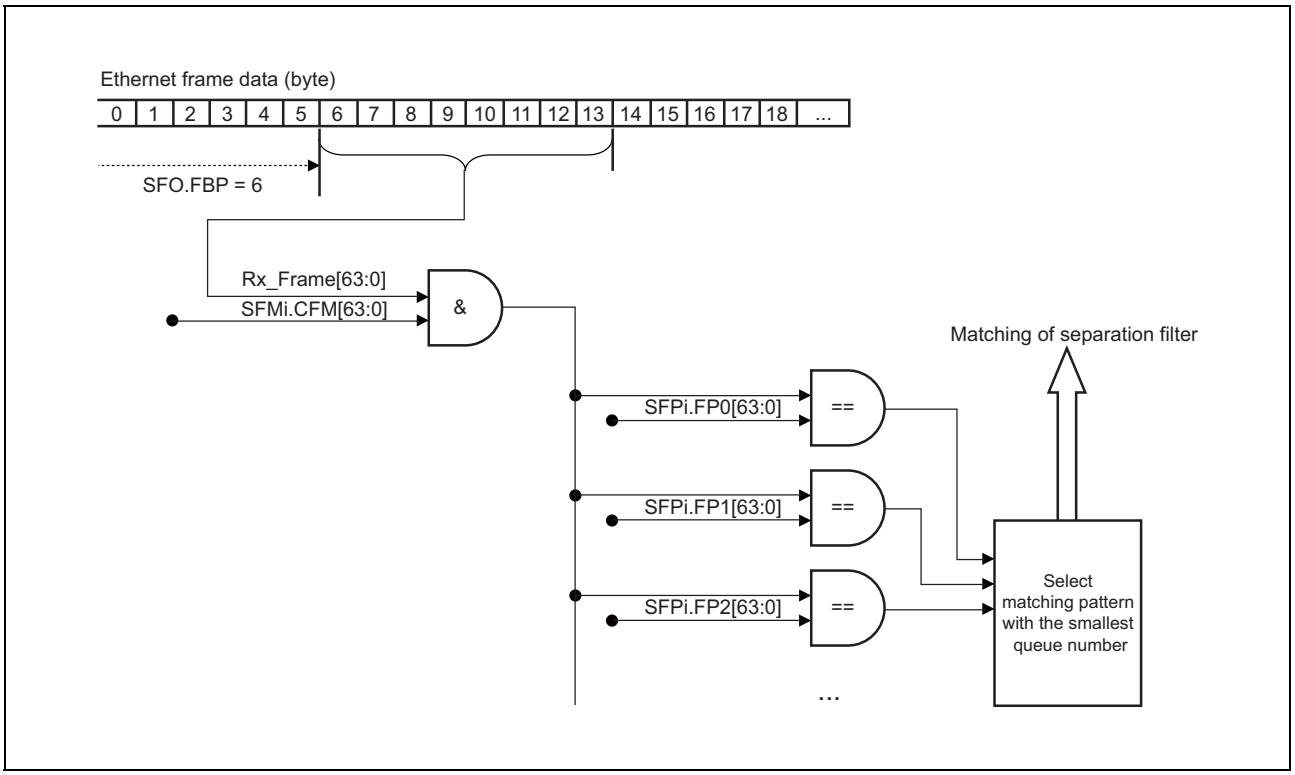

Figure 45.22 Overview of Separation Filtering (when SFO.FBP = 6)

(a) Restrictions on Number of Filters Used

The AVB-DMAC always checks all the separation filter patterns. When it is not necessary to use all the reception queues, providing a special pattern can prevent data from being stored in the unused reception queue.

Example 1:
Setting a value other than H'FFFF_FFFF_FFFF_FFFF to the separation filter mask register (SFMi.CFM) and setting H'FFFF_FFFF_FFFF_FFFF to the separation filter pattern register (SFPi.FPs) can prevent pattern matching in the unused reception queue.

Example 2:
Setting H'FFFF_FFFF_FFFF_FFFF to the separation filter mask register (SFMi.CFM) and setting the value identical to the pattern in reception queue 2 to the separation filter pattern register (SFPi.FPs) selects, upon a pattern matching, reception queue 2, which has a smaller queue number, thus preventing the unused reception queue from being used.

(2) Separating Streams

The AVB-DMAC applies separation filtering to sort frames received in streams. An AVB network has a concept of “Talker” and “Listener”. A Talker is an end station that generates one or more streams. A Listener is an end station that has the role of being a sink for at least one stream. The various A/V streams are identified by 8-byte stream IDs.

The number of end stations within an ABV network and their roles differ with the application.

The stream ID is a specific pattern of the AVB network for identifying one stream. Figure 45.23 shows the bit allocation of bits in IEEE1722 Ethernet frames and stream ID fields.

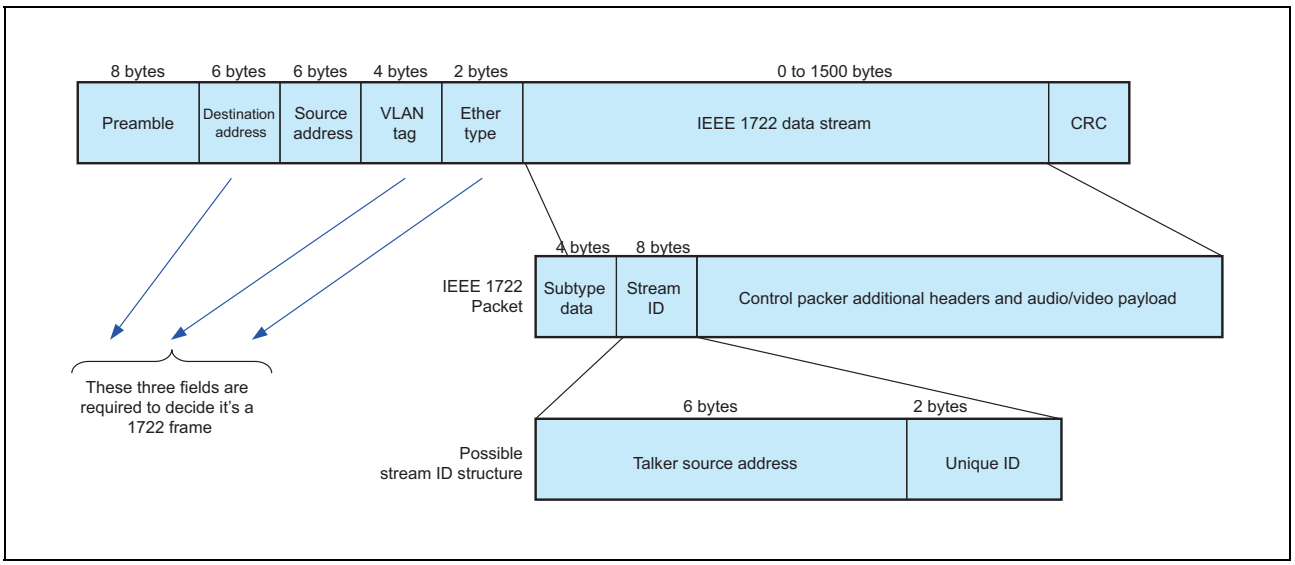

Figure 45.23 IEEE 1722 Frame Layout and Stream ID

The IEEE 1722 standard stipulates that the stream ID field starts from the 22nd byte (not counting the preamble). Accordingly, set the separation filter offset (SFO.FBP) to 22 in separations on IEEE 1722 streams. Set the separation filter mask (SFMi) and separation filter pattern (SFPi) in accord with the specification of the application in which the chip is being used.

Example: In the example of a stream ID shown in Figure 45.23, the representative application divides the field into the talker source address and the unique stream ID. The unique ID is used to differentiate between multiple streams from the same talker. Based on this, there are two settings for separation filter masking:

- To divide various streams into individual queues, set SFM0.CFM to H’FFFF FFFF and SFM1.CFM to H’FFFF FFFF.
- To divide streams for each talker into individual queues, set SFM0.CFM to H’FFFF FFFF and SFM1.CFM to H’0000 FFFF. This excludes the unique ID from the filter condition.

45.3.4.2 Setting Up Reception Descriptors

For reception, the descriptor as described in section 45.3.3, Descriptors is used.

This section describes specific operations that are especially required in handling reception queues.

(1) Reception Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

Table 45.76 shows the descriptor types used in reception. In the table, entries in the write-back column indicate how the AVB-DMAC changes the DESCR.DT field upon completion of descriptor processing.

Table 45.76 Descriptor Types in Reception

Descriptor Type (DESCR.DT)	Operation	Write-back
Frame Start (FSTART)	There is no storage space in a reception queue: The RIS2.QFFr bit indicates that queue r is full and the received frame is not stored. Descriptor processing proceeds again in response to further reception.	Not changed
Frame Middle (FMID)	Same as FSTART	Not changed
Frame End (FEND)	Same as FSTART	Not changed
Frame Single (FSINGLE)	Same as FSTART	Not changed
Link (LINK)	Processing proceeds to the descriptor specified by DESCR.DPTR.	LEMPTY
Fixed Link (LINKFIX)	Same as LINK	Not changed
End Of Set (EOS)	In the case of a divided frame (received frame being stored in FMID or FEND), storing of frames is stopped and the frame is lost. RIS2.QFFr indicates that the frame has been lost. If this happens at the start of a frame (received frame being stored in FSTART or FSINGLE), storing of frames starts from the next descriptor. In either case, processing shifts to the next descriptor in the chain.	EEMPTY
Frame Empty (FEMPTY)	Used to store received data. Up to DESCR.DS bytes are stored in the descriptor data area. For details, see section 45.3.4.3 (1) Storing Frame Data in the Descriptor Data Area.	FSTART, FMID, FEND, or FSINGLE
Frame Empty Incremental Start (FEMPTY_IS)	Used to store received data. The remaining frame data are all stored in the descriptor's data area. DESCR.DPTR indicates the base address of the incremental data area. For details, see section 45.3.4.3 (2) Incremental Data Areas.	FEND or FSINGLE
Frame Empty Incremental Continue (FEMPTY_IC)	Used to store received data. The remaining bytes of frame data are all stored in the descriptor's data area. DESCR.DPTR is undefined, but the address after processing of previous incremental data becomes the base address. For details, see section 45.3.4.3 (2) Incremental Data Areas.	FEND or FSINGLE
Frame Empty No Data storage (FEMPTY_ND)	Used to store received data. DESCR.DS bytes of spaces are secured in the reception FIFO but not stored. After processing, DESCR.DS is written back as 0. For details, see section 45.3.4.3 (2) Incremental Data Areas	FSTART, FMID, FEND or FSINGLE
Link Empty (LEMPTY)	Same as FSTART	Not changed
EOS Empty (EEMPTY)	Same as FSTART	Not changed

If a reception FIFO read error occurs when FEMPTY_ND is used, it is not reflected in DESCR.EI and queue error interrupt status bit (EIS.QEF).

Therefore, to detect a reception FIFO error also for unnecessary data, FEMPTY should be used.

(2) Configuration of Reception Frame Data Descriptors

Figure 45.24 shows the configuration of descriptors for use with reception queues. The reception-specific fields are the same whether the descriptor is normal or extended. The reception-specific fields (DESCR.MSC, DESCR.PS, DESCR.EI, and DESCR.TR) are described in Table 45.77.

For the other fields and the descriptor types, see section 45.3.3.6, Descriptor Type.

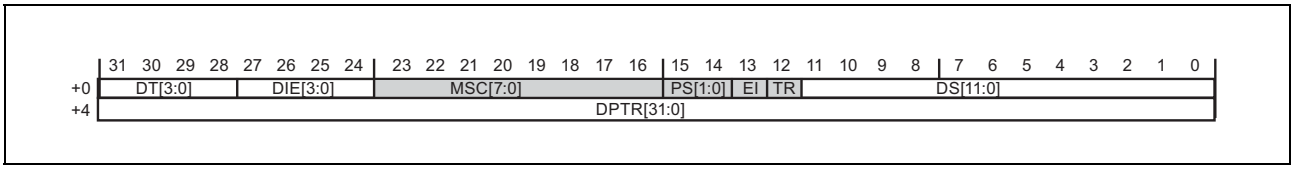

Figure 45.24 Configuration of Descriptor for a Received Frame

Table 45.77 Configuration of a Received Descriptor

Bit Name	Function
MSC	MAC Status Code These bits indicate errors in reception detected by the E-MAC. These bits are set to the same value between the frames divided by the descriptor. Details of the bits are as follows. MSC[7]: Received frame has a multicast address. MSC[6]: Reserved MSC[5]: Reserved MSC[4]: Received frame has residual bits. MSC[3]: Received frame is too long. MSC[2]: Received frame is too short MSC[1]: Error in frame reception MSC[0]: Received frame has a CRC error.
PS	Padding Selection These bits specify whether frame data are to be padded when stored in the incremental data area. Insertion of padding data is in accord with the settings in the receive padding configuration register (RPC). B’00: Padding is not to be inserted. B’01: Padding data may be inserted. This depends on the RPC settings. B'10: Setting prohibited. B'11: Setting prohibited.
EI	Error Indication This bit indicates the detection of an error in frame data while a frame was being stored. The bit is set to 1 for a descriptor in which an error has been detected. If the descriptor is for a divided frame, the frame data is discarded. 0: No error 1: Error is detected
TR	Truncation Indication This bit indicates whether frame data received from the E-MAC have been truncated before being stored in the on-chip RAM. These bits are set to the same value between the frames divided by the descriptor. 0: Data have not been truncated. 1: Data have been truncated.

CAUTION

The RCR.EFFS bit specifies whether or not frames with errors detected by the E-MAC are to be stored in the on-chip RAM. When the storing of error frames is disabled, error codes are not written to DESCR.MSC.

45.3.4.3 Reception Processing

After initialization, the AVB-DMAC is able to select the proper reception queue and store received frames in the data area in the on-chip RAM as indicated by the descriptor. The AVB-DMAC continues to store received data in the on-chip RAM as long as space is available for descriptors and data areas.

Received frames are classified and stored in the reception FIFO in accord with the algorithm described in section 45.3.4.1 (1) Separation Filtering. A frame will already have been sorted by separation filtering, truncated, or discarded based on reception by the MAC before being stored in the reception FIFO. The following data are stored in the reception FIFO.

- MAC status of received frames
- Length of received frames
- Time stamp of received frames
- Target reception queue
- Received frame data

If the reception FIFO contains even one frame, the scheduler allocates storing in the reception queue (see section 45.3.2.2, Scheduling Reception and Transmission).

If there is even one empty descriptor in a queue for which reception has started, the storage of frame data starts. Received frames for a queue that is already full (there is no empty frame descriptor or the unread frame counter stop level has been reached) are discarded from the reception FIFO. This ensures that one queue being full does not prevent the processing for data in the other queues.

(1) Storing Frame Data in the Descriptor Data Area

Frame data for storage are assumed to be in either of the two patterns described below.

- The data for an entire frame will fit in the descriptor data area.
  - In this case, the descriptor type (DESCR.DT) is FSINGLE.
- Frame data is bigger than the descriptor, so the frame data is divided and stored in the descriptor data area.
  - In this case, FSTART is written to the descriptor type (DESCR.DT) bits of the first of the frame data to arrive and FMID and FEND are written to the type bits of descriptors for subsequent data.

The descriptor type is updated by the AVB-DMAC in the last step of descriptor processing, so software can always access the descriptor written-back to DESCR.DT.

Software can write FEMPTYxxx directly to the descriptor type field after processing the stored frame data. Do not change the descriptor or any part of the descriptor data area after FEMPTYxxx is written to DESCR.DT.

(a) Single Frame

For a frame with an FSINGLE descriptor, all data for the frame are held at the position defined by DESCR.DPTR. DESCR.DS indicates the length of the received frame.

If DESCR.DS is bigger than the actual size of a received frame, the FEMPTY or FEMPTY_ND descriptor is stored in place of the FSINGLE descriptor.

Also, the FEMPTY_IS and FEMPTY_IC descriptors, which always hold the full frame data, are stored in place of the FSINGLE descriptor.

(b) Divided Frames

Divided frames can be processed in the same way as a single frame. A frame stored with divided descriptors must be recombined before use. DESCR.EI and DESCR.TS are only valid in the last descriptor of the sequence for a divided frame.

CAUTION

If the data area size setting in DESCR.DS is not a multiple of four bytes, only the number of bytes set in DESCR.DS is fetched from the reception FIFO and the remaining bytes are used by the next descriptor.

After a received frame is divided into different descriptors, each frame data is processed separately, and the descriptor type is assigned by software after processing. Accordingly, an error frame (FEMPTYxxx instead of FMID or FEND) may exist while a descriptor chain is being processed. In such a case, the CPU must postpone processing of the error frame until the corresponding descriptor has been processed.

(c) No Data

The application specification may lead to some types of received frames being unimportant (for example, when the application only requires stream data from the Ethernet frames). Storing frames in divided form makes separating out the unnecessary parts of Ethernet frames possible.

If part of a divided frame is not required, use the FEMPTY_ND descriptor so that unnecessary data is not stored in the on-chip RAM.

After processing an FEMPTY_ND descriptor, the AVB-DMAC sets DESCR.DS to 0. DESCR.DS = 0 is for the specific flag indicating that the FEMPTY_ND descriptor has been processed.

(2) Incremental Data Areas

Secure space for storing received data in the on-chip RAM. Even when all descriptor data areas of a chain are placed in the contiguous area of the on-chip RAM area, a received frame being shorter than the descriptor data area will lead to an empty space. Figure 45.25 shows an example of settings and the memory map.

In some cases, contiguous data arrangement may be effective (e.g. when received data are to be processed other than by hardware as the A/V codec module). When the length of frames differs for each received frame (e.g. when payloads vary between having one or two A/V packages), the use of a pointer in the descriptor produces empty spaces in the data area. This necessitates additional processing such as copying the frame data to remove the empty spaces.

Accordingly, and to prevent copying data, the AVB-DMAC supports an “incremental data area” function.

When incremental data areas are in use, different descriptors use a contiguous data area. The first descriptor (FEMPTY_IS) from the top defines the base address of the incremental data area and is used to, together with the subsequent descriptor (FEMPTY_IC) within the descriptor chain, hold received data. Figure 45.26 shows an example of settings and the memory map.

When an incremental data area is used, it is also possible to divide a frame into various descriptors in a way that reflects its structure (e.g. one descriptor for the Ethernet header and one for the data payload).

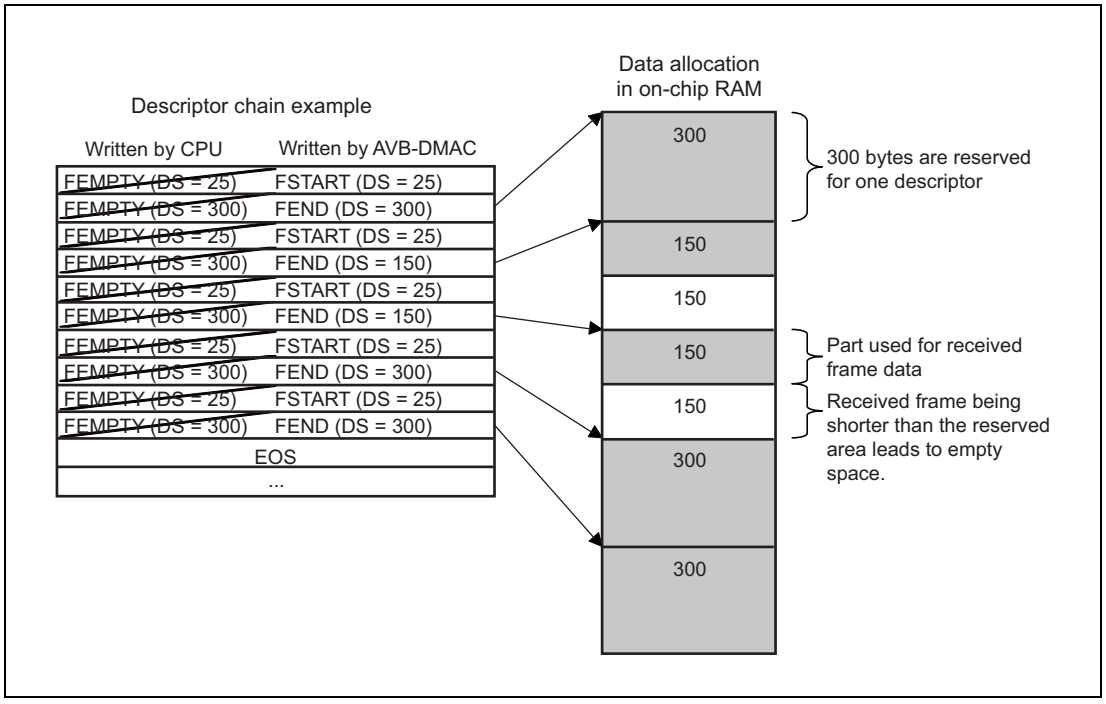

Figure 45.25 When Individual Descriptor Data Areas are Used

Figure 45.25 and Figure 45.26 show how control of the data storage areas by a descriptor chain varies according to whether incremental data areas are not in use or in use. The chains are configured for storing received frames consisting of a 25-byte header (in this example, stored in the on-chip RAM area outside the drawing range) and a 150- or 300-byte payload (whether one or two 150-byte data depending on the data source).

In Figure 45.25, an EOS descriptor is added as an example of a re-synchronization point. If a frame larger than 325 bytes is received, the frame will be divided into three descriptors, meaning that synchronization of the header and data sequences is lost. However, a frame is not divided across an EOS descriptor, so adding EOS descriptors can prevent the header and data sequences losing synchronization. While an incremental data area is in use, EOS descriptors are not required because the incremental descriptors always hold all data being processed.

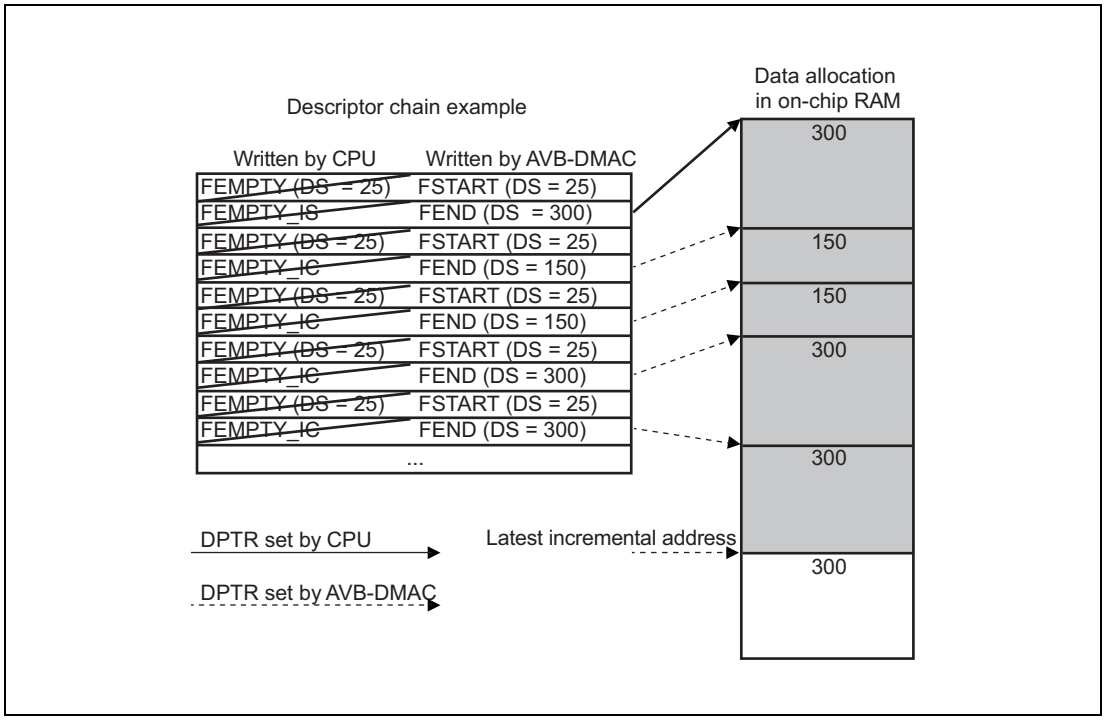

Figure 45.26 When Incremental Data Area is Used

As Figure 45.26 shows, when data are stored in an incremental data area, the descriptor pointers in the FEMPTY_IC descriptors (DESCR.DPTR) are updated. Accordingly, the FEND or FSINGLE descriptor written-back by the AVB-DMAC after processing is in the same format as the FEMPTY descriptor after processing.

Software captures contiguous received data, which has no empty spaces, from an incremental data area. The incremental data area must be aligned with a 4-byte boundary. Therefore, when the amount of received data for storage in an incremental data area is not a multiple of four bytes, from one to three bytes of empty space is placed at the end of the incremental data area. DESCR.DS can be read to check for such empty spaces.

For the normal descriptors (FEMPTY and FEMPTY_ND), controlling the amount of received data due to DESCR.DR is possible, but for the incremental descriptors (FEMPTY_IS and FEMPTY_IC), controlling the amount of received data to be stored is not possible. All received data are always stored in an incremental descriptor.

(a) Setting Up an Incremental Data Area

If a descriptor chain has N descriptors (one FEMPTY_IS and N-1 FEMPTY_IC), an area for storing N times of the maximum received data as the incremental data area must be secured.

As Figure 45.26 shows, DESCR.DPTR of an FEMPTY_IS descriptor indicates the base address of the incremental data area. The subsequent FEMPTY_IC descriptor in the chain indicates that data must be stored in the incremental data area.

(b) Processing an Incremental Data Area Based on Descriptors

Since data processing by the CPU is the same regardless of how the AVB-DMAC stores the data, data stored in an incremental data area do not require any special handling.

(c) Padding

Use padding for reception of frame data that are not aligned correctly. Padding can be set individually for each descriptor. Accordingly, in the reception of divided frames, padding can be set to only those frames that require it (e.g. A/V payload data.)

Padding can also be used to effectively use an incremental data area (e.g. to prevent inefficient access by aligning received data with 32-byte boundaries.

Padding can only be used in an incremental data area.

The value H'0000 0000 is always used in padding.

Padding is the addition of the number of words (from one to seven 32-bit words) set in the stored padding counter bit in the receive padding configuration register (RPC.PCNT). This padding is repeatedly inserted for each received data count set to the stored data counter bit (RPC.DCN) (from one to 255 32-bit words). When the stored data counter (RPC.DCNT) reaches 0, however, padding is not repeated.

The first word of padding is always inserted at the position specified by DESCR.DPTR. When divided frames are in use, a padding word can be inserted in accord with each descriptor (e.g. the first descriptor handles a 42-byte header data and the second descriptor holds padded payload data in an incremental data area).

The next figure shows a general example of how padding is inserted and an example of setting up padding. In the figure, A indicates frame data received from the E-MAC, while B indicates frame data stored in the descriptor data area (32-bit word units).

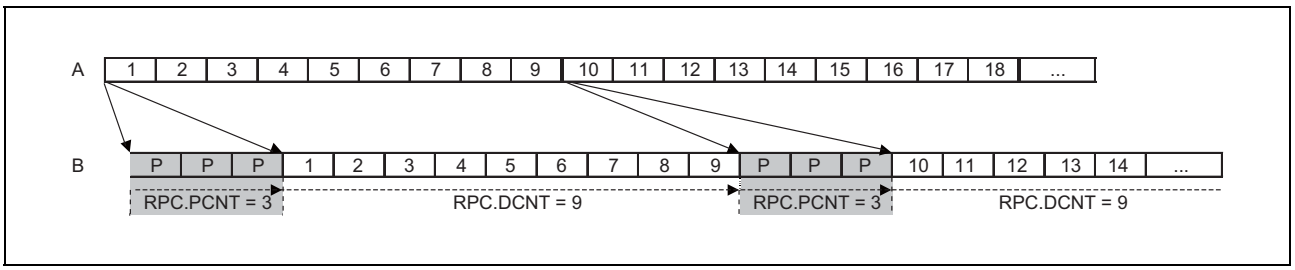

Figure 45.27 Example of a Padding Setting

Both padding and received frame data are counted in the descriptor size (DESCR.DS).

(3) Support for Reception Time Stamps

Capturing reception time stamps is essential for IEEE 802.1AS time synchronization. Other types of received frames may also require that a reception time stamp be appended; this depends on the application. The AVB-DMAC supplies reception time stamps based on the gPTP timer by storing time stamps that have been captured when the start frame delimiter (SFD) for a received frame in the last frame data descriptor (FEND or FSINGLE). For the gPTP timer, see section 45.3.7.1, gPTP Timer.

When time stamps are to be stored, use extended descriptors for the entire reception queue. Furthermore, time stamps are always stored for reception queue 1 (network control). Time stamps for reception queue 0 (best effort) and reception queue r ($r \geq 2$; for stream data) can be selected by the time stamp enable bits in the receive configuration register (RCR.ETS0 or RCR.ETS2).

45.3.4.4 Unread Frame Counters

Each reception queue has an unread frame counter (UFCVi). Use the unread frame counter configuration bits in the receive queue configuration register (RQCi.UFCCr) to select from among the four stop levels for each unread frame counter. The 0 setting disables the stop functions. For how to set this up, see Figure 45.28.

Operations of the AVB-DMAC (hardware) and CPU (software) drive an unread frame counter (UFC) in the following ways.

- The hardware indicates that it has added a new frame to the descriptor chain for the queue (this increments the counter).
- Software indicates how many frames from the descriptor chain it has processed by writing to the corresponding bits of the unread frame counter decrement register for the queue (this decrements the register by the number written).

The unread frame counter is based on the number of frames stored in the on-chip RAM and is only incremented by one even when a received frame is divided into different descriptors. Data failure in a descriptor chain requires care because this may fail in synchronization of the unread frame counter as described in section 45.3.4.4 (1) Loss of Unread Frame (UFC) Synchronization.

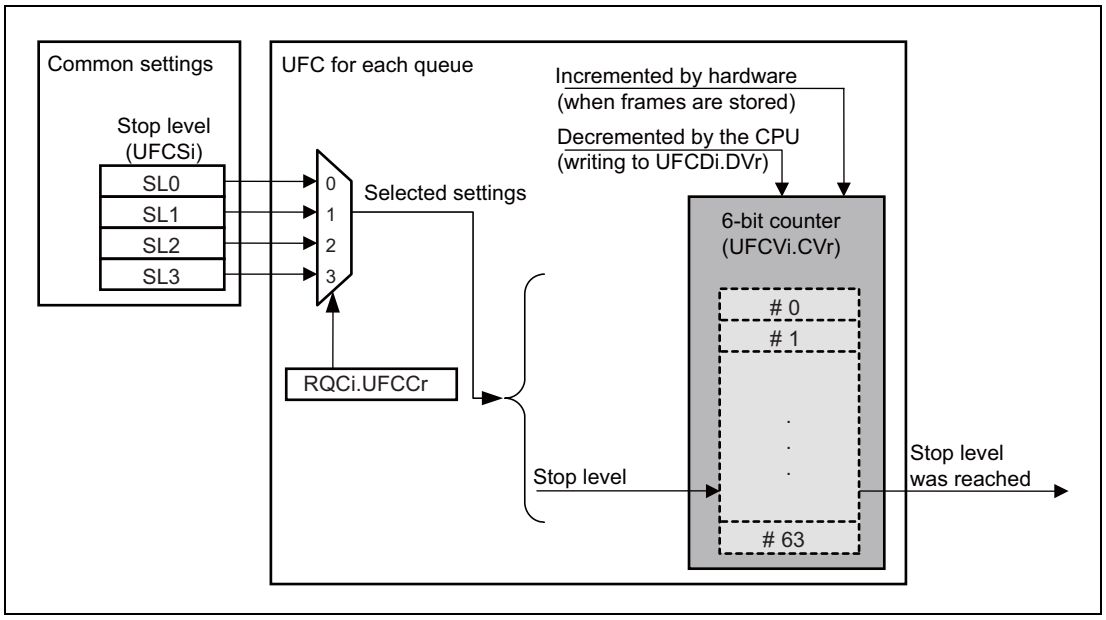

Figure 45.28 Overview of an Unread Frame Counter

Unless synchronization of hardware and software is lost, the current unread frame counter value (UFCVi.CVr) indicates the number of unread frames in the queue.

When the stop level has been reached, received frames are not stored in the descriptor chain. Setting 0 as the stop level disables the stop function. Otherwise, further received frames for the queue are discarded once its unread frame counter reaches the stop level. Activation of the unread frame counter stop function is indicating by setting of the receive queue full interrupt flag in the receive interrupt status register 2 (RIS2.QFFr).

Set the unread frame counter stop level configuration register (UFCS) for each reception queue that will use the unread frame counter function while the current operating mode is configuration mode.

(1) Loss of Unread Frame (UFC) Synchronization

The unread frame counters do not recognize failure to store a frame in the on-chip RAM. In other words, the AVB-DMAC increments the counter for a queue each time it captures a frame for that queue from the reception FIFO whether or not it succeeds in storing the frame normally in the descriptor chain.

In general, synchronization of hardware and software may be lost under the following conditions.

- An unread frame counter reaching its maximum value
  When the value of a counter in an unread frame counter register i (UFCVi) (i = 0 to 4) reaches 63, synchronization for the corresponding queue can be lost.
  It can only be judged that a loss of synchronization has not occurred when the stop level is set to 63.
- A queue not having enough space for a descriptor or the associated data
  In this case, the corresponding receive queue full interrupt flag (RIS2.QFFr) in receive interrupt status register 2 (RIS2) is set.
  If an unread frame counter reaches its stop level, the receive queue full interrupt flag (RIS2.QFFr) in the receive interrupt status register 2 (RIS2) is set.
- A problem occurring during access to memory

The result of a failure in synchronization is the unread frame counter indicating that the corresponding descriptor chain contains more available frames than it actually does. To retrieve the correct starting point for operations, use the descriptor base address load request (DLR.LBAq) for the given queue.

45.3.5 Transmission Control

Areas in the on-chip RAM for storing transmission descriptors must also be secured (for descriptors, see section 45.3.3, Descriptors).

The AVB-DMAC fetches data from the on-chip RAM in accord with the procedure the descriptor describes. The descriptor also retains tag information once the frame has been fetched for transmission. The tag information is used to maintain the relationships between state information and time stamps for the software and the AVB-DMAC. The status and time stamp information for transmitted frames remains accessible after their transmission is completed.

45.3.5.1 Transmission Modes

The AVB-DMAC has two modes of transmission.

- AVB transmission mode
  This mode is selected by the priority level setting for the transmission queue in the transmit configuration register (setting of the TGC.TQP[1:0] bits) being B'01 or B'11.
- Non-AVB transmission mode
  This mode is selected by the priority level setting for the transmission queue in the transmit configuration register (setting of the TGC.TQP[1:0] bits) being B'00.

(1) AVB Transmission Mode

AVB transmission supports the control of traffic through the output port to implement various traffic classes.

(a) Support for Traffic Classes and Associated Priority

When transmission is in AVB transmission mode, streams of traffic are transmitted in accord with the part of the AVB specification called Forwarding and Queuing for Time Sensitive Streams (FQTSS; for details on this, see the IEEE 802.1Q standard).

In the AVB specification, at least one queue for a reserving stream under the Stream Reservation Protocol (SR stream) and at least one queue for a non-SR stream are present, and the queues for reserved traffic according to the SRP have highest priority.

The AVB-DMAC supports four traffic classes: SR class A, SR class B, network control (NC) traffic (gPTP frames), and best effort (BE) traffic. Allocating a specific queue to network control (NC) frames ensures the control of synchronization.

The AVB-DMAC realizes compliance with the AVB standards by handling queues with the following architecture (in terms of traffic classes).

- Four transmission queues (Q3, Q2, Q1, and Q0) are available.
- Q3 and Q2 are for SR streams (one each for class A and class B).
- Q1 is for low-bandwidth network control (NC) traffic (gPTP frames)
- Q0 is for other types of traffic (MSRPDU*1, MVRPDU*2, best effort (BE), etc.)

CAUTIONS

1. MSRPDU: Multiple Stream Registration Protocol Data Unit
2. MVRPDU: Multiple VLAN Registration Protocol Data Unit

Fetching from queues proceeds in order of priority of the above traffic types. Three systems of priority are available through the setting of the transmit queue priority bits in the transmit configuration register (TGC.TQP[1:0]). In the default priority scheme, which is called AVB mode 1 (selected by TGC.TQP[1:0] = B'01), operation of the AVB-DMAC is fully in accord with the AVB specification. AVB mode 2 (transmit queue priority bits (TGC.TQP[1:0] = B'11) is an alternative priority scheme and varies from the AVB specification. Using this scheme thus requires more care.

Table 45.78 Default and Alternative Priority Orders in AVB Transmission Mode

Priority Schemes (AVB Mode)	Priority Order of Queues
AVB mode 1	Q3 (SR class A) > Q2 (SR class B) > Q1 (NC) > Q0 (BE)
AVB mode 2	Q1 (NC) > Q3 (SR class A) > Q2 (SR class B) > Q0 (BE)

(b) Transmission Selecting Algorithm and CBS

The algorithm the AVB-DMAC applies to select frames for transmission is in accord with the IEEE 802.1Q standard. For AVB mode, the CBS (credit-based shaping) algorithm is applied to the class A and class B SR queues (Q3 and Q2). Use of the CBS enables correct handling of the priorities of transmission from the SR queues. For the CBS algorithm, see section 45.3.6, CBS (Credit-Based Shaping).

When the following conditions are both satisfied, transmission from an SR queue (Q3 or Q2) proceeds at the specified time.

- The queue contains at least one frame ready for transmission.
- The queue has credit.
- Unless an SR queue satisfies the above conditions, a higher priority queue is not present (not ready for transmission).

A non-SR queue (Q1 or Q0) is selected if the conditions below both hold.

- The queue contains at least one frame ready for transmission.
- As well as the above condition, a higher priority queue is not present (not ready for transmission).

Figure 45.29 and Figure 45.30 are flowcharts of selection for transmission in AVB mode 1 and AVB mode 2.

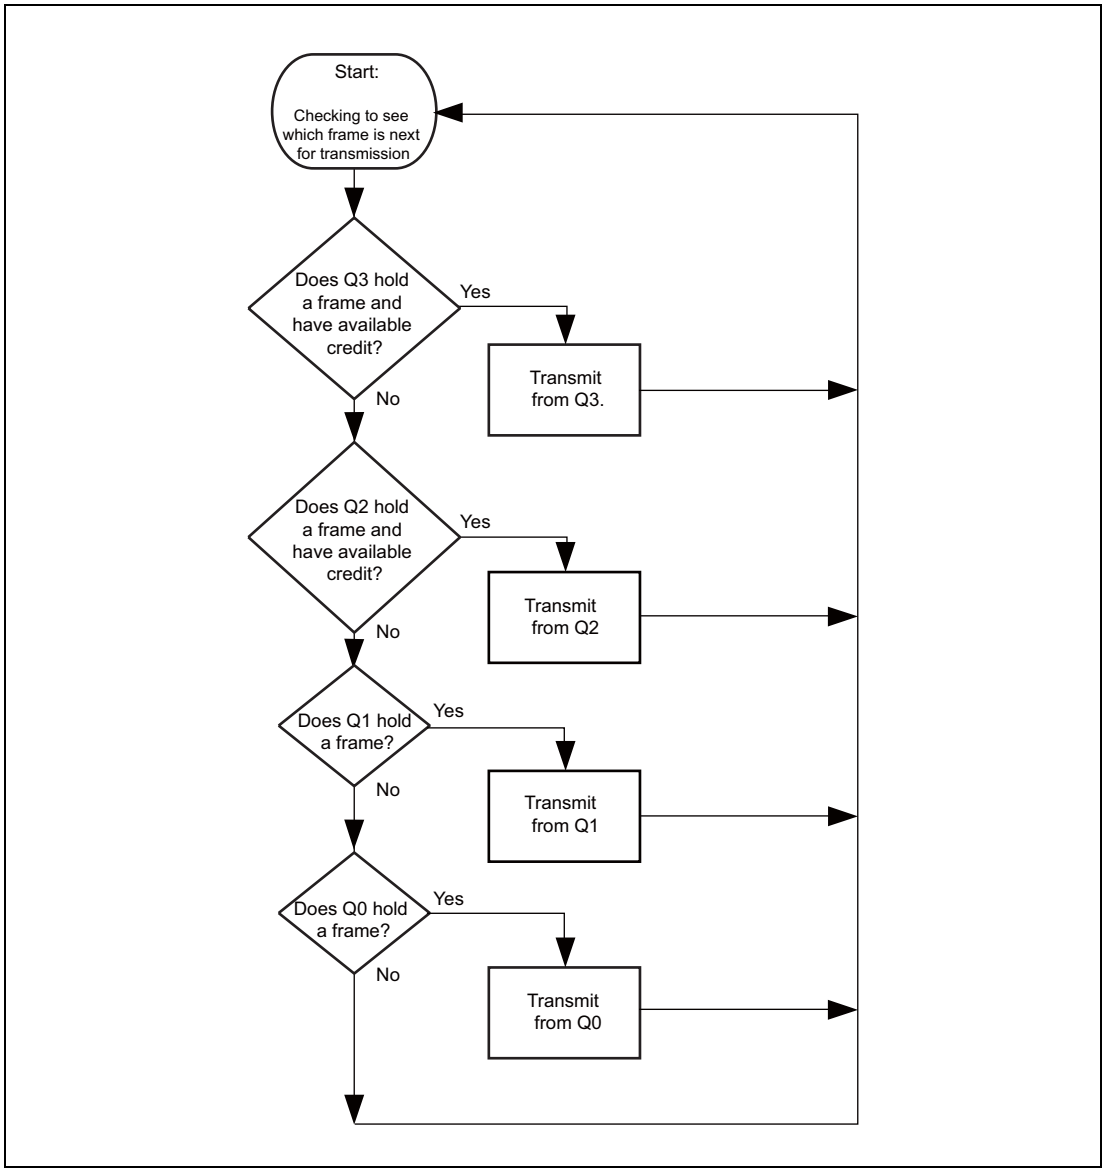

Figure 45.29 Flow of Selection for Transmission in AVB Mode 1

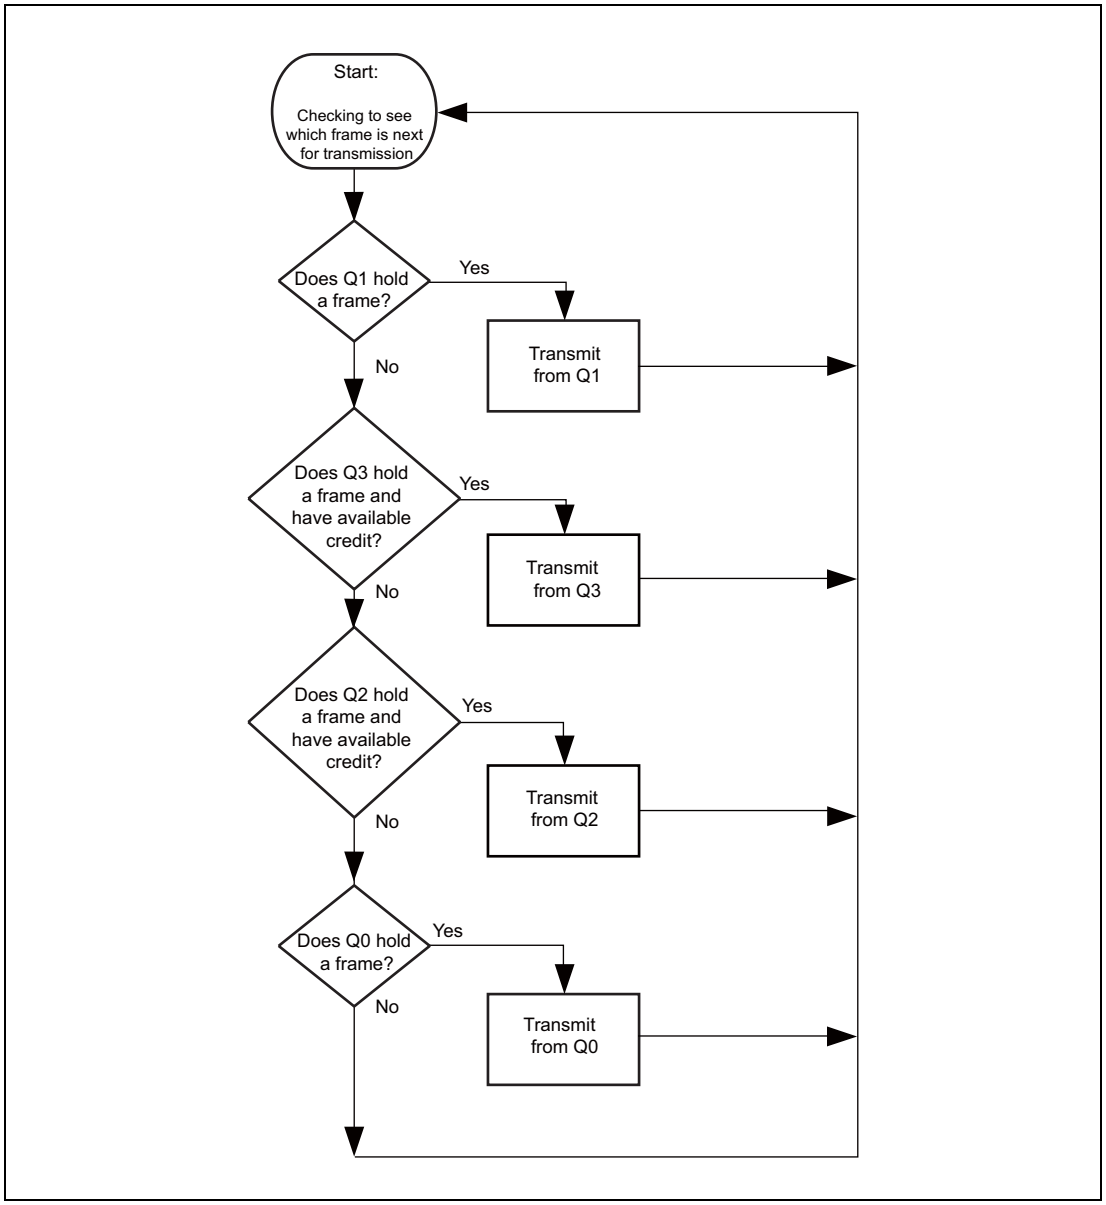

Figure 45.30 Flow of Selection for Transmission in AVB Mode 2

(2) Non-AVB Transmission Mode

In non-AVB transmission mode, an absolute priority scheme is used. The SR class is not supported and the CBS algorithm is not used.

In non-AVB transmission mode (when the transmit queue priority bits in the transmit configuration register (TGC.TQP[1:0]) are B'00), data is fetched for transmission in a strict order of priority (Q3 > Q2 > Q1 > Q0).

Figure 45.31 shows the flow of selection in non-AVB transmission mode.

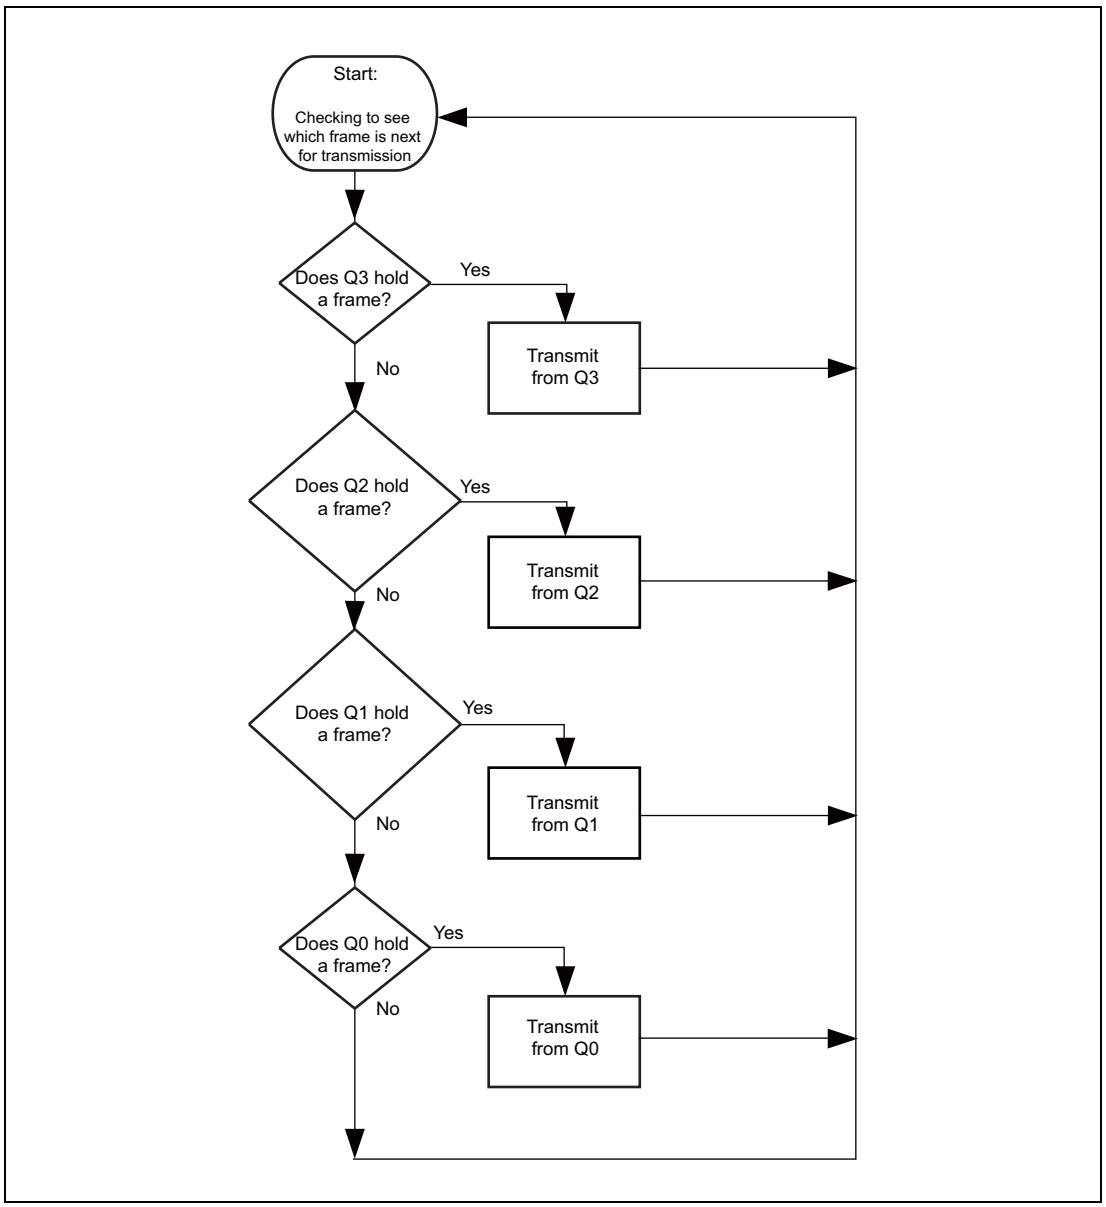

Figure 45.31 Flow of Selection for Transmission in Non-AVB Mode

(3) Setting the Size of the Transmission FIFO

The transmission FIFO is made up of 124 clusters. Each cluster can hold up to 128 bytes.

The size of the part of the transmission FIFO for use by each of the four transmission queues can be set by the corresponding transmit queue configuration q bits in the transmit control register (TGC.TBDq). The maximum number of clusters required can be determined from the maximum length of frames for transmission from the queue q.

Even if queue t already contains data of the frame size specified by TGC.TBDt, the AVB-DMAC fetches the next frame to queue t after the E-MAC starts transfer data from queue t. Therefore, a frame data area of the total of maximum frame sizes set for each transmission queue plus an area for 1 frame must be secured for a cluster.

General Usage Examples:

Q0: Frames containing up to 1500 bytes → 1500/128 = 11.7 → 12 clusters

Q1: Frames containing up to 1024 bytes → 1024/128 = 8.0 → 8 clusters

Q3: Frames containing up to 1996 bytes → 1996/128 = 15.6 → 16 clusters

Q4: Frames containing up to 1996 bytes → 1996/128 = 15.6 → 16 clusters

When the depth of all transmission queues is 2, only the following number of clusters is required.

2 * (12 + 8 + 16 + 16) + 16 = 2 * 52 + 16 = 120

Adjust the frame length of each queue so that the number of clusters to be used is no greater than 124.

45.3.5.2 Setting Up Transmission Descriptors

(1) Transmission Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

Table 45.79 shows the descriptor types used in transmission. In the table, entries in the write-back column indicate how the AVB-DMAC changes the DESCR.DT field upon completion of descriptor processing.

Table 45.79 Descriptor Types in Transmission

Descriptor Type (DESCR.DT)	Operation	Write-back
Frame Start (FSTART)	The AVB-DMAC fetches the first of the data for the divided frame and proceeds to the next descriptor.	FEMPTY
Frame Middle (FMID)	The AVB-DMAC fetches the second or subsequent data for the divided frame and proceeds to the next descriptor.	FEMPTY
Frame End (FEND)	The AVB-DMAC fetches the last of the data for the divided frame. When the frame of data that has been fetched to the transmission FIFO is ready for transmission by the E-MAC, the AVB-DMAC proceeds to the next descriptor.	FEMPTY
Frame Single (FSINGLE)	The AVB-DMAC fetches the frame of data. When the frame of data that has been fetched to the transmission FIFO is ready for transmission by the E-MAC, the AVB-DMAC proceeds to the next descriptor.	FEMPTY
Link (LINK)	Processing proceeds to the descriptor specified by DESCR.DPTR.	LEMPTY
Fixed Link (LINKFIX)	Same as LINK	Not changed
End Of Set (EOS)	Clears the transmit start request bit (TCCR.TSRQt), which stops transmission queue. When the TCCR.TSRQt is again set to 1 (a new transmission start request is issued), processing proceeds to the next descriptor.	EEMPTY
Frame Empty (FEMPTY)	Clears the transmit start request bit (TCCR.TSRQt), which stops transmission queue. When the TCCR.TSRQt is again set to 1 (a new transmission start request is issued), processes this descriptor again.	Not changed
Link Empty (LEMPTY)	Same as FEMPTY	Not changed
EOS Empty (EEMPTY)	Same as FEMPTY	Not changed

(2) Configuration of Transmission Frame Data Descriptors

Figure 45.32 shows the configuration of descriptors for use with transmission queues. The transmission-specific fields (DESCR.TSR and DESCR.TAG) are described in Table 45.80.

For the other fields and the descriptor types, see section 45.3.3.6, Descriptor Type.

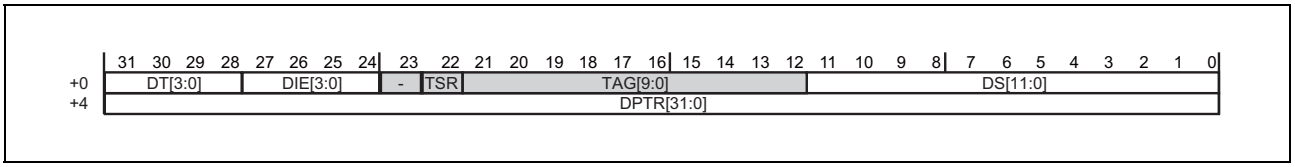

Figure 45.32 Configuration of Descriptor for a Transmitted Frame

Table 45.80 Configuration of a Transmission Descriptor

Bit Name	Function
TSR	Time Stamp Store Request This bit specifies whether the transmission time stamp together with tag information is to be stored within the EthernetAVB module. 0: The time stamp status FIFO within the EthernetAVB module does not retain a transmission time stamp. 1: The time stamp status FIFO within the EthernetAVB module retains a transmission time stamp. Only control this bit while the current DESCR.DT is FEND or FSINGLE.
TAG	Frame Tag This TAG field is used to associate each frame data status with a time stamp. Frame TAG is not required but is recommended. Only control this bit while the current DESCR.DT is FEND or FSINGLE.

For the time stamp FIFO function, see section 45.3.5.4, Time Stamping in Transmission.

45.3.5.3 Transmission

(1) Transmitting Frames

Setting the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) starts the transfer of frames from the corresponding transmission queue.

The descriptor in the current descriptor address for the queue (CDARq.CDA) is read first.

If this descriptor is a descriptor for frame transmission (FSINGLE, etc.), the AVB-DMAC fetches the frame data from the data area indicated by the descriptor, writes FEMPTY back to the descriptor type (DESCR.DT) bits to indicate completion of this processing, then proceeds to processing of the next descriptor.

If the descriptor is not for transmission, processing is as dictated by the given descriptor (for these descriptors, see the descriptions in section 45.3.3, Descriptors).

If a base address load request is issued for a descriptor chain while it is being processed (by setting 1 in the LBAq bit for transmission queue q that is currently being processed in the descriptor base address load request register, DLR), processing proceeds to the new descriptor chain (descriptor base table address bits (DBAT.TA) + 8*q). Loading the base address does not interrupt frame fetching, but note that frames that have not been fetched from the old chain remain where they are.

Figure 45.33 shows descriptor processing during transmission. “Fxxx” in the figure indicates the frame data descriptors (FSTART, FMID, FEND, FSINGLE).

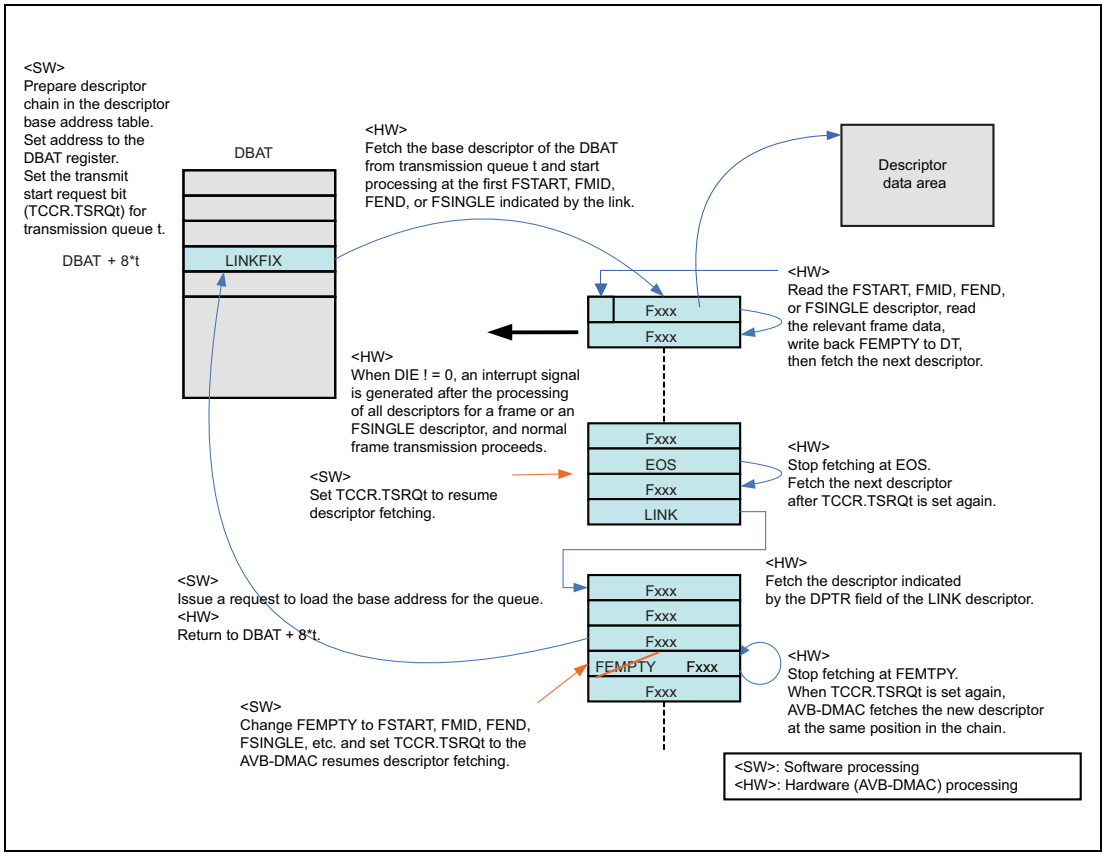

Figure 45.33 Descriptor Processing During Transmission

(2) Examples of Descriptor Usage

(a) Immediate Frame Transmission

Immediate frame transmission is a method in which fetching by the AVB-DMAC starts whenever software adds data to a queue. FEMPTY descriptors are used as stop points to keep the hardware and software in synchronization.

As preparation in transmission, software creates descriptor chains that have FEMTPY descriptors.

Figure 45.34 shows the flow for subsequent process.

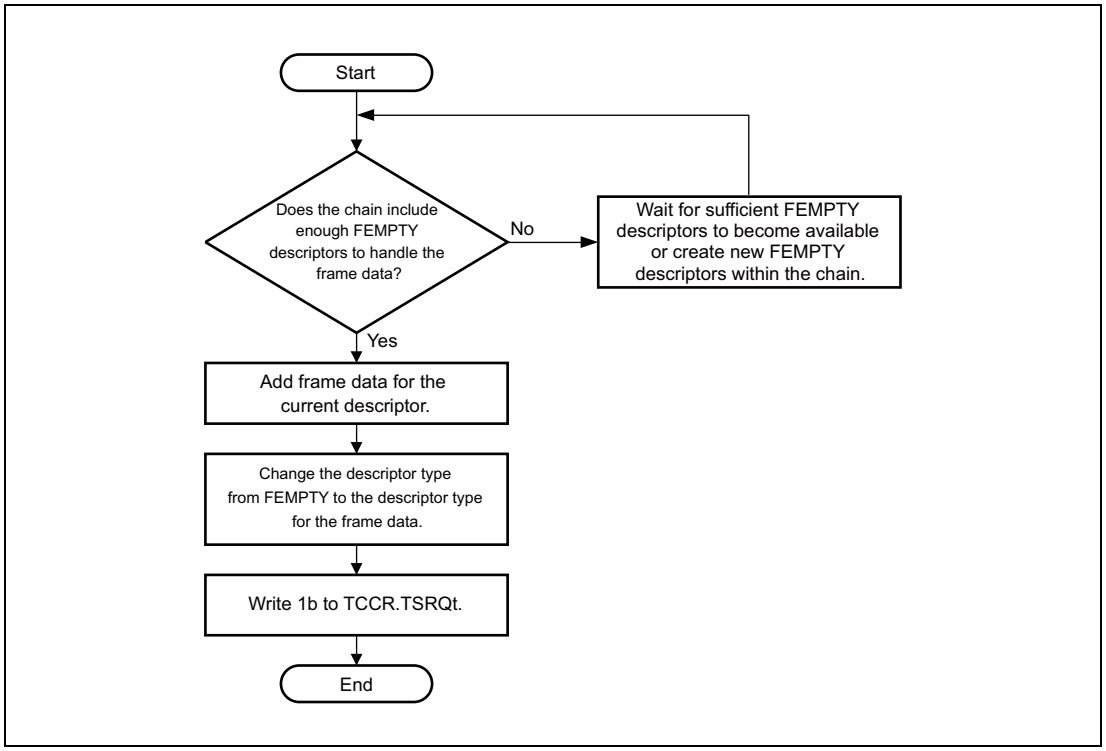

Figure 45.34 Software Flow for Immediate Frame Transmission

When processing a divided frame, change the types of descriptors in the backward direction, i.e., from FEND to FSTART. This guarantees all the descriptors including frame data to be ready when the AVB-DMAC starts fetching divided frames.

Figure 45.35 shows software and AVB-DMAC operations for divided frame transmission. In the figure, software and hardware independently perform processing. This allows software to prepare the descriptor for frame n + 1 even when the AVB-DMAC is currently fetching frame n.

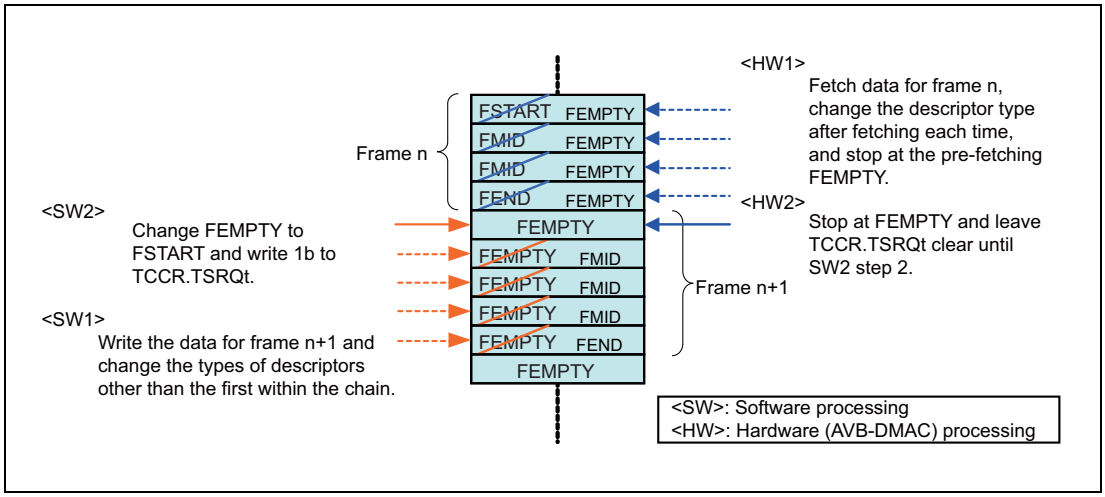

Figure 45.35 Software and AVB-DMAC Operation Examples for Immediate Frame Transmission (divided frames)

(b) Frame Set Transmission with Switching of the Active Descriptor Chain

This method is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. EOS descriptors are used for the stop points.

As preparation in transmission, software creates descriptor chains that have FEMTPY descriptors.

Figure 45.36 shows the flow for subsequent process.

In the first task, software creates and adds a transmission frame to the descriptor chain, which is followed by EOS descriptor insertion.
In the second task, software processes the transmission trigger for the transmission descriptor prepared. This guarantees transmission of a frame set per trigger.
No particular operation is necessary for synchronization between two tasks. If not enough frame sets are prepared when the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is set, only the prepared frame sets are transmitted. If nothing is prepared in the queue, only clearance of a transmission request is performed.

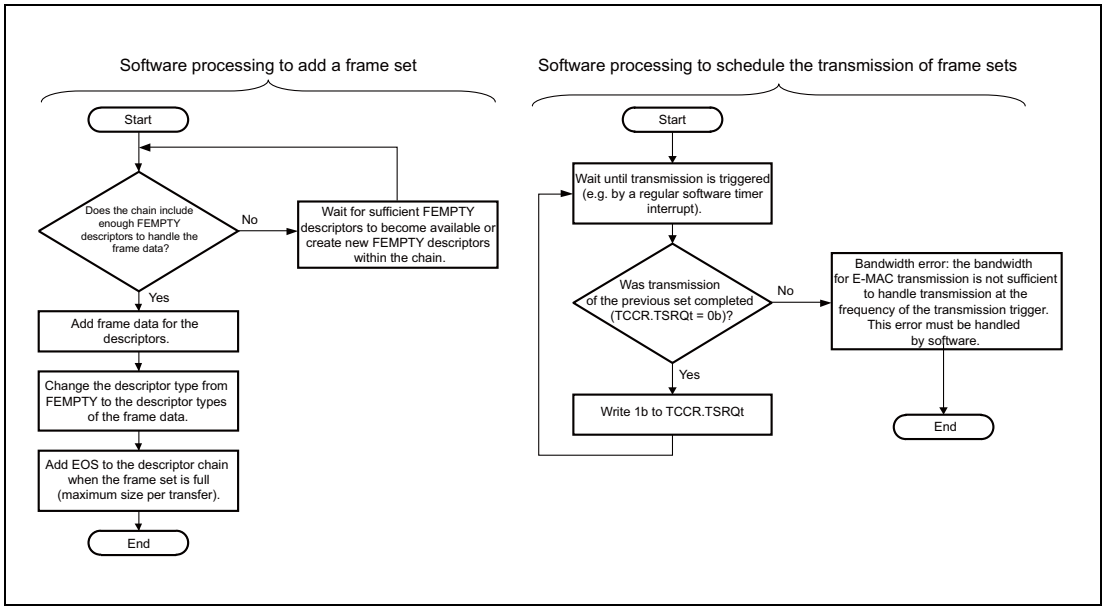

Figure 45.36 Software Flow for Frame Set Transmission with Switching of the Active Descriptor Chain

In a given time, the AVB-DMAC does not use the descriptor chain area currently being updated by software; therefore, descriptor types for a divided frame can be changed in any order.

Figure 45.37 shows software and AVB-DMAC operation examples in this method.

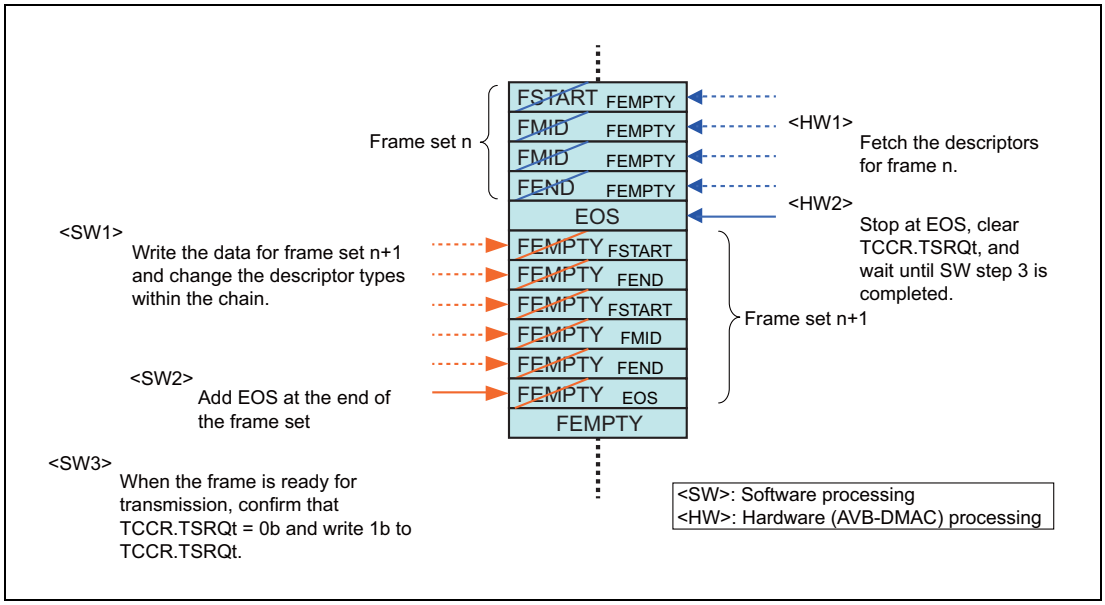

Figure 45.37 SW and AVB-DMAC Operation Examples for Frame Set Transmission with Switching of the Active Descriptor Chain

(c) Frame Set Transmission Using a Shadow Descriptor Chain

This method is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. Two or more descriptor chains are used. The chains are classified as active or shadow chains. Software prepares frame data in shadow chain and descriptor while hardware processes active chain. EOS or FEMPTY descriptors are used for the stop points.

As preparation in transmission, software creates a shadow descriptor chain that has a FEMPTY descriptor, and creates a frame data descriptor in an active chain. Software then sets the transmit start request bit (TCCR.TSRQt) to start transmission of the active chain. During active chain transmission, software can prepare frame data for the shadow chain.

Figure 45.38 shows the flow for software implementing this method.

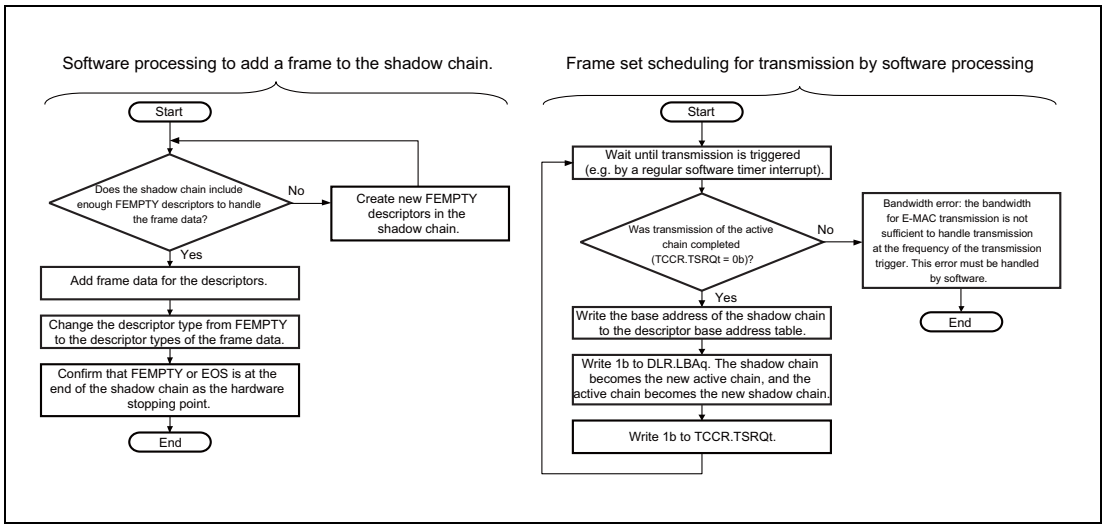

Figure 45.38 Software Flow for Frame Set Transmission Using the Shadow Descriptor Chain

Figure 45.39 shows software and AVB-DMAC operation examples in this method.

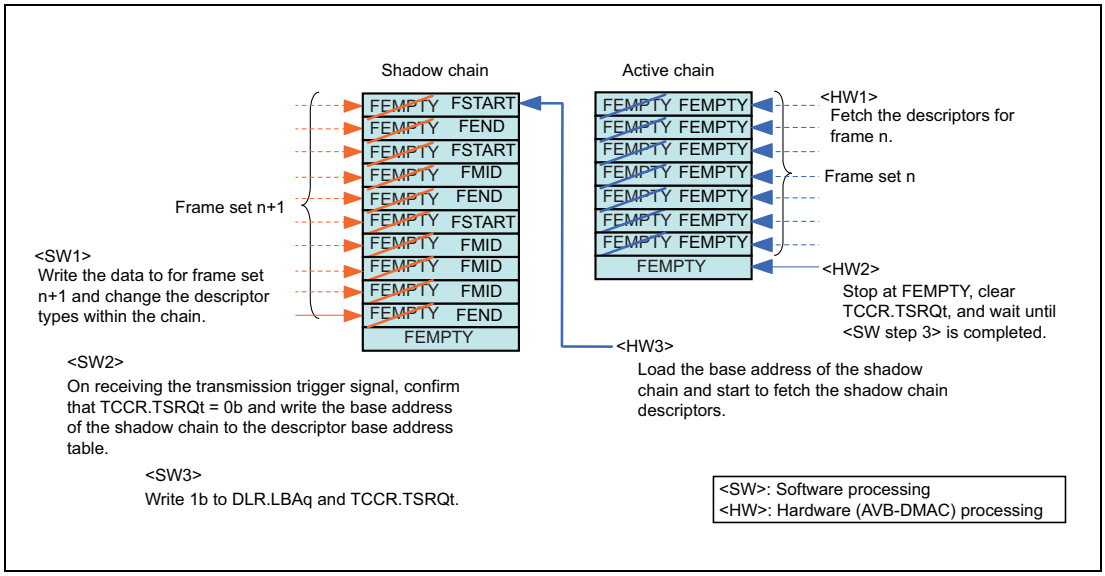

Figure 45.39 SW and AVB-DMAC Operation Examples for Frame Set Transmission Using the Shadow Descriptor Chain

45.3.5.4 Time Stamping in Transmission

Transmission time stamps are important in performing timing and synchronization processing of the IEEE 802.1AS standard. Reference to the transmission time stamps can also be useful to other applications and so on. The AVB-DMAC supplies the time-stamp values based on the gPTP timer by storing the time stamps captured at the same time as sending of the Start of Frame Delimiter (SFD) for transmitted frames.

When the time stamp storage request field (DESCR.TSR) is set to 1, selecting storage of a time stamp, the tag number defined in the tag field (DESCR.TAG) of the last descriptor in a set (FEND) or of an FSINGLE descriptor for the frame being transmitted is stored with the time stamp. This eases identification and association. The time-stamp FIFO is accessible at any time.

The method of using this function is described below:

1. Create descriptor and frame data in the on-chip RAM for the frame requiring time stamping. Write the tag number of the frame to the frame tag field (DESCR.TAG) and set the time stamp storage request field (DESCR.TSR) to 1.
2. The AVB-DMAC fetches and analyzes the descriptor. When the time stamp storage request field (DESCR.TSR) is 1, the AVB-DMAC recognizes that transmitting this frame also requires storage of the time stamp.
3. The AVB-DMAC fetches the frame data and stores the frame data in the transmission FIFO for scheduling.
4. Under the control of priority settings according to credit-based shaping (CBS) or another scheme, the transmission scheduler decides it is time to transmit frame.
5. The EthernetAVB starts transmission of frame.
6. The gPTP time stamp is captured at the start of sending the frame delimiter (SFD) for transmission and stored with the tag frame field (DESCR, TAG) in the time-stamp FIFO upon completion of the frame transmission. When the time stamp update interrupt is enabled, update of time stamp is notified by an interrupt.
7. The time stamp can now be acquired from the time-stamp FIFO.

Use the time-stamp FIFO for the timing and synchronization of frames with IEEE 802.1AS compliance.

Time stamping can also be used with other frames, but take care not to allow the time-stamp FIFO to overflow. When the time-stamp FIFO is full, further time stamps in subsequent transmissions are not stored.

Figure 45.40 shows software flow in time-stamp FIFO operation. The time stamp FIFO update interrupt status bit (TIS.TFUF) and the time stamp FIFO warning interrupt status bit (TIS.TFWF) are used for the start flag of the START block in the figure.

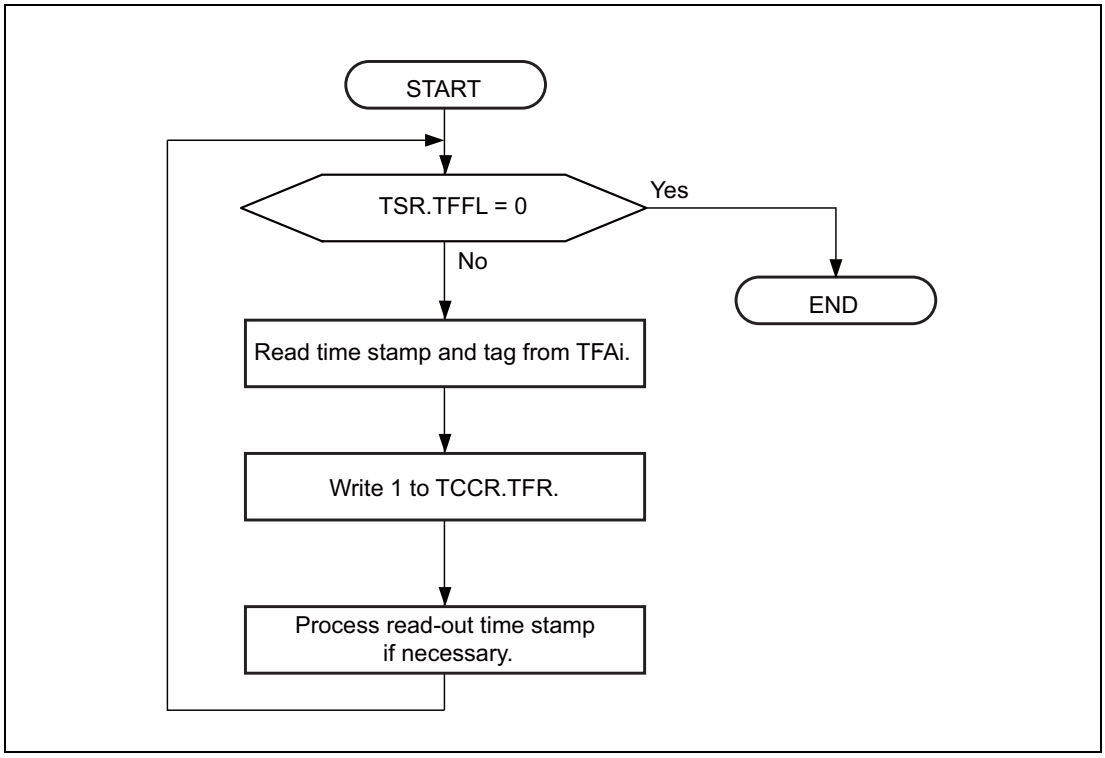

Figure 45.40 Flow of Transmission Time Stamping

When all the entries in the time-stamp FIFO are released, the time stamp FIFO update interrupt status bit (TIS.TFUF) and time stamp FIFO warning interrupt status bit (TIS.TFWF) are cleared by the AVB-DMAC. Therefore, clearing the interrupt flags is not necessary.

When multiple frames are transmitted with time stamps but from different queues, the order of storage in the time-stamp FIFO buffer depends on the order of frames in transmission.

45.3.6 CBS (Credit-Based Shaping)

In AVB transmission mode (i.e. when the transmit queue priority field in the transmit configuration register (TGC.TQP) is B'01 or B'11), transmission queues Q3 and Q2 are respectively assigned to class A and class B stream traffic and the CBS (Credit Based Shaping) algorithm is used to select the transmission queues in order to satisfy the Forwarding and Queuing for Time Sensitive Streams (FQTSS) specification (see section 8.6.8 or section 34 in IEEE 802.1Q).

The CBS algorithm is based on the concept of transmission credit for each queue. Credit can be thought of as the degree to which a queue has the "right" to transmit at a given time. In addition, in AVB transmission mode as specified in IEEE 802.1Q, queues that are subject to the CBS algorithm are able to transmit when the following conditions are met.

- At least one frame is stored in the queue.
- The credit for the queue is 0 or a positive value.

The credit for a transmission queue is incremented while one or more frames from the queue are present in the transmission FIFO but transmission of these frames is not proceeding. This state is indicated by the transmission process status bit for queue t in the AVB-DMAC status register (CSR.TPOt) being clear (0). The credit is decremented while transmission of a frame from the queue is in progress. This mechanism is used to control transmission so that the amount of data for transmission for each queue does not exceed the specified maximum bandwidths.

IEEE 802.1Q defines the following parameters for queues under the control of the CBS algorithm.

portTransmitRate: Maximum transmission data rate of an external port. The E-MAC determines this parameter.

bandwidthFraction: Maximum fraction of portTransmitRate that can be used for a queue.

idleSlope: Rate of change of credit for a queue when transmission of frames from the queue is not proceeding so the credit value (in bits per second) is increasing. idleSlope is also equal to the maximum fraction of the total bandwidth (portTransmitRate) that is available to the given queue under a specified condition (frames from the queue can be placed in a continuous stream. See Annex L of IEEE 802.Q.
idleSlope = bandwidthFraction * portTransmitRate

sendSlope: Rate of change of credit (in bits per second) for a queue while transmission of a frame from the queue is in progress so the credit value is decreasing.
The value of sendSlope is defined as follows:
sendSlope = idleSlope - portTransmitRate

Furthermore, the values below are used to define individual traffic classes (or queues for the classes) under control of the algorithm. See Annex L of IEEE 802.Q.

maxFrameSize: Maximum size of frames (in bits) of the corresponding traffic class that can be transmitted from a port

maxInterferenceSize: Maximum burst size (in bits) by which delays for the corresponding traffic class can be allowed

hiCredit: Maximum credit value (positive number). Can be calculated by using the following equation: hiCredit = maxInterferenceSize * (idleSlope / portTransmitRate)

loCredit: Minimum credit value (negative number). Can be calculated by using the following equation: loCredit = maxFrameSize * (sendSlope / portTransmitRate)

Figure 45.41 shows how the CBS algorithm works and the meaning of the above parameters. When there is no frame to be transmitted in the queue in the transmit-enabled state, the credit value is 0 (after Frame 0 transmission in the figure).

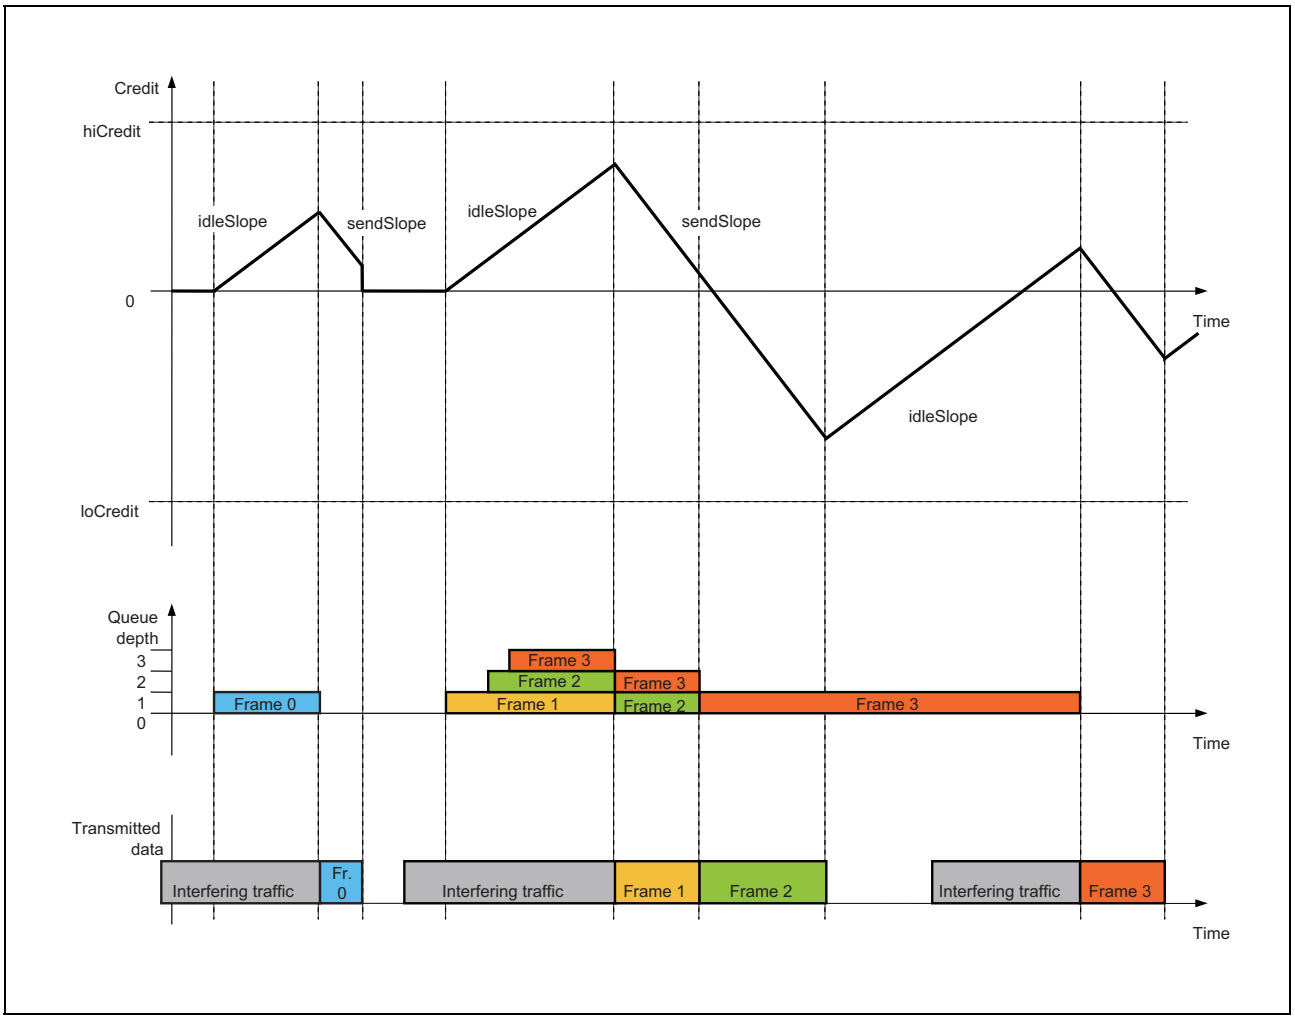

Figure 45.41 CBS (Credit-Based Shaping) Operation

Figure 45.42 shows the operation of CBS (Credit Based Shaping) in the AVB-DMAC.

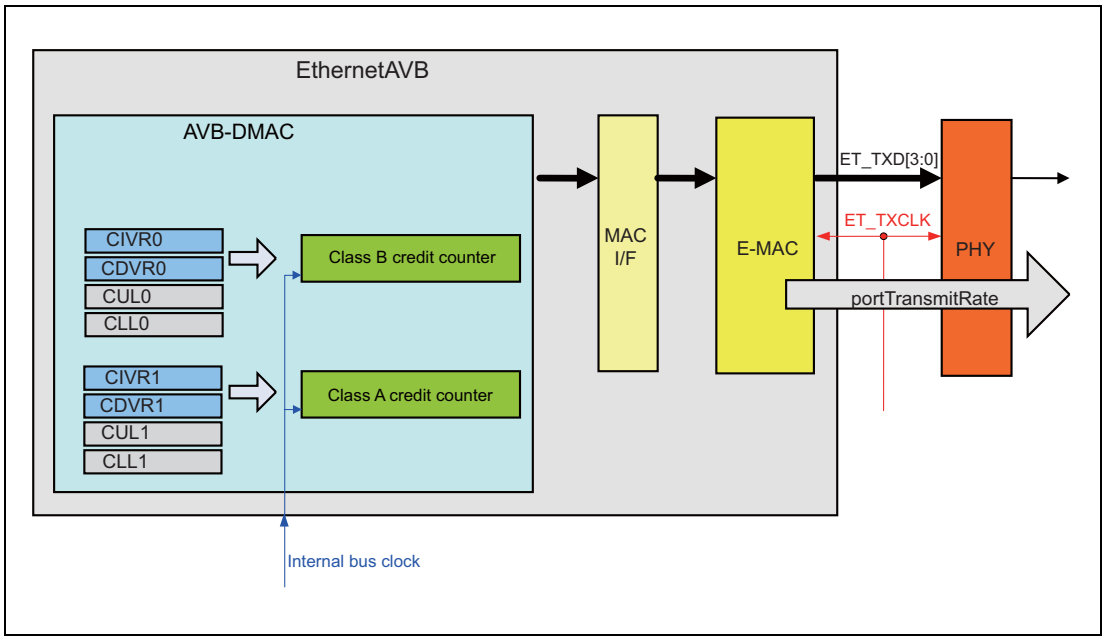

Figure 45.42 CBS (Credit-Based Shaping) Operation in the AVB-DMAC

The CBS operation in the AVB-DMAC is based on “credit counters” for the respective traffic classes (SR class A and class B). The following parameters apply for these classes.

CBS increment value (CIV): Signed positive number
The credit is incremented by this amount every internal bus clock cycle while a frame from the queue is pending but transmission has not started (idleSlope).

CBS decrement value (CDV): Signed negative number
The credit is decremented by this amount every internal bus clock cycle while transmission of a frame from the queue is proceeding (sendSlope).

The CBS increment value (CIV) and CBS decrement value (CDV) are defined as follows.

CIV = idleSlope * Mfactor

CDV = sendSlope * Mfactor

Mfactor is a multiplier factor to ensure accuracy for CIV and CDV. CIV and CDV are finally calculated by using the following equations.

CIV = (portTransmitRate/Bϕ) * bwFraction * Mfactor

CDV = (portTransmitRate/Bϕ) * (bwFraction - 1) * Mfactor

The credit counters are driven by the internal bus clock (Bϕ), so calculating the slope parameters for CBS requires (1/Bϕ).

Mfactor must be calculated for the CBS parameters. All queues for the same class must have the same CBS parameters. Mfactor for a certain class can be changed during operation, unless transmission is pending for that class (i.e. the transmit process status bit in the AVB-DMAC status register (CSR.TPOt) = 0). At that time, the credit counter values for class are 0. Note that the credit value will

not match a new incrementation or decrementation parameter if Mfactor is changed while the credit counter value is non-zero. Mfactor configuration register is not present in the AVB-DMAC.

Set the CIV and CDV parameters in the CBS increment value registers (CIVRc) and the CBS decrement value registers (CDVRc). They should be dynamically updated when streams are registered and erased in accord with IEEE 802.1Qat.

Although the credit counters operate with the internal bus clock (Bφ), a transmission clock is used in frame transmission. Therefore, time lags occur when frame transmission starts and ends.

For this reason, an extra credit is stored after a frame is transmitted. The maximum value of the credit to be stored is the credit value incremented for one cycle of the Bφ clock and equals the Tx port transmission rate in Mbps * Bφ.

Bandwidth needs to be secured by software taking this into account.

The AVB-DMAC also has CBS upper limit registers (CULc) (the upper limit registers for classes A and B) and CBS lower limit registers (CLLc) (the lower limit registers for classes A and B). Multiply the upper limit (hiCredit) and the lower limit (loCredit) by Mfactor for each class as defined above so that the resulting values agree with the credit values.

CUL = hiCredit * Mfactor = maxInterferenceSize * bwFraction * Mfactor

CLL = loCredit * Mfactor = maxFrameSize * (bwFraction - 1) * Mfactor

Example:

Assume that portTransmitRate = 100 Mbps, Bϕ = 130 MHz and bwFraction = 3%. Then idleSlope and sendSlope represented as one bit vs. cycles of the peripheral bus clock are as follows.

idleSlope = (portTransmitRate/Bϕ) * bwFraction = 100/130 (Mbps/MHz) * 3% = 0.023 (bit/Bϕ)

sendSlope = idleSlope - (portTransmitRate / Bϕ) = -0.746 (bit/Bϕ)

Let Mfactor be 100, then CIV and CDV parameters are determined as follows.

CIV = idleSlope * Mfactor = 23

CDV = sendSlope * Mfactor = -74.6

45.3.6.1 Restrictions on CIV, CDV and Mfactor

The maximum value (the minimum value for negative numbers) up to which the credit counter will not overflow determines the maximum values of CIV and CDV that can be set in the CBS registers. This maximum credit value is equivalent to the worst case of the hiCredit value, and the maximum values for class A and class B are calculated as follows.

<Conditions>

- Class A maximum value (hiCredit_max_classA)
  classA bwFraction ≅ 100%
  Maintaining the proper relations in the transmission priority order requires waiting for a period equivalent to the one maximum sized frame.
  hiCredit_max_classA ≅ maxInterferenceSize for class A = Waiting for a period equivalent to one maximum sized frame = header + maximum size payload + CRC (2000 bytes) + preamble (8 bytes) + IFG (12 bytes) + processing_delay (≅ 80 bytes) ≅ 2100 bytes
- Class B maximum value (hiCredit_max_classB)
  classB bwFraction ≅ 100%
  Maintaining the proper relations in the transmission priority order requires waiting for a period equivalent to the respective one maximum sized frame in the class A transmission queue and other transmission queues.
  hiCredit_max_classB ≅ maxInterferenceSize for class B = Waiting for a period equivalent to two maximum sized frames = 2* hiCredit_max_classA ≅ 4200 bytes

In bit units, calculated as follows:

hiCredit_max_classA = 16800

hiCredit_max_classB = 33600

The 32-bit signed counter can handle from -2^{31} to $2^{31}-1$, so the specifiable maximum values of Mfactor without overflow are:

Mfactor_max_classA = $2^{31}-1$ / hiCredit_max_classA ≅ 127826 and
Mfactor_max_classB = $2^{31}-1$ / hiCredit_max_classB ≅ 63913.

A high degree of accuracy can be achieved even with a low bandwidth. In class B, bandwidthFraction = 0.05% and the bandwidth error < 0.1%.

The maximum value of CIV is calculated from the following equation.

CIV = idleSlope x Mfactor = (portTransmitRate / Bϕ) * bandwidthFraction × Mfactor

When Mfactor is the maximum value and bandwidthFraction is the maximum value (up to 100%):

CIV_max_classA = (portTransmitRate / Bϕ) * Mfactor_max_classA and
CIV_max_classB = (portTransmitRate / Bϕ) * Mfactor_max_classB.

The maximum values when portTransmitRate = 100 Mbps and Bϕ = 130 MHz are as follows:

CIV_max_classA ≅ 98328

CIV_max_classB ≅ 49164

Table 45.81 shows examples of values for portTransmitRate and internal bus clock frequency. The values in this table are just the results of calculation, so when actually setting values, the CIV values must be limited so that the 32-bit credit counter will not overflow. In the AVB-DMAC, the CIV parameters are implemented as 16 bits + a sign bit, so CIV ≤ 65535 should be applied to both class A and class B.

Table 45.81 Example of Maximum Values for Class A and Class B CIV Parameters

portTransmitRate	Bϕ [MHz]	CIV_max_classA	CIV_max_classB
100 Mbps	100	127826	63913
100 Mbps	125	102260	51130
100 Mbps	133	96109	48054

45.3.6.2 Credit Incrementation (IFGs)

In the CBS credit counter in the AVB-DMAC, the inter-frame gap (IFG) after a frame is transmitted is not treated as part of frame transmission. During an IFG, the credit is incremented for all SR queues that have pending frames or negative credit. Figure 45.43 illustrates credit operations during IFGs.

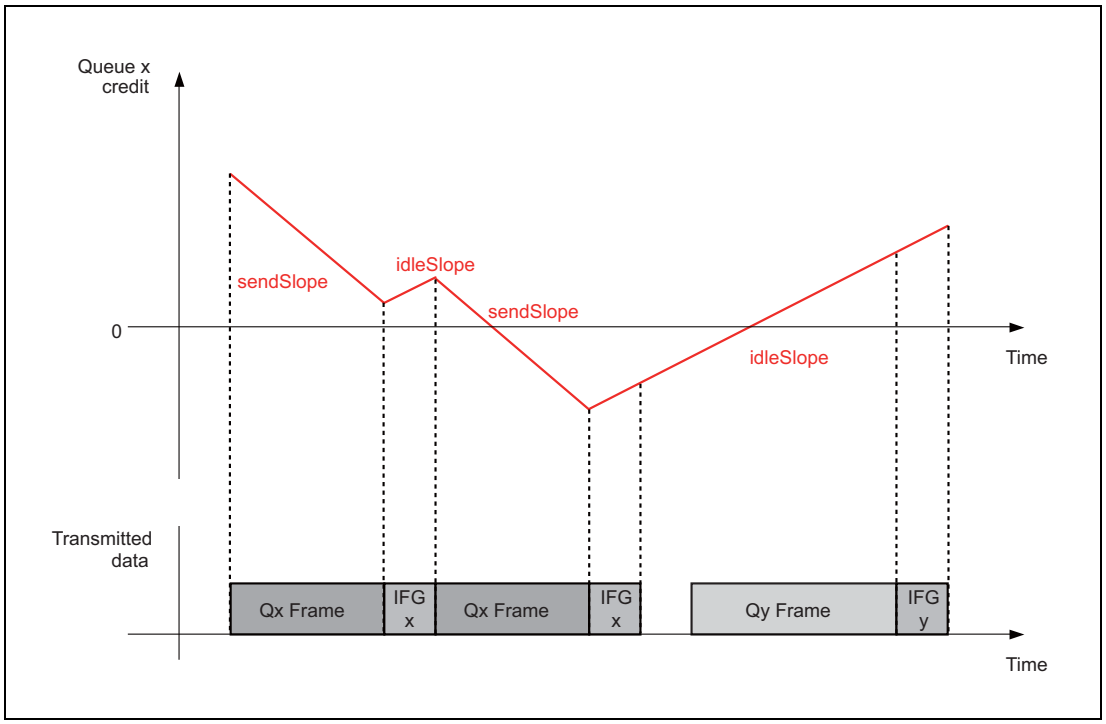

Figure 45.43 Credit Operations during IFGs

The IFG need not be included in calculation of the bandwidth for the specified SR class when deciding the idleSlope, sendSlope, and CIV and CDV parameters. However, IFG must also be included in the calculation in order to confirm that the total bandwidth allocated to all SR classes does not exceed 100% of portTransmitRate.

45.3.6.3 CBS Setting Example

The case of a class A 48-kHz stereo audio stream among Ethernet frames is described as an example.

After every class A measurement interval (125 us), 80 octets consisting of two sets of six 32-bit samples plus a 32-octet header are stored as audio data within a frame. The IEEE 802.3 also imposes a 42-octet media-specific frame overhead (an 8-octet preamble, 14-octet IEEE 802.3 header, 4-octet IEEE 802.1Q priority/VID Tag, 4-octet CRC, and 12-octet IFG) are also added. Accordingly, the total frame size is 80 + 42 = 122, and one such frame is transmitted after every class measurement interval.

This represents a total bandwidth of about 7.8 Mbits per second (122 octets × 8 bits per octet × 8000 frames per second) for this class. The E-MAC runs at 100 Mbps (portTransmitRate), so the allocation of the total bandwidth to each class A queue corresponds to 7.8%. If other traffic classes are to share the total transmission bandwidth, checking that the total allocation of bandwidth with this 7.8% allocation does not exceed 100% of portTransmitRate is required.

To obtain the CIV and CDV parameters for a given class, the IFG must not be taken into account in calculation of the frame size. For this case, therefore, we obtain the total bandwidth for the class = about 7.04 Mbps (110 octets × 8 bits per octet × 8000 frames per second) = 7.04% of portTransmitRate.

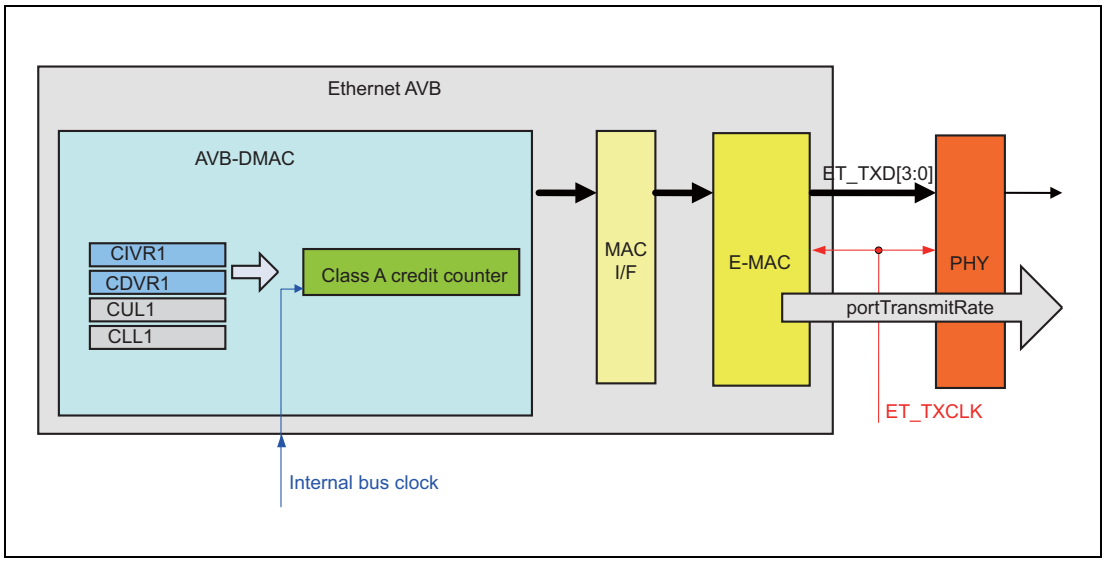

Figure 45.44 Example of CBS Settings

In this setting example, operating frequency and so on in each section are as follows:

- the E-MAC runs at 100 Mbps, so portTransmitRate = 100 Mbps and
- high-speed internal bus clock (operating clock for the credit counter) frequency = 133 MHz,

securing a bandwidth of 7.04 Mbits/sec for class A requires configuring the CBS parameters as follows.

- bandwidthFraction = 7.04%
- idleSlope = (portTransmitRate / Bϕ) * bandwidthFraction ≅ 0.05293 bits per Bϕ
- sendSlope = idleSlope – (portTransmitRate / Bϕ) ≅ -0.69895 bits per Bϕ

When Mfactor = 10000, the parameters are as follows.

- CIV = idleSlope × Mfactor = 529 bits per Bϕ

- CDV = sendSlope × Mfactor = -6989 bits per Bϕ

These are the final values for setting in the CIVR1 and CDVR1 registers.

45.3.7 IEEE802.1: gPTP

45.3.7.1 gPTP Timer

An 84-bit timer is provided to support the gPTP function. Figure 45.45 shows the overview of the timer.

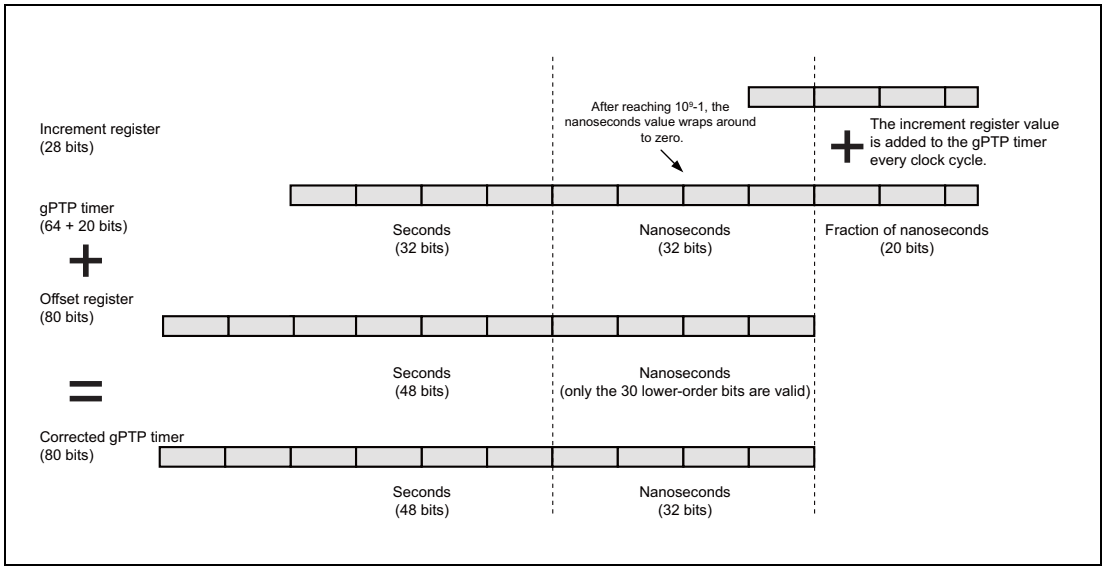

Figure 45.45 gPTP Timer

The higher-order 32 bits indicate seconds. For the next 32 bits indicate nanoseconds. The lower-order 20 bits indicate fractional nanoseconds. Software can only read the 32 higher-order bits, indicating seconds, and the subsequent 32-bits, indicating nanoseconds. The 20 lower-order 20 bits, representing less than 1 ns, are provided within the AVB-DMAC to maintain accuracy in time measurement, and cannot be referenced.

The timer can be reset by setting the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) to B'01. These bits are set to B'00 on completion of normal resetting of the timer.

After the timer starts, the value in the gPTP timer increment value bit (GTI.TIV) is added to the value of the gPTP timer every clock cycle. When the value of the nanosecond part reaches 10^9 - 1, it returns to 0 when the next 1 nanosecond is counted. The fractional nanosecond value is represented by 20 bits and can be adjusted in precision of $1/2^{20}$ (1/1048576) nanosecond.

Before setting a value in the gPTP timer increment value bit (GTI.TIV), set the timer increment value setting request bit in the gPTP configuration control register (GCCR.LTI) to 1. If this bit is not set to 1, new values that are written will not be reflected in the register. This bit returns to 0 after the setting is completed.

An offset to the gPTP timer is also available. If this is required, set the value in the timer offset value bit (GTO.TOV). Before setting a value in this register, set the timer offset value setting request bit in the gPTP configuration control register (GCCR.LTO) to 1. If this bit is not set to 1, new values that are written will not be reflected in the register. This bit returns to 0 after the setting is completed. Set the value from 0 to 10^9 - 1 to the timer offset value bits (GTO0.TOV[31:0]) in the nanoseconds portion. When adding an offset, take care that the calculation result with the offset added does not exceed 80 bits.

The value of the gPTP timer can be read from the gPTP timer capture value bit (GCTi.CTV) by setting the timer control request bits in the gPTP timer control register (GCCR.TCR[1:0]) to B'11. Set the timer capture source select bits in the gPTP configuration control register (TCCR.TCSS) to select the timer value for capture as the value of the gPTP timer, the corrected value of the gPTP timer (value with the offset added), or the AVTP presentation time. Setting the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) to B'11 initiates the capture. Once normal capture of the timer is complete, the value of the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) returns to B'00.

The timer for gPTP operates as a free-running timer but can be synchronized with the Grandmaster clock.

The timer clock source can be selected from the internal bus clock and Ethernet transmission clock by setting the gPTP clock select bits (CCC.CSEL[1:0]).

45.3.7.2 Free-Running Operation

The IEEE 802.1 AS standard does not prescribe the adjustment of local clocks to the Grandmaster clock. To avoid negative effects from the correction procedure, we recommend the use of a free-running timer.

As a free-running timer, the timer counts the local clock based on the local time. The gPTP timer increment value bit (GTI.TIV) is set to 1 ns (the setting value = H'0010 0000) and the timer offset value bit (GTOi.TOV) is set to 0. The ratio information captured at the time of the gPTP delay measurement and synchronization procedures is used to correct the frequency ratio to that of the Grandmaster clock. The Grandmaster clock can be calculated from the local clock by using the information collected during the gPTP measurement and synchronization procedures.

45.3.7.3 Synchronization with the Grandmaster Clock

In situations requiring physical synchronization of the local clock with the Grandmaster clock, the fractional nanoseconds value (the 20 lower-order bits of the gPTP timer) is used to make the adjustment. Specifically, the increment value is finely adjusted to correct for deviations of the clock frequency from that of the Grandmaster clock.

Use the timer offset value bit (GTOi.TOV) to correct for offsets for comparing with the absolute time and so on from start-up. The sum of the timer value and the offset register is the corrected gPTP timer value.

Set the value from 0 to 10^9 - 1 to the timer offset value bits (GTOi.TOV[31:0]) for setting the nanoseconds portion of the offset.

The following equation gives a method of calculating the increment (GTI.TIV) from the frequency of the gPTP clock and its deviation from that of the Grandmaster clock. Variable d is the deviation (d = 10^{-6} for 1 ppm).

$$GTI.TIV = round\left(\frac{2^{20}\,GHz}{f_{GPTP}} * (1+d)\right)$$

After adjusting for the current deviation of clock frequency, re-set the gPTP timer increment register (GTI.TIV).

After calculating the new offset value, re-set the timer offset configuration register (GTOi.TOV).

- Sample setting 1

When f_{GPTP} = 100 MHz ± 0 ppm (device used is guaranteed by the Grandmaster clock)

gPTP is updated every 10 ns.

Set the gPTP timer increment value bits (GTI.TIV) to H’00A0_0000.

- Sample setting 2

When f_{GPTP} = 100 MHz - 10 ppm

gPTP is updated every 10 ns.

Set the gPTP timer increment value bits (GTI.TIV) to H’00A0_0069 (10485864.8576 before rounded off). Rounding off the value causes a frequency error less than 1 ppm.

45.3.7.4 Support Provided by the gPTP Timer in Transmission and Reception

The timer value described above is used in the time-stamp values captured when start frame delimiters are detected in reception and generated in transmission.

Captured time stamp values for received frames are stored in the corresponding descriptors. Those for transmitted frames are stored with tag information in the time-stamp FIFO. The time stamp values are thus correlated with both transmitted and received frames.

Note that the use of corrected gPTP timer values can introduce an error due to the offset correction in the gPTP synchronization procedure.

Errors due to SFD notification and the interface between the timer modules must also be taken into account. Although SFDs for transmission and reception are detected in synchronization with the transmission and reception clocks, respectively, the gPTP operates with a gPTP clock. Therefore, an error of ± 1 GTI.TIV + 1 Bφ is generated.

45.3.8 Support for IEEE 1722

For IEEE 1722, the following two functions are supported.

- Output and capture of values in the IEEE 1722 AVTP (Audio/Video Transport Protocol) presentation time format
- Comparison of IEEE 1722 AVTP presentation time stamps

The 32-bit AVTP time stamp field of IEEE 1722 frames holds the AVTP presentation time when the AVTP time-stamp enable bit in the frame is 1. The AVTP time stamp field is generated from the pPTP timer and is given as seconds (gPTP_seconds) and nanoseconds (gPTP_nanoseconds) according to the following equation.

AVTP time stamp = (gPTP_seconds * 10^9 + gPTP_nanoseconds) modulo 2^{32}

The AVTP presentation time can be read from the gPTP timer capture value bit (GCTi.CTV). Set the timer capture source select bits in the gPTP configuration control register (TCCR.TCSS) to select the timer value for capture as the AVTP presentation time. Setting the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) to B'11 initiates the capture. The value stored as the capturing result is obtained by adding the maximum transit time defined in the maximum transit time bits (GMTT.MTTV) to the corrected gPTP timer value. The AVTP presentation time wraps around approximately every four seconds.

CAUTION

The AVTP presentation time captured in GCTi.CTV is only valid when the corrected gPTP timer value is in synchronization with the Grandmaster clock. That is, the timer increment and timer offset values for the corrected gPTP timer value must be adjusted by the synchronization procedure so that the corrected gPTP clock is adjusted to match the time kept by the Grandmaster clock.

45.3.9 Flow Control

The E-MAC supports flow control for full-duplex operation in compliance with the IEEE 802.3 standards. This flow control is applicable to both reception and transmission. In regard to the transmission of PAUSE frames, flow control operates in the following ways.

(1) Automatic PAUSE Frame Transmission

For the received frames, PAUSE frames are automatically transmitted when the amount of data having been written in the reception FIFO reaches the value specified by the receive FIFO caution level bits in the receive configuration register (RCR.RFCL). The TIME parameter contained in the PAUSE frame can be specified by the automatic PAUSE frame register (APR). If the maximum count of PAUSE frame retransmission times is not specified, PAUSE frames are automatically transmitted repeatedly until the data is read from the reception FIFO and the remaining data amount becomes smaller than the value specified by the RCR.RFCL. As the maximum count of PAUSE frame retransmission times, any value from 1 to 65535 can be specified by the PAUSE frame retransmission count register (TPAUSER). In this case, PAUSE frames are automatically transmitted repeatedly until the remaining data amount becomes smaller than the value specified by the RCR.RFCL or the count of retransmission times reaches the value specified by the TPAUSER. The retransmit counter is cleared to 0 when the next PAUSE frame is transmitted once the data amount in the reception FIFO becomes smaller than the value specified by the RCR.RFCL.

Automatic PAUSE frame transmission is enabled when the operating mode bit for flow control in transmission in the E-MAC mode register (ECMR.TXF) is 1.

(2) Manual PAUSE Frame Transmission

PAUSE frames can also be transmitted in response to software operations. Writing a timer value to the manual PAUSE frame register (MPR) starts the transmission of a PAUSE frame. This only causes the transmission of one PAUSE frame.

(3) PAUSE Frame Reception

After reception of a PAUSE frame, transmission of the next frame does not proceed until the time indicated by the Timer value elapses. However, transmission of a frame currently being transmitted continues. PAUSE frames are only received while the operating mode for flow control in reception bit in the E-MAC mode register (ECMR.RXF) is set to 1. The number of received PAUSE frames is counted.

(4) 0 TIME PAUSE Frame Control

The setting of the PAUSE frame usage with TIME = 0 enable bit in the E-MAC mode register (ECMR.ZPF) enables or disables the transmission of PAUSE frames with the TIME parameter value 0. The setting of the PAUSE frame reception with time = 0 bit in the E-MAC mode register (ECMR.RZPF) enables or disables the reception of PAUSE frames with the TIME parameter value 0.

- Operation for transmission
  When the 0-time PAUSE frame control is enabled, PAUSE frame with the TIME parameter value 0 is transmitted when the capacity of the reception FIFO is less than the value of the receive FIFO caution level bits in the receive configuration register (RCR.RFCR) while the time indicated by the TIME parameter value has not elapsed.
  When the 0-time PAUSE frame control is disabled, PAUSE frames with the TIME parameter value 0 are not transmitted.
- Operation for reception

When the 0-time PAUSE frame reception is enabled, frame transmission wait state is released when PAUSE frame with the TIME parameter value 0 is received.
When the 0-time PAUSE frame reception is disabled, received PAUSE frames with the TIME parameter value 0 are discarded.

45.3.10 Interrupts

The EthernetAVB module has four interrupts: three interrupts from the AVB-DMAC and one interrupt from the E-MAC. The three interrupts from the AVB-DMAC are generated when the AVB-DMAC is placed in operation mode, and the one interrupt from the E-MAC is generated when the AVB-DMAC is placed in configuration, operation, or standby mode.

Table 45.82 is a list of the interrupts.

Table 45.82 EthernetAVB Interrupts

Interrupt Source Name	Remarks
AVB_DATA	Transmit/receive data management interrupt
AVB_ERROR	Error management interrupt
AVB_MANAGE	Other management (FIFO caution level, etc.) interrupt
AVB_MAC	E-MAC interrupt

The AVB-DMAC related interrupts include descriptor interrupts (15 sources), error interrupts (5 sources), reception interrupts (37 sources), transmission interrupts (2 sources), and gPTP interrupts (3 sources). From the CPU's perspective, each appears as one of the above four interrupt sources.

The states of an AVB-DMAC-related interrupt sources can be checked in the following registers.

- Descriptor interrupt status register (DIS)
- Error interrupt status register (EIS)
- Receive interrupt status register (RISi)
- Transmit interrupt status register (TIS)
- gPTP interrupt status register (GIS)

The interrupts are controlled by the corresponding interrupt enable bits. However, the status flags operate independently of the settings of the enable bits.

The states of grouped interrupts can be checked by reading the interrupt summary status register (ISS) and the queue full error interrupt status bit in the error interrupt status register (EIS.QFS).

45.3.10.1 Transmit/Receive Data Management Interrupt

The management interrupt for transmission and reception is conveyed when the interrupt conditions corresponding to the following sources are satisfied.

- Receive frame interrupt in the receive interrupt status register 0 (RIS0.FRFr)
- Descriptor interrupt in the descriptor interrupt status register (DIS.DPFi)

45.3.10.2 Error Management Interrupt

The error management interrupt is conveyed when interrupt conditions corresponding to the following sources are satisfied.

- Time stamp FIFO full error interrupt in the error interrupt status register (EIS.TFFF)
- CBS limitation value error interrupts in the error interrupt status register (EIS.CULF1, EIS.CULF0, EIS.CLLF1, EIS.CLLF0)
- Receive FIFO full interrupt in the receive interrupt status register 2 (RIS2.RFFF)
- Receive queue full interrupt in the receive interrupt status register 2 (RIS2.QFFr)

45.3.10.3 Other Management (FIFO Warning, etc.) Interrupts

The other management (FIFO warning, etc.) interrupt is conveyed when interrupt conditions corresponding to the following sources are satisfied.

(1) Reception related interrupt

Receive FIFO warning interrupt in the receive interrupt status register 1 (RIS1.RFWF)

(2) Transmission related interrupts

Time stamp FIFO warning interrupt in the transmit interrupt status register (TIS.TSWF)

Time stamp FIFO update interrupt in the transmit interrupt status register (TIS.TSUF)

(3) gPTP related interrupts

Presentation time match interrupt in the gPTP interrupt status register (GIS.PTMF)

45.3.10.4 E-MAC Interrupt

The E-MAC interrupt is conveyed when the following E-MAC interrupt sources are generated.

- PAUSE frame retransmit retry over interrupt in the E-MAC status register (ECSR.PFROI)
- Illegal carrier detection interrupt in the E-MAC status register (ECSR.ICD)

45.3.12.2 Accessing MII Registers

MII registers in the PHY-LSI are accessed via PIR in this LSI. PIR is used as a serial interface conforming to the MII frame format specified in IEEE802.3u.

(1) MII Management Frame Format

Figure 45.64 shows the format of an MII management frame. To access an MII register, a management frame is implemented by the program in accordance with the procedures shown in MII Register Access Procedure.

Access Type	MII Management Frame							
Item	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
Number of bits	32	2	2	5	5	2	16	
Read	1..1	01	10	00001	RRRRR	Z0	D..D	
Write	1..1	01	01	00001	RRRRR	10	D..D	X

[Legend]

PRE: 32 consecutive 1s
ST: Write of 01 indicating start of frame
OP: Write of code indicating access type
PHYAD: Write of 0001 if the PHY-LSI address is 1 (sequential write starting with the MSB).
This bit changes depending on the PHY-LSI address.
REGAD: Write of 000q if the register address is 1 (sequential write starting with the MSB).
This bit changes depending on the PHY-LSI register address.
TA: Time for switching data transmission source on MII interface
(a) Write: 10 written
(b) Read: Bus release (notation: Z0) performed
DATA: 16-bit data. Sequential write or read from MSB
(a) Write: 16-bit data write
(b) Read: 16-bit data read
IDLE: Wait time until next MII management format input
(a) Write: Independent bus release (notation: X) performed
(d) Read: Bus already released in TA: control unnecessary

Figure 45.64 MII Management Frame Format

(2) MII Register Access Procedure

The program accesses MII registers via PIR. Access is implemented by a combination of 1-bit-unit data write, 1-bit-unit data read, bus release, and independent bus release. Figure 45.65 to Figure 45.68 show the MII register access timing. The timing will differ depending on the PHY-LSI type.

45.3.13 Usage Notes

45.3.13.1 Checksum Calculation of Ethernet Frames

This LSI is capable of calculating the checksum data of the received frames. Only the data fields of the Ethernet frames are subject to checksum calculation. Specifically, a data field follows the length/type field and is followed by the CRC field. Figure 45.69 shows schematics indicating which parts of the Ethernet frames are calculated. Calculation involves 16-bit addition only; it does not involve bit inversion. Note that when the checksum data is valid, the CRC data (4 bytes) is not transferred as a receive frame, and the checksum data (sum data) is added automatically. Figure 45.70 shows schematics of Ethernet frames to which the checksum data has been added.

CAUTION

Also for the frames with VLANtag inserted, the 15th byte from the top and the following bytes before the CRC field are subject to calculation.

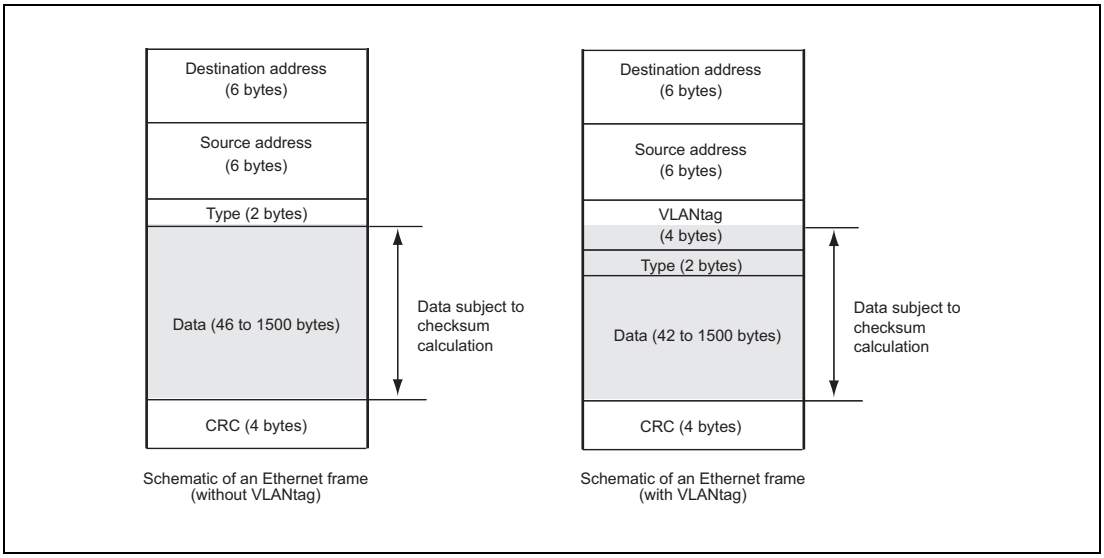

Figure 45.69 Data Subject to Checksum Calculation

Table 46.1 Register Addresses

Module	Register Name	Abbreviation	Number of Bits	Address	Access Size
Ethernet controller	Software reset register	ARSTR	32	H'E8204800	32
	E-MAC mode register	ECMR0	32	H'E8203500	32
	E-MAC status register	ECSR0	32	H'E8203510	32
	E-MAC interrupt permission register	ECSIPR0	32	H'E8203518	32
	PHY interface register	PIR0	32	H'E8203520	32
	MAC address high register	MAHR0	32	H'E82035C0	32
	MAC address low register	MALR0	32	H'E82035C8	32
	Receive frame length register	RFLR0	32	H'E8203508	32
	CRC error frame receive counter register	CEFCR0	32	H'E8203740	32
	Frame receive error counter register	FRECR0	32	H'E8203748	32
	Too-short frame receive counter register	TSFRCR0	32	H'E8203750	32
	Too-long frame receive counter register	TLFRCR0	32	H'E8203758	32
	Residual-bit frame receive counter register	RFCR0	32	H'E8203760	32
	Multicast address frame receive counter register	MAFCR0	32	H'E8203778	32
	Automatic PAUSE frame register	APR0	32	H'E8203554	32
	Manual PAUSE frame register	MPR0	32	H'E8203558	32
	Automatic PAUSE frame retransmit count register	TPAUSER0	32	H'E8203564	32
	PAUSE frame transmit counter register	PFTCR0	32	H'E820355C	32
	PAUSE frame receive counter register	PFRCR0	32	H'E8203560	32
	TSU counter reset register	TSU_CTRST	32	H'E8204804	32
	CAM entry table specification enable register (common)	TSU_FWSLC	32	H'E8204838	32
	VLANtag set register	TSU_VTAG0	32	H'E8204858	32
	CAM entry table busy register	TSU_ADSBSY	32	H'E8204860	32
	CAM entry table enable register	TSU_TEN	32	H'E8204864	32
	CAM entry table POST 1 register	TSU_POST1	32	H'E8204870	32
	CAM entry table POST 2 register	TSU_POST2	32	H'E8204874	32
	CAM entry table POST 3 register	TSU_POST3	32	H'E8204878	32
	CAM entry table POST 4 register	TSU_POST4	32	H'E820487C	32
	CAM entry table 0H register	TSU_ADRH0	32	H'E8204900	32
	CAM entry table 1H register	TSU_ADRH1	32	H'E8204908	32
	CAM entry table 2H register	TSU_ADRH2	32	H'E8204910	32
	CAM entry table 3H register	TSU_ADRH3	32	H'E8204918	32
	CAM entry table 4H register	TSU_ADRH4	32	H'E8204920	32
	CAM entry table 5H register	TSU_ADRH5	32	H'E8204928	32
	CAM entry table 6H register	TSU_ADRH6	32	H'E8204930	32
	CAM entry table 7H register	TSU_ADRH7	32	H'E8204938	32
	CAM entry table 8H register	TSU_ADRH8	32	H'E8204940	32
	CAM entry table 9H register	TSU_ADRH9	32	H'E8204948	32
	CAM entry table 10H register	TSU_ADRH10	32	H'E8204950	32
	CAM entry table 11H register	TSU_ADRH11	32	H'E8204958	32
	CAM entry table 12H register	TSU_ADRH12	32	H'E8204960	32
	CAM entry table 13H register	TSU_ADRH13	32	H'E8204968	32
	CAM entry table 14H register	TSU_ADRH14	32	H'E8204970	32
	CAM entry table 15H register	TSU_ADRH15	32	H'E8204978	32
	CAM entry table 16H register	TSU_ADRH16	32	H'E8204980	32
	CAM entry table 17H register	TSU_ADRH17	32	H'E8204988	32
	CAM entry table 18H register	TSU_ADRH18	32	H'E8204990	32

Table 46.1 Register Addresses

Module	Register Name	Abbreviation	Number of Bits	Address	Access Size
Ethernet controller	CAM entry table 19H register	TSU_ADRH19	32	H'E8204998	32
	CAM entry table 20H register	TSU_ADRH20	32	H'E82049A0	32
	CAM entry table 21H register	TSU_ADRH21	32	H'E82049A8	32
	CAM entry table 22H register	TSU_ADRH22	32	H'E82049B0	32
	CAM entry table 23H register	TSU_ADRH23	32	H'E82049B8	32
	CAM entry table 24H register	TSU_ADRH24	32	H'E82049C0	32
	CAM entry table 25H register	TSU_ADRH25	32	H'E82049C8	32
	CAM entry table 26H register	TSU_ADRH26	32	H'E82049D0	32
	CAM entry table 27H register	TSU_ADRH27	32	H'E82049D8	32
	CAM entry table 28H register	TSU_ADRH28	32	H'E82049E0	32
	CAM entry table 29H register	TSU_ADRH29	32	H'E82049E8	32
	CAM entry table 30H register	TSU_ADRH30	32	H'E82049F0	32
	CAM entry table 31H register	TSU_ADRH31	32	H'E82049F8	32
	CAM entry table 0L register	TSU_ADRL0	32	H'E8204904	32
	CAM entry table 1L register	TSU_ADRL1	32	H'E820490C	32
	CAM entry table 2L register	TSU_ADRL2	32	H'E8204914	32
	CAM entry table 3L register	TSU_ADRL3	32	H'E820491C	32
	CAM entry table 4L register	TSU_ADRL4	32	H'E8204924	32
	CAM entry table 5L register	TSU_ADRL5	32	H'E820492C	32
	CAM entry table 6L register	TSU_ADRL6	32	H'E8204934	32
	CAM entry table 7L register	TSU_ADRL7	32	H'E820493C	32
	CAM entry table 8L register	TSU_ADRL8	32	H'E8204944	32
	CAM entry table 9L register	TSU_ADRL9	32	H'E820494C	32
	CAM entry table 10L register	TSU_ADRL10	32	H'E8204954	32
	CAM entry table 11L register	TSU_ADRL11	32	H'E820495C	32
	CAM entry table 12L register	TSU_ADRL12	32	H'E8204964	32
	CAM entry table 13L register	TSU_ADRL13	32	H'E820496C	32
	CAM entry table 14L register	TSU_ADRL14	32	H'E8204974	32
	CAM entry table 15L register	TSU_ADRL15	32	H'E820497C	32
	CAM entry table 16L register	TSU_ADRL16	32	H'E8204984	32
	CAM entry table 17L register	TSU_ADRL17	32	H'E820498C	32
	CAM entry table 18L register	TSU_ADRL18	32	H'E8204994	32
	CAM entry table 19L register	TSU_ADRL19	32	H'E820499C	32
	CAM entry table 20L register	TSU_ADRL20	32	H'E82049A4	32
	CAM entry table 21L register	TSU_ADRL21	32	H'E82049AC	32
	CAM entry table 22L register	TSU_ADRL22	32	H'E82049B4	32
	CAM entry table 23L register	TSU_ADRL23	32	H'E82049BC	32
	CAM entry table 24L register	TSU_ADRL24	32	H'E82049C4	32
	CAM entry table 25L register	TSU_ADRL25	32	H'E82049CC	32
	CAM entry table 26L register	TSU_ADRL26	32	H'E82049D4	32
	CAM entry table 27L register	TSU_ADRL27	32	H'E82049DC	32
	CAM entry table 28L register	TSU_ADRL28	32	H'E82049E4	32
	CAM entry table 29L register	TSU_ADRL29	32	H'E82049EC	32

	All registers other than above	Initialized	Initialized	Retained	-	Retained
Debugger interface	Registers in CA9 PMU*7	Initialized	Initialized	Retained	-	Retained
	All registers other than above*8	Retained	Initialized*9	Retained	Retained	Retained

Note 1. Retained on internal power-on reset by the watchdog timer.
Note 2. Flag processing continues.
Note 3. Counting up continues.
Note 4. Transfer can proceed.
Note 5. The value of RTCEN bit is retained.
Note 6. The GAIN0 bit is initialized when the realtime clock is not using the EXTAL pin.
Note 7. Access to these registers from the I/O area (SLV6) is not possible while $\overline{\text{TRST}}$ is asserted.
Note 8. Initialized on assertion of $\overline{\text{TRST}}$.
Note 9. Retained in FAKE debug mode.
Note 10. An internal power-on reset by the watchdog timer does not initialize PM6[0], PMC6[0], PFC6[0], PFCE6[0], and PFCAE6[0].
Note 11. RZ/A1L only
Note 12. RZ/A1LU only

47. Electrical Characteristics

47.1 Absolute Maximum Ratings

Table 47.1 Absolute Maximum Ratings

Item		Symbol	Value	Unit
Power supply voltage (I/O)		PV_{CC}	–0.3 to 4.2	V
Power supply voltage (Internal)		V_{CC}	–0.3 to 1.6	V
PLL power supply voltage		$PLLV_{CC}$	–0.3 to 1.6	V
Analog power supply voltage		AV_{CC}	–0.3 to 4.2	V
Analog reference voltage		AVref	–0.3 to AV_{CC} +0.3	V
USB transceiver analog power supply voltage (I/O)		$USBAPV_{CC}$	–0.3 to 4.2	V
USB transceiver digital power supply voltage (I/O) Note: Products in BGA packages do not have this pin.		$USBDPV_{CC}$	–0.3 to 4.2	V
USB transceiver analog power supply voltage (internal)		$USBAV_{CC}$	–0.3 to 1.6	V
USB transceiver digital power supply voltage (internal) Note: Products in BGA packages do not have this pin.		$USBDV_{CC}$	–0.3 to 1.6	V
Power supply for USB 480 MHz (internal) Note: Products in BGA packages do not have this pin.		$USBUV_{CC}$	–0.3 to 1.6	V
Input voltage	VBUS	V_{in}	–0.3 to 5.5	V
	Other input pins	V_{in}	–0.3- to 3.3-V power supply (PV_{CC}, AV_{CC}, $USBAPV_{CC}$, $USBDPV_{CC}$) +0.3	V
Operating temperature		T_{opr}	–40 to +85	°C
Storage temperature		T_{stg}	–55 to +125	°C

Caution: Permanent damage to the LSI may result if absolute maximum ratings are exceeded.

47.2 Power-On/Power-Off Sequence

The 1.2-V power supply (V_{CC}, PLLVcc, $USBAV_{CC}$, $USBDV_{CC}$, and $USBUV_{CC}$) and 3.3-V power supply (PV_{CC}, AV_{CC}, $USBAPV_{CC}$, and $USBDPV_{CC}$) can be turned on and off in any order.

When turning on the power, be sure to drive both the $\overline{TRST}$ and $\overline{RES}$ pins low; otherwise, the output pins and input/output pins output undefined levels, resulting in system malfunction.

When turning off the power, drive the $\overline{TRST}$ and $\overline{RES}$ pins low if the undefined output may cause a problem.

47.3 DC Characteristics

- Conditions used to obtain DC characteristics (2) in Table 47.2 other than current consumption
  V_{CC} = USBDV_{CC}= USBUV_{CC} = 1.10 to 1.26 V, PV_{CC} = USBDPV_{CC} = 3.0 to 3.6 V, PLLV_{CC} = 1.10 to 1.26 V,
  AV_{CC} = 3.0 to 3.6 V, USBAPV_{CC} = 3.0 to 3.6 V, USBAV_{CC} = 1.10 to 1.26 V,
  V_{SS} = AV_{SS} = USBDV_{SS} = USBAV_{SS} = USBDPV_{SS} = USBAPV_{SS} = USBUV_{SS} = 0 V,
  Ta = –40 to 85 °C

- Conditions used to obtain DC characteristics (2) in Table 47.2 for current consumption
  V_{CC} = USBDV_{CC} = USBUV_{CC} = 1.18 V, PV_{CC} = USBDPV_{CC} = 3.3 V, PLLV_{CC} = 1.18 V, AV_{CC} = 3.3 V,
  USBAPV_{CC} = 3.3 V, USBAV_{CC} = 1.18 V,
  V_{SS} = AV_{SS} = USBDV_{SS} = USBAV_{SS} = USBDPV_{SS} = USBAPV_{SS} = USBUV_{SS} = 0 V, AVref = 3.3 V, VBUS = 5.0 V,
  Ta = –40 to 85 °C
  Iϕ = 400.00 MHz, Bϕ = 133.33 MHz, P1ϕ = 66.67 MHz, P0ϕ = 33.33 MHz

Note: Products in BGA packages do not have USBDV_{CC}, USBUV_{CC}, USBDPV_{CC}, USBDV_{SS}, USBAV_{SS}, USBDPV_{SS}, USBAPV_{SS}, and USBUV_{SS} pins.

Table 47.2 DC Characteristics (1) [Common Items]

Item		Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Power supply voltage		PV_{CC}	3.0	3.3	3.6	V	
		V_{CC}	1.10	1.18	1.26	V	
PLL power supply voltage		PLLV_{CC}	1.10	1.18	1.26	V	
Analog power supply voltage		AV_{CC}	3.0	3.3	3.6	V	
USB power supply voltage Note: Products in BGA packages do not have USBDPVcc, USBDVcc, and USBUVcc pins.		USBAPV_{CC} USBDPV_{CC}	3.0	3.3	3.6	V	
		USBAV_{CC} USBDV_{CC} USBUV_{CC}	1.10	1.18	1.26	V	
Input leakage current	All input pins	$\|I_{in}\|$	—	—	1.0	µA	V_{in} = 0.5 to PV_{CC} – 0.5 V
Three-state leakage current	All input/output pins, all output pins (except P1_0 to P7_0) (off state)	$\|I_{STI}\|$	—	—	1.0	µA	V_{in} = 0.5 to PV_{CC} – 0.5 V
	P1_0 to P7_0		—	—	10	µA	
Input capacitance	all input/output pins, all input pins	Cin	—	—	10	pF	

Table 47.2 DC Characteristics (2) [Current Consumption]

Item		Power Supply	Symbol	Typ.	Max.	Unit	Test Conditions
Current consumption in normal operation		V_{CC}	I_{CC}	384	492	mA	
		$PLLV_{CC}$	$PLLI_{CC}$	6.4	8	mA	
		PV_{CC}	PI_{CC}	70*1*2	—	mA	
		AV_{CC}	AI_{CC}	2.7	4	mA	During A/D conversion
		AVref	AIref	0.6	1	mA	During A/D conversion
		$USBAV_{CC}$	UAI_{CC}	5	6	mA	When the USB host/function is in use.
		$USBDV_{CC}$ + $USBUV_{CC}$	UDI_{CC}*3	17	20	mA	In USB high-speed operation (2ch)
		$USBAPV_{CC}$	$UAPI_{CC}$	3.3	4	mA	When the USB host/function is in use.
		$USBDPV_{CC}$	$UDPI_{CC}$*4	70*1*2	—	mA	In USB high-speed operation (2ch)
		VBUS	VI_{CC}	8	10	µA	
Current consumption in sleep mode		V_{CC}	Isleep	175	300	mA	
		For the other power supply, the current consumption is the same as in normal operation.					
Current consumption in software standby mode	Ta > 50 °C	V_{CC} + $PLLV_{CC}$ + $USBAV_{CC}$ + $USBDV_{CC}$ + $USBUV_{CC}$	Isstby	32	120	mA	
		PV_{CC} + AV_{CC} + AVref + $USBAPV_{CC}$ + $USBDPV_{CC}$	PIsstby	20	26	µA	
		VBUS	VIsstby	8	10	µA	
	Ta ≤ 50 °C	V_{CC} + $PLLV_{CC}$ + $USBAV_{CC}$ + $USBDV_{CC}$ + $USBUV_{CC}$	Isstby	13	55	mA	
		PV_{CC} + AV_{CC} + AVref + $USBAPV_{CC}$ + $USBDPV_{CC}$	PIsstby	17	20	µA	
		VBUS	VIsstby	8	10	µA	

Table 47.2 DC Characteristics (2) [Current Consumption]

Item		Power Supply	Symbol	Typ.	Max.	Unit	Test Conditions
Current consumption in deep standby mode	Ta > 50 °C	V_{CC} + $PLLV_{CC}$ + $USBAV_{CC}$ + $USBDV_{CC}$ + $USBUV_{CC}$	Idstby	27	119	µA	RAM 0 Kbytes retained, RTC_X1 selected
				32	137	µA	RAM 16 Kbytes retained, RTC_X1 selected
				37	155	µA	RAM 32 Kbytes retained, RTC_X1 selected
				42	191	µA	RAM 64 Kbytes retained, RTC_X1 selected
				62	263	µA	RAM 128 Kbytes retained, RTC_X1 selected
				When the EXTAL 13 MHz is selected, 5 µA and 7 µA are added to the "Typ." and "Max." values above, respectively.			
		PV_{CC} + AV_{CC} + AVref + $USBAPV_{CC}$ + $USBDPV_{CC}$	PIdstby	13	15	µA	RTC is not operating
				20	25	µA	RTC_X1 selected
				1	—	mA	EXTAL 13 MHz selected, small gain*1
		VBUS	VIdstby	8	10	µA	
	Ta ≤ 50 °C	V_{CC} + $PLLV_{CC}$ + $USBAV_{CC}$ + $USBDV_{CC}$+ $USBUV_{CC}$	Idstby	17	54	µA	RAM 0 Kbytes retained, RTC_X1 selected
				21	71	µA	RAM 16 Kbytes retained, RTC_X1 selected
				25	88	µA	RAM 32 Kbytes retained, RTC_X1 selected
				33	122	µA	RAM 64 Kbytes retained, RTC_X1 selected
				49	190	µA	RAM 128 Kbytes retained, RTC_X1 selected
				When the EXTAL 13 MHz is selected, 5 µA and 7 µA are added to the "Typ." and "Max." values above, respectively.			
		PV_{CC} + AV_{CC} + AVref + $USBAPV_{CC}$ + $USBDPV_{CC}$	PIdstby	12	13	µA	RTC is not operating
				19	23	µA	RTC_X1 selected
				1	—	mA	EXTAL 13 MHz selected, small gain*1
		VBUS	VIdstby	8	10	µA	

Note 1. Reference value. The actual operating current greatly depends on the system (such as slow rising/falling edges caused by IO load and toggle frequency). Be sure to determine the value using the actual system.
Note 2. The sum of PIcc and UDPIcc must be equal to or lower than 150 mA.
Note 3. In the products in BGA packages, UDIcc is added to Icc.
Note 4. In the products in BGA packages, UDPIcc is added to PIcc.

Table 47.2 DC Characteristics (3) [Except I²C Bus Interface, and USB 2.0 Host/Function Module-Related Pins]

Item		Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Input high voltage*		V_{IH}	2.2	—	PV_{CC} + 0.3	V	
Input low voltage*		V_{IL}	–0.3	—	0.8	V	
Schmitt trigger input characteristics		VT^+	$PV_{CC} \times 0.665$	—	—	V	
		VT^-	—	—	0.8	V	
		$VT^+ – VT^-$	0.2	—	—	V	
Output high voltage		V_{OH}	PV_{CC} – 0.5	—	—	V	I_{OH} = –2.0 mA
Output low voltage		V_{OL}	—	—	0.4	V	I_{OL} = 2.0 mA
RAM standby voltage	Software standby mode (large-capacity on-chip RAM)	V_{RAMS}	0.85	—	—	V	Measured with V_{CC} as parameter
	Deep standby mode (only the on-chip RAM for data retention)	V_{RAMD}	1.10	—	—	V	

Note: * Values for the input of data for boundary scanning through pins TMS, TCK, JP0_0, JP0_1, P5_0 to P5_15, and P6_0 to P6_15.

Table 47.2 DC Characteristics (4) [I²C Bus Interface Related Pins*]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Input high voltage	V_{IH}	$PV_{CC} \times 0.7$	—	PV_{CC} + 0.3	V	
Input low voltage	V_{IL}	–0.3	—	$PV_{CC} \times 0.3$	V	
Schmitt trigger input characteristics	$V_{IH} – V_{IL}$	$PV_{CC} \times 0.05$	—	—	V	
Output low voltage	V_{OL}	—	—	0.4	V	I_{OL} = 3.0 mA

Note: * The P1_0 to P7_0 pins are open-drain pins.

Table 47.2 DC Characteristics (5) [USB 2.0 Host/Function Module-Related Pins*]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Reference resistance	R_{REF}	5.6 kΩ ± 1%	5.6 kΩ ± 1%	5.6 kΩ ± 1%		
Input high voltage (VBUS1, VBUS0)	V_{IH}	4.02	—	5.25	V	
Input low voltage (VBUS1, VBUS0)	V_{IL}	–0.3	—	0.5	V	
Input high voltage (USB_X1)	V_{IH}	PV_{CC} – 0.5	—	PV_{CC} + 0.3	V	
Input low voltage (USB_X1)	V_{IL}	–0.3	—	0.5	V	

Note: * REFRIN, VBUS1, VBUS0, USB_X1, and USB_X2 pins

Table 47.2 DC Characteristics (6) [USB 2.0 Host/Function Module-Related Pins* (Low-Speed, Full-Speed, and High-Speed Common Items)]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
DP pull-up resistance (when function is selected)	R_{pu}	0.900	—	1.575	kΩ	In idle mode
		1.425	—	3.090	kΩ	In transmit/receive mode
DP and DM pull-down resistance (when host is selected)	R_{pd}	14.25	—	24.80	kΩ	

Note: * DP1, DP0, DM1, and DM pins

Table 47.2 DC Characteristics (7) [USB 2.0 Host/Function Module-Related Pins* (Low-Speed and Full-Speed)]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Input high voltage	V_{IH}	2.0	—	—	V	
Input low voltage	V_{IL}	—	—	0.8	V	
Differential input sensitivity	V_{DI}	0.2	—	—	V	| (DP) – (DM) |
Differential common mode range	V_{CM}	0.8	—	2.5	V	
Output high voltage	V_{OH}	2.8	—	3.6	V	I_{OH} = –200 µA
Output low voltage	V_{OL}	0.0	—	0.3	V	I_{OL} = 2 mA
Output signal crossover voltage	V_{CRS}	1.3	—	2.0	V	C_L = 50 pF (full-speed) C_L = 200 to 600 pF (low-speed)

Note: * DP1, DP0, DM1, and DM pins

Table 47.2 DC Characteristics (8) [USB 2.0 Host/Function Module-Related Pins* (High-Speed)]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Squelch detection threshold voltage (differential voltage)	V_{HSSQ}	100	—	150	mV	
Common mode voltage range	V_{HSCM}	–50	—	500	mV	
Idle state	V_{HSOI}	–10.0	—	10.0	mV	
Output high voltage	V_{HSOH}	360	—	440	mV	
Output low voltage	V_{HSOL}	–10.0	—	10.0	mV	
Chirp J output voltage (difference)	V_{CHIRPJ}	700	—	1100	mV	
Chirp K output voltage (difference)	V_{CHIRPK}	–900	—	–500	mV	

Note: * DP1, DP0, DM1, and DM pins

Table 47.3 Permissible Output Currents

Item		Symbol	Min.	Typ.	Max.	Unit
Permissible output low current (per pin)	P1_0 to P1_7	I_{OL}	—	—	10	mA
	Output pins other than above		—		2	mA
Permissible output high current (per pin)		$-I_{OH}$	—	—	2	mA
Permissible output current (total)		ΣI_O	—	—	150	mA

Caution: To protect the LSI's reliability, do not exceed the output current values in Table 47.3.

47.4 AC Characteristics

Signals input to this LSI are basically handled as signals in synchronization with a clock. The setup and hold times for input pins must be followed.

Conditions for AC characteristics: V_{CC} = $USBDV_{CC}$ = $USBUV_{CC}$ = 1.10 to 1.26 V, PV_{CC} = $USBDPV_{CC}$ = 3.0 to 3.6 V, $PLLV_{CC}$ = 1.10 to 1.26 V, AV_{CC} = 3.0 to 3.6 V, $USBAPV_{CC}$ = 3.0 to 3.6 V, $USBAV_{CC}$ = 1.10 to 1.26 V, V_{SS} = AV_{SS} = $USBDV_{SS}$ = $USBAV_{SS}$ = $USBDPV_{SS}$ = $USBAPV_{SS}$ = $USBUV_{SS}$ = 0 V, Ta = –40 to 85 °C

Note: Products in BGA packages do not have $USBDV_{CC}$, $USBUV_{CC}$, $USBDPV_{CC}$, $USBDV_{SS}$, $USBAV_{SS}$, $USBDPV_{SS}$, $USBAPV_{SS}$, and $USBUV_{SS}$ pins.

Table 47.4 Operating Frequency

Item		Symbol	Min.	Max.	Unit	Remarks
Operating frequency	CPU clock (Iϕ)	f	100.00	400.00	MHz	
	Internal bus clock (Bϕ)		100.00	133.33	MHz	
	Peripheral clock 1 (P1ϕ)		50.00	66.67	MHz	
	Peripheral clock 0 (P0ϕ)		25.00	33.33	MHz	

47.4.1 Clock Timing

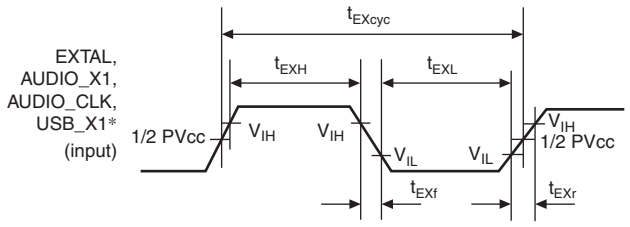
Table 47.5 Clock Timing

Item	Symbol	Min.	Max.	Unit	Figure
EXTAL clock input frequency (when the clock is supplied to USB 2.0 host/function module)	f_{EX}	12MHz ± 100ppm			Figure 47.1
EXTAL clock input frequency (when the clock isn't supplied to USB 2.0 host/function module)		10.00	13.33	MHz	
EXTAL clock input cycle time (when the clock isn't supplied to USB 2.0 host/function module)	t_{EXcyc}	75.00	100.00	ns	
AUDIO_X1 clock input frequency (crystal resonator connected)	f_{EX}	10.00	50.00	MHz	
AUDIO_X1 clock input cycle time (crystal resonator connected)	t_{EXcyc}	20.00	100.00	ns	
AUDIO_X1, AUDIO_CLK clock input frequency (external clock input)	f_{EX}	1.00	50.00	MHz	
AUDIO_X1, AUDIO_CLK clock input cycle time (external clock input)	t_{EXcyc}	20.00	1000.00	ns	
USB_X1 clock input frequency (when the 48-MHz clock is supplied to USB 2.0 host/function module and high-speed transfer function is used)	f_{EX}	48 MHz ±100 ppm			
USB_X1 clock input frequency (when the 48-MHz clock is supplied to USB 2.0 host/function module, high-speed transfer function is not used, and host controller function is used)		48 MHz ±500 ppm			
USB_X1 clock input frequency (when the 48-MHz clock is supplied to USB 2.0 host/function module, high-speed transfer function is not used, and host controller function is not used)		48 MHz ±2500 ppm			
EXTAL, AUDIO_X1, AUDIO_CLK, USB_X1 clock input low pulse width	t_{EXL}	0.4	0.6	t_{EXcyc}	
EXTAL, AUDIO_X1, AUDIO_CLK, USB_X1 clock input high pulse width	t_{EXH}	0.4	0.6	t_{EXcyc}	

Table 47.5 Clock Timing

Item	Symbol	Min.	Max.	Unit	Figure
EXTAL, AUDIO_X1, AUDIO_CLK, USB_ X1 clock input rise time	t_{EXr}	—	4	ns	Figure 47.1
EXTAL, AUDIO_X1, AUDIO_CLK, USB_ X1 clock input fall time	t_{EXf}	—	4	ns	
CKIO clock output frequency	f_{OP}	50.00	66.67	MHz	
CKIO clock output cycle time	t_{cyc}	15.00	20.00	ns	Figure 47.2 (1) and Figure 47.2 (2)
CKIO clock output low pulse width 1	t_{CKOL1}	$t_{cyc}/2 - t_{CKOr1}$	—	ns	Figure 47.2 (1)
CKIO clock output high pulse width 1	t_{CKOH1}	$t_{cyc}/2 - t_{CKOr1}$	—	ns	
CKIO clock output rise time 1	t_{CKOr1}	—	3	ns	
CKIO clock output fall time 1	t_{CKOf1}	—	3	ns	
CKIO clock output low pulse width 2	t_{CKOL2}	$t_{cyc}/2 - t_{CKOr2}$	—	ns	Figure 47.2 (2)
CKIO clock output high pulse width 2	t_{CKOH2}	$t_{cyc}/2 - t_{CKOr2}$	—	ns	
CKIO clock output rise time 2	t_{CKOr2}	—	2	ns	
CKIO clock output fall time 2	t_{CKOf2}	—	2	ns	
On-chip PLL circuit oscillation settling time	t_{POSC}	1	—	ms	Figure 47.3 and Figure 47.5 (1)
On-chip oscillation circuit oscillation settling time (RTC_X1)	t_{ROSC}	—	3*	s	Figure 47.6
On-chip oscillation circuit oscillation settling time (other than above)		—	4*	ms	Figure 47.3, Figure 47.5 (1), and Figure 47.6
Mode hold time	t_{MDH}	200	—	ns	Figure 47.3 and Figure 47.5 (1)
SSCG stabilizing time	t_{SSCG}	1	—	us	Figure 47.4

Note: * Settings for values smaller than the above specifications may be possible, as long as the values are confirmed through evaluation by the manufacturer of the oscillator.



Note: * When the clock is input on the EXTAL, AUDIO_X1, AUDIO_CLK, or USB_X1

47.4.11 I²C Bus Interface Timing

Table 47.15 I²C Bus Interface Timing

Item	Symbol	I/O	Standard mode (Sm) Min.	Standard mode (Sm) Max.	Fast mode (Fm) Min.	Fast mode (Fm) Max.	Unit
SCL clock frequency	f_{CLK}	I/O	0	100	0	400	kHz
Bus free time (between stop and start condition)	t_{BUF}	I/O	4.7	-	1.3	-	µs
Hold time*1	$t_{HD:STA}$	I/O	4.0	-	0.6	-	µs
Low period of SCL clock	t_{LOW}	I/O	4.7	-	1.3	-	µs
High period of SCL clock	t_{HIGH}	I/O	4.0	-	0.6	-	µs
Setup time for start/restart condition	$t_{SU:STA}$	I/O	4.7	-	0.6	-	µs
Data hold time (I²C bus device)	$t_{HD:DAT}$	I/O	0*2	-	0*2	-	µs
Data setup time	$t_{SU:DAT}$	I/O	250	-	100*3	-	ns
SDA and SCL signal rise time	t_R	Input	-	1000	20	300	ns
SDA and SCL signal fall time*3	t_F	Input	-	300	20 × (PV_{CC}/5.5V)	300	ns
		Output	-	250	20 × (PV_{CC}/5.5V)	250	ns
Setup time for STOP condition	$t_{SU:STO}$	I/O	4.0	-	0.6	-	µs
Capacitive load for each bus line	C_b	-	-	400*4	-	400*4	pF
Pulse width of spikes that must be suppressed by the input filter	t_{SP}	Input	-	-	0	50*5	ns

In the above table and subsequently, SCL and SDA refer to the RIICnSCL and RIICnSDA signals, respectively.

Note 1. The first clock pulse is generated on the SCL line after the start condition has been issued and the hold time has elapsed.

Note 2. This module requires a minimum of 300 ns hold time internally for the SDA signal to handle the period over which the falling edge of SCL has not reached a defined level (time until the SCL signal reaches V_{IL} (max.) from V_{IH} (min.)).

Note 3. The fast-mode I²C bus device can be used in the standard mode I²C bus system. In this case, the minimum value of the data setup time ($t_{SU:DAT}$ 250 [ns]) must be satisfied.
If the system does not extend the low period of SCL clock (t_{LOW}), this condition is automatically satisfied. If the system extends the low period of SCL clock (t_{LOW}), transmit the subsequent data bit to the SDA line before the SCL line is released ($t_R$max. + $t_{SU:DAT}$ = 1000 + 250 = 1250 [ns]: (standard mode I²C bus specification)).

Note 4. Total capacitance of one bus line. The allowable maximum bus capacitance may differ from this specification, depending on the actual operating voltage and frequency of an application. For techniques to cope with a large bus capacitance, see the I²C bus specification provided by NXP Semiconductors.

Note 5. Noise is removed by the analog and digital input filters. The level of noise reduction of the digital input filter is determined by the period of internal reference clock (IICφ) and the NF[1:0] bits in RIICnMR3. For details, refer to section 18, I²C Bus Interface.

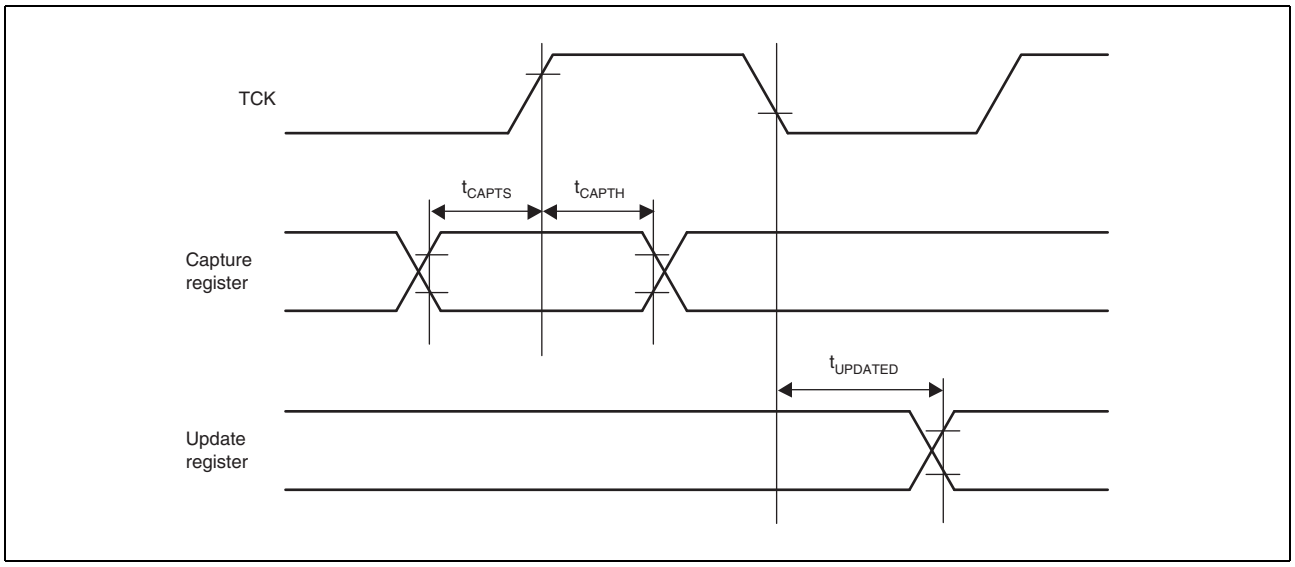

Figure 47.84 Boundary Scan Input/Output I/O Timing

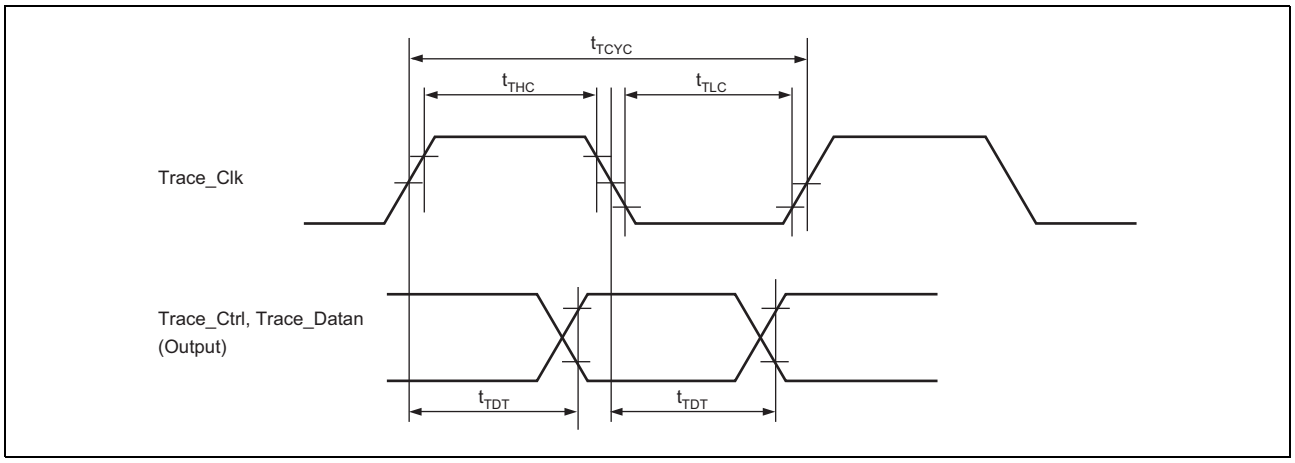

Figure 47.85 Trace Interface Timing

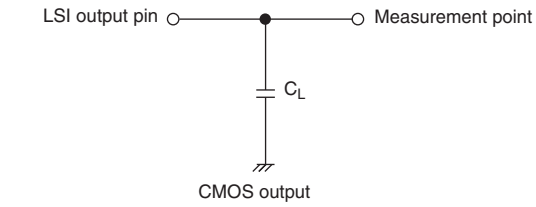
47.4.24 AC Characteristics Measurement Conditions

- I/O signal reference level: $PV_{CC}/2$, the minimum values of V_{IH}, V_{T+}, and V_{OH}, and the maximum values of V_{IL}, V_{T-}, and V_{OL} (refer to the individual timing chart)
- Input pulse level: PV_{CC}
- Input rise and fall times: 1 ns



Note: C_L is the total value that includes the capacitance of measurement tools.
C_L = 30 pF

Figure 47.86 Output Load Circuit

47.5 A/D Converter Characteristics

Conditions: V_{CC} = $USBDV_{CC}$ = $USBUV_{CC}$ = 1.10 to 1.26 V, PV_{CC} = $USBDPV_{CC}$ = 3.0 to 3.6 V,
$PLLV_{CC}$ = 1.10 to 1.26 V, AV_{CC} = 3.0 to 3.6 V, $USBAPV_{CC}$ = 3.0 to 3.6 V, $USBAV_{CC}$ = 1.10 to 1.26 V,
V_{SS} = AV_{SS} = $USBDV_{SS}$ = $USBAV_{SS}$ = $USBDPV_{SS}$ = $USBAPV_{SS}$ = $USBUV_{SS}$ = 0 V,
Ta = –40 to 85 °C

Note: Products in BGA packages do not have $USBDV_{CC}$, $USBUV_{CC}$, $USBDPV_{CC}$, $USBDV_{SS}$, $USBAV_{SS}$, $USBDPV_{SS}$, $USBAPV_{SS}$, and $USBUV_{SS}$ pins.

Table 47.30 A/D Converter Characteristics

Item		Min.	Typ.	Max.	Unit
Resolution		12	12	12	bits
Conversion time	12-bit	5	—	—	µs
	10-bit				
Analog input capacitance		—	—	20	pF
Permissible signal-source impedance		—	—	3	kΩ
DNL	12-bit	—	—	±1.0	LSB
	10-bit	—	—	±1.0	LSB
INL	12-bit	—	—	±4.0	LSB
	10-bit	—	—	±4.0	LSB
Offset error	12-bit	—	—	±8.0	LSB
	10-bit	—	—	±2.0	LSB
Full-scale error	12-bit	—	—	±8.0	LSB
	10-bit	—	—	±2.0	LSB
Absolute accuracy	12-bit	—	—	±11.0	LSB
	10-bit	—	—	±5.0	LSB

48. States and Handling of Pins

This section describes pin states in each operating mode and how to handle pins.

48.1 Pin States

Table 48.1 shows the pin states in each operating mode.

As for the input/output functions, input buffers are listed on the upper column and output buffers on the lower column.

Table 48.1 Pin States

Pin Function				Pin State					
				Normal State (Other than States at Right)	Power-On Reset*1	Pin State Retained*2			Power-Down State
						EBUSKEEPE*3(Other than States at Right)		Power-On Reset*4	Deep Standby Mode	Software Standby Mode
Type	Pin Name					0	1			
Clock	EXTAL*6			I	I	I			I/Z*5	I
	XTAL*6			O	O	O			O/Z*5	O/Z*5
	CKIO	Boot mode	0, 1	O/Z*7	O	O	O/Z*7		O/Z*7	O/Z*7
			Other than above	O/Z*7	O	O/Z*7			O/Z*7	O/Z*7

[Legend]
I: Input
O: Output
H: High-level output
L: Low-level output
Z: High-impedance
-: Condition under which the pin function is not selectable

Note 1. Indicates the power-on reset by low-level input to the $\overline{\text{RES}}$ pin. The pin states after a power-on reset by the watchdog timer overflow is the same as the initial pin states at normal operation (see section 41, Ports).
Note 2. After the chip has been released from deep standby mode by the input on pins for canceling the standby mode such as NMI or by the realtime clock alarm interrupt, the pins retain the state until the IOKEEP bit in the deep standby cancel source flag register (DSFR) is cleared (see section 42, Power-Down Modes).
Note 3. The EBUSKEEPE bit in deep standby control register (DSTCR) (see section 42, Power-Down Modes).
Note 4. This LSI enters the power-on reset state for a certain period after recovery from deep standby control mode (see section 42, Power-Down Modes).
Note 5. Depends on the setting of the RCKSEL bit in the realtime clock control register 5 (RCR5) (see section 13, Realtime Clock).
Note 6. When pins for the connection with a crystal resonator are not used, the input pins (EXTAL, RTC_X1, AUDIO_X1, and USB_X1) must be fixed (pull-up/down resistor, power supply, or ground.) and the output pins (XTAL, RTC_X2, AUDIO_X2, and USB_X2) must be open.
Note 7. Depends on the setting of the CKOEN bit in the frequency control register (FRQCR) of the clock pulse generator (see section 6, Clock Pulse Generator).
Note 8. Depends on the setting of the PIPCnm bit in the port IP control register (PIPCn) of the general I/O ports.
Note 9. Depends on the setting of the HIZ bit in the standby control register 2 (STBCR2) (see section 42, Power-Down Modes).
Note 10. Depends on the setting of the HIZMEM bit in the common control register (CMNCR) of the bus state controller (see section 8, Bus State Controller).
Note 11. Depends on the setting of the HIZCNT bit in the common control register (CMNCR) of the bus state controller (see section 8, Bus State Controller).
Note 12. Depends on the setting of the corresponding bit in the deep standby cancel source select register (DSSSR) and the RCKSEL bit in the realtime clock control register 5 (RCR5) (see section 42, Power-Down Modes).
Note 13. Depends on the setting of the RTCEN bit in the realtime clock control register 2 (RCR2) and the RCKSEL bit in the realtime clock control register 5 (RCR5) (see section 13, Realtime Clock).
Note 14. O in serial wire debug (SWD) mode. In modes other than serial wire debug (SWD), Z when the TAP controller is neither the Shift-DR nor Shift-IR state.
Note 15. When this is an output, the output is fixed to either the High or Low level. There is no oscillation.
Note 16. RZ/A1L only
Note 17. RZ/A1LU only

48.2 Treatment of Unused Pins

How unused pins are to be handled is indicated below.

Table 48.2 Handling of Unused Pins (Except for Debugger Interface Pins)

Pin Name	Handling
NMI	Fix this pin at a high level (pull up or connect to a power supply).
DP1, DP0, DM1, DM0, VBUS1, VBUS0	- Connect these pins to USBDPVss (QFP package). - Connect them to Vss (BGA package).
REFRIN	Connect this pin, via a 5.6 kΩ ± 20 % resistor, to USBAPVcc.
1.18-V power dedicated to the USB (USBAVcc, USBDVcc, USBUVcc)	Supply power at 1.18 V. Note: Products in BGA packages do not have pins USBDVcc and USBUVcc.
3.3-V power dedicated to the USB (USBAPVcc, USBDPVcc)	Supply power at 3.3 V. Note: Products in BGA packages do not have the USBDPVcc pin.
Dedicated USB ground (USBAPVss, USBDPVss, USBAVss, USBDVss, USBUVss)	Connect to ground. Note: Products in BGA packages do not have the dedicated USB ground pins.
AVref	Connect this pin to AVcc.
Dedicated A/D power (AVcc)	Supply power at 3.3 V.
Dedicated A/D ground (AVss)	Connect to ground.
Dedicated input pins other than those listed above	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level)*2.
Input/output pins other than those listed above	Make the input-pin settings and then fix the level (pull them up or down)*2; alternatively, make the output-pin settings and leave the pins open-circuit.
Dedicated output pins	Open-circuit

Note 1. We recommend that the values of pull-up or pull-down resistors are in the range from 4.7 kΩ to 100 kΩ.
Note 2. By setting the ports in accord with section 41, Ports, setting of a fixed level can be made unnecessary for some pins. For details, see section 41.3.12, Port Input Buffer Control Register (PIBCn/JPIBC0).

Table 48.3 Handling of Debugger Interface Pins (when Emulator is not Used)

Pin	Handling
BSCANP	Fix this pin at a low level (pull down or connect to the ground level).
$\overline{\text{TRST}}$*3	Fix this pin at a low level (pull down or connect to the ground level). Or connect to another pin which operates in the same manner as the $\overline{\text{RES}}$ pin
TCK, TMS, TDI	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level).
TDO	Open-circuit

Note 1. When using the emulator, handle these pins as described in the manual for the emulator.
Note 2. We recommend that the values of pull-up or pull-down resistors are in the range from 4.7 kΩ to 100 kΩ.
Note 3. If the pin is not fixed to the low level, whether an emulator is or is not in use, the specifications in Table 43.12, Reset Signal Setting, or $\overline{\text{RES}}$ input rise time (t_{RSr}) or $\overline{\text{RES}}$ negating hold time (t_{RSNH}) in Table 47.6, Control Signal Timing, must be satisfied.

48.3 Handling of Pins in Deep Standby Mode

How pins are to be handled in deep standby mode is indicated below.
For the states of pins in deep standby mode, refer to the corresponding items under section 48.1, Pin States. Handling of unused pins as described under section 48.2, Treatment of Unused Pins, also applies in deep standby mode.

Table 48.4 Handling of Pins in Deep Standby Mode

Pin	Handling
1.2-V power (Vcc, USBDVcc, USBUVcc, USBAVcc, PLLVcc)	Supply power at 1.2 V. Note: Products in BGA packages do not have pins USBDVcc and USBUVcc.
3.3-V power (PVcc, AVcc, USBDPVcc, USBAPVcc)	Supply power at 3.3 V. Note: Products in BGA packages do not have the USBDPVcc pin.
Ground (Vss, USBDVss, USBUVss, USBAVss, AVss USBDPVss, USBAPVss)	Connect to ground. Note: Products in BGA packages do not have the USBDVss, USBAVss, USBUVss, USBDPVss, and USBAPVss pins.
VBUS1, VBUS0	Fix the level on this pin (pull it up or down, or connect it to the power supply or ground level) or open circuit. However, note that current as indicated in table 45.2, DC Characteristics (2) [Current Consumption] will be drawn by the pin fixed to the high level.
REFRIN	Connect this pin to USBAPVss via 5.6 kΩ ± 1 % resistor (QFP package). Connect this pin to Vss via 5.6 kΩ ± 1% resistor (BGA package).
DP1, DP0, DM1, DM0	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level) or open circuit.
EXTAL, RTC_X1, AUDIO_X1, USB_X1	Connect the pins to the crystal oscillator or the clock-input signal, or to a fixed level (pull them up or down, or connect them to the power supply or ground level)
XTAL, RTC_X2, AUDIO_X2, USB_X2	Connect the pins to the crystal oscillator or open circuit.
Dedicated input pins other than those listed above	Fix the level on the pins (pull them up or down, or connect them to the power supply or ground level).
Input/output pins (other than those listed above) in the input state	Fix the level on the pins (pull them up or down).
Input/output pins (other than those listed above) in the high-impedance state	Fix the level on the pins (pull them up or down) or open circuit.
Input/output pins (other than those listed above) in the output state	Open-circuit
Dedicated output pins other than those listed above	Open-circuit

Note: We recommend that the values of pull-up or pull-down resistors are in the range from 4.7 kΩ to 100 kΩ.

48.4 Recommended Combination of Bypass Capacitor

Mount a multilayer ceramic capacitor between a pair of the power supply pins as a bypass capacitor. These capacitors must be placed as close as the power supply pins of the LSI. The capacitance of the capacitors should be used 0.1 µF to 0.33 µF (recommended values). For details of the capacitor related to the crystal resonator, see section 6, Clock Pulse Generator.

Figure 48.1 and Figure 48.2 are examples of the externally allocated capacitor in the products in 208-pin and 176-pin QFP packages, respectively.

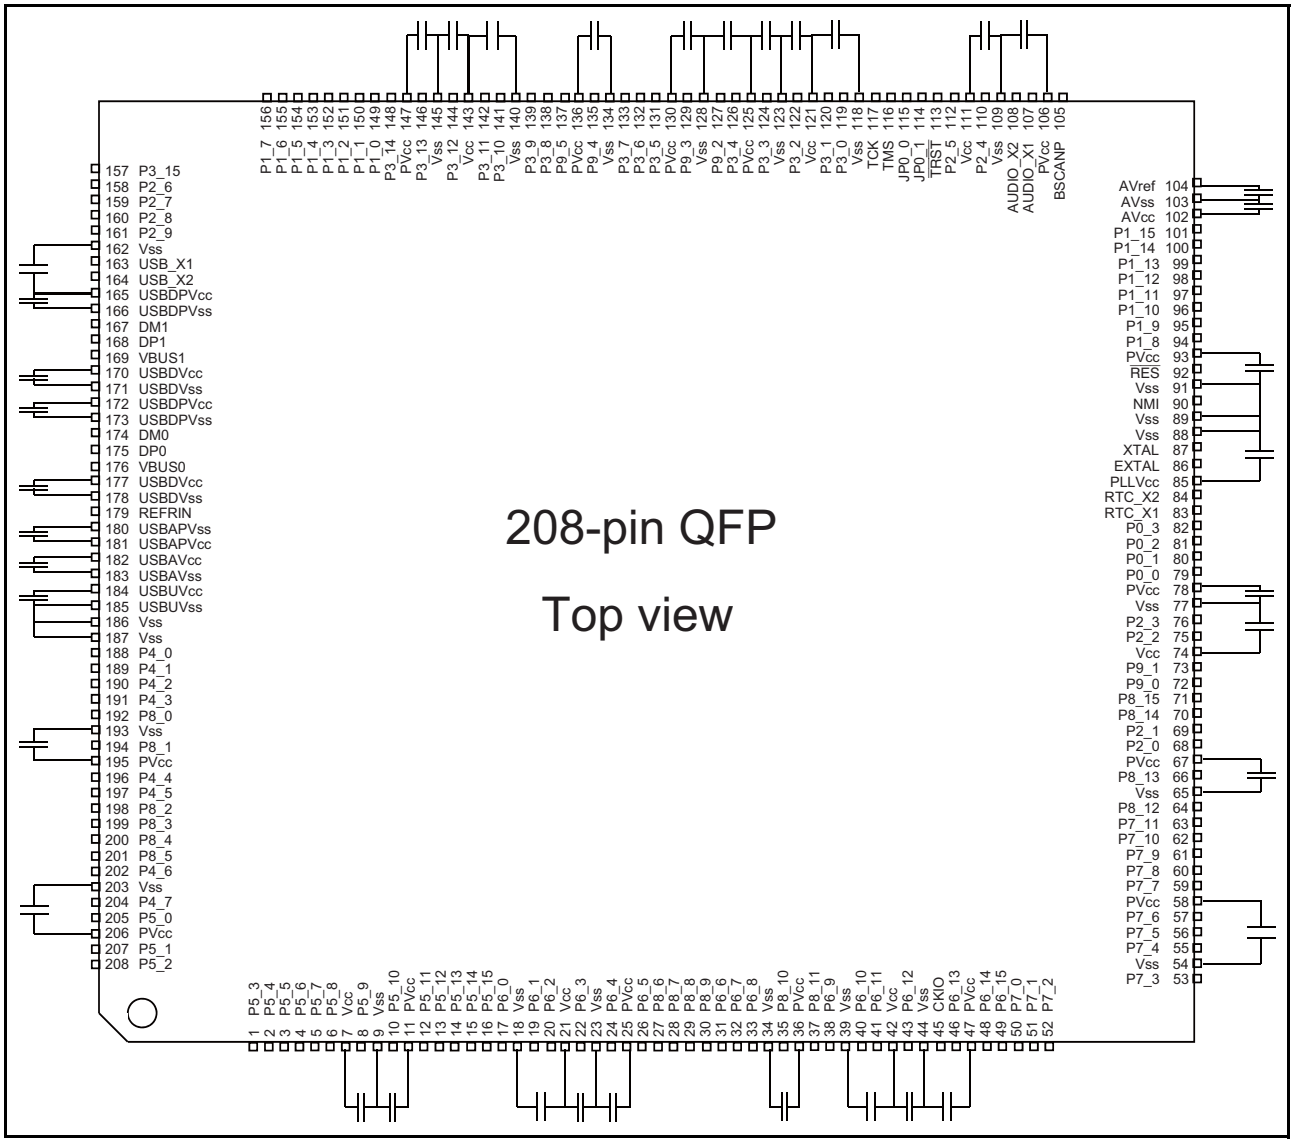

Figure 48.1 Example of Externally Allocated Capacitors in the Products in 208-Pin QFP Packages

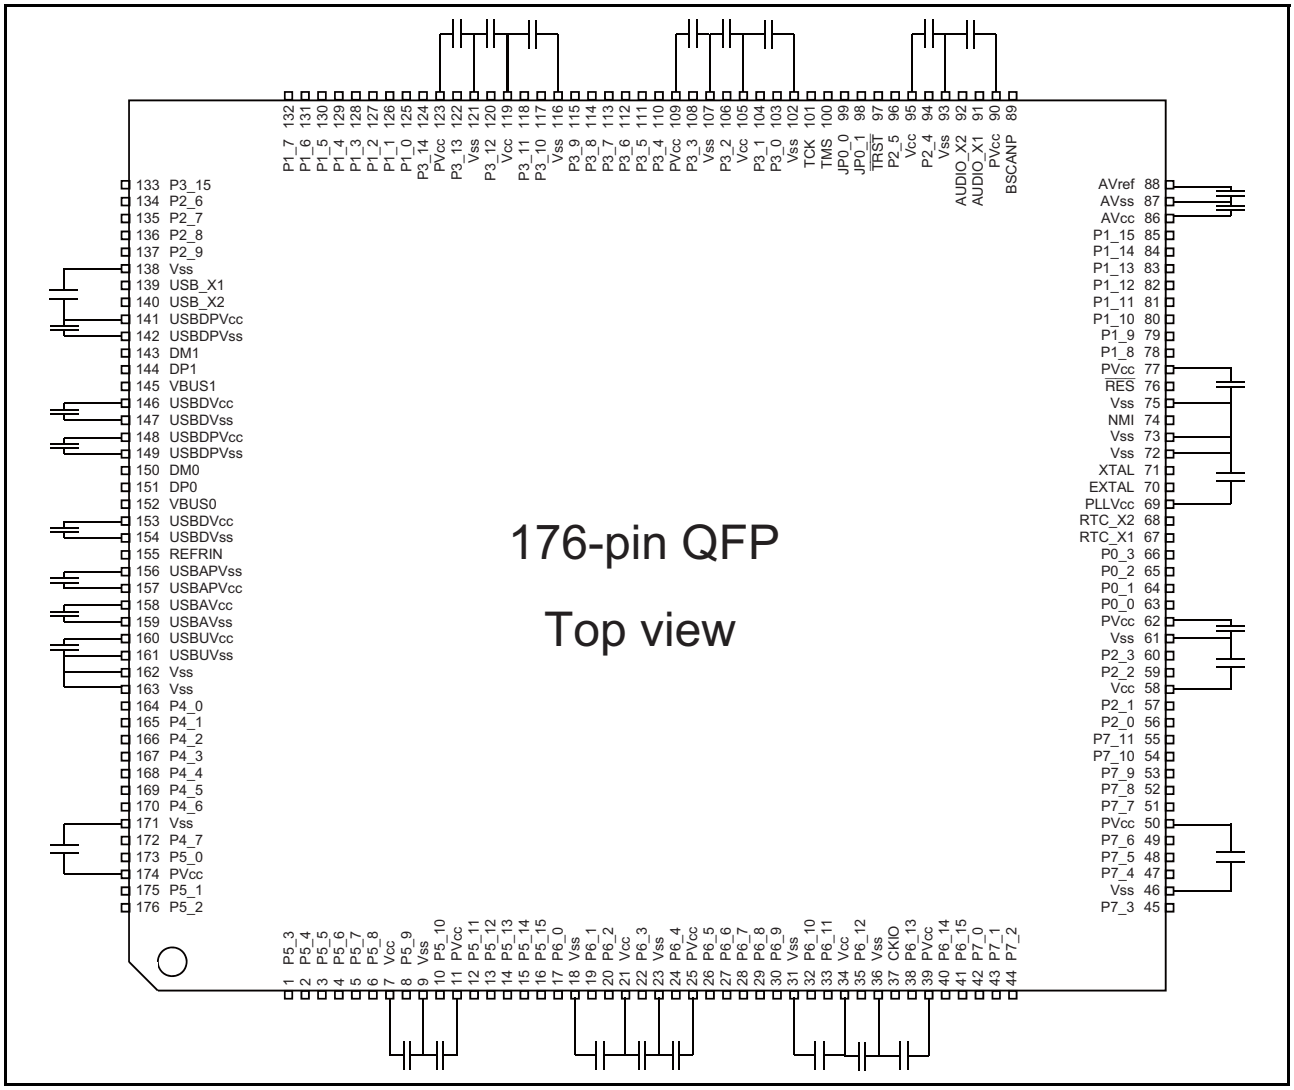

Figure 48.2 Example of Externally Allocated Capacitors in the Products in 176-Pin QFP Packages

Revision History

RZ/A1L Group, RZ/A1LU Group, RZ/A1LC Group User's Manual: Hardware

Rev.	Date	Description	
		Page	Summary
1.00	Aug 30, 2013	—	First edition, issued
2.00	May 25, 2015	All	Erroneous pin names, register names, and bit names corrected
		1. Overview	
		1-2 to 1-6	Table 1.1 RZ/A1L Features: Specification of CPU, IEBus™ controller, and capture engine unit corrected
		1-9	Figure 1.1 Pin Assignment of the 176-pin BGA (Upper Perspective View) corrected
		1-10	Figure 1.2 Pin Assignment of the 176-pin QFP (Top View) corrected
		1-11	Figure 1.3 Pin Assignment of the 208-pin QFP (Top View) corrected
		1-14, 1-16, 1-17	Table 1.3 Pin Functions: Note added to TIOC0A, TIOC0B, TIOC0C, and TIOC0D, function of TIOC4A, TIOC4B, TIOC4C, and TIOC4D corrected, function of REFRIN corrected, function of A/D converter corrected, and name of the symbol of general I/O port corrected
		1-18, 1-19, 1-21	Table 1.4 List of Pins: I/O of D31 to D0 corrected (I/O corrected to I(s)/O), I/O of $\overline{\text{WAIT}}$ corrected (O corrected to I(s)), symbol of Port function/dedicated function corrected (VBUSIN1 corrected to VBUS1, VBUSIN0 corrected to VBUS0)
		1-22	Figure 1.4 (2) Simplified Circuit Diagram (TTL AND Input Buffer) corrected
		2. CPU	
		2-1	2.1 Features: Note 2 added
		4. Secondary Cache	
		4-1	Table 4.1 Setting Values of Configuration Signals: Setting value of ASSOCIATIVITY corrected and note 2 corrected
		5. LSI Internal Bus	
		5-2	Figure 5.2 North Main Bus Configuration corrected (write buffer added)
		5-7	Table 5.5 Address Map: "Upper" in the area name deleted
		5-12	5.8 AXI Protocol Control Signal: Body corrected
		5-13	5.9 Write Buffers: Body corrected
		6. Clock Pulse Generator	
		6-3	(1) Crystal Oscillator: Description corrected
		6-5	Table 6.2 Input/Output Clock Frequency: Pin name corrected (MD_CLK0 → MD_CLK)
		6-7	6.4.1 Frequency Control Register (FRQCR): Description of CKOEN[1:0] bits corrected (Table 6.6 corrected to Table 6.7)
		6-15 to 6-19	6.10 Clock Signals: Newly added
		7. Interrupt Controller	
		7-1	7.1 Features: Body corrected and ARM PrimeCell® generic interrupt controller (PL390) added
		7-3	7.3 Register Descriptions: Body corrected
		7-3, 7-12	Table 7.2 Register Configuration: Superscript "*3" added to the initial value of the interrupt controller type register Table 7.2 Register Configuration: Note 1 corrected and Note 3 added
		7-15	7.3.3 IRQ Interrupt Request Register (IRQRR): Description of bits IRQ7F to IRQ0F corrected
		7-16	7.4 Interrupt Sources: Erroneous description corrected
		7-16	7.4.1 NMI Interrupt: Body corrected
		7-16	7.4.2 IRQ Interrupts: Body corrected
		7-17	7.4.3 On-Chip Peripheral Module Interrupts: Body corrected
		7-17	7.4.4 Pin Interrupts: Body corrected
		7-18	7.5 Interrupt IDs: Body corrected
		7-25	Table 7.3 List of Interrupt IDs: Entry under "ICDICFRn" for interrupt ID 240 corrected
		7-28	Table 7.3 List of Interrupt IDs: Request source names of LIN interface corrected
		7-35	7.6.1 Initial Settings: Body corrected
		7-37	7.6.2 Flow of Interrupt Operations: Body corrected
		7-39	7.8.3 Notes on Reading Interrupt ID Values from Interrupt Acknowledge Register (ICCIAR): Body corrected

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	8. Bus State Controller	
		8-1	8.1 Features: Erroneous description of item 10 corrected
		8-4	Table 8.2 Address Map: Space of H'40000000 to H'407FFFFF corrected (Other → CS0 mirror)
		8-7	8.4.1 Common Control Register (CMNCR): Erroneous description of bits 28 and 24 corrected
		8-11	8.4.3 CSn Space Wait Control Register (CSnWCR) (n = 0 to 5): Description of HW[1:0] bits corrected
		8-34	8.4.10 Timeout Enable Register (TOENR): Erroneous description of CS5TOEN to CS0TOEN bits corrected
		8-77	Table 8.17 Relationship between Bus Width, Access Size, and Number of Bursts: Erroneous description in note 1 corrected
		8-78	8.5.8 SRAM Interface with Byte Selection: Body corrected
		8-86	Figure 8.40 Idle Cycle Conditions corrected
		9. Direct Memory Access Controller	
		9-2	9.3 Register Configuration: Register name corrected (into TC) in (e) DMA Register Set
		9-15	9.4.7 Channel Status Register n (CHSTAT_n): Description of the DER bit corrected
		9-22	9.4.9 Channel Configuration Register n (CHCFG_n): Description of bits 2 to 0 corrected
		9-23	9.4.11 Channel Extension Register n (CHEXT_n): DPR[2:0] and SPR[2:0] bits added, and notes corrected
		9-25	9.4.14 DMA Control Register (DCTRL_0_7, DCTRL_8_15): LWPR and LDPR bits added
		9-32	9.4.25 DMA Extension Resource Selectors 0 to 7 (DMARS0 to DMARS7): Bit 14 of DMARS2 corrected
		9-34	9.5.1 Transfer Flow: Body corrected
		9-34	9.5.2 DMA Transfer Requests: Body in (1) Auto-Request Mode corrected
		9-34	9.5.2 DMA Transfer Requests: Body in (2) External Request Mode corrected
		9-37	Table 9.4 On-Chip Peripheral Module Requests: Setting of AM[2:0] for the serial sound interface channels 0 to 3 corrected
		9-44	Figure 9.5 Register Mode Setting Example 2 corrected
		9-47	9.6.3 Link Mode: Body of <Explanation of the link mode flow>, 8. Link end analysis in (1) Operation Flow corrected
		9-57	9.7.5 DMA Acknowledge Output Function: Erroneous description corrected
		9-68, 9-69	9.8.2 Setting Example 2 (Register Mode/Software Request) changed
		9-70, 9-71	9.8.3 Setting Example 3 (Register Mode/Continuous Execution) changed
		9-73	Table 9.29 Descriptor Setting changed
		9-76	9.9.1 Divided Output of DACK0 and TEND0: Erroneous description corrected
		9-77	9.9.3 Atomic Access (ARLOCK[1:0] and AWLOCK[1:0]) added
		10. Multi-Function Timer Pulse Unit 2	
		10-1	10.1 Features: The number of interrupt sources corrected (28 corrected to 25)
		10-5	Table 10.2 Pin Configuration: Note corrected
		10-12	Table 10.10 Setting of Operation Mode by Bits MD0 to MD3: Description corrected
		10-31	10.3.4 Timer Interrupt Enable Register (TIER): Description of TTGE and TTGE2 bits corrected
		10-36	10.3.6 Timer Buffer Operation Transfer Mode Register (TBTM): Description added to description of TTSE, TTSB, and TTSA bits
		10-46	10.3.17 Timer Output Control Register 1 (TOCR1): Note 2 corrected
		10-54	10.3.23 Timer Cycle Data Register (TCDR): Body corrected
		10-55	10.3.25 Timer Interrupt Skipping Set Register (TITCR): Note corrected
		10-57	10.3.26 Timer Interrupt Skipping Counter (TITCNT): Body corrected and description of 4VCNT[2:0] bits corrected
		10-60	10.3.29 Timer Waveform Control Register (TWCR): Note corrected
		10-89	Figure 10.35 Procedure for Selecting Reset-Synchronized PWM Mode: Description of [6] and note corrected
		10-94	Figure 10.38 Example of Complementary PWM Mode Setting Procedure: Description of [9] corrected
		10-126	Figure 10.73 Example of Procedure for Specifying A/D Converter Start Request Delaying Function: Description of [2] corrected
		10-154	10.8.2 Reset Start Operation: Body corrected
		11. OS Timer	
		11-1	Table 11.2 Register Base Addresses corrected

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	11-2	11.2.1 Registers Overview: Table corrected
		11-5	Table 11.8 OSTMnTS register contents: Function of the OSTMnTS bit corrected (0: This setting has no effect.)
		11-6	Table 11.9 OSTMnTT register contents: Function of the OSTMnTT bit corrected (0: This setting has no effect.)
		11-7	11.3.1 Block Diagram added, and Figure 11.1 Block Diagram of OSTM added
		11-8	11.3.3 Generation of Interrupt Request: Body corrected, and Figure 11.2 Generating an Interrupt when Counting Starts (in Interval Timer Mode) added
		11-9	11.3.4 Starting and Stopping the Timer: Description of Initializing deleted
		11-9 to 11-11	11.3.5.1 Basic Operation in Interval Timer Mode: Body corrected, Figure 11.3 Timing Diagram of OSTM in Interval Timer Mode added, and Figure 11.4 Timing Diagram of Forced Restart in Interval Timer Mode added
		11-12	11.3.5.2 Operation when OSTMnCMP = 0000 0000$_H$: Body corrected, and Figure 11.5 Timing Diagram when OSTMnCMP = 0000 0000$_H$ in Interval Timer Mode added
		11-13, 11-14	11.3.6.1 Basic Operation in Free-Running Comparison Mode: Body corrected, Figure 11.6 Timing Diagram of OSTM in Free-Run Compare Mode added, and Table 11.11 OSTMTINT Generation Timing added
		11-14, 11-15	11.3.6.2 Operation when OSTMnCMP = 0000 0000$_H$ added, and Figure 11.7 Timing Diagram when OSTMnCMP = 0000 0000$_H$ in Free-Run Compare Mode added
		12. Watchdog Timer	
		12-1	12.1 Features: Body corrected
		12-5	12.3.3 Watchdog Reset Control/Status Register (WRCSR): Bit 5 corrected
		12-6	Figure 12.2 Writing to WTCNT and WTCSR: Addresses corrected
		12-6	12.3.4 (2) Writing to WRCSR: Body corrected
		12-6	Figure 12.3 Writing to WRCSR: Addresses corrected
		12-8	12.4.1 Canceling Software Standby Mode: Body corrected
		12-8	12.4.2 Using Watchdog Timer Mode: Body corrected
		14. Serial Communication Interface with FIFO	
		14-19	14.3.9 FIFO Control Register (SCFCR): Description of MCE bit corrected
		15. Serial Communications Interface	
		15-1	Table 15.1 Specifications of SCI: Specifications in "Clock source" under "Asynchronous mode" corrected
		15-2	Table 15.2 Input and Output Pins of the SCIs: Note corrected
		15-65	Table 15.18 Pin Configuration corrected
		16. Renesas Serial Peripheral Interface	
		16-3	16.2 Input/Output Pins: Note corrected (RSPCK)
		16-8	16.3.4 Status Register (SPSR): Note added to the description of TEND bit
		16-28	Figure 16.10 MSB First Transfer (8-Bit Data): Note corrected
		17. SPI Multi I/O Bus Controller	
		17-9	17.4.3 (1) Bit Rate: Calculation formula added
		17-9	Table 17.3 Relationship between SPBR[7:0] and BRDV[1:0] Settings: Description corrected
		18. I^{2}C Bus Interface	
		18-1	18.1.2 Register Base Addresses: Body corrected
		18-1	Table 18.3 Register Base Address corrected
		18-2	18.1.3 External I/O Signals: Title corrected
		18-2	Table 18.4 RIICn Pin Configuration corrected
		18-3	18.2.1 Functional Overview, Issuing and detecting conditions: Body corrected
		18-4	18.2.1 Functional Overview, Noise removal: Body corrected
		18-6	Figure 18.2 Connections to the External Circuit by the I/O Pins (I^{2}C Bus Configuration Example): Description corrected
		18-7 to 18-38	Bit position of each register corrected
		18-8	18.3.1 RIICnCR1 - I^{2}C Bus Control Register 1: Body of IICRST Bit (I^{2}C Bus Interface Internal Reset) corrected
		18-9	Table 18.6 RIIC Resets corrected
		18-9	18.3.1 RIICnCR1 - I^{2}C Bus Control Register 1: Body of ICE Bit (I^{2}C Bus Interface Enable) corrected
		18-11, 18-12	18.3.2 RIICnCR2 - I^{2}C Bus Control Register 2: Body and cautions of RS Bit (Restart Condition Issuance Request) and body of TRS Bit (Transmit/Receive Mode) corrected

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	18-14	Table 18.8 RIICnMR1 register contents: Note 1 corrected
		18-17	18.3.4 RIICnMR2 - I2C Bus Mode Register 2: Note 1 of SDDL[2:0] Bits (SDA Output Delay Setup Counter) corrected (fm → Fm)
		18-19	18.3.5 RIICnMR3 - I2C Bus Mode Register 3: Body of NF[1:0] Bits (Noise Filter Stage Selection) corrected
		18-19	18.3.5 RIICnMR3 - I2C Bus Mode Register 3: Body of ACKBT Bit (Transmit Acknowledge) corrected
		18-20	18.3.5 RIICnMR3 - I2C Bus Mode Register 3: Name and body of SMBE Bit (SMBus Select) corrected
		18-29	18.3.9 RIICnSR1 - I2C Bus Status Register 1: Body of DID Flag (Device-ID Address Detection) and HOA Flag (Host Address Detection) corrected
		18-31, 18-33	18.3.10 RIICnSR2 - I2C Bus Status Register 2: Body of TMOF Flag (Timeout), AL Flag (Arbitration-Lost), and RDRF Flag (Receive Data Full) corrected
		18-35	Table 18.17 RIICnSARy register contents: Function of SVA[9:1] bits corrected
		18-36	18.3.11 RIICnSARy - I2C Slave Address Register y (y = 0 to 2): Name of SVA[9:1] Bits (7-Bit Address/10-Bit Address Upper Bits) corrected
		18-37	18.3.12 RIICnBRL - I2C Bus Bit Rate Low-Level Register: Note 1 corrected ((Sm), (Fm))
		18-38, 18-39	18.3.13 RIICnBRH - I2C Bus Bit Rate High-Level Register: Description corrected
		18-39, 18-40	Table 18.20 Minimum Specifiable Value for RIICnBRL and RIICnBRH: Title and description corrected
		18-40	Table 18.21 Examples of RIICnBRH/RIICnBRL Settings for Transfer Rate (when RIICnFER.SCLE = 1 and RIICnFER.NFE = 0) corrected
		18-40	Table 18.22 Examples of RIICnBRH/RIICnBRL Settings for Transfer Rate (when RIICnFER.SCLE = 1, RIICnFER.NFE= 1, and Number of NF Stages = 4) corrected
		18-41	18.3.14 RIICnDRT - I2C Bus Transmit Data Register: Body corrected
		18-45	18.5.1 Communication Data Format: Body corrected
		18-45	Figure 18.3 I2C Bus Format corrected
		18-45	18.5.1 Communication Data Format: Description of A# added
		18-47, 18-48	18.5.3 Master Transmit Operation: Description of (3), (5), and (7) corrected, and caution added
		18-52	18.5.4 Master Receive Operation: Body corrected
		18-54	Figure 18.10 Example Flowchart for the Master Reception of 3 or More Bytes (7-Bit Address Format): Title corrected
		18-56	Figure 18.13 Master Receive Operation Timing (3) (when RDRFS = 0): Level of TRS and TDRE corrected
		18-57	Figure 18.14 Example Flowchart for the Master Reception of 1 or 2 Bytes (7-Bit Address Format) added
		18-58	18.5.5 Slave Transmit Operation: Description of (7) corrected and caution added
		18-59	Figure 18.15 Example of Slave Transmission Flowchart corrected
		18-64	18.6 SCL Synchronization Circuit: Body corrected
		18-65	Figure 18.22 SDA Output Delay Facility corrected
		18-66	18.8 Digital Noise-Filter Circuits: Body corrected
		18-69	18.9.2 Detection of the General Call Address: Body corrected
		18-70	18.9.3 Device-ID Address Detection: Body corrected
		18-71	Figure 18.28 AASy/DID Flag Set/Clear Timing during Reception of Device-ID corrected
		18-74	Figure 18.31 Suspension of Data Transfer when NACK is Received (NACKE = 1) corrected
		18-79	18.11.2 Function to Detect Loss of Arbitration during NACK Transmission (NALE Bit): Body corrected
		18-80	18.11.3 Slave Arbitration-Lost Detection (SALE Bit): Body corrected
		18-82	Figure 18.37 Start Condition/Restart Condition Issue Timing (ST and RS Bits) corrected
		18-83	Figure 18.38 Stop Condition Issue Timing (SP Bit): Erroneous description corrected (IICϕ)
		18-84	18.13.1 Timeout Function: Body and description of <1> to <3> corrected
		18-87	18.13.3 RIIC Reset and Internal Reset: Reference section corrected
		18-88	18.14 SMBus Operation: Body corrected
		18-90	18.15 Reset Function of RIIC: Title corrected
		18-90, 18-91	Table 18.24 RIIC Reset Functions: Title of the table and description corrected

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	19. Serial Sound Interface	
		19-39	19.5.3 Limits on TDM mode and WS Continue Mode: Body corrected
		21. CAN Interface	
		21-2	21.1.2 Register addresses: Body corrected
		21-2	Table 21.4 Register base address corrected
		21-8	Table 21.10 List of RS-CAN Module Registers (2/12): Name of transmit/receive FIFO buffer receive interrupt flag status register and transmit/receive FIFO buffer transmission interrupt flag status register corrected
		21-18	Table 21.11 Transmit Buffer p Allocated to Each Channel: CANn corrected to CANm
		21-19	Table 21.12 Transmit/Receive FIFO Buffer k Allocated to Each Channel: CANn corrected to CANm
		21-24	21.3.2 RSCAN0CmCTR - Channel Control Register (m = 0 or 1): Erroneous description of OLIE bit corrected (OLF corrected to OVLF)
		21-26	Table 21.17 RSCAN0CmSTS register contents: Function of TEC[7:0] bits corrected
		21-26	Table 21.17 RSCAN0CmSTS register contents: Function of REC[7:0] bits corrected
		21-27	21.3.3 RSCAN0CmSTS - Channel Status Register (m = 0 or 1): Body of EPSTS flag corrected
		21-52	21.3.18 RSCAN0RMNDy - Receive Buffer New Data Register y (y = 0): Body of RMNSq Flags (q = 0 to 31) corrected
		21-53	21.3.21 RSCAN0RMIDq - Receive Buffer ID Register (q = 0 to 31): Name of RMIDE bit corrected
		21-87	21.3.43 RSCAN0TMCp - Transmit Buffer Control Register (p = 0 to 31): Body corrected
		21-102	Table 21.74 RSCAN0TXQSTSm register contents: Function of bits 31 to 3 corrected
		21-122	21.5.2.1 Channel Stop Mode: Body corrected (GSLPR bit corrected to CSLPR bit)
		21-142	Figure 21.16 CAN Setting Procedure after the this LSI is Reset corrected
		21-164	21.11 Notes on the RS-CAN Module: Description corrected
		22. IEBus Controller	
		22-3	22.2.1 Function overview: Description of effective transmission speed corrected
		22-50	Table 22-29 Received control data and data written to the IEBBnDR register: Function of 5H corrected
		22-76	Note 1 corrected
		22-92	(c) Slave status transmission request processing flow example: Title corrected
		22-100	Figure 22-45 Master transmission (FIFO mode): Description corrected
		22-102	Figure 22-47 Master reception (FIFO mode): Description corrected
		22-106	Figure 22-51 Slave transmission (FIFO mode): When the control bit 3H or 7H is received: Description corrected
		22-107	Figure 22-52 Slave transmission (FIFO mode): When the control bit 0H or 6H is received (or when 4H or 5H is received from the locked master while the unit is locked): Reference section corrected
		22-111	22.7.1 (3) Effective transmission speed: Description corrected
		22-112	Table 22-56 Transfer rate and maximum number of transfer bytes in each communication mode: Effective transfer rate corrected
		22-119	Table 22-60 Control field $\overline{\text{ACK}}$ signal response conditions (when the received control data is 0H, 3H, 4H, 5H, 6H, or 7H): Title corrected (H → 0H)
		22-123	22.7.6 (9) (b) Last acknowledge bit of the control field: Body corrected
		22-125	Figure 22-62 Slave status bit configuration: Note b) corrected
		24. CD-ROM Decoder	
		24-6	Table 24.1 Register Configuration: Access size of CD-ROM decoder stream data input register corrected (R: 16, W: 16, 32)
		25. LIN Interface	
		—	LIN slave mode deleted
		25-1	25. LIN Interface: Body corrected
		25-1	25.1 Features: Title corrected
		25-1	25.1.2 Register Addresses: Body corrected
		25-1	Table 25.2 Register Base Addresses corrected
		25-2	Table 25.4 RLIN3n Interrupt and DMA Requests corrected
		25-3	25.2 Function: Body corrected
		25-4	Table 25.6 LIN Interface Specifications corrected (prohibition of the frame separated mode setting added)
		25-5	Figure 25.1 LIN Interface Block Diagram: n = 0, 1 deleted

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	25-6	Table 25.7 List of LIN Interface Registers corrected (LIN master and LIN slave deleted)
		25-7 to 25-32	25.3.1 LIN Master Related Registers: Address and bit position of each register corrected
		25-7	Table 25.8 RLN3nLWBR register contents: Functions of LPRS[2:0] and LWBR0 bits corrected
		25-7	25.3.1.1 RLN3nLWBR - LIN Wake-up Baud Rate Select Register: Description of NSPB[3:0] bits (bit sampling count select bits) and LWBR0 bit (wake-up baud rate select bit) corrected
		25-8	Table 25.9 RLN3nLBRP0 register contents: Function corrected (setting range corrected)
		25-8	25.3.1.2 RLN3nLBRP0 — LIN Baud Rate Prescaler 0 Register: Body corrected
		25-8	Table 25.10 RLN3nLBRP1 register contents: Function corrected (setting range corrected)
		25-9	Table 25.11 RLN3nLSTC register contents: Function of reserved bits corrected
		25-9	25.3.1.4 RLN3nLSTC - LIN Self-Test Control Register: Body corrected
		25-10, 25-11	25.3.1.5 RLN3nLMD - LIN Mode Register: Description of LCKS[1:0] bits (LIN system clock select bits) corrected
		25-14	25.3.1.8 RLN3nLWUP - LIN Wake-up Configuration Register: Description of WUTL[3:0] bits (wake-up transmission low level width select bits) corrected
		25-15	Table 25.16 RLN3nLIE register contents: Function of SHIE, ERRIE, FRCIE, and FTCIE bits corrected
		25-15, 25-16	25.3.1.9 RLN3nLIE - LIN Interrupt Enable Register: Description of SHIE bit (successful header transmission interrupt enable bit), ERRIE bit (error detection interrupt request enable bit), FRCIE bit (successful frame/wake-up reception interrupt request enable bit), and FTCIE bit (successful frame/wake-up transmission interrupt request enable bit) corrected
		25-18	25.3.1.10 RLN3nLEDE -LIN Error Detection Enable Register: Description of PBERE bit (physical bus error detection enable bit) corrected
		25-19	25.3.1.11 RLN3nLCUC - LIN Control Register: Description of OM1 bit (LIN mode select bit) corrected
		25-20	25.3.1.12 RLN3nLTRC - LIN Transmission Control Register: Description of RTS bit (response transmission/ reception start bit) and FTS bit (frame transmission/wake-up transmission/reception start bit) corrected
		25-20	Table 25.19 RLN3nLTRC register contents: Note added (prohibition of the frame separated mode setting) in the RTS bit function
		25-22, 25-23	25.3.1.14 RLN3nLST - LIN Status Register: Body and description of HTRC flag (successful header transmission flag), D1RC flag (successful data 1 reception flag), ERR flag (error detection flag), FRC flag (successful frame/ wake-up reception flag) and FTC flag (successful frame/wake-up transmission flag) corrected
		25-24, 25-25	25.3.1.15 RLN3nLEST - LIN Error Status Register: Body and description of RPER flag (response preparation error flag), CSER flag (checksum error flag), FER flag (framing error flag), FTER flag (timeout error flag), PBER flag (physical bus error flag), and BER flag (bit error flag) corrected
		25-26 to 25-28	25.3.1.16 RLN3nLDFC - LIN Data Field Configuration Register: Description of LSS bit (transmission/reception continuation select bit), FSM bit (frame separate mode select bit), RFT bit (response field communication direction select bit), and RFDL[3:0] bits (response field length select bits) corrected
		25-26	Table 25.23 RLN3nLDFC register contents: Note added (prohibition of the frame separated mode setting) in the FSM bit function
		25-29	25.3.1.17 RLN3nLIDB — LIN ID Buffer Register: Body corrected
		25-30	25.3.1.18 RLN3nLCBR - LIN Checksum Buffer Register: Access and body corrected
		25-32	25.3.1.19 RLN3nLDBRm - LIN Data Buffer m Register (m = 1 to 8): Description of For transmission of response data of 9 bytes or more corrected
		25-34	Table 25.28 Transition Condition of Each Mode corrected
		25-38	Table 25.30 Transition Conditions of Operation Modes corrected
		25-40	Table 25.32 Processing in Response Transmission corrected
		25-41	Table 25.33 Processing in Response Reception corrected
		25-42	25.7.2.1 Data Transmission: Body corrected
		25-42	Figure 25.7 Example of Data Transmission Timing (LIN Master Mode) corrected
		25-43	Figure 25.8 Example of Data Reception Timing corrected
		25-46	25.7.3.3 Multi-Byte Response Transmission/Reception Function: Body corrected
		25-47	25.7.4.1 Wake-up Transmission: Body corrected
		25-48	25.7.4.2 Wake-up Reception: Body corrected
		25-48	25.7.4.3 Wakeup Collision added
		25-49	Table 25.34 Types of Statuses in LIN Master Mode corrected
		25-50, 25-51	Table 25.35 Types of Error Statuses in LIN Master Mode corrected
		25-50	25.7.6.1 LIN Master Mode (1) Types of Error Statuses: Body corrected

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	25-53	Figure 25.14 Connection in LIN Reset Mode and LIN Mode and Figure 25.15 Connection in LIN Self-Test Mode: n = 0, 1 deleted
		25-54	25.8.1 Change to LIN Self-Test Mode: Description corrected
		25-55, 25-56	25.8.2 Transmission in LIN Master Self-Test Mode: Description corrected
		25-56, 25-57	25.8.3 Reception in LIN Master Self-Test Mode: Description corrected
		25-58	25.9 Baud Rate Generator: Body corrected
		25-58	Figure 25.16 Block Diagram of Baud Rate Generation in LIN Master Mode corrected
		25-58	25.9.1 LIN Master Mode: Title and body corrected
		—	Table 25.36 Examples of Baud Rate (19200, 10417, 9600, and 2400 bps) Generation in LIN Master Mode deleted
		25-59	25.9.2 Noise Filter: Body corrected
		25-59	Figure 25.17 Configuration of Noise Filter corrected
		25-59	Figure 25.18 Example of Noise Filter Circuit corrected
		25-60	Figure 25.19 Determination of Received Data when Noise Filter is Used corrected
		26. Ethernet Controller	
		26-15	26.3.9 CRC Error Frame Receive Counter Register (CEFCR) corrected
		26-15	26.3.10 Frame Receive Error Counter Register (FRECR) corrected
		26-16	26.3.11 Too-Short Frame Receive Counter Register (TSFRCR) corrected
		26-16	26.3.12 Too-Long Frame Receive Counter Register (TLFRCR) corrected
		26-17	26.3.13 Residual-Bit Frame Receive Counter Register (RFCR) corrected
		26-17	26.3.14 Multicast Address Frame Receive Counter Register (MAFCR) corrected
		26-55	26.4.1 (1) (b) Transmit Descriptor 1 (TD1): Description of TDL[15:0] bits corrected
		26-55	26.4.1 (1) (c) Transmit Descriptor 2 (TD2): Body corrected and description of TBA[31:0] bits corrected
		26-58	26.4.1 (2) (a) Receive Descriptor 0 (RD0): Description of RCSE bit corrected (Table 26.4 corrected to Table 26.3)
		26-59	26.4.1 (2) (b) Receive Descriptor 0 (RD0): Description of RBL[15:0] bits corrected
		26-60	Figure 26.5 Relationship between Transmit Descriptor and Transmit Buffer corrected
		27. A/D Converter	
		27-19	Table 27.5 A/D Conversion Time (Single Mode) corrected
		27-22	27.6 Definitions of A/D Conversion Accuracy: Body corrected
		27-23	27.7.1 Module Standby Mode Setting: Body corrected
		28. USB2.0 Host/Function Module	
		—	Erroneous description corrected: DxFIFO corrected to DnFIFO, DEVADDx corrected to DEVADDn, PIPExCTR corrected to PIPEnCTR, PIPExTRE corrected to PIPEnTRE, PIPExTRN corrected to PIPEnTRN, PIPExCFG corrected to PIPECFG
		28-3	Table 28.1 Pin Configuration: Function of REFRIN corrected
		28-11	28.3.1 System Configuration Control Register (SYSCFG0): Description of UCKSEL bit corrected
		28-18, 28-19	28.3.6 DMAn-FIFO Bus Configuration Registers (D0FBCFG, D1FBCFG): Description of DFACC[1:0] and TENDE bits corrected
		28-20	28.3.7 FIFO Port Registers (CFIFO, D0FIFO, D1FIFO): Description of FIFOPORT[31:0] bits corrected
		28-23	28.3.8 (1) CFIFOSEL: Description of MBW[1:0], BIGEND, ISEL, and CURPIPE[3:0] bits corrected
		28-24, 28-25	29.3.8 (2) D0FIFOSEL, D1FIFOSEL: Description of DREQE and MBW[1:0] bits corrected
		28-44, 28-45	28.3.28 DCP Configuration Register (DCPCFG): Description of bits 7 and 8 added
		28-46	Table 28.10 Relationship between Transfer Mode Settings by CNTMD Bit and Timings at which Reading Data or Transmitting Data from FIFO Buffer is Enabled added
		28-53	28.3.32 Pipe Configuration Register (PIPECFG): Description of TYPE[1:0] bits corrected
		28-56	Table 28.11 Relationship between Transfer Mode Settings by CNTMD Bit and Timings at which Reading Data or Transmitting Data from FIFO Buffer is Enabled added
		28-70	28.3.37 PIPEn Transaction Counter Enable Registers (PIPEnTRE) (n = 1 to 5, 9, and A to F): Description of TRENB bit corrected
		28-89	Table 28.19 Pipe Setting Items: Remarks of CNTMD and SHTNAK bits corrected

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	28-96	Table 28.19 Relationship between Transfer Mode Settings by CNTMD Bit and Timings at which Reading Data or Transmitting Data from FIFO Buffer is Enabled deleted
		28-97	Table 28.21 FIFO Port Function Settings: Function of DREQE bit corrected
		28-98	Figure 28.6 Procedure for Pipe Switching during Access to the FIFO Port corrected
		30. Video Display Controller 5 (2): Input Controller	
		30-17	Table 30.14 Timing of Delay for Output of Vertical Synchronization Signal corrected
		30-41, 30-42	The order of 30.2.9, 30.2.10, and 30.2.11 changed
		31. Video Display Controller 5 (3): Scaler	
		31-23	Table 31.20 Settings for Field Determination Signal Control corrected
		31-26	Table 31.25 Frame Buffer Writing Mode Setting corrected
		31-27	Table 31.30 Frame Buffer Writing Control: Description corrected
		31-34	Table 31.37 Field Specification for Frame Buffer Reading corrected
		31-36	Table 31.38 Frame Buffer Control corrected
		31-51	31.2.17 Vertical Scaling Register (SC0_SCL0_DS6): Note corrected
		31-64	31.2.33 Frame Sub-Sampling Register (SC0_SCL1_WR5): Description of SC0_RES_WENB bit corrected
		31-71, 31-72	31.2.45 Pointer Buffer and Field Information Register (SC0_SCL1_PBUF_FLD): Description corrected
		31-74	31.2.49 Frame Buffer Control Register 1 (Graphics 0) (GR0_FLM1): Description of GR0_FLM_SEL [1:0] bits corrected
		31-76	31.2.51 Frame Buffer Control Register 3 (Graphics 0) (GR0_FLM3): Description of GR0_FLD_NXT bit corrected
		31-88	31.3.1 Scaling Setting Example for 525i Video Input and VGA-Size (640 x 480) Video Output: Title corrected
		31-88	Table 31.40 Input and Output Angles for 525i Video Input and VGA-Size (640 x 480) Video Output: Title corrected and output signal corrected (640 x 480)
		31-88	(2) Horizontal Scaling (Horizontal Scale Down, Scaling Filter: 2-Tap Linear): Body corrected
		31-88	(3) Horizontal Scaling (Horizontal Scale Up, Scaling Filter: 2-Tap Linear) deleted
		31-88	(3) Vertical Scaling (Vertical Scale Up, Scaling Filter: 2-Tap Linear): Body corrected
		34. Video Display Controller 5 (7): Output Controller	
		34-6, 34-7	Table 34.5 Gamma Correction: Description corrected
		34-34 to 34-41	34.2.4 Area Setting Register G1 in Gamma Correction Block (GAM_G_AREA1) to 34.2.11 Area Setting Register G8 in Gamma Correction Block (GAM_G_AREA8): Description corrected
		34-45 to 34-52	34.2.14 Area Setting Register B1 in Gamma Correction Block (GAM_B_AREA1) to 34.2.21 Area Setting Register B8 in Gamma Correction Block (GAM_B_AREA8): Description corrected
		34-56 to 34-63	34.2.24 Area Setting Register R1 in Gamma Correction Block (GAM_R_AREA1) to 34.2.31 Area Setting Register R8 in Gamma Correction Block (GAM_R_AREA8): Description corrected
		36. Capture Engine Unit	
		36-2	Table 36.1 Functional Overview of CEU corrected
		36-7	36.4.1 Capture Start Register (CAPSR): Note added
		36-13	36.4.3 Capture Interface Control Register (CAMCR): Description of JPG[1:0] bits corrected and note added to body
		36-18	36.4.6 Capture Interface Width Register (CAPWR): Description of VWDTH[11:0] and HWDTH[12:0] bits corrected
		36-36	36.4.17 Capture Bundle Destination Size Register (CBDSR): Description of CBVS[22:0] corrected
		36-36	36.4.17 (a) Image capture and data synchronous fetch: Body corrected
		36-49	Figure 36.47 Operating Status during Capturing: Erroneous description corrected (CSPSR.CE corrected to CAPSR.CE)
		36-59	Table 36.11 Restrictions on CEU Input/Output Functions corrected
		37. SCUX	
		37-2	Figure 37.1 Block Diagram of SCUX corrected (MTU2 added)
		37-3	Table 37.1 Pin Configuration: Function corrected
		37-15	37.3.9 FFD0_n FIFO Download Boot Register (FFDBR_FFD0_n) (n = 0, 1, 2, 3): Description of BOOT bit corrected
		37-16	37.3.10 FFD0_n FIFO Download Event Mask Register (DEVMR_FFD0_n) (n = 0, 1, 2, 3): Description of DEVMRQ bit corrected

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	37-22	37.3.17 FFU0_n FIFO Upload Event Clear Register (UEVCR_FFU0_n) (n = 0, 1, 2, 3): Description of UEVCUF, UEVCOF, and UEVCOL bits corrected
		37-70	37.3.68 FFD0_n Timing Select Register (FDTSELn_CIM) (n = 0, 1, 2, 3): Description of MTUSEL bit added and description of SCKSEL bit corrected
		37-71	Figure 37.4 Configuration Diagram of Input Timing Signal Selector corrected
		37-72	37.3.69 FFU0_n Timing Select Register (FDTSELn_CIM) (n = 0, 1, 2, 3): Description of MTUSEL bit added and description of SCKSEL bit corrected
		37-73	Figure 37.5 Configuration Diagram of Output Timing Signal Selector corrected
		37-87	Figure 37.7 Initial Setting Procedure of SCUX (2) corrected
		37-87	Figure 37.8 Initial Setting Procedure of SCUX (3) corrected
		37-88	Figure 37.9 Transfer Start Procedure and Stop Procedure of SCUX (1) corrected
		37-90	Figure 37.11 Transfer Start Procedure and Stop Procedure of SCUX (3) corrected
		37-95	37.4.5 Data Transfer Route: Body corrected
		37-101 to 37-103	Table 37.18 Input/Output Timing Setting (1) to Table 37.20 Input/Output Timing Setting (3) corrected, and notes corrected
		37-109	Figure 37.16 Volume Ramp Operation: Note added to description of operation (2)
		37-112, 37-113	Figure 37.20 Volume Ramp Operation for 4-System Data corrected, and note added to description of operation (2)
		41. Ports	
		41-1	41.1.2 Port group index n: Body corrected
		41-2	Table 41.3 Pin Function Configuration Overview corrected, note deleted, and caution added
		41-3	41.2.2 Pin Data Input/Output: Body corrected
		41-3	Table 41.4 PPRn.PPRnm Bit Read Values corrected, and note changed to caution
		41-4	41.3.1 Port Register (Pn): Body corrected
		41-5	41.3.2 Port Set and Reset Register (PSRn): Body corrected
		41-5	41.3.3 Port Pin Read Register (PPRn/JPPR0): Body corrected and function of PPRn[15:0] bits corrected
		41-6	41.3.4 Port Mode Register (PMn): Caution added and note corrected
		41-7	Table 41.6 Alternative Mode Selection corrected and note changed to caution
		41-8	41.3.8 Port NOT Register (PNOTn): Function of PNOTn[15:0] bits corrected
		41-9	41.3.9 Port Mode Set and Reset Register (PMSRn): Body corrected
		41-10	41.3.10 Port Mode Control Set and Reset Register (PMCSRn/JPMCSR0): Body corrected
		41-10	41.3.11 Port Function Control Additional Expansion Register (PFCAEn): Caution corrected
		41-11	41.3.12 Port Input Buffer Control Register (PIBCn): Title and body corrected, and description added to note
		41-11	41.3.13 Port Bidirection Control Register (PBDCn/JPBDC0): Title and body corrected, and note deleted
		41-12	Table 41.7 Alternative Functions for Which the PIPCn.PIPCnm Bit Should be Set to 0 corrected
		41-13	41.3.15 Serial Sound Interface Noise Canceler Control Register (SNCR): Bits 4 to 6 corrected
		41-14	Table 41.8 Number and Function of Ports: Pin name corrected
		41-14	41.5 JTAG Port 0 (JP0): Note changed to caution
		41-14	Table 41.10 Control Registers (JP0) corrected and note changed to caution
		41-15	Table 41.11 Pin Function (P0) corrected and note changed to caution
		41-15	Table 41.12 Control Registers (P0): Note changed to caution
		41-16	Table 41.13 Pin Function (P1) corrected and note changed to caution
		41-16	Table 41.14 Control Registers (P1) corrected and note changed to caution
		41-17	Table 41.16 Control Registers (P2): Note changed to caution
		41-18	Table 41.17 Pin Function (P3) corrected
		41-18	Table 41.18 Control Registers (P3) corrected and note changed to caution
		41-19	Table 41.20 Control Registers (P4): Note changed to caution
		41-20	Table 41.22 Control Registers (P5) corrected and note changed to caution
		41-22	Table 41.24 Control Registers (P6) corrected and caution added
		41-23	Table 41.25 Pin Function (P7) corrected

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	41-23	Table 41.26 Control Registers (P7): Note changed to caution
		41-24	Table 41.28 Control Registers (P8) corrected
		41-25	Table 41.30 Control Registers (P9): Note changed to caution
		41-27	Figure 41.2 Example Flow of Port Settings (in Port Mode) (a): Title corrected
		41-28	Figure 41.3 Example Flow of Port Settings (in Software I/O Control Alternative Mode) (b): Title corrected and note changed to caution
		41-29	Figure 41.4 Example Flow of Port Settings (in Direct I/O Control Alternative Mode) (c) corrected and title corrected
		42. Power-Down Modes	
		42-1	Figure 42.1 Transitions between Processing States corrected
		42-2	Table 42.1 States of Power-Down Modes: Transition Conditions corrected and note 6 added
		42-4	42.2.1 Standby Control Register 1 (STBCR1): Description of STBY and DEEP bits corrected
		42-5	42.2.2 Standby Control Register 2 (STBCR2): Description of HIZ bit corrected
		42-10	42.2.7 Standby Control Register 7 (STBCR7): Erroneous description of MSTP74 bit corrected
		42-12	42.2.9 Standby Control Register 9 (STBCR9): Description of MSTP93 bit corrected
		42-13	42.2.10 Standby Control Register 10 (STBCR10): Note 1 deleted
		42-23	42.2.20 Standby Acknowledge Register 1 (STBACK1): Title corrected and note 1 corrected
		42-24	42.2.21 Standby Acknowledge Register 2 (STBACK2): Note 1 corrected
		42-30	42.2.26 Deep Standby Cancel Source Flag Register (DSFR): Body corrected
		42-32	42.3.1 (1) Transition to Sleep Mode: Body corrected and not added
		42-32	42.3.1 (2) Canceling Sleep Mode: Body corrected
		42-33	42.3.2 (1) Transition to Software Standby Mode: Description corrected
		42-35	42.3.3 Software Standby Mode Application Example: Note added
		42-36	42.3.4 (1) Transition to Deep Standby Mode: Body corrected
		42-37	Figure 42.3 Flowchart of Transition to Deep Standby Mode corrected
		42-38	Figure 42.4 Flowchart of Canceling Deep Standby Mode: Description corrected
		42-40	42.3.5 Module Standby Function: Body corrected
		42-41	42.3.6 Software Reset added
		43. Debugger Interface	
		43-7 to 43-10	Table 43.10 Correspondence between Pins of this LSI and Boundary Scan Registers corrected
		43-12	43.4 ICE Registers: Body corrected
		44. List of Registers	
		44-2	Table 44.1 Register Addresses: Frequency control register 2 deleted
		44-31	Table 44.1 Register Addresses: Access size of CD-ROM decoder stream data input register (STRMDIN0) corrected (16 (R/W), 32 (W))
		44-28	Table 44.1 Register Addresses: Register name of transmit/receive FIFO buffer receive interrupt flag status register and transmit/receive FIFO buffer transmit interrupt flag status register corrected
		44-3, 44-4, 44-51, 44-52, 44-53, 44-61	Table 44.1 Register Addresses: Interrupt clear-enable registers 17 and 18, Interrupt set-pending registers 17 and 18, Port register_10, Port register_11, Port set/reset register_10, Port set/reset register_11, Port pin read register_10, Port pin read register_11, Port mode register_10, Port mode register_11, Port mode control register_10, Port mode control register_11, Port function control register_10, Port function control register_11, Port function control expansion register_10, Port function control expansion register_11, Port NOT register_10, Port NOT register_11, Port mode set/reset register_10, Port mode set/reset register_11, Port mode control set/reset register_10, Port mode control set/reset register_11, Port function control additional expansion register_10, Port function control additional expansion register_11, Port input buffer control register_10, Port input buffer control register_11, Port bi-direction control register_10, Port bi-direction control register_11, Port IP control register_10, Port IP control register_11, and BSID register deleted
		44-69, 44-79, 44-88, 44-96, 44-97, 44-120, 44-121	Table 44.2 Register Bits: Registers of bus state controller corrected, DCTRL_0_7 and DCTRL_8_15 registers corrected, RIICxMR1, RIIC0SER, RIIC1SER, RIIC2SER, and RIIC3SER registers of I2C bus interface corrected, CEFCR0, FRECR0, TSFRCR0, TLFRCR0, RFCR0, and MAFCR0 registers of Ethernet controller corrected, and DCPCFG_0 and DCPCFG_1 registers of USB2.0 host/function module corrected

Rev.	Date	Description	
		Page	Summary
2.00	May 25, 2015	44-66, 44-120, 44-207	Table 44.2 Register Bits: FRQCR2 register of clock pulse generator, all registers of LIN interface LIN slave, and BSID register of debugger interface deleted
		44-208, 44-209	Table 44.3 Register States: Register name (FRQCR2) deleted, module name of CAN interface corrected ((RS-CAN) deleted), and note 11 added
		45. Electrical Characteristics	
		45-5	Table 45.2 DC Characteristics (3) [Except I^2C Bus Interface, and USB 2.0 Host/Function Module-Related Pins]: Note corrected
		45-8	Table 45.5 Clock Timing: Description of real time clock oscillation settling time (t_{ROSC}) corrected
		45-9	Figure 45.3 Power-On Oscillation Settling Time corrected
		45-18	Title of figure 45.13 corrected
		45-19	Title of figure 45.14 corrected
		45-43	Figure 45.41 Clock Timing corrected
		45-44	Figure 45.42 Transmission and Reception Timing (Master, CPHA = 0) corrected
		45-44	Figure 45.43 Transmission and Reception Timing (Master, CPHA = 1) corrected
		45-44	Figure 45.44 Transmission and Reception Timing (Slave, CPHA = 0) corrected
		45-45	Figure 45.45 Transmission and Reception Timing (Slave, CPHA = 1) corrected
		45-46	Table 45.14 SPI Multi I/O Bus Controller Timing corrected
		45-46	Figure 45.47 Transmission and Reception Timing (CPHAT = 0, CPHAR = 0) corrected
		45-47	Figure 45.48 Transmission and Reception Timing (CPHAT = 1, CPHAR = 1) corrected
		45-61	Table 45.25 Capture Engine Unit Module Signal Timing corrected
		45-61	Figure 45.74 Capture Engine Unit Module Signal Timing corrected
		46. States and Handling of Pins	
		46-1	Table 46.1 Pin States corrected (clock and bus state controller)
		46-8	Figure 46.1 Example of Externally Allocated Capacitors in the Products in 208-Pin QFP Packages corrected
		46-9	Figure 46.2 Example of Externally Allocated Capacitors in the Products in 176-Pin QFP Packages corrected
		Appendix	
		Appendix-1	Figure A.1 Dimensions of 176-Pin BGA Package corrected
3.00	Nov 30, 2016	All	RZ/A1LU and RZ/A1LC specification added
		1. Overview	
		1-1	1.1 Features of This LSI: Body corrected
		1-2, 1-4, 1-5, 1-6, 1-7, 1-8	Table 1.1 Features of RZ/A1L, RZ/A1LU, and RZ/A1LC: Title corrected. Items of media local bus, IEBus™ controller, and CD-ROM decoder corrected. Items and specification of LIN interface corrected. EthernetAVB (RZ/A1LU only) and JPEG codec unit (RZ/A1LU only) added. Specification of on-chip RAM and package corrected.
		1-9	Table 1.2 Product Lineup: RZ/A1LU and RZ/A1LC group added
		1-15, 1-16	Table 1.3 Pin Functions: Symbol within the classification of "Renesas serial peripheral interface" corrected. Classification of media local bus, IEBus™ controller, LIN interface, and Ethernet controller corrected. EthernetAVB (RZ/A1LU only) added.
		1-19 to 1-23	Table 1.4 List of Pins: Table corrected, function 8 added, and notes 1 to 4 added
		2. CPU	
		2-2	Table 2.1 Cortex-A9 Configuration Signal Settings: Error corrected
		3. Boot Mode	
		3-4	Figure 3.1 Control Signals Output to the Serial Flash Memory Through SPI Communication Conversion corrected
		5. LSI Internal Bus	
		5-2	Figure 5.2 North Main Bus Configuration: Notes 1 and 2 added
		5-3, 5-4	Table 5.2 List of Peripheral Buses: Description of IEBus controller, LIN interface, media local bus, and CD-ROM decoder corrected. Description of JPEG codec unit (RZ/A1LU only) added to peripheral bus 4. Description of EthernetAVB (RZ/A1LU only) added to peripheral bus 6.

Rev.	Date	Description	
		Page	Summary
3.00	Nov 30, 2016	5-5	Figure 5.3 South Main Bus Configuration: EthernetAVB added, and notes 1 and 2 added
		5-7, 5-8, 5-9	Table 5.5 Address Map: "Area" of address 0x6020_0000 to 0x602F_FFFF and address 0x2020_0000 to 0x202F_FFFF corrected. Note 5 corrected.
		5-10	Figure 5.4 Address Remapping corrected
		5-10	5.5.2 Operation: Body corrected
		5-12	5.8.1 (3) Protection unit information (ARPROT[2:0], AWPROT[2:0]): Note added
		5-13	5.8.5 (4) Atomic access (ARLOCK[1:0], AWLOCK[1:0]): Note added
		5-14	Table 5.6 Register Configuration: Register name of AXI bus control register 5 corrected
		5-15	5.10.1 Remap Register (RMPR): Description of bit 1 (AXI128) corrected
		5-16	5.10.2 AXI Bus Control Register 0 (AXIBUSCTL0): Body corrected, description of bits 27 to 24 (JCUARCACHE[3:0]) and bits 19 to 16 (JCUAWCACHE[3:0]) added, and note added
		5-17	5.10.4 AXI Bus Control Register 5 (AXIBUSCTL5): Body corrected
		5-20	5.10.7 AXI Bus Response Error Interrupt Control Register 0 (AXIRERRCTL0): Description of bit 28 (JCURERREN) added, and note added
		5-22	5.10.9 AXI Bus Response Error Status Register 0 (AXIRERRST0): Description of bits 31 and 30 (JCURRESP[1:0]) and bits 29 and 28 (JCUBRESP[1:0]) added, and note added
		5-24	5.10.11 AXI Bus Response Error Clear Register 0 (AXIRERRCLR0): Description of bit 30 (JCURRESPCLR) and bit 28 (JCUBRESPCLR) added, and note added
		6. Clock Pulse Generator	
		6-3	6.1 (7) SSCG Circuit: Body corrected
		6-5	6.3 Clock Mode: Body corrected
		6-5	Table 6.3 Settable Frequency Ranges corrected
		6-12	6.7.1 Oscillation Stabilizing Time of the On-chip Crystal Oscillator: Body corrected
		6-12	6.7.2 Oscillation Stabilizing Time of the PLL circuit: Body corrected
		6-16	Figure 6.6 Audio and USB Clock Signals corrected
		6-16	Figure 6.7 Video Image Clock Signals corrected
		6-17	Figure 6.8 Clock Signals for Other Modules corrected
		6-18	Figure 6.9 Distribution of Internal Clock Signals (1) corrected
		6-19	Figure 6.10 Distribution of Internal Clock Signals (2) corrected
		7. Interrupt Controller	
		7-2	Figure 7.1 Block Diagram corrected
		7-17	7.4.3 On-Chip Peripheral Module Interrupts: Body corrected
		7-22, 7-28, 7-29	Table 7.3 List of Interrupt IDs: Module column of IEBus™ controller, CD-ROM decoder, media local bus, and LIN interface channel 0 corrected. JPEG codec unit (RZ/A1LU only) assigned to interrupt ID 126 and 127. EthernetAVB (RZ/A1LU only) assigned to interrupt ID 355 to 358.
		8. Bus State Controller	
		8-5	Table 8.3 Initial States by Areas in Boot Modes 0 and 1 to 3: Note 1 corrected
		8-87	8.5.11 (3) On-Chip Peripheral Module Access: Body corrected
		9. Direct Memory Access Controller	
		9-1	9.1 Features, Transfer requests: Body corrected
		9-31	9.4.25 DMA Extension Resource Selectors 0 to 7 (DMARS0 to DMARS7): Body corrected
		9-36 to 9-38	Table 9.4 On-Chip Peripheral Module Requests: “DMA Transfer Request Source” of IEBus™ controller, CD-ROM decoder, media local bus, and LIN interface channel 0 corrected
		10. Multi-Function Timer Pulse Unit 2	
		10-44, 10-68, 10-88, 10-95, 10-111, 10-147, 10-149, 10-152, 10-153	TCNT0, TCNT1, TCNT2, TCNT3, and TCNT4 have been respectively changed to TCNT_0, TCNT_1, TCNT_2, TCNT_3, and TCNT_4.
		10-104	Figure 10.44 Example of Initial Output in Complementary PWM Mode (1) corrected

Rev.	Date	Description	
		Page	Summary
3.00	Nov 30, 2016	10-105	Figure 10.45 Example of Initial Output in Complementary PWM Mode (2) corrected
		12. Watchdog Timer	
		12-1	Error in the body corrected
		12-8	12.4.1 Canceling Software Standby Mode: Body corrected
		13. Realtime Clock	
		13-16	13.4.1 Initial Settings of Registers after Power-On and Oscillation Stabilization Time: Body corrected
		14. Serial Communication Interface with FIFO	
		14-13	14.3.7 Serial Status Register (SCFSR): Description of bit 1 (RDF) corrected
		14-19	14.3.9 FIFO Control Register (SCFCR): Description of bits 10 to 8 (RSTRG[2:0]), bits 7 and 6 (RTRG[1:0]), and bits 5 and 4 (TTRG[1:0]) corrected
		14-33, 14-38	14.4.2 (3) Transmitting and Receiving Data: Body corrected
		15. Serial Communications Interface	
		15-4	15.2.2 Receive Data Register (RDR): Body corrected
		16. Renesas Serial Peripheral Interface	
		16-10	16.3.5 Data Register (SPDR): Body corrected
		16-12	16.3.9 Data Control Register (SPDCR): Description of bits 6 and 5 (SPLW1, SPLW0) corrected, and Note added
		17. SPI Multi I/O Bus Controller	
		17-1	17.1 Features, Serial Flash Memory Interface: Body corrected
		17-2	Figure 17.1 Block Diagram corrected
		17-4	Table 17.2 Register Configuration corrected
		17-5, 17-6	17.4.1 Common Control Register (CMNCR): Description of bits 23 and 22 (MOIIO3[1:0]), bits 21 and 20 (MOIIO2[1:0]), bits 19 and 18 (MOIIO1[1:0]), bits 17 and 16 (MOIIO0[1:0]), bits 15 and 14 (IO3FV[1:0]), bits 13 and 12 (IO2FV[1:0]), bits 9 and 8 (IO0FV[1:0]), bit 6 (CPHAT), and bit 5 (CPHAR) corrected
		17-22	17.4.14 SPI Mode Read Data Register 0 (SMRDR0): Description of bits 31 to 0 (RDATA0[31:0]) corrected
		17-22	17.4.15 SPI Mode Read Data Register 1 (SMRDR1): Description of bits 31 to 0 (RDATA1[31:0]) corrected
		17-23	17.4.16 SPI Mode Write Data Register 0 (SMWDR0): Description of bits 31 to 0 (WDATA0[31:0]) corrected
		17-23	17.4.17 SPI Mode Write Data Register 1 (SMWDR1): Description of bits 31 to 0 (WDATA1[31:0]) corrected
		17-25	17.4.19 SPI AC Input Characteristics Adjustment Register (CKDLY) (RZ/A1LU only) added
		17-27	17.4.21 Data Read DDR Enable Register (DRDRENR) (RZ/A1LU only) added
		17-29	17.4.23 SPI Mode DDR Enable Register (SMDRENR) (RZ/A1LU only) added
		17-30	17.4.24 SPI AC Output Characteristics Adjustment Register (SPODLY) (RZ/A1LU only) added
		17-32	17.5.3 32-bit Serial Flash Addresses: Error in note corrected (RBE bit in DRCR = 1)
		17-34	17.5.6 External Address Space Read Mode: Body corrected
		17-38	Figure 17.12 Example of Initial Setting Flow in External Address Space Read Mode corrected
		17-40	17.5.8 SPI Operating Mode: Body corrected
		17-41	Figure 17.16 Example of Initial Setting Flow in SPI Operating Mode corrected
		17-42	Figure 17.17 Example of a Data Transfer Setting Flow in SPI Operating Mode corrected
		17-43	17.5.9 (3) Data Transmission and Reception Timing: Body corrected
		17-43	Figure 17.18 SDR Transfer Format: Title corrected
		17-44	Figure 17.19 DDR Transfer Format (RZ/A1LU only) added
		17-45	Table 17.5 Data Registers: Error corrected (DRDMCR, SMDMCR)
		17-45	17.5.10 (2) Data Enable: Body corrected
		17-46	Figure 17.20 Data and Enable corrected
		17-50	Table 17.7 Pin Status (2) corrected
		17-51	Table 17.8 Pin Status (3) corrected
		18. I^2C Bus Interface	
		18-37	18.3.12 RIICnBRL — I^2C Bus Bit Rate Low-Level Register: Body corrected
		18-38, 18-39	18.3.13 RIICnBRH — I^2C Bus Bit Rate High-Level Register: Calculation formulae of frequency and duty cycle corrected, and note 1 added
		18-46	Figure 18.5 Example of RIIC Initialization Flowchart: Note 1 corrected

Rev.	Date	Description	
		Page	Summary
3.00	Nov 30, 2016	18-67	18.9.1 Slave-Address Match Detection: Body corrected
		18-68	Figure 18.25 AASy Flag Set Timing with 10-Bit Address Format Selected: Error of SDAn signal corrected
		18-72	18.9.4 Host Address Detection: Body corrected
		18-74	18.10.2 NACK Reception Transfer Suspension Function: Body corrected
		18-74	Figure 18.31 Suspension of Data Transfer when NACK is Received (NACKE = 1) corrected
		18-88	18.14 SMBus Operation: Body corrected
		19. Serial Sound Interface	
		19-21	19.3.12 FC Status Register (SSIFCSR): Error in the table corrected
		20. Media Local Bus	
		20-1	Description added
		21. CAN Interface	
		21-6	Figure 21.1 RS-CAN Module Block Diagram corrected
		22. IEBus Controller	
		22-1	Description added
		22-1	22.1 IEBB Features: Body corrected
		22-5	22.3.1 IEBBn register overview: Body corrected
		22-30	22.3.2 (14) IEBBnTMS - IEBBn transfer mode setting register: Body corrected
		24. CD-ROM Decoder	
		24-1	Description added
		24-46	24.6.8 Note on Software Reset added
		25. LIN Interface	
		25-1	Description added
		25-12	Table 25.13 RLN3nLBFC register contents: Error in the function column of bits 5 and 4 (BDT[1:0]) corrected
		25-13	Table 25.14 RLN3nLSC register contents: Error of the function column of bits 5 and 4 (IBS[1:0]) corrected
		25-36	25.6 LIN Reset Mode: Body corrected
		26. Ethernet Controller	
		26-2	Figure 26.1 Configuration of ETHER corrected
		26-57, 26-58	26.4.1 (2) Receive Descriptor, (a) Receive Descriptor 0 (RD0): Description of bits 29 and 28 (RFP[1:0]) and bits 25 to 16 (RFS[9:0]) corrected
		26-59	26.4.1 (2) Receive Descriptor, (b) Receive Descriptor 1 (RD1): Description of bits 31 to 16 (RBL[15:0]) corrected
		26-61	26.4.1 (3) Descriptor and Transmit/Receive Buffer, (b) Reception: Body corrected
		26-61	Figure 26.6 Relationship between Receive Descriptor and Receive Buffer corrected
		26-69	Figure 26.11 Sample Reception Flowchart (Single-Frame/Single-Descriptor): Title and figure corrected
		26-70	26.4.3 (2) Reception Error Processing, (b) Receive FIFO Overflow: Error in the body corrected
		26-74	Table 26.5 List of ETHER Interrupts: Error in “Register and Bit” corrected (EESR0.TC)
		26-84	26.6.3 Software Reset added
		27. A/D Converter	
		27-25	Figure 27.9 Example of Analog Input Circuit: Note deleted
		27-25	Table 27.8 Analog Input Pin Ratings: Note added
		30. Video Display Controller 5 (2): Input Controller	
		30-24	Table 30.19 YCbCr/RGB Signal Reception Timing corrected
		31. Video Display Controller 5 (3): Scaler	
		31-1	Figure 31.1 Functional Block Diagram of Scaler 0 corrected
		31-9	31.1.4 (2) Generating a Full-Screen Enable Signal: Body corrected
		31-27	Table 31.29 Frame Buffer Transfer Mode: Description corrected
		31-61	31.2.29 Writing Mode Register (SC0_SCL1_WR1): Description of bit 0 (SC0_RES_BST_MD) corrected
		31-74	31.2.49 Frame Buffer Control Register 1 (Graphics 0) (GR0_FLM1): Note corrected
		33. Video Display Controller 5 (5): Image Synthesizer	
		33-22	33.1.14 Alpha Blending Calculation: Body corrected

Rev.	Date	Description	
		Page	Summary
3.00	Nov 30, 2016	33-27	Table 33.28 CLUT Table Configuration: Abbreviation corrected
		34. Video Display Controller 5 (7): Output Controller	
		34-4	34.1.6 (2) Offset calculation formulas for each area: Calculation formula corrected
		34-34	34.2.4 Area Setting Register G1 in Gamma Correction Block (GAM_G_AREA1): Error corrected
		34-35	34.2.5 Area Setting Register G2 in Gamma Correction Block (GAM_G_AREA2): Error corrected
		34-45	34.2.14 Area Setting Register B1 in Gamma Correction Block (GAM_B_AREA1): Error corrected
		34-46	34.2.15 Area Setting Register B2 in Gamma Correction Block (GAM_B_AREA2): Error corrected
		34-56	34.2.24 Area Setting Register R1 in Gamma Correction Block (GAM_R_AREA1): Error corrected
		34-57	34.2.25 Area Setting Register R2 in Gamma Correction Block (GAM_R_AREA2): Error corrected
		36. Capture Engine Unit	
		36-2	Table 36.1 Functional Overview of CEU: The description of "Binary data" within the classification of "Connectable camera" corrected
		36-5	Figure 36.2 Register Plane Switching Timing (VD Polarity is High-Active in Data Enable Fetch Mode): Title corrected
		36-7	Body corrected
		36-12 to 36-13	36.4.3 Capture Interface Control Register (CAMCR): Body corrected. Description of bit 27 (VDSEL), bit 26 (HDSEL), bit 25 (FLDSEL), and bit 24 (DSEL) added. Description of bits 5 and 4 (JPG[1:0]) and bit 1 (VDPOL) corrected. Note added.
		36-14	Body corrected
		36-15	Figure 36.14 Relationship between the VIO_VD and VIO_HD signals and the VD Interrupt when VD and HD are High-Active (in Image Capture Mode or Data Synchronous Fetch Mode): Title corrected
		36-15	Figure 36.15 Relationship between the VIO_VD and VIO_HD signals and the VD Interrupt when VD and HD are High-Active (in Image Capture Mode or Data Synchronous Fetch Mode) added
		36-47	36.4.22 Capture Event Flag Clear Register (CETCR): Description of bit 9 (VD) corrected
		36-59	36.5.1 (1) Clock Frequency: Body corrected
		36-60	36.5.4 Software Reset added
		37. SCUX	
		37-3	Table 37.1 Pin Configuration: Note 1 added to MLB_CLK
		37-70	37.3.68 FFD0_n Timing Select Register (FDTSELn_CIM) (n = 0, 1, 2, 3): Description of bits 3 to 0 (SCKSEL) corrected
		37-71	Figure 37.4 Configuration Diagram of Input Timing Signal Selector corrected
		37-72	37.3.69 FFU0_n Timing Select Register (FDTSELn_CIM) (n = 0, 1, 2, 3): Description of bits 3 to 0 (SCKSEL) corrected
		37-73	Figure 37.5 Configuration Diagram of Output Timing Signal Selector corrected
		37-114	37.5 Usage Note added
		38. SD Host Interface	
		38-1 to 38-56	Some specifications that don't require an NDA have been disclosed.
		39. MMC Host Interface	
		39-42	39.8.3 Software Reset added
		40. On-Chip RAM	
		40-1	40.1 Features: Body corrected
		40-1	Table 40.1 Address Spaces of On-Chip Large-Capacity RAM: Note added
		41. Ports	
		41-12	Table 41.7 Alternative Functions for Which the PIPCn.PIPCnm Bit Should be Set to 0: SSITxD4 deleted
		41-13	41.3.15 Serial Sound Interface Noise Canceler Control Register (SNCR): Body corrected, description of bit 6 (ETSEL) added, and note added
		41-17	Table 41.15 Pin Function (P2): Table corrected, and note added
		41-19	Table 41.19 Pin Function (P4): Table corrected, and note added
		41-20	Table 41.21 Pin Function (P5): Table corrected, and note added
		41-21	Table 41.23 Pin Function (P6): Table corrected, and notes 1 to 3 added
		41-23	Table 41.25 Pin Function (P7): Table corrected, and notes 1 and 2 added

Rev.	Date	Description	
		Page	Summary
3.00	Nov 30, 2016	42. Power-Down Modes	
		42-3	Table 42.2 Register Configuration corrected
		42-6	42.2.3 Standby Control Register 3 (STBCR3): Note 1 added to bit 7 (MSTP37) and bit 5 (MSTP35)
		42-9	42.2.6 Standby Control Register 6 (STBCR6): Description of bit 1 (MSTP61) added, and note 2 added to bit 1 (MSTP61)
		42-11	42.2.8 Standby Control Register 8 (STBCR8): Description of bit 2 (MSTP82) added, note 2 added to bit 3 (MSTP83), and note 3 added to bit 2 (MSTP82)
		42-13	42.2.10 Standby Control Register 10 (STBCR10): Note 1 added to bit 2 (MSTP102)
		42-15	42.2.12 Standby Control Register 12 (STBCR12): Note added
		42-17	42.2.14 Software Reset Control Register 2 (SWRSTCR2) added
		42-22	42.2.19 Standby Request Register 1 (STBREQ1): Description of bit 3 (STBRQ13) and bit 2 (STBRQ12) added, and note 2 added to bit 3 (STBRQ13) and bit 2 (STBRQ12)
		42-23	42.2.20 Standby Request Register 2 (STBREQ2): Note 2 added to bit 7 (STBRQ27)
		42-24	42.2.21 Standby Acknowledge Register 1 (STBACK1): Description of bit 3 (STBAK13) and bit 2 (STBAK12) added, and note 2 added to bit 3 (STBAK13) and bit 2 (STBAK12)
		42-25	42.2.22 Standby Acknowledge Register 2 (STBACK2): Note 2 added to bit 7 (STBAK27)
		42-34	42.3.2 (1) Transition to Software Standby Mode: Body corrected
		42-36	42.3.4 (1) Transition to Deep Standby Mode: Body corrected
		42-39	42.3.4 (2) Canceling Deep Standby Mode: Body corrected
		42-41	42.3.5 (1) Transition to Module Standby Function: Body corrected
		43-42	42.3.6 Software Reset: Body corrected
		42-42	42.3.7 Adjustment of XTAL Crystal Oscillator Gain: Body corrected
		42-43	42.4.3 Usage Notes Applying when the USB_X1 Pin is not to be Used added
		43. Debugger Interface	
		43-5	Table 43.7 Pin Configuration: Function of the test data output (pin name: TDO) corrected, and note corrected
		43-6	Table 43.8 List of Registers of Boundary-Scan TAP Controller: Initial value of ID register (BSID) corrected, and notes 1 and 2 added
		43-11	43.3.4 ID Register (BSID): Initial value and description of bits 31 to 0 (DID[31:0]) corrected, and notes 1 and 2 added
		43-15	Table 43.12 Reset Signal Setting: Note 2 corrected, and note 3 added
		44. JPEG Codec Unit	
		44-1 to 44-46	Added
		45. EthernetAVB	
		45-1 to 45-198	Added
		46. List of Registers	
		46-1 to 46-66	Table 46.1 Register Addresses: Register addresses of SD host interface, JPEG codec unit, and EthernetAVB added. Notes 1 and 2 added.
		46-67 to 46-227	Table 46.2 Register Bits: Bits of SD host interface, JPEG codec unit, and EthernetAVB added. Notes 1 to 6 added.
		46-228, 46-229	Table 46.3 Register States: Register states of SD host interface, JPEG codec unit, and EthernetAVB added. Notes 12 and 13 added.
		47. Electrical Characteristics	
		47-8	Table 47.5 Clock Timing: Table corrected, and note added
		47-9	Figure 47.3 Power-On Oscillation Settling Time corrected
		47-9	Figure 47.4 Oscillation Settling Time on Return from Standby (Return by Reset) corrected
		47-10	Figure 47.5 Oscillation Settling Time on Return from Standby (Return by NMI or IRQ) corrected
		47-10	Figure 47.6 On-chip Oscillation Circuit Oscillation Settling Time: Title and figure corrected
		47-11	Table 47.6 Control Signal Timing: Table corrected, and notes 1 and 2 added
		47-11	Figure 47.7 (1) Reset Input Timing 1: Title corrected
		47-11	Figure 47.7 (3) Reset Input Timing 2 added

Rev.	Date	Description	
		Page	Summary
3.00	Nov 30, 2016	47-12	Figure 47.7 (4) Reset Input Timing 3 added
		47-47	Table 47.14 SPI Multi I/O Bus Controller Timing: Table corrected, and note 2 added
		47-48	Figure 47.47 SDR Transfer Format Transmission and Reception Timing (CPHAT = 0, CPHAR = 0): Title and figure corrected
		47-48	Figure 47.48 SDR Transfer Format Transmission and Reception Timing (CPHAT = 1, CPHAR = 1): Title and figure corrected
		47-49	Figure 47.49 DDR Transfer Format Transmission and Reception Timing (CPHAT = 0, CPHAR = 0) (RZ/A1LU only) added
		47-49	Figure 47.50 DDR Transfer Format Transmission and Reception Timing (CPHAT = 1, CPHAR = 1) (RZ/A1LU only) added
		47-49	Figure 47.51 Timing for Switching the Buffers on and off (CPHAT = 0, CPHAR = 0) corrected
		47-49	Figure 47.52 Timing for Switching the Buffers on and off (CPHAT = 1, CPHAR = 1) corrected
		47-51	Table 47.16 Serial Sound Interface Timing: Table corrected, and note added
		47-54	47.4.13 Media Local Bus Timing: Description added
		47-56	47.4.15 Ethernet Controller and EthernetAVB Timing: Title corrected, and description added
		47-56	Table 47.19 Ethernet Controller and EthernetAVB Timing: Title and table corrected, and note added
		47-57	Figure 47.65 gPTP Timer External Clock Timing added
		47-58	Figure 47.66 Timer Capture Signal Timing added
		47-62	Table 47.24 Video Display Controller 5 Timing: Table corrected, and notes 1 and 2 added
		47-64	Table 47.25 Capture Engine Unit Module Signal Timing corrected
		47-65	Figure 47.78 (1) Capture Engine Unit Module Signal Timing when Data is Captured at the Rising Edges of VIO_CLK : Title and figure corrected
		47-65	Figure 47.78 (2) Capture Engine Unit Module Signal Timing when Data is Captured at the Falling Edges of VIO_CLK (RZ/A1LU and RZ/A1LC Only) added
		47-69	47.4.23 AC Characteristics Measurement Conditions: Body corrected
		48. States and Handling of Pins	
		48-2, 48-3, 48-4, 48-5	Table 48.1 Pin States: Table corrected, [Legend] corrected, notes 2 and 14 corrected, and notes 16 and 17 added
		48-6	Table 48.2 Handling of Unused Pins (Except for Debugger Interface Pins): Note 2 added
		48-6	Table 48.3 Handling of Debugger Interface Pins (when Emulator is not Used): Note 3 added
4.00	Mar 19. 2018	All	Trademarks of Arm changed
		1. Overview	
		1-3	Table 1.1 Features of RZ/A1L, RZ/A1LU, and RZ/A1LC: Specification of SPI multi I/O bus controller corrected
		1-4	Table 1.1 Features of RZ/A1L, RZ/A1LU, and RZ/A1LC: Specification of media local bus (RZ/A1L only) corrected
		1-8	Table 1.1 Features of RZ/A1L, RZ/A1LU, and RZ/A1LC: “233-pin BGA” added to specification of Package
		1-9	Table 1.2 Product Lineup: R7S721031VCBG and R7S721031VLBG added to the RZ/A1LU group
		1-13	Figure 1.4 Pin Assignment of the 233-pin BGA (Upper Perspective View): Newly added
		1-16	Table 1.3 Pin Functions: I/O column of the $\overline{\text{RTS2}}$ to $\overline{\text{RTS0}}$ and $\overline{\text{CTS2}}$ to $\overline{\text{CTS0}}$ pins in the serial communication interface with FIFO corrected
		1-19	Table 1.3 Pin Functions: Symbol of capture engine unit corrected
		1-20 to 1-24	Table 1.4 List of Pins: Column “233 BGA” and note on pins to which the PVcc, Vcc, and Vss functions can be allocated on 233-pin BGA products added
		2. CPU	
		2-2	Table 2.1 Cortex-A9 Configuration Signal Settings: Setting value of CLUSTERID signal corrected
		6. Clock Pulse Generator	
		6-20	6.11 Usage Note added and 6.11.1 Notes on the SSCG added
		7. Interrupt Controller	
		7-36	Figure 7.2 Flow of Initial Settings: Description corrected
		7-40	7.8.2 Notes on Selecting IRQ Interrupt Pin Functions: Body corrected
		7-41	7.8.4 Notes on Using IRQ Pins as Triggers for Release from Standby when Software Standby is in Use: Newly added

Rev.	Date	Description	
		Page	Summary
4.00	Mar 19. 2018	8. Bus State Controller	
		8-27	8.4.4 SDRAM Control Register (SDCR): Description of bit 10 (RMODE) corrected
		16. Renesas Serial Peripheral Interface	
		16-12	Table 16.3 Relationship between SPBR and BRDV1 and BRDV0 Settings: Note 1 added
		18. I²C Bus Interface	
		18-40	Table 18.21 Examples of RIICnBRH/RIICnBRL Settings for Transfer Rate (when RIICnFER.SCLE = 1 and RIICnFER.NFE = 0): Description corrected
			Table 18.22 Examples of RIICnBRH/RIICnBRL Settings for Transfer Rate (when RIICnFER.SCLE = 1, RIICnFER.NFE= 1, and Number of NF Stages = 4): Description corrected
		20. Media Local Bus	
		20-1	20.1 Features: Body corrected
		20-2	20.3 Register Description: Body corrected
		20-2	Table 20.2 Register Configuration: Note 1 corrected
		25. LIN Interface	
		25-31	25.3.1.19 RLN3nLDBRm — LIN Data Buffer m Register (m = 1 to 8): Description under "For response reception" corrected
		26. Ethernet Controller	
		26-4	Table 26.2 Register Configuration: CAM entry table specification enable register (common), CAM entry table POST 1 register, CAM entry table POST 2 register, CAM entry table POST 3 register, and CAM entry table POST 4 register added
		26-22	26.3.21 CAM Entry Table Specification Enable Register (Common) (TSU_FWSLC): Newly added
		26-27	26.3.25 CAM Entry Table POST 1 Register (TSU_POST1): Newly added
		26-28	26.3.26 CAM Entry Table POST 2 Register (TSU_POST2): Newly added
		26-29	26.3.27 CAM Entry Table POST 3 Register (TSU_POST3): Newly added
		26-30	26.3.28 CAM Entry Table POST 4 Register (TSU_POST4): Newly added
		26-66	26.4.1 (2) (b) Receive Descriptor 1 (RD1): Descriptions of bits 31 to 16 (RBL[15:0]) and bits 15 to 0 (RDL[15:0]) corrected
		26-93	Figure 26.23 Data Subject to Checksum Calculation and Figure 26.24 Data after Checksum Data Addition: Corrected
		29. Video Display Controller 5 (1): Overview	
		29-1	Table 29.1 Features of Video Display Controller 5: Function of operating frequency corrected
		31. Video Display Controller 5 (3): Scaler	
		31-23	Table 31.22 Control of Interrupt on Specified Image Line before Scaling-down, and Reading of Current Image line before Scaling-down: Description of the SC_RES_LINE[10:0] bits of the SC_SCL0_INT register corrected
		31-46	31.2.11 Interrupt Control Register (SC0_SCL0_INT): Description of bits 10 to 0 (SC0_RES_LINE[10:0]) corrected
		33. Video Display Controller 5 (5): Image Synthesizer	
		33-22	33.1.15 CLUT Table: Body corrected
		33-23	33.1.16 Multiplication Processing with Current Alpha at Alpha Blending in Rectangular Area: Body corrected
		35. Video Display Controller 5 (8):System Controller	
		35-1	Table 35.1 Interrupt Signals: Function of the INT_STA 9 bit of the S0_WLINE request source corrected
		35-2	Table 35.2 Interrupt Clear/Hold Settings: Description of the INT_STA9 bit of the SYSCNT_INT2 register corrected
		35-3	Table 35.3 Interrupt Output On/Off Settings: Description of the INT_OUT9_ON bit of the SYSCNT_INT5 register corrected
		35-9	35.2.2 Interrupt Control Register 2 (SYSCNT_INT2): Description of bit 4 (INT_STA9) corrected
		35-11	35.2.4 Interrupt Control Register 5 (SYSCNT_INT5): Description of bit 4 (INT_OUT9_ON) corrected
		37. SCUX	
		37-66	37.3.65 DMA Transfer Register for FFD0_n (DMATDn_CIM) (n = 0, 1, 2, 3): Body corrected
		37-67	37.3.66 DMA Transfer Register for FFU0_n (DMATUn_CIM) (n = 0, 1, 2, 3): Body corrected
		42. Power-Down Modes	
		42-21	42.2.18 CPU Status Register (CPUSTS): Description of bit 7 to 5 and bit 3 to 0 corrected
		42-24	42.2.21 Standby Acknowledge Register 1 (STBACK1): Descriptions of bits 7, 6, 4, and 1 corrected
		42-25	42.2.22 Standby Acknowledge Register 2 (STBACK2): Description of bits 4 to 0 corrected

Rev.	Date	Description	
		Page	Summary
4.00	Mar 19. 2018	42-44	42.4.4 Notes on Using IRQ Pins as Triggers for Release from Standby when Software Standby is in Use: Newly added
		43. Debugger Interface	
		43-12	Table 43.11 Configuration of ICE Registers: Initial value of mode reset control register (ICEREGMDRSTCTL) corrected
			43.4.1 Mode Reset Control Register (ICEREGMDRSTCTL): Initial value and description of bits 15 to 13 corrected
			43.4.1 Mode Reset Control Register (ICEREGMDRSTCTL): Initial value and description of bits 11 to 9 corrected
		45. EthernetAVB	
		45-199	Figure 45.69 Data Subject to Checksum Calculation and Figure 45.70 Data after Checksum Data Addition: Corrected
		46. List of Registers	
		46-11	Table 46.1 Register Addresses: Address of CPU interface implementer identification register (ICCIIDR) corrected
		46-33	Table 46.1 Register Addresses: CAM entry table specification enable register (common) (TSU_FWSLC), CAM entry table POST 1 register (TSU_POST1), CAM entry table POST 2 register (TSU_POST2), CAM entry table POST 3 register (TSU_POST3), and CAM entry table POST 4 register (TSU_POST4) added
		46-128	Table 46.2 Register Bits: TSU_FWSLC, TSU_POST1, TSU_POST2, TSU_POST3, and TSU_POST4 registers added
		46-231	Table 46.3 Register States: SDIR*7 register of the debugger interface module and note 7 deleted
		47. Electrical Characteristics	
		47-8	Table 47.5 Clock Timing: Figures for reference of on-chip PLL circuit oscillation settling time, on-chip oscillation circuit oscillation settling time (other than above), and mode hold time corrected
			Table 47.5 Clock Timing: SSCG stabilizing time added
		47-9	Figure 47.4 SSCG Stabilizing Time: Newly added
		47-10	Figure 47.5 (1) Oscillation Stabilizing Time on Return from Standby (Return by Reset) and Figure 47.5 (2) Oscillation Stabilizing Time on Return from Standby (Return by NMI or IRQ): Figure numbers corrected
		47-11	Table 47.6 Control Signal Timing: Figures for reference of $\overline{\text{RES}}$ pulse width and $\overline{\text{TRST}}$ pulse width corrected
			Table 47.6 Control Signal Timing: Figures for reference of NMI pulse width, IRQ pulse width, and TINT pulse width corrected
		47-68	47.4.20 SD Host Interface Timing: Newly added
		Appendix	
		Appendix-1 to Appendix-3	Package Dimensions A.1, A.2, A.3: Corrected
		Appendix-4	Package Dimensions A.4: Newly added
