The serial sound interface mode used to transfer the stream data may affect the order (through the endian setting) or lead to padding before the data is transferred. To handle the different arrangements of data appropriately, the stream-data input control block includes a register for changing the operating mode and generates signals to control the core of the CD-ROM decoder.
The data holding registers for the input stream consists of two 16-bit registers. The data holding registers are controlled according to the mode set in the control register. For example, controlling the order in which 16-bit data is supplied to the core of the CD-ROM decoder (sending the second 16-bytes first or vice versa). It is also possible to stop the supply of padding data to the core of the CD-ROM decoder.

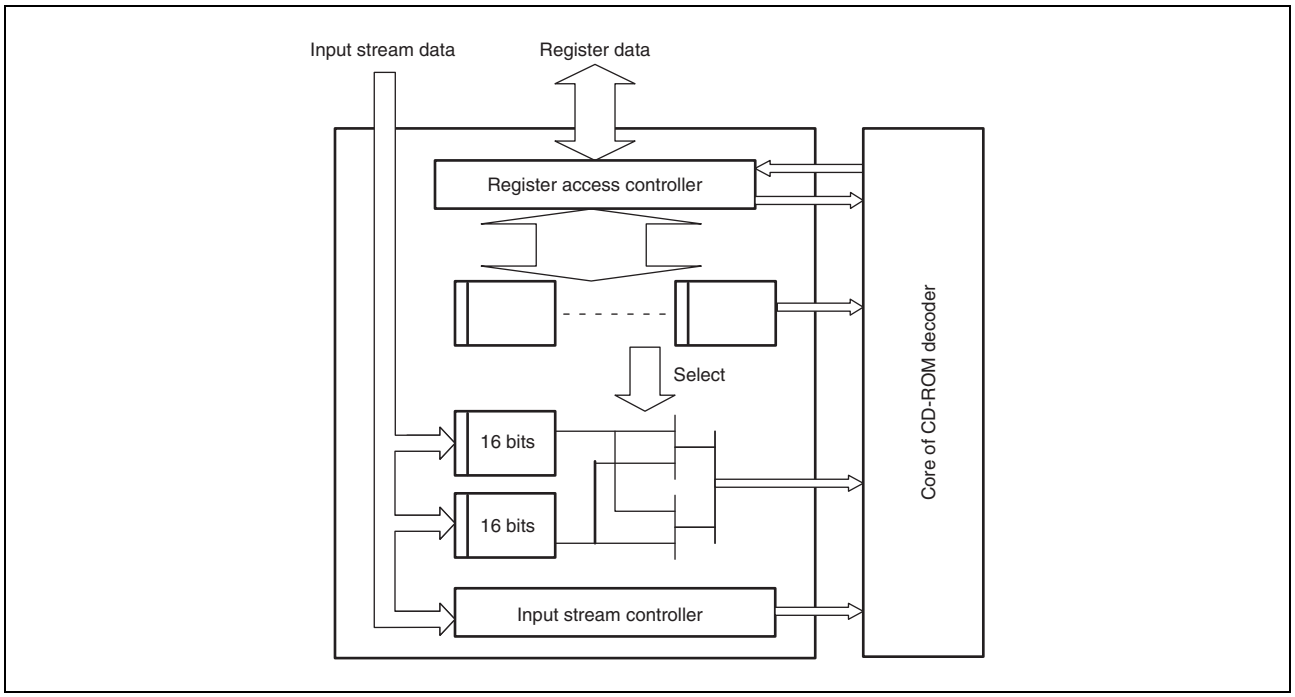

Figure 24.4 Schematic Diagram of the Stream-Data Input Control Block

Figure 24.5 is a schematic diagram of the stream-data output control block.
On recognizing that one sector of CD-ROM data is ready in the core of the CD-ROM decoder, this block ensures that the output stream-data register in the bus bridge section is empty and then starts to acquire the data for output from the core of the CD-ROM decoder.

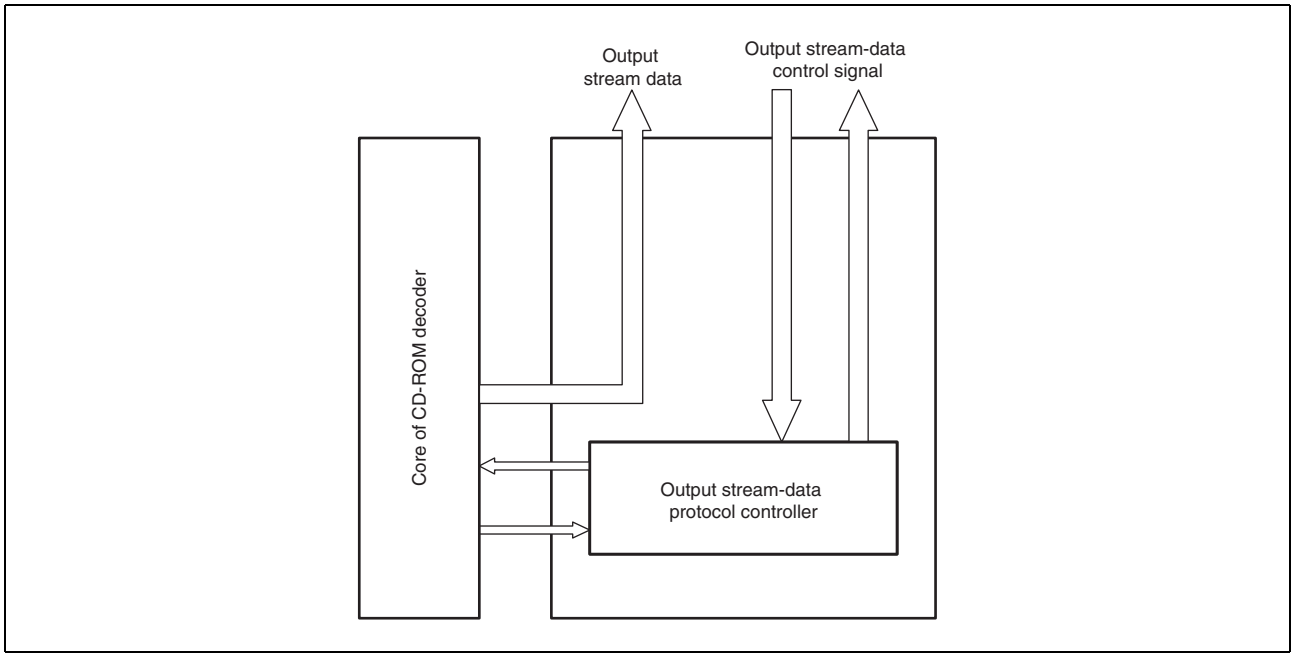

Figure 24.5 Schematic Diagram of the Stream-Data Output Control Block

This block has functions related to interrupts and direct memory access controller activation control such as suspending and masking of interrupts, turning interrupt flags off after they are read, asserting the activation signal to the direct

memory access controller, and negating the activation signal according to the detected amount of data that has been transferred.

24.3 Register Descriptions

This module has the following registers.

Table 24.1 Register Configuration

Name	Abbreviation	R/W	Initial Value	Address	Access Size
Enable control register	CROMEN	R/W	H'00	0xE8005000	8
Sync code-based synchronization control register	CROMSY0	R/W	H'89	0xE8005001	8
Decoding mode control register	CROMCTL0	R/W	H'82	0xE8005002	8
EDC/ECC check control register	CROMCTL1	R/W	H'D1	0xE8005003	8
Automatic decoding stop control register	CROMCTL3	R/W	H'00	0xE8005005	8
Decoding option setting control register	CROMCTL4	R/W	H'00	0xE8005006	8
HEAD20 to HEAD22 representation control register	CROMCTL5	R/W	H'00	0xE8005007	8
Sync code status register	CROMST0	R	H'00	0xE8005008	8
Post-ECC header error status register	CROMST1	R	H'00	0xE8005009	8
Post-ECC subheader error status register	CROMST3	R	H'00	0xE800500B	8
Header/subheader validity check status register	CROMST4	R	H'00	0xE800500C	8
Mode determination and link sector detection status register	CROMST5	R	H'00	0xE800500D	8
ECC/EDC error status register	CROMST6	R	H'00	0xE800500E	8
Buffer status register	CBUFST0	R	H'00	0xE8005014	8
Decoding stoppage source status register	CBUFST1	R	H'00	0xE8005015	8
Buffer overflow status register	CBUFST2	R	H'00	0xE8005016	8
Pre-ECC correction header: minutes data register	HEAD00	R	H'00	0xE8005018	8
Pre-ECC correction header: seconds data register	HEAD01	R	H'00	0xE8005019	8
Pre-ECC correction header: frames (1/75 second) data register	HEAD02	R	H'00	0xE800501A	8
Pre-ECC correction header: mode data register	HEAD03	R	H'00	0xE800501B	8
Pre-ECC correction subheader: file number (byte 16) data register	SHEAD00	R	H'00	0xE800501C	8
Pre-ECC correction subheader: channel number (byte 17) data register	SHEAD01	R	H'00	0xE800501D	8
Pre-ECC correction subheader: sub-mode (byte 18) data register	SHEAD02	R	H'00	0xE800501E	8
Pre-ECC correction subheader: data type (byte 19) data register	SHEAD03	R	H'00	0xE800501F	8
Pre-ECC correction subheader: file number (byte 20) data register	SHEAD04	R	H'00	0xE8005020	8
Pre-ECC correction subheader: channel number (byte 21) data register	SHEAD05	R	H'00	0xE8005021	8
Pre-ECC correction subheader: sub-mode (byte 22) data register	SHEAD06	R	H'00	0xE8005022	8
Pre-ECC correction subheader: data type (byte 23) data register	SHEAD07	R	H'00	0xE8005023	8
Post-ECC correction header: minutes data register	HEAD20	R	H'00	0xE8005024	8
Post-ECC correction header: seconds data register	HEAD21	R	H'00	0xE8005025	8
Post-ECC correction header: frames (1/75 second) data register	HEAD22	R	H'00	0xE8005026	8
Post-ECC correction header: mode data register	HEAD23	R	H'00	0xE8005027	8
Post-ECC correction subheader: file number (byte 16) data register	SHEAD20	R	H'00	0xE8005028	8
Post-ECC correction subheader: channel number (byte 17) data register	SHEAD21	R	H'00	0xE8005029	8
Post-ECC correction subheader: sub-mode (byte 18) data register	SHEAD22	R	H'00	0xE800502A	8
Post-ECC correction subheader: data type (byte 19) data register	SHEAD23	R	H'00	0xE800502B	8

Table 24.1 Register Configuration

Name	Abbreviation	R/W	Initial Value	Address	Access Size
Post-ECC correction subheader: file number (byte 20) data register	SHEAD24	R	H'00	0xE800502C	8
Post-ECC correction subheader: channel number (byte 21) data register	SHEAD25	R	H'00	0xE800502D	8
Post-ECC correction subheader: sub-mode (byte 22) data register	SHEAD26	R	H'00	0xE800502E	8
Post-ECC correction subheader: data type (byte 23) data register	SHEAD27	R	H'00	0xE800502F	8
Automatic buffering setting control register	CBUFCTL0	R/W	H'04	0xE8005040	8
Automatic buffering start sector setting: minutes control register	CBUFCTL1	R/W	H'00	0xE8005041	8
Automatic buffering start sector setting: seconds control register	CBUFCTL2	R/W	H'00	0xE8005042	8
Automatic buffering start sector setting: frames control register	CBUFCTL3	R/W	H'00	0xE8005043	8
ISY interrupt source mask control register	CROMST0M	R/W	H'00	0xE8005045	8
CD-ROM decoder reset control register	ROMDECRST	R/W	H'00	0xE8005100	8
CD-ROM decoder reset status register	RSTSTAT	R	H'00	0xE8005101	8
Serial sound interface data control register	SSI	R/W	H'18	0xE8005102	8
Interrupt flag register	INTHOLD	R/W	H'00	0xE8005108	8
Interrupt source mask control register	INHINT	R/W	H'00	0xE8005109	8
CD-ROM decoder stream data input register	STRMDIN0	R/W	H'0000	0xE8005200	R: 16 W: 16, 32
CD-ROM decoder stream data input register	STRMDIN2	R/W	H'0000	0xE8005202	16
CD-ROM decoder stream data output register	STRMDOUT0	R	H'0000	0xE8005204	16

24.3.1 Enable Control Register (CROMEN)

The enable control register (CROMEN) enables subcode processing and CD-ROM decoding, and stops CD-ROM decoding forcibly.

Bit:	7	6	5	4	3	2	1	0
	SUBC_EN	CROM_EN	CROM_STP	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	SUBC_EN	0	R/W	Subcode Processing Enable This bit should be set and cleared simultaneously with CROM_EN. It is automatically cleared when decoding is automatically stopped due to an abnormal condition or when CROM_STP = 1
6	CROM_EN	0	R/W	CD-ROM Decoding Enable When this bit is set to 1, CD-ROM decoding starts after detection of a valid sync code. When the bit is cleared to 0, decoding stops on completion of the processing for the sector currently being decoded. This bit is automatically cleared to 0 when the automatic decode-stopping function woks or when CROM_STP = 1.
5	CROM_STP	0	R/W	Forcible Stop of CD-ROM Decoding When this bit is set to 1, CD-ROM decoding is stopped immediately and the SUBC_EN and CROM_EN bits are automatically reset to 0. Before decoding can resume, this bit must be cleared to 0.
4 to 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

24.3.2 Sync Code-Based Synchronization Control Register (CROMSY0)

The sync code-based synchronization control register (CROMSY0) selects the sync code maintenance function.

Bit:	7	6	5	4	3	2	1	0
	SY_AUT	SY_IEN	SY_DEN	-	-	-	-	-
Initial value:	1	0	0	0	1	0	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	SY_AUT	1	R/W	Automatic CD-ROM Sync Code Maintenance Mode When this bit is set to 1, automatic sync maintenance (insertion of sync codes) is applied to obtain the CD-ROM sync codes. While this bit is set, the settings of the SY_IEN and SY_DEN bits are invalid.
6	SY_IEN	0	R/W	Internal Sync Signal Enable Enables the internal sync signal that is produced by the counter in the CD-ROM decoder. When this bit is set to 1 while SY_AUT = 0, synchronization of the CD-ROM data is in interpolated mode, i.e. driven by the internal counter.
5	SY_DEN	0	R/W	Synchronization with External Sync Code Selects constant monitoring for the sync code in the input data and bases synchronization solely on detection of the code, regardless of the value of the internal counter. The setting of this bit is valid when SY_AUT = 0.
4	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
3	—	1	R/W	Reserved This bit is always read as 1. The write value should always be 1.
2, 1	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
0	—	1	R/W	Reserved This bit is always read as 1. The write value should always be 1.

Table 24.2 Register Settings for Sync Code Maintenance Function

SY_AUT	SY_IEN	SY_DEN	Operating Mode
1	—	—	Automatic sync maintenance mode
0	0	1	External sync mode
0	1	0	Interpolated sync mode
0	1	1	Interpolated sync plus external sync mode
0	0	0	Setting prohibited

24.3.3 Decoding Mode Control Register (CROMCTL0)

The decoding mode control register (CROMCTL0) enables/disables the various functions, selects criteria for mode or form determination, and specifies the sector type. The setting of this register becomes valid at the sector-to-sector transition.

Bit:	7	6	5	4	3	2	1	0
	MD_DESC	-	MD_AUTO	MD_AUTOS1	MD_AUTOS2	MD_SEC[2:0]		
Initial value:	1	0	0	0	0	0	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MD_DESC	1	R/W	Descrambling Function ON/OFF 0: Disables descrambling function 1: Enables descrambling function
6	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
5	MD_AUTO	0	R/W	Automatic Mode/Form Detection ON/OFF 0: OFF 1: ON Detectable formats are Mode 0, Mode 1, Mode 2 (non-XA), Mode 2 Form 1, and Mode 2 Form 2. If the mode and form cannot be detected, the mode and form of the previous sector is used. If the mode and form of the first sector after decoding starts is undetectable, the setting of the MD_SEC[2:0] bits is used as the initial value.
4	MD_AUTOS1	0	R/W	Criteria for Mode Determination when MD_AUTO = 1 0: Mode determination is made only when the sync code is detected 1: Mode determination is always made The setting of this bit is valid only when the MD_AUTO bit is 1. If the mode cannot be determined, the mode of the previous sector is used. When this bit is cleared to 0, mode determination is made only when the sync code is detected for the sector.
3	MD_AUTOS2	0	R/W	Criteria for Mode 2 Form Determination when MD_AUTO = 1 0: The sector is assumed to be non-XA if the two form code bytes in the subheader do not match 1: No determination of XA or non-XA for the sector. The first form byte is regarded as valid. However, the two form bytes are compared, and the result is reflected in a status bit. The setting of this bit is valid only when the MD_AUTO bit is 1.
2 to 0	MD_SEC[2:0]	010	R/W	Sector Type 000: Setting prohibited 001: Mode 0 010: Mode 1 011: Long (Mode 0, Mode 1, or Mode 2 with no EDC/ECC data) 100: Setting prohibited 101: Mode 2 Form 1 110: Mode 2 Form 2 111: Mode 2 with automatic form detection If the form cannot be determined when set to B'111, it is processed as Mode 2 not XA.

24.3.4 EDC/ECC Check Control Register (CROMCTL1)

The EDC/ECC check control register (CROMCTL1) controls EDC/ECC checking. The setting of this register becomes valid at the sector-to-sector transition.

Bit:	7	6	5	4	3	2	1	0
	M2F2 EDC	MD_DEC[2:0]			-	-	MD_PQREP[1:0]	
Initial value:	1	1	0	1	0	0	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	M2F2EDC	1	R/W	For Mode 2 Form 2, disables the EDC function for sectors where all bits of the EDC are 0. When this bit set to 1 and all bits of the EDC for a Mode 2 Form 2 sector are 0, an IERR interrupt is not generated even if the result of EDC checking is 'fail'.
6 to 4	MD_DEC[2:0]	101	R/W	EDC/ECC Checking Mode Select 000: No checking 001: EDC only 010: Q correction + EDC 011: P correction + EDC 100: QP correction + EDC 101: PQ correction + EDC 110: Setting prohibited 111: Setting prohibited
3, 2	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	MD_PQREP[1:0]	01	R/W	Number of Iterations of PQ or QP Correction Number of correction iterations when PQ- or QP- correction is specified by MD_DEC[2:0]. 00: Setting prohibited 01: One iteration 10: Two iterations 11: Three iterations

24.3.5 Automatic Decoding Stop Control Register (CROMCTL3)

The automatic decoding stop control register (CROMCTL3) is used to select abnormal conditions on which decoding will be automatically stopped. When decoding is stopped in response to any of the selected conditions, an IBUF interrupt is generated and the condition is indicated in the CBUFST1 register. The setting of this register becomes valid at the sector-to-sector transition.

Bit:	7	6	5	4	3	2	1	0
	STP_ECC	STP_EDC	-	STP_MD	STP_MIN	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	STP_ECC	0	R/W	When this bit is set to 1, decoding is stopped if an error is found to be not correctable by ECC correction.
6	STP_EDC	0	R/W	When this bit is set to 1, decoding is stopped if post-ECC correction EDC checking indicates an error.
5	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
4	STP_MD	0	R/W	When this bit is set to 1, decoding is stopped if the sector has a mode or form setting that does not match those of the immediately preceding sector.
3	STP_MIN	0	R/W	When this bit is set to 1, decoding is stopped if a non-sequential minutes, seconds, or frames (1 frame = 1/75 second) value is encountered.
2 to 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

24.3.6 Decoding Option Setting Control Register (CROMCTL4)

The decoding option setting control register (CROMCTL4) enables/disables buffering control at link block detection, specifies the information indicated by the status register, and controls the ECC correction mode. The setting of this register becomes valid at the sector-to-sector transition.

Bit:	7	6	5	4	3	2	1	0
	-	LINK2	-	ER0SEL	NO_ECC	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	—	0	R/W	Reserved Either 0 or 1 can be written to this bit. When it is read, the value written will be read.
6	LINK2	0	R/W	Link Block Detection Condition 0: The block is regarded as a link block when either run-out 1 or 2 and both run-in 3 and 4 have been detected. 1: The block is regarded as a link block when two out of run-out 1 and 2 and “link” have been detected. The condition for setting of the LINK_ON bit in CROMST5 is decoding of the link sector.
5	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
4	ER0SEL	0	R/W	CD-ROM Data-Related Status Register Setting Condition 0: Information is on the sector being decoded. 1: Information is on the latest sector that has been buffered. This condition affects the information given by bits 5 to 0 in the CROMST0 register, bits 7 to 1 in the CROMST4 and CROMST5 registers, and HEAD00 to HEAD02.
3	NO_ECC	0	R/W	ECC correction mode when the result of the EDC check before ECC correction was ‘pass’ When this bit is set to 1, ECC correction is not performed if the result of pre-ECC correction EDC checking is a ‘pass’, regardless of the results of syndrome calculation.
2 to 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

24.3.7 HEAD20 to HEAD22 Representation Control Register (CROMCTL5)

The HEAD20 to HEAD22 representation control register (CROMCTL5) specifies the representation mode for HEAD20 to HEAD22.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	MSF_LBA_SEL
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
0	MSF_LBA_SEL	0	R/W	HEAD20 to HEAD22 Representation Mode 0: Header MSF is represented in BCD (decimal) as is 1: Total sector number is represented in HEX (hexadecimal)

24.3.8 Sync Code Status Register (CROMST0)

The sync code status register (CROMST0) indicates various status information in sync code maintenance modes.

Bit:	7	6	5	4	3	2	1	0
	-	-	ST_SYIL	ST_SYNO	ST_BLKS	ST_BLKL	ST_SECS	ST_SECL
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.
5	ST_SYIL	0	R	Indicates that a sync code was detected at a position where the value in the word counter (used to measure intervals between sync codes) was not correct, but the sync code was ignored and not taken into account in synchronization. This bit is only valid in automatic sync maintenance mode and interpolated sync mode.
4	ST_SYNO	0	R	Indicates that a sync code has not been detected despite the word counter having reached the final value, and synchronization has been continued with the aid of an interpolated sync code. This bit is only valid in automatic sync maintenance mode and interpolated sync mode.
3	ST_BLKS	0	R	Indicates that a sync code was detected at a position where the value in the word counter was not correct, and the sync code was used in synchronization. This bit is only valid in automatic sync maintenance mode and external sync mode.
2	ST_BLKL	0	R	Indicates that a sync code has not been detected despite the word counter having reached the final value, and the period of the sector has been prolonged. This bit is only valid in external sync mode.
1	ST_SECS	0	R	Indicates that a sector has been processed as a short sector with the aid of interpolated sync codes. If this bit is set to 1, stop decoding immediately and retry the procedure starting from the sector prior to the sector currently being decoded.
0	ST_SECL	0	R	Indicates that a sector has been processed as a long sector with the aid of interpolated sync codes. If this bit is set to 1, stop decoding immediately and retry the procedure starting from two sectors prior to the sector currently being decoded.

24.3.9 Post-ECC Header Error Status Register (CROMST1)

The post-ECC header error status register (CROMST1) indicates error status in the post-ECC header.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	ER2_HEAD0	ER2_HEAD1	ER2_HEAD2	ER2_HEAD3
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.
3	ER2_HEAD0	0	R	Indicates an error in the minutes field of the header after ECC correction.
2	ER2_HEAD1	0	R	Indicates an error status in the seconds field of the header after ECC correction.
1	ER2_HEAD2	0	R	Indicates an error in the frames (1 frame = 1/75 second) field of the header after ECC correction.
0	ER2_HEAD3	0	R	Indicates an error in the mode field of the header after ECC correction.

24.3.10 Post-ECC Subheader Error Status Register (CROMST3)

The post-ECC subheader error status register (CROMST3) indicates error status in the post-ECC subheader.

Bit:	7	6	5	4	3	2	1	0
	ER2_SHEAD0	ER2_SHEAD1	ER2_SHEAD2	ER2_SHEAD3	ER2_SHEAD4	ER2_HEAD5	ER2_HEAD6	ER2_HEAD7
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	ER2_SHEAD0	0	R	Indicates that the subheader (file number) still has an error after ECC correction. Indicates the error of the SHEAD20 register.
6	ER2_SHEAD1	0	R	Indicates that the subheader (channel number) still has an error after ECC correction. Indicates the error of the SHEAD21 register.
5	ER2_SHEAD2	0	R	Indicates that the subheader (sub-mode) still has an error after ECC correction. Indicates the error of the SHEAD22 register.
4	ER2_SHEAD3	0	R	Indicates that the subheader (data type) still has an error after ECC correction. Indicates the error of the SHEAD23 register.
3	ER2_SHEAD4	0	R	Indicates that the subheader (file number) still has an error after ECC correction. Indicates the error of the SHEAD24 register.
2	ER2_SHEAD5	0	R	Indicates that the subheader (channel number) still has an error after ECC correction. Indicates the error of the SHEAD25 register.
1	ER2_SHEAD6	0	R	Indicates that the subheader (sub-mode) still has an error after ECC correction. Indicates the error of the SHEAD26 register.
0	ER2_SHEAD7	0	R	Indicates that the subheader (data type) still has an error after ECC correction. Indicates the error of the SHEAD27 register.

24.3.11 Header/Subheader Validity Check Status Register (CROMST4)

The header/subheader validity check status register (CROMST4) indicates errors relating to the automatic mode determination or form determination for Mode 2.

Bit:	7	6	5	4	3	2	1	0
	NG_MD	NG_MDCMP1	NG_MDCMP2	NG_MDCMP3	NG_MDCMP4	NG_MDDEF	NG_MDTIM1	NG_MDTIM2
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	NG_MD	0	R	Indicates that the sector mode could not be determined according to the automatic mode determination criteria.
6	NG_MDCMP1	0	R	Indicates a mismatch between the file number bytes (bytes 16 and 20) during the form determination for Mode 2.
5	NG_MDCMP2	0	R	Indicates a mismatch between the channel number bytes (bytes 17 and 21) during the form determination for Mode 2.
4	NG_MDCMP3	0	R	Indicates a mismatch between the sub-mode bytes (bytes 18 and 22) during the form determination for Mode 2.
3	NG_MDCMP4	0	R	Indicates a mismatch between the data-type bytes (bytes 19 and 23) during the form determination for Mode 2.
2	NG_MDDEF	0	R	Indicates that the mode and form differ from those of the previous sector.
1	NG_MDTIM1	0	R	Indicates that the minutes, seconds, or frames (1 frame = 1/75 second) value is out of sequence. In the continuity check for the next and subsequent sectors, the updated values will be used.
0	NG_MDTIM2	0	R	Indicates that the minutes, seconds, or frames (1 frame = 1/75 second) value was not a BCD value. Specifically, this bit means that any half-byte was beyond the range for BCD (i.e. was A to F), HEAD01 was greater than H'59, or HEAD02 was greater than H'74. In the continuity check for the next and subsequent sectors, interpolated values will be used.

24.3.12 Mode Determination and Link Sector Detection Status Register (CROMST5)

The mode determination and link sector detection status register (CROMST5) indicates the result of automatic mode determination and link block detection.

Bit:	7	6	5	4	3	2	1	0
	ST_AMD[2:0]			ST_MDX	LINK_ON	LINK_ DET	LINK_ SDET	LINK_ OUT1
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	ST_AMD[2:0]	000	R	Result of Automatic Mode Determination These bits indicate the result of mode determination when the automatic mode determination function is used. 000: Automatic mode determination function is not used 001: Mode 0 010: Mode 1 011: — 100: Mode 2 not XA 101: Mode 2 Form 1 110: Mode 2 Form 2 111: —
4	ST_MDX	0	R	Indicates that, when the mode has been manually set rather than automatically determined, the mode setting disagrees with the mode as recognized by the logic. In this case, the manually set value takes priority.
3	LINK_ON	0	R	This bit is set to 1 when a link block was recognized in link block determination. For the criteria for link block determination, refer to the LINK2 bit in the CROMCTL4 register.
2	LINK_DET	0	R	Indicates that a link block (run-out 1 to run-in 4) was detected. Since detection is based on the data before ECC correction, LINK_DET may also be set to 1 if data erroneously happens to contain the same code as a link block.
1	LINK_SDET	0	R	Indicates that a link block was detected within seven sectors after the start of decoding.
0	LINK_OUT1	0	R	Indicates that the sector after ECC correction has been identified as a run-out 1 sector. This bit is only valid when an IERR interrupt is not generated (i.e. when ECC correction was successful).

24.3.13 ECC/EDC Error Status Register (CROMST6)

The ECC/EDC error status register (CROMST6) indicates ECC processing error or EDC check error before/after ECC correction.

Bit:	7	6	5	4	3	2	1	0
	ST_ ERR	-	ST_ ECCABT	ST_ ECCNG	ST_ ECCP	ST_ ECCQ	ST_ EDC1	ST_ EDC2
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	ST_ERR	0	R	Indicates that the decoded block after ECC correction contains any error (even in a single byte).
6	—	0	R	Reserved This bit is always read as 0 and cannot be modified.
5	ST_ECCABT	0	R	Indicates that ECC processing was discontinued. This bit is set to 1 when a transition from sector to sector occurs while ECC correction is in progress. This does not indicate a problem for ECC correction if the BUF_NG bit in the CBUFST2 register is 0 at the same time. Whether or not this is so depends on the timing of the sector transition.
4	ST_ECCNG	0	R	Indicates that error correction was not possible. This bit is also set to 1 on detection of a short sector.
3	ST_ECCP	0	R	Indicates that P-parity errors were not corrected in ECC correction. This bit is only valid when synchronization is normal (the sector is neither short nor long). This bit is set to 1 when the result of syndrome calculation for P parity is other than all 0s.
2	ST_ECCQ	0	R	Indicates that Q-parity errors were not corrected in ECC correction. This bit is only valid when synchronization is normal (the sector is neither short nor long). This bit is set to 1 when the result of syndrome calculation for Q parity is other than all 0s.
1	ST_EDC1	0	R	Indicates that the result of the EDC check before ECC correction was ‘fail’. This bit is also set to 1 if a short sector is encountered while EDC is enabled.
0	ST_EDC2	0	R	Indicates that the result of the EDC check after ECC correction was ‘fail’.

24.3.14 Buffer Status Register (CBUFST0)

The buffer status register (CBUFST0) indicates that the system is searching for the first sector to be buffered, or that buffering is in progress.

Bit:	7	6	5	4	3	2	1	0
	BUF_ REF	BUF_ ACT	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	BUF_REF	0	R	Indicates that the search for the first sector to be buffered is in progress. This bit is only valid when the automatic buffering function is used (CBUF_AUT = 1).
6	BUF_ACT	0	R	Indicates that buffering is in progress.
5 to 0	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.

24.3.15 Decoding Stoppage Source Status Register (CBUFST1)

The decoding stoppage source status register (CBUFST1) indicates that decoding/buffering has been stopped due to some errors.

A bit in this register can only be set when the corresponding bit in the CROMCTL3 register is set to 1.

Bit:	7	6	5	4	3	2	1	0
	BUF_ECC	BUF_EDC	-	BUF_MD	BUF_MIN	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	BUF_ECC	0	R	Indicates that decoding and buffering have been stopped because of an error that is not correctable by using the ECC.
6	BUF_EDC	0	R	Indicates that decoding and buffering have been stopped because the post-ECC correction EDC check indicated an error.
5	—	0	R	Reserved This bit is always read as 0 and cannot be modified.
4	BUF_MD	0	R	Indicates that decoding and buffering have been stopped because the current sector is in a mode or form differing from that of the previous sector.
3	BUF_MIN	0	R	Indicates that decoding and buffering have been stopped because a non-sequential minutes, seconds, or frames (1 frame = 1/75 second) value has been encountered.
2 to 0	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.

24.3.16 Buffer Overflow Status Register (CBUFST2)

The buffer overflow status register (CBUFST2) indicates that a sector-to-sector transition occurred before data transfer to the buffer is completed.

Bit:	7	6	5	4	3	2	1	0
	BUF_NG	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	BUF_NG	0	R	Indicates that a sector-to-sector transition has occurred before the data transfer to the buffer is completed. This bit is set to 1 when the data of a third sector are input while data for the output stream from the CD-ROM decoder remains unread. No interrupt is generated. Once this bit has been set to 1, its value will not recover unless it is reset by the LOGICRST bit in the ROMDECRST register.
6 to 0	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.

24.3.17 Pre-ECC Correction Header: Minutes Data Register (HEAD00)

The pre-ECC correction header: minutes data register (HEAD00) indicates the minutes value in the header before ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD00[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD00[7:0]	All 0	R	Minutes Value in Header before ECC Correction

24.3.18 Pre-ECC Correction Header: Seconds Data Register (HEAD01)

The pre-ECC correction header: seconds data register (HEAD01) indicates the seconds value in the header before ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD01[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD01[7:0]	All 0	R	Seconds Value in Header before ECC Correction

24.3.19 Pre-ECC Correction Header: Frames (1/75 Second) Data Register (HEAD02)

The pre-ECC correction header: frames (1/75 second) data register (HEAD02) indicates the frames value (1 frame = 1/75 second) in the header before ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD02[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD02[7:0]	All 0	R	Frames Value (1 frame = 1/75 second) in Header before ECC Correction

24.3.20 Pre-ECC Correction Header: Mode Data Register (HEAD03)

The pre-ECC correction header: mode data register (HEAD03) indicates the mode value in the header before ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD03[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD03[7:0]	All 0	R	Mode Value in Header before ECC Correction

24.3.21 Pre-ECC Correction Subheader: File Number (Byte 16) Data Register (SHEAD00)

The pre-ECC correction subheader: file number (byte 16) data register (SHEAD00) indicates the file number value in the subheader before ECC correction (byte 16).

Bit:	7	6	5	4	3	2	1	0
	SHEAD00[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD00[7:0]	All 0	R	Indicates file number value in the subheader before ECC correction (byte 16). For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.22 Pre-ECC Correction Subheader: Channel Number (Byte 17) Data Register (SHEAD01)

The pre-ECC correction subheader: channel number (byte 17) data register (SHEAD01) indicates the channel number value in the subheader before ECC correction (byte 17).

Bit:	7	6	5	4	3	2	1	0
	SHEAD01[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD01[7:0]	All 0	R	Indicates channel number value in the subheader before ECC correction (byte 17). For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.23 Pre-ECC Correction Subheader: Sub-Mode (Byte 18) Data Register (SHEAD02)

The pre-ECC correction subheader: sub-mode (byte 18) data register (SHEAD02) indicates the sub-mode value in the subheader before ECC correction (byte 18).

Bit:	7	6	5	4	3	2	1	0
	SHEAD02[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD02[7:0]	All 0	R	Indicates sub-mode value in the subheader before ECC correction (byte 18). For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.24 Pre-ECC Correction Subheader: Data Type (Byte 19) Data Register (SHEAD03)

The pre-ECC correction subheader: data type (byte 19) data register (SHEAD03) indicates the data type value in the subheader before ECC correction (byte 19).

Bit:	7	6	5	4	3	2	1	0
	SHEAD03[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD03[7:0]	All 0	R	Indicates data type value in the subheader before ECC correction (byte 19). For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.25 Pre-ECC Correction Subheader: File Number (Byte 20) Data Register (SHEAD04)

The pre-ECC correction subheader: file number (byte 20) data register (SHEAD04) indicates the file number value in the subheader before ECC correction (byte 20).

Bit:	7	6	5	4	3	2	1	0
	SHEAD04[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD04[7:0]	All 0	R	Indicates file number value in the subheader before ECC correction (byte 20). For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.26 Pre-ECC Correction Subheader: Channel Number (Byte 21) Data Register (SHEAD05)

The pre-ECC correction subheader: channel number (byte 21) data register (SHEAD05) indicates the channel number value in the subheader before ECC correction (byte 21).

Bit:	7	6	5	4	3	2	1	0
	SHEAD05[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD05[7:0]	All 0	R	Indicates channel number value in the subheader before ECC correction (byte 21). For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.27 Pre-ECC Correction Subheader: Sub-Mode (Byte 22) Data Register (SHEAD06)

The pre-ECC correction subheader: sub-mode (byte 22) data register (SHEAD06) indicates the sub-mode value in the subheader before ECC correction (byte 22).

Bit:	7	6	5	4	3	2	1	0
	SHEAD06[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD06[7:0]	All 0	R	Indicates sub-mode value in the subheader before ECC correction (Byte 22). For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.28 Pre-ECC Correction Subheader: Data Type (Byte 23) Data Register (SHEAD07)

The pre-ECC correction subheader: data type (byte 23) data register (SHEAD07) indicates the data type value in the subheader before ECC correction (byte 23).

Bit:	7	6	5	4	3	2	1	0
	SHEAD07[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD07[7:0]	All 0	R	Indicates data type value in the subheader before ECC correction (Byte 23). For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.29 Post-ECC Correction Header: Minutes Data Register (HEAD20)

The post-ECC correction header: minutes data register (HEAD20) indicates the minutes value in the header after ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD20[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD20[7:0]	All 0	R	Indicates minutes value in the header after ECC correction. When MSF_LBA_SEL = 1, this register indicates the first byte (1/3) of the total number of sectors calculated from M, S, and F.

24.3.30 Post-ECC Correction Header: Seconds Data Register (HEAD21)

The post-ECC correction header: seconds data register (HEAD21) indicates the seconds value in the header after ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD21[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD21[7:0]	All 0	R	Indicates seconds value in the header after ECC correction. When MSF_LBA_SEL = 1, this register indicates the second byte (2/3) of the total number of sectors calculated from M, S, and F.

24.3.31 Post-ECC Correction Header: Frames (1/75 Second) Data Register (HEAD22)

The post-ECC correction header: frames (1/75 second) data register (HEAD22) indicates the frames value (1 frame = 1/75 seconds) in the header after ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD22[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD22[7:0]	All 0	R	Indicates frames value in the header after ECC correction. When MSF_LBA_SEL = 1, this register indicates the third byte (3/3) of the total number of sectors calculated from M, S, and F.

24.3.32 Post-ECC Correction Header: Mode Data Register (HEAD23)

The post-ECC correction header: mode data register (HEAD23) indicates the mode value in the header after ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD23[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD23[7:0]	All 0	R	Indicates mode value in the header after ECC correction.

24.3.33 Post-ECC Correction Subheader: File Number (Byte 16) Data Register (SHEAD20)

The post-ECC correction subheader: file number (byte 16) data register (SHEAD20) indicates the file number value in the subheader after ECC correction (byte 16).

Bit:	7	6	5	4	3	2	1	0
	SHEAD20[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD20[7:0]	All 0	R	Indicates file number value in the subheader after ECC correction (byte 16).

24.3.34 Post-ECC Correction Subheader: Channel Number (Byte 17) Data Register (SHEAD21)

The post-ECC correction subheader: channel number (byte 17) data register (SHEAD21) indicates the channel number value in the subheader after ECC correction (byte 17).

Bit:	7	6	5	4	3	2	1	0
	SHEAD21[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD21[7:0]	All 0	R	Indicates channel number value in the subheader after ECC correction (byte 17).

24.3.35 Post-ECC Correction Subheader: Sub-Mode (Byte 18) Data Register (SHEAD22)

The post-ECC correction subheader: sub-mode (byte 18) data register (SHEAD22) indicates the sub-mode value in the subheader after ECC correction (byte 18).

Bit:	7	6	5	4	3	2	1	0
	SHEAD22[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD22[7:0]	All 0	R	Indicates sub-mode value in the subheader after ECC correction (byte 18).

24.3.36 Post-ECC Correction Subheader: Data Type (Byte 19) Data Register (SHEAD23)

The post-ECC correction subheader: data type (byte 19) data register (SHEAD23) indicates the data type value in the subheader after ECC correction (byte 19).

Bit:	7	6	5	4	3	2	1	0
	SHEAD23[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD23[7:0]	All 0	R	Indicates data type value in the subheader after ECC correction (byte 19).

24.3.37 Post-ECC Correction Subheader: File Number (Byte 20) Data Register (SHEAD24)

The post-ECC correction subheader: file number (byte 20) data register (SHEAD24) indicates the file number value in the subheader after ECC correction (byte 20).

Bit:	7	6	5	4	3	2	1	0
	SHEAD24[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD24[7:0]	All 0	R	Indicates file number value in the subheader after ECC correction (byte 20).

24.3.38 Post-ECC Correction Subheader: Channel Number (Byte 21) Data Register (SHEAD25)

The post-ECC correction subheader: channel number (byte 21) data register (SHEAD25) indicates the channel number value in the subheader after ECC correction (byte 21).

Bit:	7	6	5	4	3	2	1	0
	SHEAD25[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD25[7:0]	All 0	R	Indicates channel number value in the subheader after ECC correction (byte 21).

24.3.39 Post-ECC Correction Subheader: Sub-Mode (Byte 22) Data Register (SHEAD26)

The post-ECC correction subheader: sub-mode (byte 22) data register (SHEAD26) indicates the sub-mode value in the subheader after ECC correction (byte 22).

Bit:	7	6	5	4	3	2	1	0
	SHEAD26[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD26[7:0]	All 0	R	Indicates sub-mode value in the subheader after ECC correction (byte 22).

24.3.40 Post-ECC Correction Subheader: Data Type (Byte 23) Data Register (SHEAD27)

The post-ECC correction subheader: data type (byte 23) data register (SHEAD27) indicates the data type value in the subheader after ECC correction (byte 23).

Bit:	7	6	5	4	3	2	1	0
	SHEAD27[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD27[7:0]	All 0	R	Indicates data type value in the subheader after ECC correction (byte 23).

24.3.41 Automatic Buffering Setting Control Register (CBUFCTL0)

Bit:	7	6	5	4	3	2	1	0
	CBUF_AUT	CBUF_EN	-	CBUF_MD[1:0]		CBUF_TS	CBUF_Q	-
Initial value:	0	0	0	0	0	1	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	CBUF_AUT	0	R/W	Automatic Buffering Function ON/OFF When this bit is to be set or cleared while CROM_EN = 1, CBUF_EN should also be set or cleared simultaneously. Otherwise, the validity of the status indications in CBUFST0, CBUFST1 and CBUFST2 cannot be guaranteed. 0: Automatic buffering is OFF. 1: Automatic buffering is ON.
6	CBUF_EN	0	R/W	Buffering to Buffer RAM Enable This bit turns on/off buffering in both automatic and manual buffering modes. In manual buffering mode, set this bit after generation of the ISEC interrupt. This bit is automatically reset when automatic buffering stops. 0: Buffering is OFF. 1: Buffering is ON.
5	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
4, 3	CBUF_MD[1:0]	00	R/W	Start-sector detection mode when the automatic buffering function is in use 00: The header values for the previous and current sectors must be in sequence. 01: The header value detected in the current sector must be in sequence with the interpolated value. 10: A current sector with any header value is OK. 11: Start-sector detection is based on the interpolated value even if the current sector is not detected.
2	CBUF_TS	1	R/W	CBUFCTL1 to CBUFCTL3 Setting Mode 0: CBUFCTL1 to CBUFCTL3: BCD (in decimal) 1: Total number of sectors (in hexadecimal)
1	CBUF_Q	0	R/W	Q-channel code buffering data specification in the case of a CRC error in the Q-channel code 0: The values for the last sector for which the CRC returned a correct result are buffered. 1: The erroneous data is buffered as is. Note: Since subcodes are not input with this LSI, always set this bit to 1.
0	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.

24.3.42 Automatic Buffering Start Sector Setting: Minutes Control Register (CBUFCTL1)

The automatic buffering start sector setting: minutes control register (CBUFCTL1) indicates the minutes value in the header for the first sector to be buffered.

Bit:	7	6	5	4	3	2	1	0
	BS_MIN[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	BS_MIN[7:0]	All 0	R/W	Indicates setting of the minutes value in the header for the first sector to be buffered.

24.3.43 Automatic Buffering Start Sector Setting: Seconds Control Register (CBUFCTL2)

The automatic buffering start sector setting: seconds control register (CBUFCTL2) indicates the seconds value in the header for the first sector to be buffered.

Bit:	7	6	5	4	3	2	1	0
	BS_SEC[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	BS_SEC[7:0]	All 0	R/W	Indicates setting of the seconds value in the header for the first sector to be buffered.

24.3.44 Automatic Buffering Start Sector Setting: Frames Control Register (CBUFCTL3)

The automatic buffering start sector setting: frames control register (CBUFCTL3) indicates the frames (1 frame = 1/75 second) value in the header for the first sector to be buffered.

Bit:	7	6	5	4	3	2	1	0
	BS_FRM[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	BS_FRM[7:0]	All 0	R/W	Indicates setting of the frames (1 frame = 1/75 second) value in the header for the first sector to be buffered.

24.3.45 ISY Interrupt Source Mask Control Register (CROMST0M)

The ISY interrupt source mask control register (CROMST0M) masks the ISY interrupt sources specified by the bits in the sync code status register (CROMST0).

Bit:	7	6	5	4	3	2	1	0
	-	-	ST_SYILM	ST_SYNOM	ST_BLKSM	ST_BLKLM	ST_SECSM	ST_SECLM
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
5	ST_SYILM	0	R/W	ISY interrupt ST_SYIL (bit 5 in the CROMST0 register) source mask
4	ST_SYNOM	0	R/W	ISY interrupt ST_SYNO (bit 4 in the CROMST0 register) source mask
3	ST_BLKSM	0	R/W	ISY interrupt ST_BLKS (bit 3 in the CROMST0 register) source mask
2	ST_BLKLM	0	R/W	ISY interrupt ST_BLKL (bit 2 in the CROMST0 register) source mask
1	ST_SECSM	0	R/W	ISY interrupt ST_SECS (bit 1 in the CROMST0 register) source mask
0	ST_SECLM	0	R/W	ISY interrupt ST_SECL (bit 0 in the CROMST0 register) source mask

24.3.46 CD-ROM Decoder Reset Control Register (ROMDECRST)

The CD-ROM decoder reset control register (ROMDECRST) resets the random logic of the CD-ROM decoder and clears the RAM in the CD-ROM decoder.

Bit:	7	6	5	4	3	2	1	0
	LOGICRST	RAMRST	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	LOGICRST	0	R/W	CD-ROM Decoder Random Logic Reset Signal A reset signal is output while this bit is set to 1.
6	RAMRST	0	R/W	CD-ROM Decoder RAM Clearing Signal Refer to the RAMCLRST bit in the RSTSTAT register to confirm that RAM clearing is complete.
5 to 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

Note: • Before setting LOGICRST to 1, make sure that the RAMRST bit is cleared to 0 and then write B'10000000 to this register.

24.3.47 CD-ROM Decoder Reset Status Register (RSTSTAT)

The CD-ROM decoder reset status register (RSTSTAT) indicates that the RAM in the CD-ROM decoder has been cleared.

Bit:	7	6	5	4	3	2	1	0
	RAM CLRST	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	RAMCLRST	0	R	This bit is set to 1 on completion of RAM clearing after the RAMRST bit in ROMDECRST is set to 1. The bit is cleared by writing a 0 to the RAMRST bit.
6 to 0	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.

24.3.48 Serial Sound Interface Data Control Register (SSI)

The serial sound interface data control register (SSI) provides various settings related to the data stream. For the operation corresponding to the setting of this register, refer to section 24.4.1, Endian Conversion for Data in the Input Stream.

Bit:	7	6	5	4	3	2	1	0
	BYTEND	BITEND	BUFEND0[1:0]		BUFEND1[1:0]		-	-
Initial value:	0	0	0	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	BYTEND	0	R/W	Specifies the endian of input data from the serial sound interface. When this bit is set to 1, byte 0 and byte 1 in STRMDIN0 are swapped. This is the same for STRMDIN2.
6	BITEND	0	R/W	Specifies treatment of the bit order of the input data from the serial sound interface. When this bit is set to 1, the bits within each byte are rearranged to place them in reverse order, bit 0 → bit 7 to bit 7 → bit 0.
5, 4	BUFEND0[1:0]	01	R/W	These bits select whether to change the order of 16-bit units of data transferred from the serial sound interface or suppress the stream data. In the serial sound interface, either “padding mode” or “non-padding mode” is selectable. In non-padding mode, each 32 bits of data transferred from the serial sound interface are transferred as CD-ROM data. Since the CD-ROM decoder has two 16-bit input data registers, the order of the 16-bit data can be swapped within the 32 bits. On the other hand, in padding mode each 32 bits of data transferred from the serial sound interface includes padding. Since the padding has no meaning, it should be kept out of the input stream to the decoder. This suppression can be specified by the setting of this register. The CD-ROM decoder handles data as a stream of 16-bit data, and this register controls which 16-bit portion of each 32 bits of data transferred from the serial sound interface should be input first. 00: The 16 bits of stream data that would otherwise be processed first is discarded. 01: The higher-order 16 bits of each 32 bits of data received from the serial sound interface are placed first in the stream to the decoder. 10: The lower-order 16 bits of each 32 bits of data received from the serial sound interface are placed first in the stream to the decoder. 11: Setting prohibited
3, 2	BUFEND1[1:0]	10	R/W	These bits select whether to change the order of 16-bit units of data transferred from the serial sound interface or suppress the stream data. In the serial sound interface, either “padding mode” or “non-padding mode” is selectable. In non-padding mode, each 32 bits of data transferred from the serial sound interface are transferred as CD-ROM data. Since the CD-ROM decoder has two 16-bit input data registers, the order of the 16-bit data can be swapped within the 32 bits. On the other hand, in padding mode each 32 bits of data transferred from the serial sound interface includes padding. Since the padding has no meaning, it should be kept out of the input stream to the decoder. This suppression can be specified by the setting of this register. The CD-ROM decoder handles data as a stream of 16-bit data, and this register controls which 16-bit portion of each 32 bits of data transferred from the serial sound interface should be input second. 00: The 16 bits of stream data that would otherwise be processed second is discarded. 01: The higher-order 16 bits of each 32 bits of data received from the serial sound interface are placed second in the stream to the decoder. 10: The higher-order 16 bits of each 32 bits of data received from the serial sound interface are placed second in the stream to the decoder. 11: Setting prohibited
1, 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

24.3.49 Interrupt Flag Register (INTHOLD)

The interrupt flag register (INTHOLD) consists of various interrupt flags.

Bit:	7	6	5	4	3	2	1	0
	ISEC	ITARG	ISY	IERR	IBUF	IREADY	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	ISEC	0	R/W	ISEC Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
6	ITARG	0	R/W	ITARG Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
5	ISY	0	R/W	ISY Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
4	IERR	0	R/W	IERR Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
3	IBUF	0	R/W	IBUF Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
2	IREADY	0	R/W	IREADY Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
1, 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

24.3.50 Interrupt Source Mask Control Register (INHINT)

The interrupt source mask control register (INHINT) controls masking of various interrupt requests in the CD-ROM decoder.

Bit:	7	6	5	4	3	2	1	0
	INH ISEC	INH ITARG	INH ISY	INH IERR	INH IBUF	INH IREADY	PREINH REQDM	PREINH IREADY
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	INHISEC	0	R/W	ISEC Interrupt Mask When set to 1, inhibits ISEC interrupt requests.
6	INHITARG	0	R/W	ITARG Interrupt Mask When set to 1, inhibits ITARG interrupt requests.
5	INHISY	0	R/W	ISY Interrupt Mask When set to 1, inhibits ISY interrupt requests.
4	INHIERR	0	R/W	IERR Interrupt Mask When set to 1, inhibits IERR interrupt requests.
3	INHIBUF	0	R/W	IBUF Interrupt Mask When set to 1, inhibits IBUF interrupt requests.
2	INHIREADY	0	R/W	IREADY Interrupt Mask When set to 1, inhibits IREADY interrupt requests.
1	PREINHREQDM	0	R/W	Inhibits setting of the DMA-transfer-request interrupt source flag for the output data stream. When this bit is set to 1, the DMA-transfer-request interrupt source is not retained.
0	PREINHIREADY	0	R/W	Inhibits setting of the IREADY interrupt flag. When this bit is set to 1, the IREADY interrupt source is not retained.

24.3.51 CD-ROM Decoder Stream Data Input Register (STRMDIN0)

The CD-ROM decoder stream data input register (STRMDIN0) holds the higher 2 bytes (from MSB) of the 4 bytes of data that is to be input to the CD-ROM decoder.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STRMDIN[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	STRMDIN[31:16]	All 0	R/W	Indicates the higher 2 bytes (from MSB) of the 4-bytes of data that is to be input to the CD-ROM decoder. The CD-ROM decoder has a 4-byte wide data window as a data input register to handle the data input to this register as a stream data. The amount of data for one sector is 2352 bytes.

24.3.52 CD-ROM Decoder Stream Data Input Register (STRMDIN2)

The CD-ROM decoder stream data input register (STRMDIN2) holds the lower 2 bytes (from LSB) of the 4 bytes of data that is to be input to the CD-ROM decoder.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STRMDIN[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	STRMDIN[15:0]	All 0	R/W	Indicates the lower 2 bytes (from LSB) of the 4-bytes of data that is to be input to the CD-ROM decoder. The CD-ROM decoder has a 4-byte wide data window as a data input register to handle the data input to this register as a stream data. The amount of data for one sector is 2352 bytes.

24.3.53 CD-ROM Decoder Stream Data Output Register (STRMDOUT0)

The CD-ROM decoder stream data output register (STRMDOUT0) holds 2 bytes that is to be output from the CD-ROM decoder.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STRMDOUT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	STRMDOUT [15:0]	H'0000	R	Indicates 2 bytes that are to be output from the CD-ROM decoder. The CD-ROM decoder has a 2-byte wide data window or set of registers for the output of decoded data. Every time the relevant register is accessed, further data of access size are output sequentially in the output format that is separately defined. The amount of data for one sector is 2768 bytes. Always read 2768 bytes.

24.4 Operation

24.4.1 Endian Conversion for Data in the Input Stream

Stream data must be input to the core of the CD-ROM decoder in order according to the CD-ROM data format specifications. In some systems, however, the order of the data from the serial sound interface may have to be changed or the data will have been padded before transfer. To cope with this, the stream data input control section is capable of swapping the order of the data and preventing the input of padding data to the core of the CD-ROM decoder. These functions are controlled through the serial sound interface data control register (SSI).

Figure 24.6 shows a case where the upper and lower 16 bits of the data, consisting of padding data plus the first 2 bytes of sync code, that is, H'000000FF, are swapped (H'00FF0000) and input to the CD-ROM decoder as the stream data.

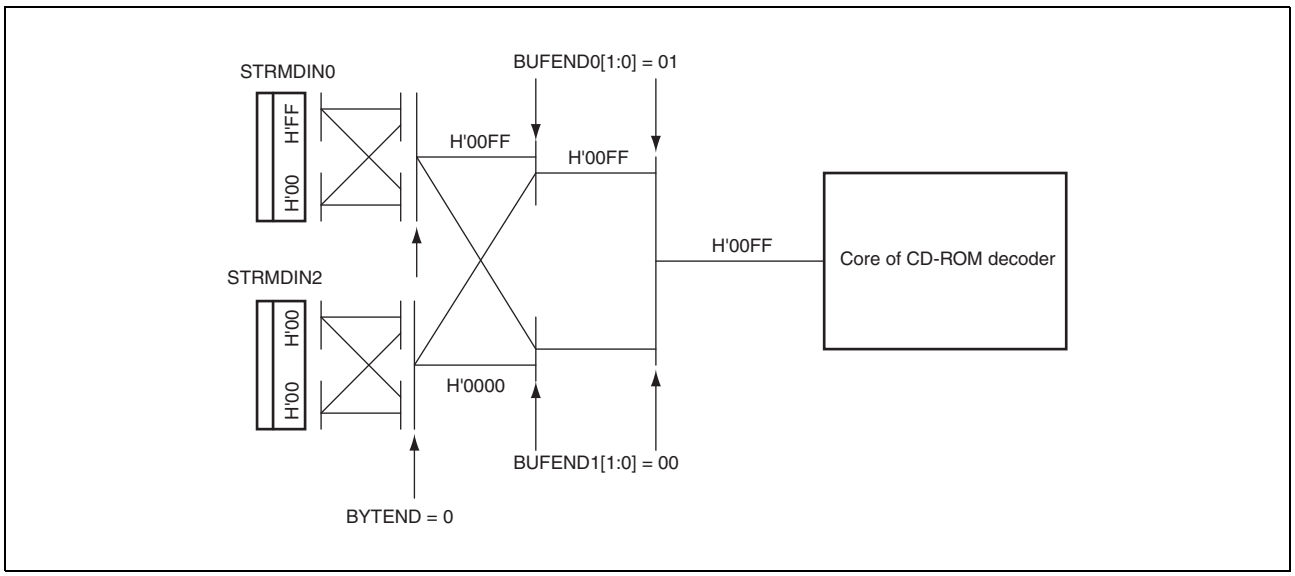

Figure 24.6 Example of Padded Stream Data Control by the SSI Register

Figure 24.7 shows a case of input stream data that has no padding (H'12345678). The upper and lower 16 bits of data are swapped (H'56781234) for input to the CD-ROM decoder.

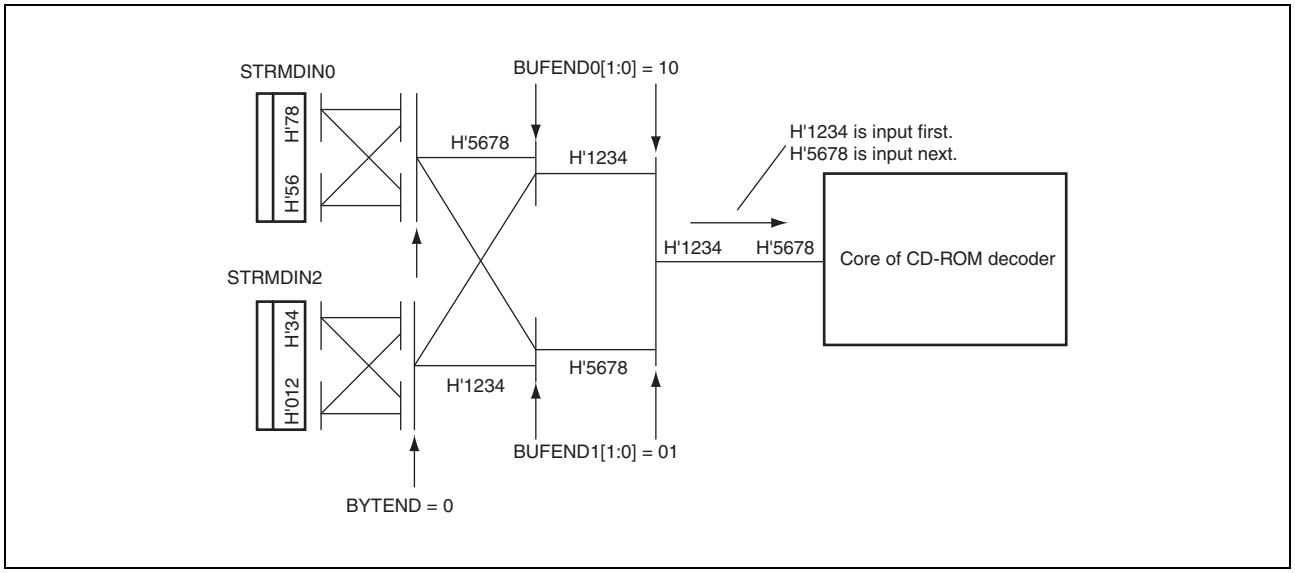

Figure 24.7 Example of Non-Padded Stream Data Control by the SSI Register

24.4.2 Sync Code Maintenance Function

Each sector of CD-ROM data consists of 2352 bytes starting with H'00FFFFFFFFFFFFFFFFFFFF00 (sync code). However, a scratch on the disc or some other factor might lead to erroneous recognition of the sync code sequence at the wrong time. Conversely, a sync code might not be detected at a point where it should be detected. As a solution to these problems, the CD-ROM decoder of this LSI has a sync-code maintenance function, which operates to ignore sync codes detected at abnormal times and maintain the appearance of the sync code at the expected times when it is not actually detected on the disc.

The operating modes of the sync-code maintenance function are listed below. For details on the settings, refer to section 24.3.2, Sync Code-Based Synchronization Control Register (CROMSY0), and Table 24.2.

- Automatic sync maintenance mode
- External sync mode
- Interpolated sync mode
- Interpolated sync plus external sync mode

(1) Automatic Sync Maintenance Mode

In automatic sync maintenance mode, the sync code is ignored if detected within the one-sector (2352-byte) period. Furthermore, if a sync code is not detected at the point where a next sector should start, sync code maintenance is applied. If synchronization timing has changed, re-synchronization is performed at the point where a sync code is detected within 2352 bytes after the change.

Therefore, this mode is effective in rejecting abnormal sync patterns and following changes in synchronization timing. Note, however, that this mode cannot achieve synchronization with the first sector after a change to the synchronization timing.

Figure 24.8 shows operation in the case of normal sync-code detection, Figure 24.9 shows a case where a sync code is detected before a current one-sector period has elapsed, and Figure 24.10 shows the case where the actual sync code is only detected some time after a full one-sector period has elapsed.

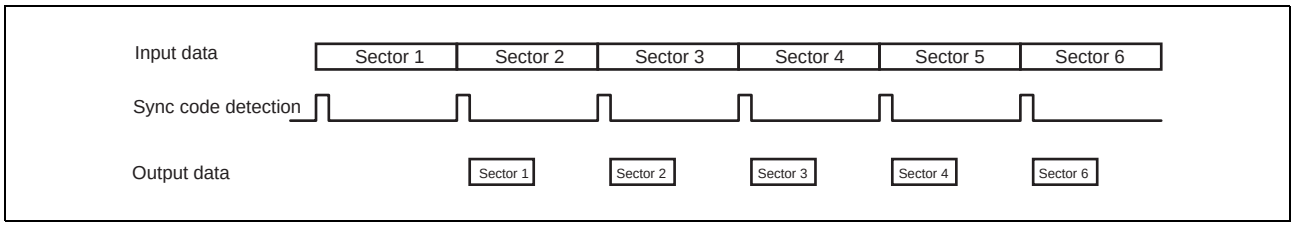

Figure 24.8 Operation in Automatic Sync Maintenance Mode (Normal Timing)

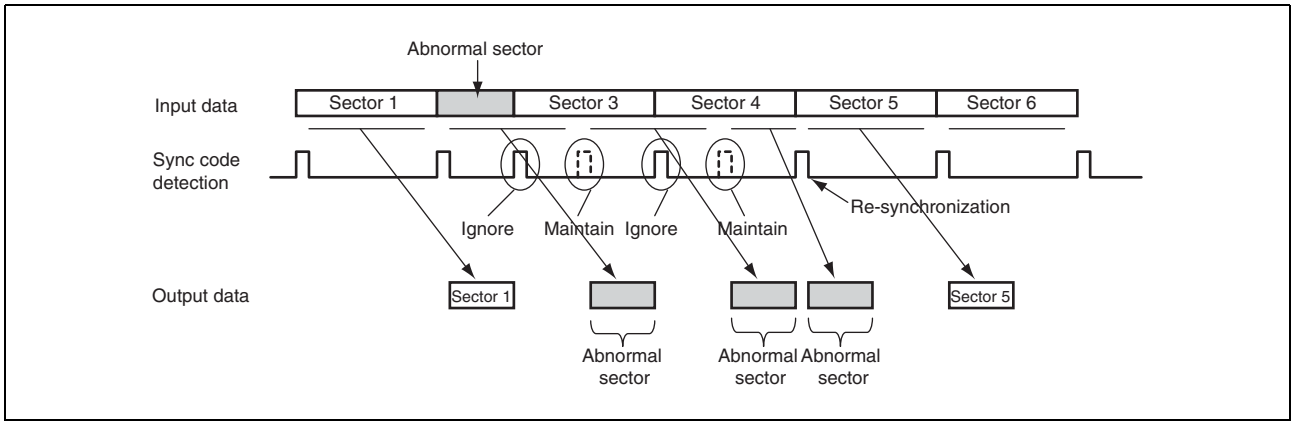

Figure 24.9 Operation in Automatic Sync Maintenance Mode (When an Abnormally Short Sector is Encountered)

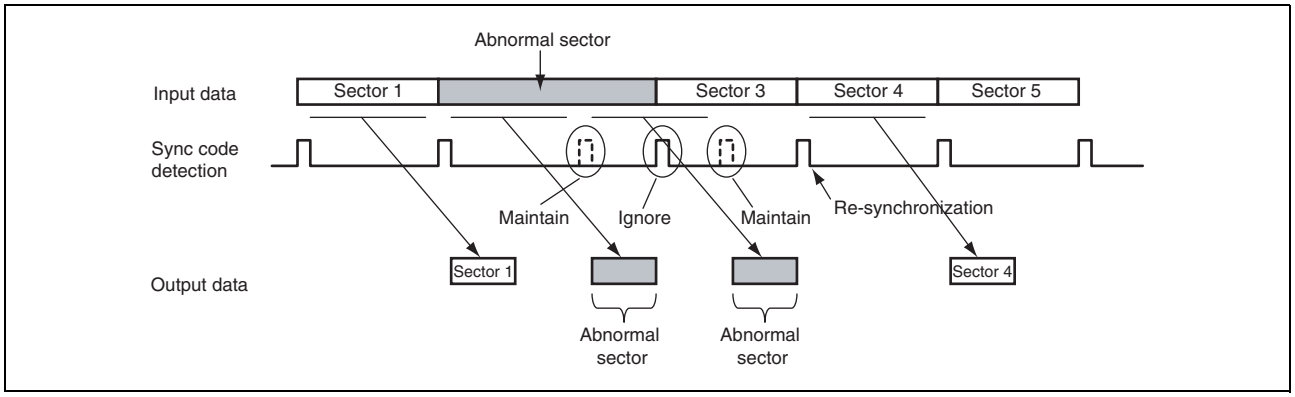

Figure 24.10 Operation in Automatic Sync Maintenance Mode (When an Abnormally Long Sector is Encountered)

(2) External Sync Mode

In external sync mode, synchronization is always based on the sync codes in the incoming data. Even if the next sync code is not detected at the 2352nd byte, decoding does not proceed until the next sync code is detected.
Accordingly, this mode is effective in that it strictly follows the external synchronization timing. Note, however, that decoding will not be performed normally when the sync-code pattern is input with abnormal timing.
Figure 24.11 shows the operation in external sync mode.

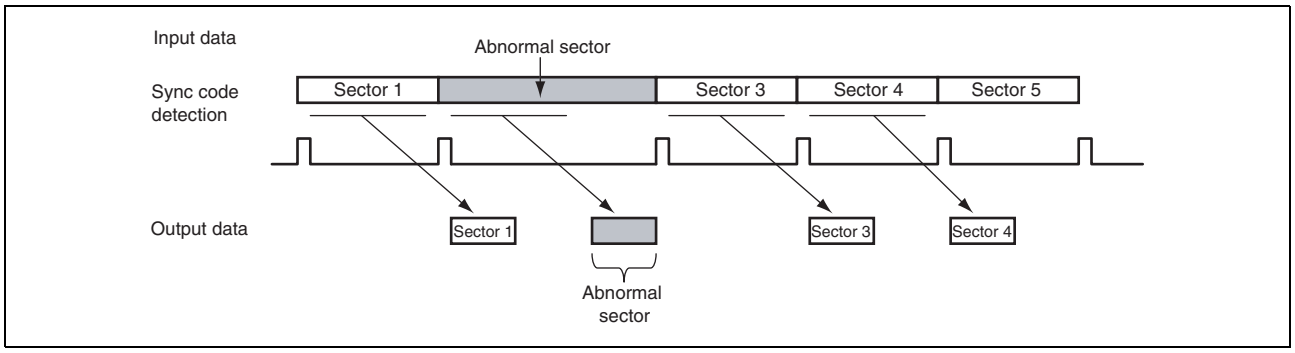

Figure 24.11 Operation in External Sync Mode

(3) Interpolated Sync Mode

In interpolated sync mode, synchronization is always driven by the internal counter after a sync code pattern has been detected at the start of decoding. Accordingly, this mode is effective when the sync patterns have been damaged. However, decoding becomes incorrect after a change to the synchronization timing, since the change in timing is not followed.
Figure 24.12 shows the operation in interpolated sync mode.

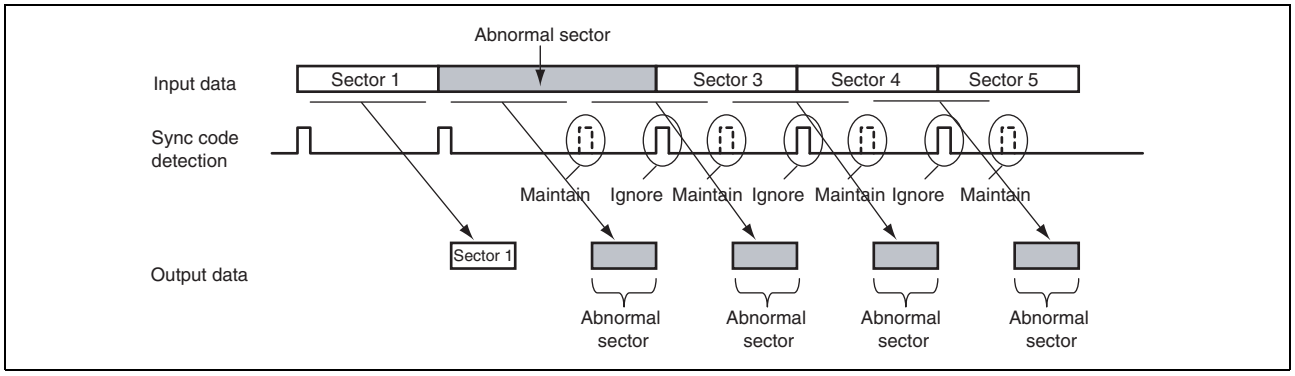

Figure 24.12 Operation in Interpolated Sync Mode

(4) Interpolated Sync Plus External Sync Mode

In interpolated sync plus external sync mode, synchronization is based on the detected sync code patterns as long as they are present, and if a sync pattern is not detected at the 2352nd byte, the sync code maintenance is applied.
Synchronization in this mode is more quickly responsive to changes in synchronization timing than synchronization in the automatic sync maintenance mode.
However, decoding still becomes incorrect when a sync pattern is input with abnormal timing.
Figure 24.13 and Figure 24.14 show the operation in interpolated sync plus external sync mode in the cases of abnormally short and long sectors, respectively.

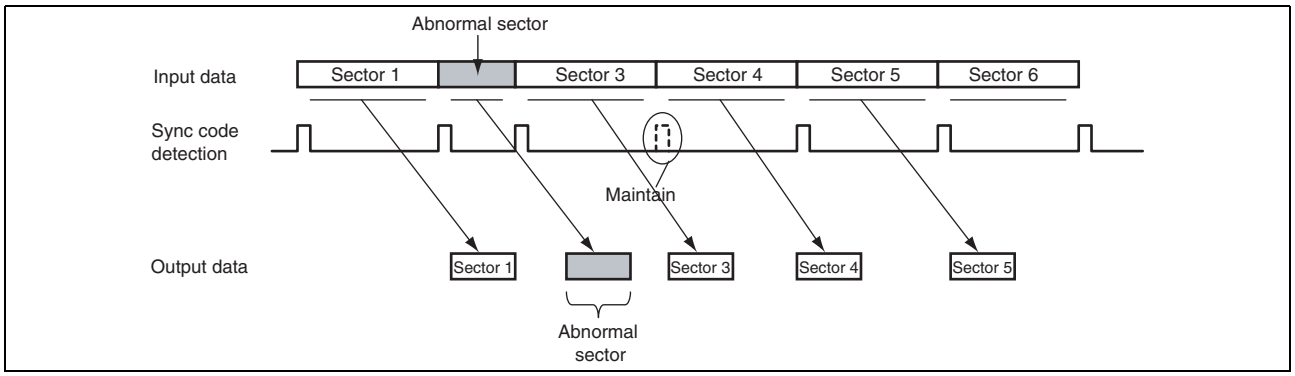

Figure 24.13 Operation in Interpolated Sync Plus External Sync Mode (When an Abnormally Short Sector is Encountered)

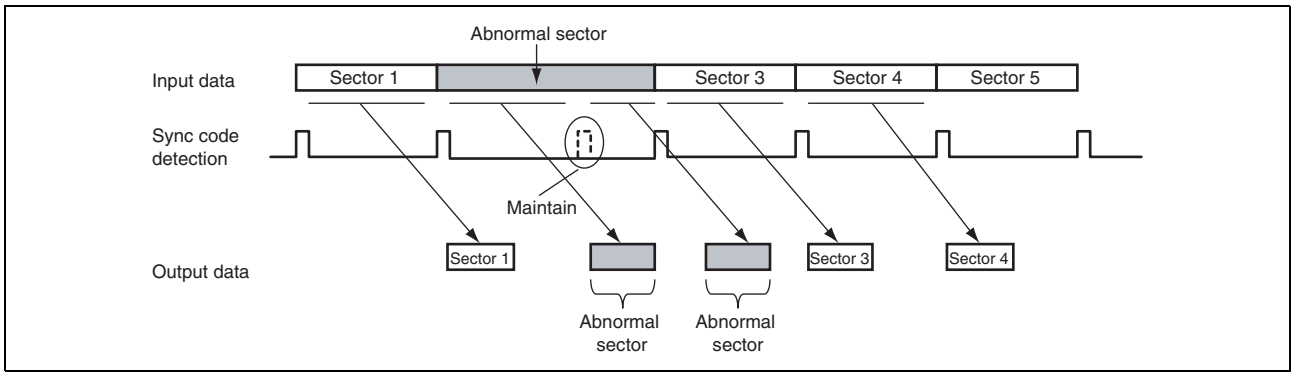

Figure 24.14 Operation in Interpolated Sync Plus External Sync Mode (When an Abnormally Long Sector is Encountered)

24.4.3 Error Correction

The CD-ROM decoder handles data in the formats containing information relevant to error correction, including the EDC, P parity, and Q parity. The CD-ROM decoder includes the following functions for use in error correction.

- Syndrome calculation
- ECC correction
- EDC checking

(1) Syndrome Calculation

After the data of a sector in Mode 1 or Form 1 of Mode 2 has been input, the ECC is used in correction if any error is detected (the result of syndrome calculation is non-zero). After correction, the results of syndrome operation for the corrected data are output to bits ST_ECCP (P parity) and ST_ECCQ (Q parity) in the CROMST6 register, respectively.

(2) ECC correction and EDC Checking

For CD-ROM format data that contains EDC, P-parity, and Q-parity fields, the CD-ROM decoder performs EDC checking and ECC correction. Supported correction modes are P correction, Q correction, PQ correction (P correction followed by Q correction), and QP correction (Q correction followed by P correction). In PQ and QP correction modes, up to three iterations of correction are possible (the number of iterations is limited by the playback speed).
The EDC check is performed twice, before and after correction.
The mode of ECC correction and EDC checking is specified by bits MD_DEC[2:0] in the CROMCTL1 register. When the PQ or QP correction mode is selected, the number of iterations of correction is specified by bits MD_PQREP[1:0] in the CROMCTL1 register.
When the automatic mode/form detection function is in use, the sector mode determines whether or not ECC correction and EDC checking can be performed. For sectors in Mode 0 and Mode 2 (non-XA), which include neither parity bits nor EDC, ECC correction and EDC checking are not performed. For sectors in Form 2 of Mode 2, ECC correction is not performed.

(a) ECC Correction

When ECC correction is in use and an error in a sector is identified as non-correctable, the CD-ROM decoder generates an IERR interrupt and sets the ST_ECCNG bit of the CROMST6 register to 1. The CD-ROM detector also sets this bit to 1 on detecting a short sector.
While the NO_ECC bit of the CROMCTL4 register is set to 1, a ‘pass’ result in pre-ECC correction EDC checking makes the CD-ROM decoder skip ECC correction, regardless of the results of the syndrome operation.

(b) EDC Checking

When EDC checking is in use, checking is in line with the specified or detected sector mode and form, depending on whether or not automatic sector mode and form detection is selected.
The results of EDC checking before and after correction are reflected in the ST_EDC1 and ST_EDC2 bits of the CROMST6 register, respectively. If EDC checking after ECC correction indicates that an error remains, an IERR interrupt is generated.

24.4.4 Automatic Decoding Stop Function

Decoding can be stopped automatically in response to an error during the decoding of CD-ROM data.
The possible conditions for automatically stopping the decoding process are listed below. The applicable conditions are specified in the CROMCTL3 register.

- An error is found to be not correctable by ECC correction.
- Post-ECC correction EDC checking indicates that an error remains.
- A change of the sector mode or form
- A non-sequential MSF (minutes, seconds, frames (1/75 second)) value

When automatic stopping is set up and any of the above conditions is encountered in a certain sector, the decoding is stopped after the results of decoding for that sector have been output.
After decoding has been stopped in response to a condition specified in the CROMCTL3 register, the condition can be identified by reading the CBUFST1 register.
The CD-ROM decoder has buffer space for two sectors. If input of the data stream continues and the output stream of data is not read, the CD-ROM decoder stops at the point where the data of a third sector starts to be input. At this time, the BUF_NG bit in the CBUFST2 register is set to 1, but no interrupt is generated. Once the BUF_NG bit in the CBUFST2 register has been set to 1, recovery can only be accomplished by using the LOGICRST bit in the ROMDECRST register to reset the CD-ROM decoder function. When the LOGICRST bit in the ROMDECRST register is set to 1, a reset signal is output and any registers in which settings have been made are cleared to their initial values.

24.4.5 Buffering Format

Figure 24.15 shows the format of the output data stream produced by CD-ROM decoding.
A 2-byte-wide window register STRMDOUT0 is provided for the output. When this window register is accessed after decoding of a CD-ROM sector has finished, the bytes of data are output in order from the sync code.

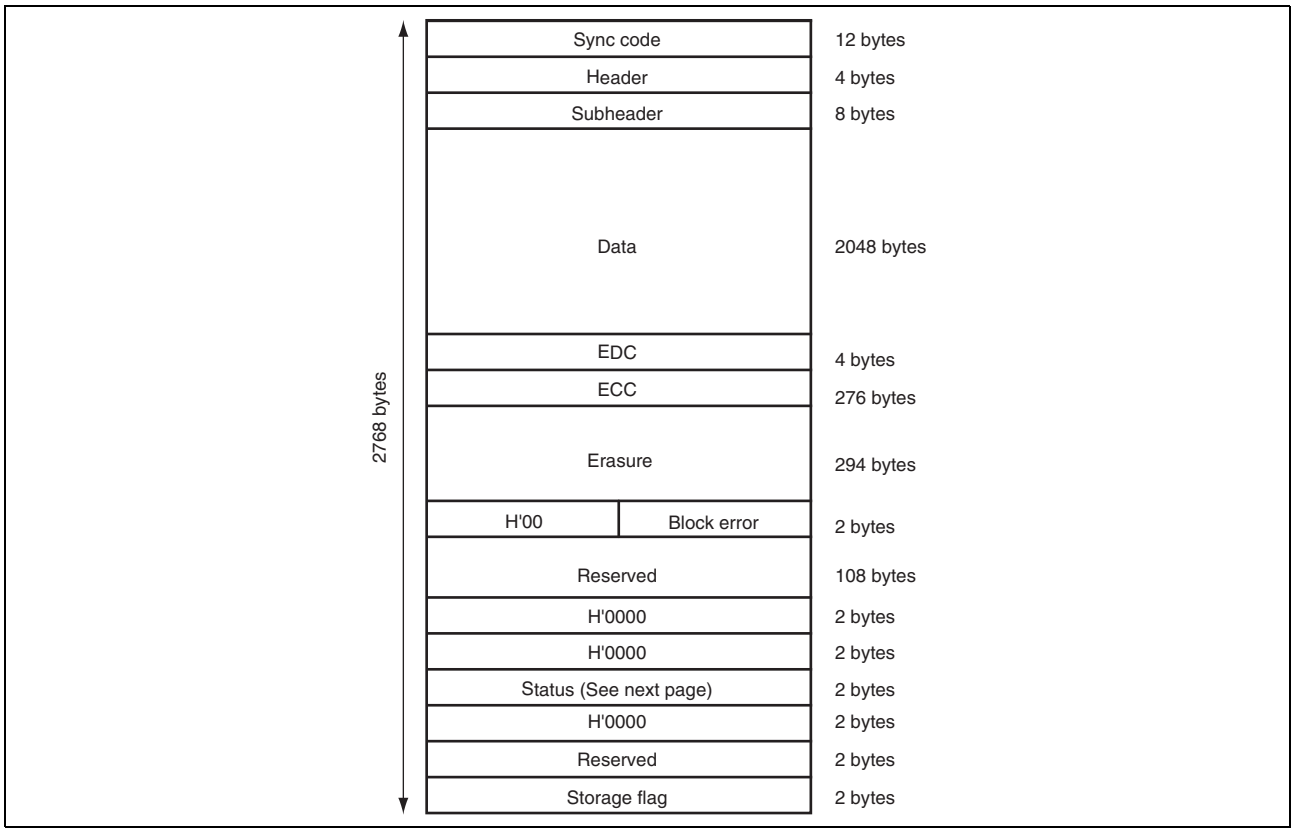

Figure 24.15 Output Data Stream Format

The meanings of bits in the two-byte status field shown in Figure 24.15 are given below. The values of the non-assigned bits are undefined.

Status

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PERR	QERR	EDCE	—	—	—	—	—	SD	SY		FM[2:0]		HD	—	—

[Legend]
PERR: Indicates that a P-parity error remains.
QERR: Indicates that a Q-parity error remains.
EDCE: Indicates that a remaining error was detected in post-ECC correction EDC checking.
SD: Indicates that a short sector was encountered.
SY: Indicates that a sync code was interpolated.
FM: Indicates the data format.
001: Mode 0
010: Mode 1
011: Long (format with no EDC and ECC)
100: Mode 2 (non-XA)
101: Mode 2 Form 1
110: Mode 2 Form 2
HD: Header continuity (minutes, seconds, and frames (1 frame = 1/75 second) are non-sequential)

The value of the storage flag field in Figure 24.15 is incremented every time the data for one sector are output. The value starts at H'0000 and wraps back around to H'0000 after it reaches H'FFFF. Note that the upper byte and lower byte in the storage flag are swapped.

24.4.6 Target-Sector Buffering Function

In the CD-ROM decoder, the sector for output can be designated in two ways: automatic buffering, where the CD-ROM decoder itself detects the presence of target sector that has been set beforehand, and manual buffering, where the target sector for output is designated by software and the software also recognizes the sectors buffered in the CD-ROM decoder.
The following describes the procedures for setting the registers in the CD-ROM decoder to set up automatic or manual buffering.

(1) Setting Up Automatic Buffering

Figure 24.16 shows an example of setting up the automatic buffering. Set the relevant CD-ROM decoder registers and start input of the data stream; the CD-ROM decoder then detects the target sector and starts the output of the stream data.

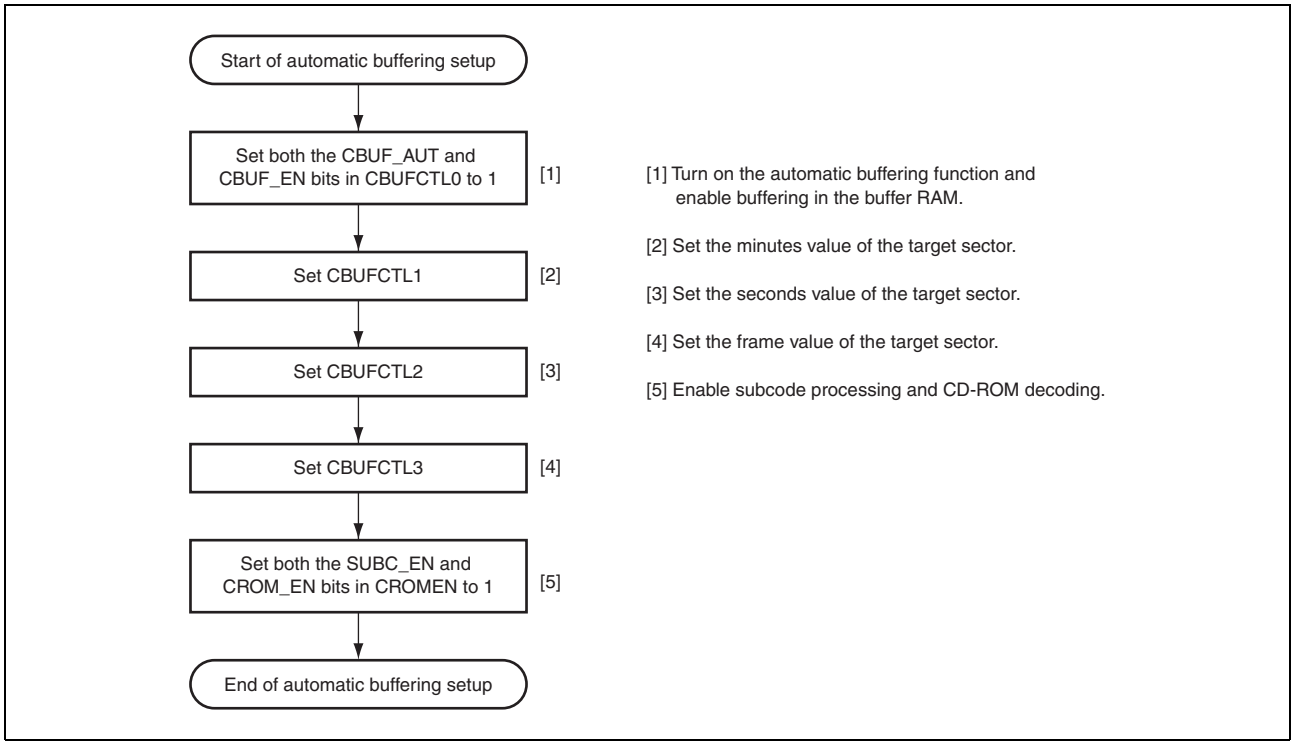

Figure 24.16 Example of Setting Up Automatic Buffering

(2) Setting Up Manual Buffering

Figure 24.17 shows an example of setting up manual buffering. Each time an ISEC interrupt is generated, the software checks whether or not the sector is the target sector and starts buffering when the target sector is found.

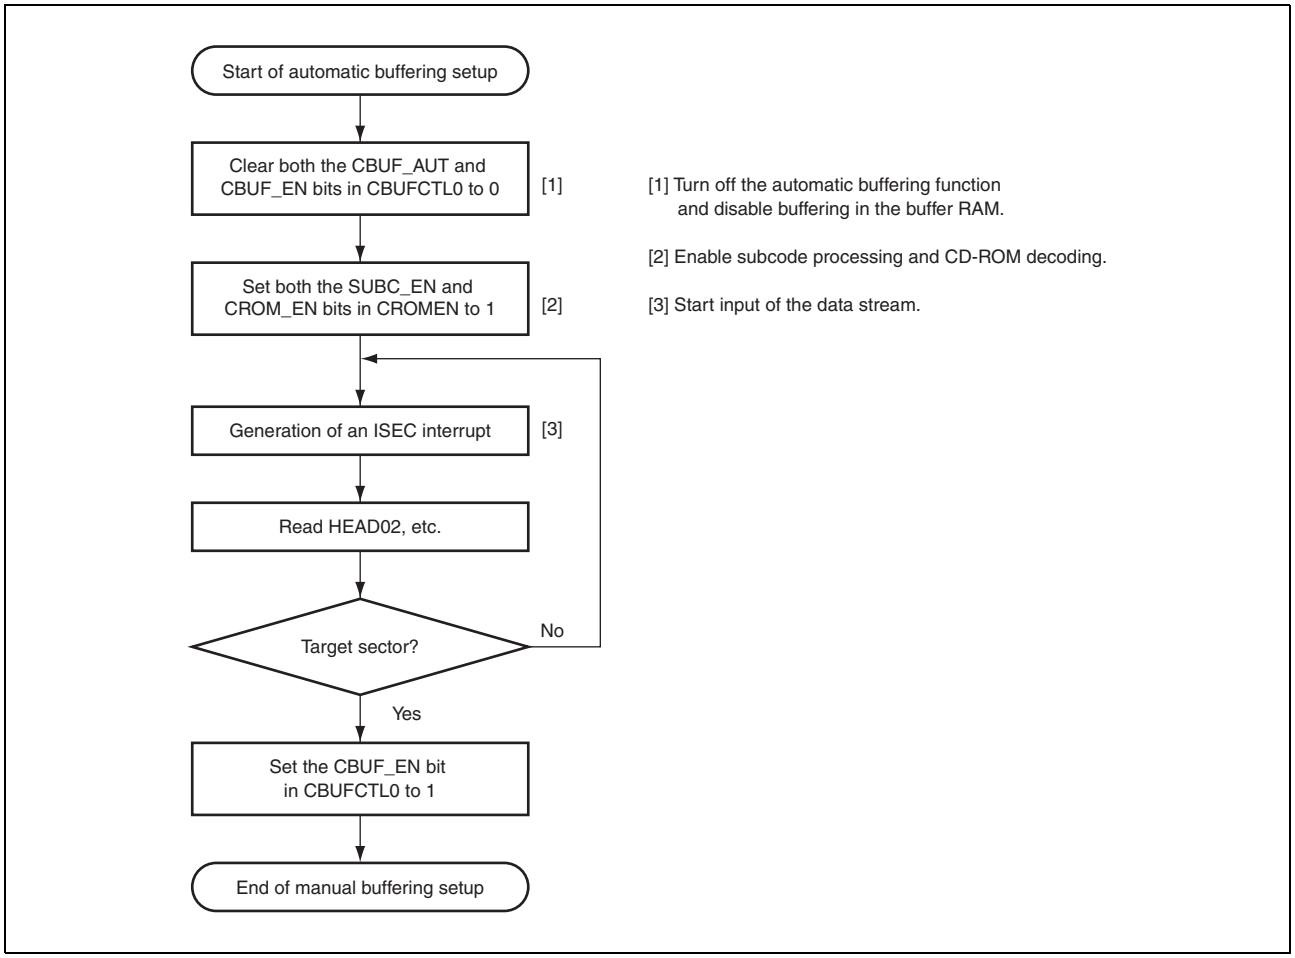

Figure 24.17 Example of Setting Up Manual Buffering

24.5 Interrupt Sources

24.5.1 Interrupt and DMA Transfer Request Signals

Table 24.3 lists the interrupt signals and DMA transfer request signal generated by the CD-ROM decoder, along with the meanings and the modules to which the signals are connected.

Table 24.3 Interrupt and DMA Transfer Request Signals

Name	Condition	Connected To
ISEC	Transition from sector to sector	Interrupt controller
ITARG	Access to a CD-ROM sector that is not the expected target sector	Interrupt controller
ISY	A sync code from the CD-ROM with abnormal timing	Interrupt controller
IERR	An error that was not correctable by ECC correction or an error indicated by EDC checking after ECC correction	Interrupt controller
IBUF	State changes in data transfer to the buffer	Interrupt controller
IREADY	Request for data transfer to the buffer for CD-ROM	Interrupt controller
DMA transfer request	Request for data transfer to the buffer for CD-ROM	Direct memory access controller

(1) ISEC Interrupt

This interrupt is generated when the sync code indicates a transition from sector to sector.

(2) ITARG Interrupt

This interrupt is generated when the stream data transferred from the CD-DSP is not the data of the target sector. The CD-ROM decoder checks the time data in the subcode. In correct operation, data transfer is expected to start slightly before the target sector. An ITARG interrupt is generated in the following cases.

- When data of a sector preceding the target sector by quite a few sectors have been transferred
- When data of a sector that comes after the target sector have been transferred

For the generation of this interrupt, ITARG is detected from the subcode. However, this interrupt has no meaning in this LSI because CD-ROM data are transferred from the serial sound interface.

(3) ISY Interrupt

This interrupt can be generated in the following cases.

- When a sync code was detected at a position where the value in the word counter (counter for checking sync code intervals) was not correct and the sync code was ignored
- When a sync code has not been detected although the word counter has reached the final value and a sync code has been interpolated (for sync maintenance)
- When a sync code was detected at a position where the value in the word counter (counter for checking sync code intervals) was not correct and the sync code was used in resynchronization
- When a sync code has not been detected although the word counter has reached the final value, so the period taken up by the sector has been prolonged
- When the sector has been processed as a short sector with the aid of interpolated sync codes
- When the sector has been processed as a long sector with the aid of interpolated sync codes

(4) IERR Interrupt

This interrupt is generated in the following cases.

- When ECC correction was incapable of correcting an error
- When ECC correction was OK but the subsequent EDC check indicated an error

(5) IBUF Interrupt

This interrupt is generated when the following transitions occur.

- Data transfer to the buffer → Data transfer complete (searching for data for the next transfer)
- Data for transfer to the buffer are being searched for → Data transfer started

(6) IREADY Interrupt

This interrupt is generated when decoding of data for one sector is completed. This interrupt should be used to start the CPU buffering stream data for output to SDRAM.

(7) DMA Transfer Request

The source of direct memory access controller activation is the same as that of IREADY. An interrupt request is generated when output stream data for one sector becomes ready, and after the 2768 bytes of data shown in figure 24.15 have been transferred, the request signal is negated. This is because a certain amount of time is required before the output data for the next sector is ready, so the transfer request from the direct memory access controller should be turned off between transfers.

24.5.2 Timing of Status Registers Updates

The status information registers of the CD-ROM decoder are updated on each ISEC interrupt. The sector for which information is reflected in the status registers is selected by the ER0SEL bit of the CROMCTL4 register.

24.6 Usage Notes

24.6.1 Stopping and Resuming Buffering Alone during Decoding

When the data of the output stream are not being read out but operation of the CD-ROM decoder has continued until the buffers are full, the BUF_NG bit in the CBUFST2 register is set to 1; after that, the CD-ROM decoder becomes incapable of operation.
To stop buffering alone, clear the CBUF_EN bit in the CBUFCTL0 register to 0. If the automatic buffering function is in use, clear the CBUF_AUT bit in the CBUFCTL0 register to 0 at the same time. In this case, the sectors currently in the buffers must be read out.
To resume automatic buffering, set the CBUF_AUT and CBUF_EN bits in the CBUFCTL0 register to 1 at the same time.

24.6.2 Setting Sync Code Status Register (CROMST0)

1. When the ST_SECS bit in the CROMST0 register becomes 1, stop decoding immediately and retry from one sector before the sector that was being decoded.
2. When the ST_SECL bit in the CROMST0 register becomes 1, stop decoding immediately and retry from two sectors before the sector that was being decoded.

24.6.3 Link Blocks

The CD-ROM decoder uses the header information before ECC correction to detect link blocks. Accordingly, an input data stream that contains an error may be erroneously detected as a link block. To prevent this, the following measures should be implemented in software.

- During buffering (BUF_ACT = 1 in the CBUFST0 register), check the LINK_OUT1 bit in the CROMST5 register on each ISEC interrupt. If it is set to 1, check to see if an IERR interrupt has also occurred; if an IERR interrupt has not occurred, save the MFS values from the HEAD20 to HEAD23 registers. If an IERR interrupt has occurred, do not save the MSF values.
- Perform the following processing for seven sectors (indicated by ISEC being generated seven times) after finding that the LINK_OUT1 bit has been set to 1.
- In either of cases 1 and 2 below,
  1. LINK_ON = 1 (in the CROMST5 register) is confirmed at each ISEC interrupt, and LINK_ON = 1 is detected again within the subsequent two-sector period
  2. LINK_ON = 1 was not detected at any ISEC interrupt

forcibly stop decoding, set the CROMSY0 register to place the decoder in external sync mode, and retry decoding by specifying the MSF value stored as described above + 7 (immediately after a link block) as the MSF value for the target sector.
The start sector address will be the address where RUN_OUT is stored + 7.

24.6.4 Stopping and Resuming CD-DSP Operation

When stopping and then resuming the stream data input to the CD-ROM decoder, if the input data stream does not stop immediately before a sync code and is then resumed, the CD-ROM decoder may recognize the data as incorrect. This happens because the system holds the data up to the point where input was stopped and the data that is input from the point of resumption at the same time. Take care on this point when stopping and then resuming input.

24.6.5 Note on Clearing the IREADY Flag

To clear the IREADY flag to 0 in interrupt processing etc., be sure to read one sector of data (2768 bytes) beforehand. If the IREADY flag is cleared to 0 before reading of one sector of data is complete, decoding of the subsequent sectors will not be possible. For recovery from this situation, write 1 to the LOGICRST bit in the CD-ROM decoder reset control register (ROMDECRST), and then clear the bit to 0.

24.6.6 Note on Stream Data Transfer (1)

If reading of the output data stream is slower than writing of the input data stream, the buffer of the CD-ROM decoder will overflow. This causes the CD-ROM decoder to abnormally stop.

When DMA transfer is in use, ensure that reading of the output data stream is faster than writing of the input data stream by making settings as listed below.

- Set a larger transfer size for reading of the output data stream than for writing of the input data stream.
- Give reading of the output data stream higher priority than writing of the input data stream.
- Set a smaller interval count for reading of the output data stream than for writing of the input data stream.

When the CPU handles transfer, ensure that reading of the output data stream is faster than writing of the input data stream by taking similar measures to those in the case of DMA transfer.

24.6.7 Note on Stream Data Transfer (2)

When reading the stream data, be sure to use either the direct memory access controller or the CPU. If both the direct memory access controller and the CPU are used for reading, the stream data may not be recognized as being in the CD-ROM format.

24.6.8 Note on Software Reset

For transitions to the software reset state by the LOGICRST bit in the ROMDECRST register, see section 42.3.6, Software Reset. However, where the procedure refers to the SRST bit, read this as the LOGICRST bit.

25. LIN Interface

This module is only incorporated in the RZ/A1L.

This section contains a generic description of the LIN Interface (RLIN3). The first part of this section describes all specific properties of this product, such as the register base addresses, etc. The remainder of the section describes the functions and registers of RLIN3.

25.1 Features

25.1.1 Channels

This LSI has following number of channels of the LIN Interface.

Table 25.1 Channels of RLIN3n

LIN Interface	RZ/A1L
Channels	1
Name	RLIN30

Index n

Throughout this section, the channel of the LIN Interface (RLIN3) is identified by the index “n” (n = 0), for example, RLN3nLMD for the LIN mode register.

25.1.2 Register Addresses

The register base address of the LIN interface is listed in the following table.

All LIN interface register addresses are given as address offsets to the individual base address.

Table 25.2 Register Base Addresses

Base Address Name	Base Address
<RLIN30_base>	FCFE 9000_H

25.1.3 Clock Supply

The following clock is provided for the LIN interface.

Table 25.3 RLIN3n Clock Supply

RLIN3n	Clock	Connected to
RLIN3n	LIN Communication Clock Source	P0φ

25.1.4 Interrupts and DMA

The LIN Interface can generate the following interrupt and DMA requests:

Table 25.4 RLIN3n Interrupt and DMA Requests

RLIN3n signal	Function
RLIN30	
LIN0_INT_M	LIN0 interrupt
LIN0_INT_T	LIN0 transmission interrupt
LIN0_INT_R	LIN0 successful reception interrupt
LIN0_INT_S	LIN0 status error interrupt

25.1.5 I/O Signals

The I/O signals of the LIN Interface are used for various purposes, as listed in Table 25.5.

Table 25.5 RLIN3n I/O Signals

Name	Function
RLIN30	
Port RLIN30RX	RLIN30 receive data input
Port RLIN30TX	RLIN30 transmit data output

25.2 Function

The LIN Interface is a hardware LIN communication controller that supports LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAEJ2602, and automatically performs frame communication and error determination.

The LIN master mode is only available.

LIN master

- LIN reset mode
- LIN mode (LIN master mode)
  - LIN wake-up mode
  - LIN operation mode
- LIN self-test mode

Table 25.6 gives the LIN Interface specifications and Figure 25.1 shows a block diagram of the LIN Interface.

Table 25.6 LIN Interface Specifications

Item		Specifications
	Channel count	1
LIN communication function	Protocol	LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAEJ2602
	Variable frame structure	Master • Break transmission width: 13 to 28 Tbits • Break delimiter transmission width: 1 to 4 Tbits • Transmission inter-byte space width (header): 0 to 7 Tbits (space between Sync field and ID field)*1 • Transmission response space width: 0 to 7 Tbits*1 • Transmission inter-byte space width: 0 to 3 Tbits (space between data bytes in response area) • Transmit wake-up width: 1 to 16 Tbits
	Checksum	• Automatic operation for both transmission and reception • Classic or enhanced selectable (for each frame)
	Response field data byte count	Variable from 0 to 8 bytes Multi-byte (9 or more bytes) response transmission and reception also possible
	Frame communication modes	Master • Mode in which header transmission and response transmission/reception is started with a single transmission start request • Mode in which header transmission and response transmission are started with separate transmission start requests (frame separate mode) (Setting of the frame separate mode is prohibited in this product.)
	Wake-up transmission and reception	LIN wake-up mode provided • Wake-up transmission (1 to 16 Tbits) • Wake-up reception Low-level width of input signals measured
	Status	Master • Successful frame/wake-up transmission • Successful header transmission • Successful frame/wake-up reception*2 • Successful data 1 reception • Error detection • Operation mode (LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode)
	Error status	Master • Bit error • Checksum error • Frame timeout error/response timeout error • Physical bus error • Framing error • Response preparation error
	Baud rate selection	Baud rate conforming to the LIN specifications generated using baud rate generator
	Test mode	Self-test mode for user evaluation
	Interrupt function	Master • Successful header/frame/wake-up transmission • Successful frame/wake-up reception*2 • Error detection

Note 1. Since the same register is used for setting, the inter-byte space (header) = response space.
Note 2. For wake-up reception, the low level width of the input signal is indicated.

25.2.1 Block Diagram

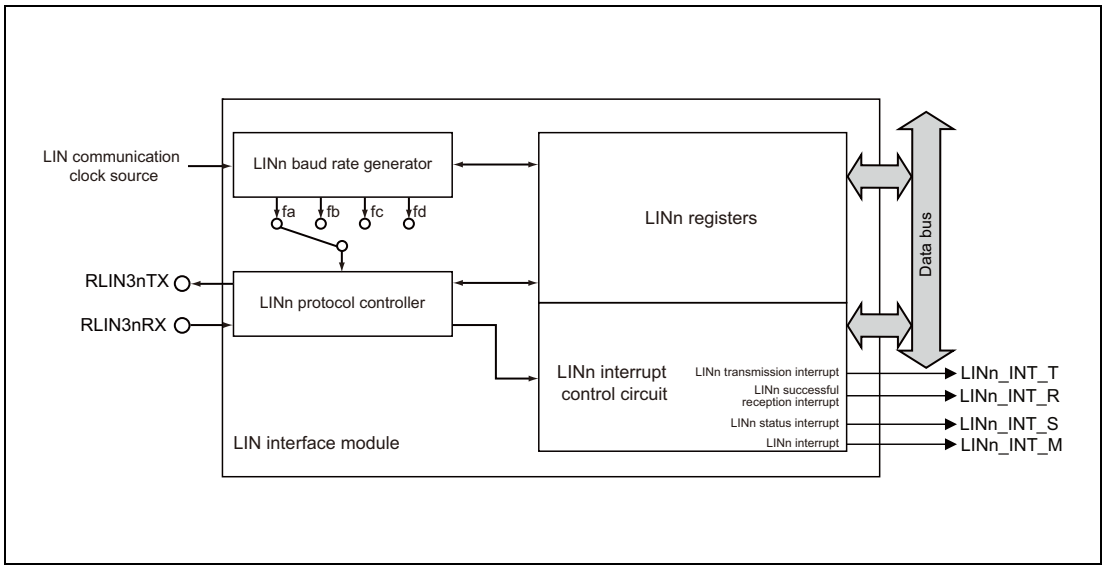

Figure 25.1 LIN Interface Block Diagram

25.2.2 Description of Blocks

- RLIN3nTX, RLIN3nRX: LIN Interface I/O pins
- LINn baud rate generator: Generates the LIN Interface communication clock signal.
- LINn registers: LIN Interface registers
- LINn interrupt controller: Controls interrupt requests generated by the LIN Interface

25.3 Registers

Table 25.7 lists the LIN Interface registers.

Table 25.7 List of LIN Interface Registers

Register Name	Symbol
LIN wake-up baud rate selector register	RLN3nLWBR
LIN baud rate prescaler 0 register	RLN3nLBRP0
LIN baud rate prescaler 1 register	RLN3nLBRP1
LIN self-test control register	RLN3nLSTC
LIN mode register	RLN3nLMD
LIN break field configuration register	RLN3nLBFC
LIN space configuration register	RLN3nLSC
LIN wake-up configuration register	RLN3nLWUP
LIN interrupt enable register	RLN3nLIE
LIN error detection enable register	RLN3nLEDE
LIN control register	RLN3nLCUC
LIN transmission control register	RLN3nLTRC
LIN mode status register	RLN3nLMST
LIN status register	RLN3nLST
LIN error status register	RLN3nLEST
LIN data field configuration register	RLN3nLDFC
LIN ID buffer register	RLN3nLIDB
LIN checksum buffer register	RLN3nLCBR
LIN data buffer 1 register	RLN3nLDBR1
LIN data buffer 2 register	RLN3nLDBR2
LIN data buffer 3 register	RLN3nLDBR3
LIN data buffer 4 register	RLN3nLDBR4
LIN data buffer 5 register	RLN3nLDBR5
LIN data buffer 6 register	RLN3nLDBR6
LIN data buffer 7 register	RLN3nLDBR7
LIN data buffer 8 register	RLN3nLDBR8

Note: When writing to a register not used, write 00_H.

25.3.1 LIN Master Related Registers

25.3.1.1 RLN3nLWBR — LIN Wake-up Baud Rate Select Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 01_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	NSPB[3:0]				LPRS[2:0]			LWBR0
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.8 RLN3nLWBR register contents

Bit Position	Bit Name	Function
7 to 4	NSPB[3:0]	Bit Sampling Count Select b7 b4 0 0 0 0: 16 sampling 1 1 1 1: 16 sampling Settings other than the above are prohibited.
3 to 1	LPRS[2:0]	Prescaler Clock Select b3 b1 0 0 0: 1/1 0 0 1: 1/2 Other than above: Setting prohibited
0	LWBR0	Wake-up Baud Rate Select 0: In LIN wake-up mode, the clock specified by the LCKS bit setting in the RLN3nLMD register is used (when LIN1.3 is used). 1: In LIN wake-up mode, the clock fa is used regardless of the setting of the LCKS bit in the RLN3nLMD register (when LIN2.x is used).

Set the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

NSPB[3:0] bits (bit sampling count select bits)

These bits select the number of sampling in one Tbit (reciprocal of the baud rate).

In LIN master mode, set these bits to 0000_B or 1111_B (16 sampling).

LPRS[2:0] bits (prescaler clock select bits)

These bits select the frequency division ratio for the prescaler.

LWBR0 bit (wake-up baud rate select bit)

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0. This allows the 2.5-Tbit or longer low-level width of the input signal to be measured. When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. Setting the LWBR0 bit to 1 selects fa as the LIN system clock (fLIN) during LIN wake-up mode regardless of the setting of the RLN3nLMD.LCKS bit (the LCKS bit is not changed). This allows the 2.5-Tbit or longer low-level width of the input signal to be measured.

Setting the baud rate to 19200 bps while fa is selected allows the 130 µs or longer low-level width of the input signal to be detected during LIN wake-up mode regardless of the setting of the RLN3nLMD.LCKS bit.

25.3.1.2 RLN3nLBRP0 — LIN Baud Rate Prescaler 0 Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 02_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	LBRP0[7:0]							
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.9 RLN3nLBRP0 register contents

Bit Position	Bit Name	Function
7 to 0	LBRP0[7:0]	Assuming that the value set in this register is N (4 to 255), the baud rate prescaler divides the frequency of the prescaler clock by N + 1. Setting Range: 04_H to FF_H Note: Set the LPRS and LBRP0 bits so that the frequency of the prescaler clock becomes no more than that of the clock source for LIN communications divided by nine.

Set the RLN3nLBRP0 register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

The value set in this register is used to control the frequency of baud rate clock sources fa, fb, and fc.

Assuming that the value set in this register is N, baud rate prescaler 0 divides the frequency of the clock that is selected by the LPRS bits by N + 1.

25.3.1.3 RLN3nLBRP1 — LIN Baud Rate Prescaler 1 Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 03_H

Initial value: 00H

Bit	7	6	5	4	3	2	1	0
	LBRP1[7:0]							
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.10 RLN3nLBRP1 register contents

Bit Position	Bit Name	Function
7 to 0	LBRP1[7:0]	Assuming that the value set in this register is M (4 to 255), the baud rate prescaler divides the frequency of the prescaler clock by M + 1. Setting Range: 04_H to FF_H Note: Set the LPRS and LBRP1 bits so that the frequency of the prescaler clock becomes no more than that of the clock source for LIN communications divided by nine.

Set the RLN3nLBRP1 register when the OMM0 bit in the RLN2uunLcMST register is 0_B (in LIN reset mode).

The value set in this register is used to control the frequency of baud rate clock source fd.

Assuming that the value set in this register is M, baud rate prescaler 1 divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) by M + 1.

25.3.1.4 RLN3nLSTC — LIN Self-Test Control Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 04_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—							LSTM
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 25.11 RLN3nLSTC register contents

Bit Position	Bit Name	Function
7 to 1	Reserved	Writing $A7_H$, 58_H, and 01_H successively to the RLN3nLSTC register places the module into LIN self-test mode.
0	LSTM	LIN Self-Test Mode 0: The module is not in LIN self-test mode 1: The module is in LIN self-test mode.

The RLN3nLSTC register cancels protection of LIN self-test mode.

Set the RLN3nLSTC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

Writing $A7_H$, 58_H, and 01_H successively to the RLN3nLSTC register places the module into LIN self-test mode.

When successive writing is completed thus placing LIN self-test mode to be entered, the LSTM bit is set to 1.

Do not write any other value during successive writing.

For making transition to LIN self-test mode, refer to Section 25.8, LIN Self-Test Mode.

When read, bits 6 to 1 return 000000_B, and bit 7 returns an undefined value.

LSTM bit (LIN self test mode bit)

When transition to LIN self-test mode is completed, the LSTM bit is set to 1.

For leaving LIN self-test mode, refer to Section 25.8, LIN Self-Test Mode.

Writing 1 to this bit does not affect the value of the RLN3nLSTC register if it is not a part of successive writing of $A7_H$, 58_H, and 01_H.

25.3.1.5 RLN3nLMD — LIN Mode Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 08_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	LRDNFS	LIOS	LCKS[1:0]		LMD[1:0]	
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.12 RLN3nLMD register contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, an initial value is returned. When written, write an initial value.
5	LRDNFS	LIN Reception Data Noise Filtering Disable 0: The noise filter is enabled. 1: The noise filter is disabled.
4	LIOS	LIN Interrupt Output Select 0: LINn interrupt is used. 1: LINn transmission interrupt, LINn successful reception interrupt, and LINn status error interrupt are used.
3, 2	LCKS[1:0]	LIN System Clock Select b3 b2 0 0: fa (Clock generated by baud rate prescaler 0) 0 1: fb (1/2 clock generated by baud rate prescaler 0) 1 0: fc (1/8 clock generated by baud rate prescaler 0) 1 1: fd (1/2 clock generated by baud rate prescaler 1)
1, 0	LMD[1:0]	LIN Mode Select b1 b0 0 0: LIN master mode

Set the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

LRDNFS bit (LIN reception data noise filtering disable bit)

The LRDNFS bit enables or disables the noise filter when receiving data.

With 0 set, the noise filter is enabled when receiving data.

With 1 set, the noise filter is disabled when receiving data.

LIOS bit (LIN interrupt output select bit)

The LIOS bit selects the number of interrupt outputs from the LIN Interface.

With 0 set, the LINn interrupt is generated from the LIN Interface.

With 1 set, the LINn transmission interrupt, LINn successful reception interrupt, and LINn status interrupt are generated from the LIN Interface.

For each interrupt source, refer to Section 25.4, Interrupt Sources.

LCKS[1:0] bits (LIN system clock select bits)

The LCKS bits select the clock to be input to the protocol controller.

With 00_B set, the protocol controller is provided with fa (clock generated by baud rate prescaler 0).

With 01_B set, the protocol controller is provided with fb (1/2 clock generated by baud rate prescaler 0).

With 10_B set, the protocol controller is provided with fc (1/8 clock generated by baud rate prescaler 0).

With 11_B set, the protocol controller is provided with fd (1/2 clock generated by baud rate prescaler 1).

With 1_B is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x is used), and the RLN3nLMST register is 01_H (LIN wake-up mode), the protocol controller is provided with fa regardless of the setting of the bit (the LCKS bit is not changed).

LMD[1:0] bits (LIN mode select bits)

The LMD bits select the LIN Interface mode.

To use the LIN Interface as an LIN master, set these bits to 00_B.

25.3.1.6 RLN3nLBFC — LIN Break Field Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 09_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	BDT[1:0]		BLT[3:0]			
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.13 RLN3nLBFC register contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, an initial value is returned. When written, write an initial value.
5, 4	BDT[1:0]	Break Delimiter (High level) width select bit b5 b4 0 0: 1 Tbit 0 1: 2 Tbits 1 0: 3 Tbits 1 1: 4 Tbits
3 to 0	BLT[3:0]	Transmit Break (Low level) width select bit b3 b0 0 0 0 0: 13 Tbits 0 0 0 1: 14 Tbits 0 0 1 0: 15 Tbits : 1 1 1 0: 27 Tbits 1 1 1 1: 28 Tbits

Set the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

Some combinations of the set values result in the length of a frame exceeding the timeout time. Set the appropriate values in this register.

BDT[1:0] bit (Transmission Break Delimiter high level width setting bit)

This bit is used to set the break high **level** width of transmission frame header.

1 Tbit to 4 Tbits can be set.

BLT[3:0] bit (Transmission Break Low level width setting bit)

This BLT bits set the break low **level** width of transmission frame header.

13 Tbits to 28 Tbits can be set.

25.3.1.7 RLN3nLSC — LIN Space Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0A_H$

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	IBHS[2:0]		
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Table 25.14 RLN3nLSC register contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, an initial value is returned. When written, write an initial value.
5, 4	IBS[1:0]	Inter-Byte Space Select b5 b4 0 0: 0 Tbit 0 1: 1 Tbit 1 0: 2 Tbits 1 1: 3 Tbits
3	Reserved	When read, an initial value is returned. When written, write an initial value.
2 to 0	IBHS[2:0]	Inter-Byte Space (Header)/Response Space Select b2 b0 0 0 0: 0 Tbit 0 0 1: 1 Tbit 0 1 0: 2 Tbits 0 1 1: 3 Tbits 1 0 0: 4 Tbits 1 0 1: 5 Tbits 1 1 0: 6 Tbits 1 1 1: 7 Tbits

Set the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

Some combinations of the set values result in the length of a frame or a response exceeding the timeout time. Set the appropriate values in this register.

IBS[1:0] bits (inter-byte space select bits)

The IBS bits set the width of the inter-byte space of the transmission frame response field.

0 Tbit to 3 Tbits can be set.

These bits are enabled only during response transmission; these are disabled during response reception.

IBHS[2:0] bits (inter-byte space (header)/response space select bits)

The IBHS bits set the width of the inter-byte space (header) of the transmission frame header field and the response space.

0 Tbit to 7 Tbits can be set.

The response space setting is enabled only during response transmission; setting is disabled during response reception.

The inter-byte space (header) is equal to the response space.

25.3.1.8 RLN3nLWUP — LIN Wake-up Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0B_H$

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	WUTL[3:0]				—	—	—	—
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 25.15 RLN3nLWUP register contents

Bit Position	Bit Name	Function
7 to 4	WUTL[3:0]	Wake-up Transmission Low level Width Select b7 b4 0 0 0 0: 1 Tbit 0 0 0 1: 2 Tbits 0 0 1 0: 3 Tbits 0 0 1 1: 4 Tbits : 1 1 0 0: 13 Tbits 1 1 0 1: 14 Tbits 1 1 1 0: 15 Tbits 1 1 1 1: 16 Tbits
3 to 0	Reserved	When read, an initial value is returned. When written, write an initial value.

Set the RLN3nLWUP register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

WUTL[3:0] bits (wake-up transmission low level width select bits)

The WUTL bits set the low level width of the wake-up signal transmission.

1 Tbit to 16 Tbits can be set.

While 1 is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x is used), fa is selected as the LIN system clock (fLIN) regardless of the setting of the RLN3nLMD.LCKS bit (the LCKS bit is not changed).

25.3.1.9 RLN3nLIE — LIN Interrupt Enable Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0C_H$

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SHIE	ERRIE	FRCIE	FTCIE
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 25.16 RLN3nLIE register contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, an initial value is returned. When written, write an initial value.
3	SHIE	Successful Header Transmission Interrupt Request Enable 0: Disables successful header transmission interrupt request. 1: Enables successful header transmission interrupt request.
2	ERRIE	Error Detection Interrupt Request Enable 0: Disables error detection interrupt request. 1: Enables error detection interrupt request.
1	FRCIE	Successful Frame/Wake-up Reception Interrupt Request Enable 0: Disables successful frame/wake-up reception interrupt request. 1: Enables successful frame/wake-up reception interrupt request.
0	FTCIE	Successful Frame/Wake-up Transmission Interrupt Request Enable 0: Disables successful frame/wake-up transmission interrupt request. 1: Enables successful frame/wake-up transmission interrupt request.

Set the RLN3nLIE register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

SHIE bit (successful header transmission interrupt enable bit)

The SHIE bit enables or disables interrupt request upon successful transmission of a header.

With 0 set, the interrupt request for LINn transmission is not generated when the HTRC flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for LINn transmission is generated when the HTRC flag in the RLN3nLST register is set to 1.

ERRIE bit (error detection interrupt request enable bit)

The ERRIE bit enables or disables interrupt request upon detection of an error.

With 0 set, the interrupt request for LINn status is not generated when the ERR flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for LINn status is generated when the ERR flag in the RLN3nLST register is set to 1.

Interrupt sources can be the bit error, physical bus error, frame/response timeout error, framing error, checksum error, and response preparation error.

Detection of the bit error, physical bus error, frame/response timeout error, and framing error can be enabled or disabled using the RLN3nLEDE register.

FRCIE bit (successful frame/wake-up reception interrupt request enable bit)

The FRCIE bit enables or disables interrupt request upon successful reception of a frame or a wake-up signal (counting of low level width of the input signal).

With 0 set, the interrupt request for successful LINn reception is not generated when the FRC flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for successful LINn reception is generated when the FRC flag in the RLN3nLST register is set to 1.

FTCIE bit (successful frame/wake-up transmission interrupt request enable bit)

The FTCIE bit enables or disables interrupt request upon successful transmission of a frame or a wake-up signal.

With 0 set, the interrupt request for LINn transmission is not generated when the FTC flag in the RLN3nLST register is set to 1.

With 1 set, the interrupt request for LINn transmission is generated when the FTC flag in the RLN3nLST register is set to 1.

25.3.1.10 RLN3nLEDE —LIN Error Detection Enable Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0D_H$

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	LTES	—	—	—	FERE	FTERE	PBERE	BERE
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R/W	R/W	R/W	R/W

Table 25.17 RLN3nLEDE register contents

Bit Position	Bit Name	Function
7	LTES	Timeout Error Select 0: Frame timeout error 1: Response timeout error
6 to 4	Reserved	When read, an initial value is returned. When written, write an initial value.
3	FERE	Framing Error Detection Enable 0: Disables framing error detection. 1: Enables framing error detection.
2	FTERE	Timeout Error Detection Enable 0: Disables frame/response timeout error detection. 1: Enables frame/response timeout error detection.
1	PBERE	Physical Bus Error Detection Enable 0: Disables physical bus error detection. 1: Enables physical bus error detection.
0	BERE	Bit Error Detection Enable 0: Disables bit error detection. 1: Enables bit error detection.

Set the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0_B (in LIN reset mode).

LTES bit (timeout error select bit)

The LTES bit selects the specific timeout function to be used.

With 0 set, the timeout function applies to frame timeout.

With 1 set, the timeout function applies to response timeout.

For details of the timeout error, refer to Section 25.7.6, Error Status.

FERE bit (framing error detection enable bit)

The FERE bit enables or disables detection of the framing error.

With 0 set, the framing error is not detected.

With 1 set, the framing error is detected.

When this bit is set to 1, the detection result is indicated in the FER flag in the RLN3nLEST register.

For details of the framing error, refer to Section 25.7.6, Error Status.

FTERE bit (timeout error detection enable bit)

The FTERE bit enables or disables detection of the frame timeout error or the response timeout error.

With 0 set, the frame timeout error or response timeout error is not detected.

With 1 set, the frame timeout error or response timeout error is detected.

When this bit is set to 1, the detection result is indicated in the FTER flag in the RLN3nLEST register.

With the LTES bit, either the frame timeout error or response timeout error can be selected.

Do not use the timeout error if response data of 9 bytes or more is to be transmitted or received.

For details of the timeout error, refer to Section 25.7.6, Error Status.

PBERE bit (physical bus error detection enable bit)

The PBERE bit enables or disables detection of the physical bus error.

With 0 set, the physical bus error is not detected.

With 1 set, the physical bus error is detected.

When this bit is set to 1, the detection result is indicated in the PBER flag in the RLN3nLEST register.

For details of the physical bus error, refer to Section 25.7.6, Error Status.

BERE bit (bit error detection enable bit)

The BERE bit enables or disables detection of the bit error.

With 0 set, the bit error is not detected.

With 1 set, the bit error is detected.

When this bit is set to 1, the detection result is indicated in the BER flag in the RLN3nLEST register.

For details of the bit error, refer to Section 25.7.6, Error Status.

25.3.1.11 RLN3nLCUC — LIN Control Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + $0E_H$

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OM1	OM0
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.18 RLN3nLCUC register contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, an initial value is returned. When written, write an initial value.
1	OM1	LIN Mode Select 0: LIN wake-up mode is caused. 1: LIN operation mode is caused.
0	OM0	LIN Reset 0: LIN reset mode is caused. 1: LIN reset mode is canceled.

Set the RLN3nLCUC register to 01_H to cause a transition to LIN wake-up mode after canceling LIN reset mode, and set the register to 03_H to cause a transition to LIN operation mode.

In LIN self-test mode, set the RLN3nLCUC register to 03h after a transition to LIN self-test mode is completed.

After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

OM1 bit (LIN mode select bit)

The OM1 bit selects the specific LIN operation mode (either LIN wake-up mode or LIN operation mode) after canceling LIN reset mode.

With 0 set, LIN wake-up mode is caused.

With 1 set, LIN operation mode is caused.

This bit is valid only when the OMM0 bit in the RLN3nLMST register is 1.

Writing a value to this bit is disabled while the FTS bit in the RLN3nLTRC register is 1.

OM0 bit (LIN reset bit)

The OM0 bit selects either causing a transition to LIN reset mode or canceling LIN reset mode.

With 0 set, LIN reset mode is caused.

With 1 set, LIN reset mode is canceled.

25.3.1.12 RLN3nLTRC — LIN Transmission Control Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 10_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RTS	FTS
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 25.19 RLN3nLTRC register contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, an initial value is returned. When written, write an initial value.
1	RTS	Response Transmission/Reception Start 0: Response transmission/reception is stopped in frame separate mode. 1: Response transmission/reception is started in frame separate mode. Note: Setting of the frame separate mode is prohibited in this product.
0	FTS	Frame Transmission/wake-up Transmission /Reception Start 0: Frame Transmission/wake-up transmission /reception is stopped. 1: Frame Transmission/wake-up transmission reception is started.

RTS bit (response transmission/reception start bit)

Set the RTS bit to 1 in frame separate mode after header transmission is started (FTS bit is 1) and response transmission data is ready. Once set, this bit is automatically cleared to 0 upon completion of frame communication (including error detection) or transition to LIN reset mode.
Only 1 can be written to this bit; 0 cannot be written. To write 1 to this bit, write 02_H to the RLN3nLTRC register using the store instruction.

Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (in LIN reset mode).

Writing a value to this bit is disabled when the FTS bit is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, set this bit to 1 each time a data group (variable from 0 to 8 bytes) is transmitted or received. Once set, this bit is automatically cleared to 0 upon completion of data group communication or transition to LIN reset mode.

FTS bit (frame transmission/wake-up transmission/reception start bit)

Set the FTS bit to 1 to start frame transmission and reception.

Also set this bit to 1 to allow wake-up transmission and wake-up reception (counting of the low level width of the input signal).

Only 1 can be written to this bit; 0 cannot be written. Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (in LIN reset mode).

This bit is set to 0 upon completion of frame or wake-up communication (including error detection) and transition to LIN reset mode.

25.3.1.13 RLN3nLMST — LIN Mode Status Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 11_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OMM1	OMM0
Initial value	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 25.20 RLN3nLMST register contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, an initial value is returned. When written, write an initial value.
1	OMM1	LIN Mode Status Monitor 0: The module is in LIN wake-up mode. 1: The module is in LIN operation mode.
0	OMM0	LIN Reset Status Monitor 0: The module is in LIN reset mode. 1: The module is not in LIN reset mode.

OMM1 bit (LIN mode status monitor)

The OMM1 bit indicate the current operating mode.

OMM0 bit (LIN reset status monitor)

The OMM0 bit indicates the current operating mode.

25.3.1.14 RLN3nLST — LIN Status Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 12_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	HTRC	D1RC	—	—	ERR	—	FRC	FTC
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W

Table 25.21 RLN3nLST register contents

Bit Position	Bit Name	Function
7	HTRC	Successful Header Transmission Flag 0: Header transmission has not been completed. 1: Header transmission has been completed.
6	D1RC	Successful Data 1 Reception Flag These bits are always read as 0. The write value should always be 0.
5, 4	Reserved	When read, an initial value is returned. When written, write an initial value.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2	Reserved	When read, an initial value is returned. When written, write an initial value.
1	FRC	Successful Frame/Wake-up Reception Flag 0: Frame or wake-up reception has not been completed. 1: Frame or wake-up reception has been completed.
0	FTC	Successful Frame/Wake-up Transmission Flag 0: Frame or wake-up transmission has not been completed. 1: Frame or wake-up transmission has been completed.

The RLN3nLST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication (when the FTS bit of the RLN3nLTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H. To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

HTRC flag (successful header transmission flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The HTRC flag is set to 1 upon completion of header transmission. Here, an interrupt request for LINn transmission is generated if the SHIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

D1RC flag (successful data 1 reception flag)

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The D1RC flag is set to 1 upon completion of data 1 reception. Here, an interrupt request is not generated. To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

When response data of 9 bytes or more is to be received, this bit is set to 1 each time data 1 of a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

ERR flag (error detection flag)

The ERR flag is set to 1 upon detection of an error (when the value of any of the flags of the RLN3nLEST registers is 1). Here, an interrupt request for LINn status is generated if the ERRIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the RPER, CSER, FER, FTER, PBER, and BER flags in the RLN3nLEST register in LIN operation mode or LIN wake-up mode. This clears the ERR flag to 0.

FRC flag (successful frame/wake-up reception flag)

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The FRC flag is set to 1 upon completion of frame or wake-up reception. Here, an interrupt request for successful LINn reception is generated if the FRCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.

When response data of 9 bytes or more is to be received, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

FTC flag (successful frame/wake-up transmission flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The FTC flag is set to 1 upon completion of frame or wake-up transmission. Here, an interrupt request for LINn transmission is generated if the FTCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.

When response data of 9 bytes or more is to be transmitted, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is transmitted. Write 0 before starting transmission of the next data group.

25.3.1.15 RLN3nLEST — LIN Error Status Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 13_H

Initial value: 00H

Bit	7	6	5	4	3	2	1	0
	RPER	—	CSER	—	FER	FTER	PBER	BER
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R	R/W	R/W	R/W	R/W

Table 25.22 RLN3nLEST register contents

Bit Position	Bit Name	Function
7	RPER	Response Preparation Error Flag 0: Response preparation error has not been detected. 1: Response preparation error has been detected.
6	Reserved	When read, an initial value is returned. When written, write an initial value.
5	CSER	Checksum Error Flag 0: Checksum error has not been detected. 1: checksum error has been detected.
4	Reserved	When read, an initial value is returned. When written, write an initial value.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	FTER	Timeout Error Flag 0: Frame/response timeout error has not been detected. 1: Frame/response timeout error has been detected.
1	PBER	Physical Bus Error Flag 0: Physical bus error has not been detected. 1: Physical bus error has been detected.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN3nLEST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

When the FTS bit in the RLN3nLTRC register is 1 (frame transmission or wake-up transmission/ reception is started), do not write a value to this register. To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

RPER flag (response preparation error flag)

Only 0 can be written to the RPER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The RPER flag is set to 1 upon response preparation error detection. To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

CSER flag (checksum error flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The CSER flag is set to 1 upon checksum error detection. To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

FER flag (framing error flag)

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The FER flag is set to 1 upon frame timeout detection when the FERE bit of the RLN3nLEDE register is 1 (frame timeout detection enabled). To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

FTER flag (timeout error flag)

Only 0 can be written to the FTER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The FTER flag is set to 1 upon frame timeout error or response timeout error detection when the FTERE bit of the RLN3nLEDE register is 1 (frame/response timeout error detection enabled). To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

PBER flag (physical bus error flag)

Only 0 can be written to the PBER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The PBER flag is set to 1 upon physical bus error detection when the PBERE bit of the RLN3nLEDE register is 1 (physical bus error detection enabled). To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.

BER flag (bit error flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The BER flag is set to 1 upon bit error detection when the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled). To clear the bit to 0 before the next communication (when the value of the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.

25.3.1.16 RLN3nLDFC — LIN Data Field Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 14_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	LSS	FSM	CSM	RFT	RFDL[3:0]			
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.23 RLN3nLDFC register contents

Bit Position	Bit Name	Function
7	LSS	Transmission/Reception Continuation Select 0: The data group to be transmitted/received next is the last one. 1: The data group to be transmitted/received next is not the last one. (Checksum is not included.)
6	FSM	Frame Separate Mode Select 0: Frame separate mode is not set. 1: Frame separate mode is set. Note: Setting of the frame separate mode is prohibited in this product.
5	CSM	Checksum Select 0: Classic checksum mode 1: Enhanced checksum mode
4	RFT	Response Field Communication Direction Select 0: Reception 1: Transmission
3 to 0	RFDL[3:0]	Response Field Length Select b3 b0 0 0 0 0: 0 byte (+ checksum) 0 0 0 1: 1 byte (+ checksum) 0 0 1 0: 2 bytes (+ checksum) : 0 1 1 1: 7 bytes (+ checksum) 1 0 0 0: 8 bytes (+ checksum) Settings other than the above are prohibited.

LSS bit (transmission/reception continuation select bit)

The LSS bit indicates that the data group to be transmitted or received next is not the last data group when response data of 9 bytes or more is to be transmitted or received. With 0 set, data and checksum are transmitted or received because the next data group to be transmitted or received is the last one.

With 1 set, only data is transmitted or received, and the checksum is not included because the next data group to be transmitted or received is not the last one.

Set the LSS bit only when the FSM bit is 1 (frame separate mode) and response data of 9 bytes or more is to be transmitted or received.

Set the LSS bit only when the RTS bit in the RLN3nLTRC is 0 (response transmit/receive is stopped).

FSM bit (frame separate mode select bit)

The FSM bit sets the response communication mode.

With 0 set, frame separate mode is not selected. In this case, after header transmission is started (the FTS bit in the RLN3nLTRC register is 1), response is transmitted/received without the RTS bit in the RLN3nLTRC register being set.

With 1 set, frame separate mode is selected. If the RTS bit of the RLN3nLTRC register is set to 1 during header transmission, response transmission is executed after header transmission is completed.

For response reception which is 8 bytes or less (the RFT bit is 0), set the FSM bit to 0.
When causing a transition to LIN self-test mode, set this bit to 0 before transition.
For details of frame separate mode, refer to Section 25.7.3.1, Transmission of LIN Frames.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, set the FSM bit to 1.

CSM bit (checksum select bit)

The CSM bit sets the checksum mode.
With 0 set, classic checksum mode is selected.
With 1 set, enhanced checksum mode is selected.
When the timeout error is used (the FTERE bit in the RLN3nLEDE register is 1), the specific timeout time depends on the setting of this bit. For details of the bit error, refer to Section 25.7.6, Error Status.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, do not change the CSM bit setting after the first data group through the last data group.

During communication of response data of 9 bytes or more, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

RFT bit (response field communication direction select bit)

The RFT bits set the direction of the response field/wake-up signal communication.
With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (low level width of the input signal is counted).
With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, do not change the RFT bit setting after the first data group through the last data group.

RFDL[3:0] bits (response field length select bits)

The RFDL bits set the length of the response field data.
The data length can be 0 to 8 bytes excluding the checksum size.
To transmit response data with the FSM bit set to 0 (not frame separate mode), set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).
To transmit response data with the FSM bit set to 1 (frame separate mode), set the RFDL bits before response transmission (the FTS bit in the RLN3nLTRC register is 0).
To receive response data, set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).

When response data of 9 bytes or more is to be transmitted or received, set the RFDL bits before data group transmission/reception (RTS bit in the RLN3nLTRC register is 0).

Only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

25.3.1.17 RLN3nLIDB — LIN ID Buffer Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 15_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	IDP[1:0]		ID[5:0]					
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.24 RLN3nLIDB register contents

Bit Position	Bit Name	Function
7	IDP1	Parity Setting (P1) Sets the parity bit (P1) to be transmitted in the ID field.
6	IDP0	Parity Setting (P0) Sets the parity bit (P0) to be transmitted in the ID field.
5 to 0	ID[5:0]	ID Setting Sets the 6-bit ID value to be transmitted in the ID field.

Set the RLN3nLIDB register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

In LIN self-test mode, this register operates as follows:

Write the value to be transmitted before communication. After completion of frame transmission/ reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see Section 25.8, LIN Self-Test Mode.

IIDP[1:0] bits (parity setting bits)

The IDP bits set the parity bits (P0 and P1) to be transmitted in the ID field of the LIN frame (IDP0 for P0 and IDP1 for P1). Since parity is not automatically calculated, set the calculation result. Note that if the erroneous result is set, it is transmitted as is.

ID[5:0] bits (ID setting bits)

The ID bit sets the 6-bit ID value to be transmitted in the ID field of the LIN frame.

25.3.1.18 RLN3nLCBR — LIN Checksum Buffer Register

Access: This register can only be read in 8-bit units. In LIN self-test mode, this register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 16_H

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	CKSM[7:0]							
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.25 RLN3nLCBR register contents

Bit Position	Bit Name	Function
7 to 0	CKSM[7:0]	Holds the checksum value transmitted or received.

In LIN mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
  The value transmitted can be read from the register. Read the value after transmission is completed.
  Writing to this register is invalid.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
  The value received can be read from the register. Read the value after reception is completed.
  Writing to this register is invalid.

In LIN self-test mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
  After completion of the frame transmission (after loopback), the reversed value of the received value can be read.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
  Write the value to be received before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.
  For details about the LIN self-test mode, see Section 25.8, LIN Self-Test Mode.

Set the RLN3nLCBR register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, the checksum is appended only to the last data group; this register is not updated for the other data groups.

25.3.1.19 RLN3nLDBRm — LIN Data Buffer m Register (m = 1 to 8)

Access: This register can be read/written in 8-bit units.

Address: RLN3nLDBR1: <RLIN3n_base> + 18_H
RLN3nLDBR2: <RLIN3n_base> + 19_H
RLN3nLDBR3: <RLIN3n_base> + $1A_H$
RLN3nLDBR4: <RLIN3n_base> + $1B_H$
RLN3nLDBR5: <RLIN3n_base> + $1C_H$
RLN3nLDBR6: <RLIN3n_base> + $1D_H$
RLN3nLDBR7: <RLIN3n_base> + $1E_H$
RLN3nLDBR8: <RLIN3n_base> + $1F_H$

Initial value: 00_H

Bit	7	6	5	4	3	2	1	0
	LDB[7:0]							
Initial value	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 25.26 RLN3nLDBRm (m = 1 to 8) register contents

Bit Position	Bit Name	Function
7 to 0	LDB[7:0]	Sets the data to be transmitted or allows the received data to be read. Setting Range: 00_H to FF_H

For response transmission:

The LDBRn registers set the data to be transmitted in the response field.
Use these registers with the following settings.

- RFT in RLN3nLDFC register is 1 (transmission)
- FSM in RLN3nLDFC register is 0 (not frame separate mode)
- FTS bit in RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted)

or

- RFT in RLN3nLDFC register is 1 (transmission)
- FSM in RLN3nLDFC register is 1 (frame separate mode)
- RTS in RLN3nLTRC register is 0 (response transmission/reception is halted)

For response reception:

The LDBRn registers hold the data received in the response field.
The received data is overwritten. If an error is detected, the data up to the byte in which the error was detected are stored in the register. Do not read these registers when the FTS bit is 1 (frame transmission or wake-up transmission/reception is started)

For transmission of response data of 9 bytes or more:

Use the LDBRn registers with the following settings.

- RFT in RLN3nLDFC register is 1 (transmission)
- FSM in RLN3nLDFC register is 1 (frame separate mode)
- RTS in RLN3nLTRC register is 0 (response transmission/reception is halted)

For reception of response data of 9 bytes or more:

Do not read these registers when the RTS bit is 1 (response transmission/reception is started).

In LIN self-test mode, these registers operate as follows:

Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see Section 25.8, LIN Self-Test Mode.

25.4 Interrupt Sources

The LIN Interface generates four types of interrupt requests.

- LINn transmission interrupt
- LINn successful reception interrupt
- LINn status interrupt
- LINn interrupt

Setting the LIOS bit in the RLN3nLMD register to 0 allows to perform logical OR operation on all of the interrupt sources, outputting the interrupt request from the LINn interrupt.

Setting the LIOS bit in the RLN3nLMD register to 1 allows to output the LINn transmission interrupt, LINn successful reception interrupt, or LINn status interrupt depending on the interrupt request.

Table 25.27 lists the sources for each interrupt.

Table 25.27 Interrupt Sources

		LIOS bit in RLN3nLMD register is 0	LIOS bit in RLN3nLMD register is 1		
		LINn Interrupt	**LINn Transmission Interrupt**	**LINn Successful Reception Interrupt**	**LINn Status Interrupt**
LIN mode	LIN master mode	• Successful frame transmission • Successful frame reception • Successful wake-up transmission • Successful wake-up reception • Successful header transmission • Bit error • Physical bus error • Frame/response timeout error • Framing error • Checksum error • Response preparation error	• Successful frame transmission • Successful wake-up transmission • Successful header transmission	• Successful wake-up reception • Successful wake-up reception	• Bit error • Physical bus error • Frame/response timeout error • Framing error • Checksum error • Response preparation error

Each interrupt request is output when the corresponding bit in the RLN3nLIE register is 1 (interrupt is enabled) and the corresponding flag in the RLN3nLST register is 1.

25.5 Modes

The LIN Interface provides the following three modes, depending upon the specific function to be performed:

- LIN reset mode
- LIN mode (LIN master mode)
- LIN self-test mode

The supply of clocks to the LIN Interface is stopped in LIN reset mode, which reduces power consumption.

Figure 25.2 shows mode transitions. Table 25.28 describes mode transition conditions. Table 25.29 lists operations available in each mode.

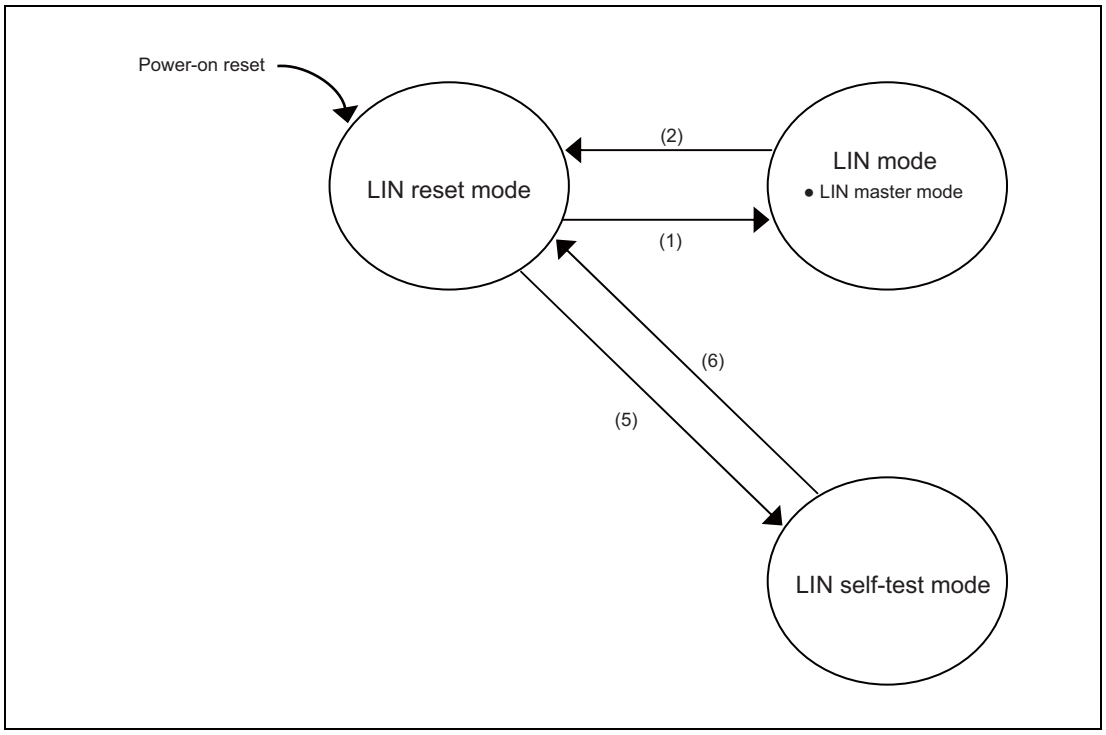

Figure 25.2 Mode Transitions

Table 25.28 Transition Condition of Each Mode

	Mode transition			Transition condition
1	LIN reset mode	→	LIN mode (LIN master mode)	RLN3nLMD.LMD = 00_B and RLN3nLCUC.OM1, OM0 = 01_B or 11_B
2	LIN mode	→	LIN reset mode	RLN3nLCUC.OM0 = 0_B
5	LIN reset mode	→	LIN self-test mode	See Section 25.8, LIN Self-Test Mode.
6	LIN self-test mode	→	LIN reset mode	See Section 25.8, LIN Self-Test Mode.

Table 25.29 Operations Available in Each Mode

LIN mode	
LIN master mode	**LIN self-test mode**
Header transmission Response transmission Response reception Wake-up transmission Wake-up reception Error detection	Self test

Whether a transition has been caused to LIN reset mode or LIN mode can be verified by reading the LMD bits in the RLN3nLMD register or the OMM0 bit in the RLN3nLMST register.

For a description of the LIN self-test mode, see Section 25.8, LIN Self-Test Mode.

25.6 LIN Reset Mode

Setting the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) causes a transition to LIN reset mode. The change to LIN reset mode can be verified by determining that the OMM0 bit in the RLN3nLMST register has been set to 0 (LIN reset mode). In this mode, the LIN communication function is halted.

When a DMA channel is activated by a LIN transfer request at the time of a transition to LIN reset mode, stop the channel.

For stopping a DMA channel, see Section 9., Direct Memory Access Controller.

From LIN reset mode, transitions to LIN mode and LIN self-test mode can be made.

When the mode changes to LIN reset mode, the following registers are initialized to their reset values, and as long as LIN reset mode is in effect, they retain their initial values.

- RLN3nLTRC register
- RLN3nLST register
- RLN3nLEST register

The following registers retain their previous values even when a transition to LIN reset mode is made:

- RLN3nLWBR register
- RLN3nLBRP0 register
- RLN3nLBRP1 register
- RLN3nLMD register
- RLN3nLBFC register
- RLN3nLSC register
- RLN3nLWUP register
- RLN3nLIE register
- RLN3nLEDE register
- RLN3nLDFC register
- RLN3nLIDB register
- RLN3nLCBR register
- RLN3nLDBRm register (m = 1 to 8)

25.7 LIN Mode

LIN mode can operate in the LIN master mode.

In LIN master mode, the following operations can be performed: header transmission, response transmission, response reception, wake-up transmission, wake-up reception, and error detection. In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 00_B (LIN master mode) and the OM1 and OM0 bits in the RLN3nLCUC register to either 01_B or 11_B sets LIN master mode, turning the OMM1 and OMM0 bits in the RLN3nLMST register to either 01_B to 11_B.

The LIN mode provides the following two operation modes:

- LIN operation mode
- LIN wake-up mode

Figure 25.3 shows the transition of operation modes. Table 25.30 describes the transition conditions of operation modes.

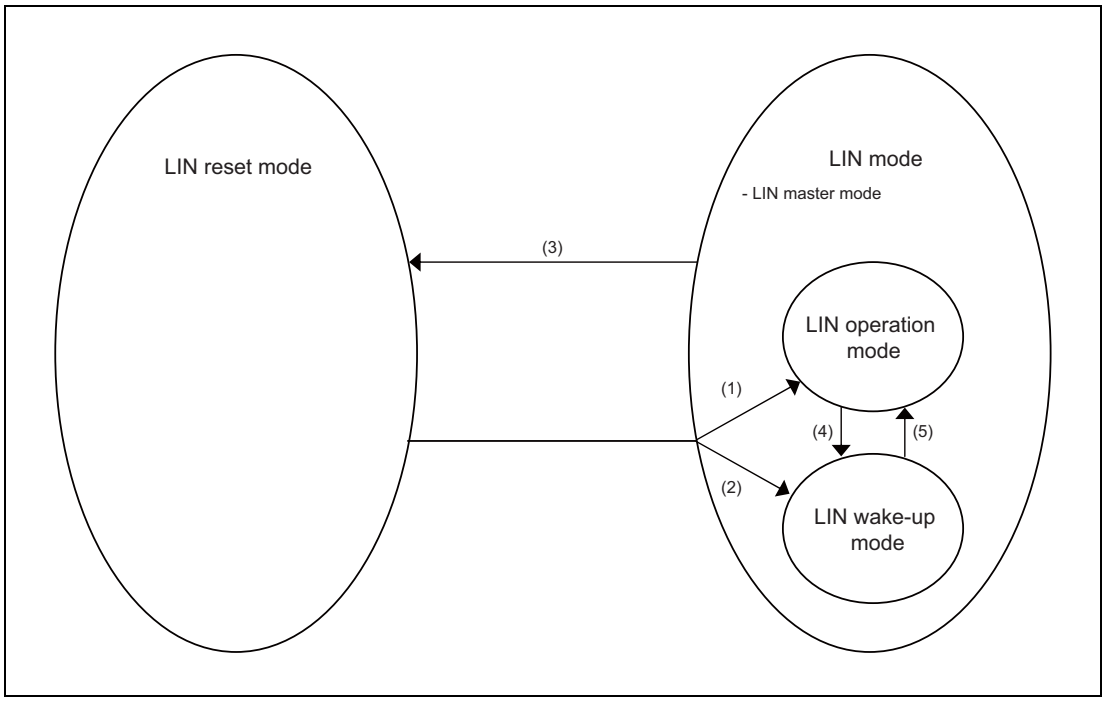

Figure 25.3 Transition of Operation Modes

Table 25.30 Transition Conditions of Operation Modes

	Operation mode transition			Transition condition
(1)	LIN reset mode	→	LIN mode - LIN operation mode	RLN3nLMD.LMD = 00_B and RLN3nLCUC.OM1, OM0 = 11_B
(2)	LIN reset mode	→	LIN mode - LIN wake-up mode	RLN3nLMD.LMD = 00_B and RLN3nLCUC.OM1, OM0 = 01_B
(3)	LIN mode -LIN operation mode -LIN wake-up mode	→	LIN reset mode	RLN3nLCUC.OM0 = 0_B
(4) *1	LIN mode -LIN operation mode	→	LIN mode - LIN wake-up mode	RLN3nLCUC.OM1, OM0 = 01_B
(5) *1	LIN mode -LIN wake-up mode	→	LIN mode - LIN operation mode	RLN3nLCUC.OM1, OM0 = 11_B

Note 1. Transition between LIN operation mode and LIN wake-up mode cannot be made when communication is going on (when the FTS bit in the RLN3nLTRC register is 1).

(1) LIN Operation Mode

In LIN operation mode, frame processing (header transmission, header reception, response transmission, response reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to 11_B changes the mode to LIN operation mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to 11_B. Communication settings should be performed after the RLN3nLMST register has become 11_B.

(2) LIN Wake-up Mode

In LIN wake-up mode, wake-up signal processing (wake-up transmission, wake-up reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to 01_B changes the mode to LIN wake-up mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to 01_B. Communication settings should be performed after the RLN3nLMST register has become 01_B.

25.7.1 LIN Master Mode

25.7.1.1 Header Transmission

Figure 25.4 shows the operation of the LIN Interface (LIN master mode) in header transmission.
Table 25.31 provides processing in header transmission.

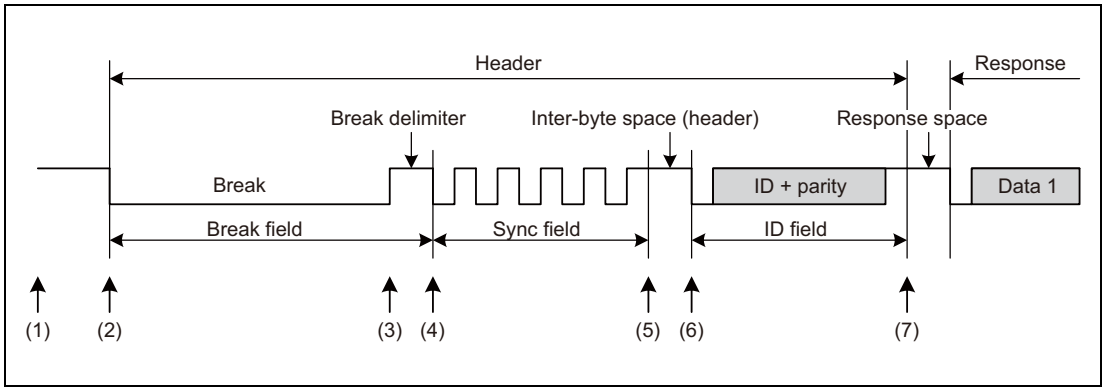

Figure 25.4 Operation in Header Transmission

Table 25.31 Processing in Header Transmission

	Software processing	LIN Interface processing
(1)	• Sets a baud rate • Sets noise filter ON/OFF • Enables interrupt • Enables error detection • Sets frame configuration parameters • Changes the LIN Interface to the LIN master mode: LIN operation mode • Sets information on the frame to be transmitted (ID, parity, data length, response direction, Checksum method, and transmission data)	Waits for the setting of the FTS bit in the RLN3nLTRC register by software (idle)
(2)	Sets the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started)	Transmits a break.
(3)	Waits for an interrupt request	Transmits a break delimiter.
(4)		Transmits a sync field (55h).
(5)		Transmits an inter-byte space (header).
(6)		Transmits an ID field.
(7)		Sets a successful header transmission flag.

Note: For information about error detection, refer to Section 25.7.6, Error Status.

25.7.1.2 Response Transmission

Figure 25.5 shows the operation of the LIN Interface (LIN master mode) in response transmission. Table 25.32 provides processing in response transmission.

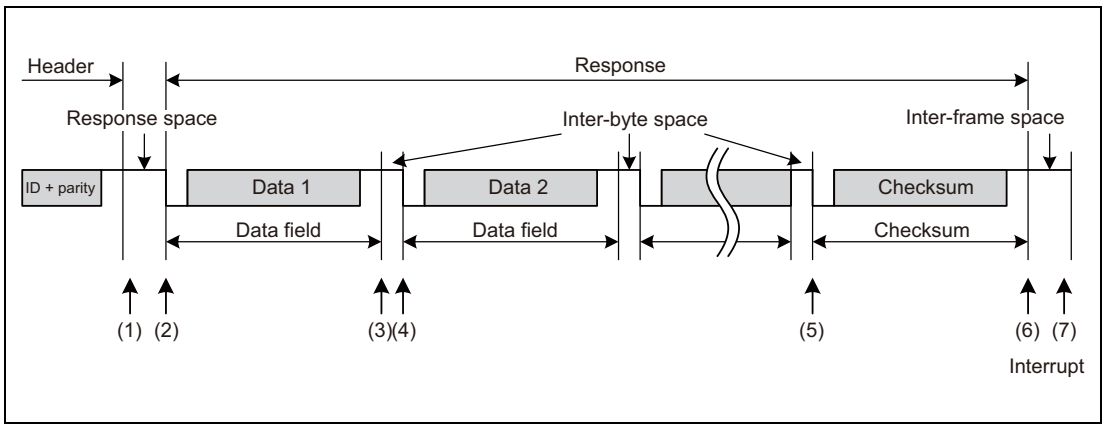

Figure 25.5 Operation in Response Transmission

Table 25.32 Processing in Response Transmission

	Software processing	LIN Interface processing
(1)	(When in frame separate mode) • Sets the RTS bit in the RLN3nLTRC register to 1 (response transmission/ reception started) (When not in frame separate mode) • Waits for an interrupt request	(When in frame separate mode) • Waits for the setting of the RTS bit in the RLN3nLTRC register to 1 by software. • When the bit is set to 1, sends a response space. (When not in frame separate mode) • Sends a response space.
(2)	Waits for an interrupt request	Transmits the data 1.
(3)		Transmits an inter-byte space.
(4)		• Transmits the data 2. • Transmits an inter-byte space • Transmits the data 3. • Transmits an inter-byte space (Repeats the transmission of inter-byte spaces as many times as the data length specified in bits RFDL[3:0] in the RFC register.) : :
(5)		Transmits the checksum.
(6)		• Sets a successful frame/wake-up transmission flag. • Sets the FTS bit in the RLN3nLTRC register to 0 (frame transmission or wake-up transmission/reception stopped) (When in frame separate mode), and the RTS bit in the RLN3nLTRC register to 0 (response transmission/reception stopped).
(7)	• Processing after communication Checks the RLN3nLST register, and clears flags.	Idle

Note: For information about error detection, refer to Section 25.7.6, Error Status.

25.7.1.3 Response Reception

Figure 25.6 shows the operation of the LIN Interface (LIN master mode) on response reception. Table 25.33 provides processing in response reception.

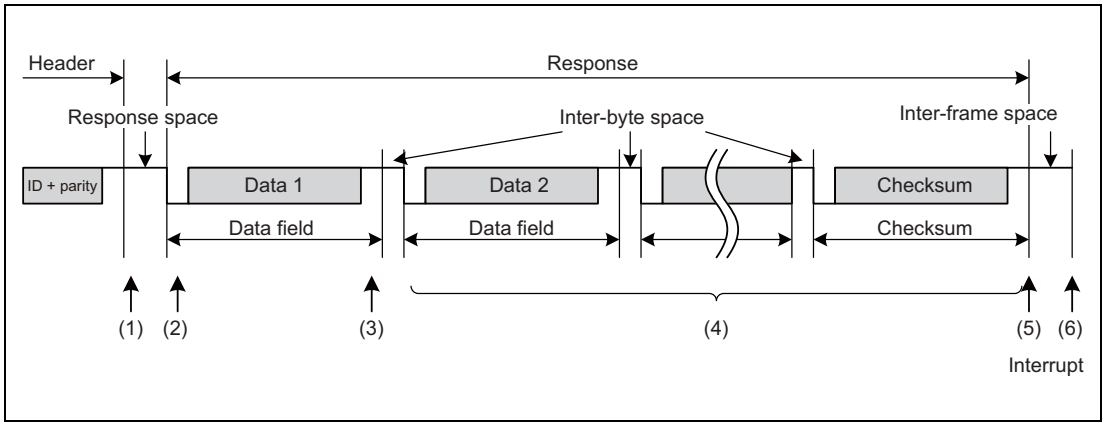

Figure 25.6 Operation in Response Reception

Table 25.33 Processing in Response Reception

	Software processing	LIN Interface processing
(1)	Waits for an interrupt request (no processing).	Waits for detection of a start bit.
(2)	Waits for an interrupt request.	Receives the data 1 when the start bit is detected.
(3)		Sets the successful data 1 reception flag.
(4)		• Receives the data 2 when the start bit is detected. • Receives the data 3 when the start bit is detected. (Repeats the transmission of inter-byte spaces as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register.) : : • Receives the checksum when the start bit is detected.
(5)		• Determines the checksum. • Sets the successful frame/wake-up reception flag. • Sets the RTS bit in the RLN3nLTRC register to 0 (response transmission/reception stopped).
(6)	• Processing after communication Reads the received data. Checks the RLN3nLST register, and clears flags.	Idle

Note: For information about error detection, refer to Section 25.7.6, Error Status.

25.7.2 Data Transmission/Reception

25.7.2.1 Data Transmission

One bit of data is transmitted per 1 Tbit.

The data that is transmitted returns to the reception data input pin via the LIN transceiver. The received data and the transmitted data is compared bit by bit, and the results are stored in the BER flag in the RLN3nLEST register (see Section 25.7.6, Error Status).

In LIN mater mode, 1 Tbit is generated to be 16 fLIN, and thus the sampling point for received data is at the 13th clock cycle (81.25% position).

Figure 25.7 shows an example of data transmission timing.

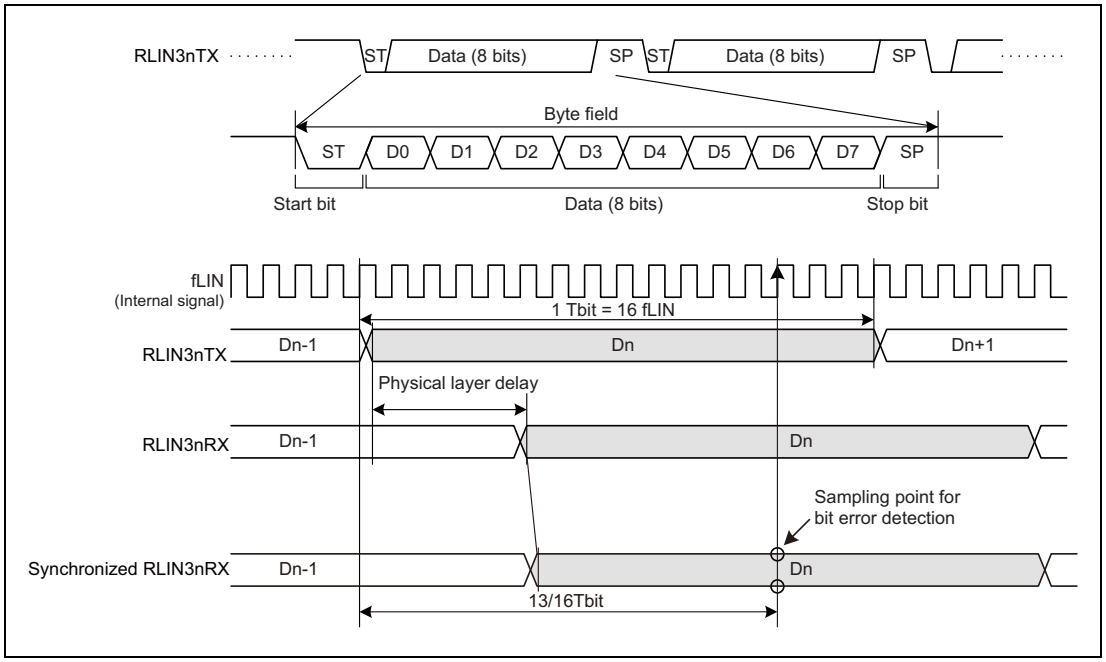

Figure 25.7 Example of Data Transmission Timing (LIN Master Mode)

25.7.2.2 Data Reception

Data reception is performed by using the synchronized RLIN3nRX signal (an internal signal) that is the input from the RLIN3nRX pin synchronized with prescaler clock.

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN3nRX signal. After the falling edge is detected, sampling is performed again a specified period of time later, and the falling edge is recognized as a start bit if the synchronized RLIN3nRX signal is low level. The falling edge is not recognized as a start bit if the RLIN3nRX signal after the clearing of the resetting is low-level-fixed or if a high level is detected on re-sampling.

After the start bit is detected, the system samples 1 bit per Tbit.

The LIN Interface has a noise filter function with respect to reception data. If the LRDNFS bit in the RLN3nLMD register is 0, the LIN Interface uses a noise filter, and for a sampling value the value determined by a 3-sampling majority rule on prescaler clocks is used. If the LRDNFS bit in the RLN3nLMD register is 1, the LIN Interface does not use a noise filter, and for a sampling value the value of the synchronized RLIN3nRX value at the sampling position is used as is.

Figure 25.8 shows an example of data reception timing.

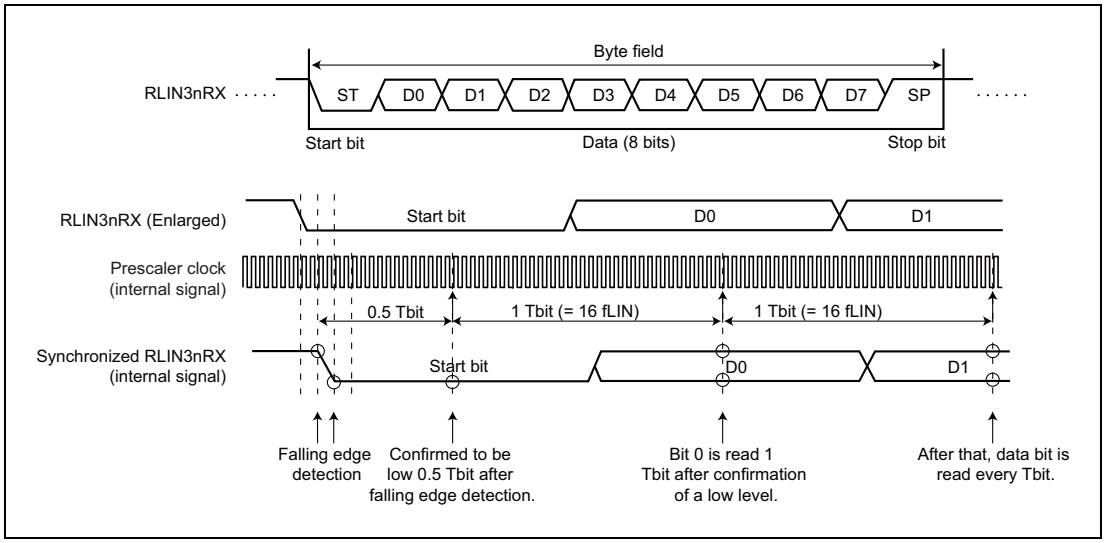

Figure 25.8 Example of Data Reception Timing

25.7.3 Transmission/Reception Data Buffering

This section explains the buffer processing that takes place when the LIN Interface sends or receives data continuously.

25.7.3.1 Transmission of LIN Frames

For an 8-byte transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR8 are sequentially transmitted to data areas 1 to 8 of the LIN frame. In the case of a 4-bytes transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR4 are transmitted to data areas 1 to 4 of the LIN frame, but the contents of registers RLN3nLDBR5 to RLN3nLDBR8 are not transmitted. The transmitted checksum data is stored in the RLN3nLCBR register.

Figure 25.9 depicts the LIN transmission processing and the required buffer.

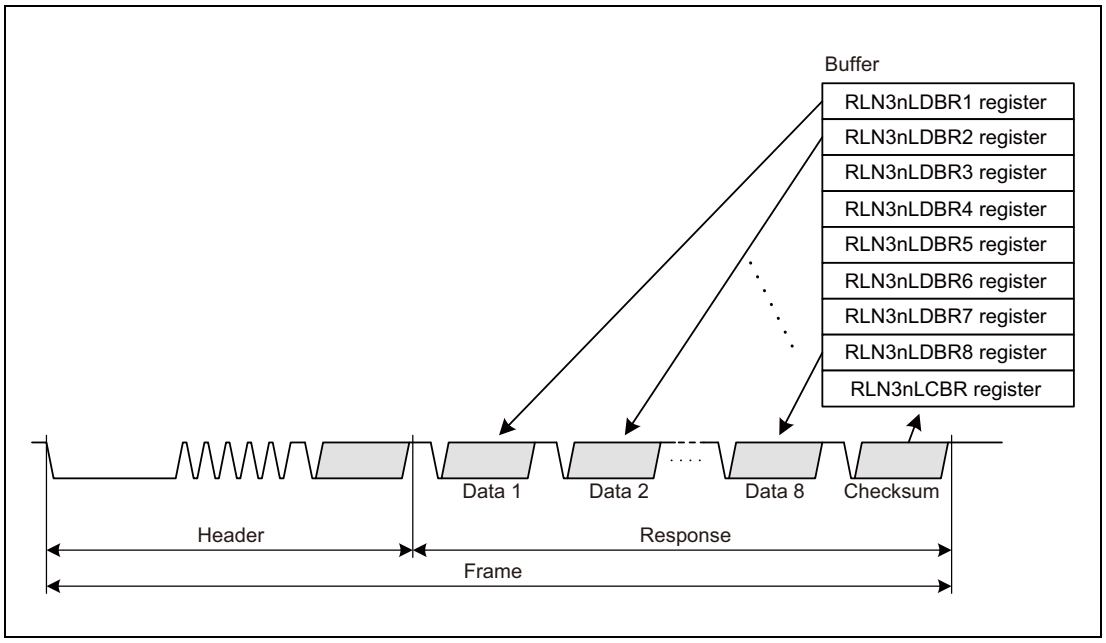

Figure 25.9 LIN Transmission Processing and Required Buffer

(1) Frame Separate Mode

Setting the FSM bit in the RLN3nLDFC register to 1 turns on the frame separate mode.

In frame separate mode, a header and a response are transmitted when prompted by separate transmission start requests.

When the transmission of a header is finished, the HTRC flag in the RLN3nLST register turns 1 (successful header transmission).

Use frame separate mode when sending or receiving response data of 9 bytes or greater in LIN master mode.

25.7.3.2 Reception of LIN Frames

For an 8-byte reception, the contents of data areas 1 to 8 of the LIN frame is stored in registers RLN3nRLN3nLDBR1 to RLN3nLDBR8, respectively, upon receipt of a stop bit. In the case of a 4-byte reception, the contents of data areas 1 to 4 of the LIN frame are stored in registers RLN3nLDBR1 to RLN3nLDBR4, respectively; however, no data is stored in registers RLN3nLDBR5 to RLN3nLDBR8. Also, the received checksum data is stored in the RLN3nLCBR register.

Figure 25.10 depicts the LIN reception processing and the required buffer.

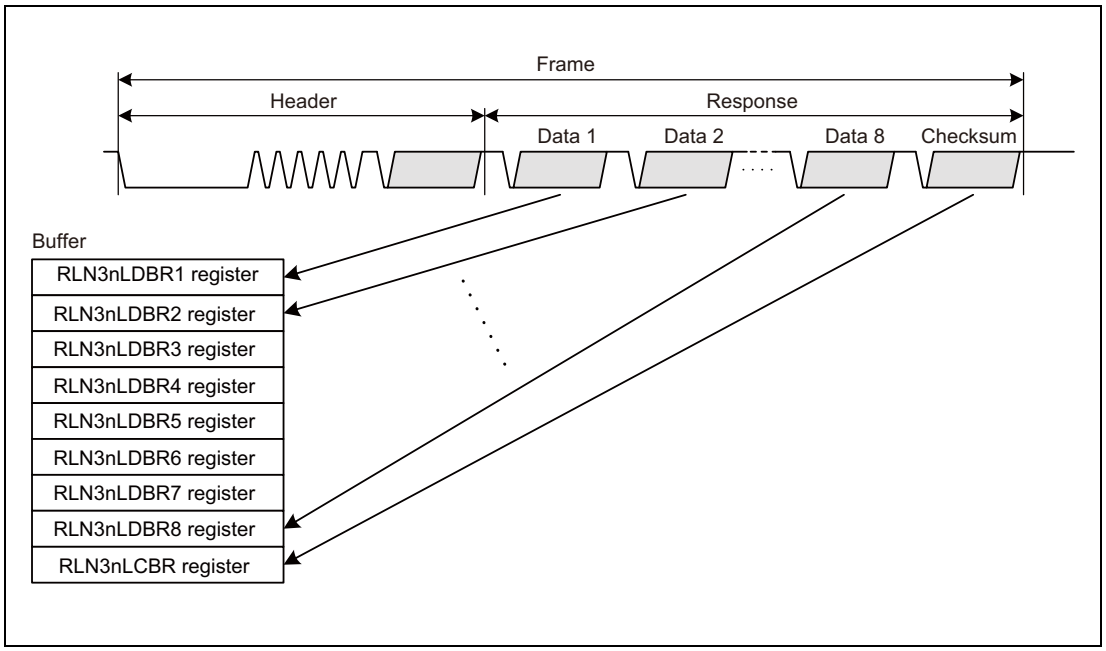

Figure 25.10 LIN Reception Processing and Required Buffer

(1) Reception of Data 1

When the reception of the first byte of data is finished, the D1RC flag in the RLN3nLST register turns 1 (successful data 1 reception).

25.7.3.3 Multi-Byte Response Transmission/Reception Function

Normally in LIN communications, a response is 9 bytes or less including a checksum field; however, responses in 10 bytes or greater can also be sent and received.

In such a case, the bit error, framing error, response preparation error detection, and auto checksum functions are enabled.

If the data length is greater than 8 bytes, the LSS bit in RLN3nLDFC register should be set to 1 (indicating that the next data group to be sent or received is not the final data group) in the first data group (variable in 0 to 8 bytes) before sending or receiving the data group. After the transmission or reception, the user should determine whether the next data group is the final data group. If it is the final data group, the LSS bit should be set to 0 (indicating that the next data group to be sent or received is the final data group, and a checksum should be appended to the final data group.

By changing the RFDL bit in RLN3nLDFC register settings when the RTS bit in RLN3nLTRC register is 0, the user can change the data length for each data group.

When performing multi-byte response transmission/reception in LIN master mode, set the FSM bit in RLN3nLDFC register in the RLN3nLDFC register to 1 (frame separate mode).

25.7.4 Wake-up Transmission/Reception

The wake-up transmission/reception can be used in LIN wake-up mode.

25.7.4.1 Wake-up Transmission

In LIN wake-up mode, setting the RCDS bit in the RLN3nLDFC register to 1 (transmission) and the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/reception started) causes a wake-up signal to be output from the output pin. The low level width of the wake-up signal should be set using the WUTL[3:0] bits in the RLN3nLWUP register.

However, if the LWBR0 bit of the RLN3nLWBR register is 1 (LIN2.x use), the LIN system clock (fLIN) becomes low level width at fa regardless of the setting of the LCKS bit of the RLN3nLMD register.

By setting the baud rate to 19200 bps while fa is selected and the WUTL[3:0] bits of the RLN3nLWUP register to 0100_B (5 Tbits), 260 µs low width can be output in LIN wake-up mode regardless of the setting of the LCKS bit of the RLN3nLMD register.

If a wake-up low is output without any bit error, the FTC flag in the RLN3nLST register turns 1 (successful frame response or wake-up transmission); when the FTCIE bit in the RLN3nLIE register is 1 (successful frame response/wakeup transmission interrupt enabled), an interrupt request is generated.

If RLN3nLEDE.BERE is set and a bit error is detected, wake-up transmission is canceled and the BER flag in the RLN3nLEST register is set to 1 (bit error detection).

When RLN3nLEDE.PBERE is set, set RLN3nLEST.PBER flag to 1 (physical bus error detection) at the same time of a bit error.

Figure 25.11 shows the wake-up transmission timing.

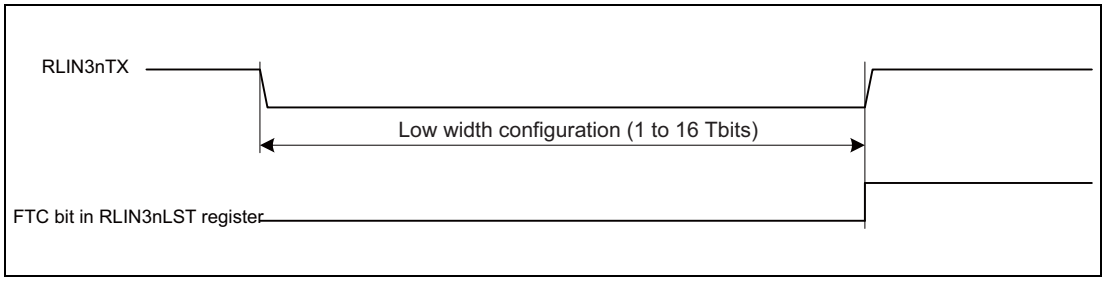

Figure 25.11 Wake-up Transmission Timing

25.7.4.2 Wake-up Reception

The detection of a wake-up involves the use of an input signal low level width count function.

The input signal low level width count function measures the low width of the input signal to the RLIN3nTX pin, using the same sampling point as data reception. The function can measure the input signal low level width of 2.5 Tbits of fLIN or greater.

By setting the LWBR0 bit in the RLN3nLWBR register, operation is executed without changing the baud rate generator setting at a transition between LIN operation mode and LIN wake-up mode.

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0. When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. Setting the LWBR0 bit to 1 selects the LIN system clock (fLIN) to fa regardless of the setting of the LCKS bit in the RLN3nLMD register. (The LCKS bit is not changed). By setting the baud rate to 19200 bps while fa is selected, the 130 µs or longer low-level width of the input signal to be measured regardless of the setting of the LCKS bit in the RLN3nLMD register.

When using the wake-up reception function, in LIN wake-up mode set the RFT bit in the RLN3nLDFC register to 0 (response reception), and then the FTS bit in the RLN3nLTRC register to 1 (frame transmission (header reception) or wake-up transmission/reception started).

When the low level width to be measured is reached, the FRC flag in the RLN3nLST register turns 1 (successful frame response/wake-up reception). If the FRCIE bit in the RLN3nLIE register is 1 (successful frame response or wake-up reception interrupt enabled), an interrupt request for successful LINn reception is generated.

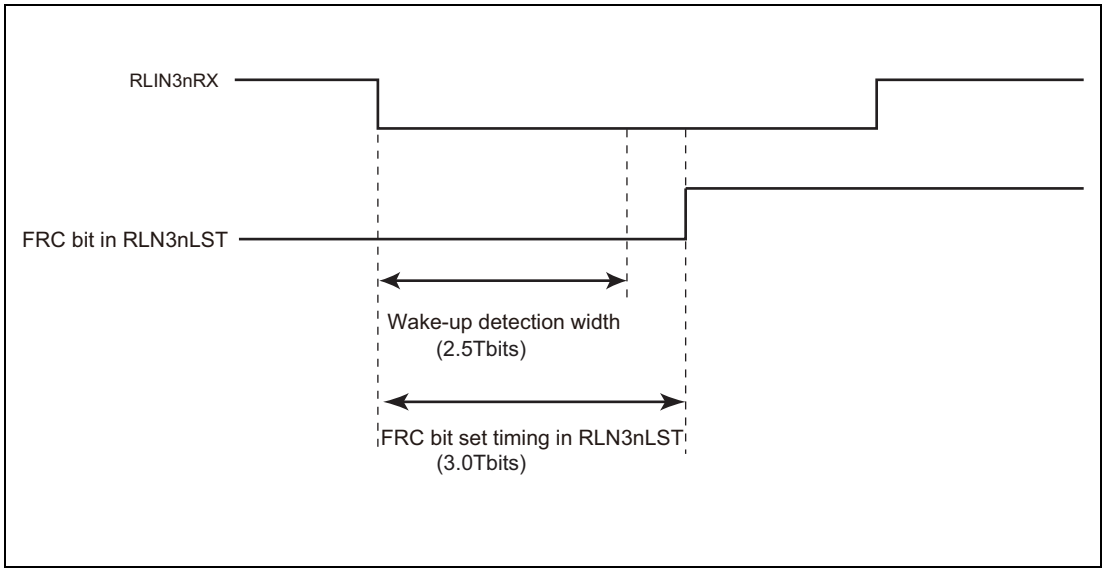

Figure 25.12 Input Signal Low level Count Function

25.7.4.3 Wakeup Collision

If the master node and the slave node transmit wakeup signals simultaneously, a collision will occur on the LIN bus, though a collision of wakeup signals is not detected in the LIN interface.

25.7.5 Status

During LIN mode operation, the LIN Interface can detect seven types of statuses.

The four statuses, successful frame/wake-up transmission, successful frame/wake-up reception, error detection, successful header transmission/header reception, can generate interrupt requests.

Table 25.34 shows the types of statuses available in LIN master mode.

Table 25.34 Types of Statuses in LIN Master Mode

Status	Status set condition	Status clear condition	Operation mode capable of status detection	Corresponding bit	Interrupt
Reset	After the OM0 bit in the RLN3nLCUC register is set to LIN reset mode (OM0 = 0), if the LIN Interface enters LIN reset mode.	After the OM0 bit in the RLN3nLCUC register is set to 0 (LIN reset mode is canceled), if LIN reset mode is canceled.	All modes	OMM0 bit in RLN3nLMST register	—
Operation mode	After the OM1 bit in the RLN3nLCUC register is set to LIN operation mode, if actually the LIN Interface enters LIN operation mode.	After the OM1 bit in the RLN3nLCUC register is set to LIN wake-up mode, if actually the LIN Interface enters LIN wake-up mode.	• LIN operation mode • LIN wake-up mode	OMM1 bit in RLN3nLMST register	—
Frame/wake-up transmission end	When a frame (header transmission + response transmission), a wake-up signal, or a data group is transmitted successfully.	• When another communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	FTC flag in RLN3nLST register	√
Frame/wake-up reception end	When a frame (header transmission + response reception), a wake-up signal, or a data group is received successfully.	• When another communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	FRC flag in RLN3nLST register	√
Error detection	If any of the RPER flag, CSER flag, FER flag, FTER flag, PBER flag, and BER flags in the RLN3nLEST register turns 1 (error detected).	• When another communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	ERR flag in RLN3nLST register	√
Data 1 reception end	The RFT bit in the RLN3nLDFC register is 0 (reception) and the first byte of the response field or the first byte of each data group is received.*2	• When another communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	LIN operation mode	D1RC flag in RLN3nLST register	—
Header transmission end	When a header field is transmitted successfully.	• When another communication is started • When cleared by software • After transition to LIN reset mode	LIN operation mode	HTRC flag in RLN3nLST register	√

Note 1. In LIN operation mode, the ERR flag in the RLN3nLST register is cleared to 0 by writing 0 to the RPER flag, CSER flag, FER flag, FER flag, FTER flag, PBER flag or BER flags in the RLN3nLEST register.

Note 2. Not detected when the RFDL [3:0] bits in the RLN3nLDFC register are 0000_B (0-byte + checksum).

25.7.6 Error Status

25.7.6.1 LIN Master Mode

(1) Types of Error Statuses

The LIN Interface can detect six types of error statuses in LIN master mode. The condition of these error statuses can be checked by means of the corresponding bits in the RLN3nLEST register.

All error statuses represent interrupt events.

Table 25.35 shows the types of error statuses.

Table 25.35 Types of Error Statuses in LIN Master Mode

Status	Error detection condition	Operation mode capable of error detection	Communication	Enable/ disable detection	Corresponding bit
Bit error	The transmitted data and the data on the LIN bus monitored by the receive pin do not match *1*2	• LIN operation mode • LIN wake-up mode	Cancel	√	BER flag in RLN3nLEST register
Physical bus error	• LIN bus is detected to be high level when sending a break • LIN bus is detected to be low level when sending a break delimiter • LIN bus is detected to be high level when sending a wake-up	• LIN operation mode • LIN wake-up mode	Cancel	√	PBER flag in RLN3nLEST register
Timeout error	A frame or response transmission/reception does not terminate within a given time*3	LIN operation mode	Cancel	√	FTER flag in RLN3nLEST register
Framing error	In response field reception, a stop bit of each data byte is low level	LIN operation mode	Cancel	√	FER flag in RLN3nLEST register
Checksum error	In response field reception, the result of checksum test gives an error	LIN operation mode	—	×	CSER flag in RLN3nLEST register
Response preparation error	One of the following conditions occurs in frame separate mode during a multi-byte response reception: • The first reception data byte is received after completion of header transmission but before a response transmission/reception request is set • The first reception data byte is received after the completion of previous data group reception before a transmission/reception request for another data group is sett	LIN operation mode	Cancel	×	RPER flag in RLN3nLEST register

Note 1. If a bit error is detected, the process is canceled after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is canceled immediately after that area. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is canceled after the error-causing bit is sent.

Note 2. In a multi-byte response transmission, bit errors are detected also between data groups.

Note 3. The timeout time depends on the response field data length (the RFDL [3:0] bits in the RLN3nLDFC register) and the checksum selection (the CSM bit in the RLN3nLDFC register), and this can be calculated according to the following formula.
When the setting of the FSM bit in the RLN3nLDFC register is 1 (i.e., frame separation mode), the timeout time is that for eight bytes until the RTS bit of the RLN3nLTRC register is set. Once the RTS bit is set, the timeout time is re-set to the time based on the response field data length (the RFDL[3:0] bits in the RLN3nLDFC register).
[Frame timeout]
On classic selection (when the CSM bit in RLN3nLDFC is 0):
Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]

On enhanced selection (when the CSM bit in RLN3nLDFC is 1):
Timeout time = 48 + (number of data bytes + 1) × 14 [Tbit]
The aforementioned timeout time is a time greater than the TFRAME_MAX of LIN Specification Package Revision 1.3 on classic selection, or the TFRAME_MAX of LIN Specification Package Revision 2.x on enhanced selection.
[Response timeout]
Timeout time = (number of data bytes + 1) × 14 [Tbit]
When an error is detected, time-out error detection function stops.

The error status is cleared when the next communication is started (when the FTS bit in the RLN3nLTRC register is set), by software, or at a transition to LIN reset mode.

(2) Target Time Area for LIN Error Detection

Figure 25.13 shows the time domain in which the LIN Interface in master mode performs monitoring for error detection.

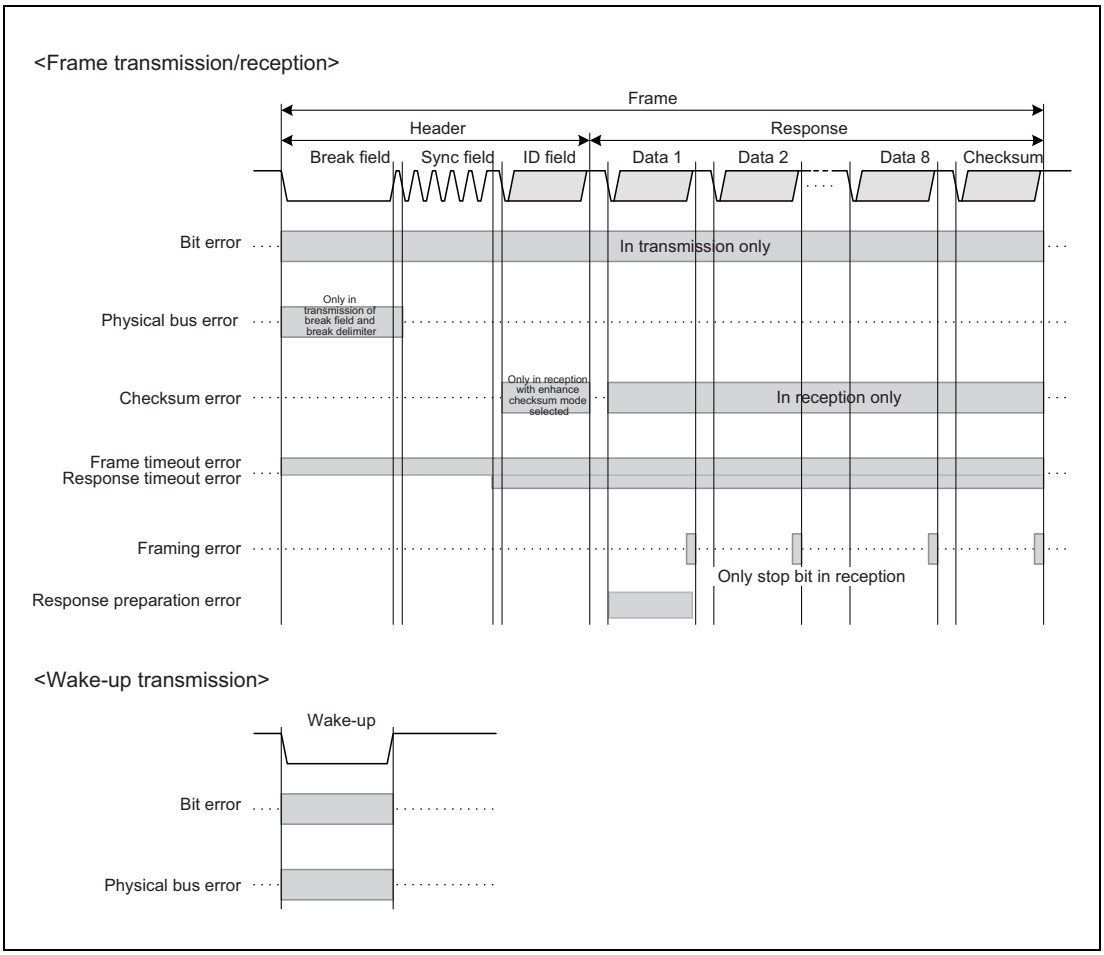

Figure 25.13 Target Time Area for LIN Error Detection (LIN Master Mode)

25.8 LIN Self-Test Mode

When the LIN interface enters the LIN self-test mode, RLIN3nTX and RLIN3nRX are disconnected from external pins and RLIN3nTX and RLIN3nRX are connected in the LIN interface. Therefore, the frame transmitted from RLIN3nTX is looped back to RLIN3nRX.

The LIN self-test mode can perform tests exclusively in LIN mode.

The self-test can be performed in the following two types.

- LIN master self-test mode (transmission): Header transmission and response transmission
- LIN master self-test mode (reception): Header transmission and response reception

In LIN self-test mode, the operate is at the fastest baud rate, regardless of the setting of the baud rate generator,

Regardless of the setting of the baud rate related registers, the baud rate operates at the LIN communication clock source/16 [bps]. (The NSPB bits in the RLN3nLWBR register should be set to 0000_B or 1111_B.)

In addition, in LIN self-mode, the following functions are not supported.

- LIN wake-up mode
- Frame separate mode
- Multi-byte response transmission/reception
- Frame/response timeout error

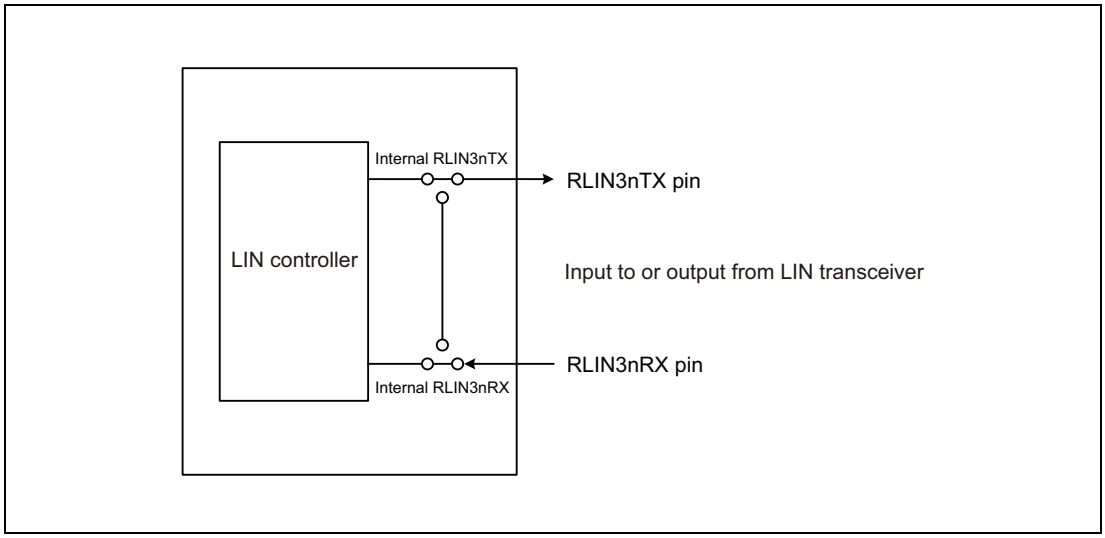

Figure 25.14 Connection in LIN Reset Mode and LIN Mode

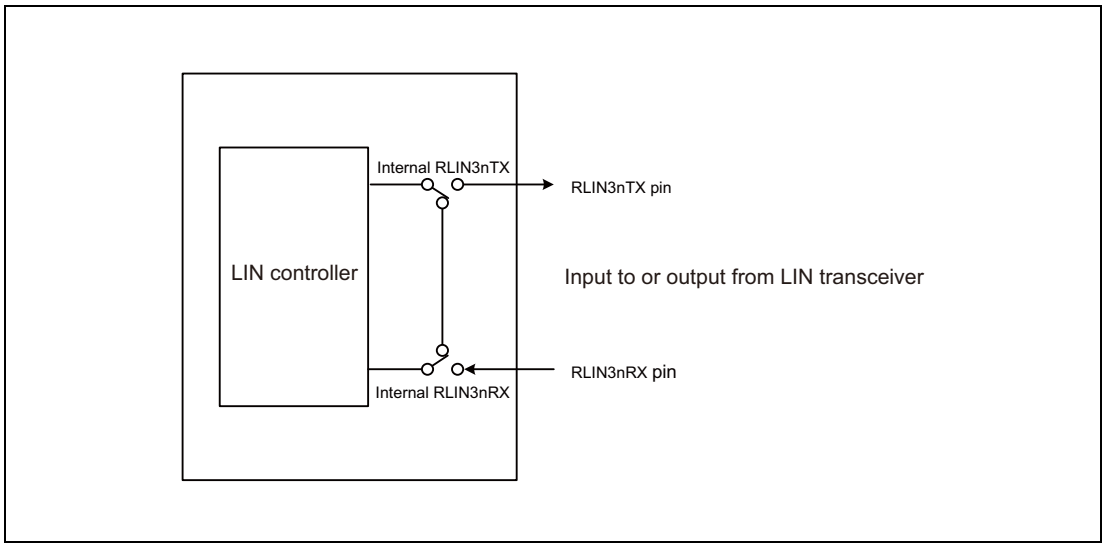

Figure 25.15 Connection in LIN Self-Test Mode

25.8.1 Change to LIN Self-Test Mode

Writing to the RLN3nLSTC register makes a transition to the LIN self-test mode.
When the LSTM bit in the RLN3nLSTC register is set to 1, the shift to the LIN self-test mode is checked.

When changing to LIN self-test mode, be sure to execute a specific sequence. In that sequence, information must be written three times consecutively to the LIN self-test control register, as follows:

- Change to LIN reset mode
  Set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode).
  Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).
- Select a LIN mode
  LMD bits in RLN3nLMD = 00_B (LIN master mode)
- 1st write: RLN3nLSTC register = $1010\ 0111_B$ ($A7_H$)
- 2nd write: RLN3nLSTC register = $0101\ 1000_B$ (58_H)
- 3rd write: RLN3nLSTC register = $0000\ 0001_B$ (01_H)
- Verify the transition to LIN self-test mode
  Read the LSTM bit in the RLN3nLSTC register; verify that it is 1 (LIN self-test mode).

If the key of the first write ($A7_H$) is written twice by mistake, the transition to LIN self-test mode is canceled. The above sequence should be retried from the step of first write. In addition, if a write to another LIN-related register is performed during transition to LIN self-test mode (three consecutive write operations to the RLN3nLSTC register), the transition is also canceled.

25.8.2 Transmission in LIN Master Self-Test Mode

To execute a self-test on LIN master transmission, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = $0000xxxx_B$*1
  RLN3nLBRP0 register = $xxxxxxxx_B$*1
  RLN3nLBRP1 register = $xxxxxxxx_B$*1
  RLN3nLMD register = $00xxxx00_B$*1
- Set the interrupt enable and error enable related registers.
  RLN3nLIE register = $0000xxxx_B$
  RLN3nLEDE register = $x000x0xx_B$
- Set the break field and space related registers.
  RLN3nLBFC register = $00xxxxxx_B$
  RLN3nLSC register = $00xx0xxx_B$
- Cancel the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are 11_B.
- Set the transmit frame related registers.
  RLN3nLDFC register = $00x1xxxx_B$
  RLN3nLIDB register = $xxxxxxxx_B$
  RLN3nLDRB1 to RLN3nLDRB8 registers = $xxxxxxxx_B$
- Header transmission → response transmission started
  Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/ reception started).
  The LIN master self-test mode (transmission) is executed. In this mode, interrupts are generated, and status and error status are also updated. The checksum is automatically calculated by the LIN interface. To suspend the LIN master self-test mode (transmission) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRm (m = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the transmission fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Don't care

Note 1. The following register settings are not reflected to the operation of the LIN self-test mode. The LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1 register, and the LCKS bit in the RLN3nLMD register. Therefore, those settings are not necessary.

Note 2. When the successful header transmission interrupt and the successful frame transmission interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame transmission interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled). The time required from the set of the successful header transmission flag to the set of the successful frame/wake-up transmission flag is calculated by the following formula.

10 × (number of data bytes + 1) [Tbit]
1 Tbit = LIN communication clock source × 16

25.8.3 Reception in LIN Master Self-Test Mode

To execute a self-test on LIN master reception, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = $0000xxxx_B$*1
  RLN3nLBRP0 register = $xxxxxxxx_B$*1
  RLN3nLBRP1 register = $xxxxxxxx_B$*1
  RLN3nLMD register = $00xxxx00_B$*1
- Set the interrupt enable and error enable related registers.
  RLN3nLIE register = $0000xxxx_B$
  RLN3nLEDE register = $x000x0xx_B$
- Set the break field and space related registers.
  RLN3nLBFC register = $00xxxxxx_B$
  RLN3nLSC register = $00xx0xxx_B$*1
- Cancel the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are 11_B.
- Set the reception frame related registers.
  RLN3nLDFC register = $00x0xxxx_B$*3
  RLN3nLIDB register = $xxxxxxxx_B$
  RLN3nLDBR1 to RLN3nLDBR8 registers = $xxxxxxxx_B$
  RLN3nCBR register = $xxxxxxxx_B$
  Since the checksum value to be transmitted is not automatically calculated, set the calculation value to the RLN3nLCBR register. If an incorrect checksum is set at this time, the checksum error can be tested.
- Header transmission → response reception started
  Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/ reception started).
  The LIN master self-test mode (reception) is executed. In this mode, interrupts are generated, and status and error status are also updated. To suspend the LIN master self-test mode (reception) being executed, write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.
- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRm (m = 1 to 8), and RLN3nLCBR registers (the data is reversed before being stored because the set value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the reception fails to complete due to an error, the applicable error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Don't care

Note 1. The following register settings are not reflected to the operation of the LIN self-test mode. The LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1 register, the LCKS bit in the RLN3nLMD register, and the IBS bit in the RLN3nLSC register. Therefore, those settings are not necessary.

Note 2. When the successful header transmission interrupt and the successful frame reception interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame reception interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled).
The time required from the set of the successful header transmission flag to the set of the successful frame/wake-up reception flag is calculated by the following formula.

10 × (number of data bytes + 1) [Tbit]

1 Tbit = LIN communication clock source × 16

Note 3. When the reception is in self-test mode, be sure to set the response field length (RFDL bits) to at least 1 byte.

25.8.4 Terminating LIN Self-Test Mode

To terminate LIN self-test mode, perform the procedure below:

- Write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register.
  If the OMM1 and OMM0 bits in the RLN3nLMST register are not 11_B, write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register. After confirming that the OMM1 and OMM0 bits in the RLN3nLMST register have turned 11_B, change to LIN reset mode.
- Verify the cancelation of LIN self-test mode.
  Read the LSTM bit in the RLN3nLSTC register; confirm that it is not 0 (not in LIN self-test)
- Verify the transition to LIN reset mode.
  Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).

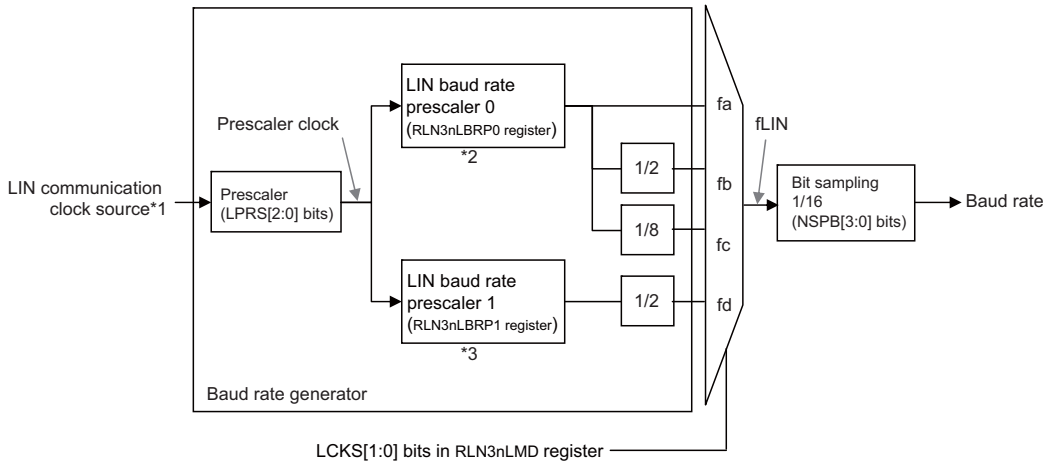
25.9 Baud Rate Generator

The prescaler clock is obtained by frequency-dividing the LIN communication clock source by the prescaler, and the LIN system clock (fLIN) is obtained by frequency-dividing the prescaler clock by the baud rate generator. The clock obtained by frequency-dividing the LIN system clock (fLIN) by the number of samples is the baud rate. The reciprocal of this baud rate is called the bit time (Tbit).

The LIN Interface has two kinds of baud rate generators. The baud rate generators switch over according to the mode used.

25.9.1 LIN Master Mode

Figure 25.16 shows a block diagram of baud rate generation in LIN master mode.



Note 1. For the LIN communication clock source, refer to **section 6, Clock Pulse Generator**.
Note 2. When the value in RLN3nLBRP0 register is N (N = 0 to 255), the clock frequency is divided by N + 1.
Note 3. When the value in RLN3nLBRP1 register is M (M = 0 to 255), the clock frequency is divided by M + 1.

Figure 25.16 Block Diagram of Baud Rate Generation in LIN Master Mode

By setting the RLN3nLBRP0 register so that fa is 307200 Hz (= 19200 × 16), the resulting bit rates are fa = 19200 × 16, fb = 9600 × 16 and fc = 2400 × 16. These bit rates are frequency-divided by 16 in the bit timing generator, enabling bit rates of 19200 bps, 9600 bps and 2400 bps to be generated. Also, by setting the RLN3nLBRP1 register so that fd is 166672 Hz (= 10417 × 16), the resulting bit rate is fd = 10417 × 16. This bit rate is frequency-divided by 16 in the bit timing generator, enabling 10417 bps to be generated.

The equation for calculating the baud rate is given below.

Baud rate of LIN master

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selection clock) ÷ (RLN3nLBRP0 + 1) ÷ 16 [bps] (When fa is selected for fLIN)

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selection clock) ÷ (RLN3nLBRP0 + 1) ÷ 2 ÷ 16 [bps] (When fb is selected for fLIN)

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selection clock) ÷ (RLN3nLBRP0 + 1) ÷ 8 ÷ 16 [bps] (When fc is selected for fLIN)

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selection clock)
÷ (RLN3nLBRP1 + 1) ÷ 2 ÷ 16 [bps] (When fd is selected for fLIN)

25.9.2 Noise Filter

The LIN Interface has a noise filter for reducing erroneous receiving of data due to noise. By setting the LRDNFS bit in the RLN3nLMD register to 0 (to use the noise filter), the noise filter is activated. The noise filter samples the level of the synchronized RLIN3nRX with the prescaler clock, and outputs the sampling value determined by a 3-sampling majority rule. The value of each bit of the receive data is determined based on the noise filter output.

Figure 25.17 shows the configuration of the noise filter, Figure 25.18 an example of a noise filter circuit, and Figure 25.19 the determination of the received data when the noise filter is used.

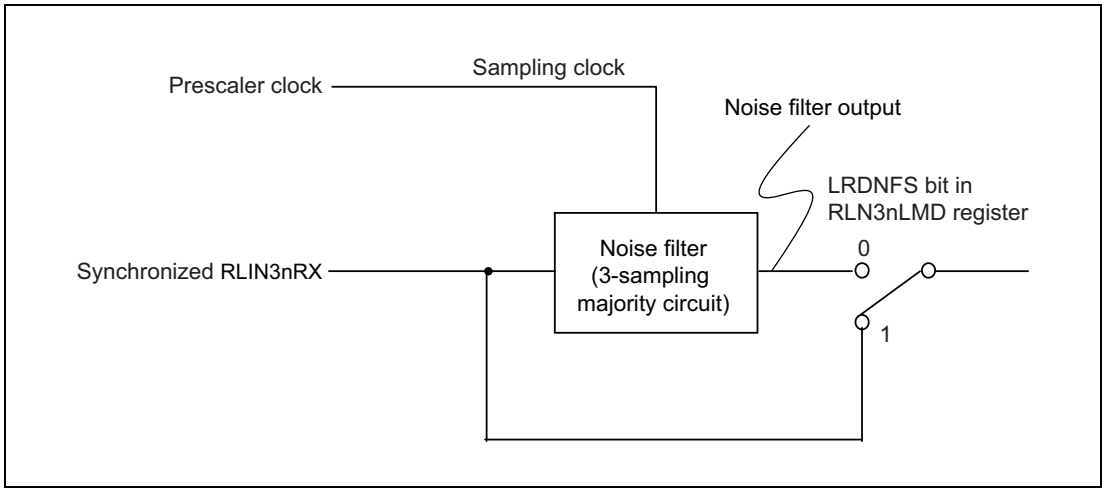


Figure 25.17 Configuration of Noise Filter

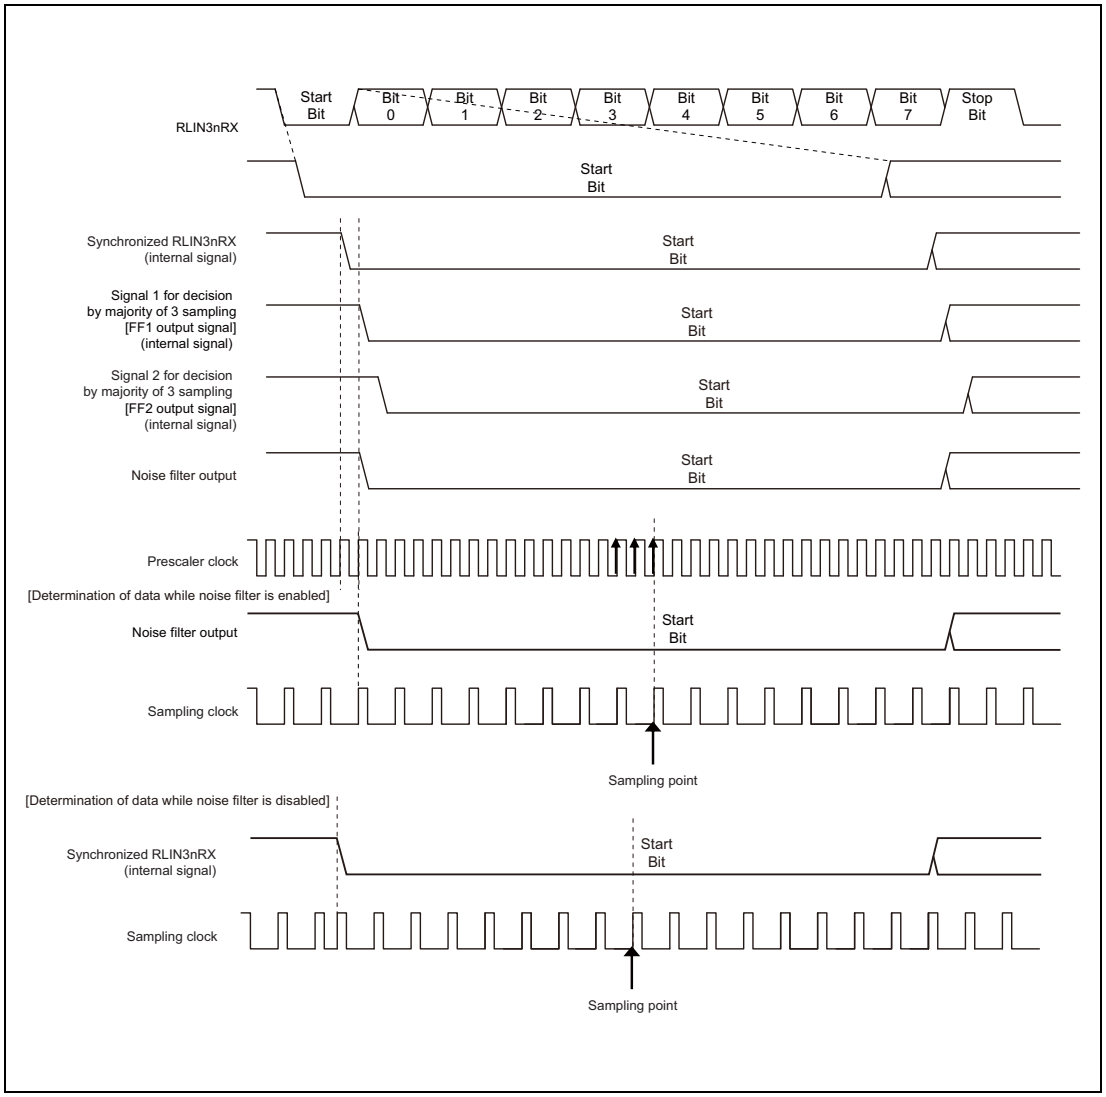

Figure 25.19 Determination of Received Data when Noise Filter is Used

26. Ethernet Controller

This LSI has an on-chip Ethernet controller (ETHER) conforming to the Ethernet or the IEEE802.3 MAC (Media Access Control) layer standard. Connecting a physical-layer LSI (PHY-LSI) complying with this standard enables the ETHER to perform transmission and reception of Ethernet/IEEE802.3 frames. The Ethernet controller in this LSI has one MAC layer interface port, which can be made to perform transmission and reception independently.
The ETHER can transfer the transmitted or received Ethernet frame data to and from the transmit/receive buffer in the memory at high speed using a dedicated direct memory access controller (E-DMAC).

26.1 Features

- MAC (Media Access Control) function
  Constructs/deconstructs data frames (frame format conforming to IEEE802.3, 2000 Edition)
  Supports transfer at 10 and 100 Mbps
  Supports full-duplex mode
  One channel (ETHER0)
  Flow control conforming to IEEE802.3x
  Supports one PHY interface conforming to IEEE802.3
  —MII (Media Independent Interface)
  Upward protocol support (checksum) function
- E-DMAC (Direct Memory Access Controller for Ethernet controller) function
  Data transfer between ETHER and external/internal memory
  One channel
  32-byte burst transfer
  Supports single-frame/single-descriptor operation and single-frame/multi-descriptor (multi-buffer) operation
  Transfer data width: 32 bits
  Transmit/receive FIFO (for transmission: 2 Kbytes, for reception: 4 Kbytes)
  Function for calculating the intelligent checksum value

Figure 26.1 shows the configuration of the ETHER.

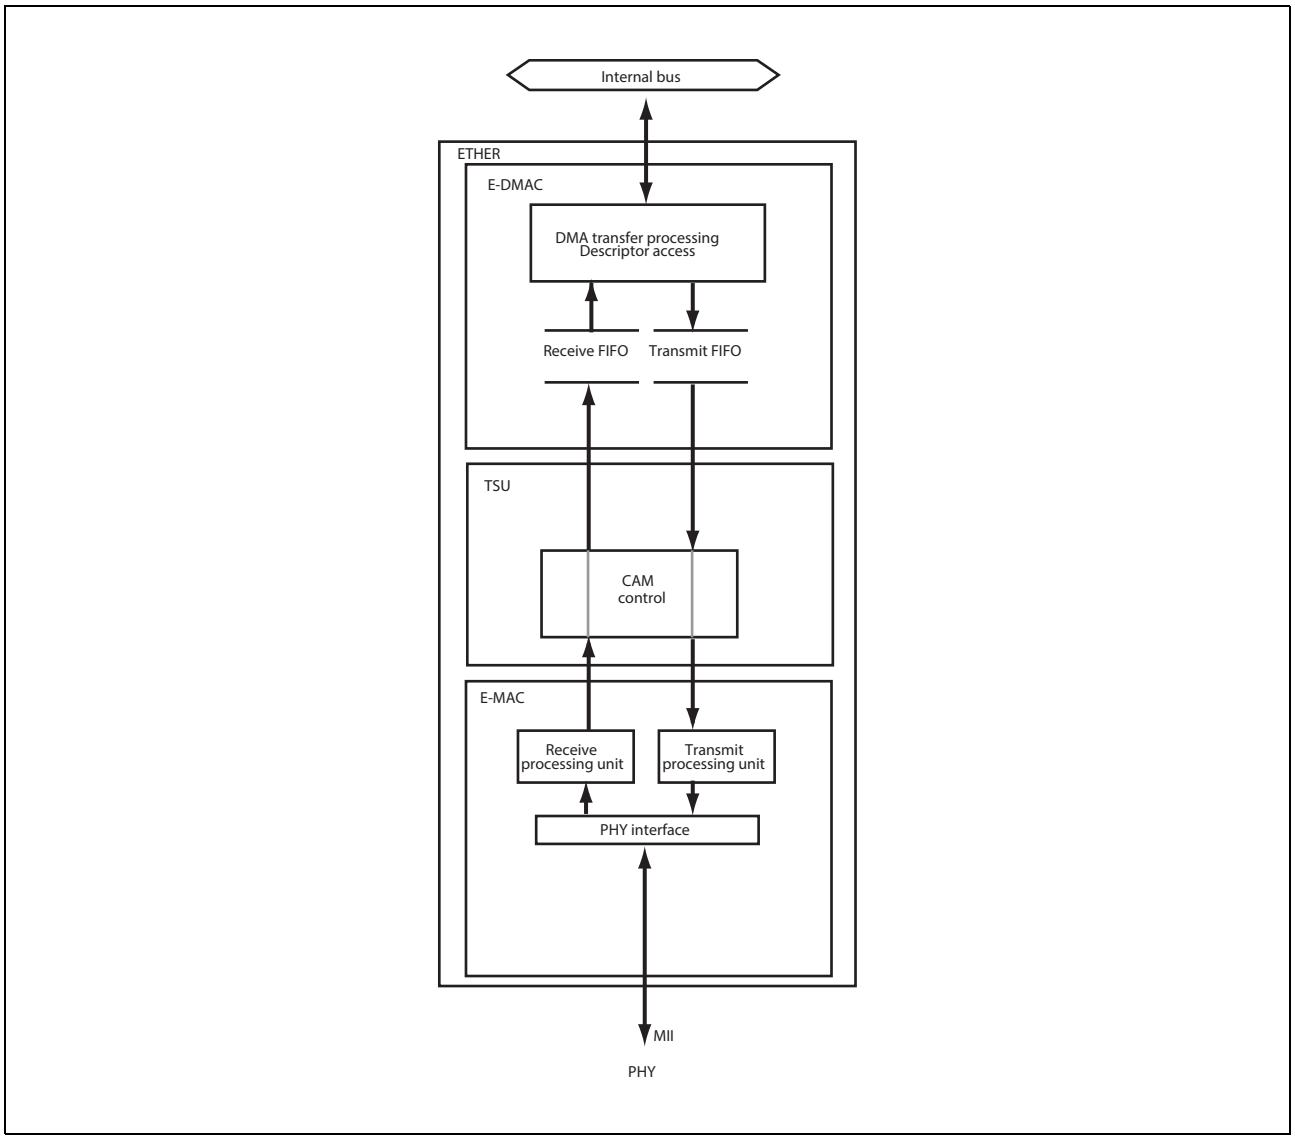

Figure 26.1 Configuration of ETHER

26.2 Input/Output Pins

Table 26.1 lists the pin configuration of the ETHER.

Table 26.1 Pin Configuration

Name	Abbreviation	I/O	Function
Transmit clock	ET_TXCLK*1	Input	ET_TXEN, ET_TXD[3:0] timing reference signal
Transmit enable	ET_TXEN*1	Output	Indicates that transmit data is ready on ET_TXD[3:0]
MII transmit data	ET_TXD[3:0]*1	Output	MII transmit data
Collision detection	ET_COL*1	Input	Collision detection signal
Transmit error	ET_TXER*1	Output	Not asserted in the ETHER
Receive clock	ET_RXCLK*1	Input	ET_RXDV, ET_RXD[3:0], ET_RXER timing reference signal
Receive data valid	ET_RXDV*1	Input	Indicates that valid receive data is on ET_RXD[3:0]
MII receive data	ET_RXD[3:0]*1	Input	MII receive data
Receive error	ET_RXER*1	Input	Identifies error state occurred during data reception
Carrier detection	ET_CRS*1	Input	Carrier detection signal
Management data clock	ET_MDC*1	Output	Reference clock signal for information transfer via ET_MDIO
Management data I/O	ET_MDIO*1	I/O	Bidirectional signal for exchange of management information between STA and PHY

Note 1. MII signal conforming to IEEE802.3u

26.3 Register Descriptions

Table 26.2 shows the configuration of registers of the ETHER.

Table 26.2 Register Configuration

Name	Abbreviation	R/W	Address	Access Size

26.3.1 Software Reset Register (ARSTR)

ARSTR resets all blocks (E-MAC, TSU, and E-DMAC) in the ETHER. By writing 1 to the ARST bit in this register, a software reset is issued to all blocks of the ETHER (for 256 cycles of internal bus clock Bφ). The ARST bit is always read as 0. While a software reset is issued, register access to all blocks of the ETHER is prohibited.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ARST	0	R/W	Software Reset When 1 is written to this bit, a software reset is issued to all blocks of the ETHER (for 256 cycles of internal bus clock Bφ). Writing 0 does not affect this bit. This bit is always read as 0. While a software reset is issued, register access to all blocks of the ETHER is prohibited. The following registers are not initialized by a software reset. TSU_ADRH0 to TSU_ADRH31, TSU_ADRL0 to TSU_ADRL31, TXNLCR0, TXALCR0, RXNLCR0, RXALCR0

26.3.2 E-MAC Mode Register (ECMR)

ECMR is a 32-bit readable/writable register that specifies the operating mode of the ETHER. The settings in this register are normally made in the initialization process following a reset.

The operating mode setting must not be changed while the transmitting and receiving functions are enabled. To switch the operating mode, return the E-MAC and E-DMAC to their initial states by means of the SWRT and SWRR bits in EDMR before making settings again.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TRCCM	—	—	RCSC	—	DPAD	RZPF	ZPF	PFR	RXF	TXF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	MCT	—	—	—	—	—	—	RE	TE	—	—	—	DM	PRM
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26	TRCCM	0	R/W	Counter Clear Mode Sets the method for clearing the counter register. Refer to the description of each register. 0: Cleared to 0 when the relevant register is written 1: Cleared to 0 when the relevant register is read
25, 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	RCSC	0	R/W	Checksum Calculation Specifies whether to perform automatic calculation (hardware calculation) of the checksum of the receive frame data unit. 0: Checksum is not automatically calculated 1: Checksum is automatically calculated Note that the checksum calculation of a frame with a VLAN tag is not supported. For details, see section 26.6.1, Checksum Calculation of Ethernet Frames.
22	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
21	DPAD	0	R/W	Data Padding 0: Padding is inserted to data less than 60 bytes so it is transmitted as 60-byte data 1: Padding is not inserted to data less than 60 bytes and it is transmitted without changes
20	RZPF	0	R/W	PAUSE Frame Reception with TIME = 0 0: Reception of a PAUSE frame whose TIME parameter value is 0 is disabled 1: Reception of a PAUSE frame whose TIME parameter value is 0 is enabled
19	ZPF	0	R/W	PAUSE Frame Usage with TIME = 0 Enable 0: Control of a PAUSE frame whose TIME parameter value is 0 is disabled. The next frame is not transmitted until the time specified by the Timer value has elapsed. If a PAUSE frame whose time specified by the Timer value is 0 is received, that PAUSE frame is discarded. 1: Control of a PAUSE frame whose TIME parameter value is 0 is enabled. When the data size in the receive FIFO becomes smaller than the FCFTR setting before the time specified by the Timer value elapses, an automatic PAUSE frame with a Timer value of 0 is transmitted. On receiving a PAUSE frame with a Timer value of 0, the transmission wait state is canceled.

Bit	Bit Name	Initial Value	R/W	Description
18	PFR	0	R/W	PAUSE Frame Receive Mode 0: PAUSE frame is not transferred to E-DMAC 1: PAUSE frame is transferred to E-DMAC
17	RXF	0	R/W	Operating Mode for Receiving Port Flow Control 0: PAUSE frame detection is disabled 1: Flow control for the receiving port is enabled
16	TXF	0	R/W	Operating Mode for Transmitting Port Flow Control 0: Flow control for the transmitting port is disabled (Automatic PAUSE frame is not transmitted) 1: Flow control for the transmitting port is enabled (Automatic PAUSE frame is transmitted as required)
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	MCT	0	R/W	Multicast Address Frame Receive Mode 0: Frames other than the multicast address set by the CAM entry table 0 to 31 (H/L) registers are received. However, if the on-chip CAM entry table reference is disabled, all multicast address frames are received. 1: Only the multicast address set by the CAM entry table 0 to 31 (H/L) registers is received.
12 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6	RE	0	R/W	Reception Enable If a switch is made from receiving function enabled (RE = 1) to disabled (RE = 0) while a frame is being received, the receiving function will be enabled until reception of the corresponding frame is completed. 0: Receiving function is disabled 1: Receiving function is enabled
5	TE	0	R/W	Transmission Enable If a switch is made from transmitting function enabled (TE = 1) to disabled (TE = 0) while a frame is being transmitted, the transmitting function will be enabled until transmission of the corresponding frame is completed. 0: Transmitting function is disabled 1: Transmitting function is enabled
4 to 2	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	DM	0	R/W	Full-duplex Transfer Enable 0: Full-duplex transfer function is disabled. 1: Full-duplex transfer function is enabled.
0	PRM	0	R/W	Promiscuous Mode Setting this bit enables all Ethernet frames to be received. All Ethernet frames means all receivable frames, irrespective of differences or enabled/disabled status (destination address, broadcast address, multicast bit, etc.). 0: ETHER performs normal operation 1: ETHER performs promiscuous mode operation

Note: • All bits, except for TE and RE, should be changed while the transmitting function is disabled (TE = 0) and the receiving function is disabled (RE = 0).

26.3.3 E-MAC Status Register (ECSR)

ECSR is a 32-bit readable/writable register that indicates the status in the E-MAC. This status can be notified to the CPU by interrupts. When 1 is written to the PFROI and ICD bits, the corresponding flags can be cleared. Writing 0 does not affect the flag. For bits that generate interrupts, the interrupt can be enabled or disabled by the corresponding bit in ECSIPR.

The interrupts generated due to this status register are indicated in the ECI bit in EESR of the E-DMAC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	PFROI	—	—	—	ICD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	PFROI	0	R/W	PAUSE Frame Retransmit Retry Over Indicates whether the retransmit count for retransmitting a PAUSE frame when flow control is enabled has exceeded the retransmit upper-limit set in the automatic PAUSE frame retransmit count register (TPAUSER). 0: PAUSE frame retransmit count has not exceeded the upper limit 1: PAUSE frame retransmit count has exceeded the upper limit
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ICD	0	R/W	Illegal Carrier Detection Indicates that the PHY-LSI has detected an illegal carrier on the line. If a change in the signal input from the PHY-LSI occurs in a period shorter than the software recognition period, the correct information may not be obtained. Refer to the timing specification for the PHY-LSI used. 0: PHY-LSI has not detected an illegal carrier on the line 1: PHY-LSI has detected an illegal carrier on the line

26.3.4 E-MAC Interrupt Permission Register (ECSIPR)

ECSIPR is a 32-bit readable/writable register that enables or disables the interrupt sources indicated by ECSR. Each bit can disable or enable interrupts corresponding to the bits in ECSR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	PFROIP	PHYIP	LCHNGIP	MPDIP	ICDIP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	PFROIP	0	R/W	PAUSE Frame Retransmit Interrupt Enable 0: Interrupt notification by the PFROI bit is disabled 1: Interrupt notification by the PFROI bit is enabled
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ICDIP	0	R/W	Illegal Carrier Detect Interrupt Enable 0: Interrupt notification by the ICD bit is disabled 1: Interrupt notification by the ICD bit is enabled

26.3.5 PHY Interface Register (PIR)

PIR is a 32-bit readable/writable register that provides a means of accessing the PHY-LSI internal registers via the MII.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	MDI	MDO	MMD	MDC
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	—	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	MDI	Undefined	R	MII Management Data-In Indicates the level of the ET_MDIO pin.
2	MDO	0	R/W	MII Management Data-Out Outputs the value set in this bit from the ET_MDIO pin when the MMD bit is 1.
1	MMD	0	R/W	MII Management Mode Specifies the data read/write direction with respect to the MII. 0: Read direction is specified 1: Write direction is specified
0	MDC	0	R/W	MII Management Data Clock Outputs the value set in this bit from the MDC pin and supplies the MII with the management data clock. For the method of accessing the MII registers, see section 26.5.2, Accessing MII Registers.

26.3.6 MAC Address High Register (MAHR)

MAHR is a 32-bit readable/writable register that specifies the upper 32 bits of the 48-bit MAC address. The settings in this register are normally made in the initialization process after a reset. The MAC address setting must not be changed while the transmitting and receiving functions are enabled. Return the E-MAC and E-DMAC to their initial states by means of the SWRT and SWRR bits in EDMR before making settings again.

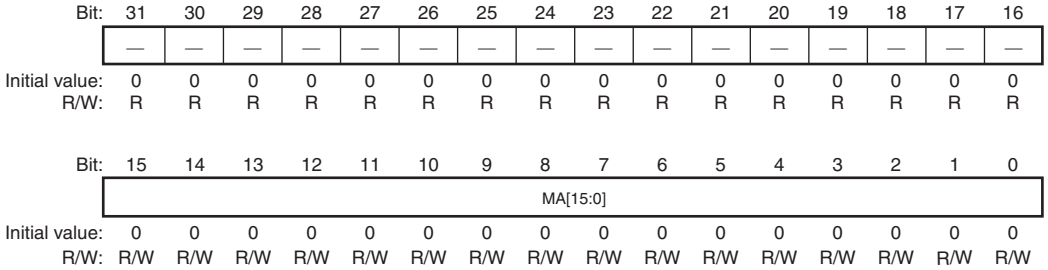
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MA[47:32]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MA[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MA[47:16]	All 0	R/W	MAC Address Bits 47 to 16 These bits are used to set the upper 32 bits of the MAC address. If the MAC address is 01-23-45-67-89-AB (hexadecimal), set H'01234567 in this register.

26.3.7 MAC Address Low Register (MALR)

MALR is a 32-bit readable/writable register that specifies the lower 16 bits of the 48-bit MAC address. The settings in this register are normally made in the initialization process after a reset. The MAC address setting must not be changed while the transmitting and receiving functions are enabled. Return the E-MAC and E-DMAC to their initial states by means of the SWRT and SWRR bits in EDMR before making settings again.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	MA[15:0]	All 0	R/W	MAC Address Bits 15 to 0 These bits are used to set the lower 16 bits of the MAC address. If the MAC address is 01-23-45-67-89-AB (hexadecimal), set H'000089AB in this register.

26.3.8 Receive Frame Length Register (RFLR)

RFLR is a 32-bit readable/writable register that specifies the maximum frame length (in bytes) that can be received by this LSI. The settings in this register must not be changed while the receiving function is enabled.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RFL[17:16]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFL[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17 to 0	RFL[17:0]	All 0	R/W	Receive Frame Length The frame data described here refers to all fields from the destination address up to the CRC data. Frame contents from the destination address up to the data are actually transferred to memory. CRC data is not included in the transfer. When data that exceeds the specified value is received, the part of data that exceeds the specified value is discarded. H'00000 to H'005EE: 1,518 bytes H'005EF: 1,519 bytes H'005F0: 1,520 bytes : : H'007FF: 2,047 bytes H'00800: 2,048 bytes : : H'01000: 4,096 bytes : : H'10000: 65,536 bytes : : H'20000 to H'3FFFF: 131,072 bytes

26.3.9 CRC Error Frame Receive Counter Register (CEFCR)

CEFCR is a 32-bit counter that indicates the number of times a frame with a CRC error was received. When the value in this register reaches H'FFFFFFFF, count-up is halted. This register is cleared to 0 when it is read with the TRCCM bit in ECMR set to 1. When the TRCCM bit in ECMR is 0, writing to this register will clear it regardless of the value written.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CEFC[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CEFC[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CEFC[31:0]	All 0	R/W	CRC Error Frame Count These bits indicate the number of CRC error frames received.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.10 Frame Receive Error Counter Register (FRECR)

FRECR is a 32-bit counter that indicates the number of frames for which a receive error was generated by the RXER pin input from the PHY-LSI. FRECR is incremented each time the RXER pin becomes active. When the value in this register reaches H'FFFFFFFF, count-up is halted. This register is cleared to 0 when it is read with the TRCCM bit in ECMR set to 1. When the TRCCM bit in ECMR is 0, writing to this register will clear it regardless of the value written.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

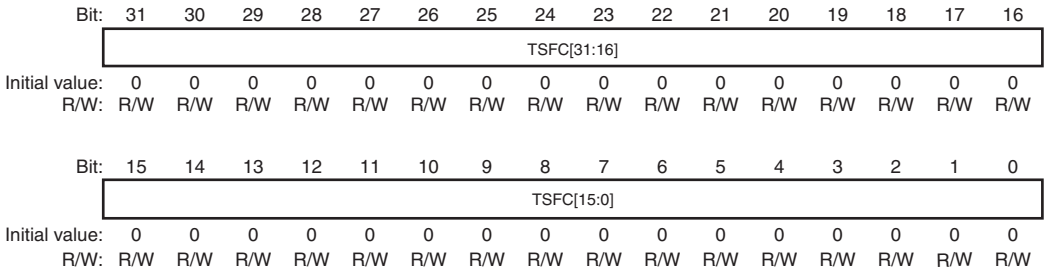
Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FREC[31:0]	All 0	R/W	Frame Receive Error Count These bits indicate the number of errors during frame reception.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.11 Too-Short Frame Receive Counter Register (TSFRCR)

TSFRCR is a 32-bit counter that indicates the number of frames received with a length fewer than 64 bytes. When the value in this register reaches H'FFFFFFFF, count-up is halted. This register is cleared to 0 when it is read with the TRCCM bit in ECMR set to 1. When the TRCCM bit in ECMR is 0, writing to this register will clear it regardless of the value written.

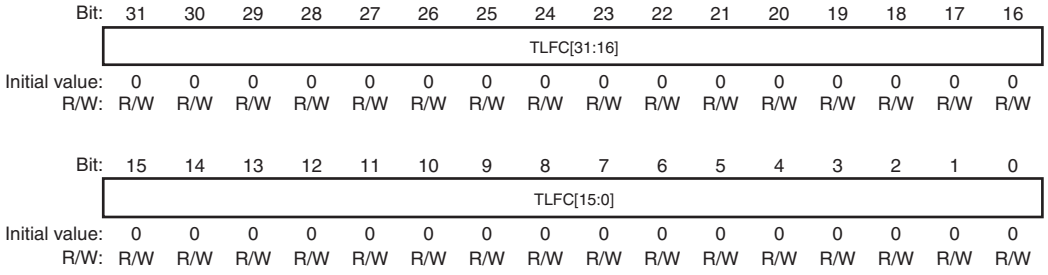


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TSFC[31:0]	All 0	R/W	Too-Short Frame Receive Count These bits indicate the number of frames received with a length of less than 64 bytes.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.12 Too-Long Frame Receive Counter Register (TLFRCR)

TLFRCR is a 32-bit counter that indicates the number of frames received with a length exceeding the value specified by the receive frame length register (RFLR). When the value in this register reaches H'FFFFFFFF, count-up is halted. This register is not incremented when a frame containing residual bits is received. In this case, the reception of the frame is indicated in the residual-bit frame receive counter register (RFCR). This register is cleared to 0 when it is read with the TRCCM bit in ECMR set to 1. When the TRCCM bit in ECMR is 0, writing to this register will clear it regardless of the value written.

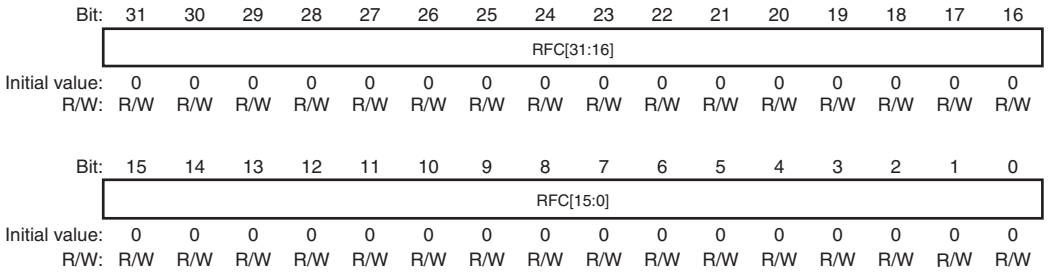


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TLFC[31:0]	All 0	R/W	Too-Long Frame Receive Count These bits indicate the number of frames received with a length exceeding the value in RFLR.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.13 Residual-Bit Frame Receive Counter Register (RFCR)

RFCR is a 32-bit counter that indicates the number of frames received containing residual bits (less than an 8-bit unit). When the value in this register reaches H'FFFFFFFF, count-up is halted. This register is cleared to 0 when it is read with the TRCCM bit in ECMR set to 1. When the TRCCM bit in ECMR is 0, writing to this register will clear it regardless of the value written.

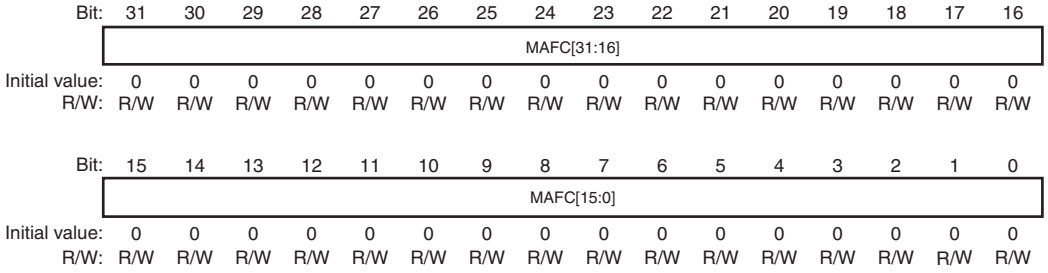


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RFC[31:0]	All 0	R/W	Residual-Bit Frame Receive Count These bits indicate the number of frames received containing residual bits.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.14 Multicast Address Frame Receive Counter Register (MAFCR)

MAFCR is a 32-bit counter that indicates the number of frames received with a specified multicast address. When the value in this register reaches H'FFFFFFFF, count-up is halted. This register is cleared to 0 when it is read with the TRCCM bit in ECMR set to 1. When the TRCCM bit in ECMR is 0, writing to this register will clear it regardless of the value written.

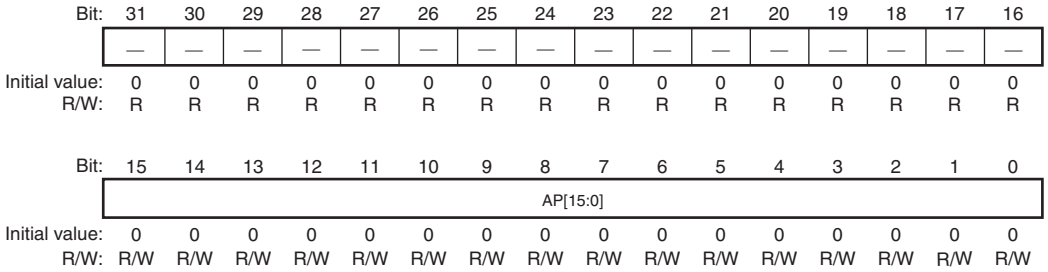


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	MAFC[31:0]	All 0	R/W	Multicast Address Frame Count These bits indicate the number of multicast frames received.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.15 Automatic PAUSE Frame Register (APR)

APR is used to set the TIME parameter value of an automatic PAUSE frame. When an automatic PAUSE frame is transmitted, the value set in this register is used as the TIME parameter of the PAUSE frame.



Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	AP[15:0]	All 0	R/W	Automatic PAUSE These bits set the TIME parameter value of an automatic PAUSE frame. One bit is equivalent to 512 bit-time. When flow control is enabled in transmission (PAUSE frame transmission) (TXF bit in ECMR = 1), set a value other than H'0000 in these bits. H'0000: — H'0001: 512 × 1 bit-time H'0002: 512 × 2 bit-time : : H'FFFF: 512 × 65,535 bit-time Note: The bit-time becomes as follows according to the transfer speed. 100 Mbps: 1 bit-time = 10 ns 10 Mbps: 1 bit-time = 100 ns

26.3.16 Manual PAUSE Frame Register (MPR)

MPR is used to set the TIME parameter value of a manual PAUSE frame. When a manual PAUSE frame is transmitted, the value set in this register is used as the TIME parameter of the PAUSE frame.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	MP[15:0]	All 0	R/W	Manual PAUSE These bits set the TIME parameter value of a manual PAUSE frame. One bit is equivalent to 512 bit-time. H'0000: — H'0001: 512 × 1 bit-time H'0002: 512 × 2 bit-time : : H'FFFF: 512 × 65,535 bit-time Note: The bit-time becomes as follows according to the transfer speed. 100 Mbps: 1 bit-time = 10 ns 10 Mbps: 1 bit-time = 100 ns

26.3.17 Automatic PAUSE Frame Retransmit Count Register (TPAUSER)

TPAUSER is used to set the upper limit for the number of times to retransmit an automatic PAUSE frame. The settings in this register must not be changed while the transmitting function is enabled.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	TPAUSE[15:0]	All 0	R/W	Upper Limit for Automatic PAUSE Frame Retransmission H'0000: Retransmit count is unlimited H'0001: Retransmit count is 1 : : H'FFFF: Retransmit count is 65,535

26.3.18 PAUSE Frame Transmit Counter Register (PFTCR)

PFTCR is a 16-bit counter that indicates the number of times a PAUSE frame is transmitted. This register is cleared to 0 when it is read.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFTXC[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	PFTXC[15:0]	All 0	R	PAUSE Frame Transmit Count These bits indicate the total number of automatic PAUSE frames and manual PAUSE frames transmitted.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.19 PAUSE Frame Receive Counter Register (PFRCR)

PFRCR is a 16-bit counter that indicates the number of times a PAUSE frame is received. This register is cleared to 0 when it is read.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFRXC[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	PFRXC[15:0]	All 0	R	PAUSE Frame Receive Count These bits indicate the number of PAUSE frames received when flow control is enabled in reception (RXF bit in ECMR = 1).

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.20 TSU Counter Reset Register (TSU_CTRST)

TSU_CTRST clears the transmit, receive, and relay frame counters to 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CTRST	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	CTRST	0	R/W	TSU Counter Reset When 1 is written to this bit, the values of registers TXNLCR0, TXALCR0, RXNLCR0, and RXALCR0 are cleared to 0. Writing 0 does not affect this bit. This bit is always read as 0.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

26.3.21 CAM Entry Table Specification Enable Register (Common) (TSU_FWSLC)

When the CAM function is in use, you can use the TSU_POST1 to TSU_POST4 registers to specify which of among the CAM entry tables are for reference or reference to all tables. The TSU_FWSLC register enables or disables this action of the settings of the TSU_POST1 to TSU_POST4 registers.

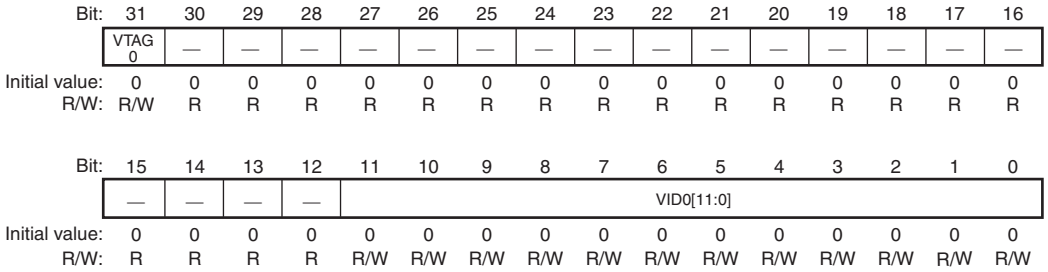
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	POSTENU	POSTENL	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	POSTENU	0	R/W	This bit enables the settings for CAM entry tables 0 to 15 in the POST bits of the TSU_POST1 and TSU_POST2 registers. 0: The settings of the POST bits are disabled (CAM entry tables 0 to 15 are referred to on reception of frames). 1: The settings of the POST bits are enabled (whether to refer to each of CAM entry tables is determined by the settings of the corresponding POST bit).
12	POSTENL	0	R/W	This bit enables the settings for CAM entry tables 16 to 31 in the POST bits of the TSU_POST3 and TSU_POST4 registers. 0: The settings of the POST bits are disabled (CAM entry tables 16 to 31 are not referred to on reception of frames). 1: The settings of the POST bits are enabled (whether to refer to each of CAM entry tables is determined by the settings of the corresponding POST bit).
11 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

26.3.22 VLANtag Set Register (TSU_VTAG0)

TSU_VTAG0 enables or disables the frame receive/discard evaluation function based on the VLAN number, and also sets the VLAN number.



Bit	Bit Name	Initial Value	R/W	Description
31	VTAG0	0	R/W	Port 0 VLANtag Evaluation Function 0: Disables receive/discard evaluation for frames based on the VLAN number 1: Enables receive/discard evaluation for frames based on the VLAN number
30 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	VID0[11:0]	All 0	R/W	V-LAN ID Setting (VID) These bits set the VLAN number received by receive frames.

26.3.23 CAM Entry Table Busy Register (TSU_ADSBSY)

When CAM entry table registers (TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31) are set by register writing, the ADSBSY bit in this register is set to 1 (when the process of reflecting the contents of the CAM entry table registers in the CAM controller is completed inside the TSU, the ADSBSY bit is automatically restored to 0). Access to TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31 is prohibited, while the ADSBSY bit in this register is set to 1. This register is a read-only status register, which must not be written to.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADS BSY
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ADSBSY	0	R	CAM Entry Table Setting Busy When TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31 are set by register writing, this bit is set to 1. When the process of reflecting the contents of the CAM entry table registers in the CAM controller is completed inside the TSU, this bit is automatically restored to 0. Access to TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31 is prohibited, while this bit is set to 1. Writing to this register is also prohibited.

26.3.24 CAM Entry Table Enable Register (TSU_TEN)

TSU_TEN enables or disables the settings of TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

26.3.25 CAM Entry Table POST 1 Register (TSU_POST1)

When the CAM function is in use, you can use the TSU_POST1 to TSU_POST4 registers to specify which of the CAM entry tables are for reference. The TSU_POST1 register specifies the conditions for reference to TSU_ADRH0 to TSU_ADRH7 and TSU_ADRL0 to TSU_ADRL7. The setting of this register is effective when the POSTENU bit of the TSU_FWSLC register is set to 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	POST0	—	—	—	POST1	—	—	—	POST2	—	—	—	POST3	—	—	—

R/W:	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	POST0	0	R/W	Specifies whether reference is or is not made to CAM entry table 0. Setting this bit to 1 selects the condition below. POST0: CAM entry table 0 is referred to on reception of frames.
30 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27	POST1	0	R/W	Specifies whether reference is or is not made to CAM entry table 1. Setting this bit to 1 selects the condition below. POST1: CAM entry table 1 is referred to on reception of frames.
26 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	POST2	0	R/W	Specifies whether reference is or is not made to CAM entry table 2. Setting this bit to 1 selects the condition below. POST2: CAM entry table 2 is referred to on reception of frames.
22 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19	POST3	0	R/W	Specifies whether reference is or is not made to CAM entry table 3. Setting this bit to 1 selects the condition below. POST3: CAM entry table 3 is referred to on reception of frames.
18 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	POST4	0	R/W	Specifies whether reference is or is not made to CAM entry table 4. Setting this bit to 1 selects the condition below. POST4: CAM entry table 4 is referred to on reception of frames.
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	POST5	0	R/W	Specifies whether reference is or is not made to CAM entry table 5. Setting this bit to 1 selects the condition below. POST5: CAM entry table 5 is referred to on reception of frames.
10 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	POST6	0	R/W	Specifies whether reference is or is not made to CAM entry table 6. Setting this bit to 1 selects the condition below. POST6: CAM entry table 6 is referred to on reception of frames.
6 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	POST7	0	R/W	Specifies whether reference is or is not made to CAM entry table 7. Setting this bit to 1 selects the condition below. POST7: CAM entry table 7 is referred to on reception of frames.

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

26.3.26 CAM Entry Table POST 2 Register (TSU_POST2)

When the CAM function is in use, you can use the TSU_POST1 to TSU_POST4 registers to specify which of the CAM entry tables are for reference. The TSU_POST2 register specifies the conditions for reference to TSU_ADRH8 to TSU_ADRH15 and TSU_ADRL8 to TSU_ADRL15. The setting of this register is effective when the POSTENU bit of the TSU_FWSLC register is set to 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	POST8	—	—	—	POST9	—	—	—	POST10	—	—	—	POST11	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	POST12	—	—	—	POST13	—	—	—	POST14	—	—	—	POST15	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	POST8	0	R/W	Specifies whether reference is or is not made to CAM entry table 8. Setting this bit to 1 selects the condition below. POST8: CAM entry table 8 is referred to on reception of frames.
30 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27	POST9	0	R/W	Specifies whether reference is or is not made to CAM entry table 9. Setting this bit to 1 selects the condition below. POST9: CAM entry table 9 is referred to on reception of frames.
26 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	POST10	0	R/W	Specifies whether reference is or is not made to CAM entry table 10. Setting this bit to 1 selects the condition below. POST10: CAM entry table 10 is referred to on reception of frames.
22 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19	POST11	0	R/W	Specifies whether reference is or is not made to CAM entry table 11. Setting this bit to 1 selects the condition below. POST11: CAM entry table 11 is referred to on reception of frames.
18 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	POST12	0	R/W	Specifies whether reference is or is not made to CAM entry table 12. Setting this bit to 1 selects the condition below. POST12: CAM entry table 12 is referred to on reception of frames.
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	POST13	0	R/W	Specifies whether reference is or is not made to CAM entry table 13. Setting this bit to 1 selects the condition below. POST13: CAM entry table 13 is referred to on reception of frames.
10 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
7	POST14	0	R/W	Specifies whether reference is or is not made to CAM entry table 14. Setting this bit to 1 selects the condition below. POST14: CAM entry table 14 is referred to on reception of frames.
6 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	POST15	0	R/W	Specifies whether reference is or is not made to CAM entry table 15. Setting this bit to 1 selects the condition below. POST15: CAM entry table 15 is referred to on reception of frames.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

26.3.27 CAM Entry Table POST 3 Register (TSU_POST3)

When the CAM function is in use, you can use the TSU_POST1 to TSU_POST4 registers to specify which of the CAM entry tables are for reference. The TSU_POST3 register specifies the conditions for reference to TSU_ADRH16 to TSU_ADRH23 and TSU_ADRL16 to TSU_ADRL23. The setting of this register is effective when the POSTENL bit of the TSU_FWSLC register is set to 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	POST16	—	—	—	POST17	—	—	—	POST18	—	—	—	POST19	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	POST16	0	R/W	Specifies whether reference is or is not made to CAM entry table 16. Setting this bit to 1 selects the condition below. POST16: CAM entry table 16 is referred to on reception of frames.
30 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27	POST17	0	R/W	Specifies whether reference is or is not made to CAM entry table 17. Setting this bit to 1 selects the condition below. POST17: CAM entry table 17 is referred to on reception of frames.
26 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	POST18	0	R/W	Specifies whether reference is or is not made to CAM entry table 18. Setting this bit to 1 selects the condition below. POST18: CAM entry table 18 is referred to on reception of frames.
22 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19	POST19	0	R/W	Specifies whether reference is or is not made to CAM entry table 19. Setting this bit to 1 selects the condition below. POST19: CAM entry table 19 is referred to on reception of frames.
18 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	POST20	0	R/W	Specifies whether reference is or is not made to CAM entry table 20. Setting this bit to 1 selects the condition below. POST20: CAM entry table 20 is referred to on reception of frames.

Bit	Bit Name	Initial Value	R/W	Description
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	POST21	0	R/W	Specifies whether reference is or is not made to CAM entry table 21. Setting this bit to 1 selects the condition below. POST21: CAM entry table 21 is referred to on reception of frames.
10 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	POST22	0	R/W	Specifies whether reference is or is not made to CAM entry table 22. Setting this bit to 1 selects the condition below. POST22: CAM entry table 22 is referred to on reception of frames.
6 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	POST23	0	R/W	Specifies whether reference is or is not made to CAM entry table 23. Setting this bit to 1 selects the condition below. POST23: CAM entry table 23 is referred to on reception of frames.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

26.3.28 CAM Entry Table POST 4 Register (TSU_POST4)

When the CAM function is in use, you can use the TSU_POST1 to TSU_POST4 registers to specify which of the CAM entry tables are for reference. The TSU_POST4 register specifies the conditions for reference to TSU_ADRH24 to TSU_ADRH31 and TSU_ADRL24 to TSU_ADRL31. The setting of this register is effective when the POSTENL bit of the TSU_FWSLC register is set to 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	POST24	—	—	—	POST25	—	—	—	POST26	—	—	—	POST27	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	POST28	—	—	—	POST29	—	—	—	POST30	—	—	—	POST31	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	POST24	0	R/W	Specifies whether reference is or is not made to CAM entry table 24. Setting this bit to 1 selects the condition below. POST24: CAM entry table 24 is referred to on reception of frames.
30 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27	POST25	0	R/W	Specifies whether reference is or is not made to CAM entry table 25. Setting this bit to 1 selects the condition below. POST25: CAM entry table 25 is referred to on reception of frames.
26 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	POST26	0	R/W	Specifies whether reference is or is not made to CAM entry table 26. Setting this bit to 1 selects the condition below. POST26: CAM entry table 26 is referred to on reception of frames.
22 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
19	POST27	0	R/W	Specifies whether reference is or is not made to CAM entry table 27. Setting this bit to 1 selects the condition below. POST27: CAM entry table 27 is referred to on reception of frames.
18 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	POST28	0	R/W	Specifies whether reference is or is not made to CAM entry table 28. Setting this bit to 1 selects the condition below. POST28: CAM entry table 28 is referred to on reception of frames.
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	POST29	0	R/W	Specifies whether reference is or is not made to CAM entry table 29. Setting this bit to 1 selects the condition below. POST29: CAM entry table 29 is referred to on reception of frames.
10 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	POST30	0	R/W	Specifies whether reference is or is not made to CAM entry table 30. Setting this bit to 1 selects the condition below. POST30: CAM entry table 30 is referred to on reception of frames.
6 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	POST31	0	R/W	Specifies whether reference is or is not made to CAM entry table 31. Setting this bit to 1 selects the condition below. POST31: CAM entry table 31 is referred to on reception of frames.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

26.3.29 CAM Entry Table 0H to 31H Registers (TSU_ADRH0 to TSU_ADRH31)

TSU_ADRH0 to TSU_ADRH31 are entry tables referred to by the CAM in reception and relay. Each of these registers sets the upper 32 bits of the 48-bit MAC address. Maximum 32 entries of MAC addresses can be registered.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADRHn[31:16] (n = 0 to 31)															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADRHn[15:0] (n = 0 to 31)															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ADRHn[31:0] (n: 0 to 31)	All 0	R/W	MAC Address Bits These bits set the upper 32 bits of the MAC address. When the MAC address is 01-23-45-67-89-AB (displayed in hexadecimal), set H'01234567 in this register.

Note: • Set the CAM entry tables following the procedure below.
1. Check that the ADSBSY bit in TSU_ADSBSY is cleared to 0.
2. Set the upper 32 bits of the MAC addresses by TSU_ADRH0 to TSU_ADRH31.
3. Set the lower 16 bits of the MAC addresses by TSU_ADRL0 to TSU_ADRL31.

26.3.30 CAM Entry Table 0L to 31L Registers (TSU_ADRL0 to TSU_ADRL31)

TSU_ADRL0 to TSU_ADRL31 are entry tables referred to by the CAM in reception and relay. Each of these registers sets the lower 16 bits of the 48-bit MAC address. Maximum 32 entries of MAC addresses can be registered.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADRLn[15:0] (n = 0 to 31)															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	ADRLn[15:0] (n: 0 to 31)	All 0	R/W	MAC Address Bits These bits set the lower 16 bits of the MAC address. When the MAC address is 01-23-45-67-89-AB (displayed in hexadecimal), set H'000089AB in this register.

Note: • Set the CAM entry tables following the procedure below.
1. Check that the ADSBSY bit in TSU_ADSBSY is cleared to 0.
2. Set the upper 32 bits of the MAC addresses by TSU_ADRH0 to TSU_ADRH31.
3. Set the lower 16 bits of the MAC addresses by TSU_ADRL0 to TSU_ADRL31.

26.3.31 Transmit Frame Counter Register (Normal Transmission Only) (TXNLCR0)

TXNLCR0 is a 32-bit counter indicating the number of frames successfully transmitted in the E-MAC. When the value in this register reaches H'FFFFFFFF, count-up is halted. The counter is cleared to 0 by reading from this register. This register cannot be written to.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	NTC0[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NTC0[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	NTC0[31:0]	All 0	R	Transmit Frame Counter Bits These bits indicate the number of frames successfully transmitted.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.32 Transmit Frame Counter Register (Normal and Erroneous Transmission) (TXALCR0)

TXALCR0 is a 32-bit counter indicating the number of frames transmitted in the E-MAC, including the number of frames erroneously transmitted. When the value in this register reaches H'FFFFFFFF, count-up is halted. The counter is cleared to 0 by reading from this register. This register cannot be written to.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TC0[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

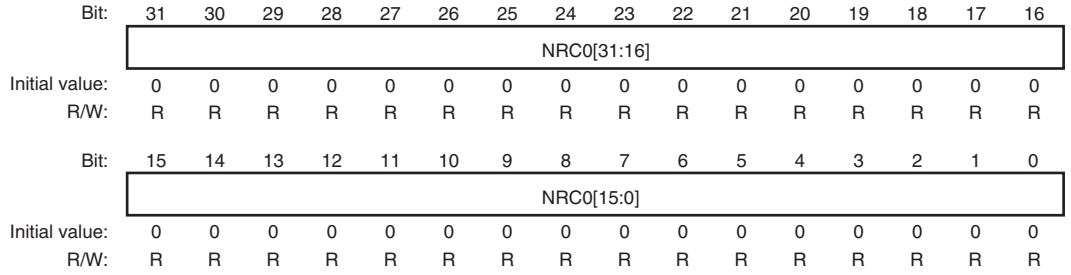
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TC0[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TC0[31:0]	All 0	R	Transmit Frame Counter Bits These bits indicate the number of frames successfully transmitted and erroneously transmitted.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.33 Receive Frame Counter Register (Normal Reception Only) (RXNLCR0)

RXNLCR0 is a 32-bit counter indicating the number of frames successfully received in the E-MAC. When the value in this register reaches H'FFFFFFFF, count-up is halted. The counter is cleared to 0 by reading from this register. This register cannot be written to.

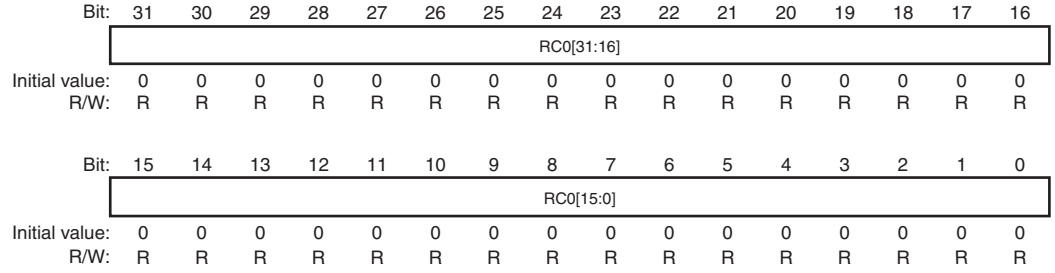


Bit	Bit Name	Initial Value	R/W	Description
31 to 0	NRC0[31:0]	All 0	R	Receive Frame Counter Bits These bits indicate the number of frames successfully received.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.34 Receive Frame Counter Register (Normal and Erroneous Reception) (RXALCR0)

RXALCR0 is a 32-bit counter indicating the number of frames received in the E-MAC, including the number of frames erroneously received. When the value in this register reaches H'FFFFFFFF, count-up is halted. The counter is cleared to 0 by reading from this register. This register cannot be written to.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RC0[31:0]	All 0	R	Receive Frame Counter Bits These bits indicate the number of frames successfully received and erroneously received.

Note: • When count-up and count-clearing of this register value occur simultaneously, count-clearing is performed.

26.3.35 E-DMAC Start Register (EDSR)

EDSR specifies activation of the transmitting unit and receiving unit of the E-DMAC. This register can only be written to, and the read values are invalid.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ENT	ENR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	ENT	0	W	E-DMAC Transmitting Unit Start 0: Stops the E-DMAC transmitting unit 1: Starts the E-DMAC transmitting unit
0	ENR	0	W	E-DMAC Receiving Unit Start 0: Stops the E-DMAC receiving unit 1: Starts the E-DMAC receiving unit

26.3.36 E-DMAC Mode Register (EDMR)

EDMR is a 32-bit readable/writable register that specifies E-DMAC resetting and the transmit/receive descriptor length. This register is to be set before the transmitting or receiving function is enabled (before the TR bit in EDTRR or the RR bit in EDRRR is set to 1). However, the SWRR and SWRT bits can be written to even after the transmitting or receiving function is enabled. If a software reset is executed with this register during data transmission, abnormal data may be transmitted on the line. Execute a software reset with this register before specifying the transmit/receive descriptor length or modifying the settings of TDLAR, RDLAR, and so forth, the setting of ECMR (E-MAC mode register), and the settings of registers related to the E-DMAC and E-MAC operation.

To execute a software reset with this register, 1 must be written to both the SWRT and SWRR bits simultaneously. Writing 1 to the SWRT and SWRR bits initializes the E-MAC registers and E-DMAC registers, except for TDLAR, RDLAR, and RMFCR of the E-DMAC. The TSU registers (registers whose names are prefixed with TSU_) are not initialized. The SWRT and SWRR bits in EDMR0 initializes the registers related to the E-DMAC and E-MAC. Note that during the period a software reset is issued (for 64 cycles of the internal bus clock Bck), accesses to all Ethernet-related registers are prohibited.

26.3.37 E-DMAC Transmit Request Register (EDTRR)

EDTRR is a 32-bit readable/writable register that issues transmit directives to the E-DMAC. After writing 11 to bits TR[1:0] in this register, the E-DMAC reads the transmit descriptor at the address specified by TDLAR. If the TACT bit of this transmit descriptor is set to 1 (valid), transmit DMA transfer by the E-DMAC starts. When DMA transfer based on the first transmit descriptor is completed, the E-DMAC reads the next transmit descriptor. If the TACT bit of that transmit descriptor is set to 1 (valid), the E-DMAC continues transmit DMA operation. If the TACT bit of a transmit descriptor is cleared to 0 (invalid), the E-DMAC clears bits TR[1:0] and stops transmit DMA operation.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TR[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	TR[1:0]	00	R/W	Transmit Request 00, 01, 10: Transmission-halted state If 00, 01, or 10 is written to these bits, the E-DMAC stops DMA transfer of the currently processed transmit descriptor, reads the next transmit descriptor, and then clears these bits. (Write-back is completed for the valid transmit descriptors that have been detected up till then.) The E-DMAC clears these bits when transmit descriptor empty occurs, or transmission of a transmit descriptor has completed. (Write-back is completed for the valid transmit descriptors that have been detected up till then.) 11: Transmit DMA operation by E-DMAC After writing 11 to these bits, the E-DMAC starts reading a transmit descriptor.

26.3.38 E-DMAC Receive Request Register (EDRRR)

EDRRR is a 32-bit readable/writable register that issues receive directives to the E-DMAC. After writing 1 to the RR bit in this register, the E-DMAC reads the receive descriptor at the address specified by RDLAR. If the RACT bit of this receive descriptor is set to 1 (valid), and the receive FIFO holds a receive frame, the E-DMAC starts receive DMA transfer. When DMA transfer based on the first receive descriptor is completed, the E-DMAC reads the next receive descriptor. If the RACT bit of that receive descriptor is set to 1 (valid), the E-DMAC continues receive DMA operation. However, if the receive FIFO holds no receive data, the E-DMAC places receive DMA operation in the standby state. If the RACT bit of the receive descriptor is cleared to 0 (invalid), the E-DMAC clears the RR bit and stops receive DMAC operation.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RR	0	R/W	Receive Request 0: Receiving function is disabled*1 If 0 is written to this bit, the E-DMAC stops receive operation after DMA transfer of one frame has completed and then clears this bit. The E-DMAC clears this bit when receive descriptor empty occurs. 1: Receive descriptor is read, and the E-DMAC is ready to receive.

Note 1. If the receiving function is disabled during frame reception, write-back is not performed successfully to the receive descriptor. Following pointers to read a receive descriptor become abnormal and the E-DMAC cannot operate successfully. In this case, to make E-DMAC reception enabled again, execute a software reset by the SWRT and SWRR bits in EDMR0. To disable the E-DMAC receiving function without executing a software reset, specify the RE bit in ECMR0. Next, after the E-DMAC has completed the reception and write-back to the receive descriptor has been confirmed, disable the receiving function using this register.

26.3.39 Transmit Descriptor List Start Address Register (TDLAR)

TDLAR is a 32-bit readable/writable register that specifies the start address of the transmit descriptor list. Descriptors have a boundary configuration in accordance with the descriptor length indicated by the DL bits in EDMR. This register must not be modified during transmission. Modifications to this register should only be made in the transmission-halted state specified by bits TR[1:0] (= 00) in the E-DMAC transmit request register (EDTRR).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

26.3.40 Receive Descriptor List Start Address Register (RDLAR)

RDLAR is a 32-bit readable/writable register that specifies the start address of the receive descriptor list. Descriptors have a boundary configuration in accordance with the descriptor length indicated by the DL bits in EDMR. This register must not be modified during reception. Modifications to this register should only be made while reception is disabled by the RR bit (= 0) in the E-DMAC receive request register (EDRRR).

26.3.41 E-MAC/E-DMAC Status Register (EESR)

EESR is a 32-bit readable/writable register that shows communications status information on the E-DMAC in combination with the E-MAC. The information in this register is reported in the form of interrupt sources. Individual bits are cleared by writing 1 (however, bit 22 (ECI) is a read-only bit that is not cleared by writing 1) and are not affected by writing 0. Each interrupt source can also be masked by means of the corresponding bit in the E-MAC/E-DMAC status interrupt permission register (EESIPR).

The interrupt generated by this status register is ETHERI. For interrupt priorities, see section 7.4, Interrupt Sources.

R/W:	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	TWB[1:0]	00	R/W	Write-Back Complete Indicates that write-back from the E-DMAC to the corresponding descriptor after frame transmission has completed. This operation is enabled only when the TWBI bit in the transmit descriptor that includes the end of the transmit frame is set to 1. 00: Write-back has not completed, or no transmission directive 11: Write-back has completed Others: Setting disabled
29	TC[1]	0	R/W	Frame Transmission Complete Indicates, in combination with the TC[0] bit, that all the data specified by the transmit descriptor has been transmitted from the E-MAC. This bit is set to 1 on assuming the completion of transmission. This is when transmission of one frame is completed and the transmit descriptor valid bit (TACT) of the next transmit descriptor not being set in single-frame/single-descriptor operation or when the last data of a frame has been transmitted and the transmit descriptor valid bit (TACT) of the next descriptor not being set in multi-buffer frame processing based on single-frame/multi-descriptor operation. After frame transmission has completed, the E-DMAC writes the transmission status back to the relevant descriptor. TC[1:0] 00: Transmission has not completed, or no transmission directive 11: Transmission has completed Others: Setting disabled
28	TUC	0	R/W	Transmit Underflow Frame Write-Back Complete 0: Write-back has not completed for the frame causing transmit underflow 1: Write-back has completed for the frame causing transmit underflow
27	ROC	0	R/W	Receive Overflow Frame Write-Back Complete 0: Write-back has not completed for the frame causing receive overflow 1: Write-back has completed for the frame causing receive overflow
26	TABT	0	R/W	Transmit Abort Detect Indicates that the E-MAC aborts transmitting a frame because of failures during frame transmission. 0: Frame transmission has not been aborted or no transmission directive 1: Frame transmission has been aborted
25	RABT	0	R/W	Receive Abort Detect Indicates that the E-MAC aborts receiving a frame because of failures during frame reception. 0: Frame reception has not been aborted or no reception directive 1: Frame reception has been aborted

Bit	Bit Name	Initial Value	R/W	Description
24	RFCOF	0	R/W	Receive Frame Counter Overflow Indicates that the frame counter in the receive FIFO has overflowed. 0: Receive frame counter has not overflowed 1: Receive frame counter has overflowed
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22	ECI	0	R	E-MAC Status Register Source This bit is a read-only bit. When the source of an ECSR interrupt is cleared, this bit is also cleared. 0: E-MAC status interrupt source has not been detected 1: E-MAC status interrupt source has been detected
21	TC[0]	0	R/W	Frame Transmission Complete Indicates, in combination with the TC[1] bit, that all the data specified by the transmit descriptor has been transmitted from the E-MAC. For details, see the description of the TC[1] bit.
20	TDE	0	R/W	Transmit Descriptor Empty Indicates that the transmit descriptor valid bit (TACT) of a transmit descriptor read by the E-DMAC is not set if the previous descriptor does not represent the end of a frame in multi-buffer frame processing based on single-frame/ multi-descriptor operation. As a result, an incomplete frame may be sent. 0: Transmit descriptor active bit TACT = 1 detected 1: Transmit descriptor active bit TACT = 0 detected When transmit descriptor empty (TDE = 1) occurs, execute a software reset and initiate transmission. In this case, transmission starts from the address that is stored in the transmit descriptor list start address register (TDLAR).
19	TFUF	0	R/W	Transmit FIFO Underflow Indicates that an underflow has occurred in the transmit FIFO during frame transmission. Incomplete data is sent onto the line. 0: Underflow has not occurred 1: Underflow has occurred
18	FR	0	R/W	Frame Reception Indicates that a frame has been received and the receive descriptor has been updated. This bit is set to 1 each time a frame is received. 0: Frame has not been received 1: Frame has been received
17	RDE	0	R/W	Receive Descriptor Empty Indicates that the RACT bit of a receive descriptor read by the E-DMAC for receive DMA operation is cleared to 0 (invalid). When receive descriptor empty (RDE = 1) occurs, reception can be resumed by setting the RACT bit (cleared to 0) of the receive descriptor to 1 and then writing 1 to the RR bit in EDRRR. 0: Receive descriptor active bit RACT = 1 detected 1: Receive descriptor active bit RACT = 0 detected
16	RFOF	0	R/W	Receive FIFO Overflow Indicates that the receive FIFO has overflowed during frame reception. 0: Overflow has not occurred 1: Overflow has occurred
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10, 9	—	Undefined	R	Reserved The write value should always be 0.
8	—	0	R	Reserved The write value should always be 0.
7	RMAF	0	R/W	Receive Multicast Address Frame 0: Multicast address frame has not been received 1: Multicast address frame has been received
6, 5	—	All 0	R	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
4	RRF	0	R/W	Receive Residual-Bit Frame 0: Residual-bit frame has not been received 1: Residual-bit frame has been received
3	RTLF	0	R/W	Receive Too-Long Frame Indicates that a frame whose byte size exceeds the upper limit for the receive frame length set by RFLR has been received. 0: Too-long frame has not been received 1: Too-long frame has been received
2	RTSF	0	R/W	Receive Too-Short Frame Indicates that a frame of fewer than 64 bytes has been received. 0: Too-short frame has not been received 1: Too-short frame has been received
1	PRE	0	R/W	PHY-LSI Receive Error 0: PHY-LSI receive error has not been detected 1: PHY-LSI receive error has been detected
0	CERF	0	R/W	CRC Error on Received Frame 0: CRC error has not been detected 1: CRC error has been detected

26.3.42 E-MAC/E-DMAC Status Interrupt Permission Register (EESIPR)

EESIPR is a 32-bit readable/writable register that enables interrupts corresponding to individual bits in the E-MAC/E-DMAC status register (EESR). An interrupt is enabled by writing 1 to the corresponding bit.

0	CERFIP	0	R/W	CRC Error on Received Frame Interrupt Enable 0: CRC error interrupt is disabled 1: CRC error interrupt is enabled

26.3.43 Transmit/Receive Status Copy Enable Register (TRSCER)

TRSCER specifies whether the information for the transmit and receive state reported by bits 26, 25, and 10 to 0 in the E-MAC/E-DMAC status register (EESR) is to be reflected in the TFE or RFE bit of the corresponding descriptor. The bits in this register correspond to bits 26, 25, and 10 to 0 in EESR. When a bit is cleared to 0, the transmit status (bits 26 and 10 to 8 in EESR) is reflected in the TFE bit of the transmit descriptor, and the receive status (bits 25 and 7 to 0 in EESR) is reflected in the RFE bit of the receive descriptor. In this case, the state of a status bit set to 1 is reflected as the TFE or RFE bit set to 1. When a bit is set to 1, the occurrence of the corresponding source is not reflected in the descriptor. After this LSI is reset, all bits are cleared to 0.

15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	RMAFCE	0	R/W	RMAF Bit Copy Directive 0: Reflects the RMAF bit status in the RFE bit of the receive descriptor 1: Occurrence of the corresponding source is not reflected in the RFE bit of the receive descriptor
6, 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	RRFCE	0	R/W	RRF Bit Copy Directive 0: Reflects the RRF bit status in the RFE bit of the receive descriptor 1: Occurrence of the corresponding source is not reflected in the RFE bit of the receive descriptor
3	RTLFCE	0	R/W	RTLF Bit Copy Directive 0: Reflects the RTLF bit status in the RFE bit of the receive descriptor 1: Occurrence of the corresponding source is not reflected in the RFE bit of the receive descriptor
2	RTSFCE	0	R/W	RTSF Bit Copy Directive 0: Reflects the RTSF bit status in the RFE bit of the receive descriptor 1: Occurrence of the corresponding source is not reflected in the RFE bit of the receive descriptor
1	PRECE	0	R/W	PRE Bit Copy Directive 0: Reflects the PRE bit status in the RFE bit of the receive descriptor 1: Occurrence of the corresponding source is not reflected in the RFE bit of the receive descriptor

Bit	Bit Name	Initial Value	R/W	Description
0	CERFCE	0	R/W	CERF Bit Copy Directive 0: Reflects the CERF bit status in the RFE bit of the receive descriptor 1: Occurrence of the corresponding source is not reflected in the RFE bit of the receive descriptor

26.3.44 Receive Missed-Frame Counter Register (RMFCR)

RMFCR is a 16-bit counter that indicates the number of frames that could not be saved in the receive buffer and so were discarded during reception. When the receive FIFO overflows, the receive frames in the FIFO are discarded. The number of frames discarded at this time is counted. When the value in this register reaches H'0000FFFF, count-up is halted. Clear the counter by writing H'00000000 in this register. Note that a value other than H'00000000 must not be written to this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	MFC[15:0]	All 0	R/W	Missed-Frame Counter These bits indicate the number of frames that are discarded and not transferred to the receive buffer during reception.

26.3.45 Transmit FIFO Threshold Register (TFTR)

TFTR is a 32-bit readable/writable register that specifies the transmit FIFO threshold at which the first transmission is started. The actual threshold is 4 times the set value. The E-MAC starts transmission when the amount of data in the transmit FIFO exceeds the number of bytes specified by this register, when the transmit FIFO is full, or when one frame of data write is performed. This register must not be written to during transmission (bits TR[1:0] in EDTRR = 11).

31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TFT[10:0]	All 0	R/W	Transmit FIFO Threshold A value in 32-byte units and smaller than the FIFO size specified by FDR must be set as the transmit FIFO threshold. H'000: Store and forward modes H'008: 32 bytes H'010: 64 bytes H'018: 128 bytes : : H'07F: 508 bytes H'080: 512 bytes : : H'0FF: 1,020 bytes H'100: 1,024 bytes : : H'1FF: 2,044 bytes H'200: 2,048 bytes

Note: • When starting transmission before one frame of data write has completed, take care no underflow occurs.

26.3.46 FIFO Depth Register (FDR)

FDR is a 32-bit readable/writable register that specifies the sizes of the transmit and receive FIFOs.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
31 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 8	TFD[2:0]	All 1	R/W	Transmit FIFO Size Specifies 256 bytes to 2 Kbytes in 256-byte units as the size of the transmit FIFO whose maximum size is 2 Kbytes. The setting must not be changed after transmission/reception has started. H'00: 256 bytes H'01: 512 bytes : : H'07: 2048 bytes
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	RFD[4:0]	All 1	R/W	Receive FIFO Size Specifies 256 bytes to 4 Kbytes in 256-byte units as the size of the receive FIFO whose maximum size is 4 Kbytes. The setting must not be changed after transmission/reception has started. H'00: 256 bytes H'01: 512 bytes : : H'0F: 4096 bytes

26.3.47 Receiving Method Control Register (RMCR)

RMCR is a 32-bit readable/writable register that specifies the control method for the RE bit in ECMR while a frame is received. This register must be set during the receiving-halted state.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RNC
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RNC	0	R/W	Receive Enable Control Sets whether to continue frame reception. 0: Upon completion of reception of one frame, the E-DMAC writes the receive status to the descriptor and clears the RR bit in EDRRR to 0. 1: Upon completion of reception of one frame, the E-DMAC writes (writes back) the receive status to the descriptor. In addition, the E-DMAC reads the next descriptor and prepares for reception of the next frame.

26.3.48 Receive Descriptor Fetch Address Register (RDFAR)

RDFAR stores the descriptor start address that is required when the E-DMAC fetches descriptor information from the receive descriptor. Which receive descriptor information is used for processing by the E-DMAC can be recognized by monitoring addresses displayed in this register. The address from which the E-DMAC is actually fetching a descriptor may be different from the value read from this register. In the initial setting, set the address of the receive descriptor at which receive processing is to be started.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RDFA[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

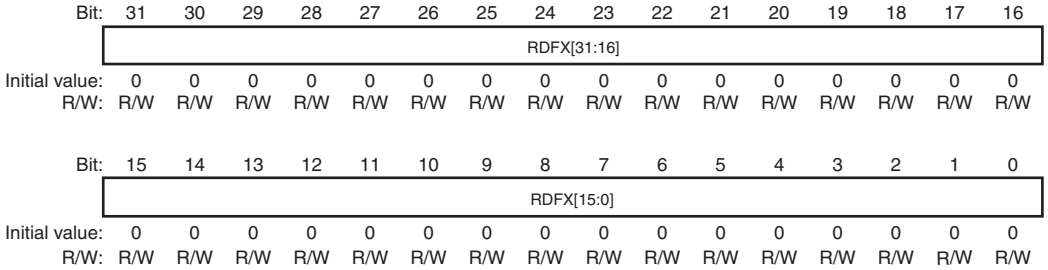
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RDFA[31:0]	All 0	R/W	Receive Descriptor Fetch Address Writing to these bits during the reception is prohibited.

26.3.49 Receive Descriptor Finished Address Register (RDFXR)

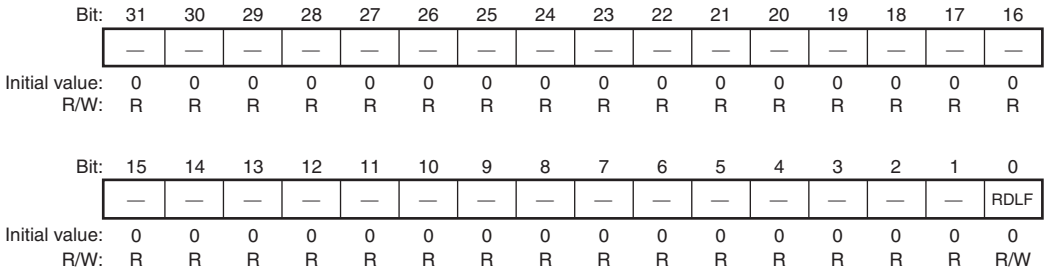
RDFXR stores the start address of the receive descriptor for which the E-DMAC has just completed the write-back processing. Up to which receive descriptor has been processed by the E-DMAC can be recognized by monitoring addresses displayed in this register. In the initial setting, set the address of the descriptor immediately before the descriptor that is pointed to by the address in RDFAR.



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RDFX[31:0]	All 0	R/W	Receive Descriptor Finished Address Writing to these bits during the reception is prohibited.

26.3.50 Receive Descriptor Final Flag Register (RDFFR)

RDFFR indicates whether the receive descriptor for which the E-DMAC has just completed the write-back processing and whose start address is stored in RDFXR is at the end of the receive descriptor queue (descriptor list).



Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RDLF	0	R/W	Receive Descriptor Queue Last Flag Indicates whether the receive descriptor for which the E-DMAC has just completed the write-back processing and whose start address is stored in RDFXR is at the end of the receive descriptor queue (descriptor list). 0: Not the last descriptor in the receive descriptor queue 1: Last descriptor in the receive descriptor queue

26.3.51 Transmit Descriptor Fetch Address Register (TDFAR)

TDFAR stores the descriptor start address that is required when the E-DMAC fetches descriptor information from the transmit descriptor. Which transmit descriptor information is used for processing by the E-DMAC can be recognized by monitoring addresses displayed in this register. The address from which the E-DMAC is actually fetching a descriptor may be different from the value read from this register. In the initial setting, set the address of the transmit descriptor at which transmit processing is to be started.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TDFA[31:0]	All 0	R/W	Transmit Descriptor Fetch Address Writing to these bits during transmission is prohibited.

26.3.52 Transmit Descriptor Finished Address Register (TDFXR)

TDFXR stores the start address of the transmit descriptor for which the E-DMAC has just completed the write-back processing. Up to which transmit descriptor has been processed by the E-DMAC can be recognized by monitoring addresses displayed in this register. In the initial setting, set the address of the transmit descriptor immediately before the descriptor that is pointed to by the address in TDFAR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	TDLF	0	R/W	Transmit Descriptor Queue Last Flag Indicates whether the transmit descriptor for which the E-DMAC has just completed the write-back processing and whose start address is stored in TDFXR is at the end of the transmit descriptor queue (descriptor list). 0: Not the last descriptor in the transmit descriptor queue 1: Last descriptor in the transmit descriptor queue

26.3.54 Overflow Alert FIFO Threshold Register (FCFTR)

FCFTR is a 32-bit readable/writable register that sets the flow control of the E-MAC. The threshold can be set by the size of the receive FIFO data (bits RFD[7:0]) and the number of receive frames (bits RFF[4:0]).
If the same receive FIFO size as set by the FIFO depth register (FDR) is set when flow control is turned on according to the RFD setting condition, flow control is turned on with (FIFO data size – 64) bytes. For instance, when the RFD bits in FDR is 7 and the RFD bits in this register is 7, flow control is turned on when (2,048 – 64) bytes of data is stored in the receive FIFO. The value set in the RFD bits in this register should be equal to or less than that set in the RFD bits in FDR. Flow control is turned on when either of the setting conditions of bits RFF[4:0] and bits RFD[7:0] is satisfied. Flow control is turned off when neither of the conditions is satisfied (release).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

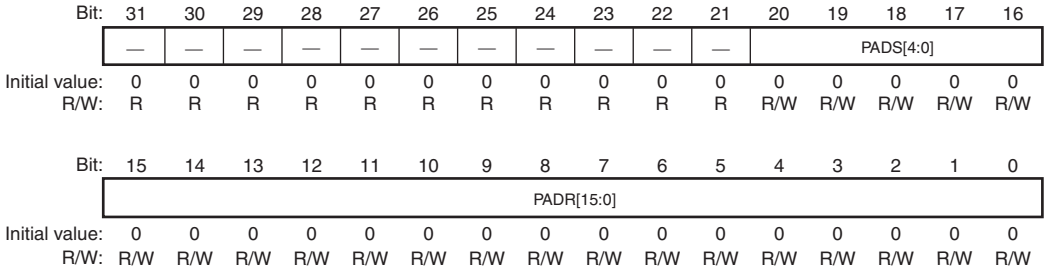
Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	RFF[4:0]	H'17	R/W	Receive FIFO Overflow Alert Signal Output Threshold H'00: When one receive frame has been stored in the receive FIFO H'01: When two receive frames have been stored in the receive FIFO : : H'16: When 23 receive frames have been stored in the receive FIFO H'17: When 24 receive frames have been stored in the receive FIFO
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	RFD[7:0]	H'FF	R/W	Receive FIFO Overflow Alert Signal Output Threshold H'00: When (256 – 32) bytes of data is stored in the receive FIFO H'01: When (512 – 32) bytes of data is stored in the receive FIFO : : H'06: When (1,792 – 32) bytes of data is stored in the receive FIFO H'07: When (2,048 – 64) bytes of data is stored in the receive FIFO

26.3.55 Receive Data Padding Insert Register (RPADIR)

RPADIR is a 32-bit readable/writable register that inserts padding in receive data. To change the settings of this register, execute a software reset by means of the SWRT and SWRR bits in the E-DMAC mode register (EDMR) before making settings again.



Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	PADS[4:0]	H'00	R/W	Padding Size H'00: No padding insertion H'01: 1-byte insertion : : H'1F: 31-byte insertion
15 to 0	PADR[15:0]	H'0000	R/W	Padding Slot H'0000: Inserts specified size of padding at the first byte H'0001: Inserts specified size of padding at the second byte : : H'FFFF: Inserts specified size of padding at the 64K byte

26.3.56 Intelligent Checksum Mode Register (CSMR)

CSMR is a readable 32-bit register that specifies the intelligent checksum operation mode. This register must be set while reception is halted.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CSEBL	CSMD	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	SB[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	CSELB	1	R	Intelligent Checksum Calculation Operation Setting 0: The result of checksum calculation is not written back to the receive descriptor. 1: The result of checksum calculation is written back to the receive descriptor.
30	CSMD	1	R/W	Intelligent Checksum Calculation Mode Setting 0: After having skipped the number of bytes specified in SB[5:0], counting from the beginning of the MAC-layer packet, the checksum is calculated for all subsequent data 1: MAC- or IP-layer packets are detected and checksums are calculated for upper-layer protocol packets such as TCP or UDP.
29 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	SB[5:0]*1	011010	R/W	Intelligent Checksum Calculation Skip Bytes These bits specify the number of bytes to be skipped for checksum calculation, counting from the beginning of the data received in the E-DMAC. When padding bytes are to be added, specify the checksum start position to cover the amount or extent of padding. H'00: 0 bytes (meaning checksum calculation is performed from the beginning of the packet.) H'02: 2 bytes : : H'1A: 26 bytes H'3E: 62 bytes

Note 1. These bits should only be set when CSEL is 1 and CSMD is 0; otherwise, set to H'00.

26.3.57 Intelligent Checksum Skipped Bytes Monitor Register (CSSBM)

CSSBM is a 32-bit readable register that holds the number of bytes that have been skipped in received packets being handled by the E-DMAC. The number of skipped bytes can be monitored through this register. The amount of data received in E-DMAC may not match the number of skipped bytes.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	SBM[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	SBM[5:0]	000000	R	Number of Skipped Bytes These bits are read-only. Writing is prohibited. These bits are initialized when the beginning of a packet for reception is detected.

Note: • This register is only valid when CSEL is 1 and CSMD is 0.

26.3.58 Intelligent Checksum Monitor Register (CSSMR)

CSSMR is a 32-bit register that holds the checksum value of received packets being handled by the E-DMAC. The checksum value can be monitored through this register. The amount of data received in E-DMAC may not match the number of skipped bytes.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	CS[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	CS[15:0]	000000	R	Intelligent Checksum Value These bits are read-only. Writing is prohibited. These bits are initialized when the beginning of a packet for reception is detected.

Note: • This register is only valid when CSEL = 1 and CSMD = 0.

26.4 Operation

The ETHER consists of the following three function units:

- DMA transfer controller (E-DMAC): DMA transfer between the transmit/receive buffer in the memory and the transmit/receive FIFO
- MAC controller (E-MAC): Transmission/reception processing between the transmit/receive FIFO and the MII
- Transfer Switching Unit (TSU): CAM processing

Using its direct memory access (DMA) function, the E-DMAC performs DMA transfer of frame data between a user-specified Ethernet frame transmission/reception data storage destination (accessible memory space: transmit buffer/ receive buffer) and the transmit/receive FIFO in the E-DMAC. The user cannot read and write data from and to the transmit/receive FIFO directly via the CPU.

To enable the E-DMAC to perform DMA transfer, information (data) including a transmit/receive data storage address and so forth, referred to as a descriptor, is required. The E-DMAC reads transmit data from the transmit buffer or writes receive data to the receive buffer according to the descriptor information. By arranging multiple descriptors as a descriptor row (list) (to be placed in a readable/writable memory space), multiple Ethernet frames can be transmitted or received continuously.

The E-MAC constructs an Ethernet frame using the data written to the transmit FIFO and transmits the frame to the MII. It also performs a CRC check of an Ethernet frame received from the MII and deconstructs the frame to write to the receive FIFO. The E-MAC supports the MII format for interface to the PHI-LSI connected externally to this LSI.

The TSU, which is placed between the E-DMAC and E-MAC, references the CAM entry table to select one of the following tasks according to the Ethernet frame destination address (DA) input to the E-MAC.

- Receives data and writes to the receive FIFO.
- Discards data.

Figure 26.2 shows the frame data path and an overview of each setting.

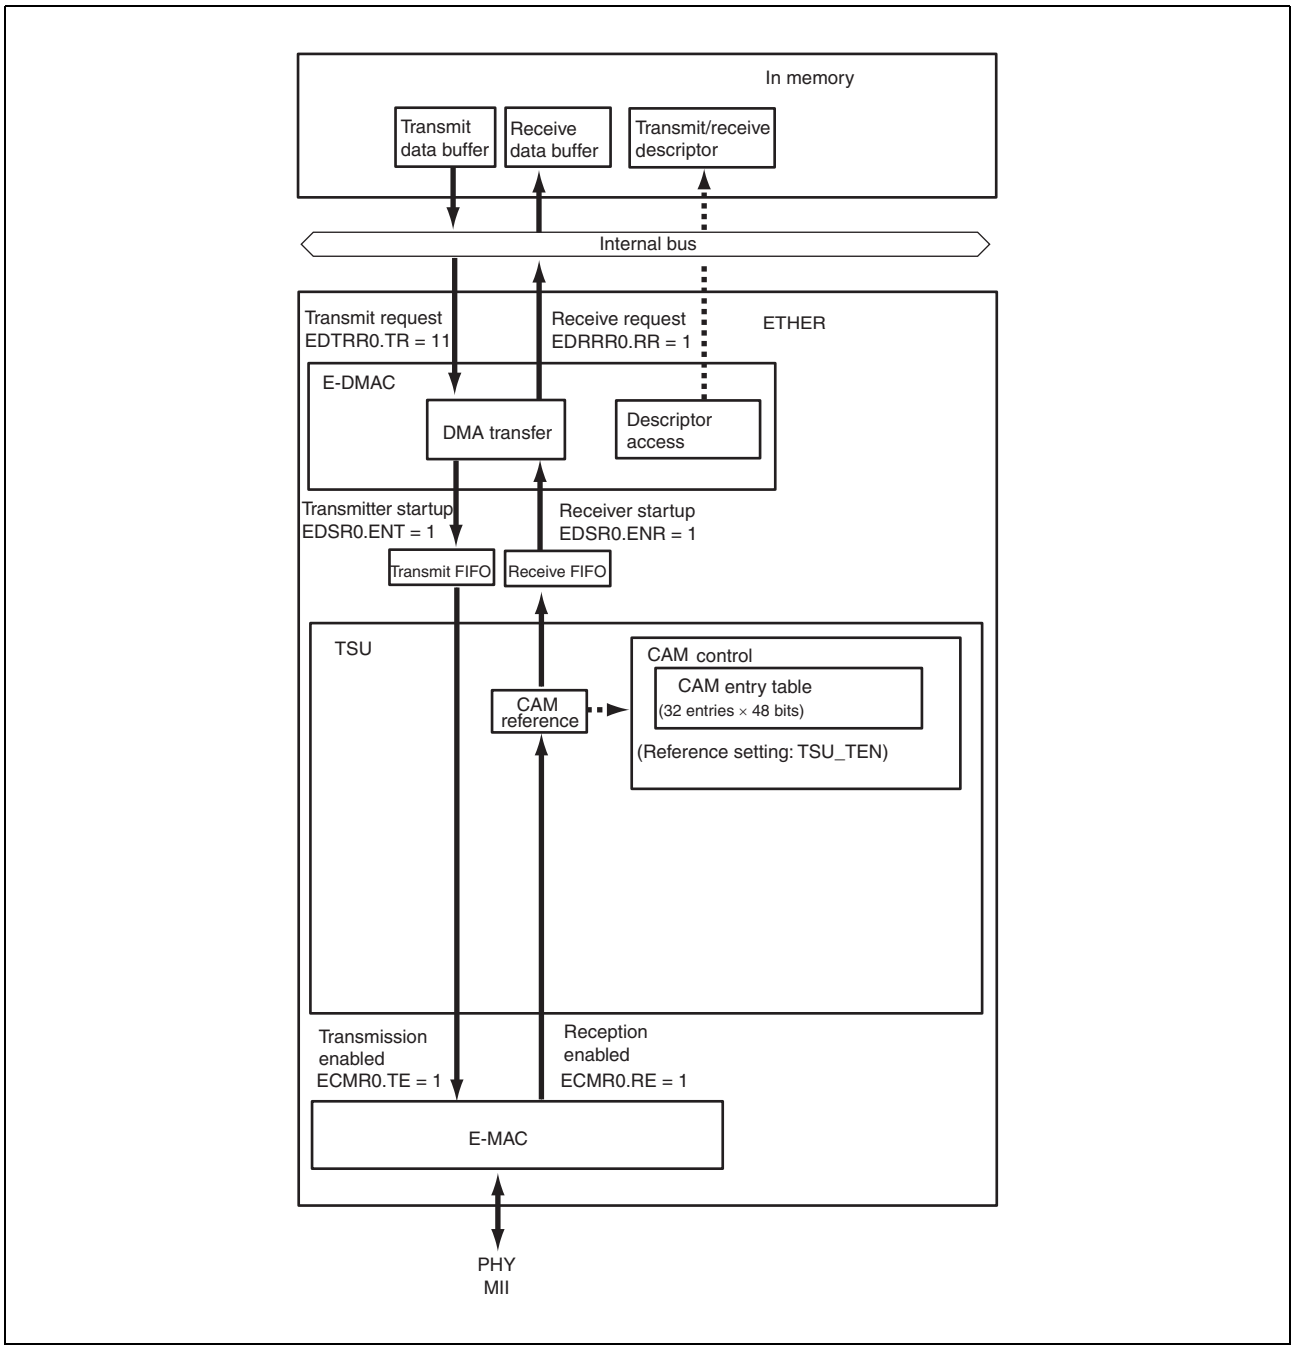

Figure 26.2 ETHER Data Path and Various Settings

26.4.1 Descriptors and Descriptor List

The E-DMAC performs DMA transfer according to the information (data), referred to as a descriptor, written in memory space. There are two types of descriptors: transmit descriptors and receive descriptors. Before a DMA transfer, DMA transfer information including a transmit/receive frame data storage address must be set by software.
The E-DMAC automatically starts reading a transmit/receive descriptor when the TR bits in EDTRR are set to 11 or the RR bit in EDRRR is set to 1, and performs DMA transfer of frame data between the transmit/receive buffer and transmit/receive FIFO according to the information stored in the descriptor. After completion of Ethernet frame transmission/reception, the E-DMAC disables the descriptor valid/invalid bit and reflects the result of transmission/reception in the status bits.
Descriptors are placed in a readable/writable memory space. The address of the start descriptor (descriptor to be read first by the E-DMAC) is set in TDLAR/RDLAR. When multiple descriptors are prepared as a descriptor row (descriptor list), the descriptors are placed in continuous addresses (memory) according to the descriptor length set in the DL0 and DL1 bits in EDMR.

(1) Transmit Descriptor

Figure 26.3 shows the configuration of a transmit descriptor and the relationship with a transmit buffer.
The data of a transmit descriptor consists of TD0, TD1, TD2, and padding data in groups of 32 bits from top to end. The length of padding data is determined according to the descriptor length specified by the DL0 and DL1 bits in EDMR. TD0 indicates whether the transmit descriptor is valid or invalid, and information about the descriptor configuration and status. TD1 indicates the length of data in a transmit buffer to be transferred (TDL) as specified by the descriptor. TD2 indicates the start address of a transmit buffer that holds data to be transferred (TBA).
Depending on the descriptor specification, one transmit descriptor can specify all transmit data of one frame (single-frame/single-buffer) or multiple descriptors can specify the transmit data of one frame (single-frame/multi-buffer). As an example of single-frame/multi-buffer operation, the data portion that is used in a fixed manner in each Ethernet frame transmission can be referenced by multiple descriptors. For example, multiple descriptors can share the destination address and transmit source address in an Ethernet frame, and the remaining data can be stored in each separate buffer.

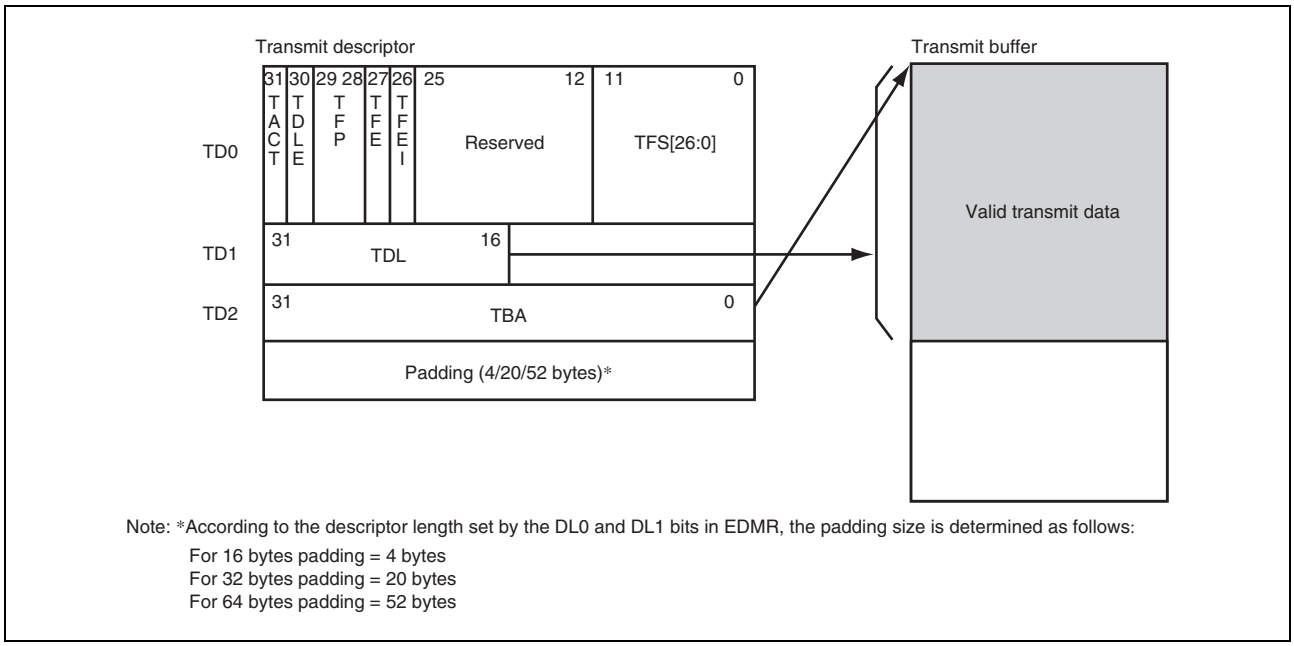

Figure 26.3 Relationship between Transmit Descriptor and Transmit Buffer

(a) Transmit Descriptor 0 (TD0)

Before the TR bits in EDTRR are set to 11, the user sets whether the bits of the descriptor are valid or invalid bit and sets other descriptor configuration. After Ethernet frame transmission, the E-DMAC disables the valid/invalid bits of the descriptor and writes status information. This operation is referred to as write-back.
When using TD0, the user should write desired values to bits 31 to 28 and 26 according to the descriptor configuration. Bits 27 and 25 to 0 should be cleared to 0.

Bit	Bit Name	Initial Value	R/W	Description
31	TACT	0	R/W	Transmit Descriptor Valid/Invalid Indicates whether the corresponding descriptor is valid or invalid. To make this bit valid, store transmit data in a transmit buffer (user-specified transmit data storage destination) beforehand, then write 1 to this bit. The E-DMAC clears this bit to 0 after data transfer. 0: Indicates that this transmit descriptor is invalid Indicates the initial setting state, the state after 0 is written, or (in case the user writes 1 to this bit) that this bit is cleared to 0 because the E-DMAC data transfer processing is completed. If this state is recognized when the E-DMAC reads a descriptor, the E-DMAC clears the TR bit in EDTRR to 0, and halts transfer operation related to transmission by the E-DMAC. 1: Indicates that this transmit descriptor is valid After the user writes 1 to this bit, this bit indicates that data is not transferred yet or data is being transferred. When there is a descriptor row (descriptor list) consisting of multiple continuous descriptors, the E-DMAC can continue operation when this bit of the next descriptor is valid.
30	TDLE	0	R/W	Transmit Descriptor List End Indicates whether the corresponding descriptor is the last descriptor of the descriptor row (descriptor list). 0: Not last descriptor After transfer of the corresponding descriptor, the E-DMAC reads the next one in the list of continuous descriptors. 1: Last descriptor After transfer of the corresponding descriptor, the E-DMAC reads the descriptor placed at the address indicated by TDLAR.
29, 28	TFP[1:0]	00	R/W	Transmit Frame Position These bits indicate whether information of this descriptor represents information about the start, middle, or end of the transmit frame. 00: The information of the descriptor represents information about the middle of the frame. 01: The information of the descriptor represents information about the end of the frame. 10: The information of the descriptor represents information about the start of the frame. 11: The information of the descriptor represents all information about the frame (single-frame/single-descriptor (single-buffer)). Reference When one frame is divided for use, the method of specifying this bit for a descriptor row according to the number of divisions is described below. • For single-frame/single-descriptor operation First descriptor: TFP[1:0] = 11 • For single-frame/two-descriptor operation First descriptor: TFP[1:0] = 10 Second descriptor: TFP[1:0] = 01 • For single-frame/three-descriptor operation First descriptor: TFP[1:0] = 10 Second descriptor: TFP[1:0] = 00 Third descriptor: TFP[1:0] = 01 When the number of divisions is large, a descriptor row is configured by adding intermediate descriptors with TFP[1:0] = 00.

Bit	Bit Name	Initial Value	R/W	Description
27	TFE	0	R/W	Transmit Frame Error Occurrence Indicates that an error occurred in the transmit frame. 0: The TFS11 to TFS0 bits are all 0 1: One of the TFS11 to TFS0 bits is 1 The TFS8 to TFS0 bits can be masked for each factor by using TRSCER. The TFS11 to TFS9 bits cannot be masked. This bit is set by the E-DMAC write-back operation.
26	TWBI	0	R/W	Write-Back Completion Interrupt Notification 0: Does not notify of a write-back completion interrupt 1: After a write-back operation to this descriptor is complete, this bit sets the TWB1 and TWB0 bits in EESR to 11 and notifies the CPU of a write-back completion interrupt. This bit is valid only for the descriptor including the end of transmit frame (TFP = 01 or 11). This bit is cleared to 0 by the E-DMAC write-back operation.
25 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	TFS [11:0]	All 0	R/W	Transmit Frame Status These bits indicate the status of the corresponding frame. A bit below, which is set by the E-DMAC write-back operation, indicates the occurrence of the corresponding event when set to 1. • TFS[11:10]: Reserved (The write value should always be 0.) • TFS[9]: Transmit FIFO underflow (Corresponding to the TUC bit in EESR) • TFS[8]: Detection of transmission abort (Corresponding to the TABT bit in EESR) • TFS[7:0]: Reserved (The write value should always be 0.)

(b) Transmit Descriptor 1 (TD1)

TD1 indicates the data length of the transmit buffer used by the corresponding descriptor.
The user should set TD1 before the start of a read by the E-DMAC.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	TDL [15:0]	All 0	R/W	Transmit Buffer Data Length (in bytes) These bits indicate the data length of the corresponding transmit buffer in bytes. The specifiable data lengths are from a minimum of 1 (H'0001) byte to a maximum of 64 K - 32 (H'FFE0) bytes.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

(c) Transmit Descriptor 2 (TD2)

TD2 indicates the start address of the corresponding 32-bit width transmit buffer. An address value should be specified in a 16-byte boundary.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	TBA [31:0]	All 0	R/W	Transmit Buffer Start Address These bits set the start address of the corresponding transmit buffer in a 16-byte boundary.

If descriptors are set below, the E-DMAC does not return to normal operation until a system reset is performed.

- TFP (transmit frame position) is not logically correct
  Example: The TFP bits are set to 11 in a descriptor (descriptor A) and the TFP bits are set to 01 in the next descriptor (descriptor B). This specification means that there is no descriptor indicating the start of the transmit frame specified by descriptor B.
- TBL (transmit buffer length) is set to 0

When one transmit frame is divided into three parts or more with transmit descriptors, the E-DMAC performs the following write-back operation:

- A write-back operation is performed for a transmit descriptor including information for the start of the transmit frame (TFP = 10 or 11) and for a transmit descriptor including information for the end of the frame (TFP = 01 or 11).
- A write-back operation is not performed for a transmit descriptor for the middle of the frame (TFP = 00).

However, TFE (transmit frame error occurrence) or TFS (transmit frame status) is written only to a transmit descriptor including information for the end of the frame (TFP = 01 or 11) by a write-back operation.
Before changing a transmit descriptor with the software, make sure that a write-back operation has been performed (TACT = 0) for the transmit descriptor including information for the end of the frame (TFP = 01 or 11) to avoid overwriting (re-setting) an unprocessed transmit descriptor.

(2) Receive Descriptor

Figure 26.4 shows the relationship between a receive descriptor and receive buffer.
The data of a receive descriptor consists of RD0, RD1, RD2, and padding data in groups of 32 bits from top to end. The length of padding data is determined according to the descriptor length specified by the DL0 and DL1 bits in EDMR. RD0 indicates whether the receive descriptor is valid or invalid, and information about descriptor configuration and status. RD1 indicates the length of data that can be received in the receive buffer specified by the descriptor (RBL) and the length of the received frame data (RDL). RD2 indicates the start address of the receive buffer for storing receive data (RBA).
Depending on the descriptor specification, one receive descriptor can specify the storing of all receive data of one frame in a receive buffer (single-frame/single-buffer). All receive frames can be stored in a single buffer if RBL of each descriptor is set to more than 1514 bytes (maximum Ethernet frame length).

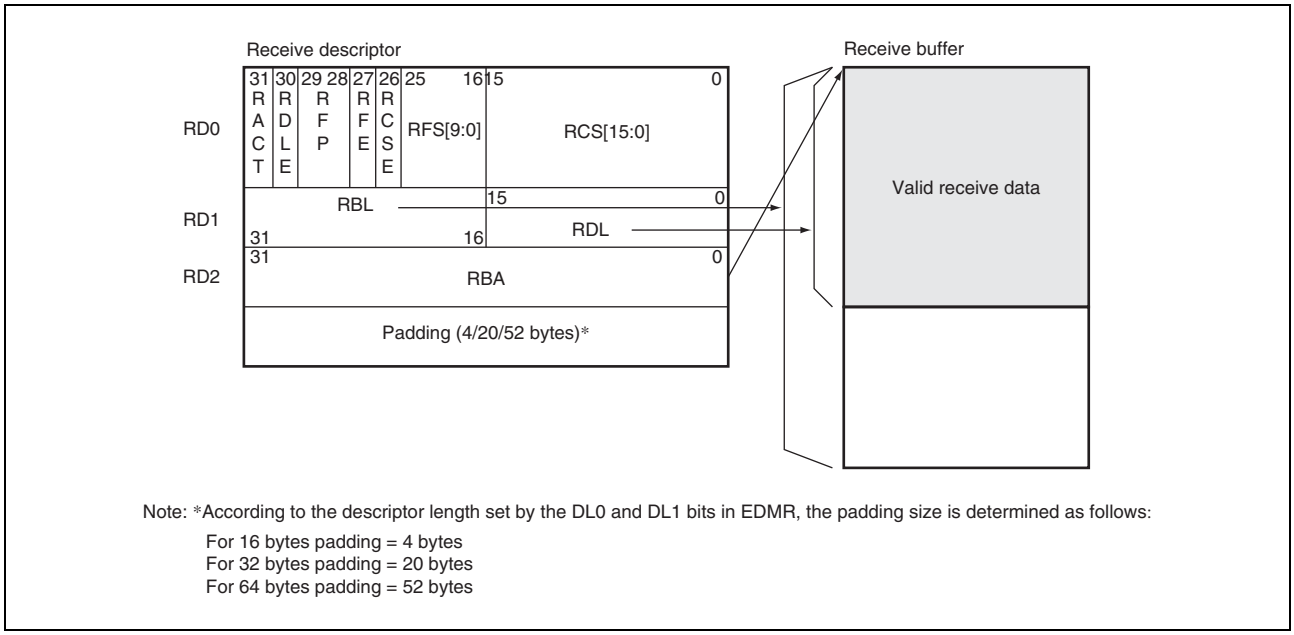

Figure 26.4 Relationship between Receive Descriptor and Receive Buffer

(a) Receive Descriptor 0 (RD0)

The user sets whether the bits of the descriptor are valid or invalid and whether the descriptor represents the end of the descriptor list in RD0 before the RR bit in EDRRR is set to 1 and the start of a read by the E-DMAC. After receive DMA transfer of an Ethernet frame by the E-DMAC, the E-DMAC disables the valid/invalid bits of the descriptor and writes status information. This operation is referred to as write-back.
When using RD0, the user should write desired values to bits 31 and 30 according to the descriptor configuration. Bits 29 to 0 should be cleared to 0.

Bit	Bit Name	Initial Value	R/W	Description
31	RACT	0	R/W	Receive Descriptor Valid/Invalid Indicates whether this descriptor is valid or invalid. To make this bit valid, prepare a receive buffer (user-specified receive data storage destination) beforehand, then write 1 to this bit. The E-DMAC clears this bit to 0 after data transfer. 0: Indicates that this receive descriptor is invalid Indicates the initial setting state, the state after 0 is written to, or (in case the user writes 1 to this bit) that this bit is cleared to 0 because the E-DMAC data transfer processing is completed If this state is recognized when the E-DMAC reads a descriptor, the E-DMAC clears the RR bit in EDRRR to 0, and halts transfer operation related to reception by the E-DMAC 1: Indicates that this receive descriptor is valid Indicates that data is not transferred yet after the user writes 1 to this bit, or that data is being transferred When there is a descriptor row (descriptor list) consisting of multiple continuous descriptors, the E-DMAC can continue operation when this bit of the next descriptor is valid
30	RDLE	0	R/W	Receive Descriptor List End Indicates whether this descriptor is the last descriptor of the descriptor row (descriptor list). 0: Not last descriptor After transfer of this descriptor, the E-DMAC reads the next one in the list of continuous descriptors 1: Last descriptor After transfer of this descriptor, the E-DMAC reads the descriptor placed at the address indicated by RDLAR
29, 28	RFP[1:0]	00	R/W	Receive Frame Position 1, 0 The E-DMAC indicates by write-back operation whether information of the corresponding descriptor represents information about the start, middle, or end of the receive frame. 00: The information of the descriptor represents information about the middle of the frame 01: The information of the descriptor represents information about the end of the frame 10: The information of the descriptor represents information about the start of the frame 11: The information of the descriptor represents all information about the frame (single-frame/single-descriptor (single-buffer)) Note: The relationship between a frame after reception of one frame and a descriptor is described below. When the receive buffer data length is less than the receive frame length, these bits are set to a value other than 11 after reception. When they are set so, reception processing should be started after a software reset.
27	RFE	0	R/W	Receive Frame Error Occurrence Indicates that an error occurred in the receive frame. 0: RFS11 to RFS0 are all 0 1: One of RFS11 to RFS0 is 0 Each of RFS8 to RFS0 can be masked by using TRSCER. RFS11 to RFS9 cannot be masked. This bit is set by the E-DMAC write-back operation.

Bit	Bit Name	Initial Value	R/W	Description
26	RCSE	0	R/W	Receive Packet Checksum Value Evaluation by Intelligent Checksum When CSEBL = 1 and CSMD = 1, the value of this bit is set as shown in Table 26.3, according to the receive packet and receive data. The information of this bit is invalid when operation is performed with a setting other than above.
25 to 16	RFS[9:0]	All 0	R/W	Receive Frame Status These bits indicate the error status during frame reception. RFS9: Receive FIFO overflow (corresponding to the RFOF bit in EESR) RFS8: Reserved (write value should be 0) RFS7: Multicast address frame received (corresponding to the RMAF bit in EESR) RFS[6:5]: Reserved (write value should be 0) RFS4: Residual-bit frame receive error (corresponding to the RRF bit in EESR) RFS3: Long frame receive error (corresponding to the RTLF bit in EESR) RFS2: Short frame receive error (corresponding to the RTSF bit in EESR) RFS1: PHY-LSI receive error (corresponding to the PRE bit in EESR) RFS0: CRC error on receive frame (corresponding to the CERF bit in EESR)
15 to 0	RCS[15:0]	All 0	R/W	Receive Packet Checksum Value in Intelligent Checksum

Table 26.3 RCSE State Determined by Receive Packet Type and Receive Data

Frame Type		Normal Data		Abnormal Data	
IP Version	Option and Extension Header	RCS[15:0]	RCSE	RCS[15:0]	RCSE
IPv4	None	H'FFFF H'0000	0	Undefined	1

	MobileIPv6	H'0000	1	H'0000	1
	Others	H'0000	1	H'0000	1
Other than IPv4 or IPv6		H'0000	0	H'0000	0

(b) Receive Descriptor 1 (RD1)

In RD1, the user specifies the data length of a receive buffer usable by the corresponding descriptor. After reception of a frame, RD1 indicates the length of a frame received by the E-DMAC.
The user should set RD1 before the start of a read by the E-DMAC.

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	RBL [15:0]	All 0	R/W	Receive Buffer Data Length (in bytes, to be specified with a 32-byte boundary) These bits set the length of data that can be received by the corresponding receive buffer with an integral multiple of 32 bytes. The specifiable data lengths are from a minimum of 32 (H'0020) bytes to a maximum of 64 K - 32 (H'FFE0) bytes. Set the data length so that a receive frame can be stored in a single buffer. When the checksum function is disabled, any received frame can be stored in a single buffer if the setting is for 1514 bytes (the maximum length of an Ethernet frame) or more. When the checksum function is enabled, any received frame can be stored in a single buffer if the setting is for 1516 bytes (the maximum length of an Ethernet frame + checksum data) or more.
15 to 0	RDL [15:0]	All 0	R	Receive Data Length These bits indicate the data length of a receive frame stored in the receive buffer. Receive data transferred to the receive buffer does not include CRC data (4 bytes) placed at the end of a frame. Accordingly, these bits indicate the number of bytes (valid data bytes), excluding the CRC code, as the data length of the received frame. When the checksum function is enabled, they indicate the number of bytes including the checksum value (2 bytes) as the data length. In single-frame/multi-buffer (descriptor) operation, only the receive data length of the last descriptor is valid. The receive data length of an intermediate descriptor has no meaning. The maximum frame length that can be received is: When padding function is invalid: 64 Kbytes between 1 byte (H'FFFF) When padding function is valid: 64 Kbytes between 32 bytes (H'FFE0)

(c) Receive Descriptor 2 (RD2)

RD2 indicates the start address of the corresponding receive buffer. Set the start address of a receive buffer with a 32-byte boundary.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RBA [31:0]	All 0	R/W	Receive Buffer Start Address These bits set the start address of the corresponding receive buffer with a 32-byte boundary.

The E-DMAC performs DMA transfer for a receive frame from the address specified by RBA (receive buffer address) to the receive buffer in 32-byte units. RBL (receive buffer length) must be set to be an integral multiple of 32 bytes.
If data to be transferred is less than 32 bytes, invalid data will be written to.
[Example]
When the receive frame length is 170 bytes and the required receive buffer capacity is 192 bytes (32 bytes × 6), the sixth DMA-transfer causes invalid data to be written to the receive buffer (In the 32-byte DMA data, the former 10 bytes are valid and the latter 22 bytes are invalid).
Padding of the value 0 can be inserted into only one position in the receive frame by setting RPADIR. The padding size can be selected from 1 byte to 31 bytes in byte units. When padding is inserted into a receive frame, a receive buffer area equal to the total of "receive frame length and padding size" is required. RPADIR setting is valid for all receive frames.
RFE (receive frame error occurrence), PV (padding insertion), RFS (receive frame status) and RFS (receive frame status) are only set in the receive descriptor including information for the end of the frame (TFP = 01 or 11) by a write-back operation.
Before re-setting a receive descriptor with the software, completion of a write-back operation for the receive descriptor (RACT = 0) must be confirmed to avoid rewriting to (and re-setting) an unprocessed receive descriptor.

(3) Descriptor and Transmit/Receive Buffer

(a) Transmission

Each transmit descriptor specifies one transmit buffer. The E-DMAC transfers a transmit frame stored in a transmit buffer specified by a transmit descriptor to the transmit FIFO. Multiple transmit frames stored in transmit buffers specified by multiple descriptors can be connected into one transmit frame and transferred to the transmit FIFO. Figure 26.5 shows the relationship between the transmit descriptors and transmit buffers.

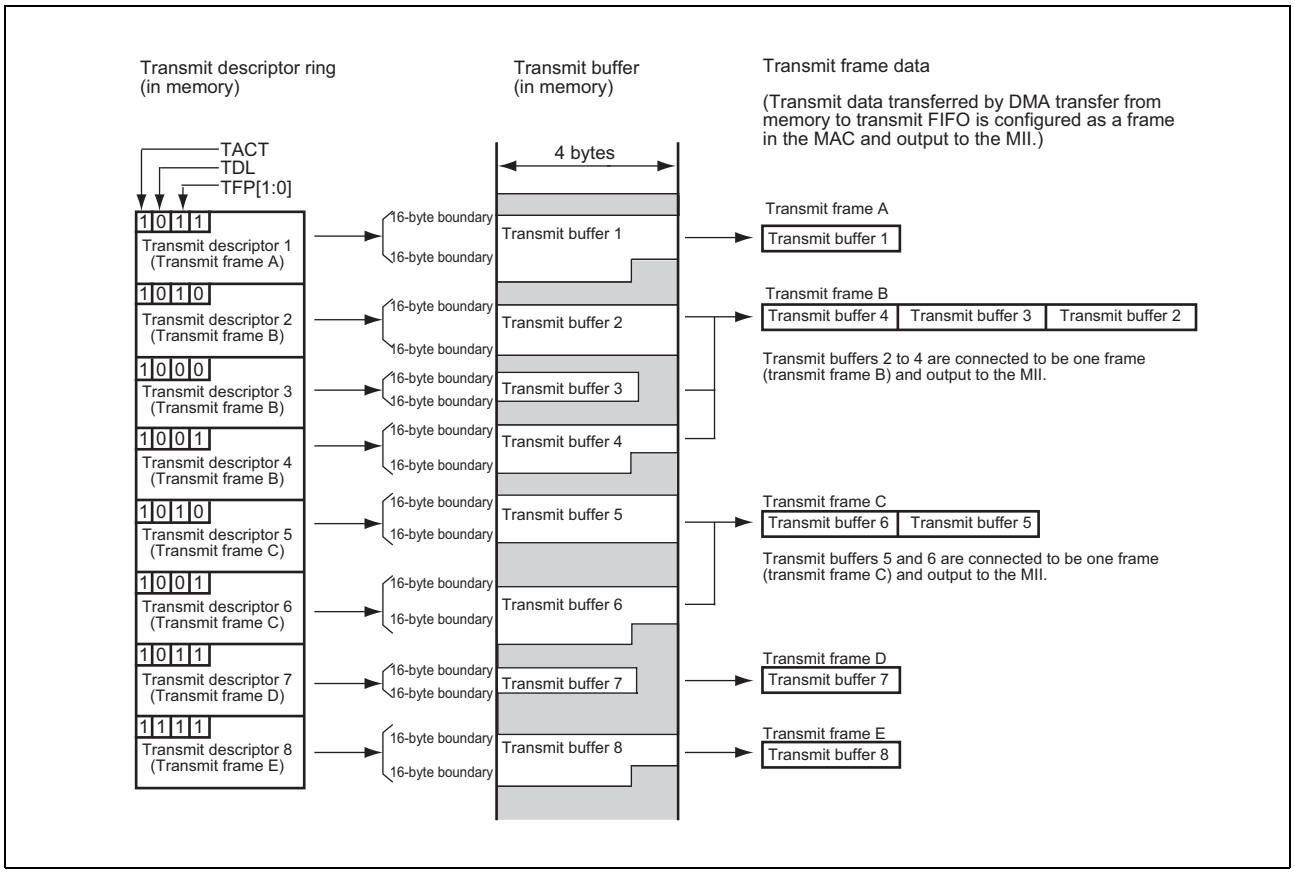

Figure 26.5 Relationship between Transmit Descriptor and Transmit Buffer

(b) Reception

Each receive descriptor specifies one receive buffer. The E-DMAC receives a receive frame from the receive FIFO and stores it in a receive buffer specified by a receive descriptor.

Figure 26.6 shows the relationship between the receive descriptors and receive buffers.

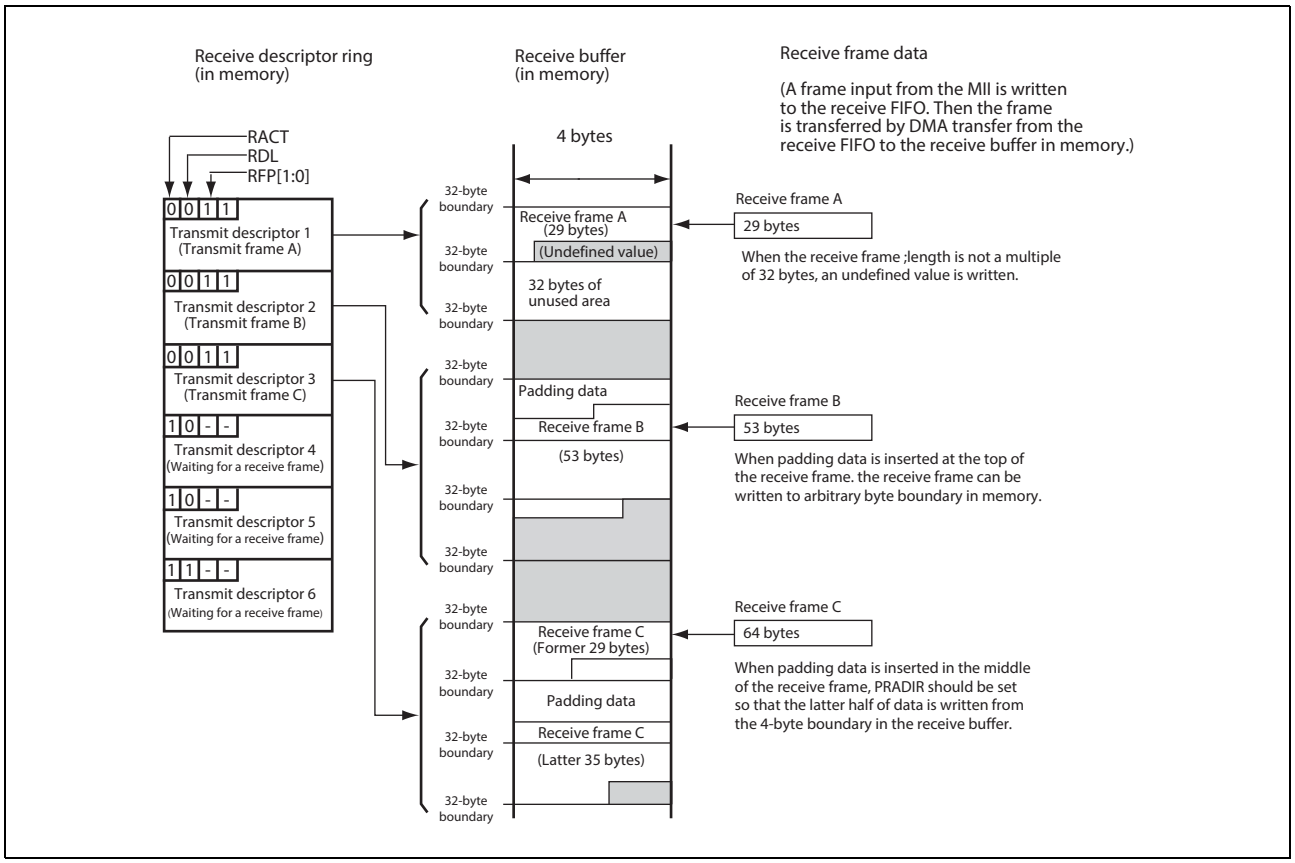

Figure 26.6 Relationship between Receive Descriptor and Receive Buffer

(4) Descriptor Pointer

The E-DMAC controls the transmit and receive descriptor addresses in memory and the processing priority by using the following registers.

1. Registers related to a transmit descriptor

- TDLAR: Address of the start descriptor in a list of transmit descriptors.
- TDFAR: Address of the transmit descriptor to be processed
- TDFXR: Address of the transmit descriptor that finished processing (set by a write-back operation) last
- TDFFR (DL bit): Indicates whether the TDLE value of the transmit descriptor specified by TDFXR is 1 or not.

2. Registers related to receive descriptor:

- RDLAR: Address of the start descriptor in a list of receive descriptors.
- RDFAR: Address of the receive descriptor to be processed
- RDFXR: Address of the receive descriptor that finished processing (set by a write-back operation) last
- RDFFR (DL bit): Indicates whether the RDLE value of the receive descriptor specified by RDFXR is 1 or not.

Transmit descriptors and receive descriptors have a ring structure. When the TDLE (RDLE) value of the processed transmit (receive) descriptor is 0, the next descriptor will be processed. The next descriptor is the transmit (receive) descriptor at the address obtained by adding the processed transmit (receive) descriptor address to the descriptor length specified by the DL bits in EDMR. When the TDLE (RDLE) value of the processed transmit (receive) descriptor is 1, the transmit descriptor indicated by TDLAR (RDLAR) will be processed next. Figure 26.7 shows the relationship between the transmit/receive descriptor ring and read pointer.

The transmit descriptor list must be large enough to point to five or more transmit frames. If four or less transmit frames are pointed to in a list, E-DMAC operation is not guaranteed. Accordingly, do not set that all the transmit descriptors in a ring are used by four or less descriptors. The receive descriptor list does not have this restriction. For example, one receive frame can use all receive descriptors in a list.

In the initial setting, the start address of a descriptor list must be set to TDLAR (RDLAR) and TDFAR (RDFAR), and the end descriptor address of the descriptor list to TDFXR (RDFXR) by the software.

The E-DMAC updates TDFAR (RDFAR), TDFXR (RDFXR), and the DL bit in TDFFR (DL bit in RDFFR) each time a descriptor is processed.

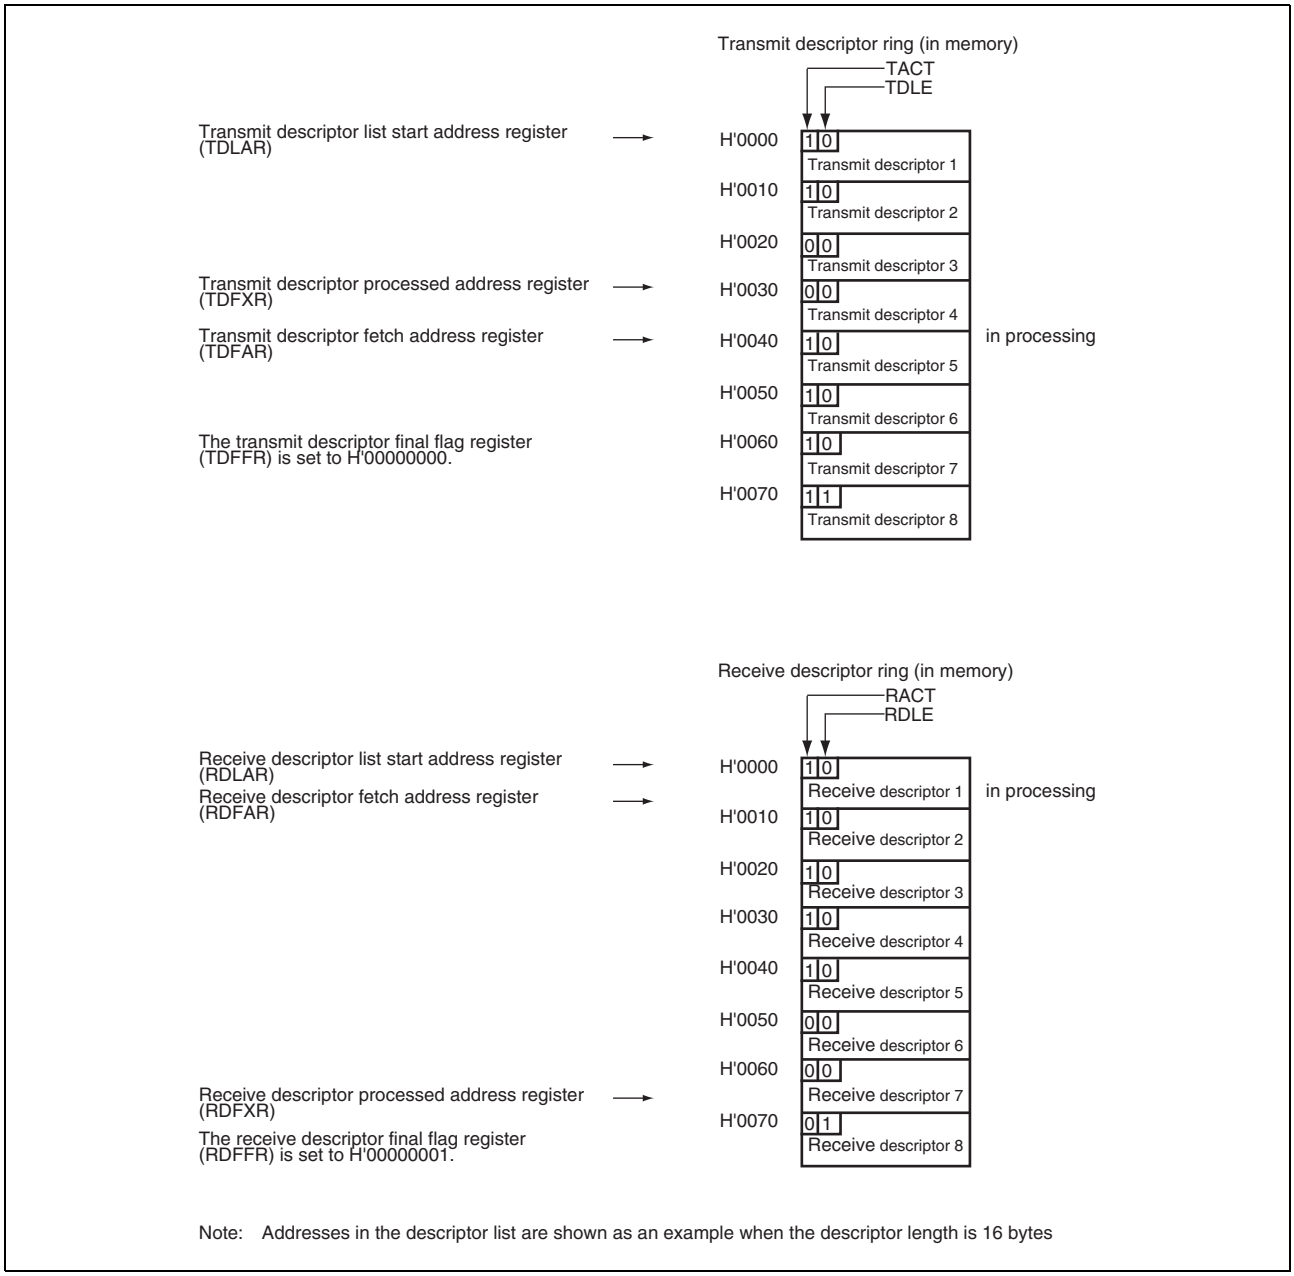

Figure 26.7 Relationship between Transmit/Receive Descriptor and Descriptor Pointing Registers

26.4.2 Transmission

(1) Transmission Procedure and Processing Flow

When 11 is written to the TR bits in EDTRR with the TE bit in ECMR set to 1 and there is empty space of 32 bytes or more in the transmit FIFO, the E-DMAC reads the descriptor following the previously used descriptor from the transmit descriptor list (or the descriptor indicated by TDLAR at the initial startup).
If the TACT bit of the read descriptor is set to 1 (valid), the E-DMAC sequentially reads transmit frame data from the transmit buffer start address specified by TD2 and transfers the data to the transmit FIFO. The E-DMAC configures a transmit frame and starts transmission to the MII. After DMA transfer of data equivalent to the buffer length specified in the descriptor, the following processing is carried out according to the TFP value.

- TFP = 10 (start of a frame)
  Descriptor write-back (writing 0 to the TACT bit) is performed after completion of DMA transfer.
- TFP = 01 or 11 (end of a frame)
  Descriptor write-back (writing 0 to the TACT bit and writing status) is performed after completion of frame transmission.
- TFP = 00 (frame continued)
  Descriptor write-back is not performed. The TACT bit retains the value 1.

As long as the TACT bit of a read descriptor is set to 1 (valid), the reading of E-DMAC descriptors and the transmission of frames continue.
When a descriptor with the TACT bit cleared to 0 (invalid) is read, the E-DMAC performs the following processing and completes transmit processing.

- Clears the TR bits in EDTRR to 00.
- Writes the TC bits in EESR to 11 and generates an interrupt to the CPU.

The E-DMAC can store up to four frames of data in the transmit FIFO.
When the following conditions are satisfied, the E-MAC transmit processing section reads transmit data from the transmit FIFO to configure a frame and transmits the frame to the MII.

- The amount of data in the transmit FIFO exceeds the number of bytes specified by TFTR.
- One or more frame of data is stored in the transmit FIFO.
- The transmit FIFO has no space (full of transmit wait data for the MII).

Figure 26.8 shows an example of transmission flow.

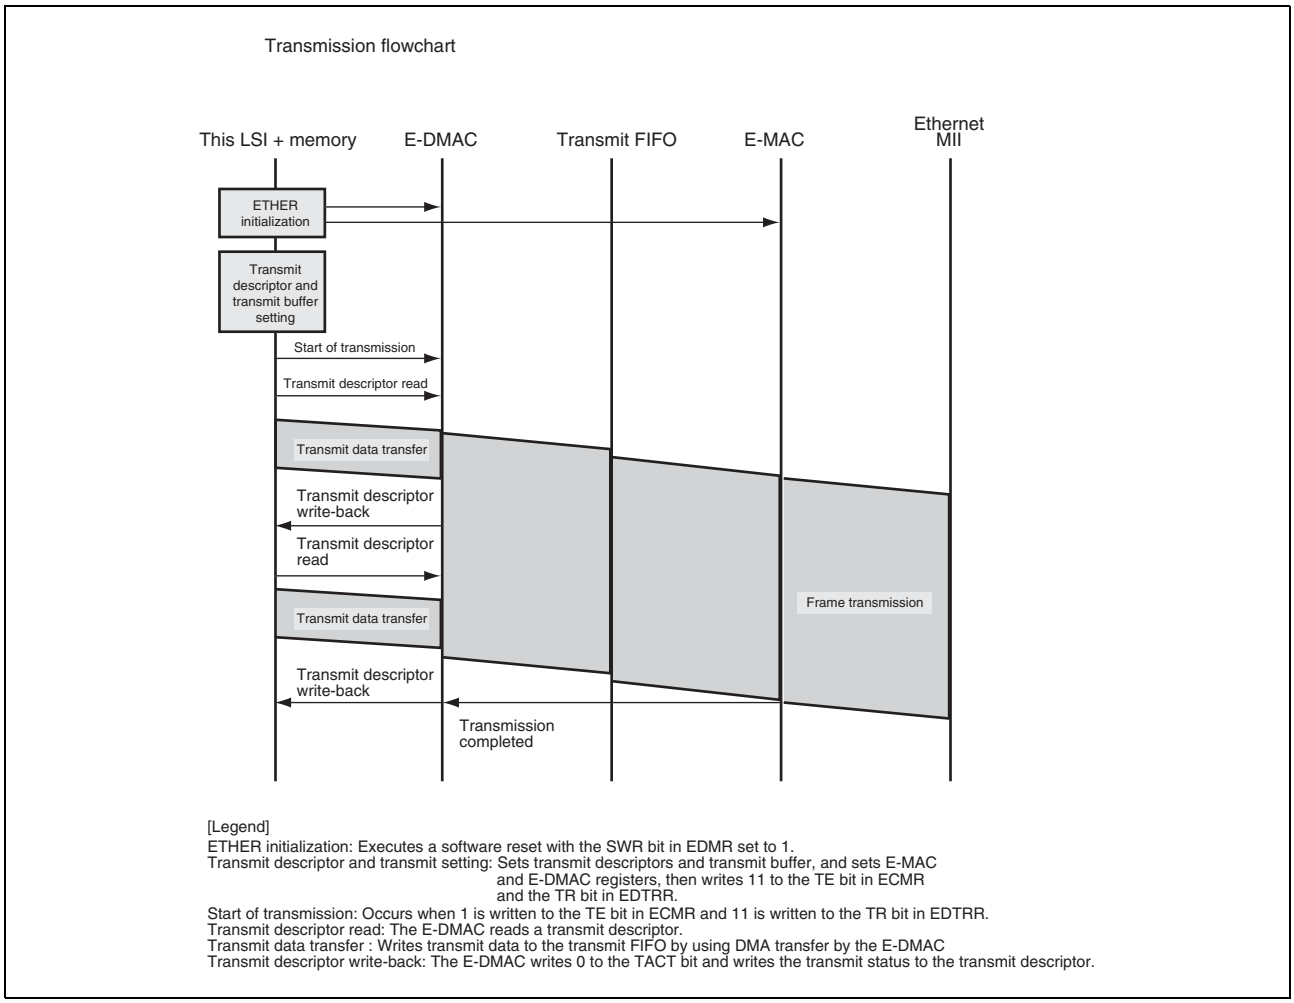

Figure 26.8 Sample Transmission Flowchart (Single-Frame/Two-Description)

Figure 26.9 shows the status change of the E-MAC transmitter.

1. When the TE bit in ECMR is set, the transmitter enters the transmit idle state.
2. The preamble is sent as soon as a transmit request is issued by the E-DMAC.
3. The transmitter sends the SFD, data, and CRC sequentially. At the end of transmission, the transmit E-DMAC generates a transmission complete interrupt (TC).
4. After waiting for the frame interval time, the transmitter enters the idle state, and if there is more transmit data, continues transmitting.

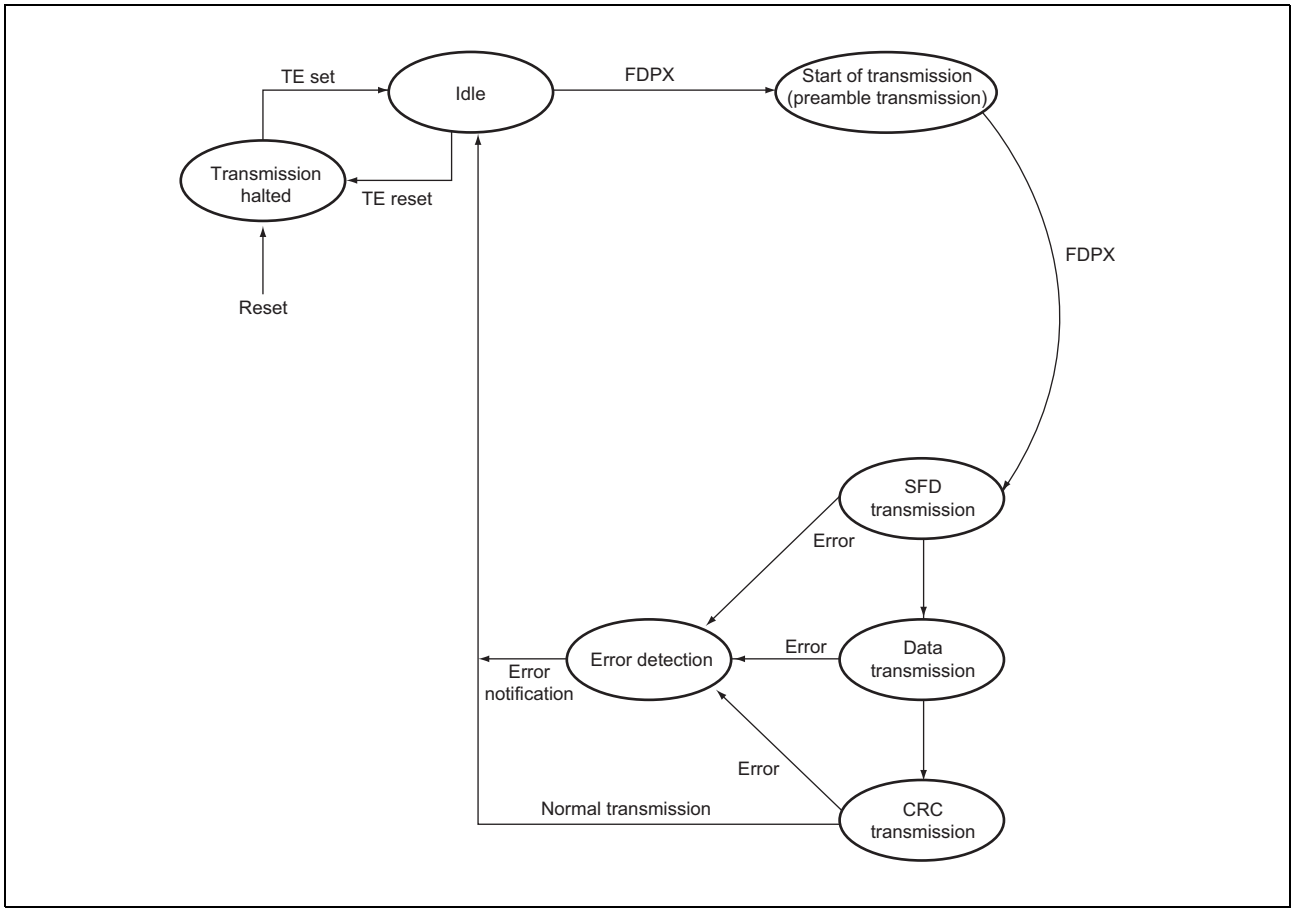

Figure 26.9 E-MAC Transmitter State Transitions

(2) Transmission Error Processing

(a) Transmission Abort

If a transmission error is detected during frame transmission from the transmit FIFO to the MII, transmission of the frame data is aborted. At this time, if DMA transfer of the appropriate frame from the transmit buffer to the transmit FIFO has not been completed, the DMA transfer is also aborted.
Following a write-back operation to the transmit descriptor related to the transmit frame aborted by a transmission error, 1 is written to the TABT bit in EESR and an interrupt is issued to the CPU. The subsequent transmit descriptors will be processed normally.

(b) Transmit FIFO Underflow

If the transmit FIFO is empty (transmit FIFO underflow) during frame transmission from the transmit FIFO to the MII, the E-MAC forcibly aborts transmission of the frame to the MII. At this time, the frame that the E-MAC receives from the E-DMAC is cut off halfway. Then, the E-MAC performs the following operation:

- Writes the TFUF bit in EESR to 1 and generates an interrupt to the CPU.
- Performs a write-back operation to the transmit descriptor corresponding to the transmit frame.
- Following the write-back operation, writes the TUC bit in EESR and generates an interrupt to the CPU.

The subsequent transmit descriptors operate normally.
The E-MAC waits to start frame transmission from the transmit FIFO to the MII until the data that was stored in the transmit FIFO exceeds the number of the bytes specified by TFTR. Through the effective use of TFTR, the transmit FIFO underflow counts can be controlled.

(c) Transmit Descriptor Empty

When the TFP bits of the descriptor previously processed are set to 00 or 10 and the TACT bit of the read transmit descriptor is set to 0 (invalid), a transmit descriptor empty state is determined and 1 is written to the TDE bit in EESR, and then an interrupt is issued to the CPU.
When a transmit descriptor state is empty, start transmission processing after a software reset.

26.4.3 Reception

(1) Reception Procedure and Processing Flow

The E-MAC receiver separates the frame from the MII into preamble, SFD, data and CRC, and transfers the fields from DA (destination address) to the data to the receive FIFO. Up to 24 frames can be written in the receive FIFO. Figure 26.10 shows the status change of the E-MAC receiver.

1. When the RE bit in ECMR is set to 1, the receiver enters the receive idle state.
2. When an SFD (start frame delimiter) is detected after a receive packet preamble, the receiver starts receive processing. A frame with an invalid pattern is discarded.
3. In normal mode, if the destination of the frame address is this LSI, the receiver starts data reception when broadcast or multicast transmission is specified. In promiscuous mode, data reception starts regardless of the frame type.
4. Following data reception from the MII, the receiver carries out a CRC check. The result is indicated as a status bit in the descriptor after the frame data has been written to the receive FIFO. Reports an error status in the case of an abnormality.

After one frame has been received, if the RE bit in ECMR is set to 1, the receiver prepares to receive the next frame.

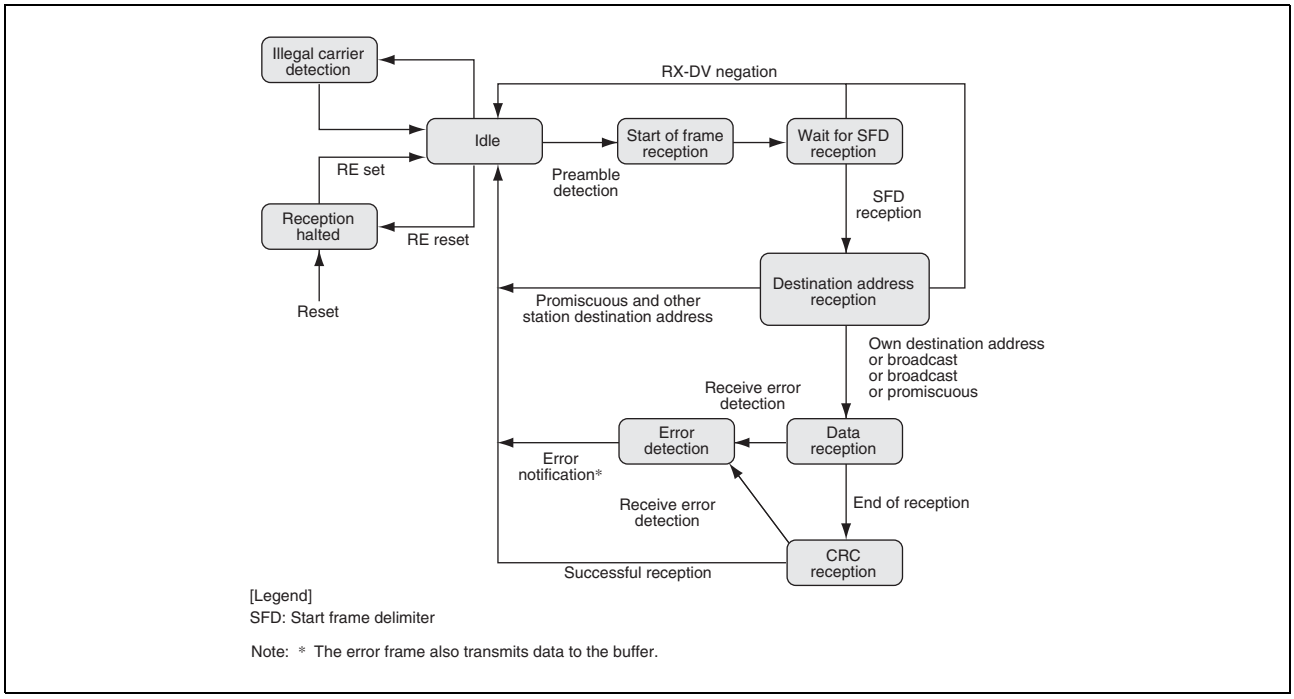

Figure 26.10 E-MAC Receiver State Transitions

CAM evaluation can be referenced during frame processing in reception (for details on the CAM function, refer to section 26.4.4, CAM Function).

When 1 is written to the RR bit in EDRRR while the RE bit in ECMR is set to 1, the E-DMAC reads the descriptor following the previously used descriptor from the receive descriptor list (or the descriptor indicated by RDLAR at the initial startup) then enters the receive wait state. If 32 bytes or more of data or the last byte of the receive frame is stored in the receive FIFO, the E-DMAC transfers receive FIFO data to the receive buffer specified by RD2 according to the receive descriptor with the RACT bit set to 1 (valid).

If the data length of a received frame is longer than the buffer length specified by RD1, the E-DMAC performs a write-back operation to the descriptor (set RFP to 10 or 00) when the buffer is full, then reads the next descriptor. The E-DMAC then continues to transfer data to the receive buffer specified by the new RD2.

When the following conditions are satisfied, a write-back operation is performed for the descriptor (RFP = 11 or 01), 11 is written to the FR bits in EESR, and an interrupt is issued to the CPU.

- The receive buffer has been full during DMA transfer.
- DMA transfer to the receive buffer of the last byte of the receive frame has been completed.

After the reception processing of the frame, the next descriptor reading standby state begins. At this time, if 32 bytes or more of data or the last byte of the receive frame is stored in the receive FIFO, the next receive descriptor process is performed continuously.
When the TACT bit of the read receive descriptor is 0 (invalid), the receive descriptor empty state is determined and the RDE bit in EESR is written to 1, and then an interrupt is issued to the CPU.
To receive frames continuously, set the RNC bit in RMCR to 1. The initial value is 0.
Figure 26.11 shows an example of reception flow.

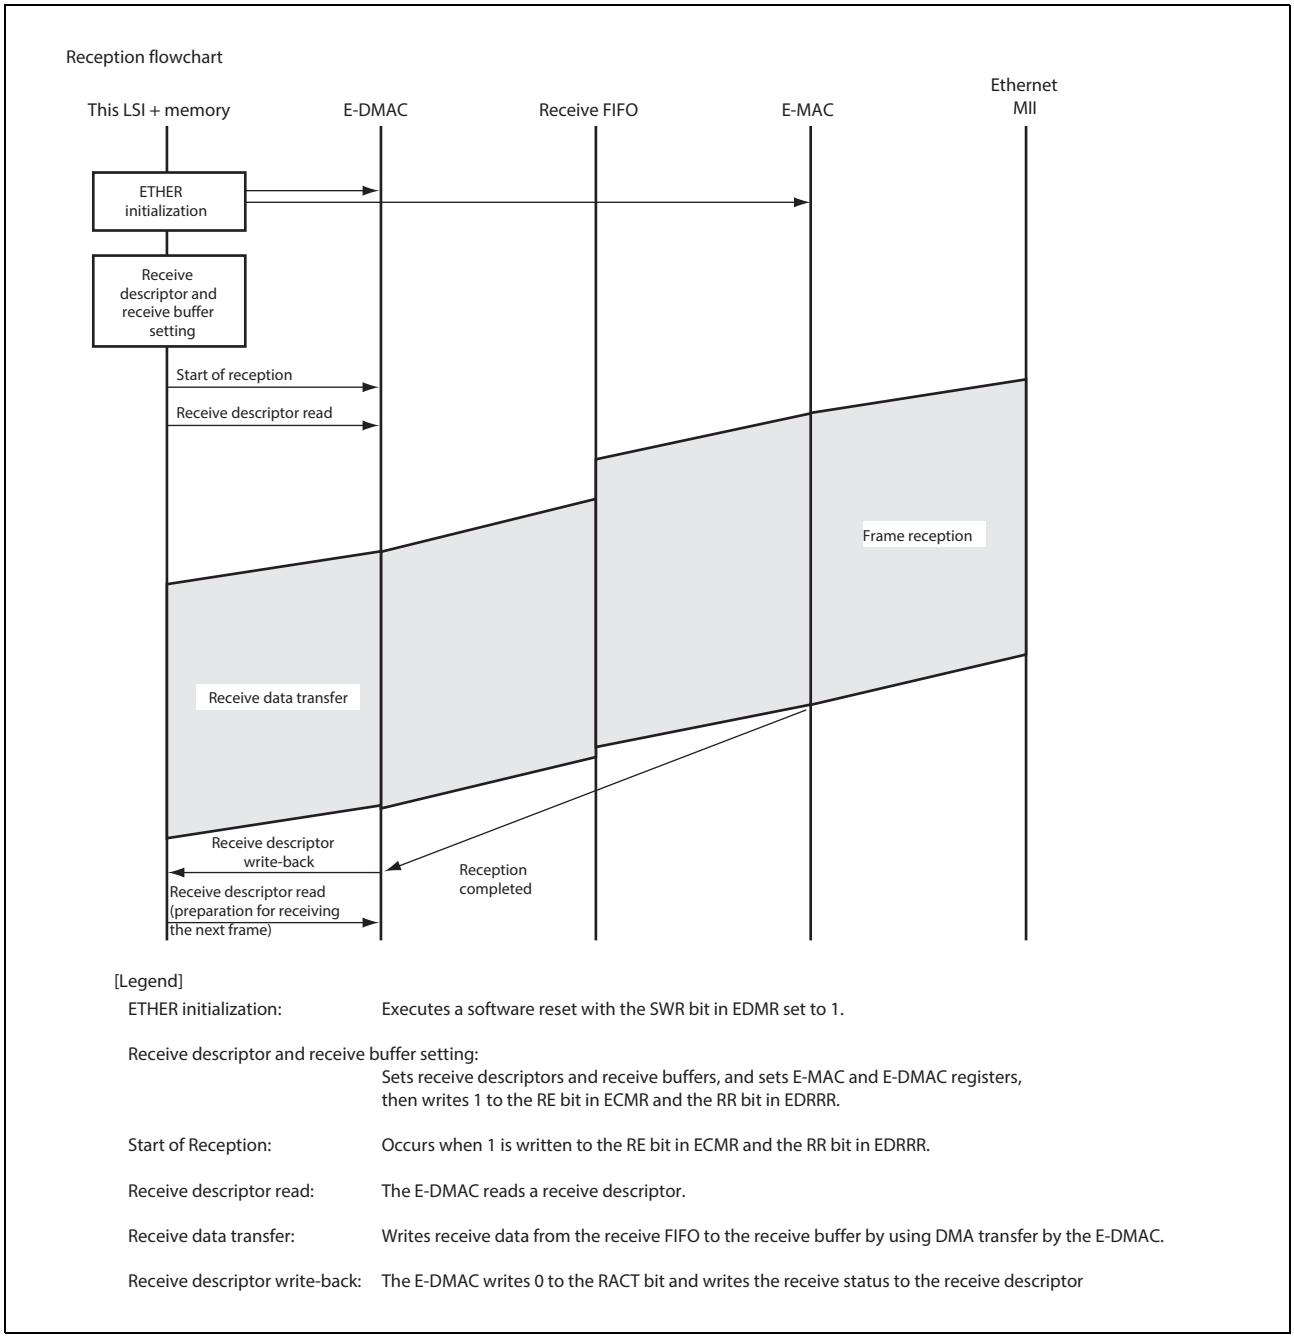

Figure 26.11 Sample Reception Flowchart (Single-Frame/Single-Descriptor)

(2) Reception Error Processing

(a) Reception Error

When a reception error occurs, the FR and RABT bits in EESR are set to 1 and an interrupt is issued to the CPU after a write-back operation for the receive descriptor related to the reception error frame.
If a reception error occurs when the length of the frame received from the MII is less than 32 bytes, DMA transfer to the receive buffer for the frame is not performed. At this time, the receive frame is discarded in the E-DMAC (flush function). However, if padding is inserted in the receive frame by RPADIR, the flush function is performed when the frame length including the padding bytes is less than 32 bytes.

(b) Receive FIFO Overflow

In any of the following cases, the E-MAC cannot receive frames from the MII because it has no space to store receive frames, and all the receive frames that have been transferred to the E-MAC will be discarded in the E-MAC (receive FIFO overflow).

- Receive FIFO is full of data waiting for DMA transfer (the receive FIFO has no space).
- The number of receive frames waiting for DMA transfer is 24 in total (the receive frame information managing area has no empty space; up to 24 frames can be managed).

If an overflow occurs due to the former case, the RFOF bit in EESR is set to 1 and an interrupt is generated to the CPU.
If an overflow occurs due to the latter case, the RFCOF bit in EESR is set to 1 and an interrupt is generated to the CPU.
Each time a receive frame is discarded due to an overflow, RMFCR is incremented. However, RMFCR is not incremented for a receive frame that is cut off due to insufficient receive FIFO space. If a receive frame is cut off due to insufficient receive FIFO space (the frame is partially stored in the receive FIFO), the E-DMAC performs the following operation:

- Performs DMA transfers for the cut-off frame stored in the receive FIFO to the receive buffer.
- After the DMA transfer, performs a write-back operation on the receive descriptor.
- After the write-back operation, sets the ROC bit in EESR to 1 and generates an interrupt to the CPU.

When the receive FIFO is full of data waiting for DMA transfer, frame reception from the MII can be resumed if DMA transfer is performed from the receive FIFO to the receive buffer and 32 bytes or more of empty space is generated in the receive FIFO. When the number of receive frames waiting for DMA transfer is 24 in total, frame reception from the MII can be resumed if one or more frame has been DMA transferred from the receive FIFO to the receive buffer. For restarting frame reception from the MII, when the E-DMAC resumes frame reception from the MII, it only accepts from the start of the frame.

(c) Flow Control

When the amount of receive data or the number of receive frames in the receive FIFO leads to one of the following conditions, the E-DMAC notifies the E-MAC to control E-MAC writing to the receive FIFO.

- When the space used in the receive FIFO exceeds the data amount specified by FCFTR
- When the number of receive frames in the receive FIFO exceeds the value specified by FCFTR

The threshold of the receive data amount can be set in a range from 256 to 65536 bytes in 256-byte units.
The threshold of receive frames can be set in a range from 1 to 24 frames (by the frame) in frame units.

(d) Receive Descriptor Empty

When the RACT bit of the read descriptor is 0 (invalid), the receive descriptor empty state is determined and DMA transfer is stopped. Then the following operation is performed.

- Writes the RR bit in EDRRR to 0
- Sets the RDE bit in EESR to 1 and generates an interrupt to the CPU.

To resume the DMA transfer to the receive buffer, the interrupt source needs to be cleared by software, the receive descriptor needs to be re-set and the RR bit in EDRRR should be set to 1.
Even if receive descriptor is empty, frame reception from the MII to the receive FIFO is continued if there is empty space left in the receive FIFO and receive frame information management area. Therefore, even if a receive descriptor empty state is determined, the DMA transfer can be performed without discarding the frames received from the MII if DMA transfer to the receive buffer can be resumed before an overflow occurs.

26.4.4 CAM Function

Frames input to the E-MAC are grouped into the following four types; unicast for this LSI, broadcast, multicast, and unicast to other destinations. The MAC addresses of unicast for this LSI and broadcast are fixed, and determined only by register settings. Consequently, only multicast and unicast to other destinations determine whether to receive or not by using the CAM (unicast frames whose destination MAC addresses match this LSI are called unicast frames to this LSI, and those that do not are called unicast frames to other destinations).

Furthermore, the evaluation of reception of unicast to other destinations and multicast frames by using CAM are performed by referencing the registered MAC addresses of the CAM entry table in the TSU. By using this function, receive FIFO overflow can be prevented caused by accumulation of frame data not required for reception, and CPU processing for determining reception can be reduced.

The on-chip CAM has entry tables which can register the MAC address of 32 entries, the details of which can be set by TSU_ADRH0 to TSU_ADRH31 and TSU_ADRL0 to TSU_ADRL31. The setting to enable/disable referencing of the on-chip CAM entry table is performed by the CAM entry table enable setting register which sets whether to perform CAM evaluation or not. When on-chip CAM entry table referencing is enabled, the destination address in the frame and MAC address registered in the CAM entry table are compared, and it is determined whether to transfer the frames input to the E-MAC to E-DMAC (have E-DMAC receive the frames) or discard the frames. Table 26.4 shows the processing method of frames (receive or discard) in reception from E-MAC to E-DMAC.

Table 26.4 Receive Frame Processing

CAM Entry Table Referencing Results	Types of Frame	Normal Mode		Promiscuous Mode	
		MCT = 0	MCT = 1	MCT = 0	MCT = 1
CAM hit (when addresses match)	Frame to this LSI	Discarded		Discarded	
	Broadcast frame	Discarded		Discarded	
	Multicast frame	Discarded	Received	Discarded	Received
	Frames having destinations other than this LSI	Received		Discarded	
CAM mishit (when addresses do not match)	Frames to this LSI	Received		Received	
	Broadcast frame	Received		Received	
	Multicast frame	Received	Discarded	Received	Discarded
	Frames having destinations other than this LSI	Discarded		Received	

[Legend]

MCT (Bit 13 in ECMR): Multicast receive mode (0: Receive when CAM mishit/1: Receive when CAM hit)

26.4.5 Transmit Processing of Multi-Buffer Frame (Single-Frame/Multi-Descriptor)

(1) Multi-Buffer Frame Transmit Processing

If an error occurs during multi-buffer frame transmission, the processing shown in Figure 26.12 is carried out by the E-DMAC.

In the figure where the transmit descriptor is shown as inactive (TACT bit = 0), buffer data has already been transmitted successfully, and where the transmit descriptor is shown as active (TACT bit = 1), buffer data has not been transmitted. If a frame transmit error occurs in the first descriptor part where the transmit descriptor is active (TACT bit = 1), transmission is halted, and the TACT bit is cleared to 0, immediately. The next descriptor is then read, and the position within the transmit frame is determined on the basis of bits TFP1 and TFP0 (continuing [B′00] or end [B′01]). In the case of a continuing descriptor, the TACT bit is cleared to 0, and the next descriptor is read immediately. If the descriptor is the final descriptor, not only is the TACT bit cleared to 0, but write-back is also performed to the TFE and TFS bits at the same time. Data in the buffer is not transmitted between the occurrence of an error and write-back to the final descriptor. If error interrupts are enabled in EESIPR, an interrupt is generated immediately after the final descriptor write-back.

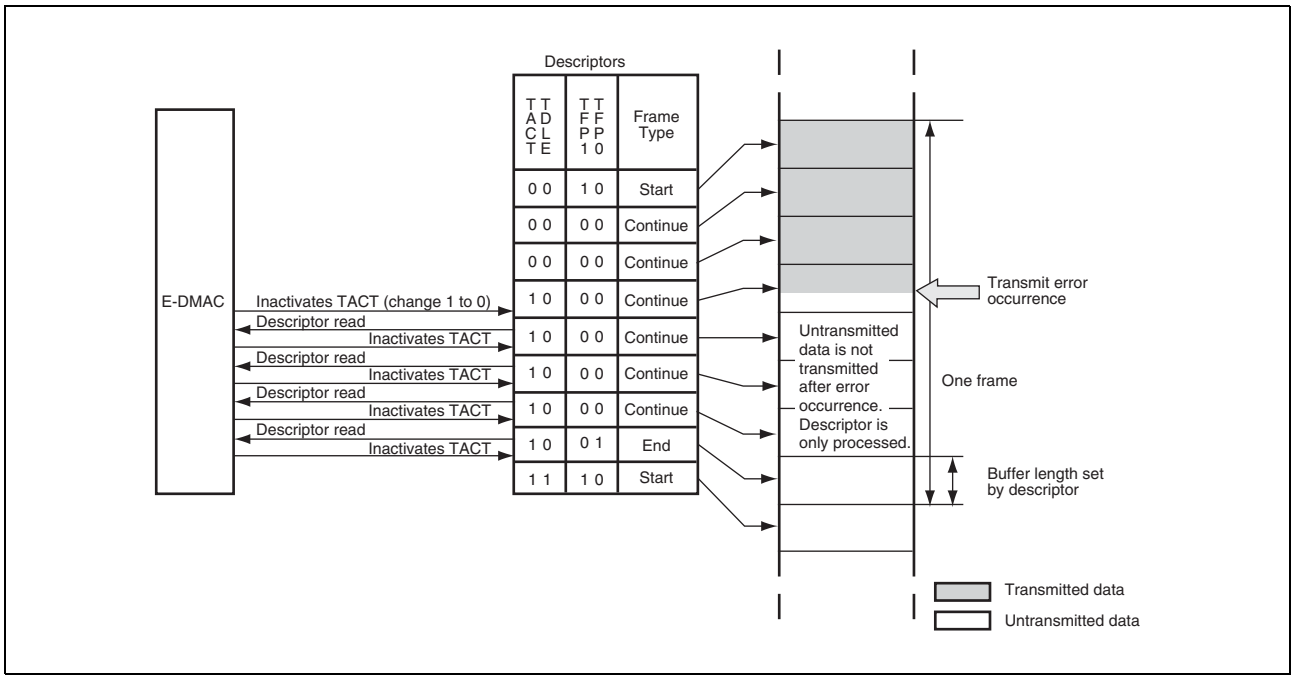

Figure 26.12 E-DMAC Operation after Transmit Error

26.4.6 Padding Insertion in Receive Data

In the E-DMAC, one to three bytes of padding can be inserted in any byte position of receive data to improve software handling capability. By using this function, for instance, inserting 2-byte padding after the MAC header (14 bytes) of Ethernet frame enables data following the MAC header to set in 4-byte boundary.

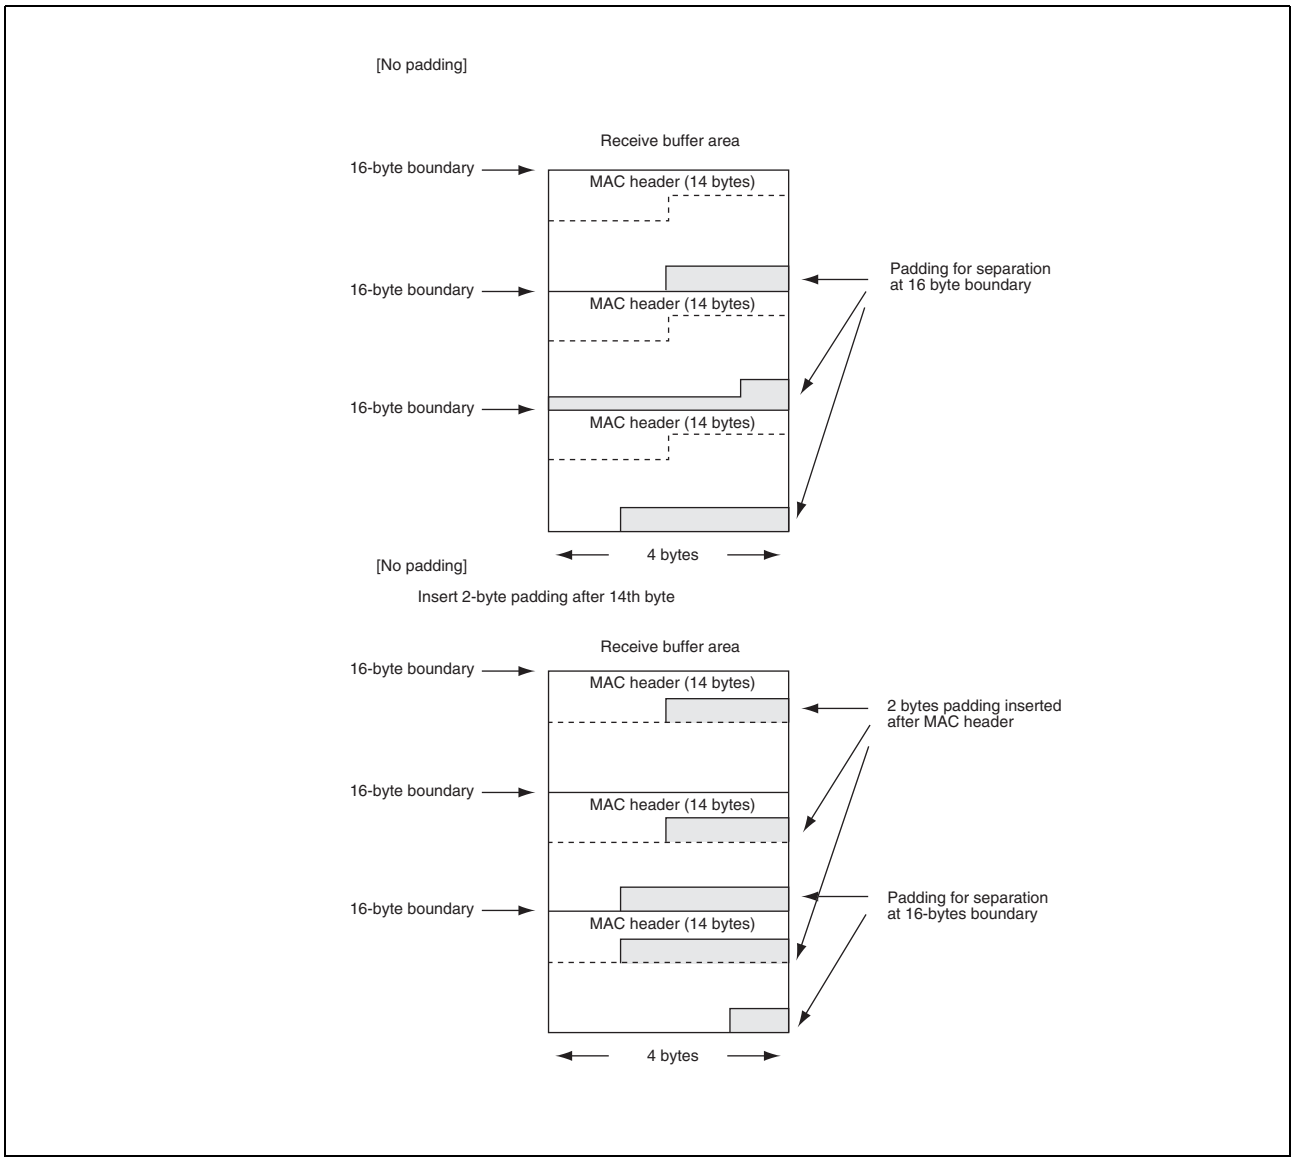

Figure 26.13 Padding Insertion in Receive Data

26.4.7 Interrupt Processing

(1) Interrupt Sources

The ETHER issues one type of interrupt to the CPU: receive/transmit interrupts (ETHERI).
ETHERI interrupts are generated in correspondence with the transmit/receive operation. When an interrupt source is generated, it is set in EESR0 and an interrupt is issued to the CPU. For some interrupt sources, the EESR0 setting and an interrupt to the CPU are performed after a write-back operation to a descriptor is completed, not immediately after the interrupt source is detected. Interrupt sources other than the E-MAC status register source (ECI bit) are cleared by writing a 1 to the corresponding source bit. The E-MAC status register source (ECI bit) is cleared by writing a 1 to the corresponding source bit in ECSR. Interrupt source bits retain the values until they are cleared. ETHERI interrupt source is allowed to issue interrupts by setting the corresponding bit in EESIPR0. Each E-MAC state register source (ECI bit) is allowed to issue an interrupt by setting the corresponding bit in ECSIPR. In the initial value, interrupts are disabled.
Table 26.5 shows these three interrupts, interrupt sources, interrupt status registers and bits set at interrupt occurrence and interrupt generation timing.

Table 26.5 List of ETHER Interrupts

Interrupt	Interrupt Source	Register and Bit	Interrupt Generation Timing
Transmit/ receive interrupt (ETHERI)	Write-back completed	EESR0.TWB	After write-back
	Transmit underflow frame write-back completed	EESR0.TUC	After write-back
	Receive underflow frame write-back completed	EESR0.ROC	After write-back
	Transmission abort detection	EESR0.TABT	After write-back
	Reception abort detection	EESR0.RABT	After write-back
	Receive frame counter overflow	EESR0.RFCOF	When the interrupt source is detected
	E-MAC status register source	EESR0.ECI	When the interrupt source is detected
	Frame transmission completed	EESR0.TC	After write-back
	Transmit descriptor empty	EESR0.TDE	When the interrupt source is detected
	Transmit FIFO underflow	EESR0.TFUF	When the interrupt source is detected
	Frame reception	EESR0.FR	After write-back
	Receive descriptor empty	EESR0.RDE	When the interrupt source is detected
	Receive FIFO overflow	EESR0.RFOF	When the interrupt source is detected
	Receive Multicast Address Frame	EESR0.RMAF	After write-back
	Receive Residual-Bit Frame	EESR0.RRF	After write-back
	Receive Too-Long Frame	EESR0.RTLF	After write-back
	Receive Too-Short Frame	EESR0.RTSF	After write-back
	PHY-LSI Receive Error	EESR0.PRE	After write-back
	CRC Error on Received Frame	EESR0.CERF	After write-back

26.4.8 Activation Procedure

The ETHER should be activated by the following procedure:

(1) Reset

1. Perform a power-on reset.
2. Set the ET_TXCLK and ET_RXCLK pins and supply the clock signal (for details on pin function settings, see section 41, Ports).
3. Start the E-DMAC transmitter and receiver (activation of descriptor engine).
   —Set ENT to 1 and ENR to 1 in EDSR.
4. Perform a software reset.
   —Set SWRR to 1 and SWRT to 1 in EDMR simultaneously.
5. Initialize the descriptor entry table.
6. Confirm cancellation of the software reset.
   —Check that the SWRR and SWRT bits in EDMR are cleared to 0.

(2) Pin Settings

See section 41, Ports.

(3) Registration of Descriptor Ring

The address of a descriptor ring configured in memory is registered in the descriptor entry table.

1. Transmit descriptor setting
   —Set TDLAR.
   —Set TDFAR.
   —Set TDFXR.
   —Set TDFFR. When the descriptor indicated by TDFXR is the last descriptor in the descriptor list, set H'00000001.
2. Receive descriptor setting
   —Set RDLAR.
   —Set RDFAR.
   —Set RDFXR.
   —Set RDFFR. When the descriptor indicated by RDFXR is the last descriptor in the descriptor list, set H'00000001.

(4) Register Settings

The following registers should be set as necessary.

1. E-DMAC related registers
   —Set EDMR: Operating mode, etc.
   —Set EESIPR: Interrupt masks
   —Set TRSCER: Error masks
   —Set TFTR: Transmit FIFO threshold
   —Set FDR: External FIFO size
   —Set RMCR: Reset method for reception activation
   —Set RPADIR: Padding insertion into receive data
   —Set FCFTR: Receive BSY output threshold
2. E-MAC related registers
   —Set ECMR setting: Transmission/reception specifications
   —Set ECSIPR setting: Interrupt masks
   —Set MAHR: MAC address
   —Set MALR: MAC address

—Set RFLR: Maximum receive frame length
—Set APR: TIME parameter value of an automatic pause frame
—Set MPR: TIME parameter value of a manual PAUSE frame
—Set TPAUSER: Upper limit of automatic PAUSE frame retransmission

(5) Activation

1. Start the E-DMAC transmission/reception function
   —Set the TR bits in EDTRR to 11.
   —Set the RR bit in EDRRR to 1.
2. Start the E-MAC transmission/reception function
   —Set the TE and RE bits in ECMR to 1.

26.4.9 Flow Control

The ETHER supports flow control functions conforming to IEEE802.3x for full-duplex operation. The flow control can be applied to both receive and transmit operations. When transmitting PAUSE frames, flow control can be performed by the following two procedures:

(1) Automatic PAUSE Frame Transmission

For receive frames, PAUSE frames are automatically transmitted when the number of data written to the receive FIFO reaches the value set in FCFTR. The TIME parameter included in the PAUSE frame is set by APR. The automatic PAUSE frame transmission is repeated until the number of data in the receive FIFO becomes less than the value set in FCFTR as the receive data is read from the FIFO. Using TPAUSER, the upper limit of retransmission counts of the PAUSE frames can also be set in the range from 1 to 65535. In this case, PAUSE frame transmission is repeated until the number of receive FIFO data becomes less than the FCFTR value, or the number of transmits reaches the value set by TPAUSER. The transmission counter is cleared to 0 when the next PAUSE frame is transmitted after the number of data in the receive FIFO becomes less than the FCFTR value.
The automatic PAUSE frame transmission is enabled when the TXF bit in ECMR is 1.

(2) Manual PAUSE Frame Transmission

PAUSE frames are transmitted by directives from the software. When writing the Timer value to MPR, manual PAUSE frame transmission is started. With this method, PAUSE frame transmission is carried out only once.

(3) PAUSE Frame Reception

The next frame is not transmitted until the time indicated by the Timer value elapses after receiving a PAUSE frame. However, the transmission of the current frame is continued. A received PAUSE frame is valid only when the RXF bit in ECMR is set to 1. The number of times of PAUSE frame receptions is counted.

(4) 0-Time PAUSE Frame Control

Flow control is performed using a PAUSE frame with the TIME parameter value set to 0. The PAUSE frame with the TIME parameter set to 0 can be enabled or disabled by the ZPF bit in ECMR.

- When PAUSE frame control with the TIME parameter value set to 0 is enabled
  A PAUSE frame with the TIME parameter value set to 0 is transmitted when the number of data in the receive FIFO is less than the FCFTR value before the time indicated by the TIME parameter value has not elapsed. When a PAUSE frame with the time indicated by the TIME parameter value set to 0 is received, the transmit standby state is canceled.
- When PAUSE frame control with the TIME parameter value set to 0 is disabled
  A PAUSE frame with the TIME parameter value set to 0 is not transmitted. When a PAUSE frame with the TIME parameter value set to 0 is received, the PAUSE frame is discarded.

26.4.10 Intelligent Checksum Calculation Function

This function accelerates checksum calculation on received packets, and provides the following two modes.

- MAC/IP packet analyzing intelligent checksum calculation mode
- All-data intelligent checksum calculation mode with bytes to be skipped specified

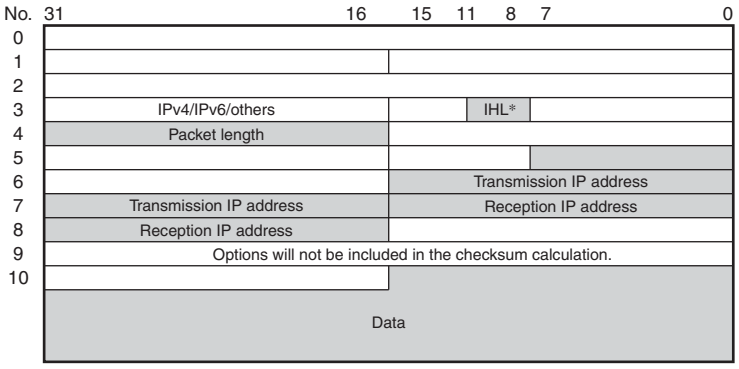
(1) MAC/IP Packet Analyzing Intelligent Checksum Calculation Mode (CSEBL = 1 and CSMD = 1 in CSMR)

In this mode, the checksum of received packets indicated in the table is calculated. However, if a MAC packet payload includes padding data in fields other than those for the IP packet itself because there is too little data for a full packet, it is not included in the checksum.

IPver	Items
IPv4	Option present
	Option not present
	Fragment*1
IPv6	Extension header not present
	Hop-by-hop options extension header length
	Routing extension header length
	Fragment extension header length*1
	Destination options header length
	AH extension header length
	ESP extension header length*2
	Extension header length for mobile IPv6*2

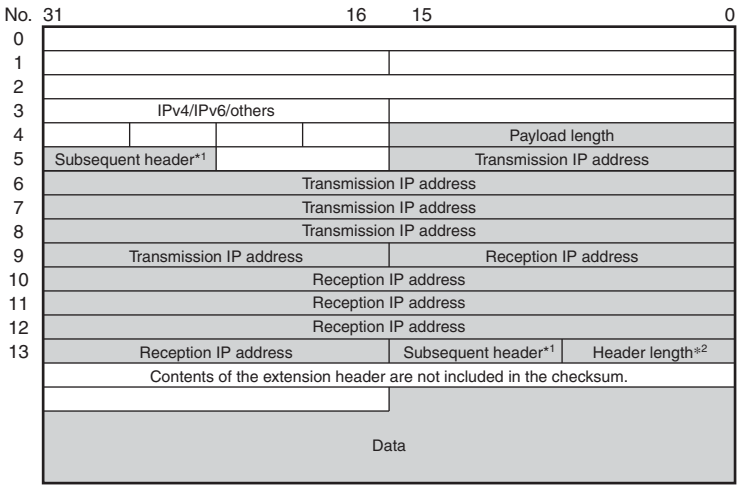
Note 1. This packet is to be checksumed, however, the RCS[15:0] bits and RCSE bit in RD0 are to be undefined even if the data is successfully received.
Note 2. The RD0.RCSE bit is set to 1 without calculating the value of the RD0.RCS[15:0] bits.

The shaded regions of the following figure indicate the parts of an IPv4 packet which are used to obtain the checksum.



Note: * After conversion to octet units, this is subtracted in the checksum calculation.
In the calculation: {8'h00, protocol no.[7:0]}

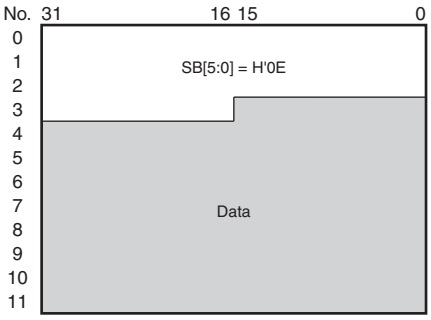
The shaded regions of the following figure indicate the parts of an IPv6 packet which are used to obtain the checksum.



Notes: *1 Only included in the checksum when the header is for the TCP or UDP. Calculation coverage is extended to {8'h00, protocol No.[7:0]} when the checksum is taken.
*2 After conversion to octet units, this is subtracted in the checksum calculation.

(2) All-Data Intelligent Checksum Calculation Mode with Bytes to be Skipped Specified (CSELB = 1 and CSMD = 0 in CSMR)

After having skipped the number of bytes specified in the SB[5:0] bits in CSMR, counting from the beginning of the packet, the checksum is calculated for all subsequent data (e.g. 14 bytes may be skipped).



26.5 Connection to PHY-LSI

26.5.1 MII Frame Transmission/Reception Timing

Each MII frame transmission/reception timing is shown in Figure 26.14 to Figure 26.17.

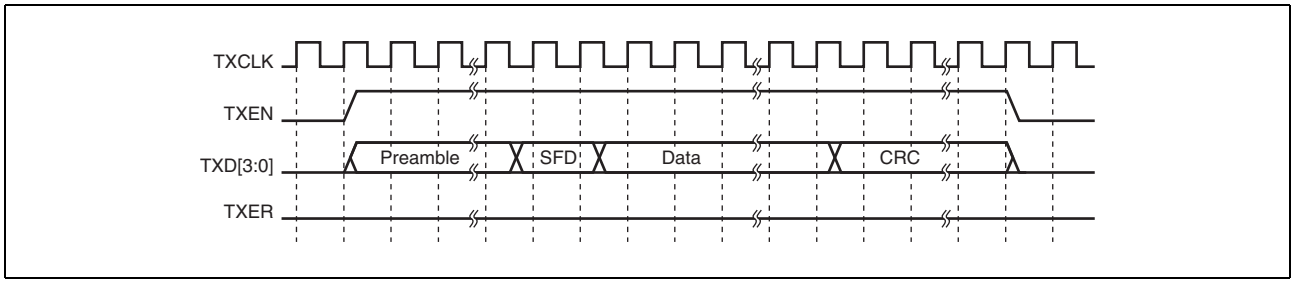


Figure 26.14 MII Frame Transmit Timing (Normal Transmission)

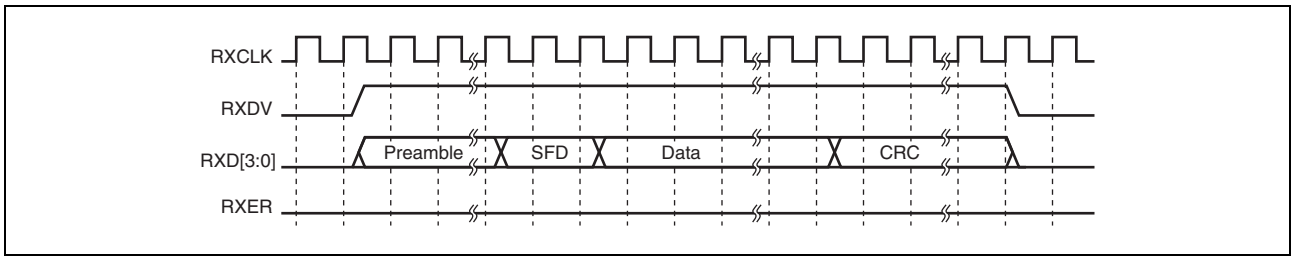

Figure 26.15 MII Frame Receive Timing (Normal Reception)

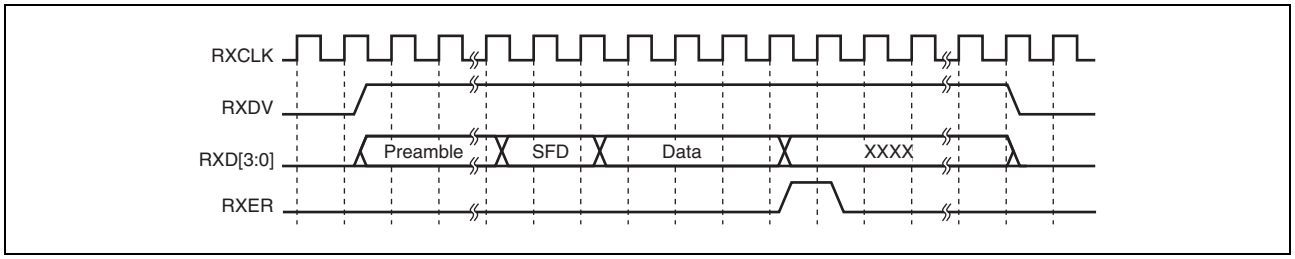

Figure 26.16 MII Frame Receive Timing (Reception Error (1))

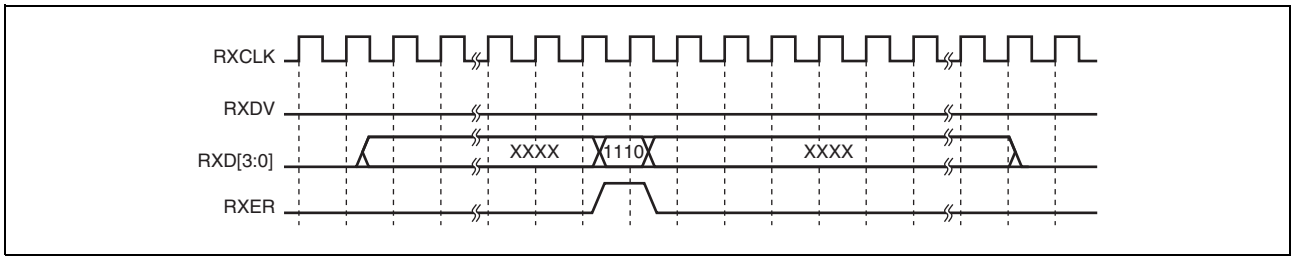

Figure 26.17 MII Frame Receive Timing (Reception Error (2))

26.5.2 Accessing MII Registers

MII registers in the PHY-LSI are accessed via PIR in this LSI. PIR is used as a serial interface conforming to the MII frame format specified in IEEE802.3u.

(1) MII Management Frame Format

Figure 26.18 shows the format of an MII management frame. To access an MII register, a management frame is implemented by the program in accordance with the procedures shown in MII Register Access Procedure.

Access Type	MII Management Frame							
Item	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
Number of bits	32	2	2	5	5	2	16	
Read	1..1	01	10	00001	RRRRR	Z0	D..D	
Write	1..1	01	01	00001	RRRRR	10	D..D	X

[Legend]

PRE: 32 consecutive 1s
ST: Write of 01 indicating start of frame
OP: Write of code indicating access type
PHYAD: Write of 0001 if the PHY-LSI address is 1 (sequential write starting with the MSB).
This bit changes depending on the PHY-LSI address.
REGAD: Write of 000q if the register address is 1 (sequential write starting with the MSB).
This bit changes depending on the PHY-LSI register address.
TA: Time for switching data transmission source on MII interface
(a) Write: 10 written
(b) Read: Bus release (notation: Z0) performed
DATA: 16-bit data. Sequential write or read from MSB
(a) Write: 16-bit data write
(b) Read: 16-bit data read
IDLE: Wait time until next MII management format input
(a) Write: Independent bus release (notation: X) performed
(d) Read: Bus already released in TA: control unnecessary

Figure 26.18 MII Management Frame Format

(2) MII Register Access Procedure

The program accesses MII registers via PIR. Access is implemented by a combination of 1-bit-unit data write, 1-bit-unit data read, bus release, and independent bus release. Figure 26.19 (1) to Figure 26.22 (4) show the MII register access timing. The timing will differ depending on the PHY-LSI type.

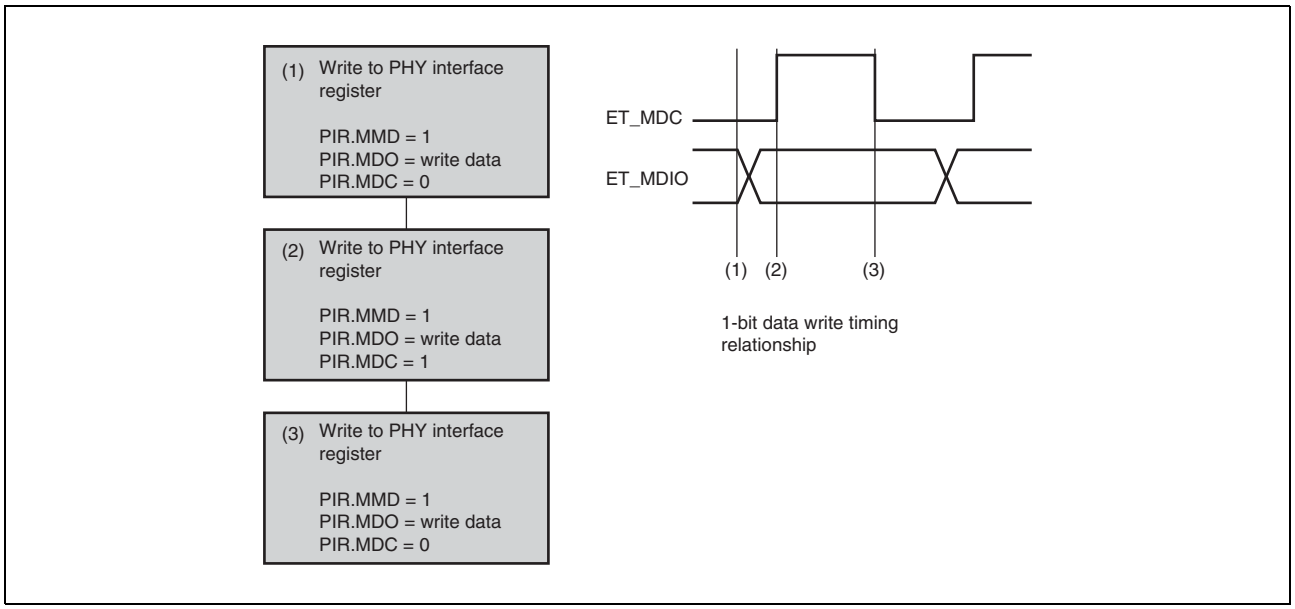

Figure 26.19 1-Bit Data Write Flowchart

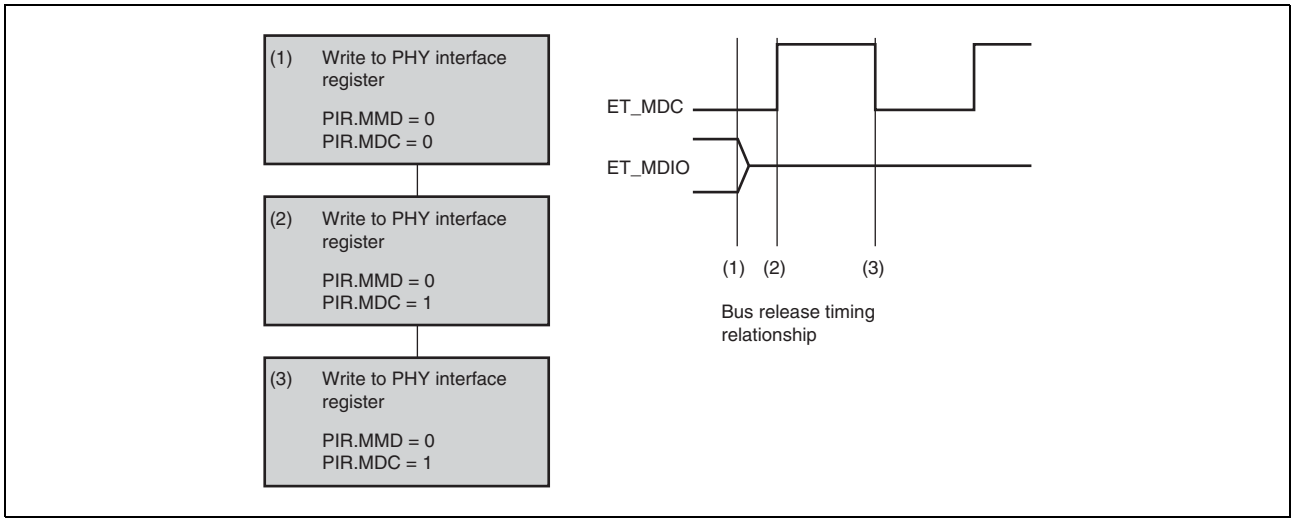

Figure 26.20 Bus Release Flowchart (TA in Read in Figure 26.18)

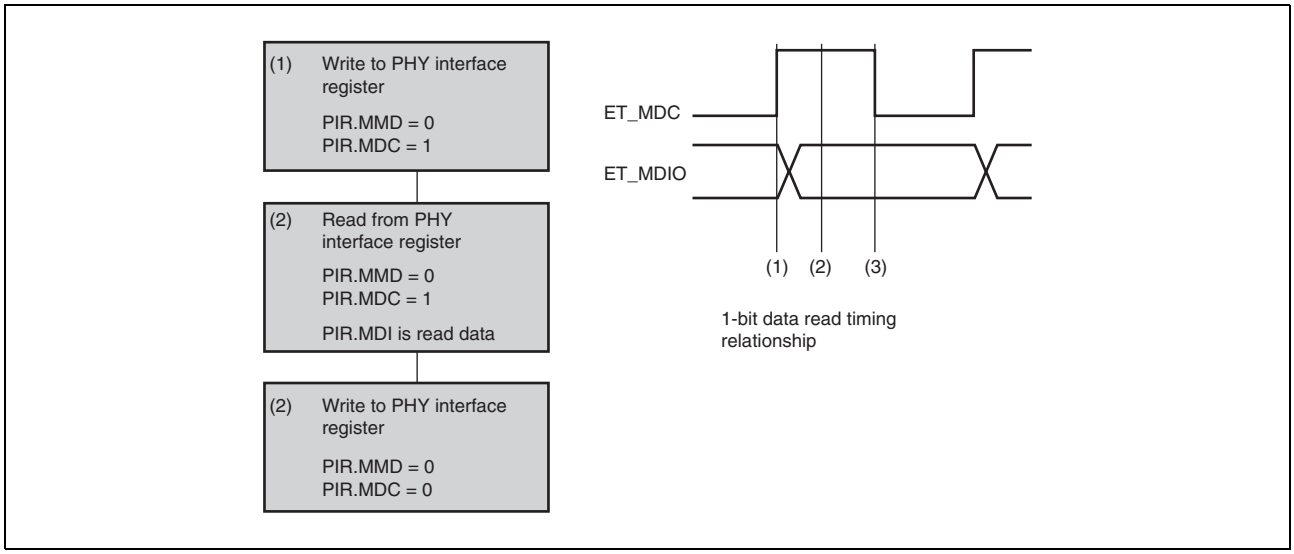

Figure 26.21 1-Bit Data Read Flowchart

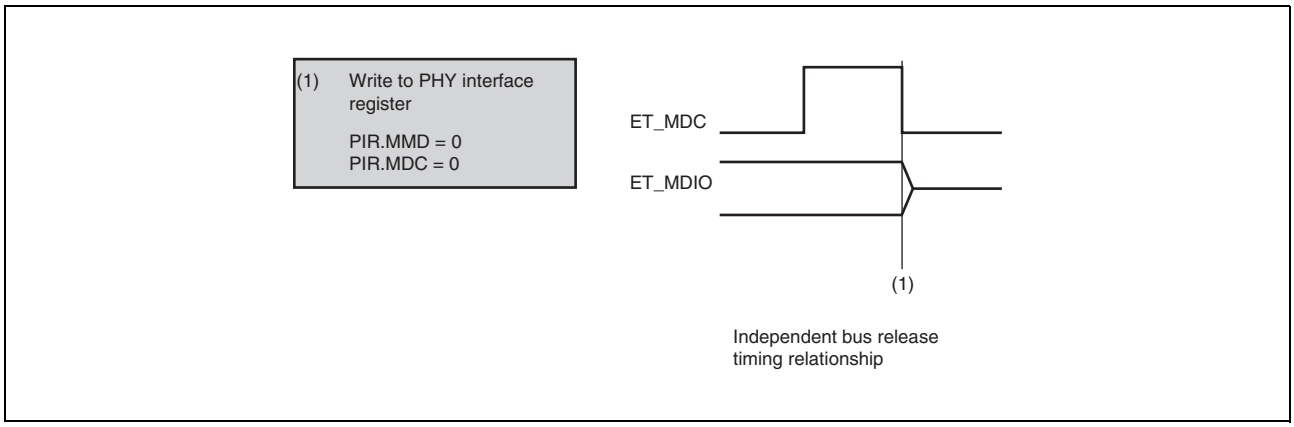

Figure 26.22 Independent Bus Release Flowchart (IDLE in Write in Figure 26.18)

26.6 Usage Notes

26.6.1 Checksum Calculation of Ethernet Frames

This LSI is capable of calculating the checksum data of the received frames. Only the data fields of the Ethernet frames are subject to checksum calculation. Specifically, a data field follows the length/type field and is followed by the CRC field. Figure 26.23 shows schematics indicating which parts of the Ethernet frames are calculated. Calculation involves 16-bit addition only; it does not involve bit inversion. Note that when the checksum data is valid, the CRC data (4 bytes) is not transferred as a receive frame, and the checksum data (sum data) is added automatically. Figure 26.24 shows schematics of Ethernet frames to which the checksum data has been added.

Note: • Also for the frames with VLANtag inserted, the 15th byte from the top and the following bytes before the CRC field are subject to calculation.

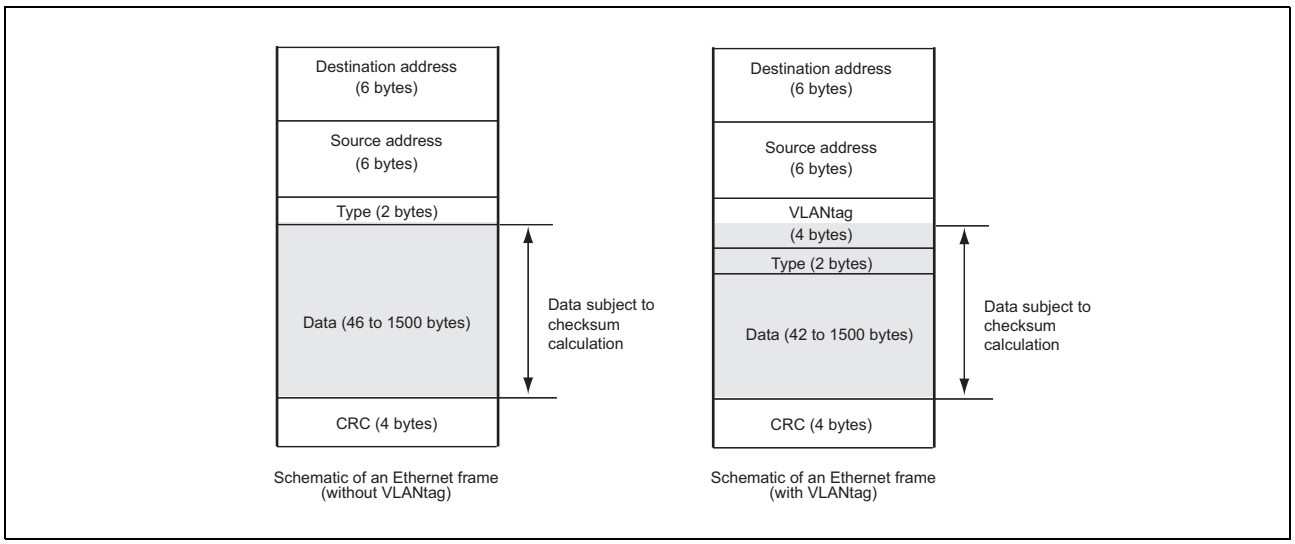

Figure 26.23 Data Subject to Checksum Calculation

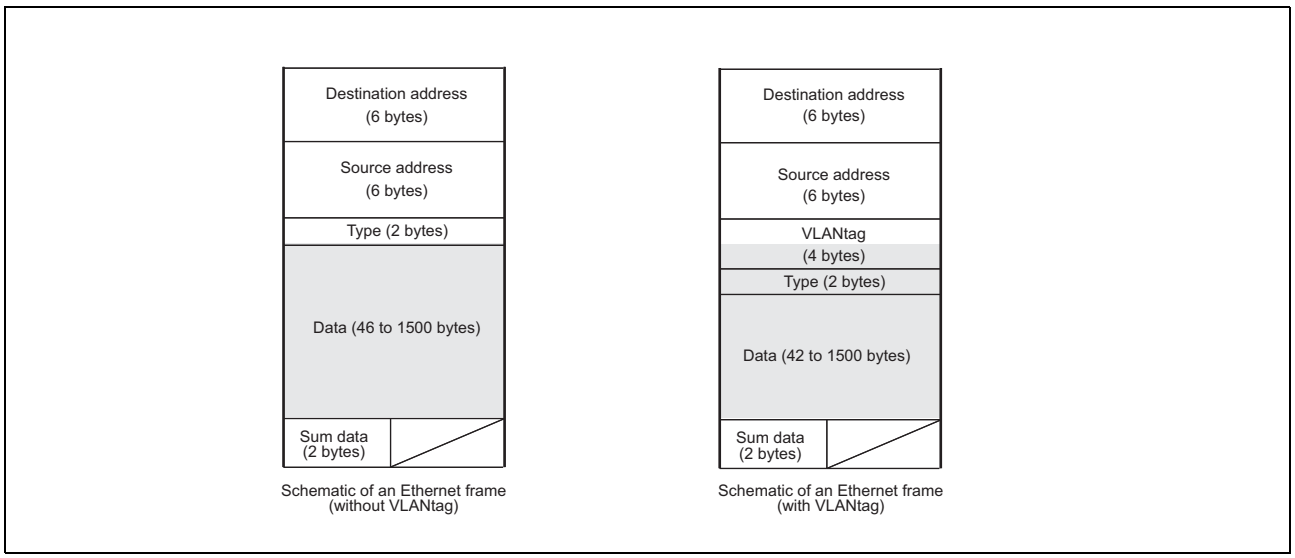

Figure 26.24 Data after Checksum Data Addition

26.6.2 Notes on Using the Intelligent Checksum Function

Checksum calculation using the intelligent checksum function is not affected by padding insertion specified by the receive data padding insert register (RPADIR). This is because checksum calculation is performed when transferring receive data from E-MAC to E-DMAC, while padding of receive data is performed when transferring receive data from E-DMAC to the receive buffer in memory.

26.6.3 Software Reset

For transitions to the software reset state by the ARST bit in the software reset register (ARSTR) or SWRT and SWRR bits in the E-DMAC mode register (EDMR0), see section 42.3.6, Software Reset. However, where the procedure refers to the SRST bit, read this as the ARST bit or SWRT and SWRR bits.

27. A/D Converter

This LSI includes a 12-bit successive-approximation A/D converter allowing selection of up to eight analog input channels.

27.1 Features

- Resolution: 12 bits
- Input channels: Eight channels
- Minimum conversion time: 5.0 µs per channel
- Absolute accuracy: ±11 LSB
- Operating modes: Three
  - Single mode: A/D conversion on one channel
  - Multi mode: A/D conversion on one to four channels or on one to eight channels
  - Scan mode: Continuous A/D conversion on one to four channels or on one to eight channels
- Data registers: Eight
  Conversion results are held in a 16-bit data register for each channel
- Sample-and-hold function
- A/D conversion start methods: Three methods
  - Software
  - Conversion start trigger from the multi-function timer pulse unit 2
  - External trigger signal
- Interrupt source: Two sources
  An A/D conversion end interrupt (ADI) request can be generated on completion of A/D conversion.
  An over-limit interrupt (LMTI) request can be generated when a result of conversion exceeds the upper or lower limit for each channel.*

Note: * This is only available when 10-bit precision is in use.

- Module standby mode can be set

Figure 27.1 shows a block diagram of the A/D converter.

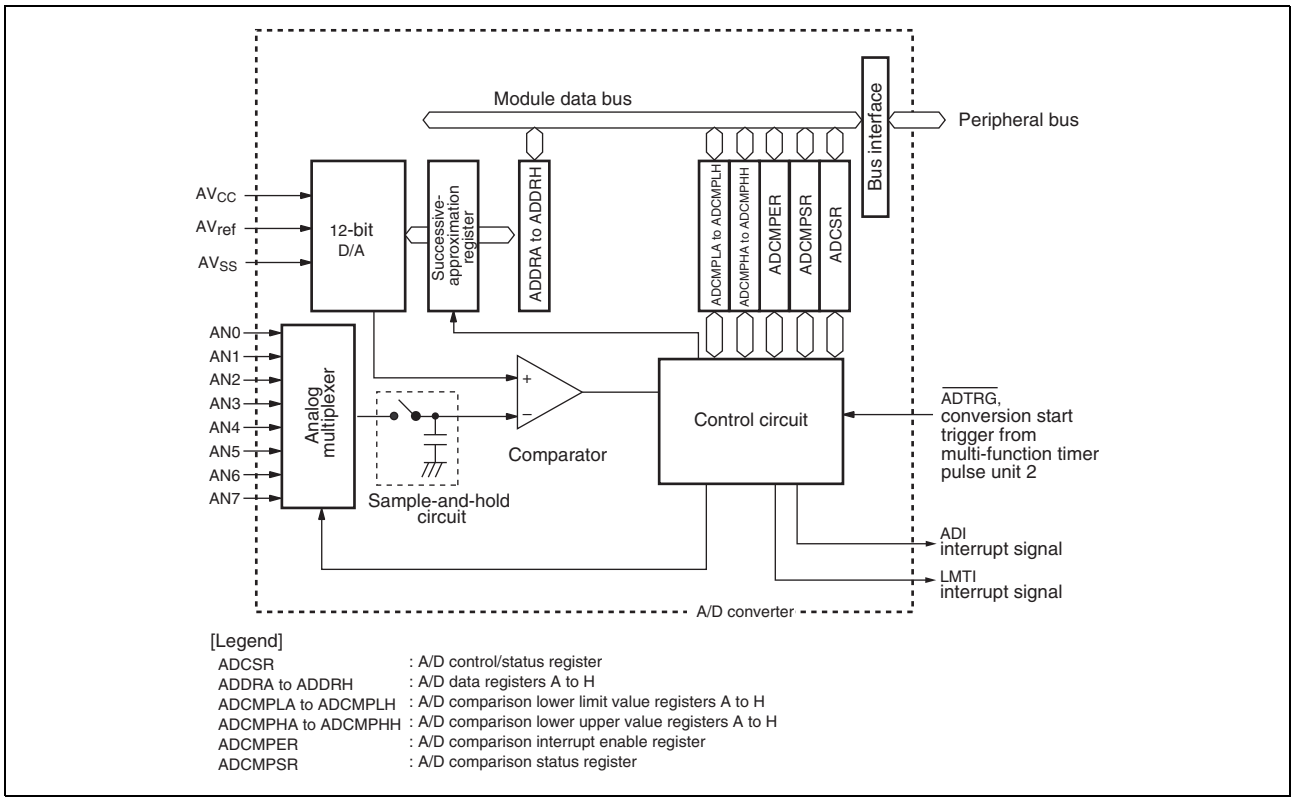

Figure 27.1 Block Diagram of A/D Converter

27.2 Input/Output Pins

Table 27.1 shows the A/D converter pins.

Table 27.1 Pin Configuration

Pin Name	Symbol	I/O	Function
Analog power supply pin	AVcc	Input	Analog power supply pin
Analog ground pin	AVss	Input	Analog ground pin and A/D conversion reference ground
Analog reference voltage pin	AVref	Input	A/D converter reference voltage pin
Analog input pin 0	AN0	Input	Analog input
Analog input pin 1	AN1	Input	
Analog input pin 2	AN2	Input	
Analog input pin 3	AN3	Input	
Analog input pin 4	AN4	Input	
Analog input pin 5	AN5	Input	
Analog input pin 6	AN6	Input	
Analog input pin 7	AN7	Input	
A/D external trigger input pin	$\overline{\text{ADTRG}}$	Input	External trigger input to start A/D conversion

27.3 Register Descriptions

The A/D converter has the following registers.

Table 27.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
A/D data register A	ADDRA	R	H'0000	H'E8005800	16
A/D data register B	ADDRB	R	H'0000	H'E8005802	16
A/D data register C	ADDRC	R	H'0000	H'E8005804	16
A/D data register D	ADDRD	R	H'0000	H'E8005806	16
A/D data register E	ADDRE	R	H'0000	H'E8005808	16
A/D data register F	ADDRF	R	H'0000	H'E800580A	16
A/D data register G	ADDRG	R	H'0000	H'E800580C	16
A/D data register H	ADDRH	R	H'0000	H'E800580E	16

27.3.1 A/D Data Registers A to H (ADDRA to ADDRH)

The eight A/D data registers, ADDRA to ADDRH, are 16-bit read-only registers that store the results of A/D conversion. An A/D conversion produces 12-bit data, which is transferred for storage into bits 15 to 4 of the ADDR corresponding to the selected channel. Bits 3 to 0 of ADDR are reserved bits that are always read as 0.

Access to ADDR in 8-bit units is prohibited. ADDR must always be accessed in 16-bit units.

Table 27.3 indicates the correspondence between analog input channels and ADDR.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
													-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 4		All 0	R	Bit Data (12bits)
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Table 27.3 Correspondence between Analog Input Channels and ADDR

AN0	ADDRA
AN1	ADDRB
AN2	ADDRC
AN3	ADDRD
AN4	ADDRE
AN5	ADDRF
AN6	ADDRG
AN7	ADDRH

27.3.2 A/D Comparison Upper Limit Value Registers A to H (ADCMPHA to ADCMPHH)

ADCMPH is a 16-bit readable/writable register that holds the upper limit value to be compared with an A/D conversion result. Eight registers, ADCMPHA to ADCMPHH, are provided.

On completion of A/D conversion on each channel, the A/D conversion result is compared with the data stored in the corresponding upper limit value register. When the result is greater than the upper limit value, the corresponding bit in the A/D comparison status register (ADCMPSR) is set. Comparison with the upper limit value is performed only when the corresponding bit in the A/D comparison interrupt enable register (ADCMPER) is set.

Access to ADCMPH in 8-bit units is prohibited. ADCMPH must always be accessed in 16-bit units.

Table 27.4 indicates the correspondence between the ADDR registers and the ADCMPH/ADCMPL registers.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
											-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 6		All 0	R/W	Comparison Upper Limit Value (10 bits)
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

27.3.3 A/D Comparison Lower Limit Value Registers A to H (ADCMPLA to ADCMPLH)

ADCMPL is a 16-bit readable/writable register that holds the lower limit value to be compared with an A/D conversion result. Eight registers, ADCMPLA to ADCMPLH, are provided.

On completion of A/D conversion on each channel, the A/D conversion result is compared with the data stored in the corresponding lower limit value register. When the result is smaller than the lower limit value, the corresponding bit in the A/D comparison status register (ADCMPSR) is set. Comparison with the lower limit value is performed only when the corresponding bit in the A/D comparison interrupt enable register (ADCMPER) is set.

Access to ADCMPL in 8-bit units is prohibited. ADCMPL must always be accessed in 16-bit units.

Table 27.4 indicates the correspondence between the ADDR registers and the ADCMPH/ADCMPL registers.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

27.3.4 A/D Control/Status Register (ADCSR)

ADCSR is a 16-bit readable/writable register that selects the operating mode, controls the A/D converter, and enables or disables starting of A/D conversion by external trigger input.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADF	ADIE	ADST	TRGS[3:0]				CKS[2:0]			MDS[2:0]			CH[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: *1 Only 0 can be written to clear the flag after 1 is read.

Bit	Bit Name	Initial Value	R/W	Description
15	ADF	0	R/(W)*1	A/D End Flag Status flag indicating the end of A/D conversion. [Clearing conditions] • Cleared by reading ADF while ADF = 1, then writing 0 to ADF • Cleared when the direct memory access controller is activated by ADI interrupt and ADDR is read [Setting conditions] • A/D conversion ends in single mode • A/D conversion ends for all the selected channels in multi mode • A/D conversion ends for all the selected channels in scan mode
14	ADIE	0	R/W	A/D Interrupt Enable Enables or disables the interrupt (ADI) requested at the end of A/D conversion. Set the ADIE bit while A/D conversion is not being performed. 0: A/D conversion end interrupt (ADI) request is disabled 1: A/D conversion end interrupt (ADI) request is enabled
13	ADST	0	R/W*2	A/D Start Starts or stops A/D conversion. This bit remains set to 1 during A/D conversion. 0: A/D conversion is stopped 1: Single mode: A/D conversion starts. This bit is automatically cleared to 0 when A/D conversion ends on the selected channel. Multi mode: A/D conversion starts. This bit is automatically cleared to 0 when A/D conversion is completed cycling through the selected channels. Scan mode: A/D conversion starts. A/D conversion is continuously performed until this bit is cleared to 0 by software, by a power-on reset as well as by a transition to deep standby mode.
12 to 9	TRGS[3:0]	0000	R/W	Timer Trigger Select These bits enable or disable starting of A/D conversion by a trigger signal. 0000: Start of A/D conversion by external trigger input is disabled 0001: A/D conversion is started by conversion trigger TRGAN from the multi-function timer pulse unit 2 0010: A/D conversion is started by conversion trigger TRG0N from the multi-function timer pulse unit 2 0011: A/D conversion is started by conversion trigger TRG4AN from the multi-function timer pulse unit 2 0100: A/D conversion is started by conversion trigger TRG4BN from the multi-function timer pulse unit 2 1001: A/D conversion is started by $\overline{\text{ADTRG}}$ Other than above: Setting prohibited
8 to 6	CKS[2:0]	000	R/W	Clock Select These bits select the A/D conversion time.*3 Set the A/D conversion time while A/D conversion is halted (ADST = 0). 000: Conversion time = 256 t_{cyc}*4 (maximum) 001: Conversion time = 298 t_{cyc}*4 (maximum) 010: Conversion time = 340 t_{cyc}*4 (maximum) 011: Conversion time = 382 t_{cyc}*4 (maximum) 100, 101, 110, 111: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
5 to 3	MDS[2:0]	000	R/W	Multi-scan Mode These bits select the operating mode for A/D conversion. 0xx: Single mode 100: Multi mode: A/D conversion on 1 to 4 channels 101: Multi mode: A/D conversion on 1 to 8 channels 110: Scan mode: A/D conversion on 1 to 4 channels 111: Scan mode: A/D conversion on 1 to 8 channels
2 to 0	CH[2:0]	000	R/W	Channel Select These bits and the MDS bits in ADCSR select the analog input channels.

MDS = 0xx	MDS = 100 or MDS = 110	MDS = 101 or MDS = 111

110: AN6	110: AN4 to AN6	110: AN0 to AN6
111: AN7	111: AN4 to AN7	111: AN0 to AN7

[Legend]
x: Don't care
Note 1. Only 0 can be written to clear the flag after 1 is read.
Note 2. Clear the ADST to stop A/D conversion before transition to software standby mode or module standby mode.
Note 3. Set the A/D conversion time to at least the minimum value to obtain the absolute accuracy specified for the A/D converter.
Note 4. t_{cyc} indicates a cycle time of the peripheral clock 1 (P1φ).

27.3.5 A/D Comparison Interrupt Enable Register (ADCMPER)

ADCMPER is a 16-bit readable/writable register that enables or disables comparison between the A/D data register (ADDR) that holds the A/D conversion result on each channel and the A/D comparison upper/lower limit value register (ADCMPH/ADCMPL), and enables or disables interrupt request.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HLMENH	HLMENG	HLMENF	HLMENE	HLMEND	HLMENC	HLMENB	HLMENA	LLMENH	LLMENG	LLMENF	LLMENE	LLMEND	LLMENC	LLMENB	LLMENA
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	HLMENH to HLMENA	All 0	R/W	Comparison with Upper Limit Value and Interrupt Enable Enables or disables comparison between an A/D conversion result and the upper limit value as well as an LMTI interrupt request in the case of the result being greater than the upper limit value. 0: Disables comparison between an A/D conversion result and the upper limit value as well as an over-limit interrupt (LMTI) request. 1: Enables comparison between an A/D conversion result and the upper limit value as well as an over-limit interrupt (LMTI) request.
7 to 0	LLMENH to LLMENA	All 0	R/W	Comparison with Lower Limit Value and Interrupt Enable Enables or disables comparison between an A/D conversion result and the lower limit value as well as an LMTI interrupt request in the case of the result being smaller than the lower limit value. 0: Disables comparison between an A/D conversion result and the lower limit value as well as an over-limit interrupt (LMTI) request. 1: Enables comparison between an A/D conversion result and the lower limit value as well as an over-limit interrupt (LMTI) request.

27.3.6 A/D Comparison Status Register (ADCMPSR)

ADCMPSR is a 16-bit read-only register that indicates the results of comparison between the A/D data register (ADDR) that holds an A/D conversion result on each channel and the A/D comparison upper/lower limit value register (ADCMPH/ADCMPL).

The bits in this register are valid only when the comparison and an LMTI interrupt are enabled in the A/D comparison interrupt enable register (ADCMPER). When they are disabled, the bits are always in the cleared state.

When an A/D conversion result exceeds the upper or lower limit value, the corresponding bit is set to 1.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HOVRH	HOVRG	HOVRF	HOVRE	HOVRD	HOVRC	HOVRB	HOVRA	LUDRH	LUDRG	LUDRF	LUDRE	LUDRD	LUDRC	LUDRB	LUDRA
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	HOVRH to HOVRA	All 0	R	Upper Limit Over Flag Status flag that indicates that an A/D conversion result on each channel has exceeded the upper limit value in ADCMPH. [Clearing condition] • Cleared by writing 0 to the HLMENn bit for the corresponding channel in ADCMPER register [Setting condition] The HLMEN bit for the corresponding channel in ADCMPER is 1, and an A/D conversion result for the corresponding channel that is greater than the upper limit value in ADCMPH is stored in the ADDR register
7 to 0	LUDRH to LUDRA	All 0	R	Lower Limit Under Flag Status flag that indicates that an A/D conversion result on each channel has exceeded the lower limit value in ADCMPL. [Clearing condition] • Cleared by writing 0 to the LLMENn bit for the corresponding channel in ADCMPER register [Setting condition] The LLMEN bit for the corresponding channel in ADCMPER is 1, and an A/D conversion result for the corresponding channel that is smaller than the lower limit value in ADCMPL is stored in the ADDR register

27.4 Operation

The A/D converter uses the successive-approximation method, and the resolution is 12 bits. It has three operating modes: single mode, multi mode, and scan mode. Switching the operating mode or analog input channels must be done while the ADST bit in ADCSR is 0 to prevent incorrect operation. The ADST bit can be set at the same time as the operating mode or analog input channels are changed.

27.4.1 Single Mode

Single mode should be selected when only A/D conversion on one channel is required.
In single mode, A/D conversion is performed once for the specified one analog input channel, as follows:

1. A/D conversion for the selected channel starts when the ADST bit in ADCSR is set to 1 by software, the multi-function timer pulse unit 2, or external trigger input.
2. When A/D conversion is completed, the A/D conversion result is transferred to the A/D data register corresponding to the channel.
3. After A/D conversion has completed, the ADF bit in ADCSR is set to 1. If the ADIE bit is set to 1 at this time, an ADI interrupt request is generated.
4. The ADST bit that remains 1 during A/D conversion is automatically cleared to 0 when A/D conversion is completed, and the A/D converter becomes idle.

When the operating mode or analog input channel selection must be changed during A/D conversion, to prevent incorrect operation, first clear the ADST bit to 0 to halt A/D conversion. After making the necessary changes, set the ADST bit to 1 to start A/D conversion again. The ADST bit can be set at the same time as the mode or channel selection is switched.

Typical operations when a single channel (AN1) is selected in single mode (MDS[2] = 0) are described next. Figure 27.2 shows a timing diagram for this example (the bits which are set in this example belong to ADCSR).

1. Single mode is selected, input channel AN1 is selected (CH[2:0] = 001), the A/D interrupt is enabled (ADIE = 1), and A/D conversion is started (ADST = 1).
2. When A/D conversion is completed, the A/D conversion result is transferred into ADDRB. At the same time the ADF flag is set to 1, the ADST bit is cleared to 0, and the A/D converter becomes idle.
3. Since ADF = 1 and ADIE = 1, an ADI interrupt is requested.
4. The A/D interrupt handling routine starts.
5. The routine reads ADF = 1, and then writes 0 to the ADF flag.
6. The routine reads and processes the A/D conversion result (ADDRB).
7. Execution of the A/D interrupts handling routine ends. Then, when the ADST bit is set to 1, A/D conversion starts and steps 2 to 7 are executed.

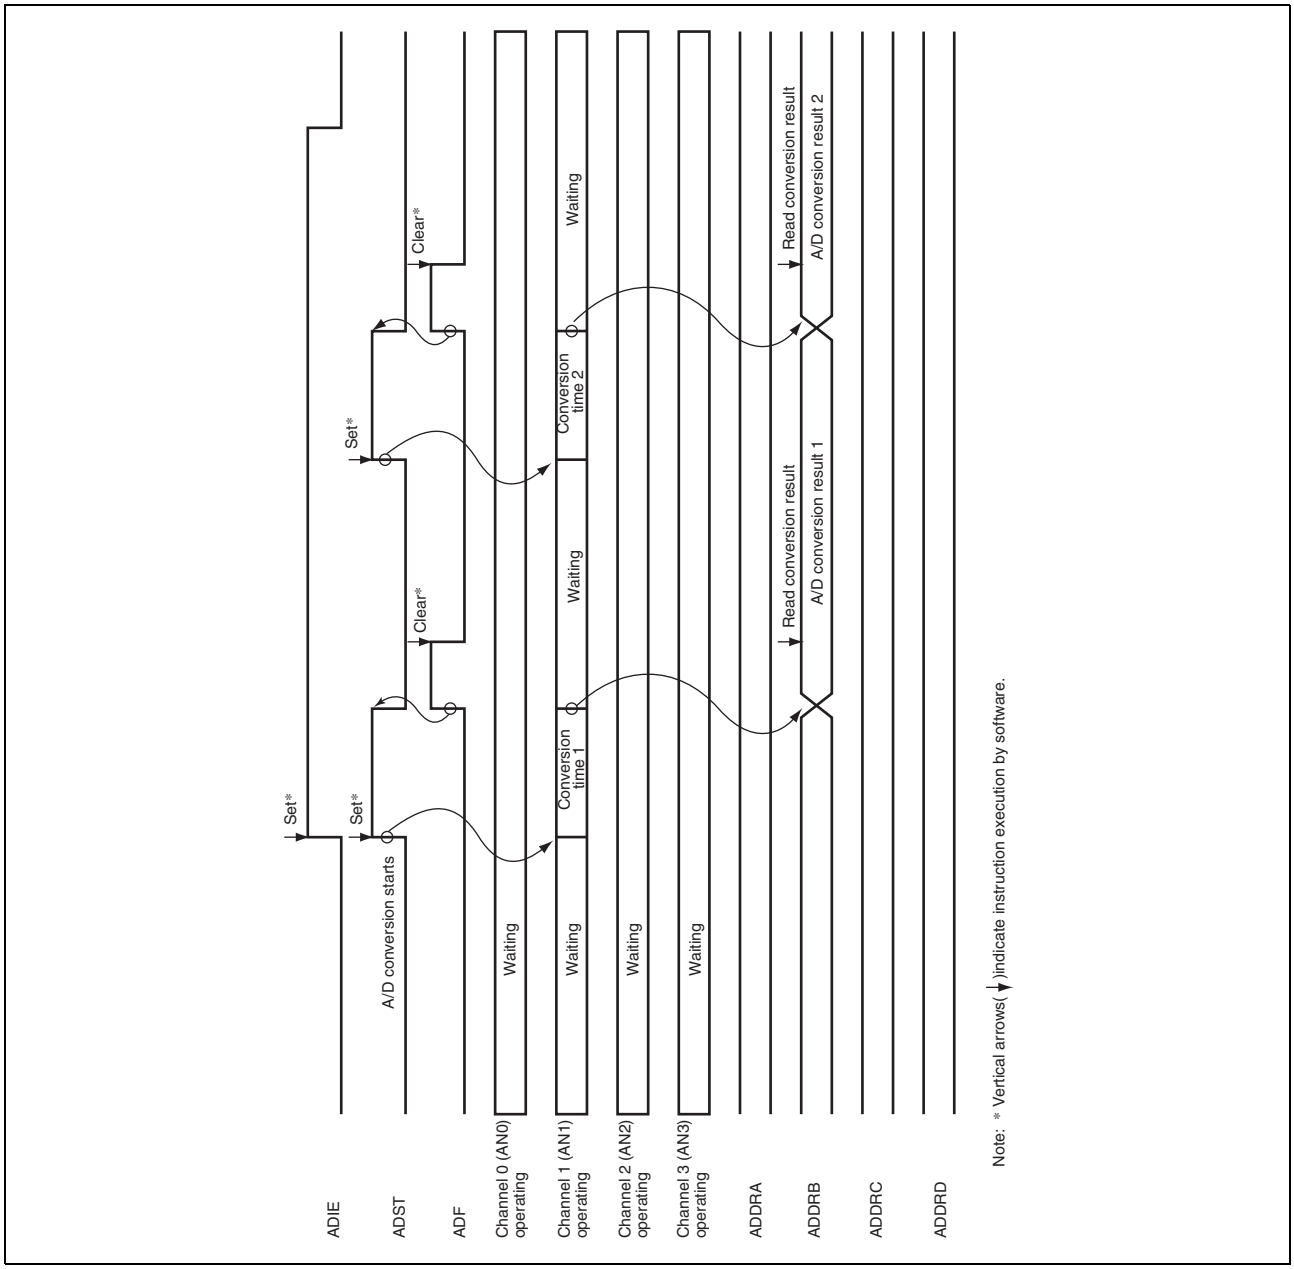

Figure 27.2 Example of A/D Converter Operation (Single Mode, One Channel (AN1) Selected)

27.4.2 Multi Mode

Multi mode should be selected when performing A/D conversion once on one or more channels.
In multi mode, A/D conversion is performed once for a maximum of eight specified analog input channels, as follows:

1. A/D conversion starts from the analog input channel with the lowest number (e.g. AN0, AN1, …, AN3) when the ADST bit in ADCSR is set to 1 by software, the multi-function timer pulse unit 2, or external trigger input.
2. When A/D conversion is completed on each channel, the A/D conversion result is sequentially transferred to the A/D data register corresponding to that channel.
3. After A/D conversion on all selected channels has completed, the ADF bit in ADCSR is set to 1. If the ADIE bit is set to 1 at this time, an ADI interrupt request is generated.
4. The ADST bit that remains 1 during A/D conversion is automatically cleared to 0 when A/D conversion is completed, and the A/D converter becomes idle. If the ADST bit is cleared to 0 during A/D conversion, A/D conversion is halted and the A/D converter becomes idle. The ADF bit is cleared by reading ADF while ADF = 1, then writing 0 to the ADF bit.

A/D conversion is to be performed once on all the specified channels. The conversion results are transferred for storage into the A/D data registers (ADDR) corresponding to the channels.
When the operating mode or analog input channel selection must be changed during A/D conversion, to prevent incorrect operation, first clear the ADST bit to 0 to halt A/D conversion. After making the necessary changes, set the ADST bit to 1. A/D conversion will start again from the first channel in the group. The ADST bit can be set at the same time as the mode or channel selection is changed.
Typical operations when three channels (AN0 to AN2) are selected in multi mode are described next. Figure 27.3 shows a timing diagram for this example.

1. Multi mode is selected (MDS[2] = 1, MDS[1] = 0), analog input channels AN0 to AN2 are selected (CH[2:0] = 010), and A/D conversion is started (ADST = 1).
2. A/D conversion of the first channel (AN0) starts. When A/D conversion is completed, the A/D conversion result is transferred into ADDRA.
3. Next, the second channel (AN1) is selected automatically and A/D conversion starts.
4. Conversion proceeds in the same way through the third channel (AN2).
5. When conversion of all selected channels (AN0 to AN2) is completed, the ADF flag is set to 1 and the ADST bit is cleared to 0.
6. If the ADIE bit is set to 1 at this time, an ADI interrupt is requested.

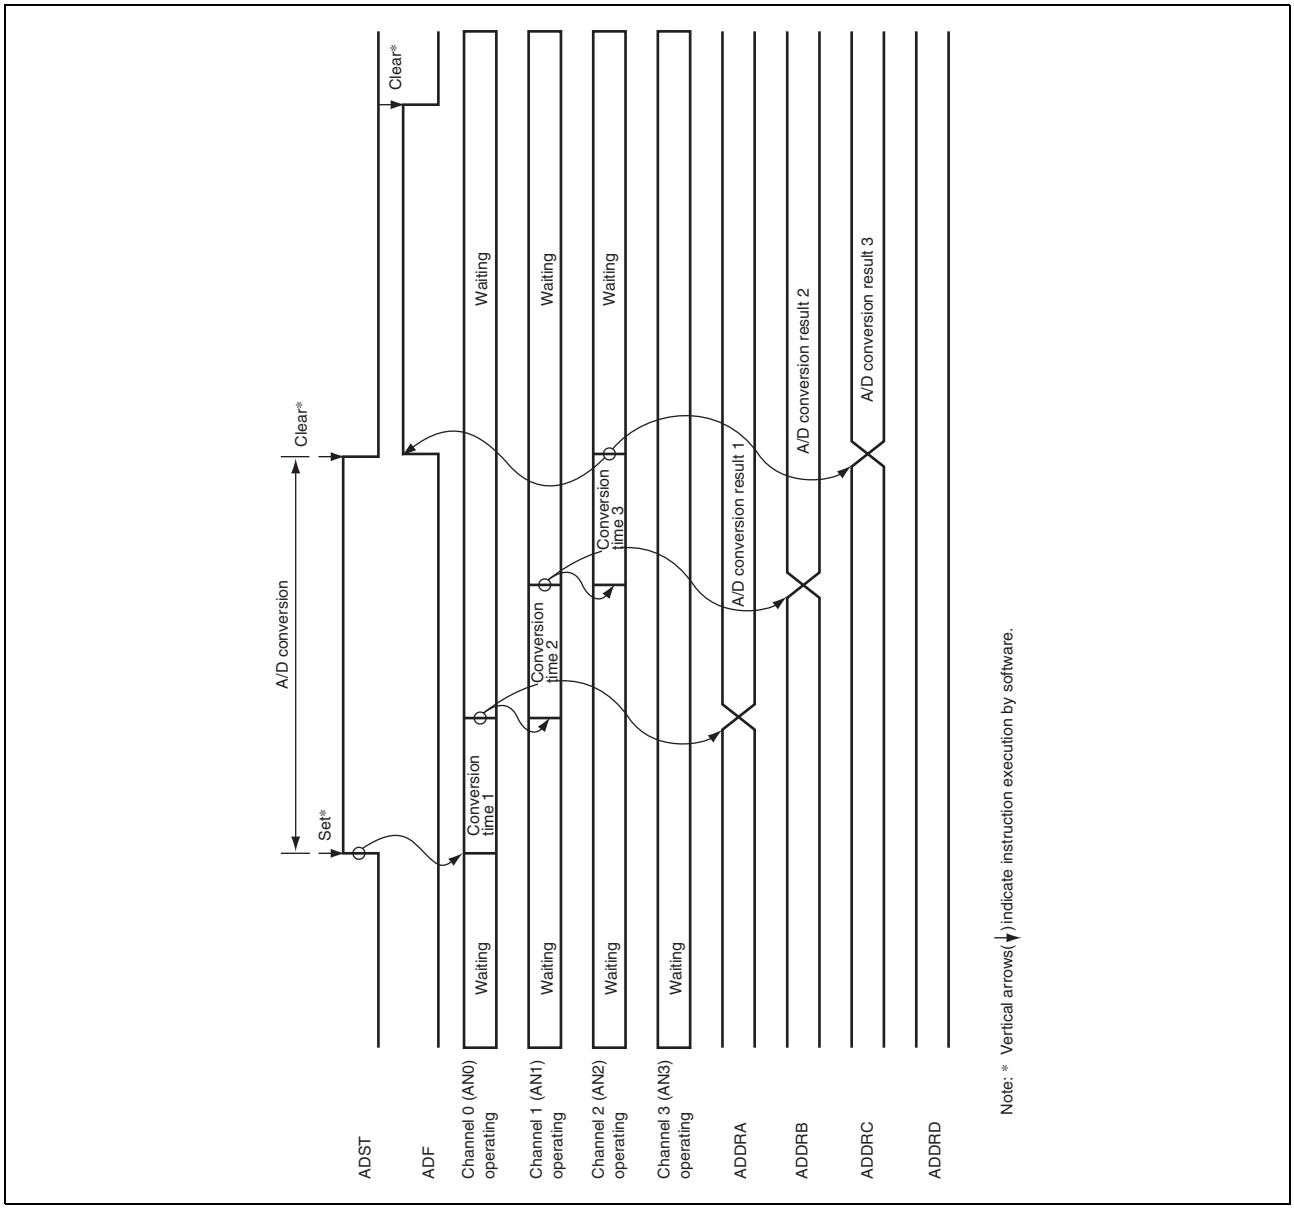

Figure 27.3 Example of A/D Converter Operation (Multi Mode, Three Channels (AN0 to AN2) Selected)

27.4.3 Scan Mode

Scan mode is useful for monitoring analog inputs in a group of one or more channels at all times. In scan mode, A/D conversion is performed sequentially for a maximum of eight specified analog input channels, as follows:

1. A/D conversion starts from the analog input channel with the lowest number (e.g. AN0, AN1, …, AN3) when the ADST bit in ADCSR is set to 1 by software, the multi-function timer pulse unit 2, or external trigger input.
2. When A/D conversion is completed on each channel, the A/D conversion result is sequentially transferred to the A/D data register corresponding to that channel.
3. After A/D conversion on all selected channels has completed, the ADF bit in ADCSR is set to 1. If the ADIE bit is set to 1 at this time, an ADI interrupt request is generated. The A/D converter starts A/D conversion again from the channel with the lowest number.
4. The ADST bit is not cleared automatically, so steps 2. and 3. are repeated as long as the ADST bit remains set to 1. When the ADST bit is cleared to 0, A/D conversion halts and the A/D converter becomes idle.
   The ADF bit is cleared by reading ADF while ADF = 1, then writing 0 to the ADF bit.

When the operating mode or analog input channel selection must be changed during A/D conversion, to prevent incorrect operation, first clear the ADST bit to 0 to halt A/D conversion. After making the necessary changes, set the ADST bit to 1. A/D conversion will start again from the first channel in the group. The ADST bit can be set at the same time as the mode or channel selection is changed.
Typical operations when three channels (AN0 to AN2) are selected in scan mode are described as follows. Figure 27.4 shows a timing diagram for this example.

1. Scan mode is selected (MDS[2] = 1, MDS[1] = 1), analog input channels AN0 to AN2 are selected (CH[2:0] = 010), and A/D conversion is started (ADST = 1).
2. A/D conversion of the first channel (AN0) starts. When A/D conversion is completed, the A/D conversion result is transferred into ADDRA.
3. Next, the second channel (AN1) is selected automatically and A/D conversion starts.
4. Conversion proceeds in the same way through the third channel (AN2).
5. When conversion of all the selected channels (AN0 to AN2) is completed, the ADF flag is set to 1 and conversion of the first channel (AN0) starts again. If the ADIE bit is set to 1 at this time, an ADI interrupt is requested after A/D conversion of the third channel.
6. The ADST bit is not cleared automatically, so steps 2. to 4. are repeated as long as the ADST bit remains set to 1. When steps 2. to 4. are repeated, the ADF flag is kept to 1. When the ADST bit is cleared to 0, A/D conversion stops. The ADF bit is cleared by reading ADF while ADF = 1, then writing 0 to the ADF bit.

If both the ADF flag and ADIE bit are set to 1 while steps 2. to 4. are repeated, an ADI interrupt is requested at all times. To generate an interrupt on completing conversion of the third channel, clear the ADF bit to 0 after an interrupt is requested.

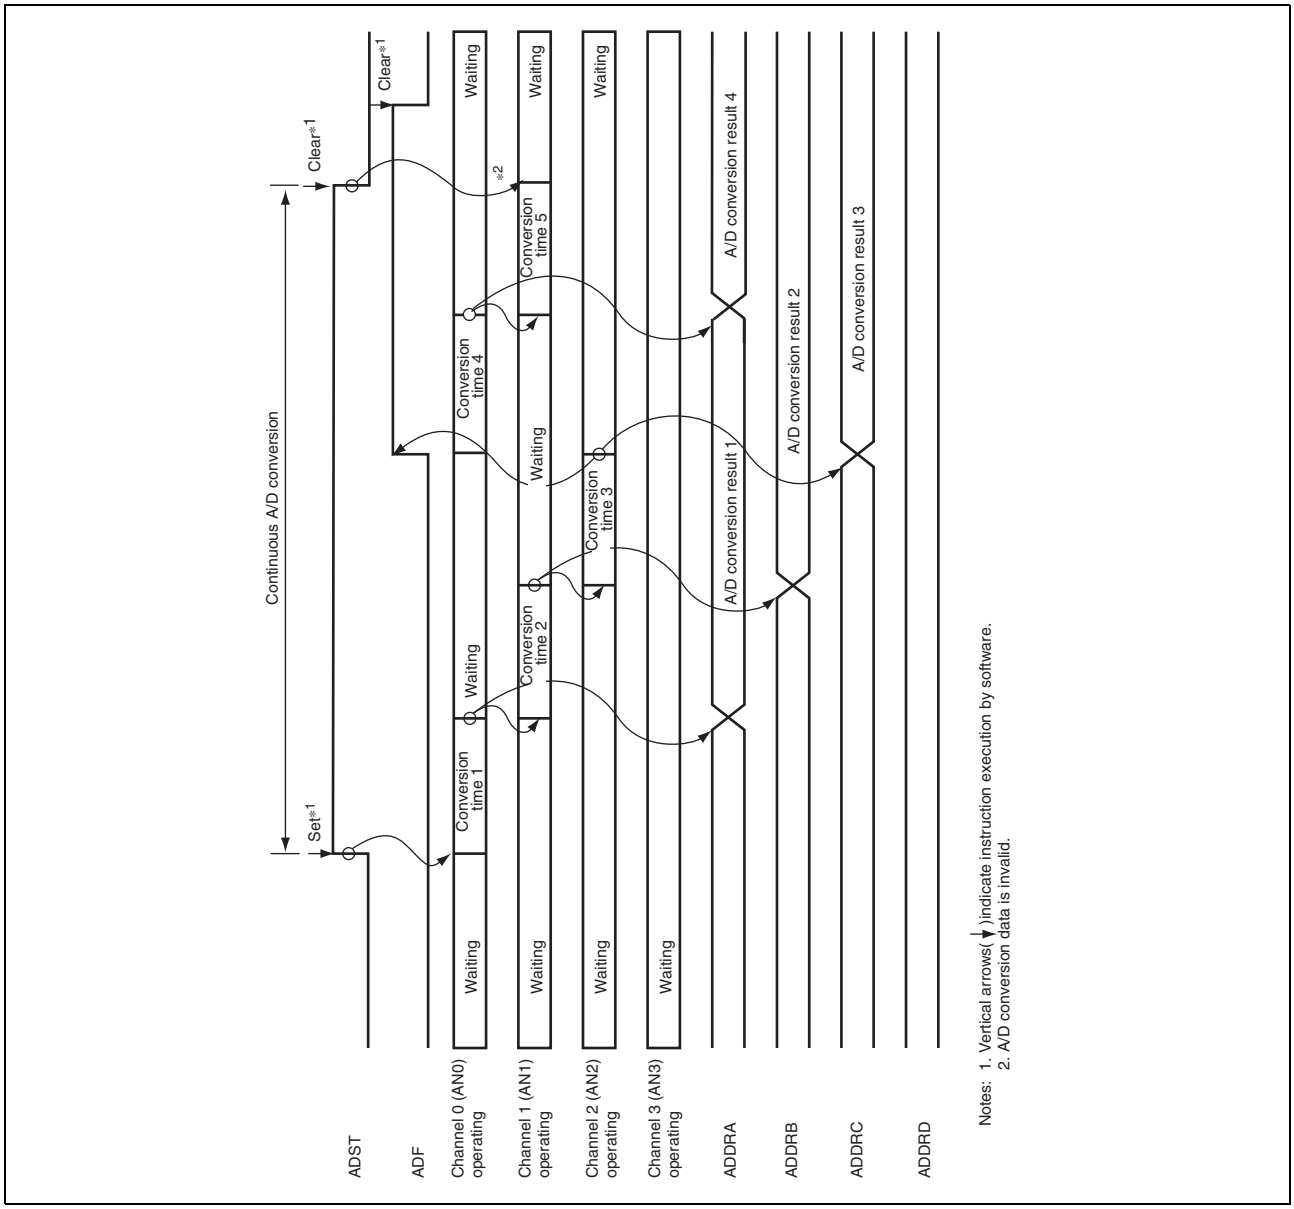

Figure 27.4 Example of A/D Converter Operation (Scan Mode, Three Channels (AN0 to AN2) Selected)

27.4.4 A/D Converter Activation by External Trigger or Multi-Function Timer Pulse Unit 2

The A/D converter can be independently activated by an external trigger or an A/D conversion request from the multi-function timer pulse unit 2. To activate the A/D converter by an external trigger or the multi-function timer pulse unit 2, set the A/D trigger enable bits (TRGS[3:0]). When an external trigger or an A/D conversion request from the multi-function timer pulse unit 2 is generated with this bit setting, the ADST bit is set to 1 to start A/D conversion. The channel combination is determined by bits CH2 to CH0 in ADCSR. The timing from setting of the ADST bit until the start of A/D conversion is the same as when 1 is written to the ADST bit by software.

27.4.5 Input Sampling and A/D Conversion Time

The A/D converter has a built-in sample-and-hold circuit. The A/D converter samples the analog input at the A/D conversion start delay time (t_D) after the ADST bit in ADCSR is set to 1, then starts conversion. Figure 27.5 shows the A/D conversion timing. Table 27.5 indicates the A/D conversion time.
As indicated in Figure 27.5, the A/D conversion time (t_{CONV}) includes t_D and the input sampling time(t_{SPL}). The length of t_D varies depending on the timing of the write access to ADCSR. The total conversion time therefore varies within the ranges indicated in Table 27.5.
In multi mode and scan mode, the values given in Table 27.5 apply to the first conversion. In the second and subsequent conversions, time is the values given in Table 27.6.

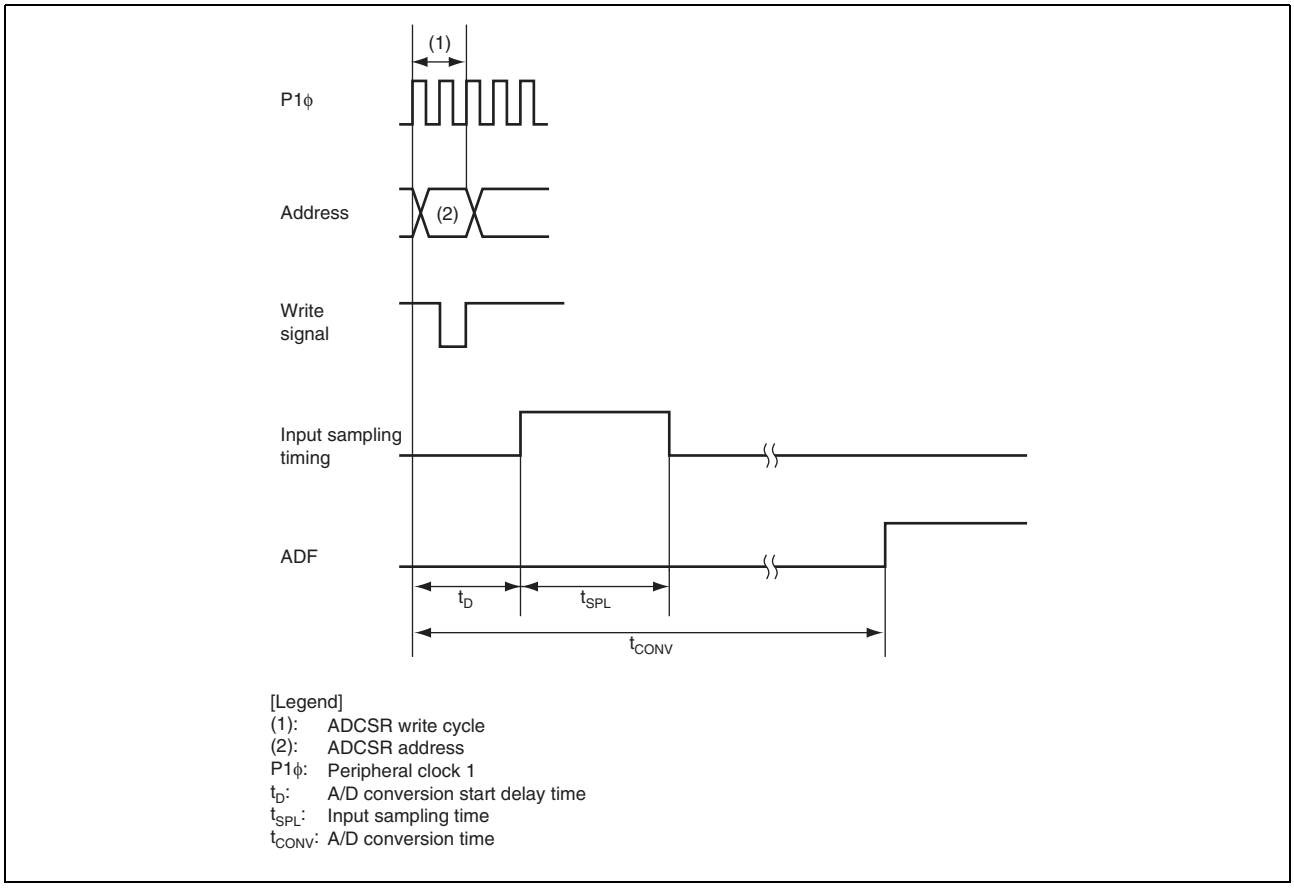

Figure 27.5 A/D Conversion Timing

Table 27.5 A/D Conversion Time (Single Mode)

		CKS1 = 0						CKS1 = 1					
		CKS0 = 0			CKS0 = 1			CKS0 = 0			CKS0 = 1		
Item	**Symbol**	**Min.**	**Typ.**	**Max.**	**Min.**	**Typ.**	**Max.**	**Min.**	**Typ.**	**Max.**	**Min.**	**Typ.**	**Max.**
A/D conversion start delay time	t_D	9	—	14	10	—	16	11	—	18	12	—	20
Input sampling time	t_{SPL}	—	78	—	—	91	—	—	104	—	—	117	—
A/D conversion time	t_{CONV}	251	—	256	292	—	298	333	—	340	374	—	382

Note: Values in the table are represented in terms of t_{cyc}. t_{cyc} indicates a cycle time of the peripheral clock 1 (P1φ).

Table 27.6 A/D Conversion Time (Multi Mode and Scan Mode)

CKS1	CKS0	Conversion Time (t_{cyc})
0	0	240 (constant)
	1	280 (constant)
1	0	320 (constant)
	1	360 (constant)

Note: Values in the table are represented in terms of t_{cyc}. t_{cyc} indicates a cycle time of the peripheral clock 1 (P1φ).

27.4.6 External Trigger Input Timing

A/D conversion can also be externally triggered. When the TRGS[3:0] bits in ADCSR are set to B'1001, an external trigger is input to the $\overline{\text{ADTRG}}$ pin. The ADST bit in ADCSR is set to 1 at the falling edge of the $\overline{\text{ADTRG}}$ pin, thus starting A/D conversion. Other operations, regardless of the operating mode, are the same as when the ADST bit has been set to 1 by software. Figure 27.6 shows the timing.

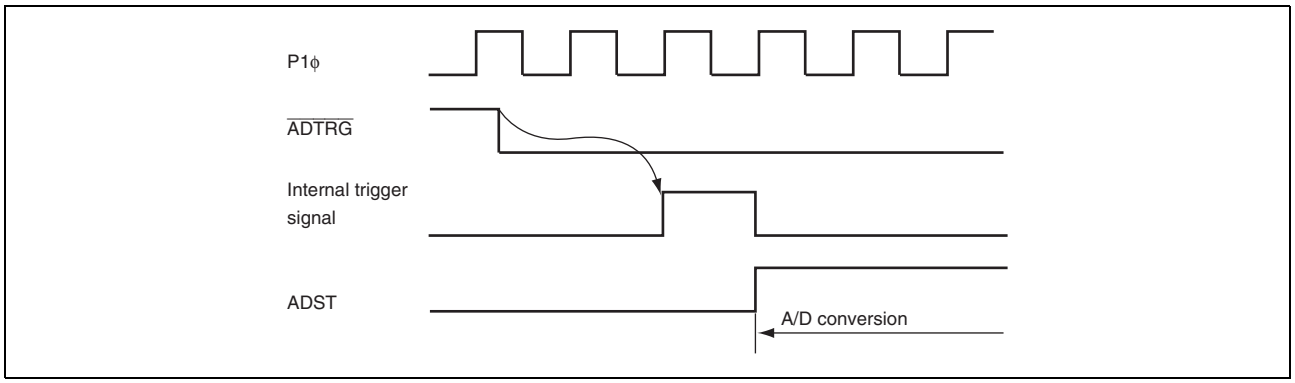

Figure 27.6 External Trigger Input Timing

27.5 Interrupt Sources and DMA Transfer Request

The A/D converter generates an A/D conversion end interrupt (ADI) and an over-limit interrupt (LMTI). The direct memory access controller can be activated by an ADI interrupt request depending on the setting of the direct memory access controller.

Table 27.7 shows the relationship between interrupt sources and the DMA transfer request.

Table 27.7 Relation between Interrupt Sources and DMA Transfer Request

Name	Interrupt Source	Interrupt Flag	Direct Memory Access Controller Activation
ADI	A/D conversion end	ADF in ADCSR	Possible
LMTI	Conversion result exceeding the limit value	HOVRA to HOVRH and LUDRA to LUDRH in ADCMPSR	Impossible

(a) ADI Interrupt

The A/D converter generates an A/D conversion end interrupt (ADI) at the end of A/D conversion. An ADI interrupt request is generated if the ADIE bit is set to 1 when the ADF bit in ADCSR is set to 1 on completion of A/D conversion. Note that the direct memory access controller can be activated by an ADI interrupt depending on the setting of the direct memory access controller. In this case, an interrupt is not issued to the CPU. If the setting to activate the direct memory access controller has not been made, an interrupt request is sent to the CPU. Having the converted data read by the direct memory access controller in response to an ADI interrupt enables continuous conversion to be achieved without imposing a load on software.

In single mode, set the direct memory access controller so that DMA transfer initiated by an ADI interrupt is performed only once. In the case of A/D conversion on multiple channels in scan mode or multi mode, setting the DMA transfer count to one causes DMA transfer to finish after transferring only one channel of data. To make the direct memory access controller transfer all conversion data, set the ADDR where A/D conversion data is stored as the transfer source address, and the number of converted channels as the transfer count.

When the direct memory access controller is activated by ADI, the ADF bit in ADCSR is automatically cleared to 0 when data is transferred by the direct memory access controller.

(b) LMTI Interrupt

An A/D conversion result is compared with the upper or lower limit value on each channel, and if the result exceeds the limit, the over-limit interrupt (LMTI) is generated. While the HLMEN bit in ADCMPER is 1, a conversion result is compared with the upper limit in ADCMPH the instant the conversion value is determined. When the value exceeds the upper limit, the corresponding bit in ADCMPSR is set to 1, which causes an LMTI interrupt to be generated. In the same way, while the LLMEN bit in ADCMPER is 1, a conversion result is compared with the lower limit. If it exceeds the limit, an LMTI interrupt request is generated.

The ADCMPSR register can be referenced in the LMTI interrupt handling to identify the channel causing over-limit value and to know whether the result has exceeded the upper limit value or the lower one.

27.6 Definitions of A/D Conversion Accuracy

The A/D converter compares an analog value input from an analog input channel with its analog reference value and converts it to 12-bit digital data. The absolute accuracy of this A/D conversion is the deviation between the input analog value and the output digital value. It includes the following errors:

- Offset error
- Full-scale error
- Quantization error
- Nonlinearity error

These four error quantities are explained below with reference to Figure 27.7. In the figure, the 12-bit A/D converter is illustrated as the 3-bit A/D converter for explanation. Offset error is the deviation between actual and ideal A/D conversion characteristics when the digital output value changes from the minimum (zero voltage) B'000000000000 (000 in the figure) to B'000000000001 (001 in the figure) (Figure 27.7, item (1)). Full-scale error is the deviation between actual and ideal A/D conversion characteristics when the digital output value changes from B'111111111110 (110 in the figure) to the maximum B'111111111111 (111 in the figure)(Figure 27.7, item (2)). Quantization error is the intrinsic error of the A/D converter and is expressed as 1/2 LSB (Figure 27.7, item (3)). Nonlinearity error is the deviation between actual and ideal A/D conversion characteristics between zero voltage and full-scale voltage (Figure 27.7, item (4)). Note that it does not include offset, full-scale, or quantization error.

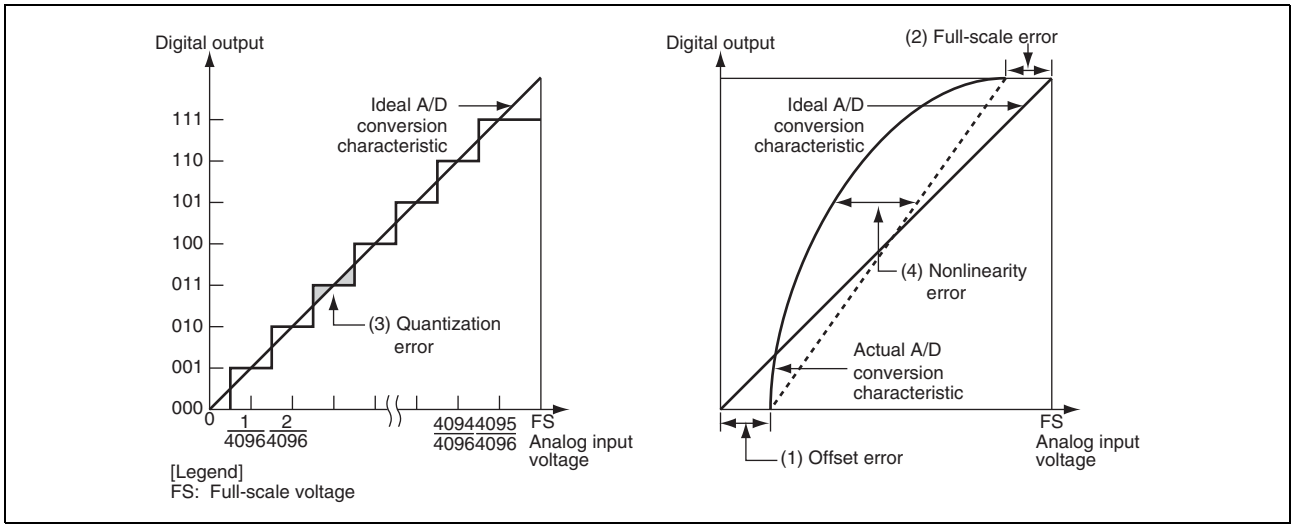

Figure 27.7 Definitions of A/D Conversion Accuracy

27.7 Usage Notes

When using the A/D converter, note the following points.

27.7.1 Module Standby Mode Setting

Operation of the A/D converter can be disabled or enabled using the standby control register. The initial setting is for operation of the A/D converter to be halted. Register access is enabled by clearing module standby mode. For details, see section 42, Power-Down Modes. The wait time (20 µs) is required after release from the module standby state. After the wait time has elapsed, perform conversion by the A/D converter.

27.7.2 Setting Analog Input Voltage

Using the LSI outside the following voltage ranges may impair the LSI reliability.

1. Analog input range
   During A/D conversion, voltages on the analog input pins ANn should not go beyond the following range: AVss ≤ ANn ≤ AVcc (n = 0 to 7).
2. AVcc and AVss input voltages
   Input voltages AVcc and AVss should be PVcc – 0.3 V ≤ AVcc ≤ PVcc and AVss = Vss. Do not leave the AVcc and AVss pins open even when the A/D converter is not in use and in software standby mode. When not in use, connect AVcc to the power supply (PVcc) and AVss to the ground (Vss).
3. Setting range of AVref input voltage
   Set the reference voltage range of the AVref pin as 3.0 V ≤ AVref ≤ AVcc.

27.7.3 Notes on Board Design

In board design, digital circuitry and analog circuitry should be as mutually isolated as possible, and layout in which digital circuit signal lines and analog circuit signal lines cross or are in close proximity should be avoided as far as possible. Failure to do so may result in incorrect operation of the analog circuitry due to inductance, adversely affecting A/D conversion values.
Digital circuitry must be isolated from the analog input signals (AN0 to AN7), analog reference voltage (AVref), and analog power supply (AVcc) by the analog ground (AVss). Also, the analog ground (AVss) should be connected at one point to a stable digital ground (Vss) on the board.

27.7.4 Processing of Analog Input Pins

To prevent damage from voltage surges at the analog input pins (AN0 to AN7), connect an input protection circuit like the one shown in Figure 27.8. The circuit shown also includes a CR filter to suppress noise. This circuit is shown as an example; the circuit constants should be selected according to actual application conditions.

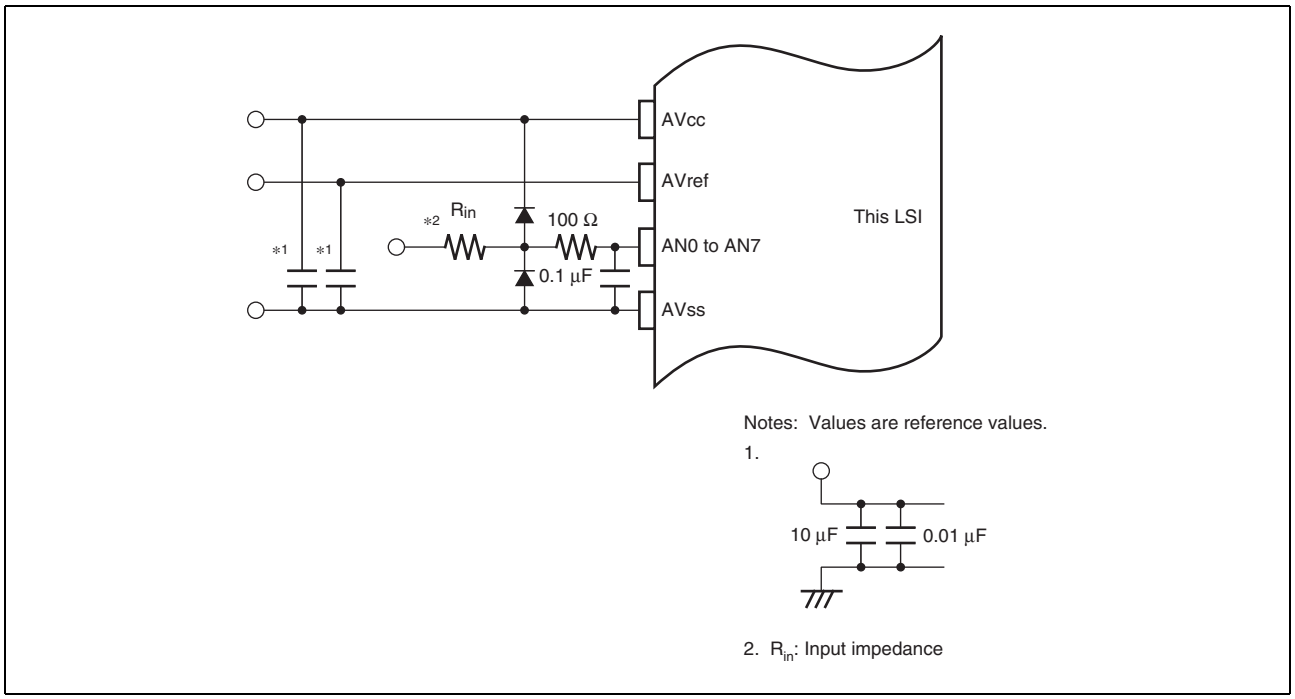

Figure 27.8 Example of Analog Input Protection Circuit

27.7.5 Permissible Signal Source Impedance

This LSI's analog input is designed such that conversion precision is guaranteed for an input signal for which the signal source impedance is 3 kΩ or less. This specification is provided to enable the A/D converter's sample-and-hold circuit input capacitance to be charged within the sampling time; if the sensor output impedance exceeds 3 kΩ, charging may be insufficient and it may not be possible to guarantee A/D conversion precision. However, for A/D conversion in single mode with a large capacitance provided externally for A/D conversion in single mode, the input load will essentially comprise only the internal input resistance of 1 kΩ, and the signal source impedance is ignored. However, as a low-pass filter effect is obtained in this case, it may not be possible to follow an analog signal with a large differential coefficient (e.g., 5 mV/µs or greater) (see Figure 27.9). When converting a high-speed analog signal or performing A/D conversion in scan mode, a low-impedance buffer should be inserted.

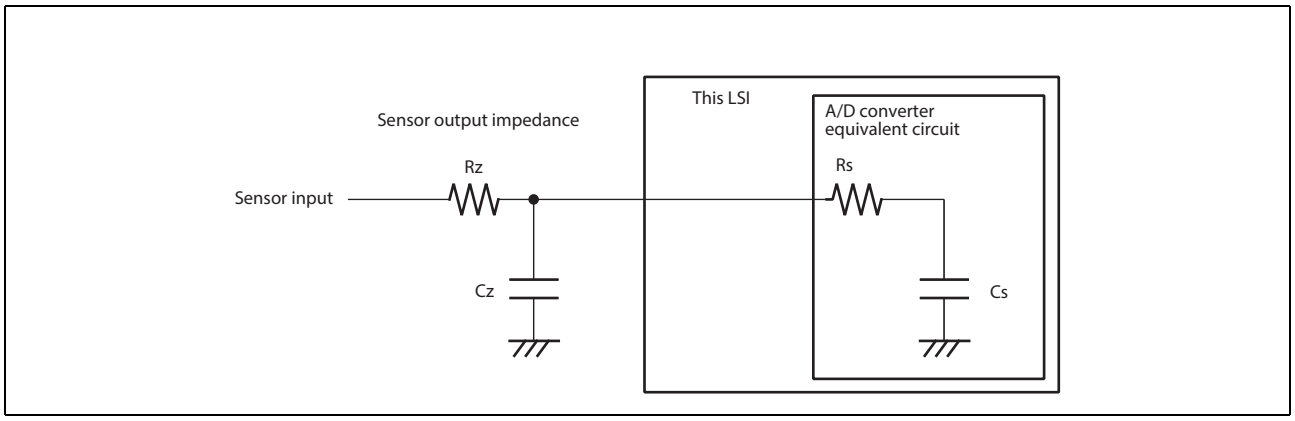

Figure 27.9 Example of Analog Input Circuit

Table 27.8 Analog Input Pin Ratings

Item	Symbol	Min.	Max.	Unit
Permissible Signal Source Impedance	Rz	—	3	kΩ
Low-Pass Filter	Cz	—	0.1	µF
Equivalent Circuit of A/D Converter	Rs	—	1	kΩ
	Cs	—	20	pF

Note: Values are reference values.

27.7.6 Influences on Absolute Precision

Adding capacitance results in coupling with GND, and therefore noise in GND may adversely affect absolute precision. Be sure to connect AVss, etc. to an electrically stable GND.

Care is also required to insure that filter circuits do not communicate with digital signals on the mounting board (i.e., acting as antennas).

27.7.7 Usage Note on Port Pins

The analog input pins (AN0 to AN7) are multiplexed with general-purpose I/O port pin functions (pins P1_8 to P1_15) and the latter can be used as digital inputs. Do not use these general-purpose I/O port pins as digital inputs while the A/D converter is in use with 12-bit precision.

28. USB2.0 Host/Function Module

This LSI includes a two-channel USB 2.0 host/function module. This module is a USB controller which provides capabilities as a USB host controller and USB function controller.
This module supports high-speed transfer, full-speed transfer, and low-speed transfer defined by USB (Universal Serial Bus) Specification 2.0, when used as the host controller, and supports high-speed transfer and full-speed transfer defined by USB (Universal Serial Bus) Specification 2.0, when used as the function controller.
This module supports all of the transfer types defined by the USB Specification. This module has an 8-Kbyte buffer memory for data transfer, providing a maximum of 16 pipes. Any endpoint numbers can be assigned to PIPE1 to PIPE15, based on the peripheral devices or user system for communication.

28.1 Features

(1) Host Controller and Function Controller Supporting USB High-Speed Operation

- The USB host controller and USB function controller are incorporated.
- The USB host controller and USB function controller can be switched by register settings.
- On-chip USB transceiver

(2) All Types of USB Transfers Supported

All types of USB transfers including isochronous transfer are supported.

- Control transfer
- Bulk transfer
- Interrupt transfer (high bandwidth transfers not supported)
- Isochronous transfer (high bandwidth transfers not supported)

(3) Internal Bus Interfaces

- Two DMA interfaces available for each channel

(4) Pipe Configuration

- Up to 8 Kbytes of buffer memory for USB communications are supported for each channel
- Up to sixteen pipes can be selected for each channel (including the default control pipe)
- Programmable pipe configuration
- Endpoint numbers can be assigned flexibly to PIPE1 to PIPE15.
- Transfer conditions that can be set for each pipe:

PIPE0:	Control transfer, 256-byte fixed single buffer
PIPE1 and PIPE2:	Bulk transfer or isochronous transfer can be selected, continuous transfer mode, programmable buffer size (up to 2 Kbytes: double buffer can be specified)
PIPE3 to PIPE5:	Bulk transfer, continuous transfer mode, programmable buffer size (up to 2 Kbytes: double buffer can be specified)
PIPE6 to PIPE8:	Interrupt transfer, 64-byte fixed single buffer
PIPE9:	Bulk transfer (only when the function controller mode is selected) Interrupt transfer (only when the host controller mode is selected), programmable buffer size (up to 2 Kbytes: double buffer can be specified only when bulk transfer has been selected)
PIPE10	Bulk transfer or interrupt transfer can be selected (only when the function controller mode is selected), programmable buffer size (up to 2 Kbytes: double buffer can be specified only when bulk transfer has been selected)

PIPE11 to PIPE15: Bulk transfer (only when the function controller mode is selected), programmable buffer size (up to 2 Kbytes: double buffer can be specified)

(5) Features of the USB Host Controller

- High-speed transfer (480 Mbps), full-speed transfer (12 Mbps), and low-speed transfer (1.5 Mbps) are supported.
- Communications with multiple peripheral devices connected via a single HUB
- Automatic response to the reset handshake
- Automatic scheduling for SOF and packet transmissions
- Programmable intervals for isochronous and interrupt transfers

(6) Features of the USB Function Controller

- High-speed transfer (480 Mbps) and full-speed transfer (12 Mbps) are supported.
- Automatic recognition of high-speed operation or full-speed operation based on automatic response to the reset handshake
- Control transfer stage monitoring function
- Device state monitoring function
- Auto response function for SET_ADDRESS request
- NAK response interrupt function (NRDY)
- SOF interpolation function

(7) Other Features

- Transfer ending function using transaction count
- BRDY interrupt event notification timing change function (BFRE)
- Function that automatically clears the buffer memory after the data for the pipe specified at the DnFIFO port has been read (DCLRM)
- NAK setting function for response PID generated by end of transfer (SHTNAK)

28.2 Input/Output Pins

Table 28.1 shows the pin configuration.

Table 28.1 Pin Configuration

Channel	Name	Pin Name	I/O	Function
0	USB D+ data	DP0	Input/ Output	The D+ input/output pin of the on-chip USB transceiver Connect this pin to the D+ pin of the USB bus.
	USB D- data	DM0	Input/ Output	The D- input/output pin of the on-chip USB transceiver Connect this pin to the D- pin of the USB bus.
	VBUS input	VBUS0	Input	A pin for monitoring connection of the USB cable Connect this pin to the Vbus pin of the USB bus so that it can detect connection and disconnection of the Vbus pin. When it is not connected to the Vbus pin of the USB, It should be fixed to 5 V. Also supply 5 V to this pin when the host controller mode is selected. Note: This module is not capable of supplying Vbus power to connected peripheral devices.
1	USB D+ data	DP1	Input/ Output	The D+ input/output pin of the on-chip USB transceiver Connect this pin to the D+ pin of the USB bus.
	USB D- data	DM1	Input/ Output	The D- input/output pin of the on-chip USB transceiver Connect this pin to the D- pin of the USB bus.
	VBUS input	VBUS1	Input	A pin for monitoring connection of the USB cable Connect this pin to the Vbus pin of the USB bus so that it can detect connection and disconnection of the Vbus pin. When it is not connected to the Vbus pin of the USB, It should be fixed to 5 V. Also supply 5 V to this pin when the host controller mode is selected. Note: This module is not capable of supplying Vbus power to connected peripheral devices.
Common	Reference input	REFRIN	Input	A pin for connecting the reference resistor Connect this pin to the USBAPVss pin through a resistor with a value of 5.6 kΩ ± 1%. (QFP package) Connect this pin to the Vss pin through a resistor with a value of 5.6 kΩ ± 1%. (BGA package)
	USB crystal oscillator/external clock	USB_X1	Input	Connect this pin to the crystal oscillator for USB. An external clock can also be input to the USB_X1 pin.
		USB_X2	Output	
	Transceiver digital core power*	USBDVcc	Input	Power supply for the module's digital core
	Transceiver digital core ground*	USBDVss	Input	Ground for the module's digital core
	Transceiver digital pin power source*	USBDPVcc	Input	Power supply for pins
	Transceiver digital pin ground*	USBDPVss	Input	Ground for pins
	Transceiver analog pin power source	USBAPVcc	Input	Power supply for pins
	Transceiver analog pin ground*	USBAPVss	Input	Ground for pins
	Transceiver analog core power	USBAVcc	Input	Power supply for the module's digital core
	Transceiver analog core ground*	USBAVss	Input	Ground for the module's digital core
	Power source for the UTMI module*	USBUVcc	Input	Power supply for operation at 480 MHz
	Ground for the UTMI module*	USBUVss	Input	Power supply for operation at 480 MHz

Note: *These pins are not present on products in the BGA package.

28.3 Register Descriptions

Table 28.2 shows the register configuration of this module.

Table 28.2 Register Configuration

Channel	Register Name	Abbreviation	R/W	Address	Access Size
0	System configuration control register_0	SYSCFG0_0	R/W	H'E801 0000	16

28.3.1 System Configuration Control Register (SYSCFG0)

SYSCFG is a register that enables high-speed operation, selects the host controller mode or function controller mode, controls the DP and DM pins, and enables operation of this module.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	HSE	DCFM	DRPD	DPRPU	—	UCK SEL	UPLLE	USBE
Initial value:	—	—	—	—	—	—	—	0	0	0	1	0	—	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
8	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
7	HSE	0	R/W	High-Speed Operation Enable 0: High-speed operation is disabled When the function controller mode is selected: Only full-speed operation is enabled. When the host controller mode is selected: Full-speed or low-speed operation is enabled. 1: High-speed operation is enabled (communication speed is detected by this module) (1) When the host controller mode is selected When HSE = 0, the USB port performs low-speed or full-speed operation. Set HSE to 0 when connection of a low-speed peripheral device to the USB port has been detected. When HSE = 1, this module executes the reset handshake protocol, and automatically allows the USB port to perform high-speed or full-speed operation according to the protocol execution result. This bit should be modified after detecting device connection (after detecting the ATTCH interrupt) and before executing a USB bus reset (before setting USBRST to 1). (2) When the function controller mode is selected When HSE = 0, this module performs full-speed operation. When HSE = 1, this module executes the reset handshake protocol, and automatically performs high-speed or full-speed operation according to the protocol execution result. This bit should be modified while DPRPU is 0.
6	DCFM	0	R/W	Controller Mode Select Selects the host controller mode or function controller mode. 0: Function controller mode is selected. 1: Host controller mode is selected. This bit should be modified while DPRPU and DRPD are 0.
5	DRPD	1	R/W	D+/D− Line Resistor Control Enables or disables pulling down D+ and D- lines when the host controller mode is selected. 0: Pulling down the lines is disabled. 1: Pulling down the lines is enabled. This bit should be set to 1 if the host controller mode is selected, and should be set to 0 if the function controller mode is selected.

Bit	Bit Name	Initial Value	R/W	Description
4	DPRPU	0	R/W	D+ Line Resistor Control Enables or disables pulling up D+ line when the function controller mode is selected. 0: Pulling up the line is disabled. 1: Pulling up the line is enabled. Setting this bit to 1 when the function controller mode is selected allows this module to pull up the D+ line, thus notifying the USB host of connection. Modifying this bit from 1 to 0 allows this module to cancel pulling up the D+ line, thus notifying the USB host of disconnection. This bit should be set to 1 if the function controller mode is selected, and should be set to 0 if the host controller mode is selected.
3	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
2	UCKSEL*1	0	R/W	Input Clock Selection Selects the clock to be supplied to this module from 48-MHz USB_X1 or 12-MHz EXTAL. 0: The 48-MHz USB_X1 clock is selected. 1: The 12-MHz EXTAL clock is selected. This bit should be modified while SUSPMODE.SUSPM for channel 0 and channel 1 is 0. Note that this bit is available only in channel 0 (SYSCFG0_0). Make the required setting for SYSCFG0_0 to use channel 1.
1	UPLLE*1	0	R/W	USB Internal PLL Operation Enable Enables or disables operation of the internal PLL of the USB block. 0: Disables operation of the internal PLL. 1: Enables operation of the internal PLL. This bit should be modified while SUSPMODE.SUSPM for channel 0 and channel 1 is 0. Set this bit to 0 when this module is to enter software standby or USB standby mode. Note that this bit is available only in channel 0 (SYSCFG0_0). Make the required setting for SYSCFG0_0 to use channel 1.
0	USBE	0	R/W	USB Module Operation Enable Enables or disables operation of this module. 0: USB module operation is disabled. 1: USB module operation is enabled. Modifying this bit from 1 to 0 initializes some register bits as listed in Table 28.3 and Table 28.4. This bit should be modified while SUSPMODE.SUSPM is 1. When the host controller mode is selected, this bit should be set to 1 after setting DPRD to 1, eliminating LNST bit chattering, and checking that the USB bus has been settled.

Note: • Writing to this register is possible even while the clock supply to this module is stopped (SUSPM = 0).
Note 1. UCKSEL and UPLLE are available only in channel 0 (SYSCFG0_0).

Table 28.3 Register Bits Initialized by Writing USBE = 0 (when Function Controller Mode is Selected)

Register Name	Bit Name	Remarks
SYSSTS0	LNST	The value is retained when the host controller mode is selected.
DVSTCTR0	RHST	
INTSTS0	DVSQ	The value is retained when the host controller mode is selected.
USBADDR	USBADDR	The value is retained when the host controller mode is selected.
USEREQ	BRequest, bmRequestType	The values are retained when the host controller mode is selected.
USBVAL	wValue	The value is retained when the host controller mode is selected.
USBINDX	wIndex	The value is retained when the host controller mode is selected.
USBLENG	wLength	The value is retained when the host controller mode is selected.

Table 28.4 Register Bits Initialized by Writing USBE = 0 (when Host Controller Mode is Selected)

Register Name	Bit Name	Remarks
DVSTCTR	RHST	
FRMNUM	FRNM	The value is retained when the function controller mode is selected.
UFRMNUM	UFRNM	The value is retained when the function controller mode is selected.

28.3.2 CPU Bus Wait Setting Register (BUSWAIT)

BUSWAIT is a register that specifies the number of wait cycles to be inserted during an access from the CPU to this module.

This register can be modified even when the SUSPM bit in SUSPMODE is 0.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	BWAIT[5:0]					
Initial value:	—	—	0	0	1	1	1	1	—	—	0	0	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
13, 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 0.
7, 6	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
5 to 0	BWAIT[5:0]	001111	R/W	CPU Bus Wait Specifies the number of wait cycles to be inserted during an access to this module. 000000: 0 wait cycles (2 access cycles) : 000010: 2 wait cycles (4 access cycles) : 000100: 4 wait cycles (6 access cycles) : 001111: 15 wait cycles (17 access cycles) (initial value) : 111111: 63 wait cycles (65 access cycles) There is the following constraint imposed on the cycle period required to access SYSSTS0 and the subsequent registers of this module: Wait constraint: The cycle period required to consecutively access registers of this controller must be at least 67 ns. To satisfy this constraint, it is necessary to exercise wait control according to the frequency of peripheral clock 1 (P1ϕ). The initial value is 17 clock cycles. Select an appropriate value. This setting is also applied to the accesses to the FIFO port registers. The maximum access speeds for the FIFO ports are as follows: MBW = 10 (32-bit width): up to 60 MBytes/sec MBW = 01 (16-bit width): up to 30 MBytes/sec MBW = 00 (8-bit width): up to 15 MBytes/sec

28.3.3 System Configuration Status Register (SYSSTS0)

SYSSTS is a register that monitors the line status (D+ and D– lines) of the USB data bus.
This register is initialized by a power-on reset or a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	HTACT	SOFEA	—	—	—	LNST[1:0]	
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
6	HTACT	Undefined	R	USB Host Sequencer Status Monitor Indicates the status of the host sequencer. 0: Stopped 1: Running This bit is set to 0 when the host sequencer in this controller is completely stopped. Make sure that the HTACT bit is set to 0 to put this controller in the USB suspended state by setting the UACT bit to 0 and stop the clock by setting the SUSPM bit to 0 in the host-mode communication state.
5	SOFEA	Undefined	R	SOF Active Monitor when the Host Controller Mode Is Selected Indicates the SOF output status. 0: SOF output stopped 1: SOF output in progress This bit allows checking if the last SOF has been output after setting the UACT bit to 0 when putting this controller in the USB suspended state with the host controller mode selected. To set the SUSPM bit to 0 (to stop the clock) after stopping this controller by setting the USBE bit to 0 in the host-mode communication state, make sure that both the HTACT bit and the SOFEA bit are set to 0.
4 to 2	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
1, 0	LNST[1:0]	Undefined	R	USB Data Line Status Monitor Indicates the status of the USB data bus lines (D+ and D-) as shown in Table 28.5. These bits should be read after setting DPRPU to 1 to notify connection when the function controller mode is selected; whereas after setting DRPD to 1 to enable pulling down the lines when the host controller mode is selected.

Table 28.5 USB Data Bus Line States

LNST[1]	LNST[0]	During Low-Speed Operation (Only when Host Controller Mode is Selected)	During Full-Speed Operation	During High-Speed Operation	During Chirp Operation
0	0	SE0	SE0	Squelch	Squelch
0	1	K state	J state	UnSquelch	Chirp J
1	0	J state	K state	Invalid	Chirp K
1	1	SE1	SE1	Invalid	Invalid

[Legend]
Chirp: The reset handshake protocol (RHSP) is being executed in high-speed operation enabled state (the HSE bit in SYSCFG is set to 1).
Squelch: SE0 or idle state
UnSquelch: High-speed J state or high-speed K state
Chirp J: Chirp J state
Chirp K: Chirp K state

28.3.4 Device State Control Register 0 (DVSTCTR0)

DVSTCTR is a register that controls and confirms the state of the USB data bus.
This register is initialized by a power-on reset. After a USB bus reset, only the WKUP bit is initialized.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	WKUP	RWUPE	USBRST	RESUME	UACT	—	RHST[2:0]		
Initial value:	—	—	—	—	0	0	0	0	0	0	0	0	—	0	0	0
R/W:	R	R	R	R	R	R	R	R/W*1	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	WKUP	0	R/W*1	Wakeup Output Enables or disables outputting the remote wakeup signal (resume signal) to the USB bus when the function controller mode is selected. 0: Remote wakeup signal is not output. 1: Remote wakeup signal is output. This module controls the output time of a remote wakeup signal. When this bit is set to 1, this module clears this bit to 0 after outputting the 10-ms K state. According to the USB Specification, the USB bus idle state must be kept for 5 ms or longer before a remote wakeup signal is output. If this module writes 1 to this bit right after detection of suspended state, the K state will be output after 2 ms. Do not write 1 to this bit unless the device state is in the suspended state (the DVSQ bits in the INTSTS0 register are set to 1xx) and the USB host enables the remote wakeup signal. When this bit is set to 1, the internal clock must not be stopped even in the suspended state (write 1 to this bit while SUSPMODE.SUSPM is 1). This bit should be set to 0 if the host controller mode is selected.
7	RWUPE	0	R/W	Remote Wakeup Detection Enable Enables or disables the downstream port peripheral device to use the remote wakeup function (resume signal output) when the host controller mode is selected. 0: Downstream port remote wakeup is disabled. 1: Downstream port remote wakeup is enabled. With this bit set to 1, on detecting the resume signal (K-state for 2.5 μs) to the downstream port when the remote wakeup signal has been detected, this module performs the resume process (drives the port to the K-state). With this bit set to 0, this module ignores the detected remote wakeup signal (K-state) from the peripheral device connected to the downstream port. While this bit is 1, the internal clock should not be stopped even in the suspended state (SUSPMODE.SUSPM should be set to 1). Also note that the USB bus should not be reset from the suspended state (USBRST should not be set to 1); it is prohibited by USB Specification 2.0. This bit should be set to 0 if the function controller mode is selected.

Bit	Bit Name	Initial Value	R/W	Description
6	USBRST	0	R/W	Bus Reset Output Controls the USB bus reset signal output when the host controller mode is selected. 0: USB bus reset signal is not output. 1: USB bus reset signal is output. When the host controller mode is selected, setting this bit to 1 allows this module to drive the USB port to SE0 to reset the USB bus. Here, this module performs the reset handshake protocol if the HSE bit is 1. This module continues outputting SE0 while USBRST is 1 (until 0 is written to USBRST). Ensure the period over which USBRST being set to 1 (= USB bus reset period) conforms to the USB Specification 2.0. Even if 1 is written to this bit during communication (UACT = 1) or during the resume process (RESUME = 1), this module does not start the USB bus reset process until both UACT and RESUME become 0. Write 1 to the UACT bit simultaneously with the end of the USB bus reset process (writing 0 to USBRST). This bit should be set to 0 if the function controller mode is selected.
5	RESUME	0	R/W	Resume Output Controls the resume signal output when the host controller mode is selected. 0: Resume signal is not output. 1: Resume signal is output. Setting this bit to 1 allows this module to drive the port to the K-state and output the resume signal. The controller sets this bit to 1 when detecting a remote wakeup signal while the RWUPE bit is set to 1 and the controller is in the USB suspended state. This module continues outputting K-state while RESUME is 1 (until 0 is written to RESUME). Ensure the period over which RESUME being set to 1 (= resume period) conforms to the USB Specification 2.0. This bit should only be set to 1 in the suspended state. Write 1 to the UACT bit simultaneously with the end of the resume process (writing 0 to RESUME). This bit should be set to 0 if the function controller mode is selected.
4	UACT	0	R/W	USB Bus Enable Enables operation of the USB bus (controls the SOF or µSOF packet transmission to the USB bus) when the host controller mode is selected. 0: Downstream port is disabled (SOF/µSOF transmission is disabled). 1: Downstream port is enabled (SOF/µSOF transmission is enabled). With this bit set to 1, this module puts the USB port to the USB-bus enabled state and performs SOF output and data transmission and reception. This module starts outputting SOF/µSOF within 1 (µ) frame after 1 is written to UACT. With this bit set to 0, this module enters the idle state after outputting SOF/µSOF. This module sets this bit to 0 on any of the following conditions. • A DTCH interrupt is detected during communication (while UACT = 1). • An EOFERR interrupt is detected during communication (while UACT = 1). Writing 1 to this bit should be done at the end of the USB bus reset process (writing 0 to USBRST) or at the end of the resume process from the suspended state (writing 0 to RESUME). This bit should be set to 0 if the function controller mode is selected.
3	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	RHST[2:0]	000	R	Reset Handshake Indicates the status of the reset handshake. (1) When the host controller mode is selected 000: Communication speed not determined (powered state or no connection) 1xx: Reset handshake in progress 001: Low-speed connection 010: Full-speed connection 011: High-speed connection These bits indicate 100 after 1 is written to USBRST. If HSE has been set to 1, these bits indicate 111 as soon as this module detects Chirp-K from the peripheral device. This module fixes the value of the RHST bits when 0 is written to USBRST and this module completes SE0 driving. When 1xxx is written to UTST (parameters for the host test have been set), these bits indicate 011. (2) When the function controller mode is selected 000: Communication speed not determined (powered state or no connection) 100: Reset handshake in progress 010: Full-speed connection 011: High-speed connection If HSE has been set to 1, these bits indicate 100 as soon as this module detects the USB bus reset. Then, these bits indicate 011 as soon as this module outputs Chirp-K and detects Chirp-JK from the USB host three times. If the connection speed is not fixed to high speed within 2.5 ms after Chirp-K output, these bits indicate 010. If HSE has been set to 0, these bits indicate 010 as soon as this module detects the USB bus reset. A DVST interrupt is generated as soon as this module detects the USB bus reset and then the value of the RHST bits is fixed to 010 or 011.

Note 1. Only 1 can be written.

28.3.5 Test Mode Register (TESTMODE)

TESTMODE is a register that controls the USB test signal output during high-speed operation.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	UTST[3:0]			
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 4	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
3 to 0	UTST[3:0]	0000	R/W	Test Mode This module outputs the USB test signals during the high-speed operation, when these bits are written appropriate value. (1) When the host controller mode is selected These bits can be set after writing 1 to DRPD. This module outputs waveforms when both DPRD and UACT have been set to 1. This module also performs high-speed termination for the USB port by writing the appropriate value to these bits. • Procedure for setting the UTST bits 1. Power-on reset. 2. Start the clock supply. 3. Set SUSPM to 1. 4. Set DCFM and DPRD to 1 (setting HSE to 1 is not required). 5. Set USBE to 1. 6. Set the UTST bits to the appropriate value according to the test specifications. 7. Set the UACT bit to 1. • Procedure for modifying the UTST bits 1. (In the state after executing step 7 above) Set UACT and USBE to 0. 2. Set USBE to 1. 3. Set the UTST bits to the appropriate value according to the test specifications. 4. Set the UACT bit to 1. When these bits are set to Test_SE0_NAK (1011), this module does not output the SOF packet even when 1 has been set to UACT for the port. When these bits are set to Test_Force_Enable (1101), this module outputs the SOF packet when 1 has been set to UACT. In this test mode, this module does not perform hardware control consequent to detection of high-speed disconnection (detection of the DTCH interrupt). When setting the UTST bits, the PID bits for all the pipes should be set to NAK. To return to normal USB communication after a test mode has been set, a power-on reset should be applied. (2) When the function controller mode is selected The appropriate value should be set to these bits according to the SetFeature request from the USB host during high-speed communication. This module does not make a transition to the suspended state while these bits are 0001 to 0100. Perform a power-on reset to carry out normal USB communication after configuring the test mode.

Table 28.6 Test Mode Operation

	UTST Bit Setting	
Test Mode	**When Function Controller Mode is Selected**	**When Host Controller Mode is Selected**
Normal operation	0000	0000
Test_J	0001	1001
Test_K	0010	1010
Test_SE0_NAK	0011	1011
Test_Packet	0100	1100
Test_Force_Enable	—	1101
Reserved	0101 to 0111	1110 to 1111

28.3.6 DMAn-FIFO Bus Configuration Registers (D0FBCFG, D1FBCFG)

D0FBCFG is a register that controls bus access to the DMA0-FIFO and D1FBCFG is a register that controls bus access to the DMA1-FIFO. Note that the setting of this register is invalid when the DMA0-FIFO bus or DMA1-FIFO bus is connected to the local bus.

These registers are initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	DFACC[1:0]		—	—	—	—	—	—	—	TENDE	—	—	—	—
Initial value:	—	—	0	0	—	—	—	—	—	—	—	0	—	—	—	—
R/W:	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
13, 12	DFACC[1:0]	00	R/W	DMAx FIFO Access Mode Specifies the access mode of the FIFO port. 00: Cycle steal mode (initial value) 01: 16-byte continuous access mode 10: 32-byte continuous access mode 11: Setting prohibited These bits specify a DMA transfer mode. (a) In cycle steal mode, use the DnFIFO port to access the FIFO buffer. (b) In 16-byte/32-byte continuous access mode, use the DnFIFO continuous transfer port to access the FIFO buffer. The MBW bit in DnFIFOSEL can be set to 10 (32-bit width) only. Be sure to follow the procedure below when setting the DFACC bits for 16- or 32-byte continuous access. (1) Set the DREQE bit in the DnFIFOSEL register to 0. (2) Set the DFACC bits to 01 (16 bytes) or 10 (32 bytes). (3) In the DnFIFOSEL register, set the CURPIPE bits to 0000 (specifying no pipe) and the MBW bits to 10 (32-bit width) at the same time. After that, read the CURPIPE bits to confirm that they have been updated to the written value (0000). (4) Use the CPU to dummy-read the DnFIFO port register (DnFIFO) with 32-bit width (the value read data can be discarded). After that, specify the target pipe by using the CURPIPE bits in the DnFIFOSEL register and read the CURPIPE bits to confirm that they have been updated to written value. (5) Set the DREQE bit in the DnFIFOSEL to 1. Note that the above procedure is not required if these bits are to be set for the cycle-stealing mode (not following the procedure has no effect).

Bit	Bit Name	Initial Value	R/W	Description
11 to 5	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
4	TENDE	0	R/W	DMA Transfer End Sampling Enable Controls acceptance of DMA transfer end signal. 0: DMA transfer end signal is not sampled. 1: DMA transfer end signal is sampled. Controls acceptance of DMA transfer end signal output from the direct memory access controller on completion of a DMA transfer. This module can control input of the DMA transfer end signal to end the DMA transfer of data to the FIFO. Set this bit to 0 when the DFACC bits are set to 01 or 10.
3 to 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

28.3.7 FIFO Port Registers (CFIFO, D0FIFO, D1FIFO)

CFIFO, D0FIFO, and D1FIFO are port registers that are used to read data from the FIFO buffer memory and write data to the FIFO buffer memory.

There are three FIFO ports: the CFIFO, D0FIFO and D1FIFO ports. There are also DnFIFO continuous transfer ports for continuous transfer. Each FIFO port is configured of a port register (CFIFO, D0FIFO, or D1FIFO) that handles reading of data from the FIFO buffer memory and writing of data to the FIFO buffer memory, a select register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL) that is used to select the pipe assigned to the FIFO port, and a control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR).

Each FIFO port has the following characteristics.

- Access to the FIFO buffer for the DCP should be performed through the CFIFO port.
- Access to the FIFO buffer by DMA transfer should be performed through the D0FIFO or D1FIFO port when the DFACC bits are set to 00 (cycle steal mode).
- Access to the FIFO buffer by DMA transfer should be performed through D0FIFO or D1FIFO continuous transfer ports when the DFACC bits are set to 01 (16-byte continuous access mode) or 10 (32-byte continuous access mode).
- The D1FIFO or D0FIFO port can be accessed by the CPU.
- When using functions specific to the FIFO port, the pipe number (selected pipe) specified by the CURPIPE bits cannot be changed (when the DMA transfer function is used, etc.).
- Registers configuring a FIFO port do not affect other FIFO ports.
- The same pipe should not be assigned to two or more FIFO ports.
- There are two FIFO buffer states: the access right is on the CPU side and it is on the SIE side. When the FIFO buffer access right is on the SIE side, the FIFO buffer cannot be accessed from the CPU.

These registers are initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FIFOPORT [31:0]	All 0	R/W	FIFO Port Accessing these bits allow reading the received data from the FIFO buffer or writing the transmit data to the FIFO buffer. These bits can be accessed only while the FRDY bit in each FIFO port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR) is 1 (or this module is issuing a DMA transfer request). The valid bits in this register depend on the settings of the MBW bits (access bit width setting) and BIGEND bit (endian setting) as shown in Table 28.7 to Table 28.9.

Table 28.7 Endian Operation in 32-Bit Access

BIGEND Bit	Bits 31 to 24	Bits 23 to 16	Bits 15 to 8	Bits 7 to 0
0	N+3 address	N+2 address	N+1 address	N+0 address
1	N+0 address	N+1 address	N+2 address	N+3 address

Table 28.8 Endian Operation in 16-Bit Access

BIGEND Bit	Bits 31 to 24	Bits 23 to 16	Bits 15 to 8	Bits 7 to 0
0	N+1 address	N+0 address	Writing: invalid, reading: prohibited*1	
1	Writing: invalid, reading: prohibited*1		N+0 address	N+1 address

Note 1. Reading data from the invalid bits in a word or byte unit is prohibited.

Table 28.9 Endian Operation in 8-Bit Access

BIGEND Bit	Bits 31 to 24	Bits 23 to 16	Bits 15 to 8	Bits 7 to 0
0	N+0 address	Writing: invalid, reading: prohibited*1		
1	Writing: invalid, reading: prohibited*1			N+0 address

Note 1. Reading data from the invalid bits in a word or byte unit is prohibited.

28.3.8 FIFO Port Select Registers (CFIFOSEL, D0FIFOSEL, D1FIFOSEL)

CFIFOSEL, D0FIFOSEL and D1FIFOSEL are registers that assign the pipe to the FIFO port, and control access to the corresponding port.

The same pipe should not be specified by the CURPIPE bits in CFIFOSEL, D0FIFOSEL and D1FIFOSEL. When the CURPIPE bits in D0FIFOSEL and D1FIFOSEL are cleared to B'0000, no pipe is selected.

The pipe number should not be changed while the DMA transfer is enabled.

These registers are initialized by a power-on reset.

(1) CFIFOSEL

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RCNT	REW	—	—	MBW[1:0]		—	BIG END	—	—	ISEL	—	CURPIPE[3:0]			
Initial value:	0	0	—	—	0	0	—	0	—	—	0	—	0	0	0	0
R/W:	R/W	R/W*1	R	R	R/W	R/W	R	R/W	R	R	R/W	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	RCNT	0	R/W	Read Count Mode Specifies the read mode for the value in the DTLN bits in CFIFOCTR. 0: The DTLN bits are cleared when all of the receive data has been read from the CFIFO. (In double buffer mode, the DTLN bit value is cleared when all the data has been read from a single plane.) 1: The DTLN bits are decremented when the receive data is read from the CFIFO. When this bit is cleared to 0, this module clears the DTLN bits in CFIFOCTR to 0 when all of the receive data has been read from the FIFO buffer that is assigned to the pipe specified in the CURPIPE bits (called the specified pipe) (in double buffer mode, the timing to clear is when finished reading data from one FIFO buffer plane). When this bit is set to 1, this module decrements the DTLN bits in CFIFOCTR every time receive data is read from the FIFO buffer that is assigned to the specified pipe.
14	REW	0	R/W*1	Buffer Pointer Rewind Specifies whether or not to rewind the buffer pointer. 0: The buffer pointer is not rewound. 1: The buffer pointer is rewound. When the selected pipe is in the receiving direction, setting this bit to 1 while the FIFO buffer is being read allows re-reading the FIFO buffer from the first data (in double buffer mode, re-reading the currently-read one FIFO buffer plane from the first data is allowed). Do not set REW to 1 simultaneously with modifying the CURPIPE bits. Before setting REW to 1, be sure to check that FRDY is 1. To re-write to the FIFO buffer again from the first data for the pipe in the transmitting direction, use the BCLR bit.
13, 12	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
11, 10	MBW[1:0]	00	R/W	FIFO Port Access Bit Width Specifies the bit width for accessing the CFIFO port. 00: 8-bit width 01: 16-bit width 10: 32-bit width 11: Setting prohibited When the pipe specified by the CURPIPE bits is in the receiving direction, once reading data is started after setting these bits, these bits should not be modified until all the data has been read. When the specified pipe is in the receiving direction, set the CURPIPE bits to a different value once, and then set the CURPIPE and MBW bits simultaneously. Regarding the procedure for changing the value of the CURPIPE bits, do so in accord with the description of the CURPIPE bits. When the specified pipe is in the transmitting direction, the bit width cannot be changed from the 8-bit width to the 16-/32-bit width or from the 16-bit width to the 32-bit width while data is being written to the buffer memory.
9	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
8	BIGEND	0	R/W	FIFO Port Endian Control Specifies the byte endian for the CFIFO port. For details, refer to the description of the FIFO port bits in section 28.3.7, FIFO Port Registers (CFIFO, D0FIFO, D1FIFO). 0: Little endian 1: Big endian
7, 6	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
5	ISEL	0	R/W	FIFO Port Access Direction when DCP is Selected Specifies the direction of FIFO port access when the DCP is selected through the CURPIPE bits. 0: Reading from the buffer memory is selected 1: Writing to the buffer memory is selected After writing to this bit with the DCP being a selected pipe, read this bit to check that the written value agrees with the read value before proceeding to the next process. When this bit is modified during access to the FIFO buffer, the access results up to that point can be retained, and after the bit is restored to the previous value, access can be continued. Set this bit and the CURPIPE bits simultaneously.
4	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
3 to 0	CURPIPE[3:0]	0000	R/W	FIFO Port Access Pipe Specification Specifies the pipe number using which data is read or written through the CFIFO port. 0000: DCP 0001: PIPE 1 0010: PIPE 2 : 1110: PIPE 14 1111: PIPE 15 After writing to these bits, read these bits to check that the written value agrees with the read value before proceeding to the next process. Do not set the same pipe number to the CURPIPE bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL. Even if the setting of these bits is modified during access to the FIFO buffer, the state of the FIFO buffer is retained, with continued access proceeding after these bits are re-set to the value before the modification.

Note 1. Only 0 can be read and 1 can be written to.

(2) D0FIFOSEL, D1FIFOSEL

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RCNT	REW	DCLRM	DREQE	MBW[1:0]		—	BIGEND	—	—	—	—	CURPIPE[3:0]			
Initial value:	0	0	0	0	0	0	—	0	—	—	—	—	0	0	0	0
R/W:	R/W	R/W*	R/W	R/W	R/W	R/W	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	RCNT	0	R/W	Read Count Mode Specifies the read mode for the value in the DTLN bits in DnFIFOCTR. 0: The DTLN bits are cleared when all of the receive data has been read from the DnFIFO. (In double buffer mode, the DTLN bit value is cleared when all the data has been read from a single plane.) 1: The DTLN bits are decremented when the receive data is read from the DnFIFO. When this bit is cleared to 0, this module clears the DTLN bits in DnFIFOCTR to 0 when all of the receive data has been read from the FIFO buffer that is assigned to the pipe specified in the CURPIPE bits (called the specified pipe) (in double buffer mode, the timing to clear is when finished reading data from one FIFO buffer plane). When this bit is set to 1, this module decrements the DTLN bits in DnFIFOCTR every time receive data is read from the FIFO buffer that is assigned to the specified pipe.
14	REW	0	R/W*	Buffer Pointer Rewind Specifies whether or not to rewind the buffer pointer. 0: The buffer pointer is not rewound. 1: The buffer pointer is rewound. When the specified pipe is in the receiving direction, setting this bit to 1 while the FIFO buffer is being read allows re-reading the FIFO buffer from the first data (in double buffer mode, re-reading the currently-read FIFO buffer plane from the first data is allowed). Do not set REW to 1 simultaneously with modifying the CURPIPE bits. Before setting REW to 1, be sure to check that FRDY is 1. To re-write to the FIFO buffer again from the first data for the pipe in the transmitting direction, use the BCLR bit.
13	DCLRM	0	R/W	Auto Buffer Memory Clear Mode Accessed after Specified Pipe Data is Read Enables or disables the buffer memory to be cleared automatically after data has been read out using the selected pipe. 0: Auto buffer clear mode is disabled. 1: Auto buffer clear mode is enabled. With this bit set to 1, this module sets BCLR to 1 for the FIFO buffer of the selected pipe on receiving a zero-length packet while the FIFO buffer assigned to the selected pipe is empty, or on receiving a short packet and reading the data while BFRE is 1. When using this module with the BRDYM bit set to 1, set this bit to 0.
12	DREQE	0	R/W	DMA Transfer Request Enable Enables or disables the issuance of a DMA transfer request. 0: DMA transfer request is disabled. 1: DMA transfer request is enabled. To enable the issuance of a DMA transfer request, set this bit to 1 after setting the CURPIPE bits. When modifying the CURPIPE bits, first set this bit to 0.

Bit	Bit Name	Initial Value	R/W	Description
11, 10	MBW[1:0]	00	R/W	FIFO Port Access Bit Width Specifies the bit width for accessing the D0FIFO or D1FIFO port. 00: 8-bit width 01: 16-bit width 10: 32-bit width 11: Setting prohibited Set 10 when the DFACC bits are set to 01 or 10. When the pipe specified by the CURPIPE bits is in the receiving direction, once reading data is started after setting these bits, these bits should not be modified until all the data has been read. When the specified pipe is in the receiving direction, set the CURPIPE bits to a different value once, and then set the CURPIPE and MBW bits simultaneously. Regarding the procedure for changing the value of the CURPIPE bits, do so in accord with the description of the CURPIPE bits. When the specified pipe is in the transmitting direction, the bit width cannot be changed from the 8-bit width to the 16-/32-bit width or from the 16-bit width to the 32-bit width while data is being written to the buffer memory. Set these bits to 10 (32-bit width) when the DFACC bits are set to 01 (16-byte continuous access mode) or 10 (32-byte continuous access mode).
9	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
8	BIGEND	0	R/W	FIFO Port Endian Control Specifies the byte endian for the D0FIFO or D1FIFO port. For details, refer to the description of the FIFO port bits in section 28.3.7, FIFO Port Registers (CFIFO, D0FIFO, D1FIFO). 0: Little endian 1: Big endian
7 to 4	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
3 to 0	CURPIPE[3:0]	0000	R/W	FIFO Port Access Pipe Specification Specify a desired pipe number for which data is read or written through the D0FIFO or D1FIFO port. 0000: No pipe specified 0001: PIPE 1 0010: PIPE 2 : 1110: PIPE 14 1111: PIPE 15 After writing to these bits, read these bits to check that the written value agrees with the read value before proceeding to the next process. Do not set the same pipe number to the CURPIPE bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL. Even if the setting of these bits is modified during access to the FIFO buffer, the state of the FIFO buffer is retained, with continued access proceeding after these bits are re-set to the value before the modification.

28.3.9 FIFO Port Control Registers (CFIFOCTR, D0FIFOCTR, D1FIFOCTR)

CFIFOCTR, D0FIFOCTR and D1FIFOCTR are registers that determine whether or not writing to the buffer memory has been finished, the buffer accessed from the CPU has been cleared, and the FIFO port is accessible. CFIFOCTR, D0FIFOCTR, and D1FIFOCTR are used for the corresponding FIFO ports.
These registers are initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BVAL	BCLR	FRDY	—	DTLN[11:0]											
Initial value:	0	0	0	—	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*2	R/W*1	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	BVAL	0	R/W*2	Buffer Memory Valid Flag Set this bit to 1 when writing has completed in the CPU-side FIFO buffer for the pipe specified in CURPIPE (called the selected pipe). 0: Invalid 1: Writing ended When the selected pipe is in the transmitting direction, set this bit to 1 in the following cases. Then, this module switches the FIFO buffer from the CPU side to the SIE side, enabling transmission. • To transmit a short packet, set this bit to 1 after data has been written. • To transmit a zero-length packet, set this bit to 1 before writing data to the FIFO buffer. • Set this bit to 1 after the number of data bytes has been written for the pipe in continuous transfer mode, where the number is a natural integral multiple of the maximum packet size and less than the buffer size. When the data of the maximum packet size has been written for the pipe in non-continuous transfer mode, this module sets this bit to 1 and switches the FIFO buffer from the CPU side to the SIE side, enabling transmission. Writing 1 to this bit should be done while FRDY indicates 1. When checking the FRDY bit after setting this bit, allow an interval of at least 80 ns before referencing FRDY. When the selected pipe is in the receiving direction, do not write 1 to this bit.
14	BCLR	0	R/W*1	CPU Buffer Clear This bit should be set to 1 to clear the FIFO buffer on the CPU side for the selected pipe. 0: Invalid 1: Clears the buffer memory on the CPU side. When double buffer mode is set for the FIFO buffer assigned to the selected pipe, this module clears only one plane of the FIFO buffer even when both planes are read-enabled. When the selected pipe is the DCP, setting BCLR to 1 allows this module to clear the FIFO buffer regardless of whether the FIFO buffer is on the CPU side or SIE side. When clearing the buffer on the SIE side, set the PID bits for the DCP to NAK before setting BCLR to 1. When the selected pipe is not the DCP, writing 1 to this bit should be done while FRDY indicates 1. When checking the FRDY bit after setting this bit, allow an interval of at least 80 ns before referencing FRDY.

Bit	Bit Name	Initial Value	R/W	Description
13	FRDY	0	R	FIFO Port Ready Indicates whether the FIFO port can be accessed. 0: FIFO port access is disabled. 1: FIFO port access is enabled. In the following cases, this module sets FRDY to 1 but data cannot be read via the FIFO port because there is no data to be read. In these cases, set BCLR to 1 to clear the FIFO buffer, and enable transmission and reception of the next data. • A zero-length packet is received when the FIFO buffer assigned to the selected pipe is empty. • A short packet is received and the data is completely read while BFRE is 1.
12	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
11 to 0	DTLN[11:0]	H'000	R	Receive Data Length Indicates the length of the receive data. While the FIFO buffer is being read, these bits indicate the different values depending on the RCNT bit value as described below. • When RCNT = 0: The length of received data is set in these bits, and the value is retained until all received data has been read from a single FIFO buffer plane. While BFRE is 1, these bits retain the length of the receive data until BCLR is set to 1 even after all the data has been read. • When RCNT = 1: This module decrements the value indicated by these bits each time data is read from the FIFO buffer. (The value is decremented by one when MBW is 00, by two when MBW is 01, and by four when MBW is 10.) This module sets these bits to 0 when all the data has been read from one FIFO buffer plane. However, in double buffer mode, if data has been received in one FIFO buffer plane before all the data has been read from the other plane, this module sets these bits to indicate the length of the receive data in the latter plane when all the data has been read from the former plane. Note: When reading these bits during FIFO buffer reading while RCNT = 1, note that these bits are updated within ten bus cycles after a read cycle for the FIFO port.

Note 1. Only 0 can be read and 1 can be written to.
Note 2. Only 1 can be written to.

28.3.10 Interrupt Enable Register 0 (INTENB0)

INTENB0 is a register that enables various interrupts. On detecting the interrupt corresponding to the bit in this register which has been set to 1, this module generates the USB interrupt.
This module sets 1 to each status bit in INTSTS0 when a detection condition of the corresponding interrupt source has been satisfied regardless of the set value in INTENB0 (regardless of whether the interrupt output is enabled or disabled).
While the status bit in INTSTS0 corresponding to the interrupt source indicates 1, this module generates the USB interrupt when the corresponding interrupt enable bit in INTENB0 is changed from 0 to 1.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VBSE	RSME	SOFE	DVSE	CTRE	BEMPE	NRDYE	BRDYE	—	—	—	—	—	—	—	—

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	VBSE	0	R/W	VBUS Interrupt Enable Enables or disables the USB interrupt request when the VBINT interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
14	RSME	0	R/W	Resume Interrupt Enable*1 Enables or disables the USB interrupt request when the RESM interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
13	SOFE	0	R/W	Frame Number Update Interrupt Enable Enables or disables the USB interrupt request when the SOFR interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
12	DVSE	0	R/W	Device State Transition Interrupt Enable*1 Enables or disables the USB interrupt request when the DVST interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
11	CTRE	0	R/W	Control Transfer Stage Transition Interrupt Enable*1 Enables or disables the USB interrupt request when the CTRT interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
10	BEMPE	0	R/W	Buffer Empty Interrupt Enable Enables or disables the USB interrupt request when the BEMP interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
9	NRDYE	0	R/W	Buffer Not Ready Response Interrupt Enable Enables or disables the USB interrupt request when the NRDY interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
8	BRDYE	0	R/W	Buffer Ready Interrupt Enable Enables or disables the USB interrupt request when the BRDY interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Note 1. The RSME, DVSE, and CTRE bits can be set to 1 only when the function controller mode is selected; do not set these bits to 1 to enable the corresponding interrupt output when the host controller mode is selected.

28.3.11 Interrupt Enable Register 1 (INTENB1)

INTENB1 is a register that enables various interrupts when the host controller mode is selected.
On detecting the interrupt corresponding to the bit in this register which has been set to 1, this module generates the USB interrupt.
This module sets 1 to each status bit in INTSTS1 when a detection condition of the corresponding interrupt source has been satisfied regardless of the set value in INTENB1 (regardless of whether the interrupt output is enabled or disabled).
While the status bit in INTSTS1 corresponding to the interrupt source indicates 1, this module generates the USB interrupt when the corresponding interrupt enable bit in INTENB1 is changed from 0 to 1.
When the function controller mode is selected, the interrupts should not be enabled.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Bit Name	Initial Value	R/W	Description
6	EOFERRE	0	R/W	EOF Error Detection Interrupt Enable Enables or disables the USB interrupt request when the EOFERR interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
5	SIGNE	0	R/W	Setup Transaction Error Interrupt Enable Enables or disables the USB interrupt request when the SIGN interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
4	SACKE	0	R/W	Setup Transaction Normal Response Interrupt Enable Enables or disables the USB interrupt request when the SACK interrupt is detected. 0: Interrupt output disabled 1: Interrupt output enabled
3 to 1	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Note 1. The INTENB1 register bits can be set to 1 only when the host controller mode is selected; do not set these bits to 1 to enable the corresponding interrupt output when the function controller mode is selected.

28.3.12 BRDY Interrupt Enable Register (BRDYENB)

BRDYENB is a register that enables or disables the BRDY bit in INTSTS0 to be set to 1 when the BRDY interrupt is detected for each pipe.

On detecting the BRDY interrupt for the pipe corresponding to the bit in this register which has been set to 1, this module sets 1 to the corresponding PIPEBRDY bit in BRDYSTS and the BRDY bit in INTSTS0, and generates the BRDY interrupt.

While at least one PIPEBRDY bit in BRDYSTS indicates 1, this module generates the BRDY interrupt when the corresponding interrupt enable bit in BRDYENB is changed from 0 to 1.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIPEBRDYE															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPEBRDYE	H'0000	R/W	BRDY Interrupt Enable for each Pipe 0: Interrupt output disabled 1: Interrupt output enabled

Note 1. The bit number corresponds to the pipe number.

28.3.13 NRDY Interrupt Enable Register (NRDYENB)

NRDYENB is a register that enables or disables the NRDY bit in INTSTS0 to be set to 1 when the NRDY interrupt is detected for each pipe.

On detecting the NRDY interrupt for the pipe corresponding to the bit in this register which has been set to 1, this module sets 1 to the corresponding PIPENRDY bit in NRDYSTS and the NRDY bit in INTSTS0, and generates the NRDY interrupt.

While at least one PIPENRDY bit in NRDYSTS indicates 1, this module generates the NRDY interrupt when the corresponding interrupt enable bit in NRDYENB is changed from 0 to 1.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIPENRDYE															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPENRDYE	H'0000	R/W	NRDY Interrupt Enable for each Pipe 0: Interrupt output disabled 1: Interrupt output enabled

Note 1. The bit number corresponds to the pipe number.

28.3.14 BEMP Interrupt Enable Register (BEMPENB)

BEMPENB is a register that enables or disables the BEMP bit in INTSTS0 to be set to 1 when the BEMP interrupt is detected for each pipe.

On detecting the BEMP interrupt for the pipe corresponding to the bit in this register which has been set to 1, this module sets 1 to the corresponding PIPEBEMP bit in BEMPSTS and the BEMP bit in INTSTS0, and generates the BEMP interrupt.

While at least one PIPEBEMP bit in BEMPSTS indicates 1, this module generates the BEMP interrupt when the corresponding interrupt enable bit in BEMPENB is changed from 0 to 1.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIPEBEMPE															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note 1. The bit number corresponds to the pipe number.

28.3.15 SOF Output Configuration Register (SOFCFG)

SOFCFG is a register that specifies the transaction-enabled time and BRDY interrupt status clear timing.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TRNENSEL	—	BRDYM	—	—	—	—	—	—

R/W:	R	R	R	R	R	R	R	R/W	R	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
8	TRNENSEL	0	R/W	Transaction-Enabled Time Select Selects the transaction-enabled time either for full-speed or low-speed communication, where is the time in which this module issues tokens in a frame. 0: For non-low-speed communication 1: For low-speed communication This bit is valid only when the host controller mode is selected. Even when the host controller mode is selected, the setting of this bit has no effect on the transaction-enabled time during high-speed communication. This bit should be set to 0 when the function controller mode is selected.
7	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
6	BRDYM	0	R/W	BRDY Interrupt Status Clear Timing for Each Pipe Specifies the timing for clearing the BRDY interrupt status for each pipe. 0: Clears the status by writing 0 to this bit. 1: This module automatically clears the status when data has been read from the FIFO buffer or data has been written to the FIFO buffer.
5 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

28.3.16 Interrupt Status Register 0 (INTSTS0)

INTSTS0 is a register that indicates the status of the various interrupts detected.
This register is initialized by a power-on reset. By a USB bus reset, the DVST and DVSQ[2:0] bits are initialized.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VBINT	RESM	SOFR	DVST	CTRT	BEMP	NRDY	BRDY	VBSTS	DVSQ[2:0]			VALID	CTSQ[2:0]		
Initial value:	0	0	0	0/1*1	0	0	0	0	0/1*3	0*2	0*2	0/1*2	0	0	0	0
R/W:	R/W*7	R/W*7	R/W*7	R/W*7	R/W*7	R	R	R	R	R	R	R	R/W*7	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	VBINT	0	R/W*7	VBUS Interrupt Status*4*5 0: VBUS interrupts not generated 1: VBUS interrupts generated This module sets this bit to 1 when a change in the value input to the VBUS pin (high to low or low to high) is detected. The module indicates the VBUS pin input value in the VBSTS bit. When a VBINT interrupt is generated, the VBSTS bit is read several times to remove the chattering effect until the same value is read repeatedly from the bit.
14	RESM	0	R/W*7	Resume Interrupt Status*4*5*6 0: Resume interrupts not generated 1: Resume interrupts generated When the function controller mode is selected, this module sets this bit to 1 on detecting the falling edge of the signal on the DP pin in the suspended state (DVSQ = 1XX). When the host controller mode is selected, the read value is invalid.
13	SOFR	0	R/W*7	Frame Number Refresh Interrupt Status*4 0: SOF interrupts not generated 1: SOF interrupts generated (1) When the host controller mode is selected This module sets this bit to 1 on updating the frame number when the UACT bit is set to 1. (This interrupt is detected every 1 ms.) (2) When the function controller mode is selected This module sets this bit to 1 on updating the frame number. (This interrupt is detected every 1 ms.) This module can detect an SOFR interrupt through the internal interpolation function even when a damaged SOF packet is received from the USB host.
12	DVST	0/1*1	R/W*7	Device State Transition Interrupt Status*4*6 0: Device state transition interrupts not generated 1: Device state transition interrupts generated When the function controller mode is selected, this module updates the DVSQ value and sets this bit to 1 on detecting a change in the device state. When this interrupt is generated, clear the status before this module detects the next device state transition. When the host controller mode is selected, the read value is invalid.
11	CTRT	0	R/W*7	Control Transfer Stage Transition Interrupt Status*4*6 0: Control transfer stage transition interrupts not generated 1: Control transfer stage transition interrupts generated When the function controller mode is selected, this module updates the CTSQ value and sets this bit to 1 on detecting a change in the control transfer stage. When this interrupt is generated, clear the status before this module detects the next control transfer stage transition. When the host controller mode is selected, the read value is invalid.

Bit	Bit Name	Initial Value	R/W	Description
10	BEMP	0	R	Buffer Empty Interrupt Status 0: BEMP interrupts not generated 1: BEMP interrupts generated This module sets this bit to 1 when at least one PIPEBEMP bit in BEMPSTS is set to 1 among the PIPEBEMP bits corresponding to the PIPEBEMPE bits in BEMPENB to which 1 has been set (when this module detects the BEMP interrupt status in at least one pipe among the pipes for which the BEMP interrupt notification is enabled). For the conditions for PIPEBEMP status assertion, refer to section 28.4.2 (4) BEMP Interrupt. This module clears this bit to 0 when 0 is written to all the PIPEBEMP bits corresponding to the PIPEBEMPE bits to which 1 has been set. This bit cannot be cleared to 0 even if 0 is written to this bit.
9	NRDY	0	R	Buffer Not Ready Interrupt Status 0: NRDY interrupts not generated 1: NRDY interrupts generated This module sets this bit to 1 when at least one PIPENRDY bit in NRDYSTS is set to 1 among the PIPENRDY bits corresponding to the PIPENRDYE bits in NRDYENB to which 1 has been set (when this module detects the NRDY interrupt status in at least one pipe among the pipes for which the NRDY interrupt notification is enabled). For the conditions for PIPENRDY status assertion, refer to section 28.4.2 (3) NRDY Interrupt. This module clears this bit to 0 when 0 is written to all the PIPENRDY bits corresponding to the PIPENRDYE bits to which 1 has been set. This bit cannot be cleared to 0 even if 0 is written to this bit.
8	BRDY	0	R	Buffer Ready Interrupt Status 0: BRDY interrupts not generated 1: BRDY interrupts generated This module sets this bit to 1 when at least one PIPEBRDY bit in BRDYSTS is set to 1 among the PIPEBRDY bits corresponding to the PIPEBRDYE bits in BRDYENB to which 1 has been set (when this module detects the BRDY interrupt status in at least one pipe among the pipes for which the BRDY interrupt notification is enabled). For the conditions for PIPEBRDY status assertion, refer to section 28.4.2 (2) BRDY Interrupt. This module clears this bit to 0 when 0 is written to all the PIPEBRDY bits corresponding to the PIPEBRDYE bits to which 1 has been set. This bit cannot be cleared to 0 even if 0 is written to this bit.
7	VBSTS	0/1*3	R	VBUS Input Status 0: The VBUS pin is low level. 1: The VBUS pin is high level.
6 to 4	DVSQ[2:0]	000/001*2	R	Device State 000: Powered state 001: Default state 010: Address state 011: Configured state 1xx: Suspended state When the host controller mode is selected, the read value is invalid.
3	VALID	0	R/W*7	USB Request Reception 0: Not detected 1: Setup packet reception When the host controller mode is selected, the read value is invalid.
2 to 0	CTSQ[2:0]	000	R	Control Transfer Stage 000: Idle or setup stage 001: Control read data stage 010: Control read status stage 011: Control write data stage 100: Control write status stage 101: Control write (no data) status stage 110: Control transfer sequence error 111: Setting prohibited When the host controller mode is selected, the read value is invalid.

Note 1. This bit is initialized to B'0 by a power-on reset and B'1 by a USB bus reset.
Note 2. These bits are initialized to B'000 by a power-on reset and B'001 by a USB bus reset.
Note 3. This bit is 1 when the level of the VBUS pin input is high and 0 when low.
Note 4. To clear the VBINT, RESM, SOFR, DVST, or CTRT bit, write 0 only to the bits to be cleared; write 1 to the other bits. Do not write 0 to the status bits indicating 0.
Note 5. A change in the status indicated by the VBINT and RESM bits can be detected by this module even while the clock supply is stopped, and the interrupts are output when the corresponding interrupt enable bits are enabled. Clearing the status should be done after enabling the clock supply.
Note 6. A change in the status of the RESM, DVST, and CTRT bits occurs only when the function controller mode is selected; disable the corresponding interrupt enable bits (set to 0) when the host controller mode is selected.
Note 7. Only 0 can be written to.

28.3.17 Interrupt Status Register 1 (INTSTS1)

INTSTS1 is a register that is used to confirm interrupt status.
The various interrupts indicated by the bits in this register should be enabled only when the host controller mode is selected.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	BCHG	—	DTCH	ATTCH	—	—	—	—	EOFERR	SIGN	SACK	—	—	—	—
Initial value:	0	0	—	0	0	—	0	0	—	0	0	0	—	—	—	0
R/W:	R	R/W*	R	R/W*	R/W*	R	R	R	R	R/W*	R/W*	R/W*	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	BCHG	0	R/W*	USB Bus Change Interrupt Status Indicates the status of the USB bus change interrupt. 0: BCHG interrupts not generated 1: BCHG interrupts generated This module detects the BCHG interrupt when a change in the full-speed or low-speed signal level occurs on the USB port (a change from J-state, K-state, or SE0 to J-state, K-state, or SE0), and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the interrupt. This module sets the LNST bits in SYSSTS to indicate the current input state of the USB port. When the BCHG interrupt is generated, the LNST bits are read several times to remove the chattering effect until the same value is read repeatedly from the bits. A change in the USB bus state can be detected even while the internal clock supply is stopped. When the function controller mode is selected, the read value is invalid.
13	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
12	DTCH	0	R/W*	USB Disconnection Detection Interrupt Status Indicates the status of the USB disconnection detection interrupt when the host controller mode is selected. 0: DTCH interrupts not generated 1: DTCH interrupts generated This module detects the DTCH interrupt on detecting USB bus disconnection, and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the interrupt. This module detects bus disconnection based on USB Specification 2.0. After detecting the DTCH interrupt, this module controls hardware as described below (irrespective of the set value of the corresponding interrupt enable bit). Software should terminate all the pipes in which communications are currently carried out for the USB port and make a transition to the wait state for bus connection to the USB port (wait state for ATTCH interrupt generation). (1) Modifies the UACT bit to 0. (2) Puts the port into the idle state. When the function controller mode is selected, the read value is invalid.

Bit	Bit Name	Initial Value	R/W	Description
11	ATTCH	0	R/W*	ATTCH Interrupt Status Indicates the status of the ATTCH interrupt when the host controller mode is selected. 0: ATTCH interrupts not generated 1: ATTCH interrupts generated This module detects the ATTCH interrupt on detecting J-state or K-state of the full-speed or low-speed level signal for 2.5 µs, and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the interrupt. Specifically, this module detects the ATTCH interrupt on any of the following conditions. • K-state, SE0, or SE1 changes to J-state, and J-state continues 2.5 µs. • J-state, SE0, or SE1 changes to K-state, and K-state continues 2.5 µs. When the function controller mode is selected, the read value is invalid.
10	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
9, 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
6	EOFERR	0	R/W*	EOF Error Detection Interrupt Status Indicates the status of the EOFERR interrupt when the host controller mode is selected. 0: EOFERR interrupt not generated 1: EOFERR interrupt generated This module detects the EOFERR interrupt on detecting that communication is not completed at the EOF2 timing prescribed by USB Specification 2.0, and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the EOFERR interrupt. After detecting the EOFERR interrupt, this module controls hardware as described below (irrespective of the set value of the corresponding interrupt enable bit). Software should terminate all the pipes in which communications are currently carried for the USB port and perform re-enumeration of the USB port. (1) Modifies the UACT bit to 0. (2) Puts the port into the idle state. When the function controller mode is selected, the read value is invalid.
5	SIGN	0	R/W*	Setup Transaction Error Interrupt Status Indicates the status of the setup transaction error interrupt when the host controller mode is selected. 0: SIGN interrupts not generated 1: SIGN interrupts generated This module detects the SIGN interrupt when ACK response is not returned from the peripheral device three consecutive times during the setup transactions issued by this module, and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the SIGN interrupt. Specifically, this module detects the SIGN interrupt when any of the following response conditions occur for three consecutive setup transactions. • Timeout is detected when the peripheral device has returned no response. • A damaged ACK packet is received. • A handshake other than ACK (NAK, NYET, or STALL) is received. When the function controller mode is selected, the read value is invalid.

Bit	Bit Name	Initial Value	R/W	Description
4	SACK	0	R/W*	Setup Transaction Normal Response Interrupt Status Indicates the status of the setup transaction normal response interrupt when the host controller mode is selected. 0: SACK interrupts not generated 1: SACK interrupts generated This module detects the SACK interrupt when ACK response is returned from the peripheral device during the setup transactions issued by this module, and sets this bit to 1. Here, if the corresponding interrupt enable bit is set to 1, this module generates the SACK interrupt. When the function controller mode is selected, the read value is invalid.
3 to 1	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Note 1. To clear the status indicated by the bits in this register, write 0 only to the bits to be cleared; write 1 to the other bits. Do not write 0 to the status bits indicating 0.

Note 2. A change in the status indicated by the BCHG bit can be detected by this module even while the clock supply is stopped, and the interrupt is output when the corresponding interrupt enable bit is enabled. Clearing the status should be done after enabling the clock supply.
No interrupts other than BCHG can be detected while the clock supply is stopped.

* Only 0 can be written to.

28.3.18 BRDY Interrupt Status Register (BRDYSTS)

BRDYSTS is a register that indicates the BRDY interrupt status for each pipe.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIPEBRDY															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPEBRDY	H'0000	R/W*1	BRDY Interrupt Status for each Pipe*2 0: Interrupts not generated 1: Interrupts generated

Note 1. The bit number corresponds to the pipe number.

Note 2. To clear the status indicated by the bits in this register when BRDYM is 0, write 0 only to the bits to be cleared; write 1 to the other bits. Do not write 0 to the status bits indicating 0.

* 1. Only 0 can be written to.

* 2. When BRDYM is 0, clearing this bit should be done before accessing the FIFO.

28.3.19 NRDY Interrupt Status Register (NRDYSTS)

NRDYSTS is a register that indicates the NRDY interrupt status for each pipe.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIPENRDY															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPENRDY	H'0000	R/W*	NRDY Interrupt Status for each Pipe 0: Interrupts not generated 1: Interrupts generated

Note 1. The bit number corresponds to the pipe number.
Note 2. To clear the status indicated by the bits in this register, write 0 only to the bits to be cleared; write 1 to the other bits. Do not write 0 to the status bits indicating 0.
* Only 0 can be written to.

28.3.20 BEMP Interrupt Status Register (BEMPSTS)

BEMPSTS is a register that indicates the BEMP interrupt status for each pipe.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIPEBEMP															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	PIPEBEMP	H'0000	R/W*	BEMP Interrupt Status for each Pipe 0: Interrupts not generated 1: Interrupts generated

Note 1. The bit number corresponds to the pipe number.
Note 2. To clear the status indicated by the bits in this register, write 0 only to the bits to be cleared; write 1 to the other bits. Do not write 0 to the status bits indicating 0.
* Only 0 can be written to.

28.3.21 Frame Number Register (FRMNUM)

FRMNUM is a register that determines the source of isochronous error notification and indicates the frame number. This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OVRN	CRCE	—	—	—	FRNM[10:0]										
Initial value:	0	0	—	—	—	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*1	R/W*1	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	OVRN	0	R/W*1	Overrun/Underrun Detection Status Indicates whether an overrun/underrun error has been detected in the pipe during isochronous transfer. On detecting either error, this module simultaneously generates the internal NRDY interrupt request. For details, refer to section 28.4.2, Interrupt Functions. 0: No error 1: An error occurred This bit can be cleared to 0 by writing 0 to the bit. Here, 1 should be written to the other bits in this register. (1) When the host controller mode is selected This module sets this bit to 1 on any of the following conditions. • For the isochronous transfer pipe in the transmitting direction, the time to issue an OUT token comes before all the transmit data has been written to the FIFO buffer. • For the isochronous transfer pipe in the receiving direction, the time to issue an IN token comes when no FIFO buffer planes are empty. (2) When the function controller mode is selected This module sets this bit to 1 on any of the following conditions. • For the isochronous transfer pipe in the transmitting direction, the IN token is received before all the transmit data has been written to the FIFO buffer. • For the isochronous transfer pipe in the receiving direction, the OUT token is received when no FIFO buffer planes are empty. Note: This bit should be used for debugging. When designing a system, control the timing so that neither overrun nor underrun occurs.
14	CRCE	0	R/W*1	Receive Data Error Indicates whether a CRC error or bit stuffing error has been detected in the pipe during isochronous transfer. On detecting either error, this module simultaneously generates the internal NRDY interrupt request. For details, refer to section 28.4.2, Interrupt Functions. 0: No error 1: An error occurred This bit can be cleared to 0 by writing 0 to the bit. Here, 1 should be written to the other bits in this register.
13 to 11	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
10 to 0	FRNM[10:0]	H'000	R	Frame Number This module sets these bits to indicate the latest frame number, which is updated every time an SOF packet is issued or received (every 1 ms). When reading these bits, repeat reading until the same value is read twice.

Note 1. Only 0 can be written to.

28.3.22 µFrame Number Register (UFRMNUM)

UFRMNUM is a register that indicates the µframe number.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	UFRNM[2:0]		
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 3	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
2 to 0	UFRNM[2:0]	000	R	µFrame The µframe number can be confirmed. This module sets these bits to indicate the µframe number during high-speed operation. During operation other than high-speed operation, this module sets these bits to B'000. When reading these bits, repeat reading until the same value is read twice.

28.3.23 USB Address Register (USBADDR)

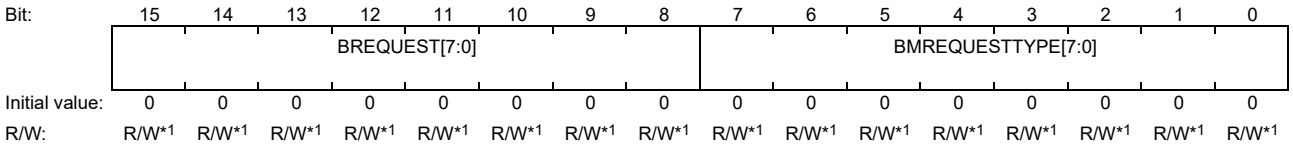
USBADDR is a register that indicates the USB address. This register is valid only when the function controller mode is selected. When the host controller mode is selected, peripheral device addresses should be set using the DEVSEL bits in PIPEMAXP.
This register is initialized by a power-on reset or a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	USBADDR[6:0]						
Initial value:	—	—	—	—	—	—	—	—	—	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
6 to 0	USBADDR[6:0]	H'00	R	USB Address When the function controller mode is selected, these bits indicate the USB address assigned by the host when the SET_ADDRESS request is successfully processed. When the function controller mode is selected, these bits indicate H’00 upon detection of a USB bus reset signal. When the host controller mode is selected, the read value is invalid.

28.3.24 USB Request Type Register (USBREQ)

USBREQ is a register that stores setup requests for control transfers.
When the function controller mode is selected, the values of bRequest and bmRequestType that have been received are stored. When the host controller mode is selected, the values of bRequest and bmRequestType to be transmitted are set. This register is initialized by a power-on reset or a USB bus reset.



Bit	Bit Name	Initial Value	R/W	Description
15 to 8	BREQUEST[7:0]	H'00	R/W*1	Request These bits store the USB request bRequest value. (1) When the host controller mode is selected The USB request data value for the setup transaction to be transmitted should be set in these bits. After SUREQ has been set to 1, do not modify these bits until SUREQ is read as 0. (2) When the function controller mode is selected Indicates the USB request data value received during the setup transaction. Writing to these bits is invalid.
7 to 0	BMREQUEST TYPE[7:0]	H'00	R/W*1	Request Type These bits store the USB request bmRequestType value. (1) When the host controller mode is selected The USB request type value for the setup transaction to be transmitted should be set in these bits. After SUREQ has been set to 1, do not modify these bits until SUREQ is read as 0. (2) When the function controller mode is selected Indicates the USB request type value received during the setup transaction. Writing to these bits is invalid.

Note 1. When the function controller mode is selected, these bits can only be read, and writing to these bits is invalid. When the host controller mode is selected, these bits can be read and written to.

28.3.25 USB Request Value Register (USBVAL)

USBVAL is a register that stores setup requests for control transfers. When the function controller mode is selected, the value of wValue that has been received is stored. When the host controller mode is selected, the value of wValue to be transmitted is set.
This register is initialized by a power-on reset or a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WVALUE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	WVALUE[15:0]	H'0000	R/W*1	Value These bits store the USB request wValue value. (1) When the host controller mode is selected The USB request wValue value for the setup transaction to be transmitted should be set in these bits. After SUREQ has been set to 1, do not modify these bits until SUREQ is read as 0. (2) When the function controller mode is selected Indicates the USB request wValue value received during the setup transaction. Writing to these bits is invalid.

Note 1. When the function controller mode is selected, these bits can only be read, and writing to these bits is invalid. When the host controller mode is selected, these bits can be read and written to.

28.3.26 USB Request Index Register (USBINDX)

USBINDX is a register that stores setup requests for control transfers. When the function controller mode is selected, the value of wIndex that has been received is stored. When the host controller mode is selected, the value of wIndex to be transmitted is set.
This register is initialized by a power-on reset or a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WINDEX[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	WINDEX[15:0]	H'0000	R/W*1	Index These bits store the USB request wIndex value. (1) When the host controller mode is selected The USB request wIndex value for the setup transaction to be transmitted should be set in these bits. After SUREQ has been set to 1, do not modify these bits until SUREQ is read as 0. (2) When the function controller mode is selected Indicates the USB request wIndex value received during the setup transaction. Writing to these bits is invalid.

Note 1. When the function controller mode is selected, these bits can only be read, and writing to these bits is invalid. When the host controller mode is selected, these bits can be read and written to.

28.3.27 USB Request Length Register (USBLENG)

USBLENG is a register that stores setup requests for control transfers. When the function controller mode is selected, the value of wLength that has been received is stored. When the host controller mode is selected, the value of wLength to be transmitted is set.
This register is initialized by a power-on reset or a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WLENGTH[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	WLENGTH[15:0]	H'0000	R/W*1	Length These bits store the USB request wLength value. (1) When the host controller mode is selected The USB request wLength value for the setup transaction to be transmitted should be set in these bits. After SUREQ has been set to 1, do not modify these bits until SUREQ is read as 0. (2) When the function controller mode is selected Indicates the USB request wLength value received during the setup transaction. Writing to these bits is invalid.

Note 1. When the function controller mode is selected, these bits can only be read, and writing to these bits is invalid. When the host controller mode is selected, these bits can be read and written to.

28.3.28 DCP Configuration Register (DCPCFG)

DCPCFG is a register that specifies the data transfer direction for the default control pipe (DCP).
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CNTMD	SHTNAK	—	—	DIR	—	—	—	—
Initial value:	—	—	—	—	—	—	—	0	0	—	—	0	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

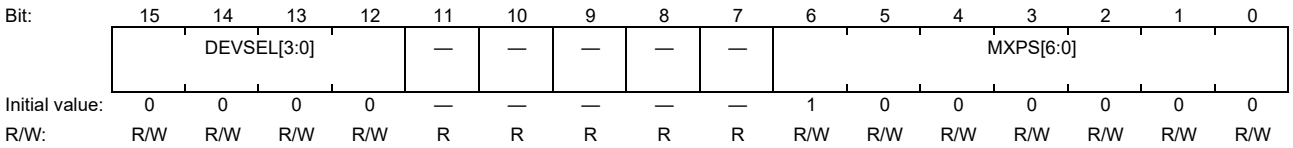
Bit	Bit Name	Initial Value	R/W	Description
8	CNTMD	0	R/W	Continuous Transfer Mode Specifies whether to use the default control pipe in continuous transfer mode. 0: Non-continuous transfer mode 1: Continuous transfer mode This module determines whether transmitting to/receiving from the FIFO buffer allocated for the DCP has completed or not using this bit setting, as shown in Table 28.10. Modify this bit while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. To modify this bit after completing USB communication using the DCP, write 1 to BCLR to clear the FIFO buffer assigned to the DCP while the CSSTS, PID, and CURPIPE bits are in the above-described state. Before modifying these bits after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
7	SHTNAK	0	R/W	Pipe Disabled at End of Transfer Specifies whether to modify PID to NAK upon the end of transfer when the default control pipe is in the receiving direction. 0: Pipe continued at the end of transfer 1: Pipe disabled at the end of transfer When this bit is set to 1, this module modifies the PID bits corresponding to the DCP to NAK on determining the end of the transfer. This module determines that the transfer has ended when a short packet (including a zero-length packet) is successfully received. Modify this bit while CSSTS is 0 and PID is NAK. Before modifying this bit after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. This bit should be cleared to 0 for the DCP in the transmitting direction.
6, 5	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
4	DIR	0	R/W	Transfer Direction When the host controller mode is selected, this bit sets the transfer direction of data stage and status stage for control transfers. 0: Data receiving direction 1: Data transmitting direction When the function controller mode is selected, this bit should be cleared to 0.
3 to 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Table 28.10 Relationship between Transfer Mode Settings by CNTMD Bit and Timings at which Reading Data or Transmitting Data from FIFO Buffer is Enabled

Continuous or Non-Continuous Transfer Mode	When Reading Data or Transmitting Data is Enabled
Non-continuous transfer (CNTMD = 0)	In the receiving direction (DIR = 0), reading data from the FIFO buffer is enabled in the following case. This module receives a single packet.
	In the transmitting direction (DIR = 1), transmitting data from the FIFO buffer is enabled in ether of the following cases. (1) Data of the maximum packet size is written to the FIFO buffer. (2) Data of the short packet size (including 0-byte data) is written to the FIFO buffer and then 1 is written to the BVAL bit
Continuous transfer (CNTMD = 1)	In the receiving direction (DIR = 0), reading data from the FIFO buffer is enabled in any of the following cases. (1) The number of the data bytes received in the FIFO buffer assigned to the DCP becomes the same as the number of assigned data bytes (fixed to 256 bytes) (2) This module receives a short packet other than a zero-length packet (3) This module receives a zero-length packet when data is already stored in the FIFO buffer assigned to the DCP.
	In the transmitting direction (DIR = 1), transmitting data from the FIFO buffer is enabled in either of the following cases. (1) The number of the data bytes written to the FIFO buffer becomes the same as the number of data bytes in a single FIFO buffer plane assigned to the DCP. (2) A number of data bytes less than the size of a single FIFO buffer (including 0-byte data) assigned to the DCP being written to the FIFO buffer and then 1 being written to BVAL.

28.3.29 DCP Maximum Packet Size Register (DCPMAXP)

DCPMAXP is a register that specifies the maximum packet size for the DCP.
This register is initialized by a power-on reset.



Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DEVSEL[3:0]				—	—	—	—	—	MXPS[6:0]						
Initial value:	0	0	0	0	—	—	—	—	—	1	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	DEVSEL[3:0]	0000	R/W	Device Select When the host controller mode is selected, these bits specify the communication target peripheral device address for control transfers. 0000: Address 0000 0001: Address 0001 : : 1001: Address 1001 1010: Address 1010 Others: Setting prohibited These bits should be set after setting the DEVADDn register corresponding to the value to be set in these bits. For example, before setting DEVSEL to 0010, the DEVADD2 register should be set first. These bits should be set while CSSTS is 0, PID is NAK, and SUREQ is 0. Before modifying these bits after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. When the function controller mode is selected, these bits should be set to B'0000.
11 to 7	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
6 to 0	MXPS[6:0]	H'40	R/W	Maximum Packet Size Specifies the maximum data payload (maximum packet size) for the DCP. These bits are initialized to H'40 (64 bytes). These bits should be set to the value based on the USB Specification. These bits should be set while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. Before modifying these bits after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. While MXPS is 0, do not write to the FIFO buffer or do not set PID to BUF.

28.3.30 DCP Control Register (DCPCTR)

DCPCTR is a register that is used to confirm the buffer memory status, change and confirm the data PID sequence bit, and set the response PID for the DCP.

This register is initialized by a power-on reset. The CCPL and PID[1:0] bits are initialized by a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSTS	SUREQ	CSCLR	CSSTS	SUREQCLR	—	—	SQCLR	SQSET	SQMON	PBUSY	PINGE	—	CCPL	PID[1:0]	
Initial value:	0	0	0	0	0	—	—	0	0	1	0	0	—	0	0	0
R/W:	R	R/W*2	R/W*1	R	R/W*1	R	R	R/W*1	R/W*1	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	BSTS	0	R	Buffer Status Indicates whether DCP FIFO buffer access is enabled or disabled. 0: Buffer access is disabled. 1: Buffer access is enabled. The meaning of the BSTS bit depends on the ISEL bit setting as follows. • When ISEL = 0, BSTS indicates whether the received data can be read from the buffer. • When ISEL = 1, BSTS indicates whether the data to be transmitted can be written to the buffer.
14	SUREQ	0	R/W*2	Setup Token Transmission Transmits the setup packet by setting this bit to 1 when the host controller mode is selected. 0: Writing invalid 1: Transmits the setup packet. After completing the setup transaction process, this module generates either the SACK or SIGN interrupt and clears this bit to 0. This module also clears this bit to 0 when the SUREQCLR bit is set to 1. Before setting this bit to 1, set the DEVSEL bits, USBREQ register, USBVAL register, USBINDX register, and USBLENG register appropriately to transmit the desired USB request in the setup transaction. Before setting this bit to 1, check that the PID bits for the DCP are set to NAK. After setting this bit to 1, do not modify the DEVSEL bits, USBREQ register, USBVAL register, USBINDX register, or USBLENG register while the setup transaction is in progress (SUREQ = 1). Write 1 to this bit only when transmitting the setup token; for the other purposes, write 0. When the function controller mode is selected, be sure to write 0 to this bit.
13	CSCLR	0	R/W*1	C-SPLIT Status Clear for Split Transaction When the host controller mode is selected, setting this bit to 1 clears the CSSTS bit to 0 for the transfer using the split transaction. In this case, the next DCP transfer restarts with the S-SPLIT. 0: Writing invalid 1: Clears the CSSTS bit to 0. When this bit is set to 1, this module clears the CSSTS bit to 0. For the transfer using the split transaction, to restart the next transfer with the S-SPLIT forcibly, set this bit to 1. However, for the normal split transaction, this module automatically clears the CSSTS bit to 0 upon completion of the C-SPLIT; therefore, clearing the CSSTS bit is not necessary. Controlling the CSSTS bit through this bit must be done while UACT is 0 and thus communication is halted or while no transfer is being performed with bus disconnection detected. Setting this bit to 1 while CSSTS is 0 has no effect. When the function controller mode is selected, be sure to write 0 to this bit.

Bit	Bit Name	Initial Value	R/W	Description
12	CSSTS	0	R	COMPLETE SPLIT (C-SPLIT) Status of Split Transaction Indicates the C-SPLIT status of the split transaction when the host controller mode is selected. 0: START-SPLIT (S-SPLIT) transaction being processed or the device not using the split transaction being processed 1: C-SPLIT transaction being processed This module sets this bit to 1 upon start of the C-SPLIT and clears this bit to 0 upon detection of C-SPLIT completion. When the function controller mode is selected, the read value is invalid.
11	SUREQCLR	0	R/W*1	SUREQ Bit Clear When the host controller mode is selected, setting this bit to 1 clears the SUREQ bit to 0. 0: Writing invalid 1: Clears the SUREQ bit to 0. This bit always indicates 0. Set this bit to 1 when communication has stopped with SUREQ being 1 during the setup transaction. However, for normal setup transactions, this module automatically clears the SUREQ bit to 0 upon completion of the transaction; therefore, clearing the SUREQ bit is not necessary. Controlling the SUREQ bit through this bit must be done while UACT is 0 and thus communication is halted or while no transfer is being performed with bus disconnection detected. When the function controller mode is selected, be sure to write 0 to this bit.
10, 9	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
8	SQCLR	0	R/W*1	Toggle Bit Clear Specifies DATA0 as the expected value of the sequence toggle bit for the next transaction during the DCP transfer. 0: Writing invalid 1: Specifies DATA0. This bit always indicates 0. Do not set the SQCLR and SQSET bits to 1 simultaneously. Set this bit to 1 while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. Before setting this bit to 1 after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
7	SQSET	0	R/W*1	Toggle Bit Set Specifies DATA1 as the expected value of the sequence toggle bit for the next transaction during the DCP transfer. 0: Writing invalid 1: Specifies DATA1. Do not set the SQCLR and SQSET bits to 1 simultaneously. Set this bit to 1 while CSSTS is 0 and PID is NAK. Before setting this bit to 1 after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
6	SQMON	1	R	Sequence Toggle Bit Monitor Indicates the expected value of the sequence toggle bit for the next transaction during the DCP transfer. 0: DATA0 1: DATA1 This module allows this bit to toggle upon normal completion of the transaction. However, this bit is not allowed to toggle when a DATA-PID disagreement occurs during the transfer in the receiving direction. When the function controller mode is selected, this module sets this bit to 1 (specifies DATA1 as the expected value) upon normal reception of the setup packet. When the function controller mode is selected, this module does not reference to this bit during the IN/OUT transaction of the status stage, and does not allow this bit to toggle upon normal completion.

Bit	Bit Name	Initial Value	R/W	Description
5	PBUSY	0	R	Pipe Busy Indicates whether or not the actual communication state of the DCP has entered the NAK state when the PID bits for the DCP are changed from BUF to NAK. 0: Has not finished the transition to NAK 1: Has finished the transition to NAK This module modifies this bit from 0 to 1 upon start of the USB transaction for the DCP, and modifies the bit from 1 to 0 upon completion of one transaction. Reading this bit after PID has been set to NAK allows checking whether modification of the pipe settings is possible. For details, refer to section 28.4.3 (1) Pipe Control Register Switching Procedures.
4	PINGE	0	R/W	PING Token Issue Enable When the host controller mode is selected, setting this bit to 1 allows this module to issue the PING token during transfers in the transmitting direction and start a transfer in the transmitting direction with the PING transaction. 0: Disables issuing PING token. 1: Enables normal PING operation. When having detected the ACK handshake during PING transactions, this module performs the OUT transaction as the next transaction. When having detected the NAK handshake or NYET handshake during OUT transactions, this module performs the PING transaction as the next transaction. When the host controller mode is selected, setting this bit to 0 prevents this module from issuing the PING token during transfers in the transmitting direction and only allows this module to perform OUT transactions for the transfers in the transmitting direction. This bit should be modified while CSSTS is 0 and PID is NAK. Before setting this bit to 1 after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. When the function controller mode is selected, be sure to write 0 to this bit.
3	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
2	CCPL	0	R/W	Control Transfer End Enable When the function controller mode is selected, setting this bit to 1 enables the status stage of the control transfer to be completed. 0: Completion of control transfer is disabled. 1: Completion of control transfer is enabled. In function controller mode, when this bit is set to 1 while the corresponding PID bits are set to BUF, this module completes the control transfer status stage. Specifically, during control read transfer, this module transmits the ACK handshake in response to the OUT transaction from the USB host, and outputs the zero-length packet in response to the IN transaction from the USB host during control write or no-data control transfer. However, on detecting the SET_ADDRESS request, this module operates in auto response mode from the setup stage up to the status stage completion irrespective of the setting of this bit. This module modifies this bit from 1 to 0 on receiving the new setup packet. 1 cannot be written to this bit while VALID is 1. When the host controller mode is selected, be sure to write 0 to this bit.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	PID[1:0]	00	R/W	Response PID Controls the response type of this module during control transfer. 00: NAK response 01: BUF response (depending on the buffer state) 10: STALL response 11: STALL response (1) When the host controller mode is selected Modify the setting of these bits from NAK to BUF using the following procedure. • When the transmitting direction is set Write all the transmit data to the FIFO buffer while UACT is 1 and PID is NAK, and then set PID to BUF. After PID has been set to BUF, this module executes the OUT transaction (or PING transaction). • When the receiving direction is set Check that the FIFO buffer is empty (or empty the buffer) while UACT is 1 and PID is NAK, and then set PID to BUF. After PID has been set to BUF, this module executes the IN transaction. This module modifies the setting of these bits as follows. • This module sets PID to STALL (11) on receiving the data of the size exceeding the maximum packet size when PID has been set to BUF. • This module sets PID to NAK on detecting a reception error such as a CRC error three consecutive times. • This module also sets PID to STALL (11) on receiving the STALL handshake. Even if the PID bits are modified to NAK after this module has issued S-SPLIT of the split transaction for the selected pipe (while CSSTS indicates 1), this module continues the transaction until C-SPLIT completes. This module sets PID to NAK upon completion of C-SPLIT. (2) When the function controller mode is selected This module modifies the setting of these bits as follows. • This module modifies PID to NAK on receiving the setup packet. Here, this module sets VALID to 1. The setting of PID cannot be modified until VALID is set to 0. • This module sets PID to STALL (11) on receiving the data of the size exceeding the maximum packet size when PID has been set to BUF. • This module sets PID to STALL (1x) on detecting the control transfer sequence error. • This module sets PID to NAK on detecting the USB bus reset. This module does not reference to the setting of the PID bits while the SET_ADDRESS request is processed (auto processing).

Note 1. Only 0 can be read and 1 can be written to.
Note 2. Only 1 can be written to.

28.3.31 Pipe Window Select Register (PIPESEL)

PIPE1 to PIPE9 should be set using PIPESEL, PIPECFG, PIPEBUF, PIPEMAXP, PIPEPERI, PIPEnCTR, PIPEnTRE, and PIPEnTRN.

After selecting the pipe using PIPESEL, functions of the pipe should be set using PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI. PIPEnCTR, PIPEnTRE, and PIPEnTRN can be set regardless of the pipe selection in PIPESEL.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	PIPESEL[3:0]

Bit	Bit Name	Initial Value	R/W	Description
15 to 4	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
3 to 0	PIPESEL[3:0]	0000	R/W	Pipe Window Select When a value between 0001 and 1111 is set in these bits, the information and settings for the corresponding pipe can be read from the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers. 0000: No pipe selected 0001: PIPE1 0010: PIPE2 0011: PIPE3 0100: PIPE4 0101: PIPE5 0110: PIPE6 0111: PIPE7 1000: PIPE8 1001: PIPE9 1010: PIPE10 1011: PIPE11 1100: PIPE12 1101: PIPE13 1110: PIPE14 1111: PIPE15 Others: Setting prohibited When 0000 is set in these bits, 0 is read from all of the bits in the PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI registers. Writing to the bits in these registers is invalid.

28.3.32 Pipe Configuration Register (PIPECFG)

PIPECFG is a register that specifies the transfer type, buffer memory access direction, and endpoint numbers for PIPE1 to PIPE15. It also selects continuous or non-continuous transfer mode, single or double buffer mode, and whether to continue or disable pipe operation at the end of transfer.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TYPE[1:0]		—	—	—	BFRE	DBLB	CNTMD	SHTNAK	—	—	DIR	EPNUM[3:0]

R/W:	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	TYPE[1:0]	00	R/W	Transfer Type Specifies the transfer type for the pipe selected by the PIPESEL bits (selected pipe). • PIPE1 and PIPE2 00: Pipe not used 01: Bulk transfer 10: Setting prohibited 11: Isochronous transfer • PIPE3 to PIPE5 00: Pipe not used 01: Bulk transfer 10: Setting prohibited 11: Setting prohibited • PIPE6 to PIPE8 00: Pipe not used 01: Pipe not used 10: Interrupt transfer 11: Setting prohibited • PIPE9 00: Pipe not used 01: Bulk transfer (when in function controller mode) 10: Interrupt transfer (when in host controller mode) 11: Setting prohibited • PIPE10 (available only in function controller mode) 01: Bulk transfer 10: Interrupt transfer • PIPE11 to PIPE15 (available only in function controller mode) 01: Bulk transfer Before setting PID to BUF for the selected pipe (before starting USB communication using the selected pipe), be sure to set these bits to the value other than 00. Modify these bits while the PID bits for the selected pipe are set to NAK. Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
13 to 11	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
10	BFRE	0	R/W	BRDY Interrupt Operation Specification Specifies the BRDY interrupt generation timing from this module to the CPU with respect to the selected pipe. 0: BRDY interrupt upon transmitting or receiving data 1: BRDY interrupt upon completion of reading data This bit is valid when PIPE1 to PIPE5 and PIPE9 to PIPE15 are selected. When this bit is set to 1 and the selected pipe is in the receiving direction, this module detects the transfer completion and generates the BRDY interrupt on having read the pertinent packet. When the BRDY interrupt is generated with the above conditions, 1 needs to be written to BCLR. The FIFO buffer assigned to the selected pipe is not enabled for reception until 1 is written to BCLR. When this bit is set to 1 and the selected pipe is in the transmitting direction, this module does not generate the BRDY interrupt. For details, refer to section 28.4.2 (2) BRDY Interrupt. Modify this bit while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. To modify this bit after completing USB communication using the selected pipe, write 1 and then 0 to ACLRM continuously to clear the FIFO buffer assigned to the selected pipe while the CSSTS, PID, and CURPIPE bits are in the above-described state. Before modifying this bit after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
9	DBLB	0	R/W	Double Buffer Mode Selects either single or double buffer mode for the FIFO buffer used by the selected pipe. 0: Single buffer 1: Double buffer This bit is valid when PIPE1 to PIPE5 and PIPE9 to PIPE15 are selected. For PIPE9 and PIPE10, this bit is only valid when the transfer type is set to bulk transfer. When this bit is set to 1, this module assigns two planes of the FIFO buffer size specified by the BUFSIZE bits in PIPEBUF to the selected pipe. Specifically, the following expression determines the FIFO buffer size assigned to the selected pipe by this module. (BUFSIZE + 1) × 64 × (DBLB + 1) [bytes] Modify this bit while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. To modify this bit after completing USB communication using the selected pipe, write 1 and then 0 to ACLRM continuously to clear the FIFO buffer assigned to the selected pipe while the CSSTS, PID, and CURPIPE bits are in the above-described state. Before modifying this bit after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
8	CNTMD	0	R/W	Continuous Transfer Mode Specifies whether to use the selected pipe in continuous transfer mode. 0: Non-continuous transfer mode 1: Continuous transfer mode This bit is valid when PIPE1 to PIPE5 and PIPE9 to PIPE15 are selected by the PIPESEL bits and bulk transfer is selected (TYPE = 01). Modify this bit while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. To modify this bit after completing USB communication using the selected pipe, write 1 and then 0 to ACLRM continuously to clear the FIFO buffer assigned to the selected pipe while the CSSTS, PID, and CURPIPE bits are in the above-described state. Before modifying this bit after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.

Bit	Bit Name	Initial Value	R/W	Description
7	SHTNAK	0	R/W	Pipe Disabled at End of Transfer Specifies whether to modify PID to NAK upon the end of transfer when the selected pipe is in the receiving direction. 0: Pipe continued at the end of transfer 1: Pipe disabled at the end of transfer This bit is valid when the selected pipe is PIPE1 to PIPE5 and PIPE9 to PIPE15 in the receiving direction. When this bit is set to 1 for the selected pipe in the receiving direction, this module modifies the PID bits corresponding to the selected pipe to NAK on determining the end of the transfer. This module determines that the transfer has ended on any of the following conditions. • A short packet (including a zero-length packet) is successfully received. • The transaction counter is used and the number of packets specified by the counter is successfully received. Modify this bit while CSSTS is 0 and PID is NAK. Before modifying this bit after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. This bit should be cleared to 0 for the pipe in the transmitting direction.
6, 5	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
4	DIR	0	R/W	Transfer Direction Specifies the transfer direction for the selected pipe. 0: Receiving direction 1: Transmitting direction When this bit is set to 0, this module uses the selected pipe in the receiving direction, and when this bit is set to 1, this module uses the selected pipe in the transmitting direction. Modify this bit while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. To modify this bit after completing USB communication using the selected pipe, write 1 and then 0 to ACLRM continuously to clear the FIFO buffer assigned to the selected pipe while the CSSTS, PID, and CURPIPE bits are in the above-described state. Before modifying this bit after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
3 to 0	EPNUM[3:0]	0000	R/W	Endpoint Number These bits specify the endpoint number for the selected pipe. Setting 0000 means unused pipe. Modify these bits while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. Do not make the settings such that the combination of the set values in the DIR and EPNUM bits should be the same for two or more pipes (EPNUM = 0000 can be set for all the pipes).

Table 28.11 Relationship between Transfer Mode Settings by CNTMD Bit and Timings at which Reading Data or Transmitting Data from FIFO Buffer is Enabled

Continuous or Non-Continuous Transfer Mode	When Reading Data or Transmitting Data is Enabled
Non-continuous transfer (CNTMD = 0)	In the receiving direction (DIR = 0), reading data from the FIFO buffer is enabled in the following case. This module receives a single packet.
	In the transmitting direction (DIR = 1), transmitting data from the FIFO buffer is enabled in either of the following cases. (1) Data of the maximum packet size is written to the FIFO buffer. (2) Data of the short packet size (including 0-byte data) is written to the FIFO buffer and then 1 is written to BVAL.
Continuous transfer (CNTMD = 1)	In the receiving direction (DIR = 0), reading data from the FIFO buffer is enabled in any of the following cases. (1) The number of the data bytes received in the FIFO buffer assigned to the selected pipe becomes the same as the number of assigned data bytes ((BUFSIZE + 1) × 64). (2) This module receives a short packet other than a zero-length packet. (3) This module receives a zero-length packet when data is already stored in the FIFO buffer assigned to the selected pipe. (4) This module receives the number of packets equal to the transaction counter value specified for the selected pipe.
	In the transmitting direction (DIR = 1), transmitting data from the FIFO buffer is enabled in any of the following cases. (1) The number of the data bytes written to the FIFO buffer becomes the same as the number of data bytes in a single FIFO buffer plane assigned to the selected pipe. (2) A number of data bytes less than the size of a single FIFO buffer (including 0 bytes of data) assigned to the selected pipe being written to the FIFO buffer and then 1 being written to BVAL (3) After setting the DMA transfer end sampling enable bit (TENDE) to 1, a number of data bytes less than the size of a single FIFO buffer (including 0 bytes of data) assigned to the selected pipe being written to the FIFO buffer by DMA transfer and the DMA transfer end signal is received when the last byte is written.

28.3.33 Pipe Buffer Setting Register (PIPEBUF)

PIPEBUF is a register that specifies the buffer size and buffer number for PIPE1 to PIPE9.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	BUFSIZE[4:0]					—	—	BUFNMB[7:0]							
Initial value:	—	0	0	0	0	0	—	—	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
14 to 10	BUFSIZE[4:0]	H'00	R/W	Buffer Size Specifies the size of the buffer for the pipe selected by the PIPESEL bits (selected pipe) in terms of blocks, where one block comprises 64 bytes. 00000 (H'00): 64 bytes 00001 (H'01): 128 bytes : : 11111 (H'1F): 2 Kbytes When the DBLB bit is set to 1, this module assigns two planes of the FIFO buffer size specified by the BUFSIZE bits to the selected pipe. Specifically, the following expression determines the FIFO buffer size assigned to the selected pipe by this module. (BUFSIZE + 1) × 64 × (DBLB + 1) [bytes] The valid value for these bits depends on the selected pipe. • PIPE1 to PIPE5 and PIPE9 to PIPE15: Any value from H'00 to H'1F is valid. • PIPE6 to PIPE8: H'00 should be set. When used with CNTMD = 1, set an integral multiple of the maximum packet size to the BUFSIZE bits. Modify these bits while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
9, 8	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	BUFNMB[7:0]	H'00	R/W	Buffer Number The first block number in the FIFO buffer to be allocated for the selected pipe should be set in these bits. The FIFO buffer blocks allocated for the selected pipe by this module are determined as follows: Block number: BUFNMB to block number of (BUFNMB + (BUFSIZE + 1) × (DBLB + 1) – 1) These bits should be set to a value from H'04 to H'7F. BUFNMB = H'00 is used exclusively for DCP. BUFNMB = H'04 is used exclusively for PIPE6. When PIPE6 is not used, H'04 can be used for other pipes. When PIPE6 is selected, writing to these bits is invalid and H'04 is automatically assigned by this module. BUFNMB = H'05 is used exclusively for PIPE7. When PIPE7 is not used, H'05 can be used for other pipes. When PIPE7 is selected, writing to these bits is invalid and H'05 is automatically assigned by this module. BUFNMB = H'06 is used exclusively for PIPE8. When PIPE8 is not used, H'06 can be used for other pipes. When PIPE8 is selected, writing to these bits is invalid and H'06 is automatically assigned by this module. BUFNMB = H'07 is used exclusively for PIPE9. When PIPE9 is not used, H'07 can be used for other pipes. When PIPE9 is selected, writing to these bits is valid and H'07 is assigned as the initial value by this module. Modify these bits while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.

28.3.34 Pipe Maximum Packet Size Register (PIPEMAXP)

PIPEMAXP is a register that specifies the maximum packet size for PIPE1 to PIPE15.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DEVSEL[3:0]				—	MXPS[10:0]										
Initial value:	0	0	0	0	—	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	DEVSEL[3:0]	0000	R/W	Device Select When the host controller mode is selected, these bits specify the USB address of the communication target peripheral device. 0000: Address 0000 0001: Address 0001 0010: Address 0010 : : 1010: Address 1010 Others: Setting prohibited These bits should be set after setting the address to the DEVADDn (n = 0 to 9, and A) register corresponding to the value to be set in these bits. For example, before setting DEVSEL to 0010, the DEVADD2 address should be set first. Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. When the function controller mode is selected, these bits should be set to B'0000.
11	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
10 to 0	MXPS[10:0]	*1	R/W	Maximum Packet Size Specifies the maximum data payload (maximum packet size) for the selected pipe. The valid value for these bits depends on the pipe as follows. PIPE1, PIPE2: 1 byte (H'001) to 1,024 bytes (H'400) PIPE3 to PIPE5: 8 bytes (H'008), 16 bytes (H'010), 32 bytes (H'020), 64 bytes (H'040), and 512 bytes (H'200) (Bits [2:0] are not available.) PIPE6 to PIPE8: 1 byte (H'001) to 64 bytes (H'040) PIPE9 (when in host controller mode): 1 byte (H'001) to 64 bytes (H'040) PIPE9 (when in function controller mode): 8 bytes (H'008), 16 bytes (H'010), 32 bytes (H'020), 64 bytes (H'040), 512 bytes (H'200) (Bits [2:0] are not available.) PIPE10 to PIPE15: 8 bytes (H'008), 16 bytes (H'010), 32 bytes (H'020), 64 bytes (H'040), 512 bytes (H'200) (Bits [2:0] are not available.) These bits should be set to the approp3riate value for each transfer type based on the USB Specification. For split transactions using the isochronous pipe, these bits should be set to 188 bytes or less. Modify these bits while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. While MXPS is 0, do not write to the FIFO buffer or set PID to BUF.

Note 1. The initial value of MXPS is H'000 when no pipe is selected with the PIPESEL bits in PIPESEL and H'040 when a pipe is selected with the PIPESEL bits in PIPESEL.

28.3.35 Pipe Timing Control Register (PIPEPERI)

PIPEPERI is a register that selects whether the buffer is flushed or not when an interval error occurred during isochronous IN transfer, and sets the interval error detection interval for PIPE1 to PIPE15.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	IFIS	—	—	—	—	—	—	—	—	—	IITV[2:0]		
Initial value:	—	—	—	0	—	—	—	—	—	—	—	—	—	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
12	IFIS	0	R/W	Isochronous IN Buffer Flush Specifies whether to flush the buffer when the pipe selected by the PIPESEL bits is used for isochronous IN transfers. 0: The buffer is not flushed. 1: The buffer is flushed. When the function controller mode is selected and the selected pipe is for isochronous IN transfers, this module automatically clears the FIFO buffer when this module fails to receive the IN token from the USB host within the interval set by the IITV bits in terms of (μ) frames. In double buffer mode (DBLB = 1), this module only clears the data in the plane used earlier. This module clears the FIFO buffer on receiving the SOF packet immediately after the (μ) frame in which this module has expected to receive the IN token. Even if the SOF packet is corrupted, this module also clears the FIFO buffer at the right timing to receive the SOF packet by using the internal interpolation. When the host controller mode is selected, set this bit to 0. When the selected pipe is not for the isochronous transfer, set this bit to 0.
11 to 3	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
2 to 0	IITV[2:0]	000	R/W	Interval Error Detection Interval Specifies the interval error detection timing for the selected pipe in terms of frames, which is expressed as n-th power of 2 (n is the value to be set). As described later, the detailed functions are different in host controller mode and in function controller mode. Modify these bits while CSSTS is 0, PID is NAK, and the pipe is not selected by the CURPIPE bits. Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. Before modifying these bits after USB communication has been completed with these bits set to a certain value, set PID to NAK and then set ACLRM to 1 to initialize the interval timer. The IITV bits are invalid for PIPE3 to PIPE5 and PIPE10 to PIPE15; set these bits to 000 for these pipes.

28.3.36 PIPEn Control Registers (PIPEnCTR) (n = 1 to F)

PIPEnCTR is a register that is used to confirm the buffer memory status for the corresponding pipe, change and confirm the data PID sequence bit, determine whether auto response mode is set, determine whether auto buffer clear mode is set, and set a response PID for PIPE1 to PIPE15. This register can be set regardless of the pipe selection in PIPESEL. These registers are initialized by a power-on reset. The PID[1:0] bits are initialized by a USB bus reset.

(1) PIPEnCTR (n = 1 to 5, 9, A to F)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSTS	INBUFM	CSCLR	CSSTS	—	ATREPM	ACLRM	SQCLR	SQSET	SQMON	PBUSY	—	—	—	PID[1:0]	
Initial value:	0	0	0	0	—	0	0	0	0	0	0	—	—	—	0	0
R/W:	R	R	R/W*2	R	R	R/W	R/W	R/W*1	R/W*1	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	BSTS	0	R	Buffer Status Indicates whether or not the FIFO buffer allocated for the pertinent pipe can be accessed by the CPU. 0: Buffer access by the CPU is disabled. 1: Buffer access by the CPU is enabled. The meaning of this bit depends on the settings of the DIR, BFRE, and DCLRM bits as shown in Table 28.12.
14	INBUFM	0	R	Transmission Buffer Monitor Indicates the pertinent FIFO buffer status when the pertinent pipe is in the transmitting direction. 0: There is no transmissible data in the buffer memory. 1: There is transmissible data in the buffer memory. When the pertinent pipe is in the transmitting direction (DIR = 1), this module sets this bit to 1 when writing data to at least one FIFO buffer plane is completed. This module sets this bit to 0 when this module completes transmitting the data from the FIFO buffer plane to which all the data has been written. In double buffer mode (DBLB = 1), this module sets this bit to 0 after this module has completed transmitting the data from both FIFO buffer planes but before it has completed writing data to a single FIFO buffer plane. This bit indicates the same value as the BSTS bit when the pertinent pipe is in the receiving direction (DIR = 0).
13	CSCLR	0	R/W*2	C-SPLIT Status Clear Bit When the host controller mode is selected, setting this bit to 1 allows this module to clear the CSSTS bit to 0. 0: Writing invalid 1: Clears the CSSTS bit to 0. For the transfer using the split transaction, to restart the next transfer with the S-SPLIT forcibly, set this bit to 1. However, for the normal split transaction, this module automatically clears the CSSTS bit to 0 upon completion of the C-SPLIT; therefore, clearing the CSSTS bit is not necessary. Controlling the CSSTS bit through this bit must be done while UACT is 0 and thus communication is halted or while no transfer is being performed with bus disconnection detected. Setting this bit to 1 while CSSTS is 0 has no effect. When the function controller mode is selected, be sure to write 0 to this bit.

Bit	Bit Name	Initial Value	R/W	Description
12	CSSTS	0	R	CSSTS Status Bit Indicates the C-SPLIT status of the split transaction when the host controller mode is selected. 0: START-SPLIT (S-SPLIT) transaction being processed or the transfer not using the split transaction in progress 1: C-SPLIT transaction being processed This module sets this bit to 1 upon start of the C-SPLIT and clears this bit to 0 upon detection of C-SPLIT completion. Indicates the valid value only when the host controller mode is selected.
11	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
10	ATREPM	0	R/W	Auto Response Mode Enables or disables auto response mode for the pertinent pipe. 0: Auto response disabled 1: Auto response enabled When the function controller mode is selected and the pertinent pipe is for bulk transfer, this bit can be set to 1. When this bit is set to 1, this module responds to the token from the USB host as described below. (1) When the pertinent pipe is for bulk IN transfer (TYPE = 01 and DIR = 1) When ATREPM = 1 and PID = BUF, this module transmits a zero-length packet in response to the IN token. This module updates (toggles) the sequence toggle bit (DATA-PID) each time this module receives the ACK from the USB host (in a single transaction, IN token is received, zero-length packet is transmitted, and then ACK is received.). In this case, this module does not generate the BRDY or BEMP interrupt. (2) When the pertinent pipe is for bulk OUT transfer (TYPE = 01 and DIR = 0) When ATREPM = 1 and PID = BUF, this module returns NAK in response to the OUT token (or PING token) and generates the NRDY interrupt. Modify this bit while CSSTS is 0 and PID is NAK. Before modifying this bit after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. For USB communication in auto response mode, set this bit to 1 while the FIFO buffer is empty. Do not write to the FIFO buffer during USB communication in auto response mode. When the pertinent pipe is for isochronous transfer, be sure to set this bit to 0. When the host controller mode is selected, set this bit to 0.
9	ACLRM	0	R/W	Auto Buffer Clear Mode Enables or disables automatic buffer clear mode for the pertinent pipe. 0: Disabled 1: Enabled (all buffers are initialized) To delete the contents in the FIFO buffer assigned to the pertinent pipe completely, write 1 and then 0 to this bit continuously. Table 28.13 shows the contents cleared by writing 1 and 0 to this bit continuously and the cases in which clearing the contents is necessary. Modify this bit while CSSTS is 0, PID is NAK, and the pertinent pipe is not selected by the CURPIPE bits. Before modifying this bit after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.

Bit	Bit Name	Initial Value	R/W	Description
8	SQCLR	0	R/W*1	Toggle Bit Clear This bit should be set to 1 to clear the expected value (to set DATA0 as the expected value) of the sequence toggle bit for the next transaction of the pertinent pipe. 0: Writing invalid 1: Specifies DATA0. Setting this bit to 1 allows this module to set DATA0 as the expected value of the sequence toggle bit of the pertinent pipe. This bit always indicates 0. When the host controller mode is selected, setting this bit to 1 for the pipe for bulk OUT transfer, this module starts the next transfer of the pertinent pipe with the PING token. Set the SQCLR bit to 1 while CSSTS is 0 and PID is NAK. Before modifying this bit after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
7	SQSET	0	R/W*1	Toggle Bit Set This bit should be set to 1 to set DATA1 as the expected value of the sequence toggle bit for the next transaction of the pertinent pipe. 0: Writing invalid 1: Specifies DATA1. Setting this bit to 1 allows this module to set DATA1 as the expected value of the sequence toggle bit of the pertinent pipe. This module always sets this bit to 0. Set the SQSET bit to 1 while CSSTS is 0 and PID is NAK. Before modifying this bit after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
6	SQMON	0	R	Toggle Bit Confirmation Indicates the expected value of the sequence toggle bit for the next transaction of the pertinent pipe. 0: DATA0 1: DATA1 When the pertinent pipe is not for the isochronous transfer, this bit is toggled upon normal completion of the transaction. However, this bit is not toggled when a DATA-PID disagreement occurs during the receiving transfer.
5	PBUSY	0	R	Pipe Busy This bit indicates whether or not the pertinent pipe is being currently used for the transaction. 0: The pertinent pipe is not being currently used for the transaction. 1: The pertinent pipe is being currently used for the transaction. This module modifies this bit from 0 to 1 upon start of the USB transaction for the pertinent pipe, and modifies the bit from 1 to 0 upon completion of one transaction. Reading this bit after PID has been set to NAK allows checking that modification of the pipe settings is possible.
4 to 2	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	PID[1:0]	00	R/W	Response PID Specifies the response type for the next transaction of the pertinent pipe. 00: NAK response 01: BUF response (depending on the buffer state) 10: STALL response 11: STALL response The default setting of these bits is NAK. Modify the setting to BUF to use the pertinent pipe for USB transfer. Table 28.14 and Table 28.15 show the basic operation (operation when there are no errors in the transmitted and received packets) of this module depending on the PID bit setting. Some registers require these bits to be set to NAK before their settings can be changed by software. Set these bits to NAK by software when changing such kind of registers. To confirm which registers apply to this, reference the descriptions of bits. After modifying the setting of these bits from BUF to NAK during USB communication using the pertinent pipe, check that PBUSY is 0 to see if USB communication using the pertinent pipe has actually entered the NAK state. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. Even if the PID bits are modified to NAK after S-SPLIT of the split transaction has been issued for the pertinent pipe (while CSSTS indicates 1), this module continues the transaction until C-SPLIT completes. • This module modifies the setting of these bits as follows. This module sets PID to NAK on recognizing the completion of the transfer when the pertinent pipe is in the receiving direction and the SHTNAK bit for the selected pipe has been set to 1. • This module sets PID to STALL (11) on receiving the data packet with the payload exceeding the maximum packet size of the pertinent pipe. • This module sets PID to NAK on detecting a USB bus reset when the function controller mode is selected. • This module sets PID to NAK on detecting a reception error such as a CRC error three consecutive times when the host controller mode is selected. • This module sets PID to STALL (11) on receiving the STALL handshake when the host controller mode is selected. To specify each response type, set these bits as follows. • To make a transition from NAK (00) to STALL, set 10. • To make a transition from BUF (01) to STALL, set 11. • To make a transition from STALL (11) to NAK, set 10 and then 00. • To make a transition from STALL to BUF, set 00 (NAK) and then 01 (BUF).

Note 1. Only 0 can be read and 1 can be written to.
Note 2. Only 1 can be written to.

Table 28.12 Meaning of BSTS Bit

DIR Bit	BFRE Bit	DCLRM Bit	Meaning of BSTS Bit
0	0	0	1: The received data can be read from the FIFO buffer. 0: The received data has been completely read from the FIFO buffer.
		1	Setting prohibited
	1	0	1: The received data can be read from the FIFO buffer. 0: The BCLR bit has been set to 1 after the received data has been completely read from the FIFO buffer.
		1	1: The received data can be read from the FIFO buffer. 0: The received data has been completely read from the FIFO buffer.
1	0	0	1: The transmit data can be written to the FIFO buffer. 0: The transmit data has been completely written to the FIFO buffer.
		1	Setting prohibited
	1	0	Setting prohibited
		1	Setting prohibited

Table 28.13 Contents Cleared by This Module by Setting ACLRM = 1

No.	Contents Cleared by ACLRM Bit Manipulation	Cases in which Clearing the Contents is Necessary
1	All the contents in the FIFO buffer assigned to the pertinent pipe (all the information in two FIFO buffer planes in double buffer mode)	
2	The interval count value when the pertinent pipe is for isochronous transfer	When the interval count value is to be reset
3	Values of the internal flags related to the BFRE bit	When the BFRE setting is modified
4	FIFO buffer toggle control	When the DBLB setting is modified
5	Values of the internal flags related to the transaction count	When the transaction count function is forcibly terminated

Table 28.14 Operation of This Module Depending on PID Setting (when Host Controller Mode is Selected)

PID	Transfer Type (TYPE Bits)	Transfer Direction (DIR Bit)	Operation of This Module
00 (NAK)	Operation does not depend on the setting.	Operation does not depend on the setting.	Does not issue tokens.
01 (BUF)	Bulk (TYPE = 01) or interrupt (TYPE = 10)	Operation does not depend on the setting.	Issues tokens while UACT is 1 and the FIFO buffer corresponding to the pertinent pipe is ready for transmission and reception. Does not issue tokens while UACT is 0 or the FIFO buffer corresponding to the pertinent pipe is not ready for transmission or reception.
	Isochronous (TYPE = 11)	Operation does not depend on the setting.	Issues tokens irrespective of the status of the FIFO buffer corresponding to the pertinent pipe when the UACT bit is set to 1. Does not issue tokens when the UACT bit is set to 0.
10 (STALL) or 11 (STALL)	Operation does not depend on the setting.	Operation does not depend on the setting.	Does not issue tokens.

Table 28.15 Operation of This Module Depending on PID Setting (when Function Controller Mode is Selected)

PID	Transfer Type (TYPE Bits)	Transfer Direction (DIR Bit)	Operation of This Module
00 (NAK)	Bulk (TYPE = 01) or interrupt (TYPE = 10)	Operation does not depend on the setting.	Returns NAK in response to the token from the USB host.
	Isochronous (TYPE = 11)	Operation does not depend on the setting.	Returns nothing in response to the token from the USB host.
01 (BUF)	Bulk (TYPE = 01)	Receiving direction (DIR = 0)	Receives data and returns ACK or NYET in response to the OUT token from the USB host if the FIFO buffer corresponding to the pertinent pipe is ready for reception. Returns NAK if not ready. Returns ACK in response to the PING token from the USB host if the FIFO buffer corresponding to the pertinent pipe is ready for reception. Returns NAK if not ready.
	Interrupt (TYPE = 10)	Receiving direction (DIR = 0)	Receives data and returns ACK in response to the OUT token from the USB host if the FIFO buffer corresponding to the pertinent pipe is ready for reception. Returns NAK if not ready.
	Bulk (TYPE = 01) or interrupt (TYPE = 10)	Transmitting direction (DIR = 1)	Transmits data in response to the token from the USB host if the corresponding FIFO buffer is ready for transmission. Returns NAK if not ready.
	Isochronous (TYPE = 11)	Receiving direction (DIR = 0)	Receives data in response to the OUT token from the USB host if the FIFO buffer corresponding to the pertinent pipe is ready for reception. Discards data if not ready.
		Transmitting direction (DIR = 1)	Transmits data in response to the token from the USB host if the corresponding FIFO buffer is ready for transmission. Transmits the zero-length packet if not ready.
10 (STALL) or 11 (STALL)	Bulk (TYPE = 01) or interrupt (TYPE = 10)	Operation does not depend on the setting.	Returns STALL in response to the token from the USB host.
	Isochronous (TYPE = 11)	Operation does not depend on the setting	Returns nothing in response to the token from the USB host.

(2) PIPEnCTR (n = 6 to 8)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSTS	—	CSCLR	CSSTS	—	—	ACLRM	SQCLR	SQSET	SQ MON	PBUSY	—	—	—	PID[1:0]

Bit	Bit Name	Initial Value	R/W	Description
15	BSTS	0	R	Buffer Status Indicates whether or not the FIFO buffer allocated for the pertinent pipe can be accessed by the CPU. 0: Buffer access is disabled. 1: Buffer access is enabled. The meaning of this bit depends on the settings of the DIR, BFRE, and DCLRM bits as shown in Table 28.12.
14	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
13	CSCLR	0	R/W*1	C-SPLIT Status Clear Bit Setting this bit to 1 allows this module to clear the CSSTS bit of the pertinent pipe to 0. 0: Writing invalid 1: Clears the CSSTS bit to 0. For the transfer using the split transaction, to restart the next transfer with the S-SPLIT forcibly, set this bit to 1. However, for the normal split transaction, this module automatically clears the CSSTS bit to 0 upon completion of the C-SPLIT; therefore, clearing the CSSTS bit is not necessary. Controlling the CSSTS bit through this bit must be done while UACT is 0 thus communication is halted or while no transfer is being performed with bus disconnection detected. Setting this bit to 1 while CSSTS is 0 has no effect. When the function controller mode is selected, be sure to write 0 to this bit.
12	CSSTS	0	R/W	CSSTS Status Bit Indicates the C-SPLIT status of the split transaction when the host controller mode is selected. 0: START-SPLIT (S-SPLIT) transaction being processed or the transfer not using the split transaction in progress 1: C-SPLIT transaction being processed This module sets this bit to 1 upon start of the C-SPLIT and clears this bit to 0 upon detection of C-SPLIT completion. Indicates the valid value only when the host controller mode is selected.
11, 10	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
9	ACLRM	0	R/W	Auto Buffer Clear Mode Enables or disables automatic buffer clear mode for the pertinent pipe. 0: Disabled 1: Enabled (all buffers are initialized) To delete the contents in the FIFO buffer assigned to the pertinent pipe completely, write 1 and then 0 to this bit continuously. Table 28.16 shows the contents cleared by writing 1 and 0 to this bit continuously and the cases in which clearing the contents is necessary. Modify this bit while CSSTS is 0, PID is NAK, and the pertinent pipe is not selected by the CURPIPE bits. Before modifying this bit after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.

Bit	Bit Name	Initial Value	R/W	Description
8	SQCLR	0	R/W*1	Toggle Bit Clear This bit should be set to 1 to clear the expected value (to set DATA0 as the expected value) of the sequence toggle bit for the next transaction of the pertinent pipe. 0: Writing invalid 1: Specifies DATA0. Setting this bit to 1 allows this module to set DATA0 as the expected value of the sequence toggle bit of the pertinent pipe. This bit always indicates 0. When the host controller mode is selected, setting this bit to 1 for the pipe for bulk OUT transfer, this module starts the next transfer of the pertinent pipe with the PING token. Set the SQCLR bit to 1 while CSSTS is 0 and PID is NAK. Before modifying this bit after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
7	SQSET	0	R/W*1	Toggle Bit Set This bit should be set to 1 to set DATA1 as the expected value of the sequence toggle bit for the next transaction of the pertinent pipe. 0: Writing invalid 1: Specifies DATA1. Setting this bit to 1 allows this module to set DATA1 as the expected value of the sequence toggle bit of the pertinent pipe. This module always sets this bit to 0. Set the SQSET bit to 1 while CSSTS is 0 and PID is NAK. Before modifying this bit after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.
6	SQMON	0	R	Toggle Bit Confirmation Indicates the expected value of the sequence toggle bit for the next transaction of the pertinent pipe. 0: DATA0 1: DATA1 When the pertinent pipe is not for the isochronous transfer, this bit is toggled upon normal completion of the transaction. However, this bit is not toggled when a DATA-PID disagreement occurs during the receiving transfer.
5	PBUSY	0	R	Pipe Busy This bit indicates whether or not the pertinent pipe is being currently used for the USB bus. 0: The pertinent pipe is not being currently used for the USB bus. 1: The pertinent pipe is being currently used for the USB bus. This module modifies this bit from 0 to 1 upon start of the USB transaction for the pertinent pipe, and modifies the bit from 1 to 0 upon completion of one transaction. Reading this bit after PID has been set to NAK allows checking that modification of the pipe settings is possible.
4 to 2	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	PID[1:0]	00	R/W	Response PID Specifies the response type for the next transaction of the pertinent pipe. 00: NAK response 01: BUF response (depending on the buffer state) 10: STALL response 11: STALL response The default setting of these bits is NAK. Modify the setting to BUF to use the pertinent pipe for USB transfer. Table 28.14 and Table 28.15 show the basic operation (operation when there are no errors in the transmitted and received packets) of this module depending on the PID bit setting. Some registers require these bits to be set to NAK before their settings can be changed by software. Set these bits to NAK by software when changing such kind of registers. To confirm which registers apply to this, reference the descriptions of bits. After modifying the setting of these bits from BUF to NAK during USB communication using the pertinent pipe, check that PBUSY is 0 to see if USB communication using the pertinent pipe has actually entered the NAK state. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. Even if the PID bits are modified to NAK after S-SPLIT of the split transaction has been issued for the pertinent pipe (while CSSTS indicates 1), this module continues the transaction until C-SPLIT completes. This module modifies the setting of these bits as follows. • This module sets PID to NAK on recognizing the completion of the transfer when the pertinent pipe is in the receiving direction and the SHTNAK bit for the selected pipe has been set to 1. • This module sets PID to STALL (11) on receiving the data packet with the payload exceeding the maximum packet size of the pertinent pipe. • This module sets PID to NAK on detecting a USB bus reset when the function controller mode is selected. • This module sets PID to NAK on detecting a reception error such as a CRC error three consecutive times when the host controller mode is selected. • This module sets PID to STALL (11) on receiving the STALL handshake when the host controller mode is selected. To specify each response type, set these bits as follows. • To make a transition from NAK (00) to STALL, set 10. • To make a transition from BUF (01) to STALL, set 11. • To make a transition from STALL (11) to NAK, set 10 and then 00. • To make a transition from STALL to BUF, set 00 (NAK) and then 01 (BUF).

Note 1. Only 0 can be read and 1 can be written to.

Table 28.16 Contents Cleared by This Module by Setting ACLRM = 1

No.	Contents Cleared by ACLRM Bit Manipulation	Cases in which Clearing the Contents is Necessary
1	All the contents in the FIFO buffer assigned to the selected pipe	
2	When the host controller mode is selected, the interval count value when the selected pipe is for interrupt transfer	When the interval count value is to be reset
3	Values of the internal flags related to the BFRE bit	When the BFRE setting is modified
4	Values of the internal flags related to the transaction count	When the transaction count function is forcibly terminated

28.3.37 PIPEn Transaction Counter Enable Registers (PIPEnTRE) (n = 1 to 5, 9, and A to F)

PIPEnTRE is a register that enables or disables the transaction counter corresponding to PIPE1 to PIPE5, and clears the transaction counter.

These registers are initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TRENB	TRCLR	—	—	—	—	—	—	—	—
Initial value:	—	—	—	—	—	—	0	0	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R/W	R/W*	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
9	TRENB	0	R/W	Transaction Counter Enable Enables or disables the transaction counter. 0: The transaction counter is disabled. 1: The transaction counter is enabled. For the pipe in the receiving direction, setting this bit to 1 after setting the total number of the packets to be received in the TRNCNT bits allows this module to control hardware as described below on having received the number of packets equal to the set value in the TRNCNT bits. • In continuous transmission/reception mode (CNTMD = 1), this module switches the FIFO buffer to the CPU side even if the FIFO buffer is not full on completion of reception. • While SHTNAK is 1, this module modifies the PID bits to NAK for the corresponding pipe on having received the number of packets equal to the set value in the TRNCNT bits. • While BFRE is 1, this module asserts the BRDY interrupt on having received the number of packets equal to the set value in the TRNCNT bits and then reading out the last received data. For the pipe in the transmitting direction, set this bit to 0. When the transaction counter is not used, set this bit to 0. When the transaction counter is used, set the TRNCNT bits before setting this bit to 1. Set this bit to 1 before receiving the first packet to be counted by the transaction counter.
8	TRCLR	0	R/W*	Transaction Counter Clear When this bit is set to 1, this module clears the current counter value of the transaction counter corresponding to the pertinent pipe and then sets this bit to 0. 0: Invalid 1: The current counter value is cleared.
7 to 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Note 1. Modify each bit in this register while CSSTS is 0 and PID is NAK. Before modifying each bit after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked.

* Only 0 can be read and 1 can be written to.

28.3.38 PIPEn Transaction Counter Registers (PIPEnTRN) (n = 1 to 5, 9, and A to F)

PIPEnTRN is a transaction counter corresponding to PIPE1 to PIPE5, 9, and A to F.
These registers are initialized by a power-on reset, but retain the set value by a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TRNCNT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	TRNCNT[15:0]	H'0000	R/W	Transaction Counter When written to: Specifies the total number of packets to be received by the pertinent pipe (number of transactions). When read from: Indicates the specified number of transactions if TRENB is 0. Indicates the number of currently counted transaction if TRENB is 1. This module increments the value of these bits by one when all of the following conditions are satisfied on receiving the packet. • TRENB is 1. • (TRNCNT setting ≠ current counter value + 1) on receiving the packet. • The payload of the received packet agrees with the set value in the MXPS bits. This module clears the value of these bits to 0 when any of the following conditions are satisfied. • All the following conditions are satisfied. TRENB is 1. (TRNCNT setting = current counter value + 1) on receiving the packet. The payload of the received packet agrees with the set value in the MXPS bits. • All the following conditions are satisfied. TRENB is 1. This module has received a short packet. • The following condition is satisfied. TRCLR is 1. For the pipe in the transmitting direction, set these bits to 0. When the transaction counter is not used, set these bits to 0. Modify these bits while CSSTS is 0, PID is NAK, and TRENB is 0. Before modifying these bits after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, the PBUSY bit does not have to be checked. To modify the value of these bits, set TRCLR to 1 before setting TRENB to 1.

28.3.39 Device Address n Configuration Registers (DEVADDn) (n = 0 to 9, and A)

DEVADDn is a register that specifies the USB address and port number of the hub to which the communication target peripheral device is connected and also specifies the USB transfer speed of the communication target peripheral device. These registers are initialized by a power-on reset.

R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
14 to 11	UPPHUB[3:0]	0000	R/W	Address of Hub to which Communication Target is Connected Specifies the USB address of the hub to which the communication target peripheral device is connected. 0000: The peripheral device is directly connected to the port of this module. 0001 to 1010: USB address of the hub 1011 to 1111: Setting prohibited
10 to 8	HUBPORT[2:0]	000	R/W	Port Number of Hub to which Communication Target is Connected Specifies the port number of the hub to which the communication target peripheral device is connected. 000: The peripheral device is directly connected to the port of this module. 001 to 111: Port number of the hub
7, 6	USBSPD[1:0]	00	R/W	Transfer Speed of the Communication Target Device Specifies the USB transfer speed of the communication target peripheral device. 00: DEVADDn register is not used. 01: Low speed 10: Full speed 11: High speed
5 to 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

Note 1. When the host controller mode is selected, the bits in this register should be set before starting communication using each pipe.
(1) When the host controller mode is selected, this module refers to the settings of the UPPHUB bits and HUBPORT bits to generate packets for split transactions.
(2) When the host controller mode is selected, this module refers to the setting of the USBSPD bits to generate packets.

Note 2. The bits in this register should be modified while no valid pipes are using the settings of this register. Valid pipes refer to the ones satisfying both of conditions (1) and (2) below.
(1) This register is selected by the DEVSEL bits as the communication target.
(2) The PID bits are set to BUF for the pertinent pipe or the pertinent pipe is the DCP with SUREQ being 1.

Note 3. When the function controller mode is selected, set all the bits in this register to 0.

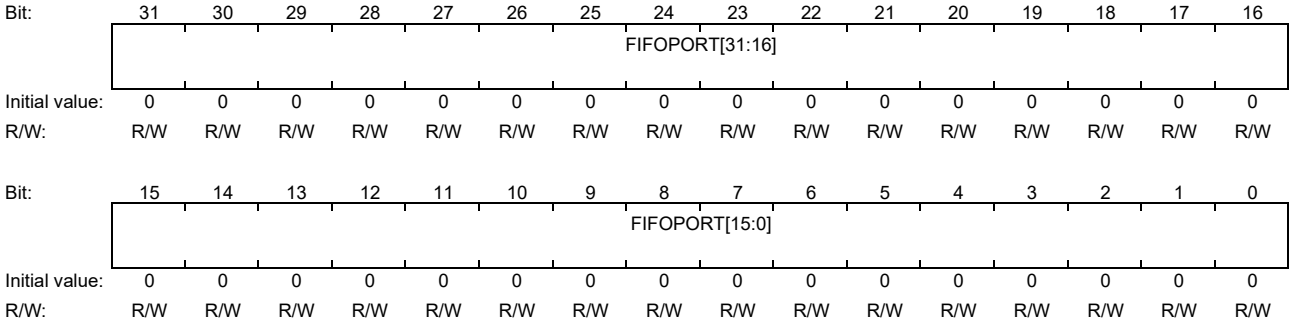
28.3.40 UTMI Suspend Mode Register (SUSPMODE)

SUSPMODE is a register that specifies the SuspendM signal to be sent to the UTMI.
This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	SUSPM	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	—	0	—	0	—	—	—	0	—	—	—	—	0	—	0	0
R/W:	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
14	SUSPM	0	R/W	SuspendM Control Enables or disables the clock to be supplied to this module. 0: The clock supplied to this module is disabled. 1: The clock supplied to this module is enabled. This module controls clock output by using the SuspendM signal. The clock to the LINK is stopped, when the SuspendM signal is low. Writing to the registers of this module is impossible when the SUSPM bit is set to 0 (the clock to this module is stopped). Reading the registers is possible. Note that writing to the following registers is possible even when the SUSPM bit is set to 0. - SYSCFG0 - BUSWAIT - INTENB1* - SUSPMODE Note: * Writing to bit 0 in INTENB1 is only possible when the SUSPM bit is set to 0. When setting this bit to 1, wait for at least 1 ms after setting the UPLLE bit to 1. Set this bit to 0 when this module is to enter software standby or USB standby mode.
13	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
12	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
11 to 9	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
8	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
7 to 4	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
1, 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

28.3.41 D0FIFO Continuous Transfer Port Register n (D0FIFOBn)
D1FIFO Continuous Transfer Port Register n (D1FIFOBn) (n = 0 to 7)



Bit	Bit Name	Initial Value	R/W	Description
31 to 0	FIFOPORT [31:0]	H'0000 0000	R/W	FIFO Port Accessing these bits allows reading the received data from the FIFO buffer or writing the transmit data to the FIFO buffer. When the DFACC bits are set to 01 (16-byte continuous access mode) or 10 (32-byte continuous access mode), use the DnFIFO continuous transfer port registers to access the DnFIFO buffer.

28.4 Operation

28.4.1 System Control and Oscillation Control

This section describes the register operations that are necessary to the initial settings of this module, and the registers necessary for power consumption control.

(1) Resets

Table 28.17 lists the types of resets for this module. For the initialized states of the registers following the reset operations, see section 28.3, Register Descriptions.

Table 28.17 Types of Reset

Name	Operation
Power-on reset	Low level input from the $\overline{\text{RES}}$ pin
USB bus reset	Automatically detected by this module from the D+ and D– lines when the function controller mode is selected

(2) Controller Mode Selection

This module can select the host controller mode or function controller mode using the DCFM bit in SYSCFG0. Changing the DCFM bit should be done in the initial settings immediately after a power-on reset or in the D+ pull-up disabled (DPRPU = 0) and D+ /D– pull-down disabled (DRPD = 0) state.

(3) USB Data Bus Resistor Control

This module controls switching between a pull-up resistor for the D+ signal and a pull-down resistor for the D+ and D- signals for the Renesas USB 2.0 PHY port. The DPRPU and DRPD bits of the SYSCFG0 register are used to make the pull-up and pull-down resistor settings.
When the function controller mode is selected, set the DPRPU bit of the SYSCFG0 register to 1, which pulls up the D+ signal, after connection to a USB host is recognized.
When disconnection from the USB host is recognized, set the DPRPU and DCFM bits according to the procedure below.

1. Set the DPRPU bit to 0.
2. Wait for at least 1 µs (1000 ns).
3. Set the DCFM bit to 1.
4. Wait for at least 200 ns.
5. Set the DCFM bit to 0.

This module incorporates the terminating resistor for the D+ and D- signals during high-speed operation and the output resistor for the signals during full-speed operation. This module automatically switches the resistor after connection with the host controller or peripheral device upon the detection of a reset handshake, suspend, and resume event.
When the function controller mode is selected and the DPRPU bit in SYSCFG0 is cleared to 0 during communication with the host controller, the pull-up resistor (or the terminating resistor) of the USB data line is disabled, making it possible to notify the USB host of the device disconnection.

(4) Selecting the Input Clock

This module can select the signal on USB_X1 or EXTAL as an input clock. The UCKSEL bit of the SYSCFG0 register for channel 0 is used to select the input clock. The UCKSEL bit should be set while supply of the clock signal to the USB module is stopped (SUSPM = 0 for channel 0 and channel 1).

(5) Setting the Clock Supply for the USB Module

Set the UCKSEL bit of the SYSCFG0 register to the target input clock and then set clock supply by following the appropriate procedure below.

Example 1: When the clock supply is enabled by the initial setting immediately after a power-on reset,

1. set the UPLLE bit to 1,
2. wait for 1 ms, and
3. set the SUSPM bit to 1.

Example 2: When the clock supply is stopped in the suspended state,

1. set the SUSPM bit to 0 and
2. set the UPLLE bit to 0.

Example 3: When the clock supply is enabled after recovery from the suspended state,

1. set the UPLLE bit to 1,
2. wait for 1 ms, and
3. set the SUSPM bit to 1.

Note: • During high-speed operation when the function controller mode is selected, set the SUSPM bit to 1 within 2.5 ms of this module resuming operation from the suspended state due to a USB reset.

28.4.2 Interrupt Functions

(1) Overview of Interrupt Functions

Table 28.18 lists the interrupt generation conditions for this module.

Table 28.18 Interrupt Generation Conditions

Bit	Interrupt Name	Cause of Interrupt	Mode That Generates the Interrupt	Related Status
VBINT	VBUS interrupt	• When a change in the state of the VBUS input pin has been detected (low to high or high to low)	Host, function	VBSTS
RESM	Resume interrupt	• When a change in the state of the USB bus has been detected in the suspended state (J-state to K-state or J-state to SE0)	Function	—
SOFR	Frame number update interrupt	When the host controller mode is selected: • When an SOF packet with a different frame number has been transmitted When the function controller mode is selected: • If SOFRM = 0, reception of an SOF packet with a different frame number • If SOFRM = 1, reception of an SOF packet with the microframe number 0 was not possible because it was corrupted.	Host, function	—
DVST	Device state transition interrupt	• When a device state transition is detected A USB bus reset detected The suspended state detected SET_ADDRESS request received SET_CONFIGURATION request received	Function	DVSQ
CTRT	Control transfer stage transition interrupt	• When a stage transition is detected in control transfer Setup stage completed Control write transfer status stage transition Control read transfer status stage transition Control transfer completed A control transfer sequence error occurred	Function	CTSQ
BEMP	Buffer empty interrupt	• When transmission of all of the data in the buffer memory has been completed and the buffer has become empty • When an excessive maximum packet size error has been detected	Host, function	PIPEBEMP
NRDY	Buffer not ready interrupt	When the host controller mode is selected: • When STALL is received from the peripheral side for the issued token • When a response cannot be received correctly from the peripheral side for the issued token (No response is returned three consecutive times or a packet reception error occurred three consecutive times.) • When an overrun/underrun occurred during isochronous transfer When the function controller mode is selected: • Reception of a token while PID = BUF and the buffer memory is not ready for transmission or reception • When a CRC error or a bit stuffing error occurred during data reception in isochronous transfer • When an interval error occurred during data reception in isochronous transfer	Host, function	PIPENRDY
BRDY	Buffer ready interrupt	• When the buffer is ready (reading or writing is enabled)	Host, function	PIPEBRDY
BCHG	Bus change interrupt	• When a change of USB bus state is detected	Host	—
DTCH	Device disconnection detection	• When disconnection of a peripheral device connected to this LSI's USB port is detected.	Host	—
ATTCH	Device connection detection	• When J-state or K-state is detected on the USB port for 2.5 µs. Used for checking whether a peripheral device is connected.	Host	—

Table 28.18 Interrupt Generation Conditions

Bit	Interrupt Name	Cause of Interrupt	Mode That Generates the Interrupt	Related Status
EOFERR	EOF error detection	• When EOF error of a peripheral device is detected	Host	—
SACK	Normal setup operation	• When the normal response (ACK) for the setup transaction is received	Host	—
SIGN	Setup error	• When a setup transaction error (no response or ACK packet corruption) is detected three consecutive times.	Host	—

Figure 28.1 shows a diagram relating to interrupts of this module.

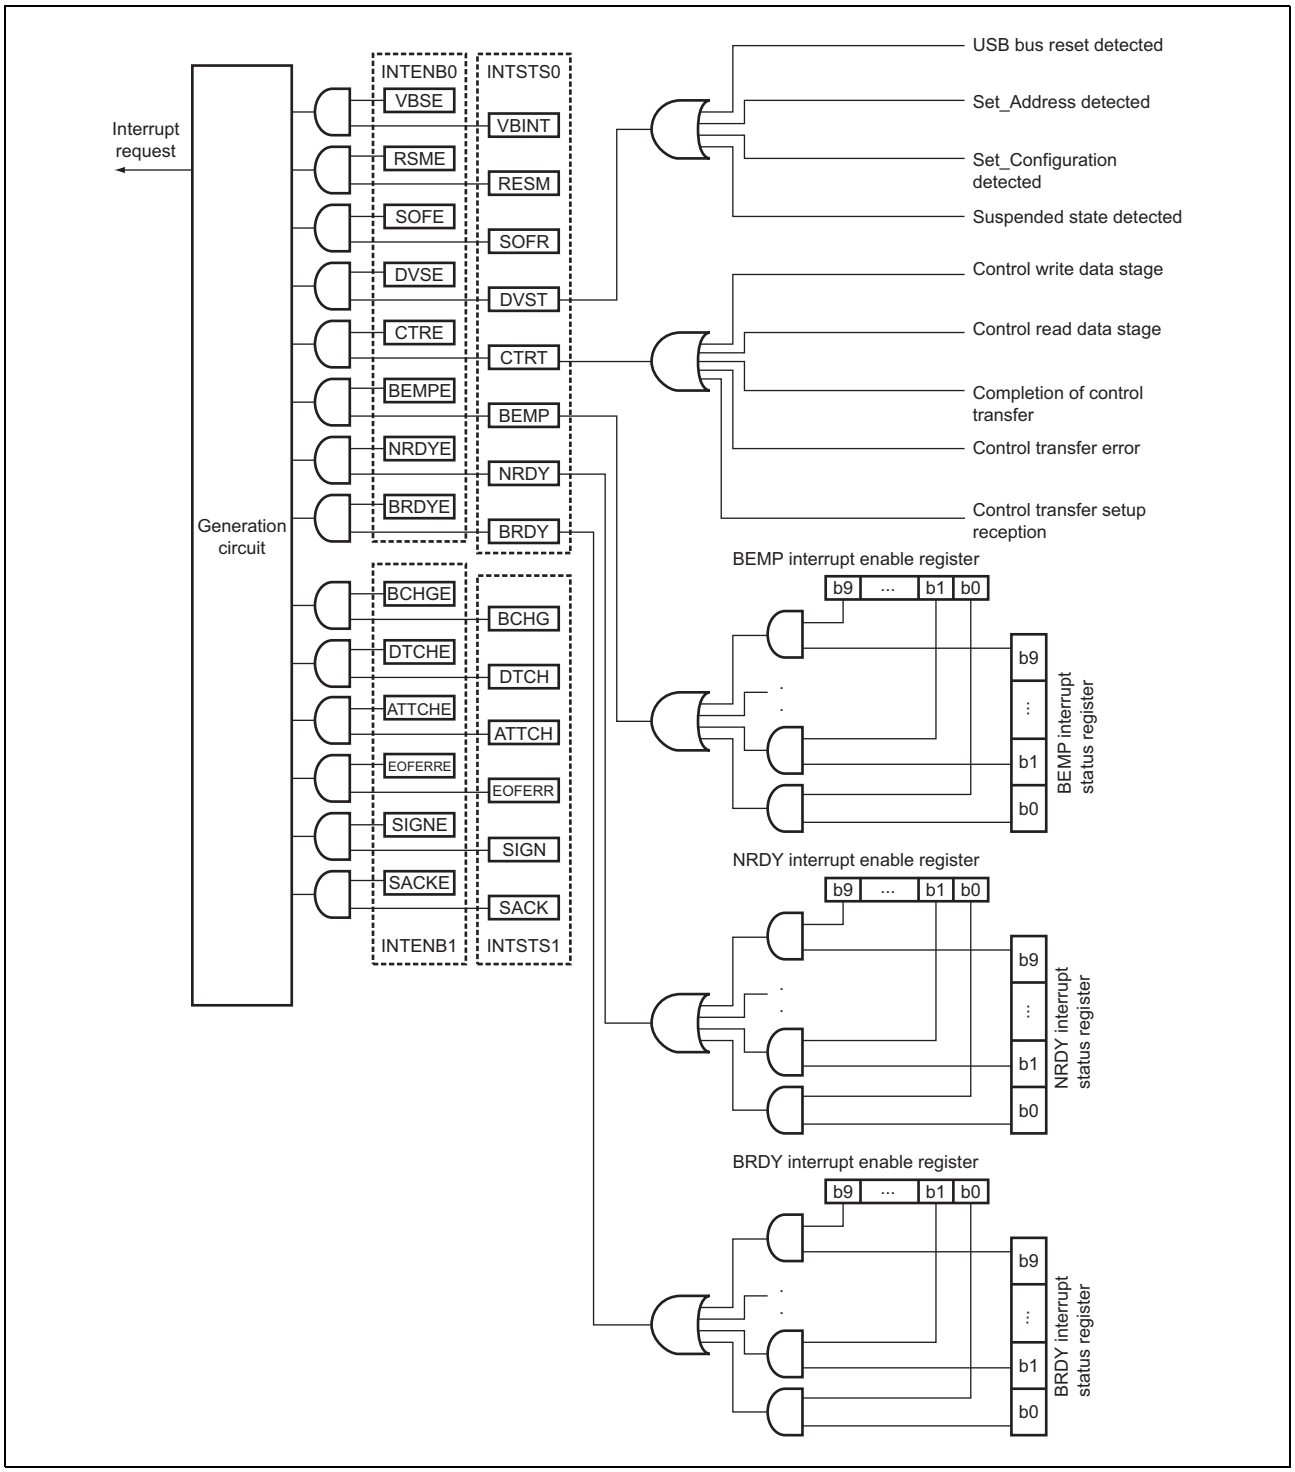


Figure 28.1 Items Relating to Interrupts

(2) BRDY Interrupt

The BRDY interrupt is generated when either of the host controller mode or function controller mode is selected. When each pipe satisfies the following conditions, this module sets 1 to a corresponding bit in BRDYSTS. Under this condition, if the PIPEBRDYE bit in BRDYENB that corresponds to the pipe is set to 1 and the BRDYE bit in INTENB0 is set to 1, this module sets the BRDY bit in INTSTS0 to 1, allowing the BRDY interrupt to be generated.
The conditions for generating and clearing the BRDY interrupt depend on the settings of the BRDYM bit and BFRE bit for the pertinent pipe as described below.

(a) When BRDYM Bit is 0 and BFRE Bit is 0

With these settings, the BRDY interrupt indicates that the FIFO port is accessible.
On any of the following conditions, this module generates the internal BRDY interrupt request trigger and sets 1 to the PIPEBRDY bit corresponding to the pertinent pipe.

1. For the pipe in the transmitting direction
   - When the DIR bit is changed from 0 to 1.
   - When packet transmission is completed using the pertinent pipe when write-access from the CPU to the FIFO buffer for the pertinent pipe is disabled (when the BSTS bit is read as 0).
     In continuous transmission/reception mode, the request trigger is generated on completion of transmitting data of one plane of the FIFO buffer.
   - When one FIFO buffer is empty on completion of writing data to the other FIFO buffer in double buffer mode.
     The request trigger is not generated until completion of writing data to the currently-written FIFO buffer plane even if transmission to the other FIFO buffer is completed.
   - When the hardware flushes the buffer of the pipe for isochronous transfers.
   - When 1 is written to the ACLRM bit, which causes the FIFO buffer to make transition from the write-disabled to write-enabled state.

The request trigger is not generated for the DCP (that is, during data transmission for control transfers).

2. For the pipe in the receiving direction
   - When packet reception is completed successfully thus enabling the FIFO buffer to be read when read-access from the CPU to the FIFO buffer for the pertinent pipe is disabled (when the BSTS bit is read as 0).
     The request trigger is not generated for the transaction in which DATA-PID disagreement occurs.
     In continuous transmission/reception mode, the request trigger is not generated when the data is of the specified maximum packet size and the buffer has available space.
     When a short packet is received, the request trigger is generated even if the FIFO buffer has available space.
   - When the transaction counter is used, the request trigger is generated on receiving the specified number of packets.
     In this case, the request trigger is generated even if the FIFO buffer has available space.
     When one FIFO buffer is read-enabled on completion of reading data from the other FIFO buffer in double buffer mode.
     The request trigger is not generated until completion of reading data from the currently-read FIFO buffer plane even if reception by the other FIFO buffer is completed.

When the function controller mode is selected, the BRDY interrupt is not generated in the status stage of control transfers.
The PIPEBRDY interrupt status of the pertinent pipe can be cleared to 0 by writing 0 to the corresponding PIPEBRDY interrupt status bit in the BRDYSTS register. In this case, 1s should be written to the PIPEBRDY interrupt status bits for the other pipes.
Be sure to clear the BRDY status before accessing the FIFO buffer.

(b) When BRDYM Bit is 0 and BFRE Bit is 1

With these settings, this module generates the BRDY interrupt on completion of reading all the data for a single transfer using the pipe in the receiving direction, and sets 1 to the PIPEBRDY bit corresponding to the pertinent pipe.
On any of the following conditions, this module determines that the last data for a single transfer has been received.

- When a short packet including a zero-length packet is received.
- When the transaction counter register (TRNCNT bits) is used and the number of packets specified by the TRNCNT bits is completely received.

When the pertinent data is completely read out after any of the above determination conditions has been satisfied, this module determines that all the data for a single transfer has been completely read out.
When a zero-length packet is received when the FIFO buffer is empty, this module determines that all the data for a single transfer has been completely read out upon the FRDY and DTLN bits of the FIFO port control register being set to 1 and 0, respectively. In this case, to start the next transfer, write 1 to the BCLR bit in the corresponding FIFOCTR register.
With these settings, this module does not detect the BRDY interrupt for the pipe in the transmitting direction.
The PIPEBRDY interrupt status of the pertinent pipe can be cleared to 0 by writing 0 to the corresponding PIPEBRDY interrupt status bit. In this case, 1s should be written to the PIPEBRDY interrupt status bits for the other pipes.
In this mode, the BFRE bit setting should not be modified until all the data for a single transfer has been processed. When it is necessary to modify the BFRE bit before completion of processing, all the FIFO buffers for the pertinent pipe should be cleared using the ACLRM bit.

(c) When the BRDYM bit is 1 and the BFRE bit is 0

With these settings, the PIPEBRDY values are linked to the BSTS bit settings for each pipe. In other words, the BRDY interrupt status bits (PIPEBRDY) are set to 1 or 0 by this module depending on the FIFO buffer status.

1. For the pipe in the transmitting direction
   The BRDY interrupt status bits are set to 1 when the FIFO buffer is write-enabled and are set to 0 when write-disabled.
   However, the BRDY interrupt is not generated if the DCP in the transmitting direction is write-enabled.
2. For the pipe in the receiving direction
   The BRDY interrupt status bits are set to 1 when the FIFO buffer is read-enabled and are set to 0 when all the data have been read (read-disabled).
   When a zero-length packet is received when the FIFO buffer is empty, the pertinent bit is set to 1 and the BRDY interrupt continues to be effective until BCLR = 1 is written.

With this setting, the PIPEBRDY bit cannot be cleared to 0. When BRDYM is set to 1, all of the BFRE bits (for all pipes) should be cleared to 0.

(3) NRDY Interrupt

On generating the internal NRDY interrupt request for the pipe whose PID bits are set to BUF, this module sets the corresponding PIPENRDY bit in NRDYSTS to 1. If the corresponding bit in NRDYENB is set to 1, this module sets the NRDY bit in INTSTS0 to 1, allowing the NRDY interrupt to be generated.
The following describes the conditions on which this module generates the internal NRDY interrupt request for each pipe.
However, the internal NRDY interrupt request is not generated during setup transaction execution when the host controller mode is selected. During setup transactions when the host controller mode is selected, the SACK or SIGN interrupt is detected.
The internal NRDY interrupt request is not generated during status stage execution of the control transfer when the function controller mode is selected.

(a) If Host Controller Mode is Selected when Connection is Used in which No Split Transactions Occur

1. For the pipe in the transmitting direction
   On any of the following conditions, this module detects the NRDY interrupt.
   - For the pipe for isochronous transfers, when the time to issue an OUT token comes in a state in which there is no data to be transmitted in the FIFO buffer.
     In this case, this module transmits a zero-length packet following the OUT token, setting the corresponding PIPENRDY bit and the OVRN bit to 1.
   - During communications other than setup transactions using the pipe for the transfers other than isochronous transfers, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the peripheral device (when timeout is detected before detection of the handshake packet from the peripheral device) and 2) an error is detected in the packet from the peripheral device.
     In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to NAK.
   - During communications other than setup transactions, when the STALL handshake is received from the peripheral device (including the STALL handshake in response to PING in addition to the STALL handshake in response to OUT).
     In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to STALL (11).

2. For the pipe in the receiving direction
   - For the pipe for isochronous transfers, when the time to issue an IN token comes in a state in which there is no space available in the FIFO buffer.
     In this case, this module discards the received data for the IN token, setting the PIPENRDY bit of the corresponding pipe and the OVRN bit to 1.
     When a packet error is detected in the received data for the IN token, this module also sets the CRCE bit to 1.
   - For the pipe for the transfers other than isochronous transfers, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the peripheral device for the IN token issued by this module (when timeout is detected before detection of the DATA packet from the peripheral device) and 2) an error is detected in the packet from the peripheral device.
     In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to NAK.
   - For the pipe for isochronous transfers, when no response is returned from the peripheral device for the IN token (when timeout is detected before detection of the DATA packet from the peripheral device) or an error is detected in the packet from the peripheral device.
     In this case, this module sets the corresponding PIPENRDY bit to 1. (The setting of the PID bits of the corresponding pipe is not modified.)

- For the pipe for isochronous transfers, when a CRC error or a bit stuffing error is detected in the received data packet.
  In this case, this module sets the corresponding PIPENRDY bit and CRCE bit to 1.
- When the STALL handshake is received.
  In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to STALL.

(b) If Host Controller Mode is Selected when Connection is Used in which Split Transactions Occur

1. For the pipe in the transmitting direction
   - For the pipe for isochronous transfers, when the time to issue an OUT token comes in a state in which there is no data to be transmitted in the FIFO buffer.
     In this case, this module transmits a zero-length packet following the OUT token, setting the corresponding PIPENRDY bit and the OVRN bit to 1 at the issuance of the start-split transaction (S-SPLIT).
   - For the pipe for the transfers other than isochronous transfers, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the HUB for the S-SPLIT or complete-split transaction (C-SPLIT) (when timeout is detected before detection of the handshake packet from the HUB) and 2) an error is detected in the packet from the HUB.
     In this case, this module sets the PIPENRDY bit of the corresponding pipe to 1 and modifies the setting of the PID bits of the corresponding pipe to NAK.
     If the NRDY interrupt is detected when the C-SPLIT is issued, this module clears the CSSTS bit to 0.
   - When the STALL handshake is received in response to the C-SPLIT.
     In this case, this module sets the corresponding PIPENRDY bit to 1, modifies the setting of the PID bits of the corresponding pipe to STALL (11) and clears the CSSTS bit to 0.
     This interrupt is not detected for setup transactions.
   - For the pipe for interrupt transfers when the NYET is received in response to the C-SPLIT and the microframe number = 4.
     In this case, this module sets the corresponding PIPENRDY bit to 1 and clears the CSSTS bit to 0 (does not modify the setting of the PID bits for the corresponding pipe).

2. For the pipe in the receiving direction
   - For the pipe for isochronous transfers, when the time to issue an IN token comes in a state in which there is no space available in the FIFO buffer.
     In this case, this module discards the received data for the IN token, setting the corresponding PIPENRDY bit and the OVRN bit to 1 at the issuance of the S-SPLIT.
   - For the pipes for bulk transfers, or the transfers other than setup transactions with the DCP, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the HUB for the IN token issued by this module at the issuance of S-SPLIT or C-SPLIT (when timeout is detected before detection of the DATA packet from the HUB) and 2) an error is detected in the packet from the HUB.
     In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to NAK. When the condition is generated during the C-SPLIT transaction, this module clears the CSSTS bit to 0.
   - During the C-SPLIT transaction for the pipe for isochronous transfers or interrupt transfers, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the HUB for the IN token issued by this module (when timeout is detected before detection of the DATA packet from the HUB) and 2) an error is detected in the packet from the HUB.
     On generating this condition for the pipe for interrupt transfers, this module sets the corresponding PIPENRDY bit to 1, modifies the setting of the PID bits of the corresponding pipe to NAK and clears the CSSTS bit to 0.
     On generating this condition for the pipe for isochronous transfers, this module sets the corresponding PIPENRDY

bit to 1 and CRCE bit to 1, and clears the CSSTS bit to 0 (does not modify the setting of the PID bits for the corresponding pipe).

- During the C-SPLIT transaction, when the STALL handshake is received for the pipe for the transfers other than isochronous transfers.
  In this case, this module sets the corresponding PIPENRDY bit to 1, modifies the setting of the PID bits of the corresponding pipe to STALL (11) and clears the CSSTS bit to 0.
- During the C-SPLIT transaction, when the NYET handshake is received for the pipe for the isochronous transfers or interrupt transfers and the microframe number = 4.
  In this case, this module sets the corresponding PIPENRDY bit for the pipe to 1, sets the CRCE bit to 1, and clears the CSSTS bit to 0 (does not modify the setting of the PID bits for the corresponding pipe).

(c) When Function Controller Mode is Selected

1. For the pipe in the transmitting direction
   - On receiving an IN token when the PID bits are set to 01 (BUF) for the pertinent pipe and there is no data to be transmitted in the FIFO buffer.
     In this case, this module generates an NRDY interrupt request at the reception of the IN token, setting the PIPENRDY bit to 1. For the pipe for the isochronous transfers in which an interrupt is generated, this module transmits a zero-length packet, setting the OVRN bit to 1.

2. For the pipe in the receiving direction
   - On receiving an OUT token when the PID bits are set to 01 (BUF) for the pertinent pipe and there is no space available in the FIFO buffer.
     For the pipe for the isochronous transfers in which an interrupt is generated, this module generates an NRDY interrupt request at the reception of the OUT token, setting the PIPENRDY bit to 1 and OVRN bit to 1.
     For the pipe for the transfers other than isochronous transfers in which an interrupt is generated, this module generates an NRDY interrupt request when an NAK handshake is transferred after the data following the OUT token was received, setting the PIPENRDY bit to 1.
     However, during re-transmission (due to DATA-PID disagreement), the NRDY interrupt request is not generated.
     In addition, if an error occurs in the DATA packet, the NRDY interrupt request is not generated.
   - On receiving a PING token when the PID bits are set to 01 (BUF) for the pertinent pipe and there is no space available in the FIFO buffer.
     In this case, this module generates an NRDY interrupt request at the reception of the PING token, setting the PIPENRDY bit to 1.
   - For the pipe for isochronous transfers, when the PID bits are set to 01 (BUF) for the pertinent pipe and a token is not received normally within an interval frame.
     In this case, this module generates an NRDY interrupt request at the reception of an SOF, and sets the PIPENRDY bit to 1.

(4) BEMP Interrupt

On detecting the BEMP interrupt for the pipe whose PID bits are set to BUF, this module sets the corresponding PIPEBEMP bit in BEMPSTS to 1. If the corresponding bit in BEMPENB is set to 1, this module sets the BEMP bit in INTSTS0 to 1, allowing the USB interrupt to be generated.

The following describes the conditions on which this module generates the internal BEMP interrupt request.

1. For the pipe in the transmitting direction, when the FIFO buffer of the corresponding pipe is empty on completion of transmission (including zero-length packet transmission). In single buffer mode, the internal BEMP interrupt request is generated simultaneously with the BRDY interrupt for the pipe other than DCP. However, the internal BEMP interrupt request is not generated on any of the following conditions.
   - When writing data to the FIFO buffer on the CPU side is started on completion of transmitting data of one plane in double buffer mode.
   - When the buffer is cleared (emptied) by setting the ACLRM or BCLR bit to 1.
   - When IN transfer (zero-length packet transmission) is performed during the control transfer status stage in function controller mode.

2. For the pipe in the receiving direction
   When the successfully-received data packet size exceeds the specified maximum packet size. In this case, this module generates the BEMP interrupt request, setting the corresponding PIPEBEMP bit to 1, and discards the received data and modifies the setting of the PID bits of the corresponding pipe to STALL (11).
   Here, this module returns no response when used as the host controller, and returns STALL response when used as the function controller.
   However, the internal BEMP interrupt request is not generated on any of the following conditions.
   - When a CRC error or bit stuffing error is detected in the received data.
   - When a setup transaction is being performed.

Writing 0 to the PIPEBEMP bit clears the status; writing 1 to the PIPEBEMP bit has no effect.

(5) Device State Transition Interrupt (Function Controller Mode)

Figure 28.2 shows a diagram of how this module handles the device state transitions. This module monitors device states and generates device state transition interrupts. However, recovery from the suspended state (resume signal detection) is detected by means of the resume interrupt. The device state transition interrupts can be enabled or disabled individually by using INTENB0. The device state after a transition can be confirmed by using the DVSQ bits in INTSTS0.

When making a transition to the default state, the device state transition interrupt is generated after the reset handshake protocol has been completed.

Device state can be monitored only when the function controller mode is selected. Also, the device state transition interrupts can be generated only when the function controller mode is selected.

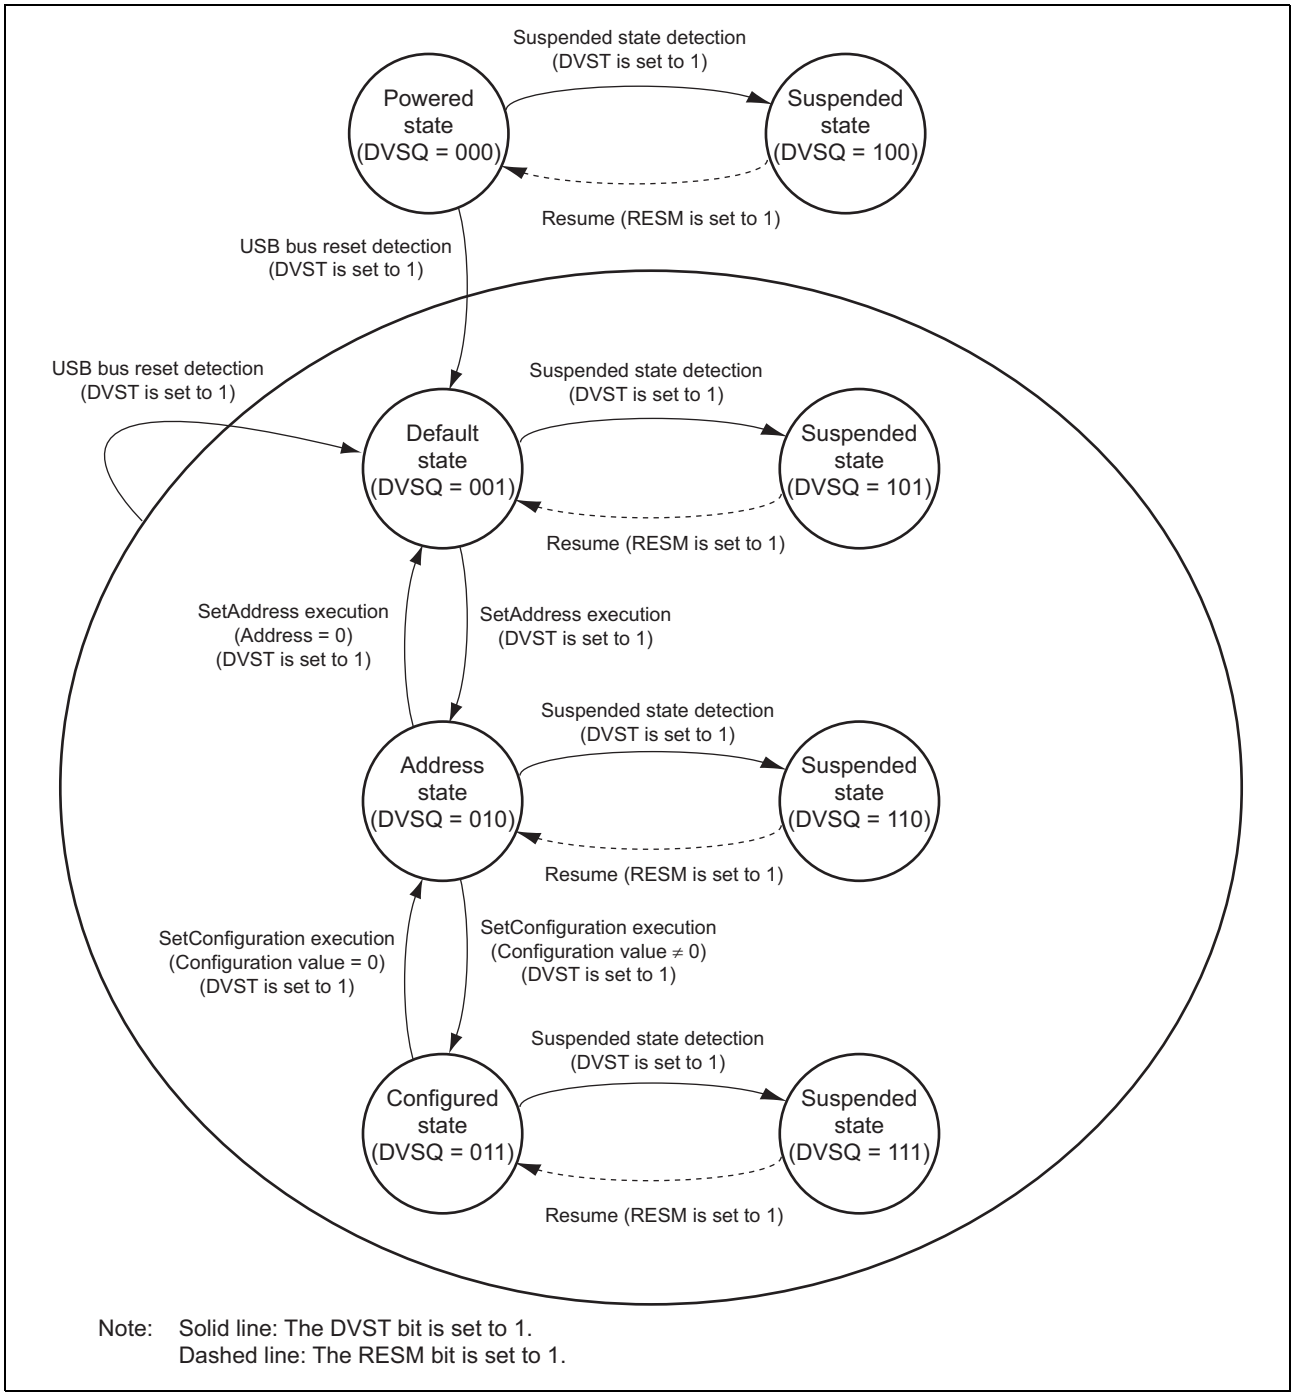

Figure 28.2 Device State Transitions

(6) Control Transfer Stage Transition Interrupt (Function Controller Mode)

Figure 28.3 shows a diagram of how this module handles the control transfer stage transition. This module monitors the control transfer sequence and generates control transfer stage transition interrupts. Control transfer stage transition interrupts can be enabled or disabled individually using INTENB0. The control transfer stage after a transition can be confirmed using the CTSQ bits in INTSTS0.

The control transfer stage transition interrupts are generated only when the function controller mode is selected.

The control transfer sequence errors are described below. If an error occurs, the PID bits in DCPCTR are set to B'1x (STALL).

1. During control read transfers
   - At the IN token of the data stage, an OUT or PING token is received when there have been no data transfers at all.
   - An IN token is received at the status stage
   - A packet is received at the status stage for which the data packet is DATAPID = DATA0
2. During control write transfers
   - At the OUT token of the data stage, an IN token is received when there have been no ACK response at all
   - A packet is received at the data stage for which the first data packet is DATAPID = DATA0
   - At the status stage, an OUT or PING token is received
3. During control write no-data transfers
   - At the status stage, an OUT or PING token is received

At the control write transfer data stage, if the number of receive data exceeds the wLength value of the USB request, it cannot be recognized as a control transfer sequence error. At the control read transfer status stage, packets other than zero-length packets are received by an ACK response and the transfer ends normally.

When a CTRT interrupt occurs in response to a sequence error (SERR = 1), the CTSQ = 110 value is retained until CTRT = 0 is written from the system (the interrupt status is cleared). Therefore, while CTSQ = 110 is being retained, the CTRT interrupt that indicates completion of the setup stage will not be generated even if a further USB request is received (this module retains the indication of completion of the setup stage, and after the interrupt status flag has been cleared, a CTRT interrupt is generated).

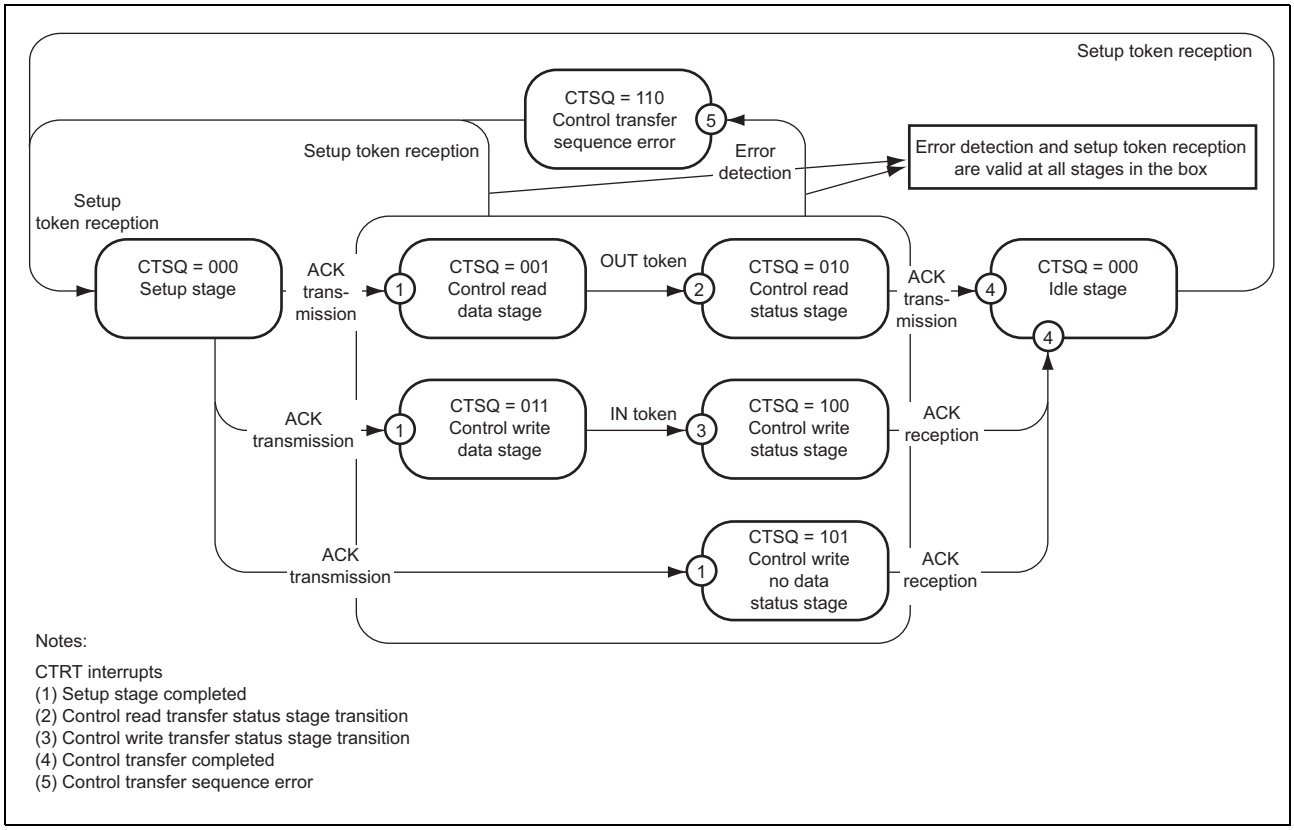

Figure 28.3 Control Transfer Stage Transitions

28.4.3 Pipe Control

Table 28.19 lists the pipe setting items of this module. With USB data transfer, data transmission has to be carried out using the logic pipe called the endpoint. This module has 16 pipes that are used for data transfer. Settings should be entered for each of the pipes in conjunction with the specifications of the system.

Table 28.19 Pipe Setting Items

Register Name	Bit Name	Setting Contents	Remarks
DCPCFG PIPECFG	TYPE	Specifies the transfer type	PIPE1 to PIPE15: Can be set
	BFRE	Selects the BRDY interrupt mode	PIPE1 to PIPE5, PIPE11 to PIPE15: Can be set
	DBLB	Selects a double buffer	PIPE1 to PIPE5, PIPE11 to PIPE15: Can be set PIPE9 and PIPE10: Can be set (only when bulk transfer has been selected).
	CNTMD	Selects continuous transfer or non-continuous transfer	DCP: Can be set. PIPE1 and PIPE2, PIPE9 and PIPE10: Can be set (only when bulk transfer has been selected). PIPE3 to PIPE5, PIPE11 to PIPE15: Can be set
	DIR	Selects transfer direction	IN or OUT can be set
	EPNUM	Endpoint number	PIPE1 to PIPE15: Can be set A value other than 0000 should be set when the pipe is used.
	SHTNAK	Selects disabled state for pipe when transfer ends	DCP: Can be set. PIPE1 and PIPE2, PIPE9 and PIPE10: Can be set (only when bulk transfer has been selected) PIPE3 to PIPE5, PIPE11 to PIPE15: Can be set
PIPEBUF	BUFSIZE	Buffer memory size	DCP: Cannot be set (fixed at 256 bytes) PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set (a maximum of 2 Kbytes can be specified) PIPE6 to PIPE8: Cannot be set (fixed at 64 bytes)
	BUFNMB	Buffer memory number	DCP: Cannot be set (areas fixed at H'0 to H'3) PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set (can be specified in areas H'7 to H'7F) PIPE6 to PIPE8: Cannot be set (areas fixed at H'4 to H'6)
DCPMAXP PIPEMAXP	DEVSEL	Selects a device	Referenced only when the host controller mode is selected.
	MXPS	Maximum packet size	Compliant with the USB standard.
PIPEPERI	IFIS	Buffer flush	PIPE1 and PIPE2: Can be set (only when isochronous transfer has been selected) PIPE3 to PIPE15: Cannot be set
	IITV	Interval counter	PIPE1 and PIPE2: Can be set (only when isochronous transfer has been selected) PIPE3 to PIPE5: Cannot be set PIPE6 to PIPE9: Can be set (only when the host controller mode has been selected) PIPE10 to PIPE15: Can be set

Table 28.19 Pipe Setting Items

Register Name	Bit Name	Setting Contents	Remarks
DCPCTR PIPEnCTR	BSTS	Buffer status	For the DCP, receive buffer status and transmit buffer status are switched with the ISEL bit.
	INBUFM	IN buffer monitor	Mounted for only PIPE3 to PIPE5 and PIPE9 to PIPE15.
	SUREQ	Setup request	Can be set only for the DCP. Can be controlled only when the host controller mode has been selected.
	SUREQCLR	SUREQ clear	Can be set only for the DCP. Can be controlled only when the host controller mode has been selected.
	CSCLR	CSSTS clear	Can be controlled only when the host controller mode has been selected.
	CSSTS	SPLIT status indication	Can be referenced only when the host controller mode has been selected.
	ATREPM	Auto response mode	PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set Can be set only when the function controller mode has been selected.
	ACLRM	Auto buffer clear	PIPE1 to PIPE15: Can be set
	SQCLR	Sequence clear	Clears the data toggle bit
	SQSET	Sequence set	Sets the data toggle bit
	SQMON	Sequence monitor	Monitors the data toggle bit
	PBUSY	Pipe busy confirmation	
	PID	Response PID	
PIPEnTRE	TRENB	Transaction counter enable	PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set
	TRCLR	Current transaction counter clear	PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set
PIPEnTRN	TRNCNT	Transaction counter	PIPE1 to PIPE5, PIPE9 to PIPE15: Can be set

(1) Pipe Control Register Switching Procedures

The following bits in the pipe control registers are only modifiable when USB communication is disabled (PID = NAK): Figure 28.4 shows the procedure for modifying the pipe control registers from the USB communication enabled (PID = BUF) state.

[Bits that should not be set in the USB communication enabled (PID = BUF) state]

- All bits in DCPCFG and DCPMAXP
- The SQCLR and SQSET bits in DCPCTR
- All bits in PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI
- The ATREPM, ACLRM, SQCLR, and SQSET bits in PIPEnCTR
- All bits in PIPEnTRE and PIPEnTRN
- All bits in DEVADDn

In addition to the settings described for the CSCLR bit and all bits in DEVADDn, the settings for each bit described in section 28.3, Register Descriptions must also be complied with.

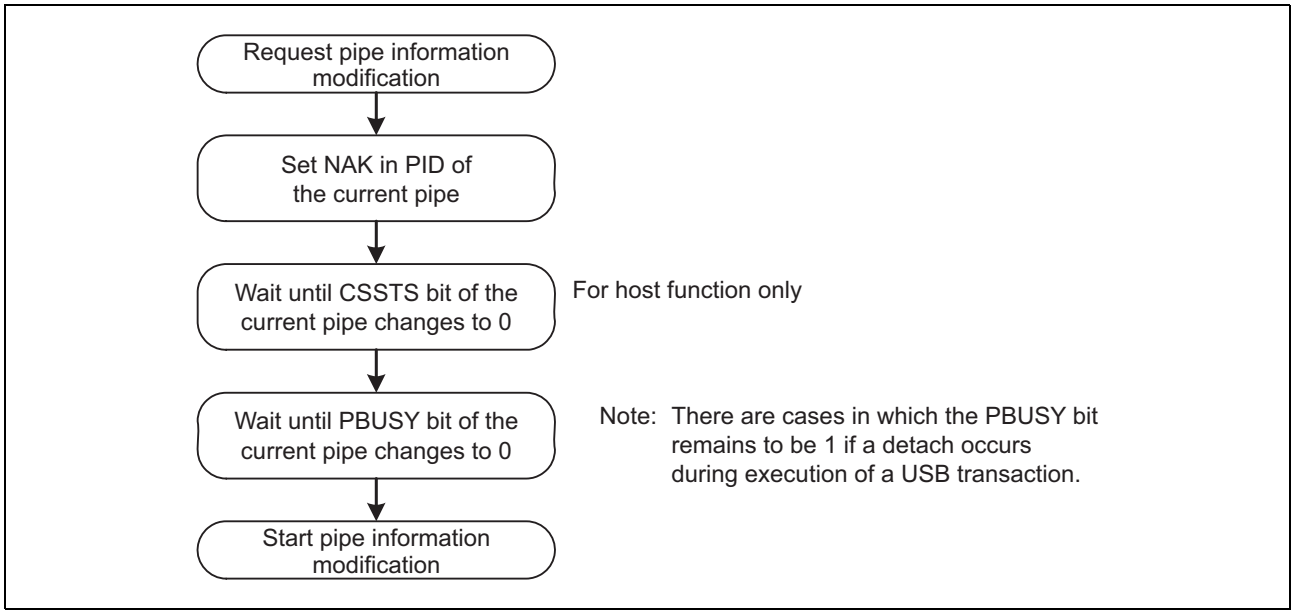

Figure 28.4 Procedure for Modifying Pipe Information from USB Communication Enabled (PID = BUF) State

The following bits in the pipe control registers are only modifiable when the pertinent pipe has not been specified by the CURPIPE bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL.

[Bits that should not be set when the pertinent pipe is specified by the CURPIPE bits in FIFO port select registers]

- All bits in DCPCFG and DCPMAXP
- All bits in PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI
- The ACLRM bit in PIPEnCTR

In order to modify pipe information, the CURPIPE bits should be set to the pipes other than the pipe to be modified. For the DCP, the buffer should be cleared using BCLR after the pipe information is modified.

(2) Maximum Packet Size Setting

The MXPS bits in DCPMAXP and PIPEMAXP are used to specify the maximum packet size for each pipe. DCP, PIPE1 to PIPE5, and PIPE11 to PIPE15 can be set to any of the maximum packet sizes defined by the USB Specification. For PIPE6 to PIPE10, 64 bytes are the upper limit of the maximum packet size. The maximum packet size should be set before beginning the transfer (PID = BUF).

- DCP: 64 should be set when using high-speed operation.
- DCP: Select and set 8, 16, 32, or 64 when using full-speed operation.
- PIPE1 to PIPE5: 512 should be set when using high-speed bulk transfer.
- PIPE1 to PIPE5: Select and set 8, 16, 32, or 64 when using full-speed bulk transfer.
- PIPE1 and PIPE2: Set a value between 1 and 1024 when using high-speed isochronous transfer.
- PIPE1 and PIPE2: Set a value between 1 and 1023 when using full-speed isochronous transfer.
  For details, see section 28.4.9, Isochronous Transfers (PIPE1 and PIPE2).
- PIPE6 to PIPE8: Set a value between 1 and 64.
- PIPE9: 64 should be set when using interrupt transfer (only when the host controller mode has been selected).
  512 should be set when using high-speed bulk transfer (only when the function controller mode has been selected).
  Select and set 8, 16, 32, or 64 when using full-speed bulk transfer (only when the function controller mode has been selected).
- PIPE10 to PIPE15: 512 should be set when using high-speed bulk transfer (only when the function controller mode has been selected).
- PIPE10 to PIPE15: Select and set 8, 16, 32, or 64 when using full-speed bulk transfer (only when the function controller mode has been selected).

The high bandwidth transfers used with interrupt transfers and isochronous transfers are not supported.

(3) Response PID

The PID bits in DCPCTR and PIPEnCTR are used to set the response PID for each pipe.
The following shows this module operation with various response PID settings:

1. Response PID settings when the host controller mode is selected
   The response PID is used to specify the execution of transactions.
   - NAK setting: Using pipes is disabled. No transaction is executed.
   - BUF setting: Transactions are executed based on the status of the buffer memory.
     For OUT direction: If there are transmit data in the buffer memory, an OUT token is issued.
     For IN direction: If there is an area to receive data in the buffer memory, an IN token is issued.
   - STALL setting: Using pipes is disabled. No transaction is executed.

Note: • Setup transactions for the DCP are set with the SUREQ bit.

2. Response PID settings when the function controller mode is selected
   The response PID is used to specify the response to transactions from the host.
   - NAK setting: The NAK response is always returned in response to the generated transaction.
   - BUF setting: Responses are made to transactions based on the status of the buffer memory.
   - STALL setting: The STALL response is always returned in response to the generated transaction.

Note: • For setup transactions, an ACK response is always returned, regardless of the PID setting, and the USB request is stored in registers USBREQ, USBVAL, USBINDX, and USBLENG.

This module may carry out writing to the PID bits, depending on the results of the transaction. Writing to the PID bits by this module is carried out in the following cases.

1. When the host controller mode has been selected and the response PID is set by this module
   - NAK setting: In the following cases, PID = NAK is set and issuing of tokens is automatically stopped:
     - For transfer that is not isochronous, any combination of the following two items occurring three consecutive times in response to transmitted tokens
       1) no response being returned or 2) a reception error such as a CRC error or a bit stuffing error
     - For isochronous transfer, a reception error such as a CRC error or a bit stuffing error occurring three consecutive times in response to transmitted tokens
     - Reception of a short packet at the stage of control read transfer data when the setting of the SHTNAK bit in PIPECFG is 1
     - If a short packet is received when the SHTNAK bit in PIPECFG has been set to 1 for bulk transfer.
     - If counting by the transaction counter ends while the SHTNAK bit in PIPECFG is set to 1 during bulk transfer.
   - BUF setting: There is no BUF writing by this module.
   - STALL setting: In the following cases, PID = STALL is set and issuing of tokens is automatically stopped:
     When STALL is received in response to the transmitted token.
     When the size of the receive data packet exceeds the maximum packet size.

2. When the function controller mode has been selected and the response PID is set by this module
   - NAK setting: When the setup token is received normally (DCP only).
     If counting by the transaction counter ends or a short packet is received while the SHTNAK bit in PIPECFG is set to 1 during bulk transfer.
   - BUF setting: There is no BUF writing by this module.
   - STALL setting: When a maximum packet size exceeded error has been detected in the receive data packet.
     When a control transfer sequence error has been detected.

(4) Data PID Sequence Bit

This module automatically toggles the sequence bit in the data PID when data is transferred normally in the control transfer data stage, bulk transfer and interrupt transfer. The sequence bit of the data PID that is to be transmitted for the next transaction can be confirmed with the SQMON bit in DCPCTR or PIPEnCTR. When data is transmitted, the sequence bit switches at the timing at which the ACK handshake is received. When data is received, the sequence bit switches at the timing at which the ACK handshake is transmitted. The SQCLR and SQSET bits in DCPCTR or PIPEnCTR can be used to change the data PID sequence bit.

When the function controller mode has been selected and control transfer is used, this module automatically sets the sequence bit when a stage transition is made. The data PID sequence bit becomes DATA1 when the setup stage ends and this module does not reference the sequence bit and responds with PID = DATA1 in the status stage. Therefore, settings are not required. However, when the host controller mode has been selected and control transfer is used, the sequence bit should be set at the stage transition.

For the ClearFeature request transmission or reception, the data PID sequence bit should be set, regardless of whether the host controller mode or function controller mode is selected.

With pipes for which isochronous transfer has been set, sequence bit operation cannot be carried out using the SQSET bit.

28.4.4 FIFO Buffer Memory

This section describes the operation of the FIFO buffers incorporated in this module. Unless specifically specified, the buffer operation is the same regardless of whether the host controller mode or function controller mode is selected.

(1) FIFO Buffer Memory Allocation

Figure 28.5 shows an example of a FIFO buffer memory map for this module. The FIFO buffer memory is an area shared by the CPU and this module. In the FIFO buffer memory status, there are times when the access right to the buffer memory is allocated to the user system (CPU side), and times when it is allocated to this module (SIE side).
Independent FIFO buffer memory areas should be set for each pipe. Each memory area can be set using the first block number and the number of blocks (specified using the BUFNMB and BUFSIZE bits in PIPEBUF), where one block comprises 64 bytes.
When continuous transfer mode has been selected using the CNTMD bit in PIPECFG, the BUFSIZE bits should be set so that the buffer memory size should be an integral multiple of the maximum packet size. When double buffer mode has been selected using the DBLB bit in PIPECFG, two planes of the memory area specified using the BUFSIZE bits in PIPEBUF can be assigned to a single pipe.
Moreover, three FIFO ports are used for access to the FIFO buffer memory (reading and writing data). A pipe is assigned to the FIFO port by specifying the pipe number using the CURPIPE bits in CFIFOSEL/DnFIFOSEL.
The FIFO buffer status of each pipe can be confirmed using the BSTS bit in DCPCTR or the BSTS and INBUFM bits in PIPEnCTR. Also, the access right of the FIFO port can be confirmed using the FRDY bit in CFIFOCTR or DnFIFOCTR.

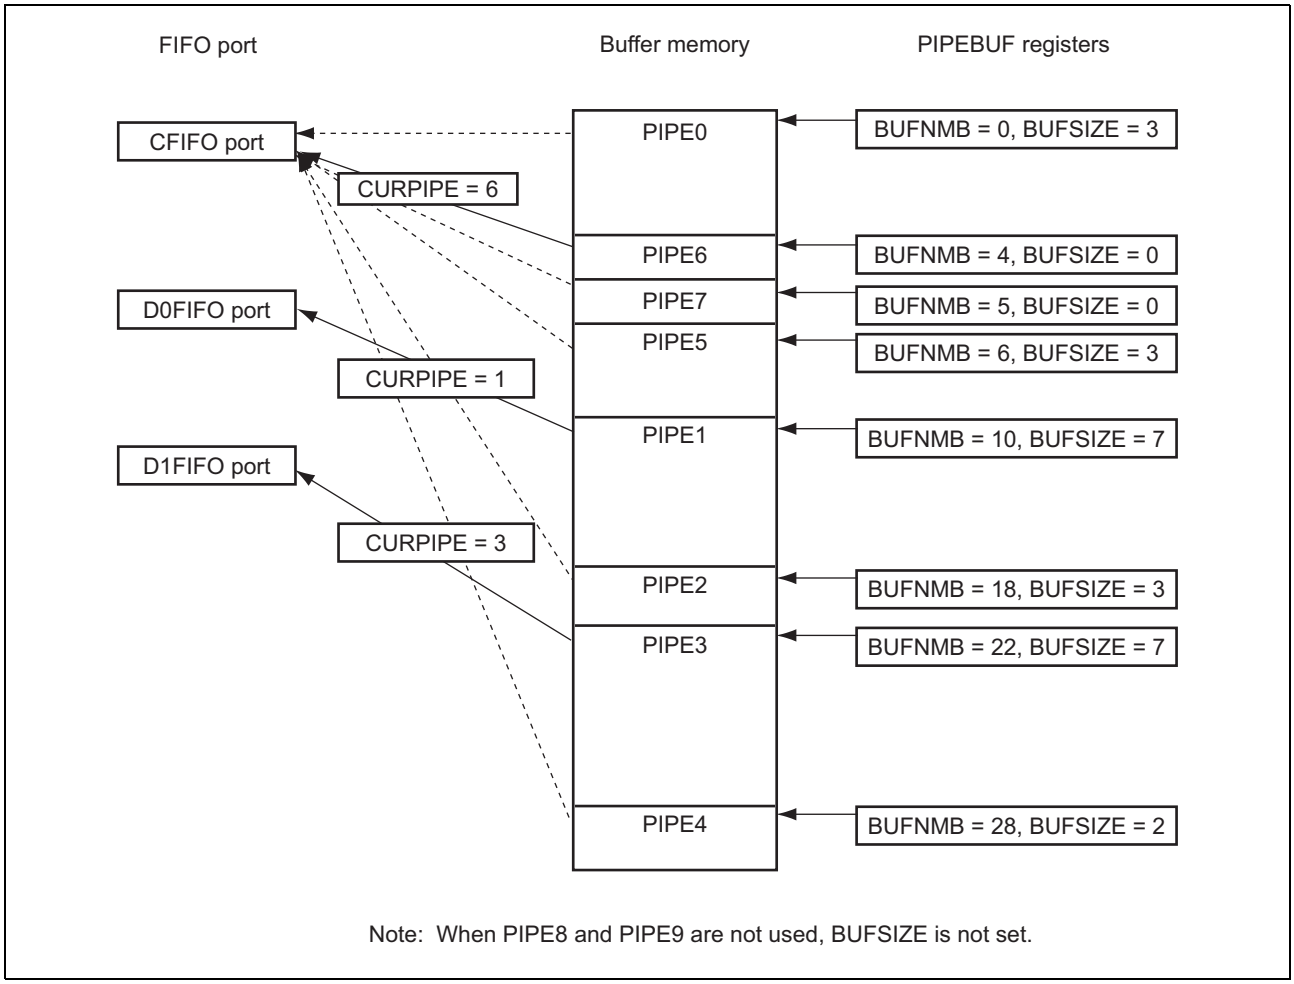

Figure 28.5 Example of a FIFO Buffer Memory Map

(a) FIFO Buffer Clearing

Table 28.20 shows the clearing of the FIFO buffer memory by this module. The FIFO buffer memory can be cleared using the BCLR, DCLRM, and ACLRM bits.

Table 28.20 List of FIFO Buffer Clearing Methods

Bit Name	BCLR	DCLRM	ACLRM
Register	CFIFOCTR DnFIFOCTR	DnFIFOSEL	PIPEnCTR
Function	Clears the FIFO buffer memory on the CPU side	In this mode, after the data of the specified pipe has been read, the FIFO buffer memory is cleared automatically.	This is the auto buffer clear mode, in which all of the received packets are discarded.
Clearing method	Cleared by writing 1	1: Mode valid 0: Mode invalid	1: Mode valid 0: Mode invalid

28.4.5 FIFO Port Functions

This section describes the FIFO port functions. Table 28.21 shows the settings for the FIFO port functions of this module. In write access, writing data until the buffer is full (or the maximum packet size for non-continuous transfers) automatically enables sending of the data to the USB bus. To enable sending of data before the buffer is full (or before the maximum packet size for non-continuous transfers), the BVAL bit in CFIFOCTR/DnFIFOCTR must be set to end the writing (TEND signal for DMA transfers). Also, to send a zero-length packet, the BCLR bit in the same register must be used to clear the buffer and then the BVAL bit is set in order to end the writing.
In read access, reception of new packets is automatically enabled if all of the data has been read. Data cannot be read when a zero-length packet has been received (DTLN = 0), so the BCLR bit in the same register must be used to clear the buffer. The length of the data being received can be confirmed using the DTLN bit in CFIFOCTR/DnFIFOCTR.

Table 28.21 FIFO Port Function Settings

Register Name	Bit Name	Function	Note
CFIFOSEL/ DnFIFOSEL	RCNT	Selects DTLN read mode	
	REW	Buffer memory rewind (re-read, rewrite)	
	DCLRM	Automatically clears data received for a specified pipe after the data has been read	For DnFIFO only
	DREQE	Enables a DMA transfer request	For DnFIFO only
	MBW	FIFO port access bit width	
	BIGEND	Selects FIFO port endian	
	ISEL	FIFO port access direction	For DCP only
	CURPIPE	Selects the current pipe	
CFIFOCTR/ DnFIFOCTR	BVAL	Ends writing to the buffer memory	
	BCLR	Clears the buffer memory on the CPU side	
	FRDY	Monitors whether the FIFO port is ready for access	
	DTLN	Checks the length of received data	

(a) FIFO Port Selection

Table 28.22 shows the pipes that can be selected with each FIFO port. The pipe to be accessed is selected using the CURPIPE bits in CFIFOSEL/DnFIFOSEL. After the pipe is selected, whether the CURPIPE value for the pipe which was written last can be correctly read should be checked. (If the previous pipe number is read, it indicates that the pipe switching is being executed by this module.) Then, the FIFO port can be accessed after FRDY = 1 is checked. Figure 28.6 shows the procedure for pipe switching during access to the FIFO port.
Also, the bus width to be accessed should be selected using the MBW bit. The buffer memory access direction conforms to the DIR bit in PIPECFG. The ISEL bit determines this only for the DCP.

Table 28.22 FIFO Port Access Categorized by Pipe

Pipe	Access Method	Port that can be Used
DCP	CPU access	CFIFO port register
PIPE1 to PIPE15	CPU access	CFIFO port register
	DMA access	D0FIFO/D1FIFO port register

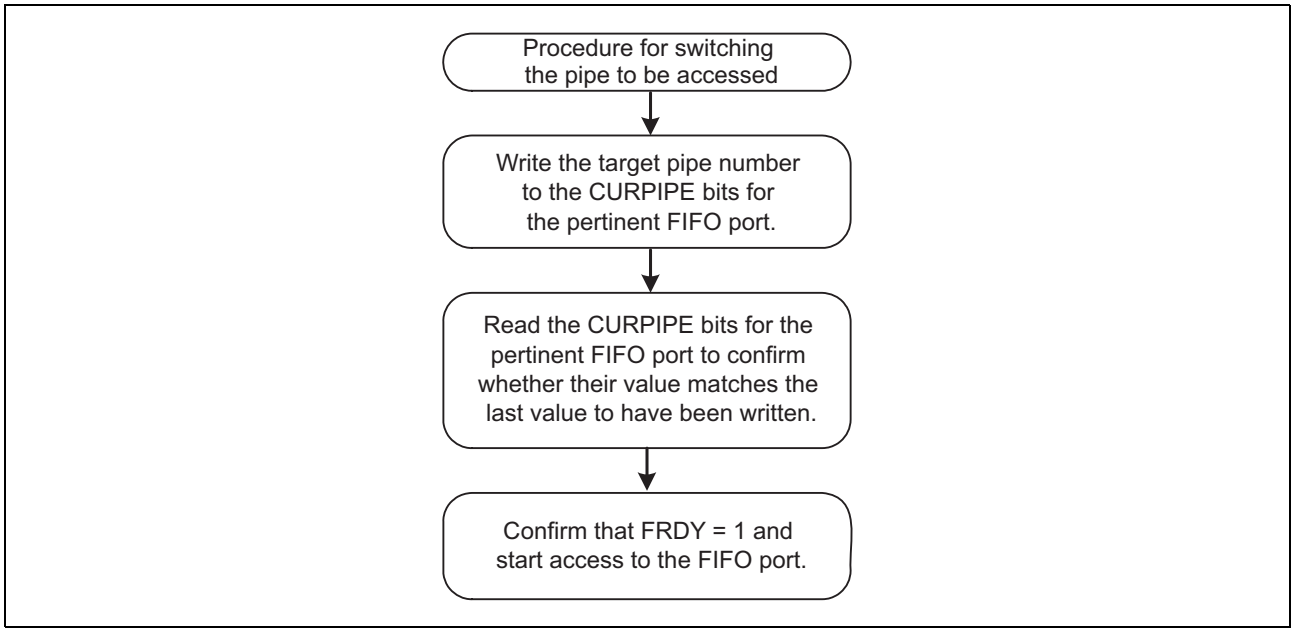

Figure 28.6 Procedure for Pipe Switching during Access to the FIFO Port

(b) DnFIFO Auto Clear Mode (D0FIFO/D1FIFO Port Reading Direction)

If 1 is set for the DCLRM bit in DnFIFOSEL, the module automatically clears the buffer memory of the selected pipe when reading of the data from the buffer memory has been completed.

Table 28.23 shows the packet reception and buffer memory clearing processing for each of the various settings. As shown in Table 28.23, the buffer clear conditions depend on the value set to the BFRE bit. Using the DCLRM bit eliminates the need for the buffer to be cleared even if a situation occurs that necessitates clearing of the buffer. This makes it possible to carry out DMA transfers without involving software.

This function can be set only in the buffer memory reading direction.

Table 28.23 Packet Reception and Buffer Memory Clearing Processing

Buffer Status when Packet is Received	Register Setting			
	DCLRM = 0		DCLRM = 1	
	BFRE = 0	BFRE = 1	BFRE = 0	BFRE = 1
Buffer full	Doesn't need to be cleared	Doesn't need to be cleared	Doesn't need to be cleared	Doesn't need to be cleared
Zero-length packet reception	Needs to be cleared	Needs to be cleared	Doesn't need to be cleared	Doesn't need to be cleared
Normal short packet reception	Doesn't need to be cleared	Needs to be cleared	Doesn't need to be cleared	Doesn't need to be cleared
Transaction count ended	Doesn't need to be cleared	Needs to be cleared	Doesn't need to be cleared	Doesn't need to be cleared

(c) Timing Selection Function for BRDY Interrupts

The BFRE bit of the PIPECFG register can be used to select non-generation of the BRDY interrupt when a data packet with the maximum packet size has been received.
For DMA transfer, this function enables the generation of an interrupt only when the last of the data have been received. Reception of the last of the data indicates either that a short packet was received or completion of counting by the transaction counter. If BFRE = 1, a BRDY interrupt is generated after the received data have been read. The length of the data packet that was last to have been received before the BRDY interrupt was generated can be confirmed by reading the DTLN bits of the DnFIFOCTR register.
Table 28.24 shows the times at which a BRDY interrupt is generated by this module.

Table 28.24 Times BRDY Interrupts are Generated

Register Setting / Buffer Status when Packet is Received	BFRE = 0	BFRE = 1
Buffer full (normal packet reception)	When a packet is received	No interrupt is generated.
Zero-length packet reception	When a packet is received	When a packet is received
Normal short packet reception	When a packet is received	When received data have been read from buffer memory
Transaction count ended	When a packet is received	When received data have been read from buffer memory

The BFRE bit function is only valid for the reading of buffer memory. In the case of writing, the value of the BFRE bit should always be 0.

28.4.6 Control Transfers (DCP)

Data transfers of the data stage of control transfers are done using the default control pipe (DCP). The DCP buffer memory is a 64-byte single buffer, and is a fixed area that is shared for both control reading and control writing. The buffer memory can be accessed through the CFIFO port.

(1) Control Transfers when the Host Controller Mode is Selected

(a) Setup Stage

USBREQ, USBVAL, USBINDX, and USBLENG are the registers that are used to transmit a USB request for setup transactions. Writing setup packet data to the registers and writing 1 to the SUREQ bit in DCPCTR transmits the specified data for setup transactions. Upon completion of transactions, the SUREQ bit is cleared to 0 by this module. The above USB request registers should not be modified while SUREQ = 1. The device address for setup transactions is specified using the DEVSEL bits in DCPMAXP.

When the data for setup transactions has been sent, a SIGN or SACK interrupt request is generated according to the response received from the peripheral device (SIGN or SACK bit in INTSTS1), by means of which the result of the setup transactions can be confirmed.

A data packet of DATA0 (USB request) is transmitted as the data packet for the setup transactions regardless of the setting of the SQMON bit in DCPCTR.

(b) Data Stage

Data transfers are done using the DCP buffer memory.

The access direction of the DCP buffer memory should be specified using the ISEL bit in CFIFOSEL. The transfer direction should be specified using the DIR bit in DCPCFG.

For the first data packet of the data stage, the data PID must be transferred as DATA1. Accordingly, transaction should be done by setting the data PID to DATA1 by using the SQSET bit in DCPCTR, and setting the response PID to BUF by using the PID bits in DCPCTR. Completion of data transfer is detected using the BRDY and BEMP interrupts.

The data in multiple packets can be transferred in continuous transfer mode. For continuous transfer in the receiving direction, however, note that a BRDY interrupt is only generated when the buffer memory is full or a short packet is received (when the number of bytes of data is an integer multiple of the maximum packet size and no greater than 256 bytes).

For control write transfers, when the number of data bytes to be sent is the integral multiple of the maximum packet size, a zero-length packet must be sent at the end.

(c) Status Stage

Zero-length packet data transfers are done in the direction opposite to that in the data stage. As with the data stage, data transfers are done using the DCP buffer memory. Transactions are done in the same manner as the data stage.

For the data packets of the status stage, the data PID must be transferred as DATA1. The data PID should be set to DATA1 using the SQSET bit in DCPCTR.

For reception of a zero-length packet, the received data length must be confirmed using the DTLN bits in CFIFOCTR after the BRDY interrupt is generated, and the buffer memory must then be cleared using the BCLR bit.

(2) Control Transfers when the Function Controller Mode is Selected

(a) Setup Stage

This module always sends an ACK response in response to a setup packet that is normal with respect to this module. The operation of this module in the setup stage is noted below.

(i) When a new setup packet is received, this module sets the following registers:

- Set the VALID bit in INTSTS0 to 1.
- Set the PID bits in DCPCTR to NAK.
- Set the CCPL bit in DCPCTR to 0.

(ii) When a data packet is received right after the setup packet, the USB request parameters are stored in USBREQ, USBVAL, USBINDX, and USBLENG.

Response processing with respect to the control transfer should always be carried out after first setting VALID = 0. In the VALID = 1 state, PID = BUF cannot be set, and the data stage cannot be terminated.

Using the function of the VALID bit, this module is able to interrupt the processing of a request currently being processed if a new USB request is received during a control transfer, and can send a response in response to the newest request.

Also, this module automatically judges the direction bit (bit 8 of the bmRequestType) and the request data length (wLength) of the USB request that was received, and then distinguishes between control read transfers, control write transfers, and control write no-data transfers, and monitors the stage transition. For a wrong sequence, the sequence error of the control transfer stage transition interrupt is generated. For information on the stage control of this module, see Figure 28.3.

(b) Data Stage

Data transfers corresponding to USB requests that have been received should be done using the DCP. Before accessing the DCP buffer memory, the access direction should be specified using the ISEL bit in CFIFOSEL.

Transaction should be done by setting the response PID to BUF by using the PID bits in DCPCTR.

Completion of data transfer is detected using the BRDY interrupt for control write transfers and BEMP interrupt for control read transfers, respectively.

With control write transfers during high-speed operation, the NYET handshake response is carried out based on the state of the buffer memory.

(c) Status Stage

Control transfers are terminated by setting the CCPL bit to 1 with the PID bits in DCPCTR set to BUF.

After the above settings have been entered, this module automatically executes the status stage in accordance with the data transfer direction determined at the setup stage. The specific procedure is as follows.

- For control read transfers
  This module receives a zero-length packet from the USB host controller and transmits an ACK response.
- For control write transfers and no-data control transfers
  This module transmits a zero-length packet and receives an ACK response from the USB host controller.

(d) Control Transfer Auto Response Function

This module automatically responds to a normal SET_ADDRESS request. If any of the following errors occur in the SET_ADDRESS request, a response is necessary.

- bmRequestType ≠ H'00
- wIndex ≠ H'00
- wLength ≠ H'00
- wValue > H'7F
- DVSQ = B'011 (Configured)

For all requests other than the SET_ADDRESS request, corresponding responses are required.

28.4.7 Bulk Transfers (PIPE1 to PIPE5, PIPE9 to PIPE15)

The buffer memory specifications for bulk transfers (single/double buffer setting, or continuous/non-continuous transfer mode setting) can be selected. The maximum size that can be set for the buffer memory is 2 Kbytes. The buffer memory state is controlled by this module, with a response sent automatically for a PING packet/NYET handshake.

(1) PING Packet Control when the Host Controller Mode is Selected

This module automatically sends a PING packet in the OUT direction at a specific timing.
On receiving an ACK handshake in the initial state in which PING packet sending mode is set, this module sends an OUT packet as noted below. Reception of an NAK or NYET handshake returns this module to PING packet sending mode. This control also applies to the control transfers in the data stage and status stage.
<Starts sending an OUT data>

1. Sets OUT data sending mode.
2. Sends a PING packet.
3. Receives an ACK handshake.
4. Sends an OUT data packet.
5. Receives an ACK handshake.
   (Repeats steps 4 and 5.)
6. Sends an OUT data packet.
7. Receives an NAK/NYET handshake.
8. Sends a PING packet.

This module is returned to PING packet sending mode by a power-on reset, receiving an NYET/NAK handshake, clearing the sequence toggle bit (SQCLR), and setting the buffer clear bit (ACLRM) in PIPEnCTR.

(2) NYET Handshake Control when the Function Controller Mode is Selected

Table 28.25 lists responses to tokens received in bulk or control transfer. The NYET response of this module is made when there is only enough space in the buffer memory for one packet when an OUT token for such transfer is received. When a short packet is received, an ACK response will be produced instead of an NYET response even if the above condition holds.

Table 28.25 NYET Handshake Responses

Value Set for PID Bits in DCPCTR	Buffer Memory State	Received Token	Response	Note
NAK/STALL	—	SETUP	ACK	—
	—	IN/OUT/ PING	NAK/STALL	—
BUF	—	SETUP	ACK	—
	RCV-BRDY	OUT/PING	ACK	If an OUT token is received, a data packet is received.*1
	RCV-BRDY	OUT	NYET	A data packet is received.*2
	RCV-BRDY	OUT (Short)	ACK	A data packet is received.*2
	RCV-BRDY	PING	ACK	*2
	RCV-NRDY	OUT/PING	NAK	
	TRN-BRDY	IN	DATA0/DATA1	A data packet is transmitted.
	TRN-NRDY	IN	NAK	

[Legend]
RCV-BRDY*1:When an OUT/PING token is received, there is space in the buffer memory for two or more packets.
RCV-BRDY*2:When an OUT token is received, there is only enough space in the buffer memory for one packet.
RCV-NRDY:When a PING token is received, there is no space in the buffer memory.
TRN-BRDY:When an IN token is received, there is data to be transmitted in the buffer memory.
TRN-NRDY:When an IN token is received, there is no data to be transmitted in the buffer memory.

28.4.8 Interrupt Transfers (PIPE6 to PIPE9, PIPE10)

When the function controller mode is selected, this module carries out interrupt transfers in accordance with the timing controlled by the host controller. For interrupt transfers, PING packets are ignored (no responses are sent), and the ACK, NAK, and STALL responses are carried out without an NYET handshake response being made.
When the host controller mode is selected, this module can set the timing of issuing a token using the interval counter. At this time, this module issues an OUT token even in the OUT direction, without issuing a PING token.
This module does not support high bandwidth transfers of interrupt transfers.

(1) Interval Counter during Interrupt Transfers when the Host Controller Mode is Selected

(a) Operation Outline

For interrupt transfers, intervals between transactions are set in the IITV bits in PIPEPERI. This module issues an interrupt transfer token based on the specified intervals.

(b) Counter Initialization

This module initializes the interval counter under the following conditions.

- Power-on reset:
  The IITV bits are initialized.
- Buffer memory initialization using the ACLRM bit:
  The IITV bits are not initialized but the count value is. Setting the ACLRM bit to 0 starts counting from the value set in the IITV bits.

Note that the interval counter is not initialized in the following case.

- USB bus reset, USB suspended:
  The IITV bits are not initialized. Setting 1 to the UACT bit starts counting from the value before entering the USB bus reset state or USB suspended state.

(c) Operation when Transmission/Reception is Impossible at Token Issuance Timing

This module cannot issue tokens even at token issuance timing in the following cases. In such a case, this module attempts transactions at the subsequent interval.

- When the PID is set to NAK or STALL.
- When the buffer memory is full at the token sending timing in the receiving (IN) direction.
- When there is no data to be sent in the buffer memory at the token sending timing in the sending (OUT) direction.

28.4.9 Isochronous Transfers (PIPE1 and PIPE2)

This module has the following functions pertaining to isochronous transfers.

- Notification of isochronous transfer error information
- Interval counter (specified by the IITV bits)
- Isochronous IN transfer data setup control (IDLY function)
- Isochronous IN transfer buffer flush function (specified by the IFIS bit)
- SOF pulse output function

This module does not support the high bandwidth transfers of isochronous transfers.

(1) Error Detection with Isochronous Transfers

This module has a function for detecting the error information in isochronous transfers noted below. Table 28.26 and Table 28.27 show the priority in which errors are confirmed and the interrupts that are generated.

1. PID errors
   - If the PID of the packet being received is illegal
2. CRC errors and bit stuffing errors
   - If an error occurs in the CRC of the packet being received, or the bit stuffing is illegal
3. Exceeded maximum packet size
   - The data size of the received packet exceeded the specified maximum packet size.
4. Overrun and underrun errors
   - When host controller mode is selected
     When using isochronous IN transfers (reception), the IN token was transmitted but there was not enough space in the buffer memory.
     When using isochronous OUT transfers (transmission), the OUT token was transmitted, but the data was not in the buffer memory.
   - When function controller mode is selected
     When using isochronous IN transfers (transmission), the IN token was received but the data was not in the buffer memory.
     When using isochronous OUT transfers (reception), the OUT token was received, but there was not enough space in the buffer memory.
5. Interval errors

When function controller mode is selected, interval errors occur in following cases.

- During an isochronous IN transfer, the IN token could not be received during the interval frame.
- During an isochronous OUT transfer, the OUT token could not be received during the interval frame.

Table 28.26 Error Detection when a Token is Received

Detection Priority Order	Error	Generated Interrupt and Status
1	PID errors	No interrupts are generated in both cases when the host controller mode is selected and the function controller mode is selected (ignored as a corrupted packet).
2	CRC error and bit stuffing errors	No interrupts are generated in both cases when the host controller mode is selected and the function controller mode is selected (ignored as a corrupted packet).
3	Overrun and underrun errors	An NRDY interrupt is generated and the OVRN bit is set in both host controller mode and function controller mode. When the function controller mode is selected, a zero-length packet is transmitted in response to IN token. However, no data packet is received in response to OUT token.
4	Interval errors	An NRDY interrupt is generated when the function controller mode is selected. It is not generated in the host controller mode.

Table 28.27 Error Detection when a Data Packet is Received

Detection Priority Order	Error	Generated Interrupt and Status
1	PID errors	No interrupts are generated (ignored as a corrupted packet)
2	CRC error and bit stuffing errors	An NRDY interrupt is generated and the CRCE bit is set in both host controller mode and function controller mode.
3	Maximum packet size exceeded error	A BEMP interrupt is generated to set the PID bits to STALL in both cases when the host controller mode is selected and the function controller mode is selected.

(2) DATA-PID

This module does not support high bandwidth transfers. When the function controller mode is selected, this module operates as follows in response to the received PID.

1. IN direction
   - DATA0: Sent as data packet PID
   - DATA1: Not sent
   - DATA2: Not sent
   - mDATA: Not sent

2. OUT direction (when using full-speed operation)
   - DATA0: Received normally as data packet PID
   - DATA1: Received normally as data packet PID
   - DATA2: Packets are ignored
   - mDATA: Packets are ignored

3. OUT direction (when using high-speed operation)
   - DATA0: Received normally as data packet PID
   - DATA1: Received normally as data packet PID
   - DATA2: Received normally as data packet PID
   - mDATA: Received normally as data packet PID

(3) Interval Counter

(a) Operation Outline

The isochronous interval can be set using the IITV bits in PIPEPERI. The interval counter enables the functions shown in Table 28.28 when the function controller mode is selected. When the host controller mode is selected, this module generates the token issuance timing. When the host controller mode is selected, the interval counter operation is the same as the interrupt transfer operation. Refer to section 28.4.8 (1) Interval Counter during Interrupt Transfers when the Host Controller Mode is Selected.

Table 28.28 Functions of the Interval Counter when the Function Controller Mode is Selected

Transfer Direction	Function	Conditions for Detection
IN	Transmission buffer flush function	When an IN token cannot be normally received in the interval frame during an isochronous IN transfer
OUT	Notifies that a token not being received	When an OUT token cannot be normally received in the interval frame during an isochronous OUT transfer

The interval count is carried out when an SOF is received or for interpolated SOFs, so the isochronism can be maintained even if an SOF is damaged. The frame interval that can be set is the 2^{IITV} frames or 2^{IITV} μ frames.

(b) Interval Counter Initialization when the Function Controller Mode is Selected

This module initializes the interval counter under the following conditions.

- Power-on reset
  The IITV bits are initialized.
- Buffer memory clearing using the ACLRM bit
  The IITV bits are not initialized but the count value is.
- USB bus reset

After the interval counter has been initialized, the counter is started under the following condition 1 or 2 when a packet has been transferred normally.

1. An SOF is received following transmission of data in response to an IN token, in the PID = BUF state.
2. An SOF is received after data following an OUT token is received in the PID = BUF state.

The interval counter is not initialized under the conditions below.

1. When the PID bits are set to NAK or STALL
   The interval timer does not stop. This module attempts the transactions at the subsequent interval.
2. The USB bus is reset or USB operations are suspended
   The IITV bits are not initialized. When the SOF has been received, the counter is restarted from the value prior to the reception of the SOF.

(c) Interval Counting and Transfer Control when the Host Controller Mode is Selected

The IITV bits can be set when the selected pipe is for isochronous or interrupt transfers. This module controls the interval between token issuance operations based on the IITV bit setting. Specifically, this module issues a token for the selected pipe once every 2^{IITV} (μ) frames.
This module counts the interval every 1-ms frame for the pipes used for communications with the full-speed or low-speed peripheral devices connected to a high-speed HUB.
This module starts counting the token issuance interval at the (μ) frame following the (μ) frame in which the PID bits are

set to BUF.

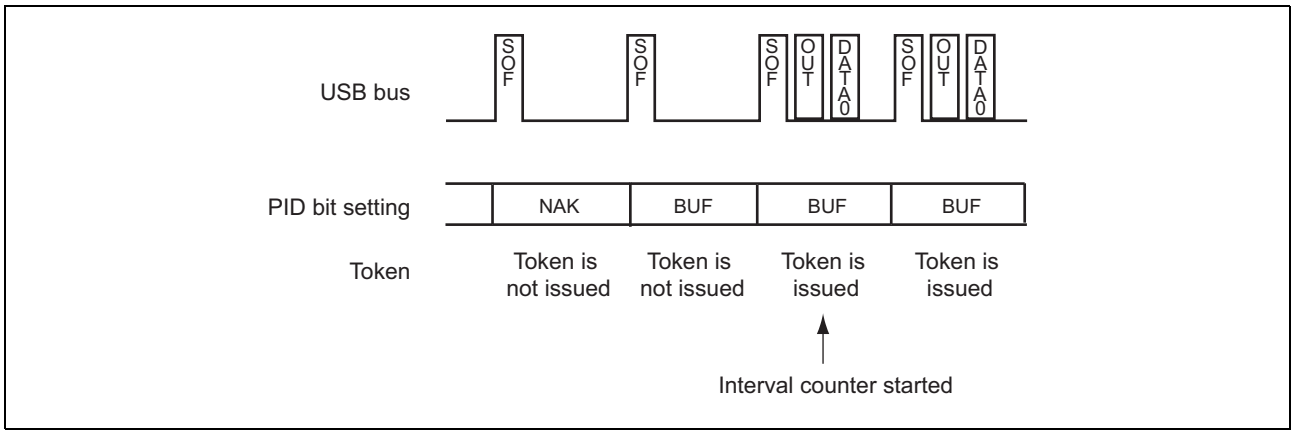

Figure 28.7 Token Issuance when IITV = 0

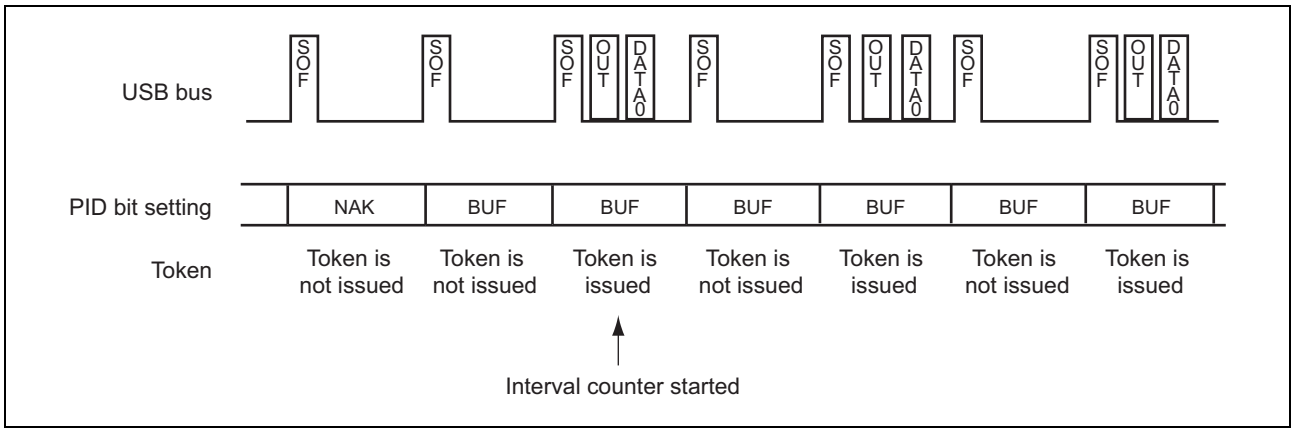

Figure 28.8 Token Issuance when IITV = 1

When the selected pipe is for isochronous transfers, this module carries out the operation below in addition to controlling token issuance interval. This module issues a token even when the NRDY interrupt generation condition is satisfied.

1. When the selected pipe is for isochronous IN transfers
   This module generates the NRDY interrupt when this module issues the IN token but does not receive a packet successfully from a peripheral device (no response or packet error).
   This module sets the OVRN bit to 1 generating the NRDY interrupt when the time to issue an IN token comes in a state in which this module cannot receive data because the FIFO buffer is full (because reading data from the FIFO buffer is slow).
2. When the selected pipe is for isochronous OUT transfers
   This module sets the OVRN bit to 1 generating the NRDY interrupt and transmitting a zero-length packet when the time to issue an OUT token comes in a state in which there is no data to be transmitted in the FIFO buffer (because writing data to the FIFO buffer is slow).
   The token issuance interval is reset by a power-on reset or when the ACLRM bit is set to 1.

(d) Interval Counting and Transfer Control when the Function Controller Mode is Selected

The IITV bits can be set when the selected pipe is for isochronous transfers.

1. When the selected pipe is for isochronous OUT transfers
   This module generates the NRDY interrupt when it fails to receive a data packet within the interval set for (μ) frames by the IITV bits.

This module generates the NRDY interrupt when this module fails to receive a data packet because of a CRC error or other errors contained in the packet, or because of the FIFO buffer being full (because reading data from the FIFO buffer is slow).
This module generates the NRDY interrupt on receiving an SOF packet. Even if the SOF packet is corrupted, the internal interpolation is used and allows the interrupt to be generated at the timing to receive the SOF packet. However, when the IITV bits are set to the value other than 0, this module generates the NRDY interrupt on receiving an SOF packet for every interval after starting interval counting operation. When the PID bits are set to NAK after starting the interval timer, this module does not generate the NRDY interrupt on receiving an SOF packet.

The interval counting starts at the different timing depending on the IITV bit setting as follows.
- When IITV = 0: The interval counting starts at the (μ) frame following the (μ) frame in which the PID bits for the selected pipe are set to BUF.

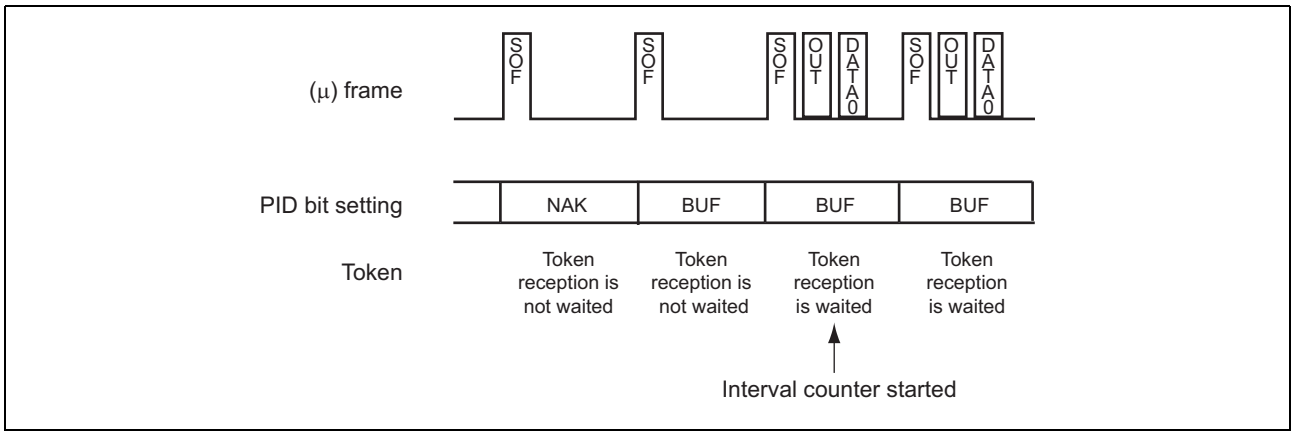

Figure 28.9 Relationship between (μ) Frames and Expected Token Reception when IITV = 0

- When IITV ≠ 0: The interval counting starts on completion of successful reception of the first data packet after the PID bits for the selected pipe have been modified to BUF.

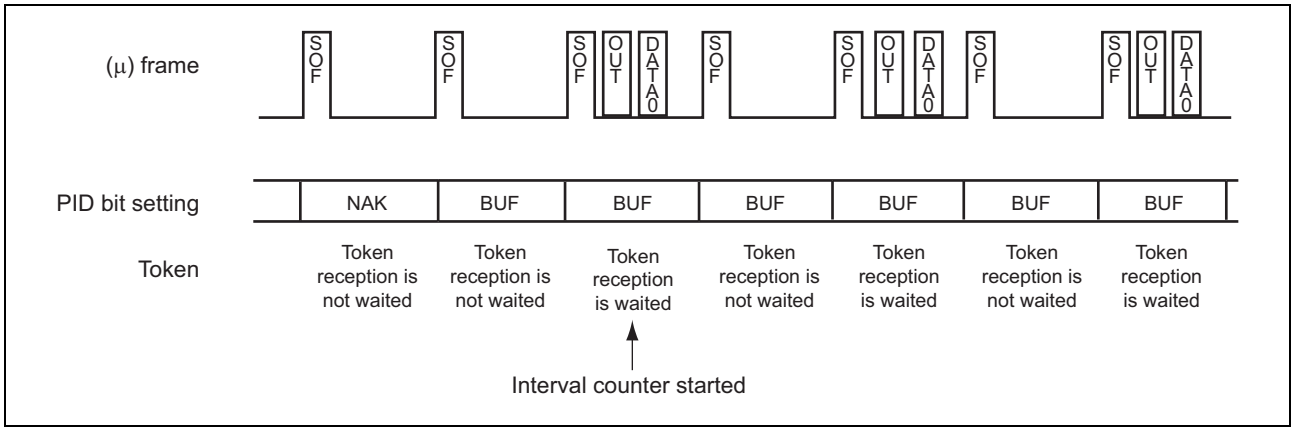

Figure 28.10 Relationship between (μ) Frames and Expected Token Reception when IITV = 1

2. When the selected pipe is for isochronous IN transfers
The IFIS bit should be 1 for this use. When IFIS = 0, this module transmits a data packet in response to the received IN token irrespective of the IITV bit setting.
When IFIS = 1, this module clears the FIFO buffer when this module fails to receive an IN token within the interval set for (μ) frames by the IITV bits in a state in which there is data to be transmitted in the FIFO buffer.
This module also clears the FIFO buffer when this module fails to receive an IN token successfully because of a bus error such as a CRC error contained in the token.

This module clears the FIFO buffer on receiving an SOF packet. Even if the SOF packet is corrupted, the internal interpolation is used and allows the FIFO buffer to be cleared at the timing to receive the SOF packet.
The interval counting starts at the different timing depending on the IITV bit setting (similar to the timing during OUT transfers).
The clearing conditions for the interval counter are any of the following in function controller mode.
- When a power-on-reset is applied to this module (the value set in the IITV bits is also cleared to 0).
- When the ACLRM bit is set to 1.
- When this module detects a USB bus reset.

(4) Setup of Data to be Transmitted using Isochronous Transfer when the Function Controller Mode is Selected

With isochronous data transmission using this module in function controller mode, after data has been written to the buffer memory, a data packet can be sent with the next frame in which an SOF packet is detected. This function is called the isochronous transfer transmission data setup function. This function enables identification of the frame that has started being transmitted.
When a double buffer is in use as the buffer memory, transmission from only one of the two buffers will be possible even after the writing of data to both buffers has been completed; the given buffer memory will be that to which the writing of data was completed first. For this reason, even if multiple IN tokens are received in a single frame, the only buffer memory that can be sent is one packet's worth of data.
When an IN token is received, if the buffer memory is in the transmission enabled state, this module transmits the data as a normal response. If the buffer memory is not in the transmission enabled state, however, a zero-length packet is sent and an underrun error occurs.
Figure 28.11 shows an example of transmission using the isochronous transfer transmission data setup function with this module, when IITV = 0 (every frame) has been set.

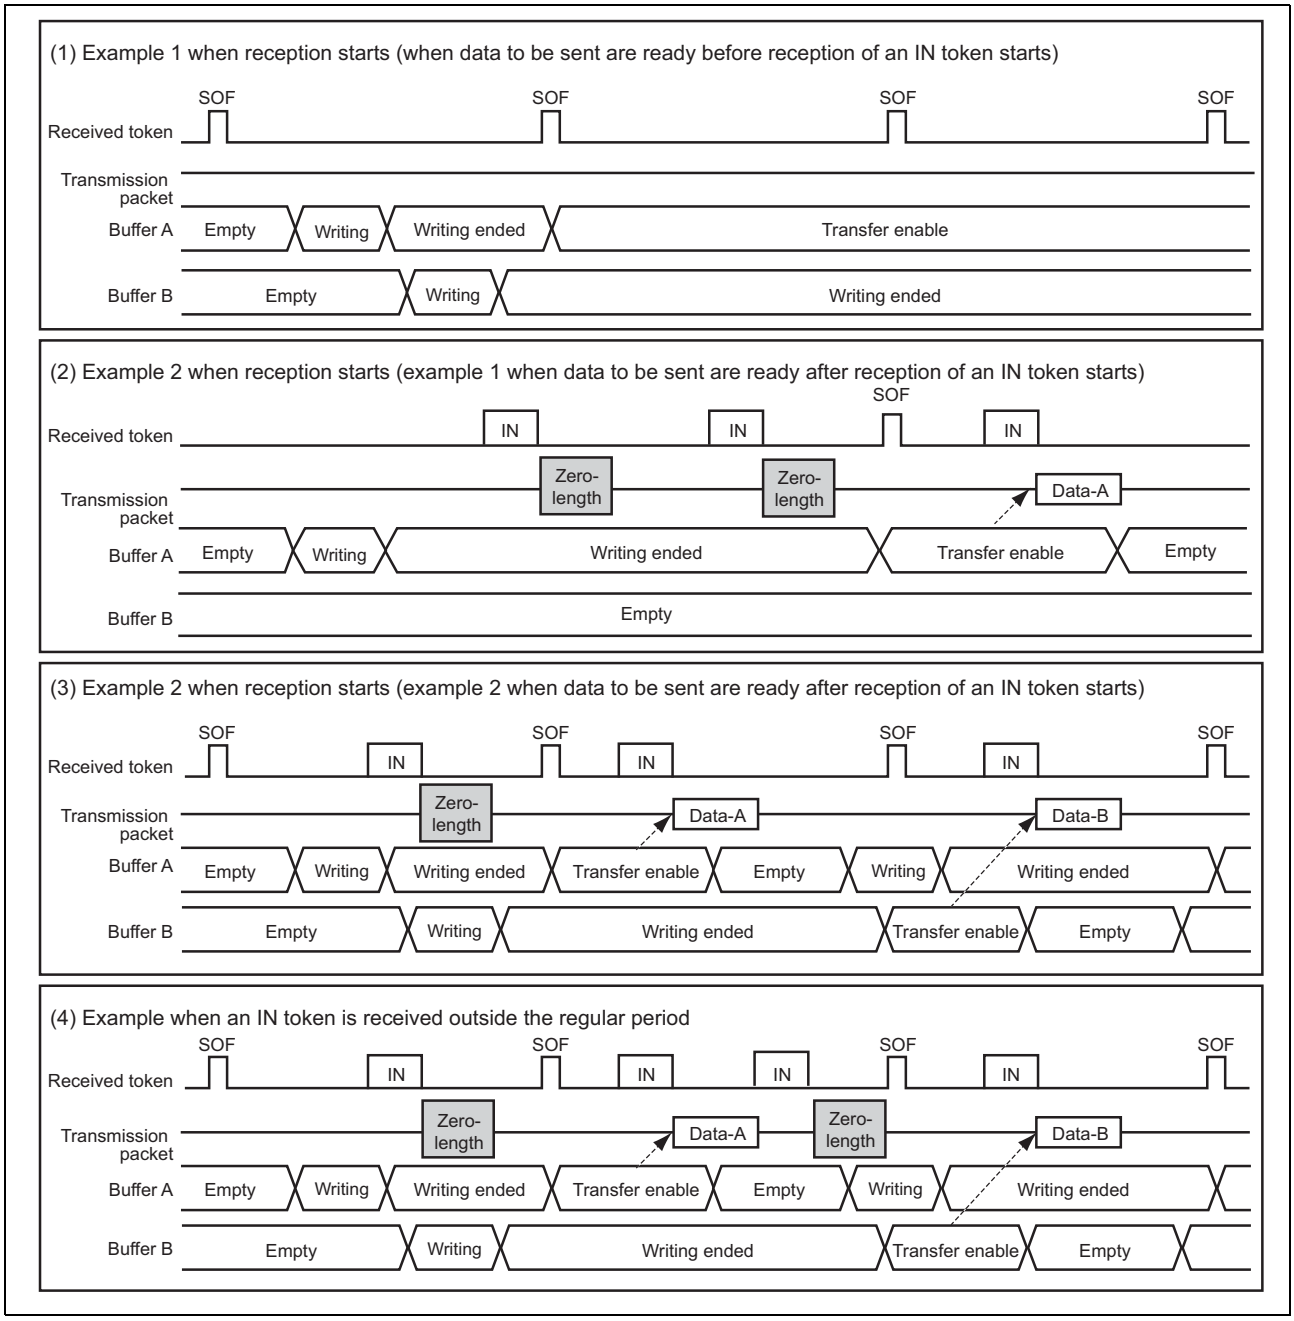

Figure 28.11 Example of Data Setup Function Operation

(5) Isochronous Transfer Transmission Buffer Flush when the Function Controller Mode is Selected

When the function controller mode is selected and an SOF packet or a µSOF packet of the next frame is received without receiving an IN token in the interval frame during isochronous data transmission, this module operates as if a corrupted IN token was received, and clears the buffer for which transmission is enabled, putting that buffer in the writing enabled state.

If a double buffer is being used and writing to both buffers has been completed, data are considered to have been sent from the buffer memory that was cleared in the same interval frame, and transmission is enabled for the buffer memory that is not discarded with SOF or µSOF packets reception.

The timing at which the buffer flush function is activated varies depending on the value set for the IITV bits.

- If IITV = 0
  The buffer flush operation starts from the next frame after the pipe becomes valid.
- In any cases other than IITV = 0
  The buffer flush operation is carried out subsequent to the first normal transaction.

Figure 28.12 shows an example of the buffer flush function of this module. When an unanticipated token is received prior to the interval frame, this module sends the written data or a zero-length packet as an underrun error according to the data setup state.

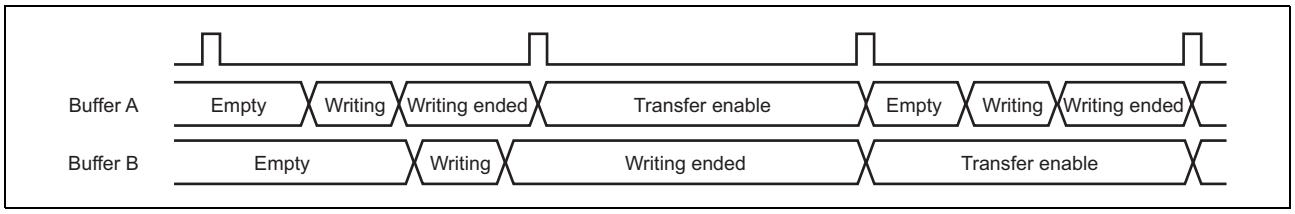

Figure 28.12 Example of Buffer Flush Function Operation

Figure 28.13 shows an example of this module generating an interval error. There are five types of interval errors, as shown below. The interval error is generated at the timing indicated by (1) in the figure, and the buffer flush function is activated.
If an interval error occurs during an IN transfer, the buffer flush function is activated; and if it occurs during an OUT transfer, an NRDY interrupt is generated.
The OVRN bit should be used to distinguish between NRDY interrupts such as received packet errors and overrun errors.
In response to tokens that are shaded in the figure, responses occur based on the buffer memory status.

1. IN direction
   - If the buffer is in the transmission enabled state, the data is transferred as a normal response.
   - If the buffer is in the transmission disabled state, a zero-length packet is sent and an underrun error occurs.
2. OUT direction
   - If the buffer is in the reception enabled state, the data is received as a normal response.
   - If the buffer is in the reception disabled state, the data is discarded and an overrun error occurs.

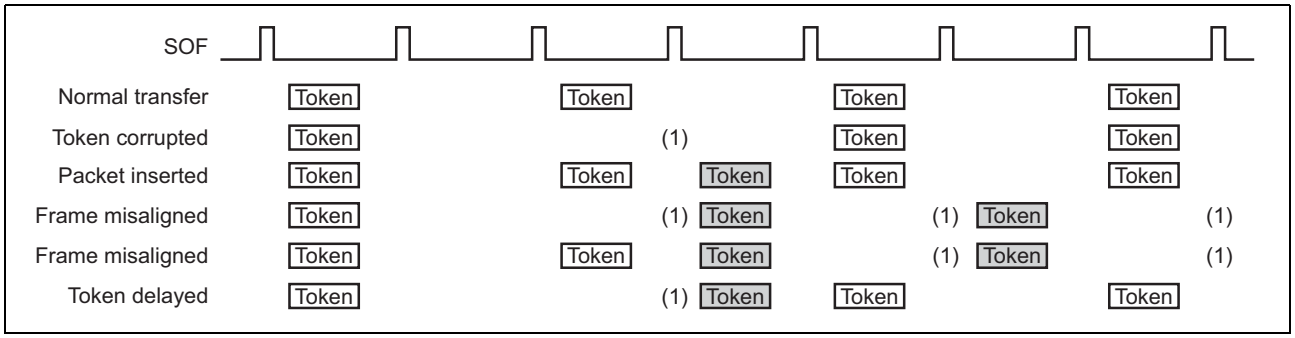

Figure 28.13 Example of an Interval Error being Generated when IITV = 1

28.4.10 SOF Interpolation Function

When the function controller mode is selected and if an SOF packet could not be received at intervals of 1 ms (when using full-speed operation) or 125 µs (when using high-speed operation) because of corruption or missing, this module interpolates the SOF. The SOF interpolation operation begins when both the USBE bit in SYSCFG and the SUSPM bit in SUSPMODE have been set to 1 and an SOF packet is received. The interpolation function is initialized under the following conditions.

- Power-on reset
- USB bus reset
- Suspended state detected

Also, the SOF interpolation operates under the following specifications.

- Frame interval (125 µs or 1 ms) conforms to the results of the reset handshake protocol.
- The interpolation function is not activated until an SOF packet is received.
- After the first SOF packet is received, either 125 µs or 1 ms is counted with an internal clock of 48 MHz, and interpolation is carried out.
- After the second and subsequent SOF packets are received, interpolation is carried out at the previous reception interval.
- Interpolation is not carried out in the suspended state or while a USB bus reset is being received. (With suspended transitions in high-speed operation, interpolation continues for 3 ms after the last packet is received.)

This module supports the following functions based on the SOF reception. These functions also operate normally with SOF interpolation, if the SOF packet was missing.

- Refreshing of the frame number and micro-frame number
- SOFR interrupt and µSOF lock
- SOF pulse output
- Isochronous transfer interval count

If an SOF packet is missing when full-speed operation is being used, the FRNM bits in FRMNUM are not refreshed. If a µSOF packet is missing during high-speed operation, the UFRNM bits in UFRMNUM are refreshed. However, if a µSOF packet for UFRNM = 000 is missing, the FRNM bits are not refreshed. In this case, the FRNM bits are not refreshed even if successive µSOF packets other than UFRNM = 000 are received normally.

29. Video Display Controller 5 (1): Overview

29.1 Features

The video display controller 5 consists of the following six blocks. For the image synthesis, one plane of video image + two graphics planes, or three graphics planes can be selected.

1. Input controller: Input video image selection, sync signal adjustment, horizontal noise reduction, and brightness adjustment, gain adjustment, and YCbCr ↔ GBR conversion using a color matrix
2. Scaler: Scale up, scale down, and rotation of input video images using the frame buffer, and repeated recording of the specified number of fields in the frame buffer
3. Image quality improver: Black stretch, LTI/sharpness, and YCbCr ↔ GBR conversion using a color matrix
4. Image synthesizer: Synthesis of one plane of video image + two graphics planes, or three graphics planes
5. Output controller: Brightness/contrast adjustment, gamma correction, dither processing, output format conversion, control signal output for TFT-LCD panel
6. System controller: Interrupt control, panel clock control, CLUT table select signal status flag output

The functions of video display controller 5 are listed in Table 29.1.

Table 29.1 Features of Video Display Controller 5

Item	Function
Operating frequency	Video input clock: 87 MHz or less (for RGB/YCbCr video image) Panel clock: 87 MHz or less (depends on the panel specifications)
Input video image specification	• 8-bit input conforming to ITU-R BT.656 standard (27 MHz, interlace signal) • 8-bit input conforming to ITU-R BT.656 extended standard (27 MHz, progressive signal) *1 • 8-bit input conforming to ITU-R BT.601 extended standard (27 MHz, interlace signal) *1 • 8-bit input conforming to ITU-R BT.601 extended standard (54 MHz, progressive signal) *1 • 16-bit input conforming to ITU-R BT.601 extended standard (13.5 MHz, interlace signal) *1 • Digital pin input: YCbCr422, YCbCr444, RGB888, RGB666, and RGB565 video image • Digital pin input size: Maximum input video image size to be set *2: 1440 pixels × 1024 lines (horizontal × vertical) Notes:1. The ITU-R BT.656 and 601 standards do not include the description regarding the progressive signal. The ITU-R BT.601 standard does not include the description regarding the connection interface. 2. Depends on the AC characteristics of the connected device. • Examples of input video image size: XGA (1024 × 768), SVGA (800 × 600), WVGA (800 × 480), VGA (640 × 480), WQVGA (480 × 240), QVGA in landscape (320 × 240), QVGA in portrait (240 × 320)
Video image recording function	• Storing the video image in the YCbCr422/YCbCr444/RGB565/RGB888 format at a rate of 1/1, 1/2, 1/4, or 1/8 field. • Maximum video image size to be stored: ×1 size of input video image
Video image quality adjustment function	Contrast adjustment, brightness adjustment, horizontal noise reduction, black stretch, LTI/sharpness
Video image scaling processing	Vertical: ×1/8 to ×8, linear/hold interpolation Horizontal: ×1/8 to ×8, linear/hold interpolation IP conversion can be performed by adjusting the initial phase.
Video image rotation function	• 0/90/180/270 degree rotation in the YCbCr422/RGB565 format • Horizontal mirroring in the YCbCr422/YCbCr444/RGB565/RGB888 format

Table 29.1 Features of Video Display Controller 5

Item	Function
Graphics	• Number of graphic planes: Three planes (graphics 0, graphics 2, and graphics 3) • Supported pixel formats: - RGB565 progressive format (α: none, R: 5 bits, G: 6 bits, B: 5 bits; 16 bits in total) - RGB888 progressive format (α: none, R: 8 bits, G: 8 bits, B: 8 bits; 24 bits in total) - α RGB1555 progressive format (α: 1 bit, R: 5 bits, G: 5 bits, B: 5 bits; 16 bits in total) - α RGB4444 progressive format (α: 4 bits, R: 4 bits, G: 4 bits, B: 4 bits; 16 bits in total) - α RGB8888 progressive format (α: 8 bits, R: 8 bits, G: 8 bits, B: 8 bits; 32 bits in total) - RGBα5551 progressive format (R: 5 bits, G: 5 bits, B: 5 bits, α: 1 bit; 16 bits in total) - RGBα8888 progressive format (R: 8 bits, G: 8 bits, B: 8 bits, α: 8 bits; 32 bits in total) - CLUT8 progressive format (CLUT: 8 bits) - CLUT4 progressive format (CLUT: 4 bits) - CLUT1 progressive format (CLUT: 1 bits) - YCbCr422 progressive format (Y: 8 bits, Cb/Cr: 8 bits; 16 bits in total) (only for graphics 0) - YCbCr444 progressive format (Y: 8 bits, Cb/Cr: 8 bits; 16 bits in total) (only for graphics 0) • Maximum image size to be read: 1440 pixels × 1440 lines (horizontal × vertical)
Graphics function	Alpha blending in rectangular area: Mixes images according to transparency rate α in the specified area (fade-in and fade-out functions are available.) Chroma-key: Mixes images using the specified RGB color and CLUT value according to transparency rate α. Alpha blending in one pixel units: Mixes images according to transparency rate α when the target graphics image is in the αRGB1555, αRGB4444, αRGB8888, RGBα5551, RGBα8888, or CLUT8/4/1 format.
	For each dot, the priority among the α values of the above functions is as follows: Alpha blending in rectangular area > Chroma-key > Alpha blending in one pixel units
Output video image size	Maximum output video image size to be set*: 1999 pixels × 2035 lines (horizontal × vertical) Note: * Depends on the AC characteristics of the display panel. Examples of output video image size: • XGA (1024 × 768) • SVGA (800 × 600), WVGA (800 × 480), • VGA (640 × 480), WQVGA (480 × 240), • QVGA size in landscape (320 × 240) • QVGA size in portrait (240 × 320)
Output video image format	• RGB888 progressive video output (24-bit parallel output) • RGB666 progressive video output (18-bit parallel output) • RGB565 progressive video output (16-bit parallel output) • RGB888 progressive video output (8-bit serial output)
Panel output adjustment	Panel brightness/contrast adjustment, RGB gamma correction, dither processing, output format conversion
Sync signal output	Control signal output for the TFT-LCD panel
Interrupt output	• Vsync signal for video image input/output • Line interrupt output (can be output on a desired line.) • Erroneous Vsync cycle detection signal for video input • Field write completion signal • Overflow/underflow signal for the internal buffer

29.2 Block Diagram

29.3 Input/Output Pins

Table 29.2 shows the pin configuration.

Table 29.2 Input/Output Pins

Symbol	I/O	Pin Name	Function
DV0_CLK	Input	External input clock 0	External input 0 clock pin
DV0_VSYNC	Input	External input Vsync 0	External input 0 Vsync signal pin
DV0_HSYNC	Input	External input Hsync 0	External input 0 Hsync signal pin
DV0_DATA 23 to DV0_DATA 0	Input	External input video image data 0	External input 0 video image data pin
LCD0_CLK	Output	Panel clock 0	Panel output 0 clock pin
LCD0_DATA 23 to LCD0_DATA 0	Output	Video image data 0 for panel	Panel output 0 video image data pin
LCD0_TCON 6 to LCD0_TCON 0	Output	Control signal 0 for panel	Panel output 0 timing control pin
LCD0_EXTCLK	Input	Panel clock source 0	Panel clock source 0 input pin

29.4 Clocks

There are two clocks to be mainly used by the video display controller 5: the video image clock and pixel clock.

The video image clock is used while the video image is processed in the input controller, passed to the scale-down control block in the scaler, and then written to the buffer (internal bus write control). The DV_CLK clock is used as the video image clock.

The pixel clock is used in graphics read-out processing by the scaler (internal bus read controller) through output controller processing. When the parallel RGB output is selected in the output controller, the frequencies of the pixel clock and panel clock (LCD_CLK) are the same. The panel clock can be selected from the video clock, LCD_EXTCLK, and peripheral bus clock 1 (P1φ) with SYSCNT_PANEL_CLK.PANEL_ICKSEL[1:0] of the system controller. When the serial RGB output (3/4 speed mode) is selected in the output controller, the pixel clock frequency is 1/3 or 1/4 the panel clock (LCD_CLK) frequency.

29.5 Hsync and Vsync Signals

Hsync and Vsync signals to be used in the logic stage following the scale-up control block of the scaler are generated by the synchronization control block of the scaler. Since the Hsync and Vsync signals are used as the reference signals for the LCD TCON, which generates various panel driving timings, they are also the reference signals for the control signals (LCD_TCON6 to LCD_TCON0 pins) passed to the panel.

The output Hsync signal always operates at a free-running frequency, and the horizontal period is set with SC_SCL0_FRC4.SC_RES_FH[10:0]. On the other hand, the output Vsync signal is selected from the external input and free-running Vsync signals with SC_SCL0_FRC3.SC_RES_VS_SEL of the scaler.

29.5.1 External Input Vsync

(1) Operation Outline

In this mode, the output Vsync signal is generated according to an external input Vsync signal. When displaying video image input from a digital pin on the panel and the pointer buffer is not in use, always use this mode. However, the output Hsync signal is free running even in this mode. Figure 29.4 shows the timing of external input Vsync signal.

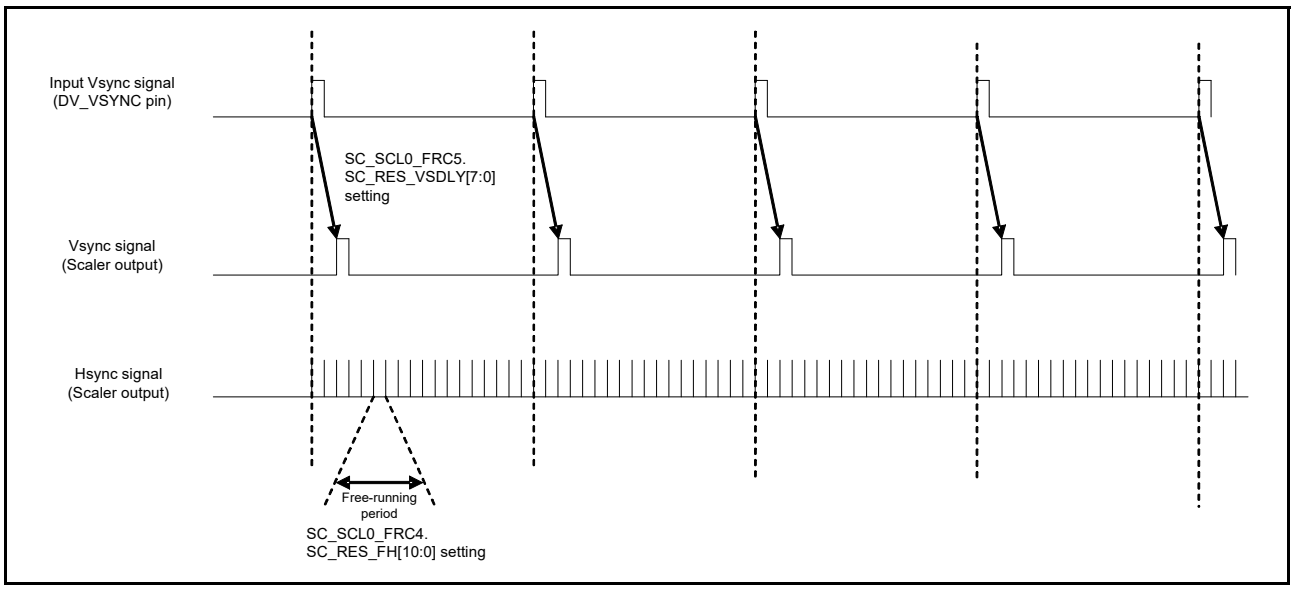

Figure 29.4 External Input Vsync Timing

(2) Notes

When Vsync is externally input, generation of the output Vsync signal is based on the external Vsync signal. That is, the output Vsync signal follows the input Vsync signal, so if an unstable Vsync signal is input, the output Vsync signal will also be unstable.

Since the output Hsync signal is generated according to the frequency generated by a free-running clock and the Vsync signal is generated from the video input as a base, the signals will not be in synchronization. This module adjusts the timing between these signals by adjusting the output Vsync signal so that it stays in time with the output Hsync signal. Therefore, even if the input Vsync signal is stable, the timing of the output Vsync signal may be increased or decreased by up to one line to stay in synchronization with the timing of the output Hsync signal.

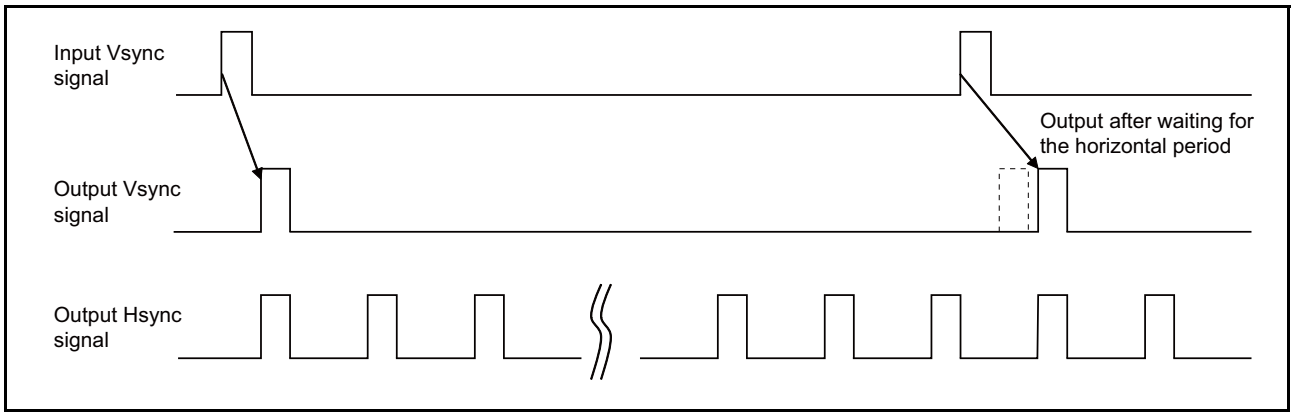

Figure 29.5 Detailed Timing Chart for Generation of the Output Vsync Signal

29.5.2 Free-Running Vsync

(1) Operation Outline

In this mode, the Vsync signal is generated according to the pixel clock (free running). The vertical period is selected with SC_SCL0_FRC4.SC_RES_FV[10:0]. The output Hsync signal is also free running. Figure 29.6 shows the timing.

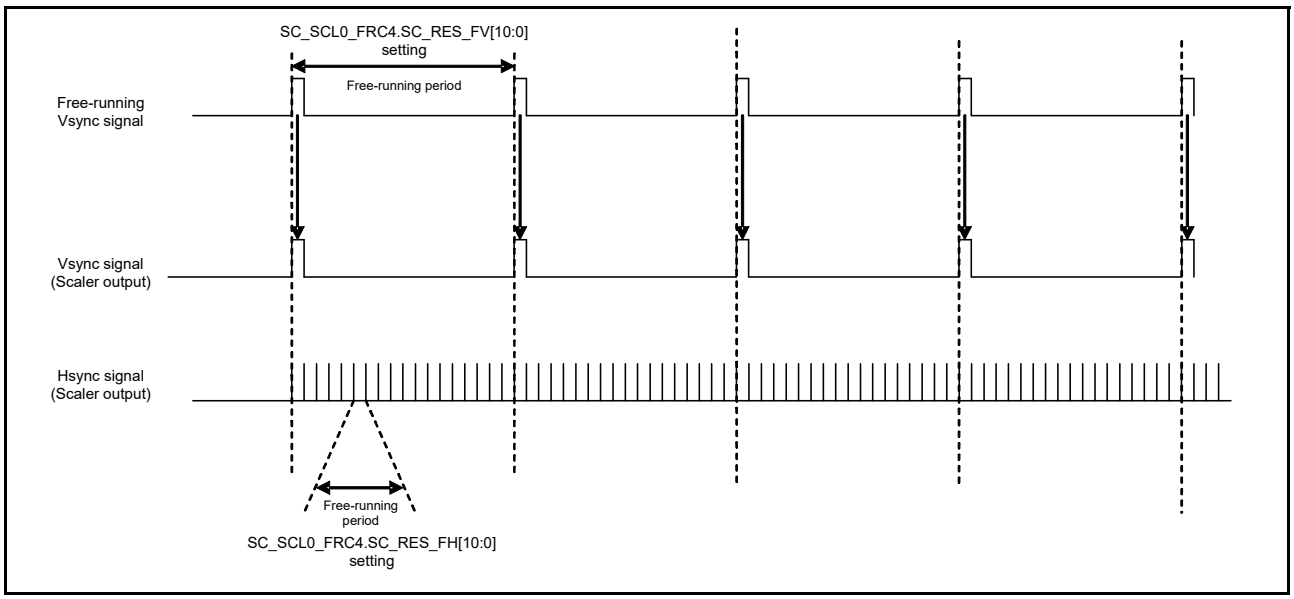

Figure 29.6 Free Running Vsync Timing

(2) Pointer Buffers

In free-running vertical synchronization mode, output of the input video image to a panel may lead to flicker in the output video image. This occurs when the input and output vertical sync signals are not in synchronization. To prevent this, use the pointer buffers to adjust the timing between the input and output video images in frame units. If the input Vsync signal is faster than the output Vsync signal, frames from the input video image are skipped in the output image for display. On the other hand, when the input Vsync signal is slower than the output Vsync signal, frames from the input video image are repeated. However, when the difference in timing between the input and output Vsync signals is too large, the pointer buffers cannot deal with the difference, so flicker may occur. As more buffers are used, the pointer buffers can deal with larger differences in frequency.

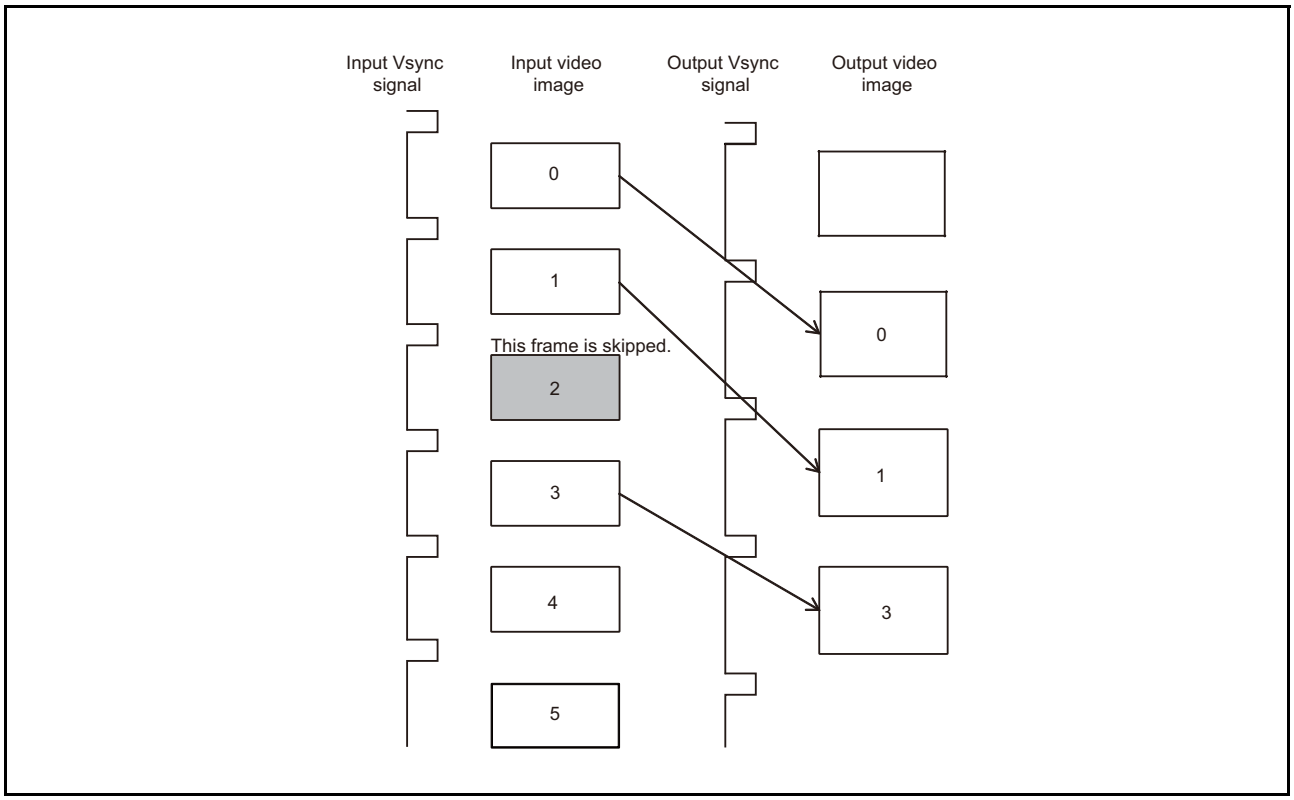

Figure 29.7 Timing when the Input Vsync Signal is Faster than the Output Vsync Signal

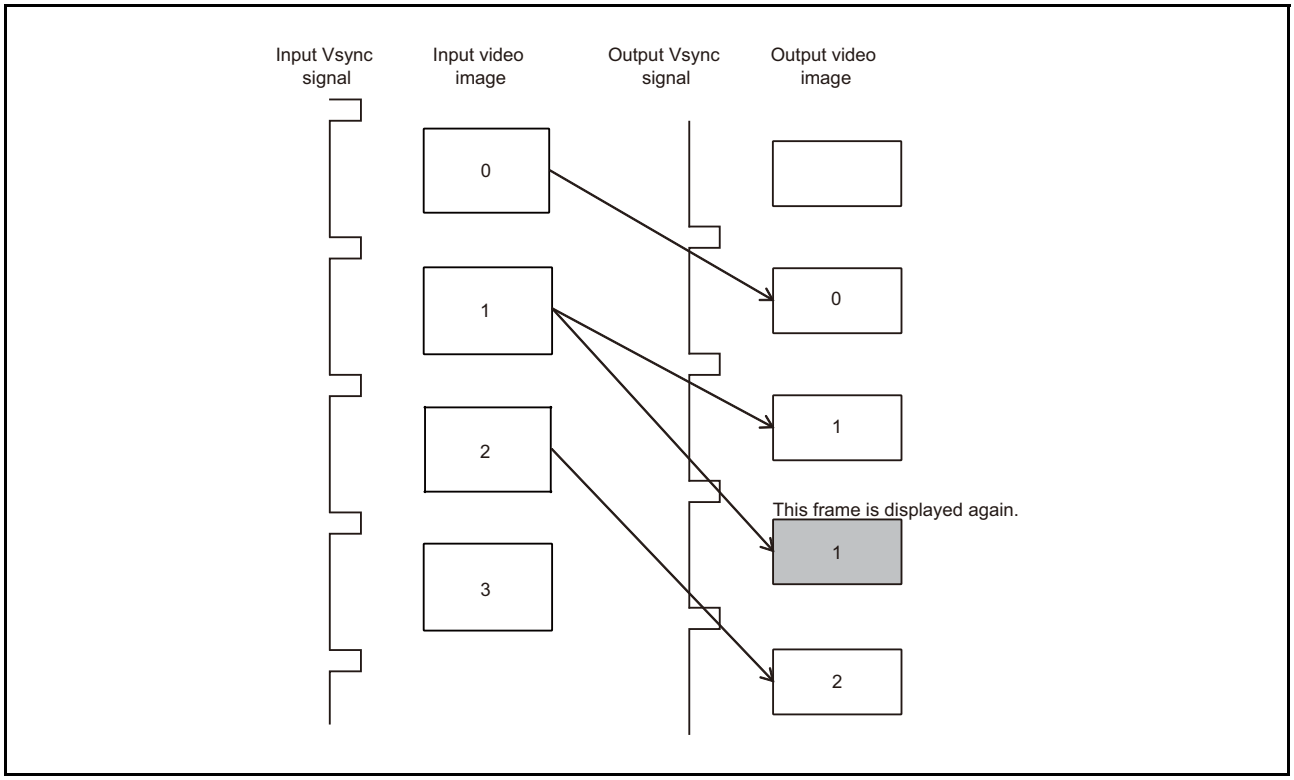

Figure 29.8 Timing when the Input Vsync Signal is Slower than the Output Vsync Signal

29.5.3 Usage Note on Changing Vsync Signal Selections

When the Vsync signal selection is changed, the output Vsync signal is discontinuous, resulting in disordered panel display. In this case, perform the mute processing according to the panel specification as necessary and change the Vsync signal selection.

30. Video Display Controller 5 (2): Input Controller

30.1 Input Controller Functions

30.1.1 Overview of Functions

The input controller performs the on/off control of input supplied via the external input pins, and subjects the signals to synchronization adjustment, horizontal noise reduction, and brightness adjustment, gain adjustment, and YCbCr ↔ GBR conversion using a color matrix.

The functional block diagram of the input controller is shown below.

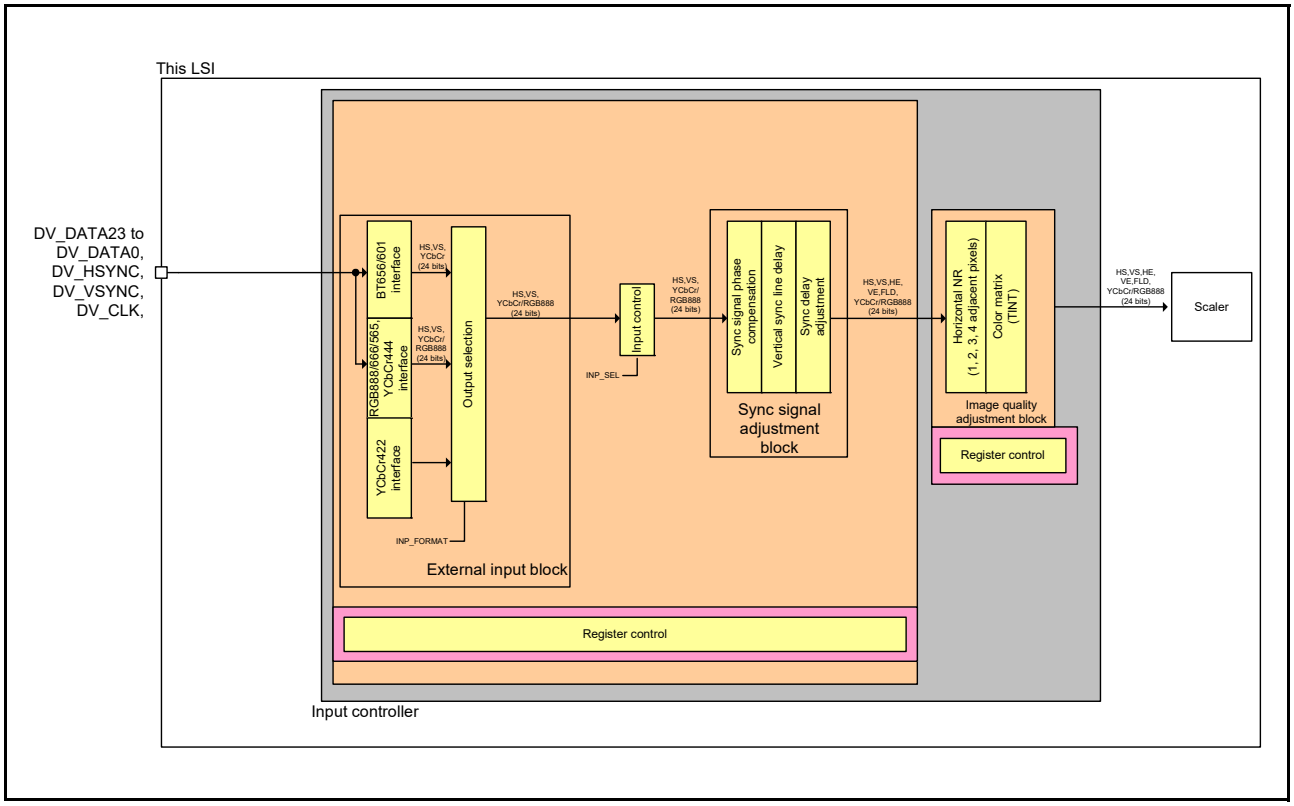

Figure 30.1 Functional Block Diagram of Input Controller

30.1.2 Updating Registers of External Signal Input Block and Sync Signal Adjustment Block

The control registers of the external input block and sync signal adjustment block are updated by setting the relevant update control bit to 1.

For the control registers other than the IMGCNT_DRC_REG register of the image quality adjustment block, the update timing is controlled using the Vsync signal.

After 1 is set to the bits in the update control register, the contents of the relevant registers are actually modified at the rising edge of the Vsync signal, when the update control register is automatically cleared to 0.

Table 30.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
INP_UPDATE	INP_EXT_UPDATE	0	External Input Block Register Update 0: Registers are not updated. 1: Registers are updated.
INP_UPDATE	INP_IMG_UPDATE	0	Sync Signal Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated.
IMGCNT_UPDATE	IMGCNT_VEN	0	Image Quality Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync signal.

30.1.3 Controlling Input

The input controller performs the on/off control of input supplied via the external input pins.

Table 30.2 Input Control

Register Name	Bit Name	Initial Value	Description
INP_SEL_CNT	INP_SEL	0	On/Off Control of Input Supplied via External Input Pin 0: Input supplied via the external input pins is off. 1: Input supplied via the external input pins is on.

30.1.4 Controlling Externally Input Video Signals

The externally input video image signals in the YCbCr444, RGB888, RGB666, RGB565, BT656 (extended), BT601 (extended), YCbCr422 (the 16-bit data format of the BT601 standard) formats can be handled.

The BT656 signals can be used for the 525-line and 59.94-Hz (27.0-MHz) or the 625-line and 50.00-Hz (27.0-MHz) interlace signals and for the 525-line and 59.94-Hz (54.0-MHz) or the 625-line and 50.00-Hz (54.0-MHz) BT656-extended progressive signals.

The BT601 signals can be used for the 8-bit data line 525-line and 59.94 Hz (27.0-MHz) or the 625-line and 50.00-Hz (27.0-MHz) interlace signals and for the 525-line and 59.94 Hz (54.0-MHz) or the 625-line and 50.00-Hz (54.0-MHz) extended progressive signals.

The YCbCr422 signals can be used for the 16-bit data line 525-line and 59.94-Hz (13.5-MHz) or the 625-line and 50.00-Hz (13.5-MHz) BT601 interlace signals.

The above signals can be selected by the INP_FORMAT[2:0] bits. Bit endian change and B/R signal swap are controlled by setting the INP_ENDIAN_ON and INP_SWAP_ON bits.

Table 30.3 Externally Input Video Signal Control

Register Name	Bit Name	Initial Value	Description
INP_SEL_CNT	INP_FORMAT[2:0]	000	External Input Format Select 0: YCbCr444, RGB888 1: RGB666 2: RGB565 3: BT656 4: BT601 5: YCbCr422 6, 7: Setting prohibited
INP_EXT_ SYNC_CNT	INP_ENDIAN_ON	0	External Input Bit Endian Change On/Off Control 0: Off 1: On
INP_EXT_ SYNC_CNT	INP_SWAP_ON	0	External Input B/R Signal Swap On/Off Control 0: Off 1: On

30.1.5 Selecting Clock Edge for Externally Input Signals

The clock edge for receiving the video image signals, Vsync signals, and Hsync signals is individually selected with the INP_PXD_EDGE, INP_VS_EDGE, INP_HS_EDGE bits.

Table 30.4 Externally Input Clock Edge Selection

Register Name	Bit Name	Initial Value	Description
INP_SEL_CNT	INP_PXD_EDGE	0	Clock Edge Select for Capturing External Input Video Image Signals DV_DATA23 to DV_DATA0 0: Rising edge 1: Falling edge
INP_SEL_CNT	INP_VS_EDGE	0	Clock Edge Select for Capturing External Input Vsync Signal DV_VSYNC 0: Rising edge 1: Falling edge
INP_SEL_CNT	INP_HS_EDGE	0	Clock Edge Select for Capturing External Input Hsync Signal DV_HSYNC 0: Rising edge 1: Falling edge

Figure 30.2 shows the typical input timing of externally input signals.

The input signals can be received at the rising edge of the clock signal DV_CLK when the INP_PXD_EDGE, INP_VS_EDGE, and INP_ES_EDGE bits are 0.

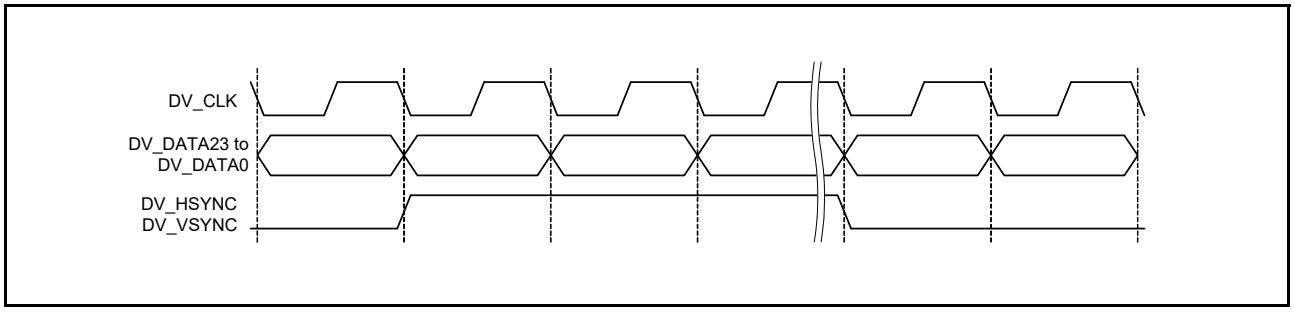

Figure 30.2 Typical Input Timing of Externally Input Signals (Clock Phase)

30.1.6 Externally Input Sync Signal Inversion Control

Inversion of polarity of the Vsync and Hsync signals can be controlled by the INP_VS_INV and INP_HS_INV bits.

Table 30.5 Sync Signal Inversion Control

Register Name	Bit Name	Initial Value	Description
INP_EXT_ SYNC_CNT	INP_VS_INV	0	External Input Vsync Signal DV_VSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)
INP_EXT_ SYNC_CNT	INP_HS_INV	0	External Input Hsync Signal DV_HSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)

30.1.7 Bit Allocation of Externally Input Video Image Signals

Allocation of the externally input video image signal pins DV_DATA to the signals in each format is described below.

(1) YCbCr444/RGB888 Input

When the external input is of YCbCr444/RGB888 format, the video image signal pins DV_DATA are allocated to the internal signals Y/GOUT, Cb/BOUT, Cr/ROUT, as shown in Table 30.6.

Table 30.6 Bit Allocation of DV_DATA Pin Inputs when the External Input is of YCbCr444/RGB888

INP_FORMAT[2:0]	**0**	**0**	**0**	**0**
INP_ENDIAN_ON	**0**	**0**	**1**	**1**
INP_SWAP_ON	**0**	**1**	**0**	**1**
DV_DATA23	Cr/ROUT[7]	Cb/BOUT[7]	Cr/ROUT[0]	Cb/BOUT[0]
DV_DATA22	Cr/ROUT[6]	Cb/BOUT[6]	Cr/ROUT[1]	Cb/BOUT[1]
DV_DATA21	Cr/ROUT[5]	Cb/BOUT[5]	Cr/ROUT[2]	Cb/BOUT[2]
DV_DATA20	Cr/ROUT[4]	Cb/BOUT[4]	Cr/ROUT[3]	Cb/BOUT[3]
DV_DATA19	Cr/ROUT[3]	Cb/BOUT[3]	Cr/ROUT[4]	Cb/BOUT[4]
DV_DATA18	Cr/ROUT[2]	Cb/BOUT[2]	Cr/ROUT[5]	Cb/BOUT[5]
DV_DATA17	Cr/ROUT[1]	Cb/BOUT[1]	Cr/ROUT[6]	Cb/BOUT[6]
DV_DATA16	Cr/ROUT[0]	Cb/BOUT[0]	Cr/ROUT[7]	Cb/BOUT[7]
DV_DATA15	Y/GOUT[7]	Y/GOUT[7]	Y/GOUT[0]	Y/GOUT[0]
DV_DATA14	Y/GOUT[6]	Y/GOUT[6]	Y/GOUT[1]	Y/GOUT[1]
DV_DATA13	Y/GOUT[5]	Y/GOUT[5]	Y/GOUT[2]	Y/GOUT[2]
DV_DATA12	Y/GOUT[4]	Y/GOUT[4]	Y/GOUT[3]	Y/GOUT[3]
DV_DATA11	Y/GOUT[3]	Y/GOUT[3]	Y/GOUT[4]	Y/GOUT[4]
DV_DATA10	Y/GOUT[2]	Y/GOUT[2]	Y/GOUT[5]	Y/GOUT[5]
DV_DATA9	Y/GOUT[1]	Y/GOUT[1]	Y/GOUT[6]	Y/GOUT[6]
DV_DATA8	Y/GOUT[0]	Y/GOUT[0]	Y/GOUT[7]	Y/GOUT[7]
DV_DATA7	Cb/BOUT[7]	Cr/ROUT[7]	Cb/BOUT[0]	Cr/ROUT[0]
DV_DATA6	Cb/BOUT[6]	Cr/ROUT[6]	Cb/BOUT[1]	Cr/ROUT[1]
DV_DATA5	Cb/BOUT[5]	Cr/ROUT[5]	Cb/BOUT[2]	Cr/ROUT[2]
DV_DATA4	Cb/BOUT[4]	Cr/ROUT[4]	Cb/BOUT[3]	Cr/ROUT[3]
DV_DATA3	Cb/BOUT[3]	Cr/ROUT[3]	Cb/BOUT[4]	Cr/ROUT[4]
DV_DATA2	Cb/BOUT[2]	Cr/ROUT[2]	Cb/BOUT[5]	Cr/ROUT[5]
DV_DATA1	Cb/BOUT[1]	Cr/ROUT[1]	Cb/BOUT[6]	Cr/ROUT[6]
DV_DATA0	Cb/BOUT[0]	Cr/ROUT[0]	Cb/BOUT[7]	Cr/ROUT[7]

(2) RGB666 Input

When the external input is of RGB666 format, the video image signal pins DV_DATA are allocated to the internal signals GOUT, BOUT, ROUT as shown in Table 30.7.

The internal signals GOUT, BOUT, ROUT to which the video image signal pins DV_DATA are allocated are output as a 24-bit video image from the RGB666 interface with the following formulae.

G[7:0] = GOUT[7:2] × 255 ÷ 63

B[7:0] = BOUT[7:2] × 255 ÷ 63

R[7:0] = ROUT[7:2] × 255 ÷ 63

Table 30.7 Bit Allocation of DV_DATA Pin Inputs When the External Input is of RGB666

INP_FORMAT[2:0]	**1**	**1**	**1**	**1**
INP_ENDIAN_ON	**0**	**0**	**1**	**1**
INP_SWAP_ON	**0**	**1**	**0**	**1**
DV_DATA17	ROUT[7]	BOUT[7]	ROUT[2]	BOUT[2]
DV_DATA16	ROUT[6]	BOUT[6]	ROUT[3]	BOUT[3]
DV_DATA15	ROUT[5]	BOUT[5]	ROUT[4]	BOUT[4]
DV_DATA14	ROUT[4]	BOUT[4]	ROUT[5]	BOUT[5]
DV_DATA13	ROUT[3]	BOUT[3]	ROUT[6]	BOUT[6]
DV_DATA12	ROUT[2]	BOUT[2]	ROUT[7]	BOUT[7]
DV_DATA11	GOUT[7]	GOUT[7]	GOUT[2]	GOUT[2]
DV_DATA10	GOUT[6]	GOUT[6]	GOUT[3]	GOUT[3]
DV_DATA9	GOUT[5]	GOUT[5]	GOUT[4]	GOUT[4]
DV_DATA8	GOUT[4]	GOUT[4]	GOUT[5]	GOUT[5]
DV_DATA7	GOUT[3]	GOUT[3]	GOUT[6]	GOUT[6]
DV_DATA6	GOUT[2]	GOUT[2]	GOUT[7]	GOUT[7]
DV_DATA5	BOUT[7]	ROUT[7]	BOUT[2]	ROUT[2]
DV_DATA4	BOUT[6]	ROUT[6]	BOUT[3]	ROUT[3]
DV_DATA3	BOUT[5]	ROUT[5]	BOUT[4]	ROUT[4]
DV_DATA2	BOUT[4]	ROUT[4]	BOUT[5]	ROUT[5]
DV_DATA1	BOUT[3]	ROUT[3]	BOUT[6]	ROUT[6]
DV_DATA0	BOUT[2]	ROUT[2]	BOUT[7]	ROUT[7]

(3) RGB565 Input

When the external input is of RGB565 format, the video image signal pins DV_DATA are allocated to the internal signals GOUT, BOUT, ROUT as shown in Table 30.8.

The internal signals GOUT, BOUT, ROUT to which the video image signal pins DV_DATA are allocated are output as a 24-bit video image from the RGB565 interface with the following formulae.

G[7:0] = GOUT[7:2] × 255 ÷ 63

B[7:0] = BOUT[7:3] × 255 ÷ 31

R[7:0] = ROUT[7:3] × 255 ÷ 31

Table 30.8 Bit Allocation of DV_DATA Pin Inputs When the External Input is of RGB565

INP_FORMAT[2:0]	**2**	**2**	**2**	**2**
INP_ENDIAN_ON	**0**	**0**	**1**	**1**

DV_DATA4	BOUT[7]	ROUT[7]	BOUT[3]	ROUT[3]
DV_DATA3	BOUT[6]	ROUT[6]	BOUT[4]	ROUT[4]
DV_DATA2	BOUT[5]	ROUT[5]	BOUT[5]	ROUT[5]
DV_DATA1	BOUT[4]	ROUT[4]	BOUT[6]	ROUT[6]
DV_DATA0	BOUT[3]	ROUT[3]	BOUT[7]	ROUT[7]

(4) BT656/BT601 Input

When the external input is of BT656 or BT601 format, the video image signal pins DV_DATA are allocated to the internal signal BTOUT, as shown in Table 30.9.

The internal signal BTOUT to which the video image signal pins DV_DATA are allocated is expanded to the YCbCr signal.

For expansion to the YCbCr signal, see section 30.1.12, BT656/BT601/YCbCr422 Format Setting.

Table 30.9 Bit Allocation of DV_DATA Pin Inputs When the External Input is of BT656 or BT601

INP_FORMAT[2:0]	3 to 4	3 to 4
INP_ENDIAN_ON	0	1
INP_SWAP_ON	0	0
DV_DATA7	BTOUT[7]	BTOUT[0]
DV_DATA6	BTOUT[6]	BTOUT[1]
DV_DATA5	BTOUT[5]	BTOUT[2]
DV_DATA4	BTOUT[4]	BTOUT[3]
DV_DATA3	BTOUT[3]	BTOUT[4]
DV_DATA2	BTOUT[2]	BTOUT[5]
DV_DATA1	BTOUT[1]	BTOUT[6]
DV_DATA0	BTOUT[0]	BTOUT[7]

(5) YCbCr422 Input

When the external input is of YCbCr422 format, the video image signal pins DV_DATA are allocated to the internal signals Y and Cb/Cr, as shown in Table 30.10.

Table 30.10 Bit Allocation of DV_DATA Pin Inputs When the External Input is of YCbCr422

INP_FORMAT[2:0]	5	5	5	5
INP_ENDIAN_ON	0	0	1	1
INP_SWAP_ON	0	1	0	1
DV_DATA15	Y[7]	Cb/Cr[7]	Y[0]	Cb/Cr[0]

Figure 30.10 SAV/EAV Code in BT656 Format (525 Lines/59.94 Hz)

30.1.11 BT656 Progressive Format

This product can be connected with devices which output data in the BT656 progressive format. Because the standard for the BT656 format does not include description of output in the progressive format, there is no guarantee that this product is connected with devices which output data in the progressive format. The following description shows how to generate a vertical/horizontal synchronization signal by decoding the SAV/EAV code input via the BT656 interface of this module. Confirm the connection with devises which output data in the BT656 progressive format in accordance with this section.

(1) SAV/EAV Code

The SAV/EAV code consists of four words. When the first word is set to FF and the second and third words are set to 00, timing signals are generated by decoding the value of the fourth word (XY).

For bit information, see Table 30.12 in section 30.1.10, SAV/EAV Code in BT656 Format. This product does not refer to the parity bits (P3 to P0).

(2) Vertical/Horizontal Synchronization Signal

Based on the SAV/EAV code, the vertical/horizontal synchronization signal is generated.

(a) Vertical Synchronization Signal

The vertical synchronization signal is output when the value of the V bit is changed from 0 to 1 in the BT656 format. The timing of the output varies with the setting of INP_EXT_SYNC_CNT.INP_F525_625 setting and the value of the F bit in the BT656 format.

Table 30.14 lists the timing.

Table 30.14 Timing of Delay for Output of Vertical Synchronization Signal

INP_EXT_SYNC_CNT. INP_F525_625	F Bit in BT656 Format	Output Timing	Remark
0: 525 lines	0 (Field 1)	2.5 lines after setting of V bit to 1 is detected	525 lines, vertical synchronization signal for field 2
	1 (Field 2)	3 lines after setting of V bit to 1 is detected	525 lines, vertical synchronization signal for field 1
1: 625 lines	0 (Field 1)	2.5 lines after setting of V bit	625 lines, vertical synchronization signal for field 2
	1 (Field 2)	2 lines after setting of V bit to 1 is detected	625 lines, vertical synchronization signal for field 1

(b) Horizontal Synchronization Signal

Based on the setting of the INP_EXT_SYNC_CNT.INP_H_EDGE_SEL bit, the horizontal synchronization signal is output.

(c) Timing Example of 525-Line Interface Input in BT656 Format

Figure 30.11 and Figure 30.12 show examples of the timing of vertical/horizontal synchronization signal extracted from 525-line interlaced input in the BT656 format.

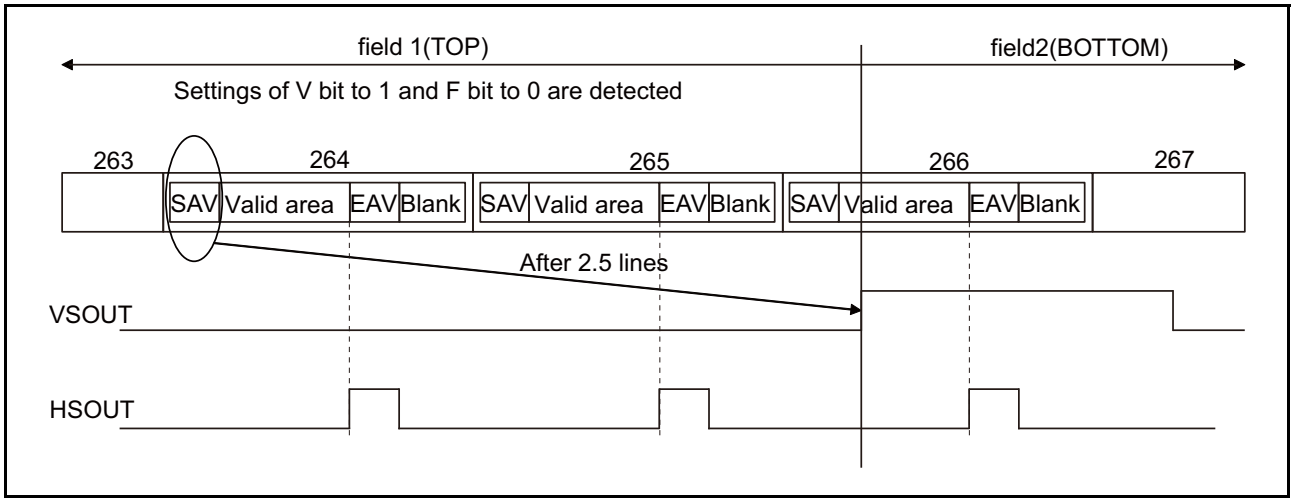

Figure 30.11 Timing of Vertical/Horizontal Synchronization Signal from 525-Line Interlaced Input in BT656 Format (Top to Bottom)

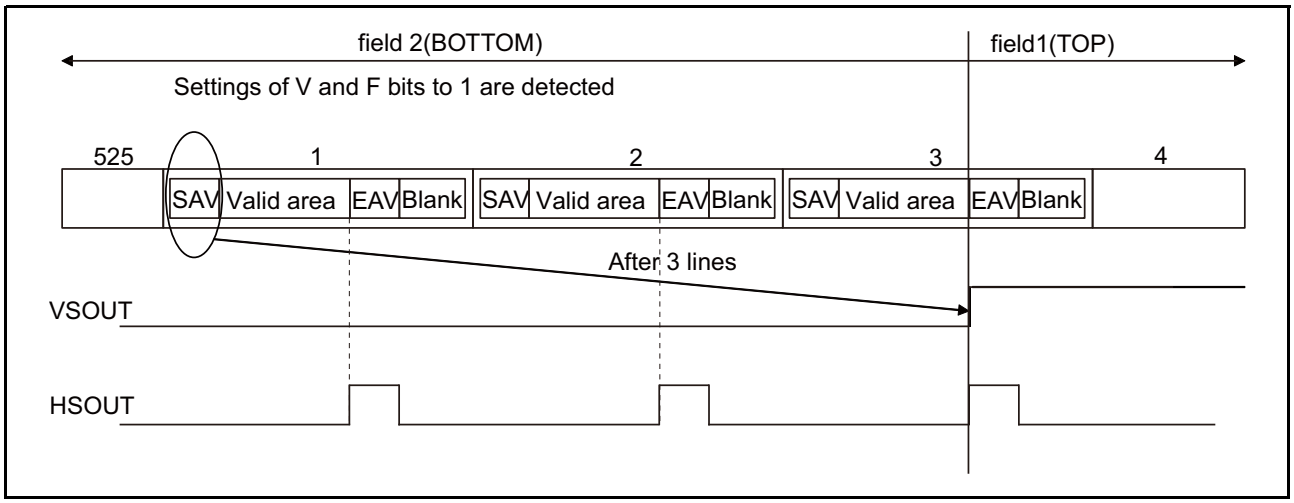

Figure 30.12 Timing of Vertical/Horizontal Synchronization Signal from 525-Line Interlaced Input in BT656 Format (Bottom to Top)

(3) Example of Timing for Progressive Input in BT656 Format

Figure 30.13 shows an example of the SAV/EAV code in 525-line progressive input in the BT656 format. Figure 30.14 shows the vertical/horizontal synchronization signal extracted from 525-line progressive input in the BT656 format. The field is detected as field 1 in this example, because the value of the F bit is set to 0 when that of the V bit is changed from 0 to 1. The filed is regarded as the bottom field. The vertical synchronization signal is output 2.5 lines after the detection of the SAV code.

		One Horizontal Period																
		EAV				H blank	SAV				Valid area							
		1	2	3	4		273	274	275	276	277	278	279	280	...	1713	1714	1715	1716

Figure 30.13 SAV/EAV Code in BT656 Progressive Format (525 Lines, 59.94 Hz)

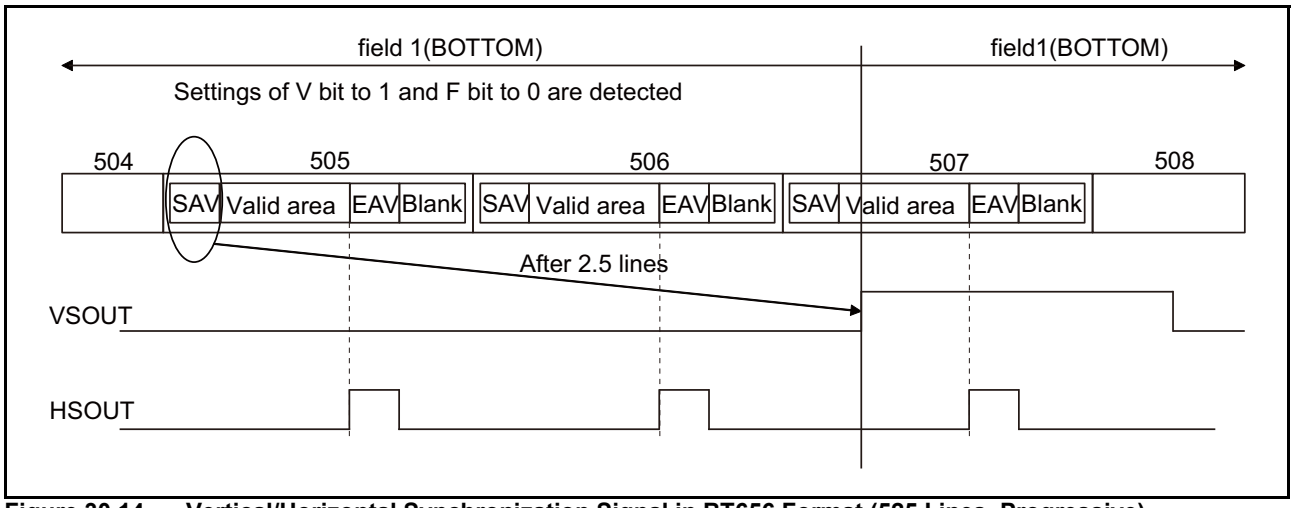

Figure 30.14 Vertical/Horizontal Synchronization Signal in BT656 Format (525 Lines, Progressive)

30.1.12 BT656/BT601/YCbCr422 Format Setting

The BT656 format can be used for the 525-line and 59.94-Hz or the 625-line and 50.00-Hz interlace signal format and progressive signal format (extended).

The BT601 format can be used for the 525-line and 59.94-Hz or the 625-line and 50.00-Hz interlace signal format and progressive signal format (extended).

The YCbCr422 format can be used for the 525-line and 59.94-Hz or the 625-line and 50.00-Hz interlace signal format in the 16-bit data-bus format of the BT601 standard.

The Vsync signal timing for the 525-line BT656 format and 625-line BT656 format are different.

The operating mode is set by the INP_F525_625 bit.

Table 30.15 Operating Mode Setting for BT656 Format

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_F525_625	0	Number of Lines for BT656 Input of External Input System 0: 525 lines 1: 625 lines

When the interlace signals are to be input in BT656/BT601/YCbCr422 format, half of 2fH phase timings of the Vsync signal and the Hsync signal are set with the INP_FH50[9:0] bits.

The INP_FH50[9:0] bits are also used for the vertical synchronous phase adjustment block. Therefore, for bit description, see Table 30.20.

When the external input is of BT656 format, the reference point of the Hsync signal is set with the INP_H_EDGE_SEL bit.

Table 30.16 Hsync Signal Reference Selection for BT656 Format

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_H_EDGE_SEL	0	Hsync Signal Reference Select for BT656 Format of External Input System 0: EAV 1: SAV

When the external input is of BT656/BT601 format, the internal signal BTOUT[7:0], which is input from the DV_DATA pins and allocated, is expanded to the 24-bit YCbCr signal.

Expansion timing with respect to the Hsync signal reference is set with the INP_H_POS[1:0] bits.

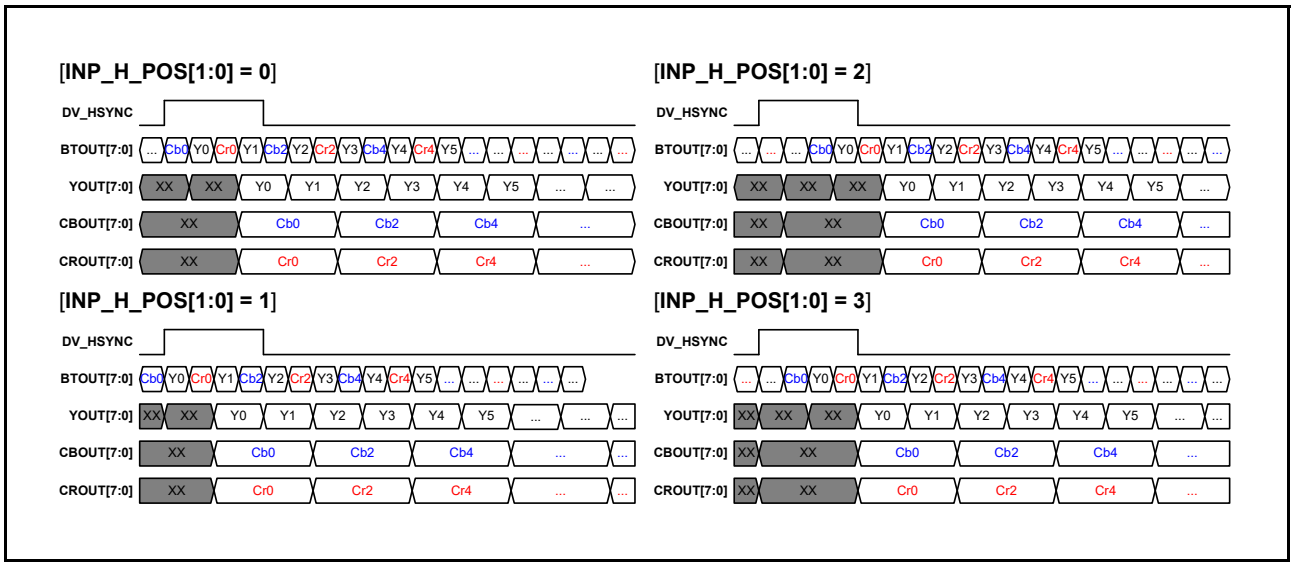

Figure 30.15 YCbCr Data Expansion for BT656/BT601 Input

Table 30.17 Data String Start Timing Selection for BT656/BT601 Input

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	0	Y/Cb/Y/Cr Data String Start Timing with respect to Hsync Reference 0: Cb/Y/Cr/Y 1: Y/Cr/Y/Cb 2: Cr/Y/Cb/Y 3: Y/Cb/Y/Cr

When the external input is in YCbCr422 format, the input from the DV_DATA pins is allocated to the internal Y[7:0] and CbCr[7:0] signals, and the CbCr[7:0] are expanded to a 16-bit signal.

Expansion timing with respect to the Hsync signal reference is set with the INP_H_POS[1:0] bits.

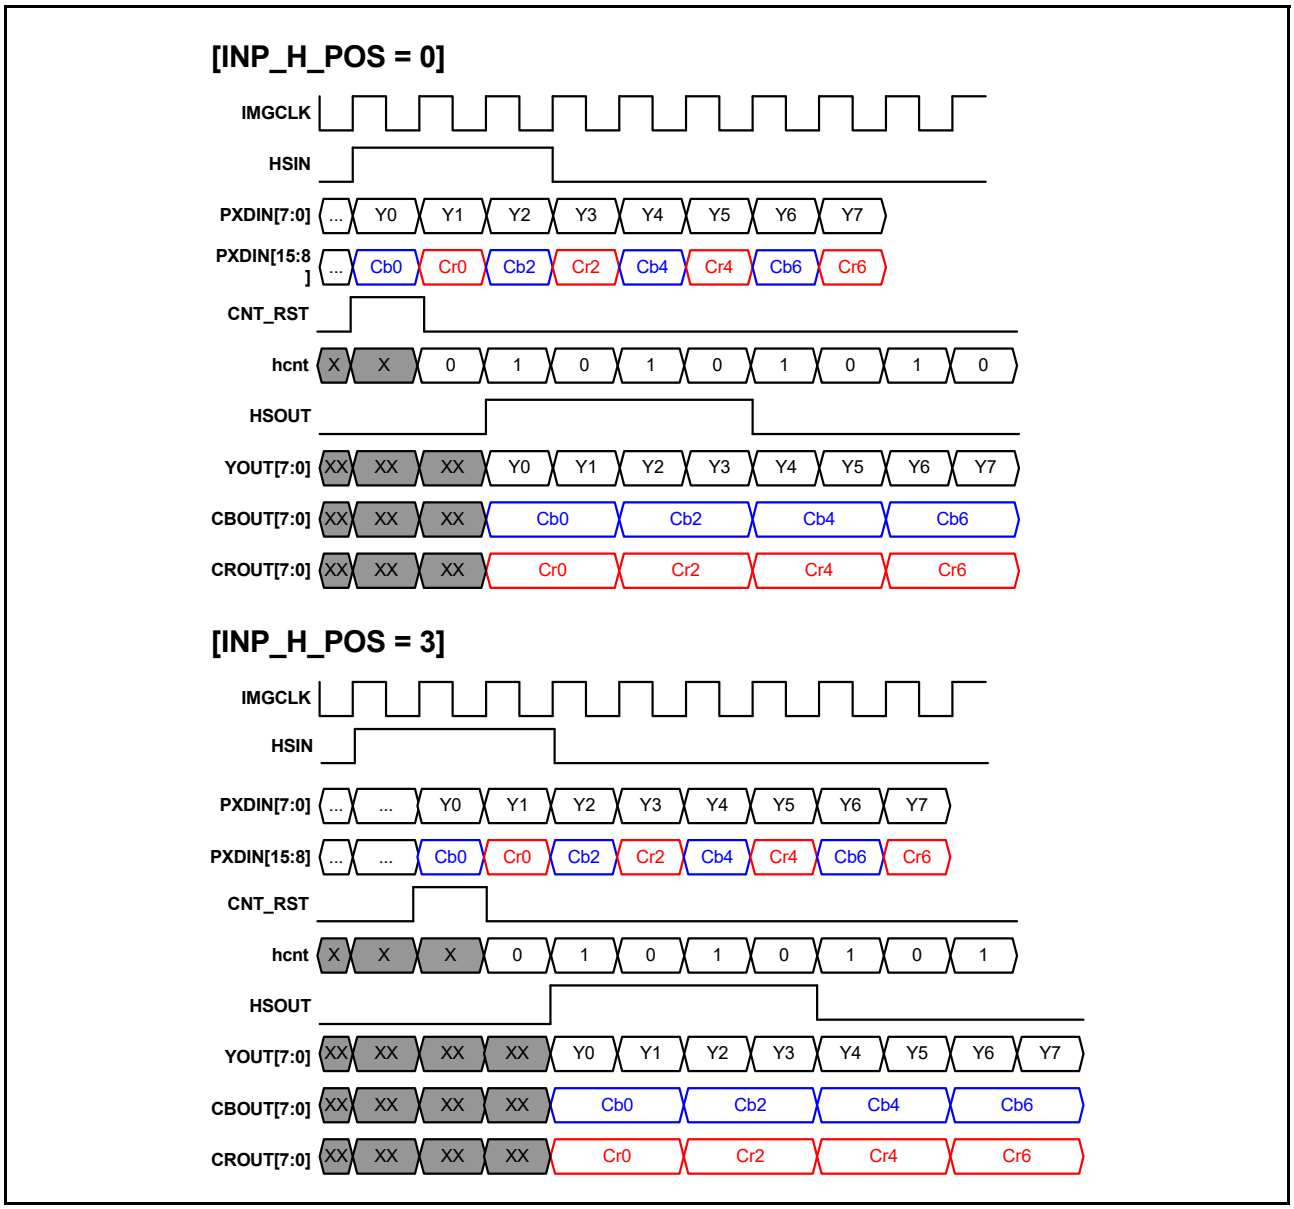

Figure 30.16 YCbCr Data Expansion for YCbCr422 Input

Table 30.18 Data String Start Timing Selection for YCbCr422 Input

Register Name	Bit Name	Initial Value	Description
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	0	Cb/Cr Data String Start Timing with respect to Hsync Reference 0: Cb/Cr 3: Cr/Cb 1, 2: Setting prohibited

30.1.13 YCbCr444/RBG888/666/565 Input Timing

The YCbCr444/RGB888/666/565 format can be used for the progressive YCbCr/RGB signal.

The sync signal width (H_SYNC, V_SYNC), sync signal polarity (H_POL, V_POL), valid period start position (H_BP, V_BP), valid period end position (H_FP, V_FP), and valid period video width (H_ACTIVE, V_ACTIVE) are shown in Table 30.19.

Table 30.19 YCbCr/RGB Signal Reception Timing

Item	Description
External input clock	Maximum external input clock frequency: 87.00 MHz
Vsync signal width (V_SYNC)	Minimum Vsync signal width: 1 CLK
Vsync signal polarity (V_POL)	Positive or negative polarity is selected by the relevant registers.
Vertical valid period start position (V_BP)	From Vsync reference to the head of the video image: 5 lines or more
Vertical valid period video width (V_ACTIVE)	Maximum vertical valid period: 1024 lines
Vertical valid period end position (V_FP)	From the end of the video image to the Vsync reference: 4 lines or more Note 1.
Hsync signal width (H_SYNC)	Minimum Hsync signal width: 1 CLK
Hsync signal polarity (H_POL)	Positive or negative polarity is selected by the relevant registers.
Horizontal valid period start position (H_BP)	From Hsync reference to the head of the video image: 16 CLK or more
Horizontal valid period video width (H_ACTIVE)	Maximum horizontal valid period: 1440 pixels
Horizontal valid period end position (H_FP)	From the end of the video image to the Hsync reference: 16 CLK or more Note 2.
Number of vertical lines (V_BP+V_ACTIVE+V_FP)	Between vertical synchronization signals: 2047 lines or less
Number of horizontal pixels (H_BP+H_ACTIVE+H_FP)	Between horizontal synchronization signals: 2047 CLK or less

Note 1. When V_FP is below four lines, the setting of INP_DLY_ADJ.INP_VS_DLY_L[2:0] should be adjusted so that V_FP is at least four lines.

Note 2. When H_FP is below 16 cycles, the settings of INP_DLY_ADJ.INP_VS_DLY[7:0], INP_HS_DLY[7:0], and INP_FLD_DLY[7:0] should be adjusted so that H_FP is at least 16 cycles of the pixel clock.

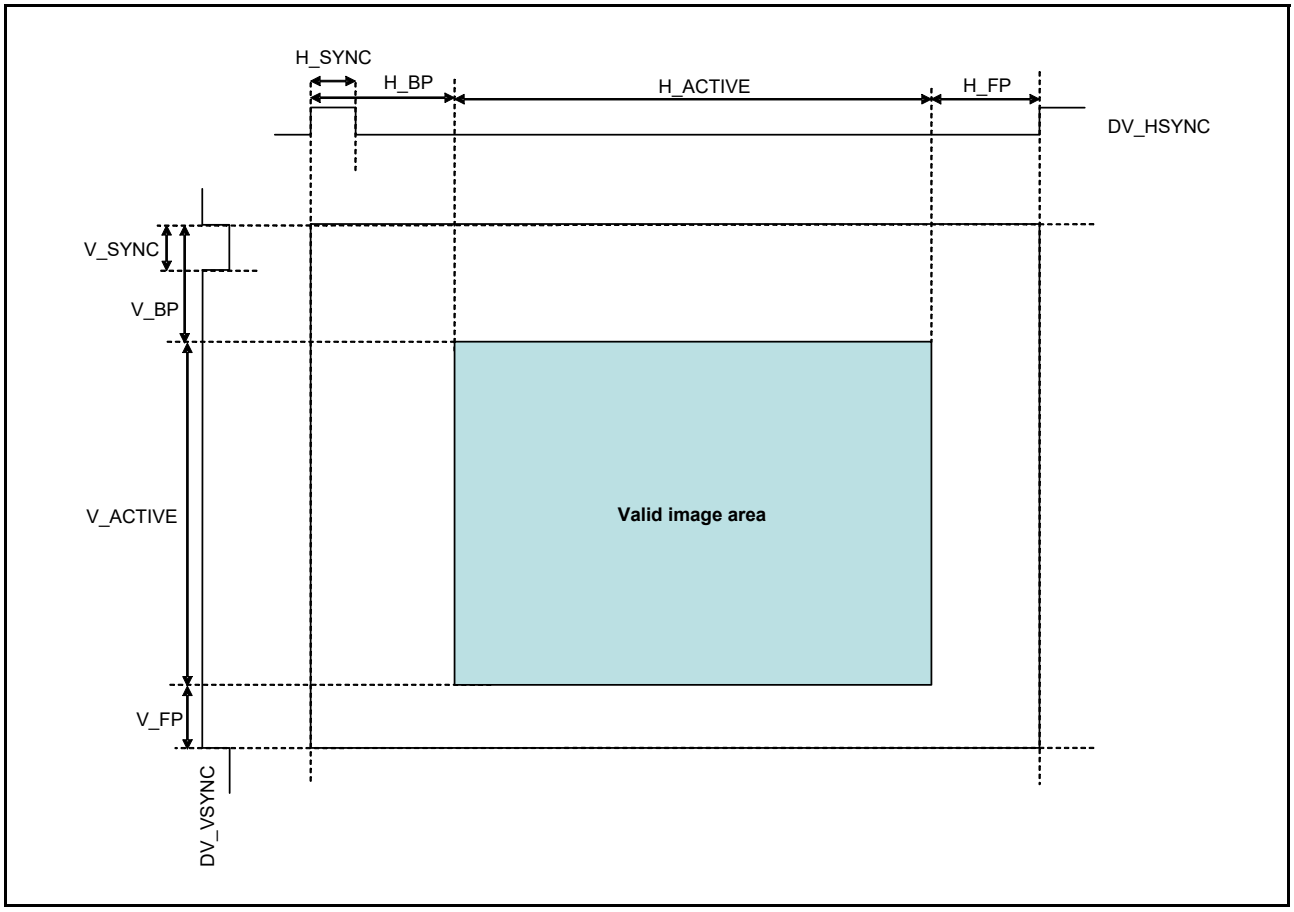

Figure 30.17 YCbCr/RGB Signal Reception Timing

30.1.14 Field Differentiation and Vsync Signal Phase Adjustment

The phase of the input Vsync signal and Hsync signal is detected and the field of the interlace signal is determined. When the reference point of the Vsync signal is detected within ±0.5 horizontal period with respect to the Hsync signal, it is determined as the interlace top field. When the reference point of the Vsync signal is detected outside ±0.5 horizontal period with respect to the Hsync signal, it is determined as the interlace bottom field.

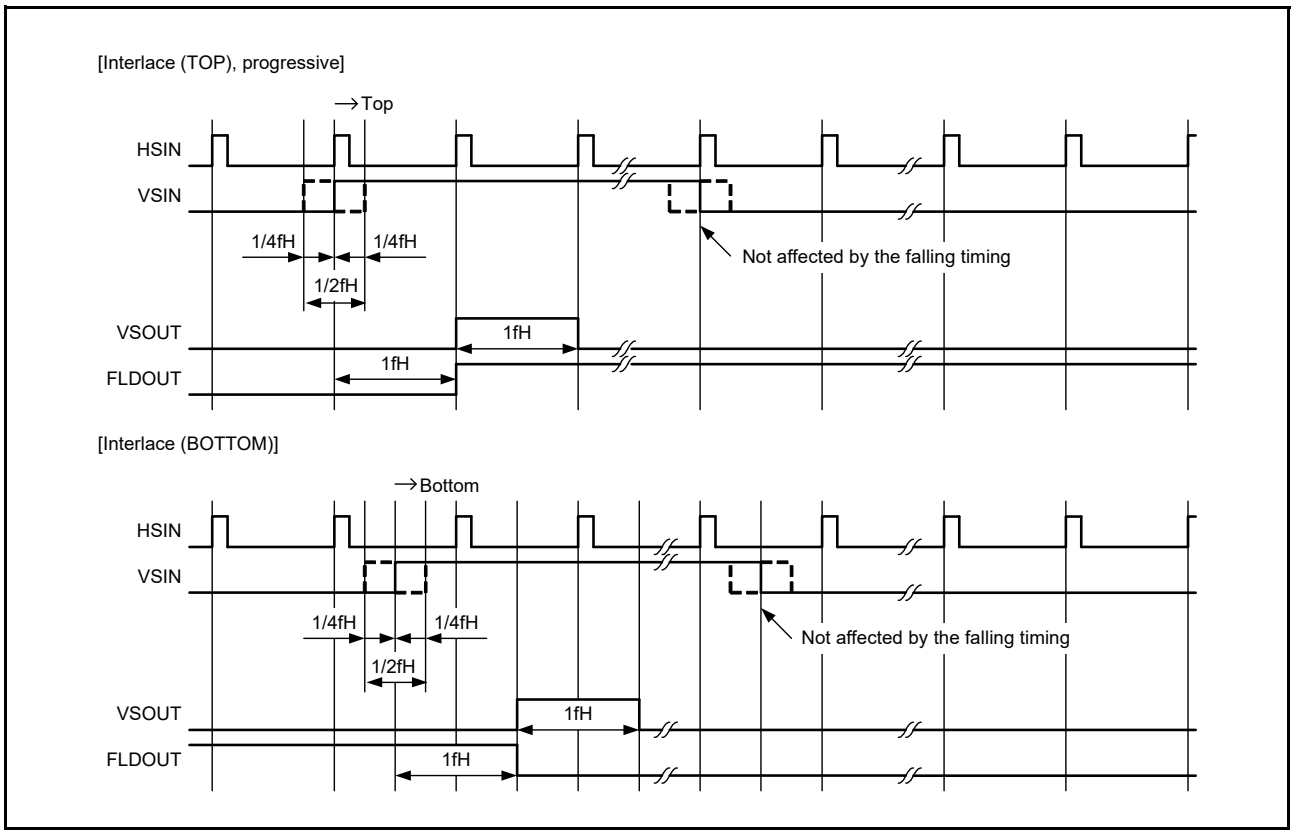

Figure 30.18 Vsync Signal Phase Adjustment

The timings of 1/2fH Vsync signal phase and 1/4fH Vsync signal phase are set with INP_FH50[9:0] and INP_FH25[9:0], respectively.

Table 30.20 Vsync Signal Phase Timing Setting

Register Name	Bit Name	Initial Value	Description
INP_VSYNC_PH_ADJ	INP_FH50[9:0]	858	Vsync Signal 1/2fH Phase Timing Should be 1/2 the horizontal cycle.
INP_VSYNC_PH_ADJ	INP_FH25[9:0]	429	Vsync Signal 1/4fH Phase Timing Should be 1/4 the horizontal cycle.

30.1.15 Vsync Signal Delay Adjustment in Line Units

The Vsync signal line delay adjust block can delay the Vsync signal and the field differentiation signal in line units.

When a video signal with a short vertical front porch is input, the vertical front porch is adjusted.

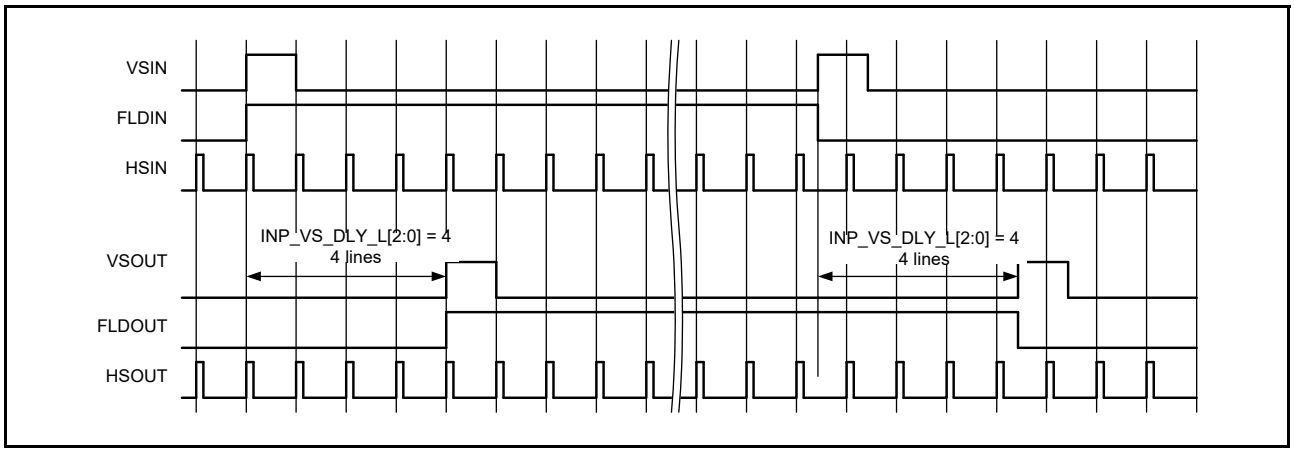

Figure 30.19 Timing of Vsync Signal Delay in Line Units

Table 30.21 Adjustment of Vsync Signal Delay in Line Units

Register Name	Bit Name	Initial Value	Description
INP_DLY_ADJ	INP_VS_DLY_L[2:0]	0	Number of Lines for Delaying Vsync Signal and Field Differentiation Signal Delay amount: 0 to 7 (lines)

30.1.16 Sync Signal Delay Adjustment

Delay can be adjusted independently for the Vsync signal, Hsync signal, and field differentiation signal in the units of clock.

Lacking margin of the horizontal front porch is adjusted according to the input synchronization disturbance.

Table 30.22 Sync Signal Delay Adjustment

Register Name	Bit Name	Initial Value	Description
INP_DLY_ADJ	INP_VS_DLY[7:0]	0	Vsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
INP_DLY_ADJ	INP_HS_DLY[7:0]	0	Hsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
INP_DLY_ADJ	INP_FLD_DLY[7:0]	0	Field Differentiation Signal Delay Amount Delay amount: 0 to 254 (clock cycles)

30.1.17 Horizontal Noise Reduction

Noise can be reduced according to horizontal pixel reference.

Noise reduction is controlled through noise component frequency band (TAP), noise level (threshold), and noise reduction intensity (gain).

(1) Frequency Band (TAP) Setting for Noise Component

The noise frequency band can be selected independently from the following four types by using the NR1D_Y_TAP[1:0], NR1D_CB_TAP[1:0], and NR1D_CR_TAP[1:0] bits.

When the number of adjacent pixels is one (noise reduction NR1D_Y/CB/CR_TAP is 0):

$$BPF_{(1)} = \frac{1}{4}\left(-1\times Z_{(-1)}, 2\times Z_{(0)}, -1\times Z_{(+1)}\right)$$

When the number of adjacent pixels is two (noise reduction NR1D_Y/CB/CR_TAP is 1):

$$BPF_{(2)} = \frac{1}{4}\left(-1\times Z_{(-2)}, 2\times Z_{(0)}, -1\times Z_{(+2)}\right)$$

When the number of adjacent pixels is three (noise reduction NR1D_Y/CB/CR_TAP is 2):

$$BPF_{(3)} = \frac{1}{4}\left(-1\times Z_{(-3)}, 2\times Z_{(0)}, -1\times Z_{(+3)}\right)$$

When the number of adjacent pixels is four (noise reduction NR1D_Y/CB/CR_TAP is 3):

$$BPF_{(4)} = \frac{1}{4}\left(-1\times Z_{(-4)}, 2\times Z_{(0)}, -1\times Z_{(+4)}\right)$$

Note: $Z_{(0)}$ indicates the target pixel for noise reduction and $Z_{(N)}$ indicates the pixel that is n pixels off from $Z_{(0)}$ In the horizontal direction.

(2) Setting Noise Level (Threshold)

The absolute value of the detected noise amount (BPF output value) is compared with the values of the NR1D_Y_TH[6:0], NR1D_CB_TH[6:0], and NR1D_CR_TH[6:0] bits. When the detected noise amount is greater than NR1D_Y/CB/CR_TH, the absolute value of the detected noise amount is considered as NR1D_Y/CB/CR_TH (fixed value).

ABS($BPF_{(n)}$) ≤ absolute value of detected noise amount when ABS($BPF_{(n)}$) ≤ NR1D_Y/CB/CR_TH: NOISE_ABS = ABS($BPF_{(n)}$)

ABS($BPF_{(n)}$) > absolute value of detected noise amount when ABS($BPF_{(n)}$) > NR1D_Y/CB/CR_TH: NOISE_ABS = NR1D_Y/CB/CR_TH

(3) Setting Noise Reduction Intensity (Gain)

The absolute value of the detected noise amount is multiplied by the value of gain specified by the NR1D_Y_GAIN[1:0], NR1D_CB_GAIN[1:0], and NR1D_CR_GAIN[1:0] bits, and the feedback is calculated for the original signal.

Computation when the amount of detected noise ($BPF_{(n)}$) is negative (−): DOUT = DIN + NOISE_ABS ÷ $2^{(NR1D\_Y/CB/CR\_GAIN+1)}$

Computation when the amount of detected noise ($BPF_{(n)}$) is positive (+): DOUT = DIN – NOISE_ABS ÷ $2^{(NR1D\_Y/CB/CR\_GAIN+1)}$

Table 30.23 Horizontal Noise Reduction

Register Name	Bit Name	Initial Value	Description
IMGCNT_NR_CNT0	NR1D_MD	1	Horizontal Noise Reduction Operating Mode 0: R/G/B mode 1: Y/Cb/Cr mode

IMGCNT_NR_CNT0	NR1D_Y_TAP[1:0]	0	Y/G Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
IMGCNT_NR_CNT0	NR1D_Y_TH[6:0]	8	Maximum Value (Absolute Value) of Y/G Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_Y_TH. Unsigned: 0 to 127 [LSB]
IMGCNT_NR_CNT0	NR1D_Y_GAIN[1:0]	3	Noise Reduction Gain Adjustment of Y/G Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16
IMGCNT_NR_CNT1	NR1D_CB_TAP[1:0]	0	Cb/B Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
IMGCNT_NR_CNT1	NR1D_CB_TH[6:0]	8	Maximum Value (Absolute Value) of Cb/B Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_C_TH. Unsigned: 0 to 127 [LSB]
IMGCNT_NR_CNT1	NR1D_CB_GAIN[1:0]	3	Noise Reduction Gain Adjustment of Cb/B Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16
IMGCNT_NR_CNT1	NR1D_CR_TAP[1:0]	0	Cr/R Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
IMGCNT_NR_CNT1	NR1D_CR_TH[6:0]	8	Maximum Value (Absolute Value) of Cr/R Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_C_TH. Unsigned: 0 to 127 [LSB]
IMGCNT_NR_CNT1	NR1D_CR_GAIN[1:0]	3	Noise Reduction Gain Adjustment of Cr/R Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16

30.1.18 Color Matrix

By using a color matrix, input signal offsets and nine-axis gain can be adjusted. This enables brightness adjustment, gain adjustment, and YCbCr and GBR mutual conversion.

(1) GBR to GBR Conversion

YGIN_A = YGIN + IMGCNT_MTX_YG – 128

CBBIN_A = CBBIN + IMGCNT_MTX_B – 128

CRRIN_A = CRRIN + IMGCNT_MTX_R – 128

YGOUT = (IMGCNT_MTX_GG×YGIN_A + IMGCNT_MTX_GB×CBBIN_A + IMGCNT_MTX_GR×CRRIN_A) ÷ 256

CBBOUT = (IMGCNT_MTX_BG×YGIN_A + IMGCNT_MTX_BB×CBBIN_A + IMGCNT_MTX_BR×CRRIN_A) ÷ 256

CRROUT = (IMGCNT_MTX_RG×YGIN_A + IMGCNT_MTX_RB×CBBIN_A + IMGCNT_MTX_RR×CRRIN_A) ÷ 256

(2) GBR to YCbCr Conversion

YGIN_A = YGIN + IMGCNT_MTX_YG – 128

CBBIN_A = CBBIN + IMGCNT_MTX_B – 128

CRRIN_A = CRRIN + IMGCNT_MTX_R – 128

YGOUT = (IMGCNT_MTX_GG×YGIN_A + IMGCNT_MTX_GB×CBBIN_A + IMGCNT_MTX_GR×CRRIN_A) ÷ 256

CBBOUT = (IMGCNT_MTX_BG×YGIN_A + IMGCNT_MTX_BB×CBBIN_A + IMGCNT_MTX_BR×CRRIN_A) ÷ 256 + 128

CRROUT = (IMGCNT_MTX_RG×YGIN_A + IMGCNT_MTX_RB×CBBIN_A + IMGCNT_MTX_RR×CRRIN_A) ÷ 256 + 128

Table 30.24 Matrix Coefficient (Typical Value) for SMPTE 293M

	YGIN		CBBIN		CRRIN	
	Coefficient	**Set Value**	**Coefficient**	**Set Value**	**Coefficient**	**Set Value**

30.2 Register Descriptions

Table 30.27 and Table 30.28 show register Configuration.

- Symbols used in Register Description:

Initial value: Register value after a power-on reset
—: Undefined value
R/W: Readable/writable. The written value can be read.
R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.
R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
R: Read-only. The write value should always be 0.
—/W: Write-only. The read value is undefined.

Table 30.27 Register Configuration of Input Controller (Channel 0)

Name	Abbreviation	R/W	Initial Value	Address	Access Size
External input block register update control register	INP_UPDATE	R/WC1	H'0000 0000	H'FCFF 7400	32
Input select control register	INP_SEL_CNT	R/W	H'0000 0000	H'FCFF 7404	32
External input sync signal control register	INP_EXT_SYNC_CNT	R/W	H'0000 0000	H'FCFF 7408	32
Vsync signal phase adjustment register	INP_VSYNC_PH_ADJ	R/W	H'035A 01AD	H'FCFF 740C	32
Sync signal delay adjustment register	INP_DLY_ADJ	R/W	H'0000 0000	H'FCFF 7410	32

Table 30.28 Register Configuration of Image Quality Adjustment Block (Channel 0)

Name	Abbreviation	R/W	Initial Value	Address	Access Size
Image quality adjustment block register update control register	IMGCNT_UPDATE	R/WC1	H'0000 0000	H'FCFF 7480	32
NR control register 0	IMGCNT_NR_CNT0	R/W	H'0010 0803	H'FCFF 7484	32
NR control register 1	IMGCNT_NR_CNT1	R/W	H'0803 0803	H'FCFF 7488	32
Image quality adjustment block matrix mode register	IMGCNT_MTX_MODE	R/W	H'0000 0003	H'FCFF 74A0	32
Image quality adjustment block matrix YG adjustment register 0	IMGCNT_MTX_YG_ADJ0	R/W	H'0080 0100	H'FCFF 74A4	32
Image quality adjustment block matrix YG adjustment register 1	IMGCNT_MTX_YG_ADJ1	R/W	H'0000 0000	H'FCFF 74A8	32
Image quality adjustment block matrix CBB adjustment register 0	IMGCNT_MTX_CBB_ADJ0	R/W	H'0080 0000	H'FCFF 74AC	32
Image quality adjustment block matrix CBB adjustment register 1	IMGCNT_MTX_CBB_ADJ1	R/W	H'0100 0000	H'FCFF 74B0	32
Image quality adjustment block matrix CRR adjustment register 0	IMGCNT_MTX_CRR_ADJ0	R/W	H'0080 0000	H'FCFF 74B4	32
Image quality adjustment block matrix CRR adjustment register 1	IMGCNT_MTX_CRR_ADJ1	R/W	H'0000 0100	H'FCFF 74B8	32

30.2.1 External Input Block Register Update Control Register (INP_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	INP_EXT_UPDATE	—	—	—	INP_IMG_UPDATE
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INP_EXT_UPDATE	0	R/WC1	External Input Block Register Update 0: Registers are not updated. 1: Registers are updated.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INP_IMG_UPDATE	0	R/WC1	Sync Signal Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated.

30.2.2 Input Select Control Register (INP_SEL_CNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	INP_SEL	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	INP_FORMAT[2:0]			—	—	—	INP_PXD_EDGE	—	—	—	INP_VS_EDGE	—	—	—	INP_HS_EDGE
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	INP_SEL	0	R/W	Input Select 0: Input supplied via the external input pins is off. 1: Input supplied via the external input pins is on.
19 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14 to 12	INP_FORMAT [2:0]	0	R/W	External Input Format Select 0: YcbCr444, RGB888 1: RGB666 2: RGB565 3: BT656 4: BT601 5: YCbCr422 6, 7: Setting prohibited
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	INP_PXD_EDGE	0	R/W	Clock Edge Select for Capturing External Input Video Image Signals DV_DATA23 to DV_DATA0 0: Rising edge 1: Falling edge
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INP_VS_EDGE	0	R/W	Clock Edge Select for Capturing External Input Vsync Signals DV_VSYNC 0: Rising edge 1: Falling edge
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INP_HS_EDGE	0	R/W	Clock Edge Select for Capturing External Input Hsync Signals DV_HSYNC 0: Rising edge 1: Falling edge

Note: INP_FORMAT, INP_PXD_EDGE, INP_VS_EDGE, and INP_HS_EDGE are updated when the INP_EXT_UPDATE bit in INP_UPDATE is 1. INP_SEL is updated when set.

30.2.3 External Input Sync Signal Control Register (INP_EXT_SYNC_CNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	INP_ENDIAN_ON	—	—	—	INP_SWAP_ON	—	—	—	INP_VS_INV	—	—	—	INP_HS_INV
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	INP_H_EDGE_SEL	—	—	—	INP_F525_625	—	—	INP_H_POS[1:0]	
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	INP_ENDIAN_ON	0	R/W	External Input Bit Endian Change On/Off Control 0: Off 1: On
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	INP_SWAP_ON	0	R/W	External Input B/R Signal Swap On/Off Control 0: Off 1: On
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	INP_VS_INV	0	R/W	External Input Vsync Signal DV_VSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	INP_HS_INV	0	R/W	External Input Hsync Signal DV_HSYNC Inversion Control 0: Not inverted (positive polarity) 1: Inverted (negative polarity)
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	INP_H_EDGE_SEL	0	R/W	Reference Select for External Input BT656 Hsync Signal 0: EAV 1: SAV
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INP_F525_625	0	R/W	Number of Lines for BT656 External Input 0: 525 lines 1: 625 lines
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	INP_H_POS[1:0]	0	R/W	Y/Cb/Y/Cr Data String Start Timing to Hsync Reference for BT656/601 or YCbCr422 External Input 0: Cb/Y/Cr/Y(BT656/601), Cb/Cr (YCbCr422) 1: Y/Cr/Y/Cb(BT656/601), setting prohibited (YCbCr422) 2: Cr/Y/Cb/Y(BT656/601), setting prohibited (YCbCr422) 3: Y/Cb/Y/Cr(BT656/601), Cr/Cb (YCbCr422)

Note: This register is updated when the INP_EXT_UPDATE bit in INP_UPDATE is 1.

30.2.4 Vsync Signal Phase Adjustment Register (INP_VSYNC_PH_ADJ)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	INP_FH50[9:0]									
Initial Value:	0	0	0	0	0	0	1	1	0	1	0	1	1	0	1	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	INP_FH25[9:0]									
Initial Value:	0	0	0	0	0	0	0	1	1	0	1	0	1	1	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	INP_FH50 [9:0]	858	R/W	Vsync Signal 1/2fH Phase Timing 1/2 clock cycle of the horizontal cycle should be set.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	INP_FH25 [9:0]	429	R/W	Vsync Signal 1/4fH Phase Timing 1/4 clock cycle of the horizontal cycle should be set.

Note: The INP_FH50[9:0] bits are updated when the INP_EXT_UPDATE and INP_IMG_UPDATE bits in INP_UPDATE are 1. The IMP_FH25[9:0] bits are updated when the INP_IMG_UPDATE bit is 1.

30.2.5 Sync Signal Delay Adjustment Register (INP_DLY_ADJ)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	INP_VS_DLY_L[2:0]			INP_FLD_DLY[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INP_VS_DLY[7:0]								INP_HS_DLY[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 24	INP_VS_ DLY_L[2:0]	0	R/W	Number of lines for Delaying Vsync signal and Field Differentiation Signal Delay amount: 0 to 7 (lines)
23 to 16	INP_FLD_ DLY[7:0]	0	R/W	Field Differentiation Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
15 to 8	INP_VS_ DLY[7:0]	0	R/W	Vsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)
7 to 0	INP_HS_ DLY[7:0]	0	R/W	Hsync Signal Delay Amount Delay amount: 0 to 254 (clock cycles)

Note: This register is updated when the INP_IMG_UPDATE bit in INP_UPDATE is 1.

30.2.6 Image Quality Adjustment Block Register Update Control Register (IMGCNT_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IMGCNT_VEN
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	IMGCNT_VEN	0	R/WC1	Image Quality Adjustment Block Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync signal.

30.2.7 NR Control Register 0 (IMGCNT_NR_CNT0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	NR1D_MD	—	—	—	NR1D_ON
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	NR1D_Y_TH[6:0]							—	—	NR1D_Y_TAP[1:0]		—	—	NR1D_Y_GAIN[1:0]	
Initial Value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	NR1D_MD	1	R/W	Horizontal Noise Reduction Operating Mode 0: G/B/R mode 1: Y/Cb/Cr mode
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	NR1D_ON	0	R/W	Noise Reduction On/Off Control 0: Noise reduction Off 1: Noise reduction On
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 8	NR1D_Y_TH[6:0]	8	R/W	Maximum Value (Absolute Value) of Y/G Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_Y_TH. Unsigned: 0 to 127 [LSB]
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	NR1D_Y_TAP[1:0]	0	R/W	Y/G Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	NR1D_Y_GAIN[1:0]	3	R/W	Noise Reduction Gain Adjustment of Y/G Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

30.2.8 NR Control Register 1 (IMGCNT_NR_CNT1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	NR1D_CB_TH[6:0]							—	—	NR1D_CB_TAP[1:0]		—	—	NR1D_CB_GAIN[1:0]	
Initial Value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	NR1D_CR_TH[6:0]							—	—	NR1D_CR_TAP[1:0]		—	—	NR1D_CR_GAIN[1:0]	
Initial Value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 24	NR1D_CB_TH[6:0]	8	R/W	Maximum Value (Absolute Value) of Cb/B Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_CB_TH. Unsigned: 0 to 127 [LSB]
23, 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21, 20	NR1D_CB_TAP[1:0]	0	R/W	Cb/B Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	NR1D_CB_GAIN[1:0]	3	R/W	Noise Reduction Gain Adjustment of Cb/B Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14 to 8	NR1D_CR_TH[6:0]	8	R/W	Maximum Value (Absolute Value) of Cr/R Signal Coring Coring is implemented when detected noise amount value ≤ NR1D_CR_TH. Unsigned: 0 to 127 [LSB]
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	NR1D_CR_TAP[1:0]	0	R/W	Cr/R Signal TAP Select 0: Adjacent pixel 1: 2 adjacent pixels 2: 3 adjacent pixels 3: 4 adjacent pixels
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	NR1D_CR_GAIN[1:0]	3	R/W	Noise Reduction Gain Adjustment of Cr/R Signal 0: 1/2 1: 1/4 2: 1/8 3: 1/16

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

30.2.9 Image Quality Adjustment Block Matrix Mode Register (IMGCNT_MTX_MODE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IMGCNT_MTX_MD[1:0]	
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	IMGCNT_MTX_MD[1:0]	3	R/W	Operating Mode 0: GBR → GBR 1: GBR → YCbCr 2: YCbCr → GBR 3: YCbCr → YCbCr

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

30.2.10 Image Quality Adjustment Block Matrix YG Adjustment Register 0 (IMGCNT_MTX_YG_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	IMGCNT_MTX_YG[7:0]							
Initial Value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	IMGCNT_MTX_GG[10:0]										
Initial Value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	IMGCNT_MTX_YG[7:0]	128	R/W	Offset (DC) Adjustment of Y/G Signal Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_MTX_GG[10:0]	256	R/W	Y/G Signal Gain Adjustment for Y/G Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

30.2.11 Image Quality Adjustment Block Matrix YG Adjustment Register 1 (IMGCNT_MTX_YG_ADJ1)

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	IMGCNT_ MTX_RB[10:0]	0	R/W	Cb/B Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	IMGCNT_ MTX_RR[10:0]	256	R/W	Cr/R Signal Gain Adjustment for Cr/R Signal Output Signed (two's complement) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when the IMGCNT_VEN bit in IMGCNT_UPDATE is 1.

30.3 Usage Methods

30.3.1 Input Format Adjustment Method

Setting examples of each input format are shown below.

Table 30.29 External Input (BT656, 525i) Setting Example

Register Name	Bit Name	Description	Setting Value
INP_SEL_CNT	INP_SEL	Performs the on/off control of input supplied via the external input pins.	1
INP_SEL_CNT	INP_FORMAT[2:0]	Selects the externally input format.	3
INP_SEL_CNT	INP_PXD_EDGE	Selects the clock edge for capturing the externally input video signals.	0
INP_SEL_CNT	INP_VS_EDGE	Selects the clock edge for capturing the externally input Vsync signals.	0
INP_SEL_CNT	INP_HS_EDGE	Selects the clock edge for capturing the externally input Hsync signals.	0
INP_EXT_SYNC_CNT	INP_ENDIAN_ON	Changes the bit endian of the external input.	0
INP_EXT_SYNC_CNT	INP_SWAP_ON	Enables or disables the B/R signal swap of the external input.	0
INP_EXT_SYNC_CNT	INP_HS_INV	Enables or disables the Hsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_VS_INV	Enables or disables the Hsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_H_EDGE_SEL	Selects the Hsync reference for BT656 input.	0
INP_EXT_SYNC_CNT	INP_F525_625	Sets the number of lines for BT656 input.	0
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	Sets the data start timing with respect to the Hsync in the BT656/601 format.	0
INP_VSYNC_PH_ADJ	INP_FH50[9:0]	Sets the 1/2fH phase in clock cycle units.	858
INP_VSYNC_PH_ADJ	INP_FH25[9:0]	Sets the 1/4fH phase in clock cycle units.	429
INP_DLY_ADJ	INP_VS_DLY_L[2:0]	Sets the number of lines for delaying the Vsync signal and field differentiation signal.	0
INP_DLY_ADJ	INP_VS_DLY[7:0]	Sets the amount of delay of the Vsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_HS_DLY[7:0]	Sets the amount of delay of the Hsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_FLD_DLY[7:0]	Sets the amount of delay of the field differentiation signal in clock units.	0

Note: Some registers require, after they are set, that the INP_EXT_UPDATE and INP_IMG_UPDATE bits in INP_UPDATE should be set to 1.

Table 30.30 External Input (BT601, 525i) Setting Example

Register Name	Bit Name	Description	Setting Value
INP_SEL_CNT	INP_SEL	Performs the on/off control of input supplied via the external input pins.	1
INP_SEL_CNT	INP_FORMAT[2:0]	Selects the externally input format.	4
INP_SEL_CNT	INP_PXD_EDGE	Selects the clock edge for capturing the externally input video signals.	0
INP_SEL_CNT	INP_VS_EDGE	Selects the clock edge for capturing the externally input Vsync signals.	0
INP_SEL_CNT	INP_HS_EDGE	Selects the clock edge for capturing the externally input Hsync signals.	0
INP_EXT_SYNC_CNT	INP_ENDIAN_ON	Changes the bit endian of the external input.	0
INP_EXT_SYNC_CNT	INP_SWAP_ON	Enables or disables the B/R signal swap of the external input.	0
INP_EXT_SYNC_CNT	INP_HS_INV	Enables or disables the Hsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_VS_INV	Enables or disables the Hsync signal inversion of the external input.	1
INP_EXT_SYNC_CNT	INP_H_EDGE_SEL	Selects the Hsync reference for BT656 input.	0
INP_EXT_SYNC_CNT	INP_F525_625	Sets the number of lines for BT656 input.	0
INP_EXT_SYNC_CNT	INP_H_POS[1:0]	Sets the data start timing with respect to the Hsync in the BT656/601 format.	0
INP_VSYNC_PH_ADJ	INP_FH50[9:0]	Sets the 1/2fH phase in clock cycle units.	858
INP_VSYNC_PH_ADJ	INP_FH25[9:0]	Sets the 1/4fH phase in clock cycle units.	429
INP_DLY_ADJ	INP_VS_DLY_L[2:0]	Sets the number of lines for delaying the Vsync signal and field differentiation signal.	0
INP_DLY_ADJ	INP_VS_DLY[7:0]	Sets the amount of delay of the Vsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_HS_DLY[7:0]	Sets the amount of delay of the Hsync signal in clock cycle units.	0
INP_DLY_ADJ	INP_FLD_DLY[7:0]	Sets the amount of delay of the field differentiation signal in clock units.	0

Note: Some registers require, after they are set, that the INP_EXT_UPDATE and INP_IMG_UPDATE bits in INP_UPDATE should be set to 1.

30.3.2 Usage Method of Conversion Color Matrix

Typical data conversion setting examples are shown below.

Table 30.31 Conversion Color Matrix

Register Name	Bit Name	GBR to GBR	GBR to YCbCr	YCbCr to GBR	YCbCr to YCbCr
IMGCNT_MTX_MODE	IMGCNT_MTX_MD[1:0]	0	1	2	3
IMGCNT_MTX_YG_ADJ0	IMGCNT_MTX_YG[7:0]	128	128	128	128
IMGCNT_MTX_YG_ADJ0	IMGCNT_MTX_GG[10:0]	256	150	256	256
IMGCNT_MTX_YG_ADJ1	IMGCNT_MTX_GB[10:0]	0	29	1960	0
IMGCNT_MTX_YG_ADJ1	IMGCNT_MTX_GR[10:0]	0	77	1865	0
IMGCNT_MTX_CBB_ADJ0	IMGCNT_MTX_B[7:0]	128	128	128	128
IMGCNT_MTX_CBB_ADJ0	IMGCNT_MTX_BG[10:0]	0	1963	256	0
IMGCNT_MTX_CBB_ADJ1	IMGCNT_MTX_BB[10:0]	256	128	454	256
IMGCNT_MTX_CBB_ADJ1	IMGCNT_MTX_BR[10:0]	0	2005	0	0
IMGCNT_MTX_CRR_ADJ0	IMGCNT_MTX_R[7:0]	128	128	128	128
IMGCNT_MTX_CRR_ADJ0	IMGCNT_MTX_RG[10:0]	0	1941	256	0
IMGCNT_MTX_CRR_ADJ1	IMGCNT_MTX_RB[10:0]	0	2027	0	0
IMGCNT_MTX_CRR_ADJ1	IMGCNT_MTX_RR[10:0]	256	128	359	256

Note: The registers require, after they are set, that the IMGCNT_VEN bit in IMGCNT_UPDATE should be set to 1.

31. Video Display Controller 5 (3): Scaler

31.1 Scaler

31.1.1 Overview of Functions

The scaler subjects the YCbCr and RGB signals output from the input controller, to sync signal generation; and reduction, enlargement, and rotation of the images.

The scaler also records video image in the frame buffer.

In scaler 0, either enlargement process or graphics 0 process can be used.

The functional block diagram of scaler 0 is shown below.

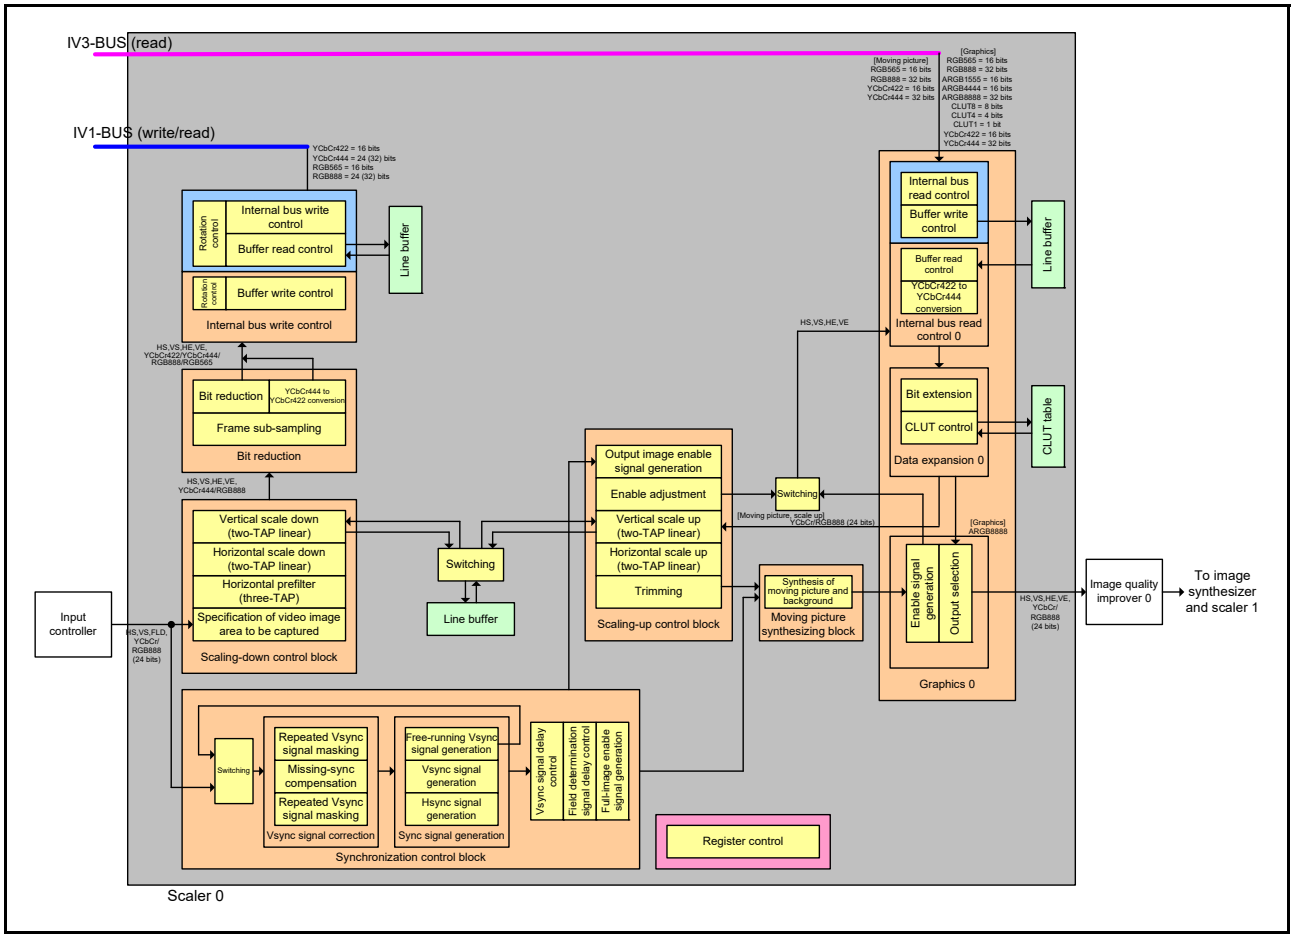

Figure 31.1 Functional Block Diagram of Scaler 0

The registers and bits in the scaler are named SC0_xxxx and those in the graphics blocks are named GR0_xxxx, but in this section, they are collectively called SC_xxxx or GR_xxxx.

31.1.2 Register Control

(1) Updating Registers

The Vsync signal is used to control the update timing of all the registers of the scaling and graphics blocks except some registers of the sync control block and some of the other blocks.

After 1 is set to the bits in the update control register, the contents of the relevant registers are modified at the rising edge of the Vsync signal. The update control register is automatically cleared to 0 after the modification.

Table 31.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_UPDATE	SC_SCL0_UPDATE	0	SYNC Control Register Update 0: Registers are not updated. 1: Registers are updated.
SC_SCL0_UPDATE	SC_SCL0_VEN_D	0	Scaling-Up Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL0_UPDATE	SC_SCL0_VEN_C	0	Scaling-Down Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL0_UPDATE	SC_SCL0_VEN_B	0	Synchronization Control and Scaling-up Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL0_UPDATE	SC_SCL0_VEN_A	0	Scaling-Down Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL1_UPDATE	SC_SCL1_UPDATE_B	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
SC_SCL1_UPDATE	SC_SCL1_UPDATE_A	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
SC_SCL1_UPDATE	SC_SCL1_VEN_B	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
SC_SCL1_UPDATE	SC_SCL1_VEN_A	0	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GR_UPDATE	GR_UPDATE	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
GR_UPDATE	GR_P_VEN	0	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GR_UPDATE	GR_IBUS_VEN	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

The registers controlled by SC_SCL0_VEN_A, SC_SCL0_VEN_C, SC_SCL1_VEN_A, and SC_SCL1_VEN_B are modified at the rising edge of the input Vsync signal.

The registers controlled by SC_SCL0_VEN_B, SC_SCL0_VEN_D, GR_P_VEN, and GR_IBUS_VEN are modified at the rising edge of the output Vsync signal.

31.1.3 Synchronization Control

(1) Selecting Vsync Signal

The Vsync signal to be output from the scaler can be selected.

When an external input signal is to be displayed, an external input Vsync signal should be selected to be output.

When an external input signal is not provided, a free-running Vsync signal should be selected to be output.

Table 31.2 Vsync Signal Selection Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC3	SC_RES_VS_SEL	1	Vsync Signal Output Select 0: External input Vsync signal 1: Internally generated free-running Vsync signal

(2) Masking Repeated Vsync Signals

It is possible to prevent receiving the Vsync signal with a period shorter than the standard period. This is achieved by setting the start timing to receive the next Vsync signal after receiving an input Vsync signal.

The Vsync signal reception masking period is set with the SC_RES_VMASK[15:0] bits.

Masking period [usec] = SC_RES_VMASK × 128 ÷ pixel clock frequency [MHz]

This function is enabled or disabled by the SC_RES_VMASK_ON bit.

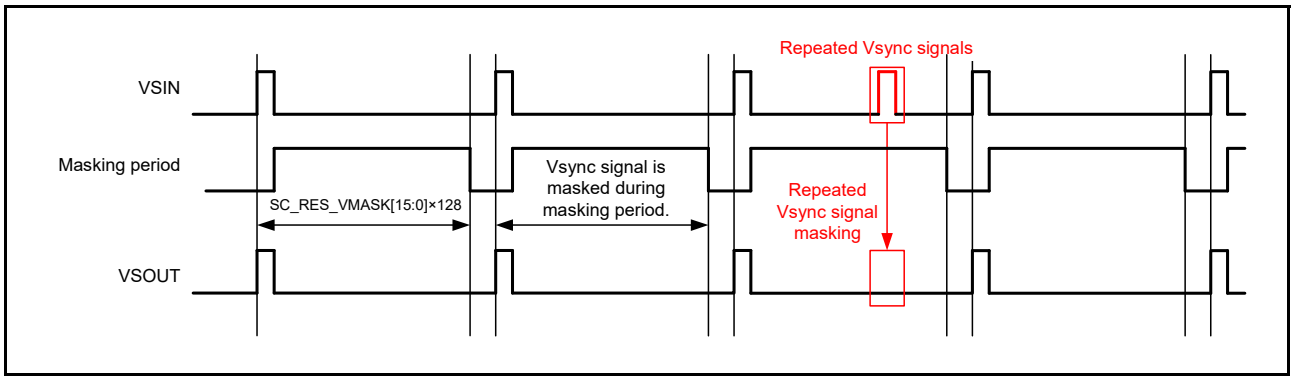

Figure 31.2 Timing for Masking Repeated Vsync Signals

Table 31.3 Repeated Vsync Signal Mask Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC1	SC_RES_VMASK_ON	1	Repeated Vsync Signal Masking Control 0: Repeated Vsync signal masking control is disabled. 1: Repeated Vsync signal masking control is enabled.
SC_SCL0_FRC1	SC_RES_VMASK[15:0]	2800	Repeated Vsync Signal Masking Period Sets the repeated Vsync signal masking period beginning at a Vsync signal in terms of 128 pixel-clock periods. Masking period [usec] = SC_RES_VMASK × 128 ÷ pixel clock frequency [MHz]

(3) Compensating for Missing Vsync Signals

It is possible to prevent output of the Vsync signal with a period longer than the standard period. This is achieved by setting the wait time after reception of an input Vsync signal until reception of the next Vsync signal.

If no Vsync signals are received during the wait time, an internally generated sync signal is inserted.

The wait time can be set using the SC_RES_VLACK[15:0] bits.

Wait time [usec] = SC_RES_VLACK × 128 ÷ pixel clock frequency [MHz]

This function is enabled or disabled by the SC_RES_VLACK_ON bit.

If no Vsync signals are input during the Vsync signal reception time, the SC_RES_QVLACK bit is set to the high level.

If Vsync signals are continuously detected four or more times during the Vsync signal reception time, the SC_RES_QVLOCK bit is set to the high level.

The SC_RES_QVLOCK bit is valid even when both the SC_RES_VMASK_ON and SC_RES_VLACK_ON bits are set to turn off the corresponding functions.

Note that, however, the SC_RES_VMASK and SC_RES_VLACK bits must be set correctly.

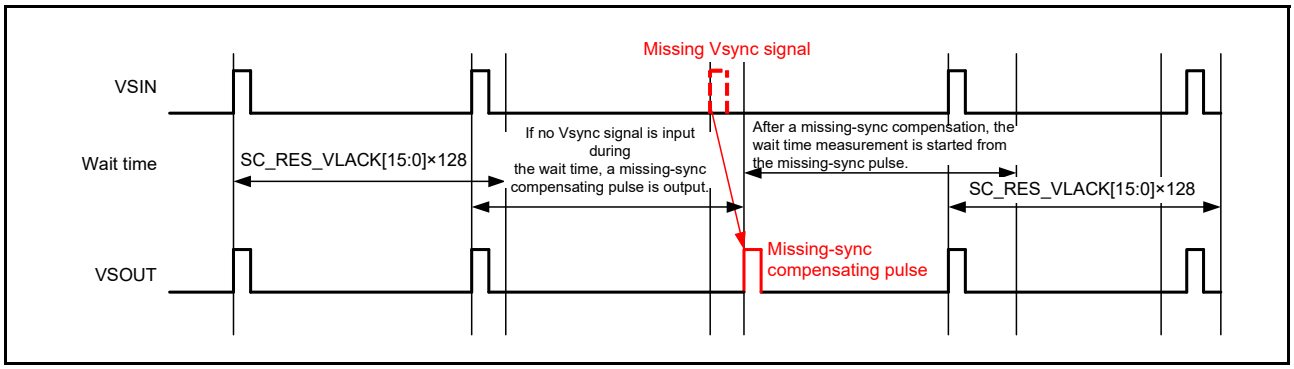

Figure 31.3 Compensation of Missing Vsync Signals

Table 31.4 Missing Vsync Compensation Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC2	SC_RES_VLACK_ON	1	Missing Vsync Signal Compensation 0: Compensation of missing Vsync signals is disabled. 1: Compensation of missing Vsync signals is enabled.
SC_SCL0_FRC2	SC_RES_VLACK[15:0]	3600	Missing-Sync Compensating Pulse Output Wait Time Sets the wait time before outputting a missing-sync compensating pulse after a Vsync signal. Wait time [usec] = SC_RES_VLACK × 128 ÷ pixel clock frequency [MHz]
SC_SCL0_FRC9	SC_RES_QVLACK	—	Missing Vsync Signal Detection Flag 1: Missing Vsync signal input has been detected. 0: No missing Vsync signal input has been detected.
SC_SCL0_FRC9	SC_RES_QVLOCK	—	Locked Vsync Signal Detection Flag 1: No repeated or missing Vsync signal input has been detected for four or more vertical periods. 0: Repeated or missing Vsync signal input has been detected.

For the Vsync signal, repeated-signal masking is first carried out and then missing-signal compensation is carried out, followed by another repeated-signal masking.

Repetition masking is inserted after missing-Vsync compensation to prevent output of the Vsync signal even in cases such as the input of a Vsync signal immediately after the input of a pulse to compensate for a missing Vsync signal.

On/off control of the missing-Vsync compensation also applies to the second repeated-Vsync masking; and masking period setting of the first repeated-Vsync masking also applies to the second repeated-Vsync masking.

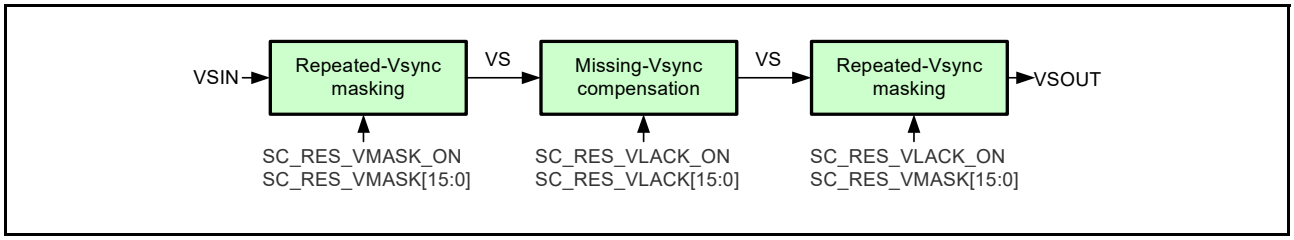

Figure 31.4 Repeated-Vsync Masking and Missing-Vsync Compensation

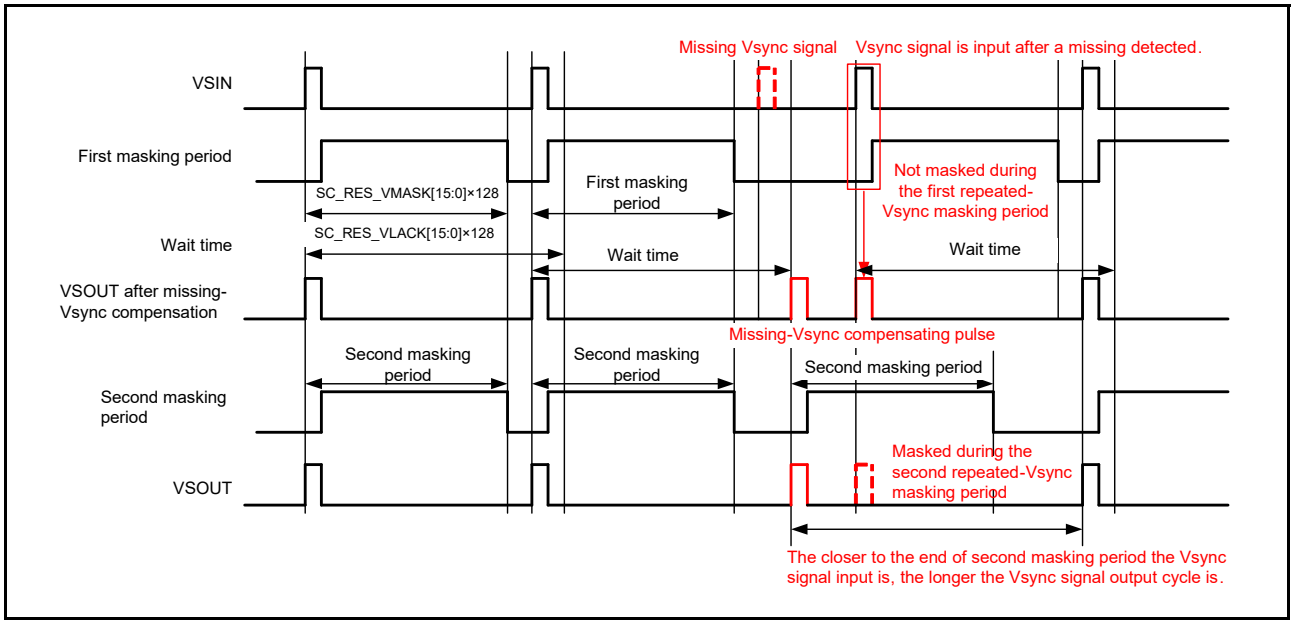

Figure 31.5 Timing for Masking Repeated Vsync Signals and Missing Vsync Signal Compensation

(4) Free-Running Period

Free-running Vsync and Hsync periods can be set.

Hsync period [usec] = (SC_RES_FH + 1) ÷ pixel clock frequency [MHz]

Vsync period [usec] = horizontal period [usec] × (SC_RES_FV + 1)

Table 31.5 Free-Running Period Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC4	SC_RES_FV[10:0]	524	Free-Running Vsync Period Setting Free-running Vsync period = (SC_RES_FV + 1) × horizontal period [usec]
SC_SCL0_FRC4	SC_RES_FH[10:0]	799	Hsync Period Setting Hsync period [usec] = (SC_RES_FH +1) ÷ pixel clock frequency [MHz]

When selecting an external input Vsync signal, set the SC_RES_VS_SEL bit to 0. At this time, the internally generated free-running Vsync signal is not output.

In the meantime, the Hsync signal is always generated according to the free-running signal setting and output from the scaler.

(5) Vsync Signal Delay Control

Delay of Vsync signal output from the scaler can be controlled.

The delay is used to adjust the frame buffer read timing.

Table 31.6 Vsync Output Delay Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC5	SC_RES_VSDLY[7:0]	1	Vsync Signal Delay Control Adjusts the Vsync signal delay in the output Hsync period units. Vsync signal delay [usec]: SC_RES_VSDLY × output Hsync period [usec]

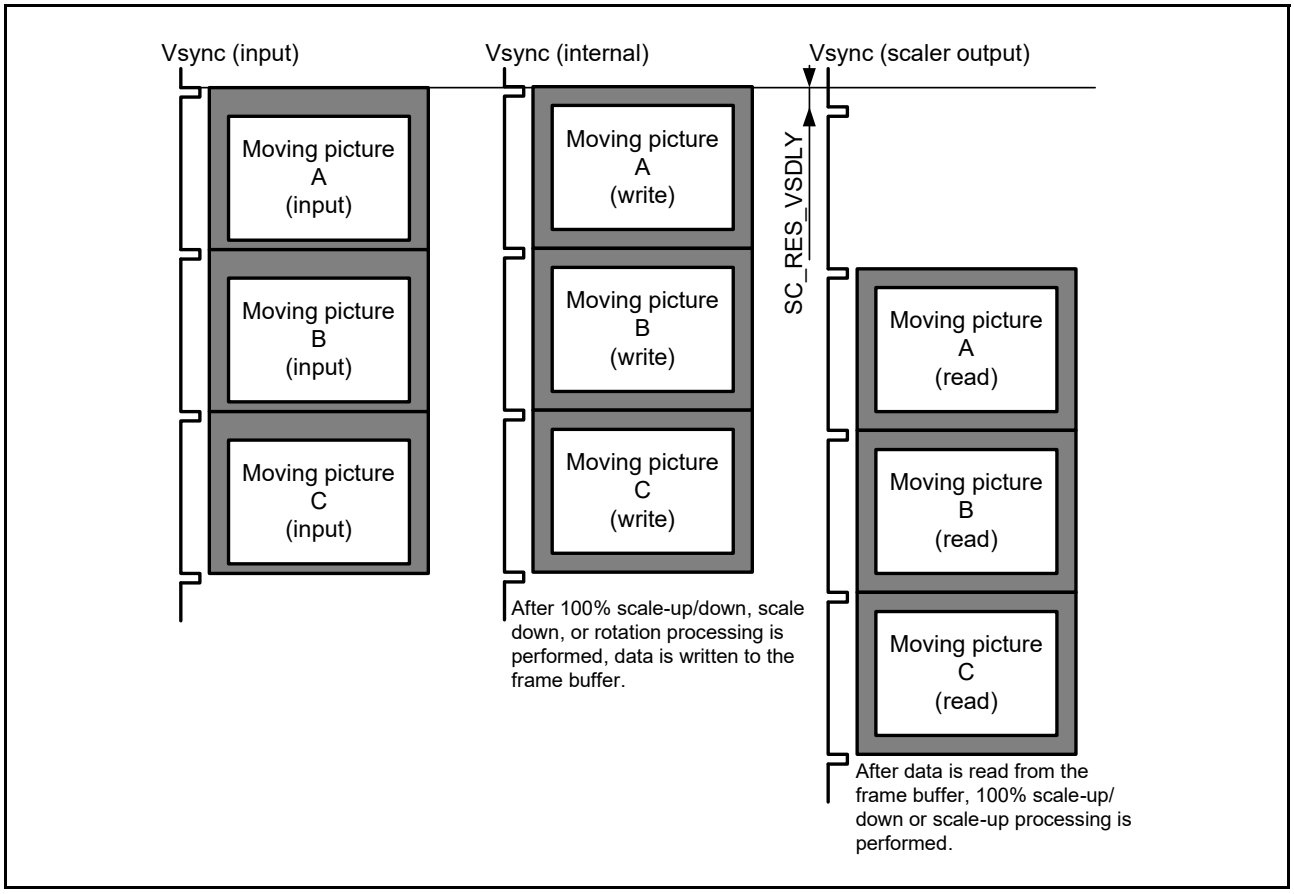

Figure 31.6 Vsync Signal Phases (Two Frame-Buffer Planes Used)

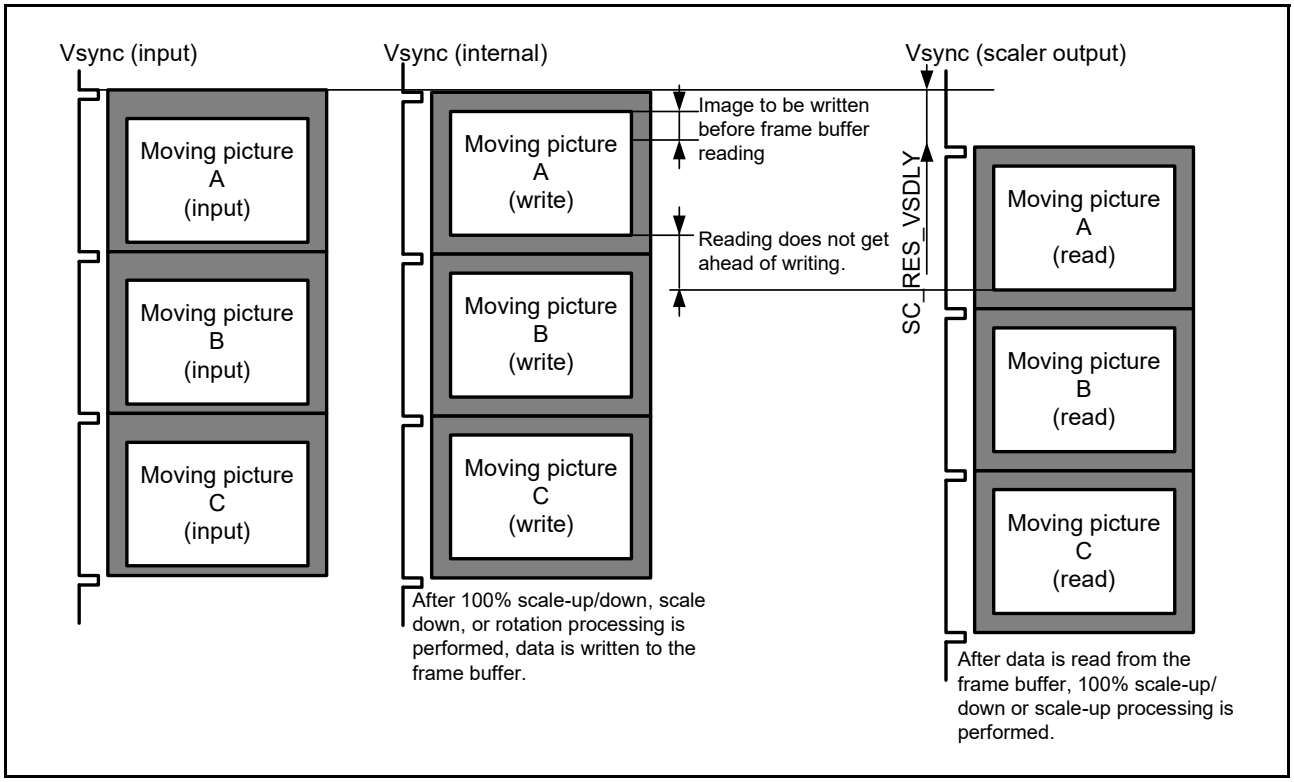

Figure 31.7 Vsync Signal Phases (One Frame-Buffer Plane Used)

31.1.4 Setting Angle of View

(1) Setting Image Area to be Captured

The image area to be captured can be set for reduction or enlargement.

The area is defined by specifying its start position and width based on the input Hsync and Vsync signals.

Table 31.7 Control of Image Area to be Captured

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS2	SC_RES_VS[10:0]	18	Vertical Position Setting for Video Signal Capturing (VSYNC + (V backporch - 1) lines) Note: The set value should be four or more (lines). SC_RES_VS + SC_RES_VW should be equal to or less than 2039 (lines).
SC_SCL0_DS2	SC_RES_VW[10:0]	240	Vertical Width of Video Signal to be Captured (lines) Note: SC_RES_VS + SC_RES_VW should be equal to or less than 2039 (lines).
SC_SCL0_DS3	SC_RES_HS[10:0]	244	Horizontal Position Setting for Video Signal Capturing (HSYNC + H backporch video-image clock cycles) Note: The set value should be 16 or more (clock cycles). SC_RES_HS + SC_RES_HW should be equal to or less than 2015 (clock cycles).
SC_SCL0_DS3	SC_RES_HW[10:0]	1440	Horizontal Width of Video Signal to be Captured (video-image clock cycles) Note: SC_RES_HS + SC_RES_HW should be equal to or less than 2015 (clock cycles).

(2) Generating a Full-Screen Enable Signal

The valid period of the full screen to be output from the scaler can be set.

The valid period is defined by specifying its start position and width based on the Hsync and Vsync signals output from the scaler.

The vertical front porch should be set to four or more lines, and the horizontal front porch should be 16 or more clock cycles.

Table 31.8 Full-Screen Enable Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC6	SC_RES_F_VS[10:0]	35	Vertical Enable Signal Start Position for Full Screen. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC_RES_F_VS + SC_RES_F_VW should be equal to or less than 2039 (lines).
SC_SCL0_FRC6	SC_RES_F_VW[10:0]	480	Vertical Enable Signal Width for Full Screen (lines) Note: SC_RES_F_VS + SC_RES_F_VW should be equal to or less than 2039 (lines).
SC_SCL0_FRC7	SC_RES_F_HS[10:0]	144	Horizontal Enable Signal Start Position for Full Screen. (HSYNC + H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC_RES_F_HS + SC_RES_F_HW should be equal to or less than 2015 (clock cycles).
SC_SCL0_FRC7	SC_RES_F_HW[10:0]	640	Horizontal Enable Signal Width for Full Screen (pixel-clock cycles) Note 1. SC_RES_F_HS + SC_RES_F_HW should be equal to or less than 2015 (clock cycles). Note 2. The set value should be equal to (horizontal signal width for full screen + 2) when serial RGB output is selected as an LCD output signal.

(3) Generating an Image Output Enable Signal

The valid period of the image to be output can be set.

The valid period is defined by specifying its start position and width based on the Hsync and Vsync signals output from the scaler.

Table 31.9 Image Output Enable Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US2	SC_RES_P_VS[10:0]	35	Vertical Enable Signal Start Position for Output Image. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC_RES_P_VS + SC_RES_P_VW should be equal to or less than 2039 (lines).
SC_SCL0_US2	SC_RES_P_VW[10:0]	480	Vertical Enable Signal Width for Output Image (lines) Note: SC_RES_P_VS + SC_RES_P_VW should be equal to or less than 2039 (lines).
SC_SCL0_US3	SC_RES_P_HS[10:0]	144	Horizontal Enable Signal Start Position for Output Image. (HSYNC + H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC_RES_P_HS + SC_RES_P_HW should be equal to or less than 2015 (clock cycles).
SC_SCL0_US3	SC_RES_P_HW[10:0]	640	Horizontal Enable Signal Width for Output Image (pixel-clock cycles) Note: SC_RES_P_HS + SC_RES_P_HW should be equal to or less than 2015 (clock cycles).

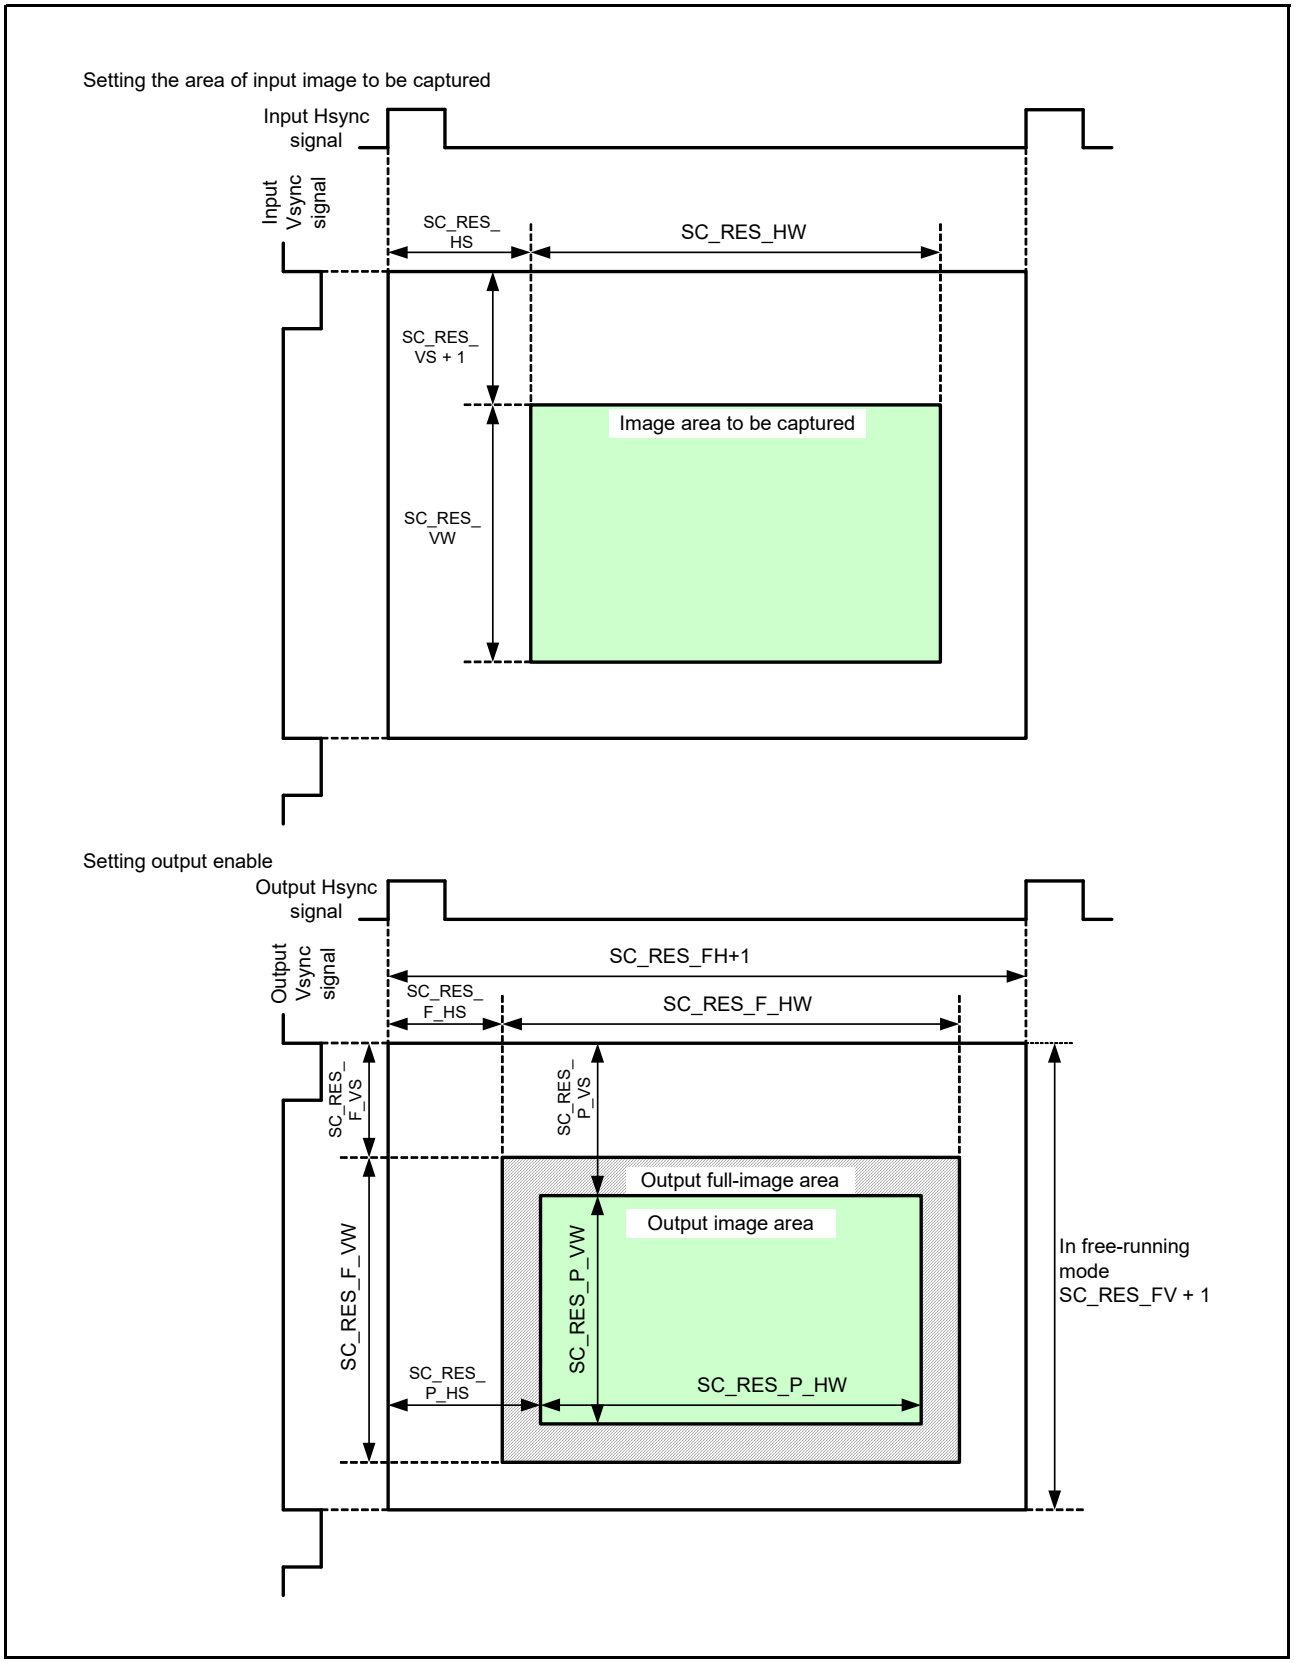

Figure 31.8 Enable Settings

31.1.5 Scaling Settings

(1) Scaling Processing Block

The scaling-down control block scales down the input image from the input controller.

When rotation is required, the scaling-down control block first scales down the image and then rotates it before writing it into the frame buffer.

The scaling-up control block reads the rotated image from the frame buffer and scales it up.

Table 31.10 Rotation and Scaling Process

Rotation	Horizontal Scaling	Vertical Scaling	Scaling-Down Control Block	Scaling-Up Control Block
Normal	Horizontal scale down	Vertical scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	Horizontal scale down	Vertical scale up	Horizontal scale down/ vertical 100% scale up	Horizontal 100% scale up/ vertical scale up
	Horizontal scale up	Vertical scale down	Horizontal 100% scale up/ vertical scale down	Horizontal scale up/ vertical 100% scale up
	Horizontal scale up	Vertical scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up
Horizontal mirroring	Horizontal scale down	Vertical scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	Horizontal scale down	Vertical scale up	Horizontal scale down/ vertical 100% scale up	Horizontal 100% scale up/ vertical scale-up
	Horizontal scale up	Vertical scale down	Horizontal 100% scale up/ vertical scale down	Horizontal scale up/ vertical 100% scale up
	Horizontal scale up	Vertical scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up
90° rotation	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale up	Horizontal scale down/ vertical 100% scale up	Horizontal scale up/ vertical 100% scale up
	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up
180° rotation	Horizontal scale down	Vertical scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	Horizontal scale down	Vertical scale up	Horizontal scale down/ vertical 100% scale up	Horizontal 100% scale up/ vertical scale up
	Horizontal scale up	Vertical scale down	Horizontal 100% scale up/ vertical scale down	Horizontal scale up/ vertical 100% scale up
	Horizontal scale up	Vertical scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up
270° rotation	(Horizontal input→vertical output) scale down	(Vertical input→horizontal output) scale down	Horizontal scale down/ vertical scale down	Horizontal 100% scale up/ vertical 100% scale up
	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale up	Horizontal scale down/ vertical 100% scale up	Horizontal scale up/ vertical 100% scale up
	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale up	Horizontal 100% scale up/ vertical 100% scale up	Horizontal scale up/ vertical scale up

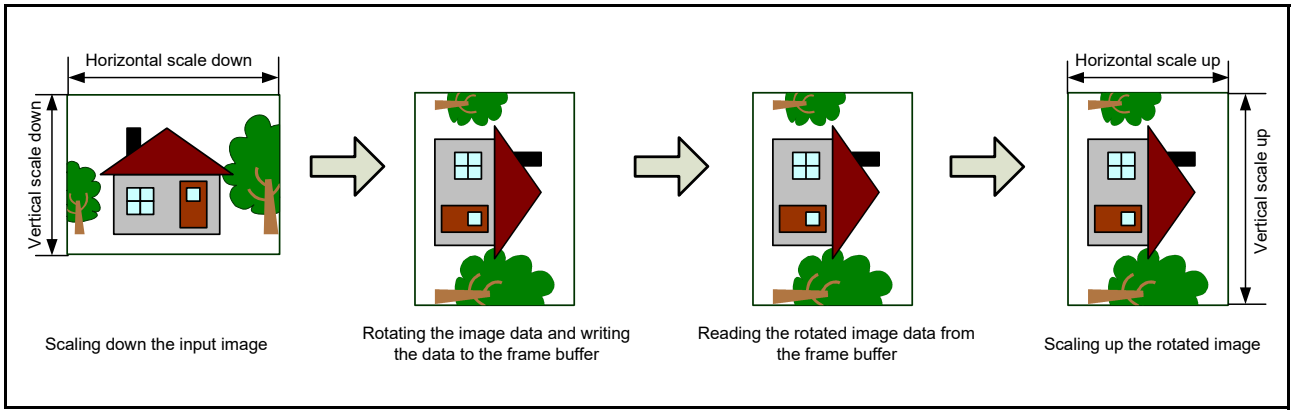

Figure 31.9 Rotation and Scaling Process

It is impossible to use vertical reduction by the scaling-down control block and vertical enlargement by the scaling-up control block simultaneously because they are mutually exclusive. Thus, the following scaling processes cannot be performed with 90° rotation or 270° rotation.

Table 31.11 Impossible Scaling Process

Rotation	Horizontal Scaling	Vertical Scaling	Scaling-Down Control Block	Scaling-Up Control Block
90° rotation 270° rotation	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale down	Horizontal 100% scale up/ vertical scale down	Horizontal 100% scale up/ vertical scale up

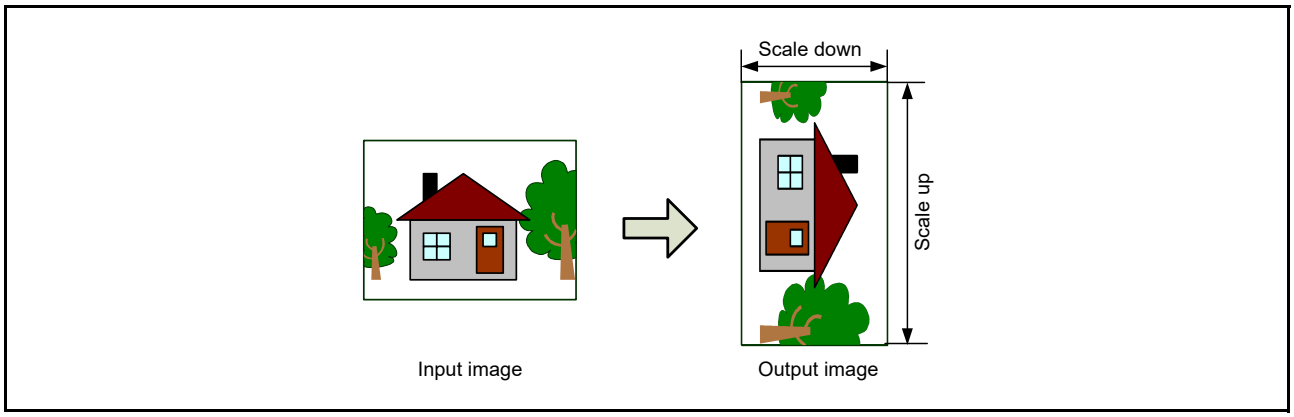

Figure 31.10 Impossible Scaling Process

31.1.6 Horizontal Prefilter

The horizontal prefilter can be turned on or off for brightness (Y) and RGB signals to suppress the frequency band of the signals during horizontal size reduction. The input format depends on the SC_RES_MD[1:0] bit setting in the writing mode register (SC_SCL1_WR1).

When the horizontal reduction ratio is high and there is too much folding frequency component to ignore, the horizontal prefilter should be turned on.

Table 31.12 Horizontal Prefilter Settings

Input Format	SC_RES_PFIL_SEL	Operation
YCbCr input	1	Turns on the horizontal prefilter for Y signal and turns off the horizontal prefilter for Cb/Cr signal.
	0	Turns off the horizontal prefilter.
RGB input	1	Turns on the horizontal prefilter for RGB signal.
	0	Turns off the horizontal prefilter.

Table 31.13 Horizontal Prefilter Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS4	SC_RES_PFIL_SEL	0	Prefilter Mode Select for Brightness Signals 0: The prefilter is turned off. 1: The prefilter is turned on. (1/4 + 1/2 + 1/4)

31.1.7 Horizontal Scale-Down

The number of horizontally arranged pixels can be decreased at a desired ratio in the range of 1/1 to 1/8 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input pixels X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input pixels X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - phase) + X_{n+1} \times phase) / 4096$$

(3) Calculation of Horizontal Scale Down Ratio

The value to be set to the horizontal scale-down ratio SC_RES_DS_H_RATIO can be obtained using the following equation based on the number of input pixels SC_RES_HW and number of output pixels SC_RES_OUT_HW, where the decimals are rounded off.

SC_RES_DS_H_RATIO = round (SC_RES_HW ÷ SC_RES_OUT_HW × 4096)

Note that, for 100% horizontal scale-up, the SC_RES_HW and SC_RES_OUT_HW values should be identical and the SC_RES_DS_H_RATIO bits should be set to 4096.

(4) Handling for Lack of Last-Input Pixel

Interpolation is carried out between the second-last-input and last-input pixels to produce the last-output pixel at the right end of a screen. The interpolation position of the last-output pixel may be close to the second-last-input pixel depending on the horizontal scale-down ratio; in this case, it may appear that the last-input pixel is lacking.

The undesirable influence by lack of last-input pixel can be decreased by appropriately adjusting the horizontal scale-down ratio using the following equations.

Pre-adjustment horizontal scale-down ratio RATIO_org should be calculated first to find adjustment value σ, and then scale-down ratio SC_RES_DS_H_RATIO should be determined.

RATIO_org = round (SC_RES_HW ÷ SC_RES_OUT_HW × 4096)

σ = (RATIO_org × (SC_RES_OUT_HW − 1) − (SC_RES_HW − 1) × 4096) ÷ (SC_RES_OUT_HW − 1)

SC_RES_DS_H_RATIO = roundup (RATIO_org − σ)

Table 31.14 Horizontal Scale Down Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS1	SC_RES_DS_H_ON	1	Horizontal Scale Down On/Off 0: Off 1: On
SC_SCL0_DS7	SC_RES_OUT_HW[10:0]	640	Number of Valid Horizontal Pixels Output by Scaling-down Control Block (Video-image clock cycles)
SC_SCL0_DS4	SC_RES_DS_H_INTERPOTYP	1	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_DS4	SC_RES_DS_H_RATIO[15:0]	9224	Horizontal Scale Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) round(SC_RES_HW ÷ SC_RES_OUT_HW × 4096) SC_RES_DS_H_RATIO < 4096: Setting prohibited SC_RES_DS_H_RATIO = 4096: 100% scale up SC_RES_DS_H_RATIO > 4096: Scale down

Note: The SC_RES_OUT_HW value should be aligned in 4-pixel units and equal to or smaller than the SC_RES_HW value.

31.1.8 Vertical Scale-Down

The number of lines can be decreased in the vertical direction at a desired ratio in the range of 1/1 to 1/8 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input lines X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input lines X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - phase) + X_{n+1} \times phase) / 4096$$

(3) Calculation of Vertical Scale Down Ratio

The value to be set to the vertical scale-down ratio SC_RES_V_RATIO can be obtained using the following equation based on the number of input lines SC_RES_VW and number of output lines SC_RES_OUT_VW, where the decimals are rounded off.

$$SC\_RES\_V\_RATIO = round\ (SC\_RES\_VW \div SC\_RES\_OUT\_VW \times 4096)$$

Note that the SC_RES_VW and SC_RES_OUT_VW values should be identical for vertical enlargement or 100% vertical enlargement.

For 100% vertical enlargement, reduction is carried out assuming SC_RES_V_RATIO as 4096.

(4) Handling for Lack of Last-Input Line

Interpolation is carried out between the second-last-input and last-input lines to produce the last-output line at the lower end of a screen. The interpolation position of the last-output line may be close to the second-last-input line depending on the vertical scale-down ratio; in this case, it may appear that the last-input line is lacking.

The undesirable influence by the lack of last-input line can be decreased by appropriately adjusting the vertical scale-down ratio using the following equations.

Pre-adjustment vertical scale-down ratio RATIO_org should be calculated first to find adjustment value σ, and then scale-down ratio SC_RES_V_RATIO should be determined.

$$RATIO\_org = round\ (SC\_RES\_VW \div SC\_RES\_OUT\_VW \times 4096)$$

$$\sigma = (RATIO\_org \times (SC\_RES\_OUT\_VW - 1) - (SC\_RES\_VW - 1) \times 4096) \div (SC\_RES\_OUT\_VW - 1)$$

$$SC\_RES\_V\_RATIO = round\ (RATIO\_org - \sigma)$$

Table 31.15 Vertical Scale Down Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS1	SC_RES_DS_V_ON	1	Vertical Scale Down On/Off 0: Off 1: On
SC_SCL0_DS7	SC_RES_OUT_VW [10:0]	240	Number of Valid Lines in Vertical Direction Output by Scaling-Down Control Block (lines) This bit setting is used for the number of lines to be written to the frame buffer. When SC_SCL1_WR1.SC_RES_LOOP is 0 (frame write mode), these bits specify the number of lines for one frame. When SC_SCL1_WR1.SC_RES_LOOP is 1 (line write mode), these bits specify the number of lines for writing in a ring configuration.
SC_SCL0_DS5	SC_RES_V_ INTERPOTYP	1	Vertical Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_DS6	SC_RES_V_RATIO [15:0]	2044	Vertical Scale UP/Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: round(SC_RES_VW ÷ SC_RES_OUT_VW × 4096) For scale up: round(SC_RES_IN_VW ÷ SC_RES_P_VW × 4096) SC_RES_V_RATIO < 4096: Scale up SC_RES_V_RATIO = 4096: 100% scale up SC_RES_V_RATIO > 4096: Scale down

Note: SC_RES_V_RATIO and SC_RES_V_INTERPOTYP are both shared by vertical reduction and vertical enlargement.
It is impossible to use vertical reduction and vertical enlargement simultaneously because they are mutually exclusive.
The SC_RES_OUT_VW value should be aligned in 4-line units and equal to or smaller than the SC_RES_VW value.

31.1.9 Horizontal Scale Up

The number of horizontally arranged pixels can be increased at a desired ratio in the range of 1/1 to 8/1 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input pixels X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input pixels X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - phase) + X_{n+1} \times phase) / 4096$$

(3) Calculation of Horizontal Scale Up Ratio

The value to be set to the horizontal scale-up ratio SC_RES_US_H_RATIO can be obtained using the following equation based on the number of input pixels SC_RES_IN_HW and number of output pixels SC_RES_P_HW, where the decimals are rounded off.

$$SC\_RES\_US\_H\_RATIO = round\ (SC\_RES\_IN\_HW \div SC\_RES\_P\_HW \times 4096)$$

Note that, for 100% horizontal scale-up, the SC_RES_IN_HW and SC_RES_P_HW values should be identical and the SC_RES_US_H_RATIO bits should be set to 4096.

(4) Folding Handling

Since interpolation is carried out between the last-input pixel and second-last-input folding pixel to produce the last-output pixel at the right end of a screen, folding may undesirably stand out depending on the horizontal scale up ratio.

The undesirable influence by folding pixels can be decreased by appropriately adjusting the horizontal scale-up ratio using the following equations.

Pre-adjustment horizontal scale-up ratio RATIO_org should be calculated first to find adjustment value σ, and then scale-up ratio SC_RES_US_H_RATIO should be determined.

$$RATIO\_org = round\ (SC\_RES\_IN\_HW \div SC\_RES\_P\_HW \times 4096)$$

$$\sigma = (RATIO\_org \times (SC\_RES\_P\_HW - 1) - (SC\_RES\_IN\_HW - 1) \times 4096 \div (SC\_RES\_P\_HW - 1)$$

$$SC\_RES\_US\_H\_RATIO = round\ (RATIO\_org - \sigma)$$

Table 31.16 Horizontal Scale Up Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US1	SC_RES_US_H_ON	1	Horizontal Scale Up On/Off 0: Off 1: On
SC_SCL0_US4	SC_RES_IN_HW[10:0]	640	Number of Valid Horizontal Pixels Input to Scaling-down Control Block (Pixel-clock cycles)
SC_SCL0_US6	SC_RES_US_H_ INTERPOTYP	1	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_US5	SC_RES_US_H_RATIO [15:0]	9224	Horizontal Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) round(SC_RES_IN_HW ÷ SC_RES_P_HW × 4096) SC_RES_US_H_RATIO < 4096: Scale up SC_RES_US_H_RATIO = 4096: 100% scale-up SC_RES_US_H_RATIO > 4096: Setting prohibited

31.1.10 Vertical Scale-Up

The number of lines can be increased in the vertical direction at a desired ratio in the range of 1/1 to 8/1 using pixel conversion.

For the scaling filter, either hold or linear interpolation mode can be selected.

(1) One-TAP Hold Interpolation

When the interpolation position is between input lines X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows.

$$X_{interpo} = X_n$$

(2) Two-TAP Linear Interpolation

When the interpolation position is between input lines X_n and X_{n+1}, the $X_{interpo}$ interpolation value is defined as follows based on the interpolation position "phase".

$$X_{interpo} = (X_n \times (4096 - phase) + X_{n+1} \times phase) / 4096$$

(3) Calculation of Vertical Scale Up Ratio

The value to be set to the vertical scale-up ratio SC_RES_V_RATIO can be obtained using the following equation based on the number of input lines SC_RES_IN_VW and number of output lines SC_RES_P_VW, where the decimals are rounded off.

SC_RES_V_RATIO = round (SC_RES_IN_VW ÷ SC_RES_P_VW × 4096)

Note that, for 100% vertical enlargement or vertical reduction, the SC_RES_IN_VW and SC_RES_P_VW values should be identical.

(4) Folding Handling

The last line to be output at the bottom of the screen is produced by interpolation between the last line and line for folding (second-last line to be input). According to the vertical scale-up rate, this may cause folding to stand out.

The undesirable influence by folding lines can be decreased by appropriately adjusting the vertical scale-up ratio using the following equations.

Pre-adjustment vertical scale-up ratio RATIO_org should be calculated first to find adjustment value σ, and then scale-up ratio SC_RES_V_RATIO should be determined.

RATIO_org = round (SC_RES_IN_VW ÷ SC_RES_P_VW × 4096)

σ = (RATIO_org × (SC_RES_P_VW − 1) − (SC_RES_IN_VW − 1) × 4096) ÷ (SC_RES_P_VW − 1)

SC_RES_V_RATIO = round (RATIO_org − σ)

Table 31.17 Vertical Scale Up Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US1	SC_RES_US_V_ON	1	Vertical Scale Up On/Off 0: Off 1: On
SC_SCL0_US4	SC_RES_IN_VW[10:0]	240	Number of Valid Lines in Vertical Direction Input to Scaling-down Control Block (Lines)
SC_SCL0_DS5	SC_RES_V_INTERPOTYP	1	Vertical Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
SC_SCL0_DS6	SC_RES_V_RATIO[15:0]	2044	Vertical Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: round(SC_RES_VW ÷ SC_RES_OUT_VW × 4096) For scale up: round(SC_RES_IN_VW ÷ SC_RES_P_VW × 4096) SC_RES_V_RATIO < 4096: Scale up SC_RES_V_RATIO = 4096: 100% scale up SC_RES_V_RATIO > 4096: Scale down

Note: SC_RES_V_RATIO and SC_RES_V_INTERPOTYP are both shared by vertical reduction and vertical enlargement.
It is impossible to use vertical reduction and vertical enlargement simultaneously because they are mutually exclusive.

31.1.11 IP Conversion

(1) Initial Phase Control

When interlaced signals are input, line flickering caused by the line offset between the top and bottom fields can be decreased before being displayed by independently adjusting the initial scaling phases of the fields.

For various operations, appropriate settings should be made referring to the relevant registers as listed in Table 31.18.

Table 31.18 Initial Scaling Phase Settings (Standard Values) for IP Conversion

Rotation	Horizontal Scaling	Vertical Scaling	Reference Bit (Setting)
Normal	Horizontal scale down	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale down	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
Horizontal mirroring	Horizontal scale down	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale down	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale up	SC_RES_TOP_INIPHASE = 2048
90° rotation	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale down	SC_RES_TOP_INIPHASE = 2048
	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale up	SC_RES_TOP_INIPHASE = 2048
	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale up	SC_RES_US_HB_INIPHASE = 2048
180° rotation	Horizontal scale down	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale down	Vertical scale up	SC_RES_BTM_INIPHASE = 2048
	Horizontal scale up	Vertical scale down	SC_RES_TOP_INIPHASE = 2048
	Horizontal scale up	Vertical scale up	SC_RES_BTM_INIPHASE = 2048
270° rotation	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale down	SC_RES_TOP_INIPHASE = 2048
	(Horizontal input → vertical output) scale down	(Vertical input → horizontal output) scale up	SC_RES_TOP_INIPHASE = 2048
	(Horizontal input → vertical output) scale up	(Vertical input → horizontal output) scale up	SC_RES_US_HT_INIPHASE = 2048

Note: Set 0 to the initial phase control registers where the specific value is not shown in the table.
Set 0 to all the initial phase control registers when progressive signals are input.

Table 31.19 Initial Scaling Phase Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_DS5	SC_RES_BTM_INIPHASE [11:0]	0	Vertical Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)
SC_SCL0_DS5	SC_RES_TOP_INIPHASE [11:0]	2048	Vertical Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)
SC_SCL0_US6	SC_RES_US_HB_INIPHASE [11:0]	0	Horizontal Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)
SC_SCL0_US6	SC_RES_US_HT_INIPHASE [11:0]	0	Horizontal Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)

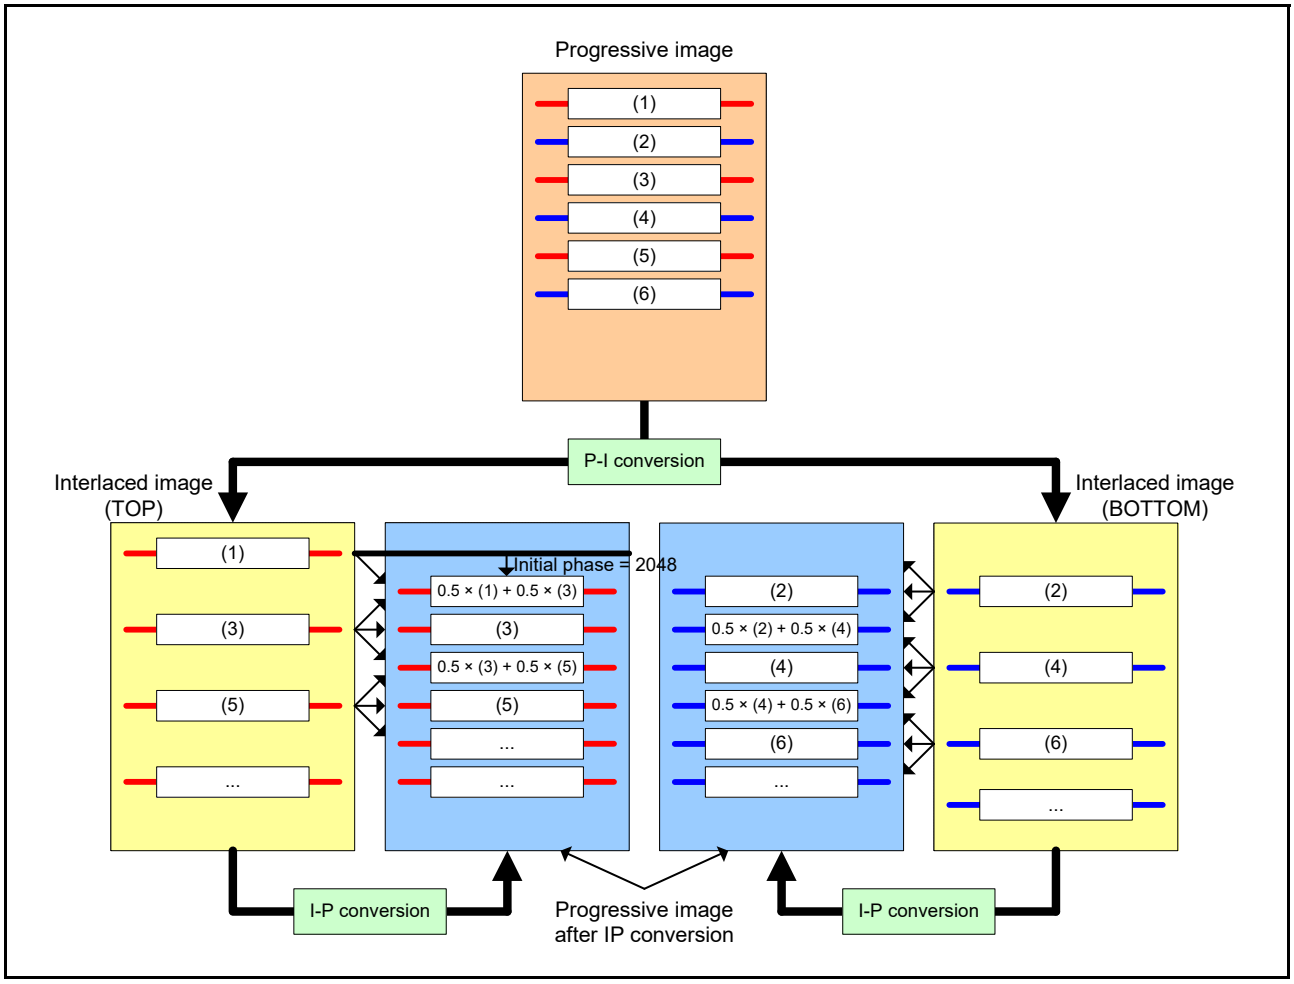

Figure 31.11 IP Conversion Processing Schematic Diagram

(2) Field Determination Signal Control

When interlaced signals are input, the field determination signal can be controlled, which is output to the scaling-up control block during vertical scaling.

When progressive signals are input or vertical scaling is carried out by the scaling-down control block, the field determination signal output to the scaling-up control block is fixed to the specific level, and thus either 0 or 1 can be set to the SC_RES_FLD_DLY_SEL bit.

Table 31.20 Settings for Field Determination Signal Control

Input Signal	Rotation	Vertical Processing	Frame Buffer	SC_RES_FLD_DLY_SEL
Progressive	—	—	—	—
Interlace	Normal Horizontal mirroring 180° rotation	Vertical scale down	—	—
		Vertical scale up	One plane or less	0
			Two planes or more	1
	90° rotation 270° rotation	(Horizontal input → vertical output) scale down	—	—
		(Horizontal input → vertical output) scale up	Two planes or more	1

Table 31.21 Field Determination Signal Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_FRC5	SC_RES_FLD_DLY_SEL	1	Field Determination Signal Delay Control 0: No delay 1: Delay of one vertical cycle

31.1.12 Control of Interrupt on Specified Image Line before Scaling-down, and Reading of Current Image Line before Scaling-down

When the location of the image line input to the scaling-down control block matches the SC_SCL1_LINE setting, an interrupt processing is done. In addition, the current location of the line input to the scaling-down control block can be read from a register.

Table 31.22 Control of Interrupt on Specified Image Line before Scaling-down, and Reading of Current Image line before Scaling-down

Register Name	Bit Name	Initial Value	Description
SC_SCL0_INT	SC_RES_LINE[10:0]	All 0	Setting of Interrupt on Image Line Input to Scaling-down Control Block When the location of the image line input to the scaling-down control block matches the SC_SCL0_LINE setting, an interrupt signal is output. (Setting prohibited in this product)
SC_SCL0_MON0	SC_RES_LIN_STAT[10:0]	All 0	Current Location of Image Line Input to Scaling-down Control Block

31.1.13 Trimming

The upper, lower, right, and left parts of a post-scaling image can be trimmed off as specified by the SC_RES_VCUT and SC_RES_HCUT bits before being output.

The frame lines of the post-scaling image can also be displayed by setting the SC_RES_DISP_ON bit to 1.

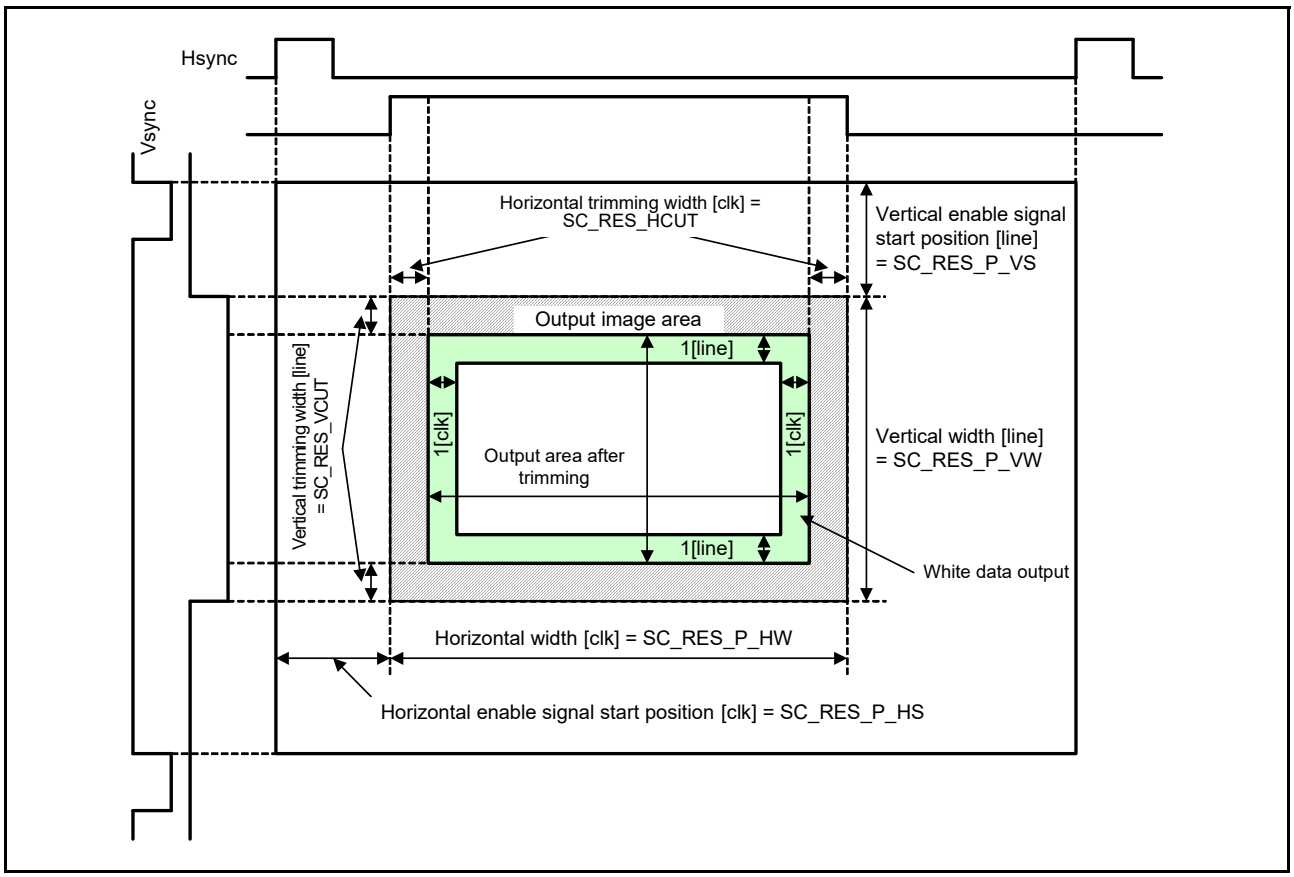

Figure 31.12 Area Relationship for Trimming (Frame Lines Displayed)

Table 31.23 Trimming Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US7	SC_RES_HCUT[7:0]	0	Horizontal Amount of Cut-off Post-Scaling Image (Right and Left Parts) Sets the number of pixel-clock cycles.
SC_SCL0_US7	SC_RES_VCUT[7:0]	0	Vertical Amount of Cut-off Post-Scaling Image (Upper and Lower Parts) Sets the number of lines.
SC_SCL0_US8	SC_RES_DISP_ON	0	Post-Scaling Image Frame Display On/Off 0: Frame display on 1: Frame display off

31.1.14 Screen Synthesis

During the valid full-screen period, the image area can be overlaid before being output. If the image area to be output is smaller than a full-screen, the background color specified by the SC_RES_BK_COL_R, SC_RES_BK_COL_G, and SC_RES_BK_COL_B bits are displayed to fill the background.

Table 31.24 Screen Synthesis Control

Register Name	Bit Name	Initial Value	Description
SC_SCL0_OVR1	SC_RES_BK_COL_R [7:0]	128	Background Color Setting R/Cr Signal R: 8 bits; unsigned (0 to 255 [LSB]) Cr: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
SC_SCL0_OVR1	SC_RES_BK_COL_B [7:0]	128	Background Color Setting B/Cb Signal B: 8 bits; unsigned (0 to 255 [LSB]) Cb: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
SC_SCL0_OVR1	SC_RES_BK_COL_G [7:0]	0	Background Color Setting G/Y Signal G/Y: 8 bits; unsigned (0 to 255 [LSB])

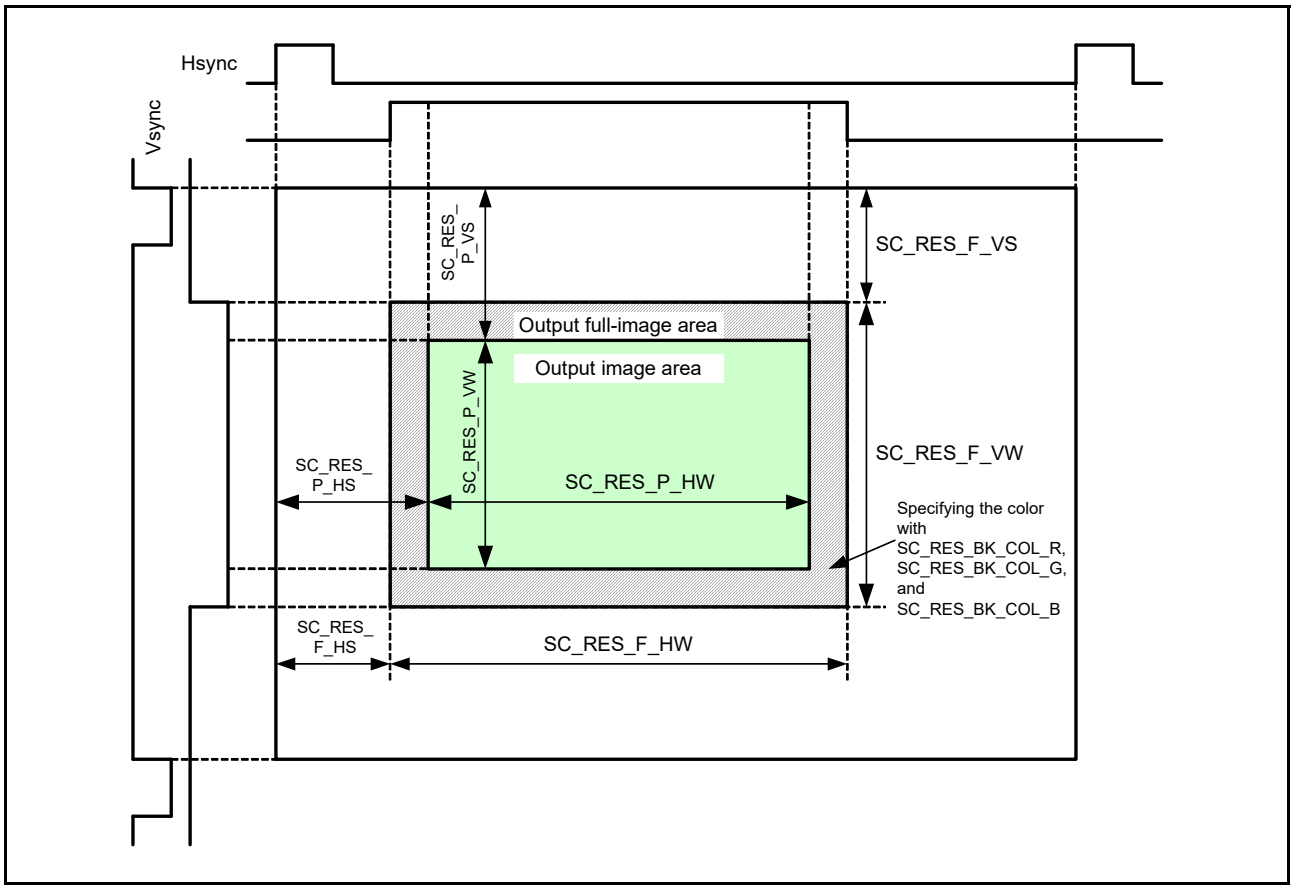

Figure 31.13 Area Relationship with Output Image Size Smaller than a Full Screen

31.1.15 Selecting Format for Writing Video Image Signals to Frame Buffer

A format can be selected for writing video image signals to the frame buffer.

Although 24-bit YCbCr signals or 24-bit RGB signals are input to the scaling control block, they are converted into 16-bit YCbCr422 signals, 16-bit RGB565 signals, 32-bit YCbCr444 signals, or 32-bit RGB888 signals before being written to the frame buffer.

As bit reduction processing of RGB565, rounding off or 2 × 2 pattern dither can be selected with the SC_RES_DTH_ON bit. For details on pattern dither, see section 34.1.7, Dither Process in section 34., Video Display Controller 5 (7): Output Controller.

Table 31.25 Frame Buffer Writing Mode Setting

RES_BITDEC_ON	SC_RES_MD[1:0]	Writing Mode
0	3	YCbCr444 (normal, horizontal mirroring)
0	2	RGB888 (normal, horizontal mirroring)
1	1	RGB565 (normal, horizontal mirroring, rotation)
*	0	YCbCr422 (normal, horizontal mirroring, rotation)

Table 31.26 Video Signal Writing Format Selection Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_MD[1:0]	0	Frame Buffer Video-Signal Writing Format 0: YCbCr422 (16 bits) 1: RGB565 (16 bits) 2: RGB888 (24 (32) bits) 3: YCbCr444 (24 (32) bits)
SC_SCL1_WR6	SC_RES_BITDEC_ON	0	Bit Reduction On/Off 0: Off 1: On
SC_SCL1_WR6	SC_RES_DTH_ON	0	Dither Correction On/Off 0: Off (rounded off) 1: On (2 × 2 pattern dither)

31.1.16 Horizontal Mirroring and Rotation

Horizontal mirroring and rotation can be carried out for scaled-down images before being written to the frame buffer.

Table 31.27 and Table 31.28 show the relationship between various writing modes for image processing and video signals.

Table 31.27 Relationship between Writing Modes and Video Signals

RES_DS_WR_MD[2:0]	Writing Modes	YCbCr444	YCbCr422	RGB565	RGB888
0	Normal writing	Enabled	Enabled	Enabled	Enabled
1	Horizontal mirroring	Enabled	Enabled	Enabled	Enabled
2	90° rotation	Disabled	Enabled	Enabled	Disabled
3	180° rotation	Disabled	Enabled	Enabled	Disabled
4	270° rotation	Disabled	Enabled	Enabled	Disabled
5 to 7	Setting prohibited	—	—	—	—

Table 31.28 Horizontal Mirroring and Rotation Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_DS_WR_MD [2:0]	0	Frame Buffer Writing Mode for Image Processing 0: Normal 1: Horizontal mirroring 2: 90° rotation 3: 180° rotation 4: 270° rotation 5 to 7: Setting prohibited

31.1.17 Writing to Frame Buffer

(1) Frame Buffer Transfer Mode

Either 32-byte or 128-byte transfer mode can be selected for accessing the frame buffer in which video image data and graphics data are stored.

Table 31.29 Frame Buffer Transfer Mode

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_BST_MD	0	Transfer Burst Length for Frame Buffer Writing 0: 32-byte 1: 128-byte

(2) Frame Buffer Write Control

Frame buffer writing is enabled or disabled.

Table 31.30 Frame Buffer Writing Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR5	SC_RES_WENB	0	Frame Buffer Write Enable After making the setting to enable writing, writing starts from the second frame. 0: Frame buffer writing is disabled. 1: Frame buffer writing is enabled.

(3) Frame Buffer Writing Rate Selection

A frame buffer writing rate can be selected from among 1/1, 1/2, 1/4, and 1/8 the vertical frequency of the input signal.

When 1/2, 1/4, or 1/8 is selected, either the top or bottom field can be selected for writing.

Table 31.31 Frame Buffer Write Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR5	SC_RES_FS_RATE [1:0]	0	Writing Rate Sets the frame buffer writing rate to the vertical frequency of the input signal. 0: 1/1 an input signal (The SC_RES_FLD_SEL setting is invalid.) 1: 1/2 an input signal 2: 1/4 an input signal 3: 1/8 an input signal
SC_SCL1_WR5	SC_RES_FLD_SEL	0	Write Field Select 0: Top field 1: Bottom field
SC_SCL1_WR5	SC_RES_INTER	1	Field Operating Mode Select 0: Progressive 1: Interlace

(4) Frame Buffer Write Addresses

Frame buffer addresses are specified using the base address, line offset address, frame offset address, data size of a line, and the number of lines in a frame. When an interlaced video image is input, the top and bottom field data can be separately stored in the frame buffer.

The SC_RES_BASE[31:0], SC_RES_LN_OFF[14:0], and SC_RES_FLM_OFF[22:0] bits should be set in 32-byte units (the lower five bits should be fixed to 0).

For 128-byte transfer, bits [6:5] in the address control registers should be fixed to 0 since addresses should be specified in 128-byte units.

For the data size of a line and the number of lines in a frame, the relevant register values set for the scaling-down control block are used.

Table 31.32 Frame Buffer Write Address Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR1	SC_RES_TB_ADD_MOD	0	Top and Bottom Data Write Address Specification Method 0: A write address is specified in common for top and bottom data. 1: Separate write addresses are specified for top and bottom data.
SC_SCL1_WR2	SC_RES_BASE [31:0]	0	Frame Buffer Base Address Sets the start address of the frame buffer to store the frame data for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0. For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
SC_SCL1_WR8	SC_RES_BASE_B [31:0]	0	Frame Buffer Base Address for Bottom Sets the start address of the frame buffer to store the frame data for the bottom field when SC_RES_TB_ADD_MOD = 1. For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
SC_SCL1_WR3	SC_RES_LN_OFF [14:0]	2048	Frame Buffer Line Offset Address Sets the line offset address for calculating the line start address for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0. Line 0: SC_RES_BASE Line 1: SC_RES_BASE + SC_RES_LN_OFF × 1 : Line n: SC_RES_BASE + SC_RES_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
SC_SCL1_WR9	SC_RES_LN_OFF_B [14:0]	2048	Frame Buffer Line Offset Address for Bottom Sets the line offset address for calculating the line start address for the bottom field when SC_RES_TB_ADD_MOD = 1. Line 0: SC_RES_BASE_B Line 1: SC_RES_BASE_B + SC_RES_LN_OFF_B × 1 : Line n: SC_RES_BASE_B+ SC_RES_LN_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
SC_SCL1_WR4	SC_RES_FLM_OFF [22:0]	524288	Frame Buffer Frame Offset Address Sets the frame offset address for calculating the start address of each frame for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0. Buffer 0: SC_RES_BASE Buffer 1: SC_RES_BASE + SC_RES_FLM_OFF × 1 : Buffer n: SC_RES_BASE + SC_RES_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.

Table 31.32 Frame Buffer Write Address Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR10	SC_RES_FLM_OFF_B [22:0]	524288	Frame Buffer Frame Offset Address for Bottom Sets the frame offset address for calculating the start address of each frame for the bottom field when SC_RES_TB_ADD_MOD = 1. Buffer 0: SC_RES_BASE_B Buffer 1: SC_RES_BASE_B + SC_RES_FLM_OFF_B × 1 : Buffer n: SC_RES_BASE_B + SC_RES_FLM_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.

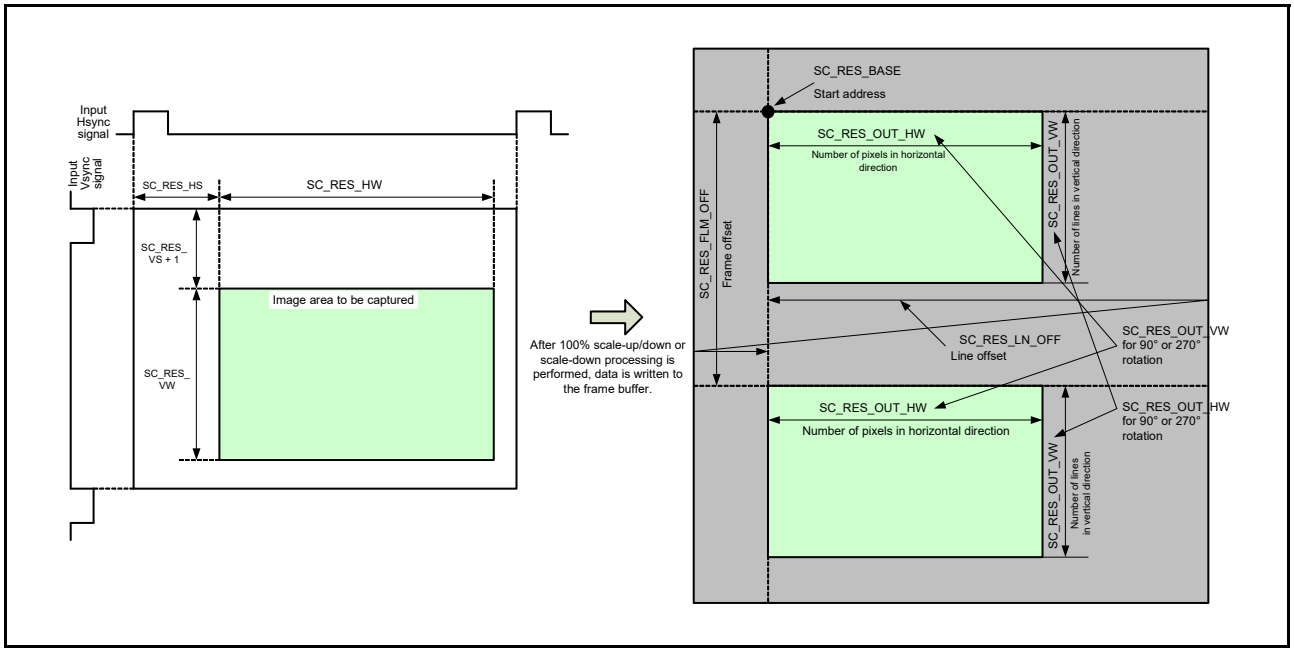

Figure 31.14 Data Arrangement in Frame Buffer

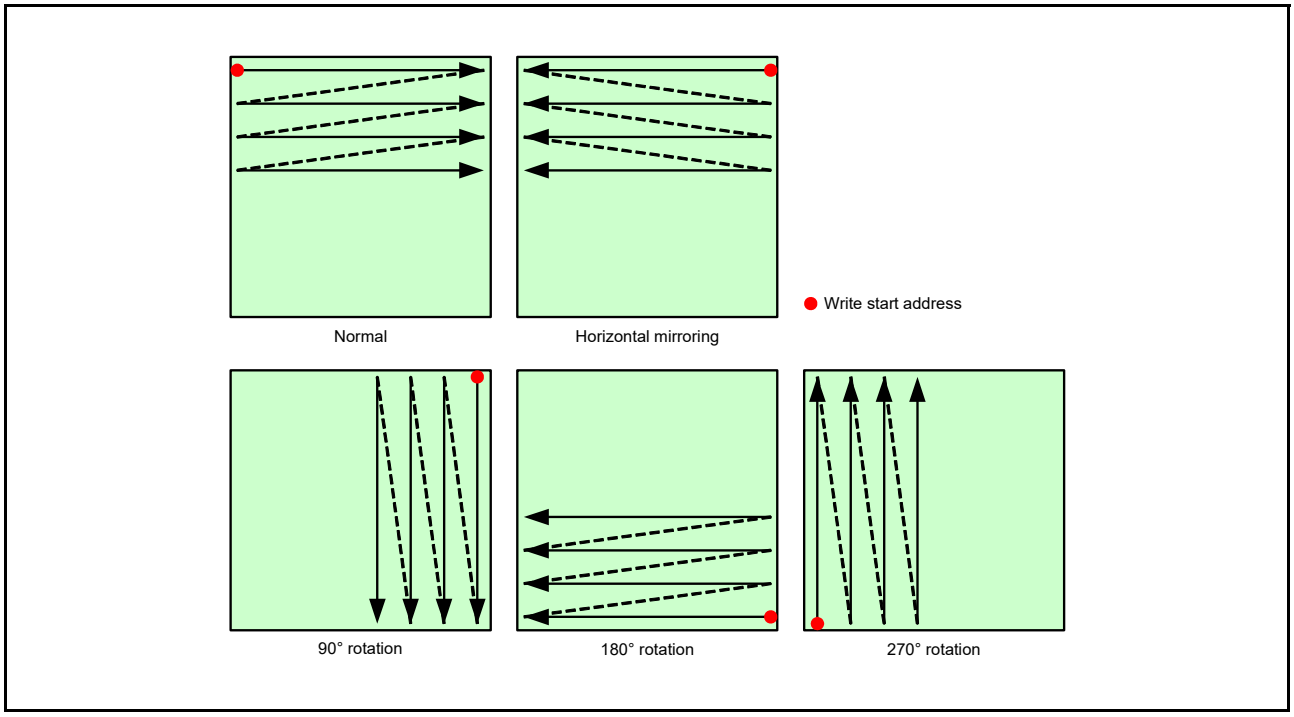

Figure 31.15 Data Arrangement in Frame Buffer in Various Writing Modes

(5) Frame Buffer Management

The scaling control block can handle multiple frames as the frame buffer.

Data is written to the buffer in cyclic mode according to the number of frames specified by the SC_RES_FLM_NUM bits.

For rotation, the SC_RES_FLM_NUM bits should be set to two or more frames.

To use the frame buffer as the ring buffer in line mode, the SC_RES_FLM_NUM bits should be set to 0 (1 frame) and the SC_RES_LOOP bit to 1.

Table 31.33 Frame Buffer Write Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR3	SC_RES_FLM_ NUM[9:0]	1	Number of Frames of Buffer to be Written to Sets the number of frames for the top field when SC_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC_RES_TB_ADD_MOD = 0 Number of frames defined by SC_RES_FLM_NUM + 1 are used.
SC_SCL1_WR9	SC_RES_FLM_ NUM_B[9:0]	1	Number of Frames of Buffer to be Written to for Bottom Field when SC_RES_TB_ADD_MOD = 1 Number of frames defined by SC_RES_FLM_NUM_B + 1 are used.
SC_SCL1_WR1	SC_RES_LOOP	0	Frame Buffer Write Mode Select 0: Frame mode 1: Line mode (read as ring buffer)
SC_SCL1_WR7	SC_RES_FLM_ CNT[9:0]	—	Frame Number of Frame Being Accessed Frame number of the frame being accessed in the top field when SC_RES_TB_ADD_MOD = 1 or that in the top or bottom field when SC_RES_TB_ADD_MOD = 0.
SC_SCL1_WR11	SC_RES_FLM_ CNT_B[9:0]	—	Frame Number of Frame Being Accessed in Bottom Field Frame number of the frame being accessed in the bottom field when SC_RES_TB_ADD_MOD = 1.

(6) Buffer Overflow Handling

If writing to the frame buffer cannot be completed due to bus-traffic related problems, an overflow interrupt can be output to the interrupt controller.

Table 31.34 Buffer Overflow Detection

Register Name	Bit Name	Initial Value	Description
SC_SCL1_WR7	SC_RES_OVERFLOW	—	Line Buffer Overflow Detect 1: Line buffer has overflowed. 0: Line buffer has not overflowed.

(7) Frame Buffer Write End Flag

When writing one frame of data to the frame buffer is completed, a frame buffer write end interrupt can be output to the interrupt controller.

31.1.18 Selecting a Scaling-up Process or Graphics 0 Process

Scaling-up process and graphics 0 process are mutually exclusive and thus frame buffer cannot be read out simultaneously for the processes.

When displaying input video image signals or displaying enlarged graphics, data is read from the frame buffer via the scaling-up control block.

However, graphics can be enlarged and displayed by the scaling-up control block only when the RGB565, RGB888, YCbCr422, or YCbCr444 format is used.

When displaying graphics without enlargement, the data is read from the frame buffer via the graphics 0 processing block.

With the SC_RES_IBUS_SYNC_SEL bit, sync signals for reading out the frame buffer and read size setting bits are selected.

Table 31.35 Selection of Scaling-Up Process and Graphics 0 Process

Type of Output Scaling Display	SC_RES_ IBUS_SYNC_SEL	Sync Signals for Frame Buffer Read	Frame Buffer Read Size Setting Bits	Display Enabling Bits
Input video signal display Enlarged graphics display	0	Output from scaling-up control block	SC_RES_IN_VW SC_RES_IN_HW	SC_RES_P_VS SC_RES_P_VW SC_RES_P_HS SC_RES_P_HW
Graphics display	1	Output from graphics 0 processing block	GR_FLM_LNUM* GR_HW*	GR_GRC_VS GR_GRC_VW GR_GRC_HS GR_GRC_HW

Note: * The value set to the register + 1 is the actual read size.

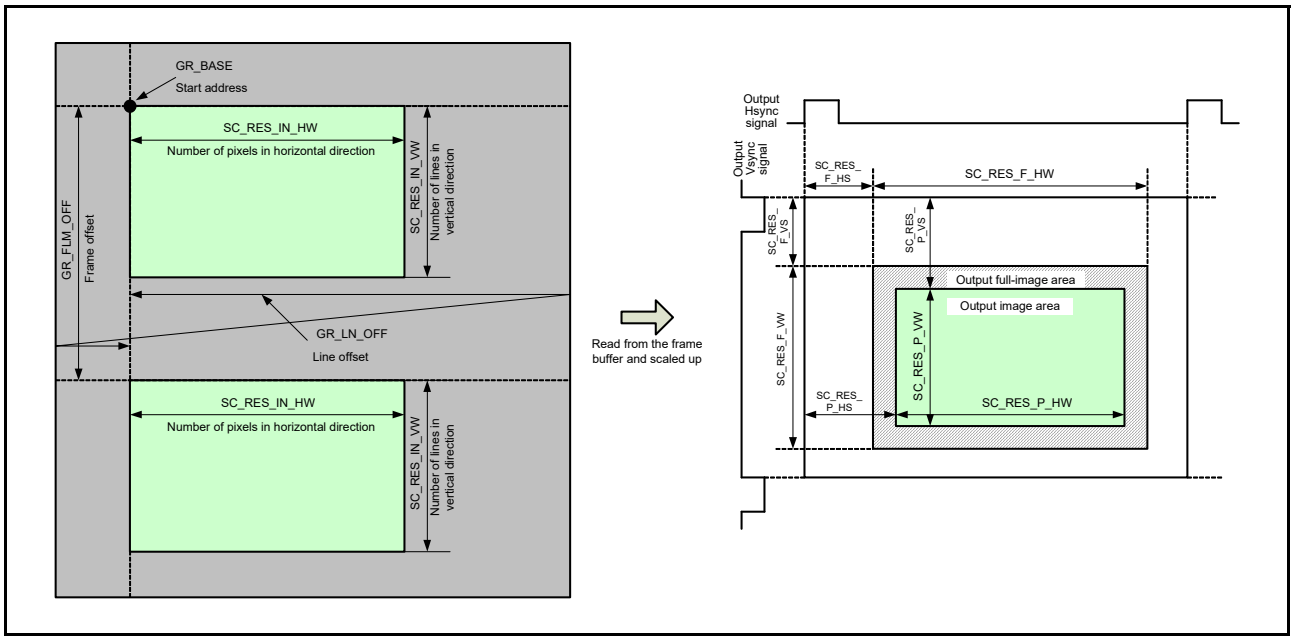

Figure 31.16 Area Setting for Input Video Image Signal Display and Enlarged Graphics Display

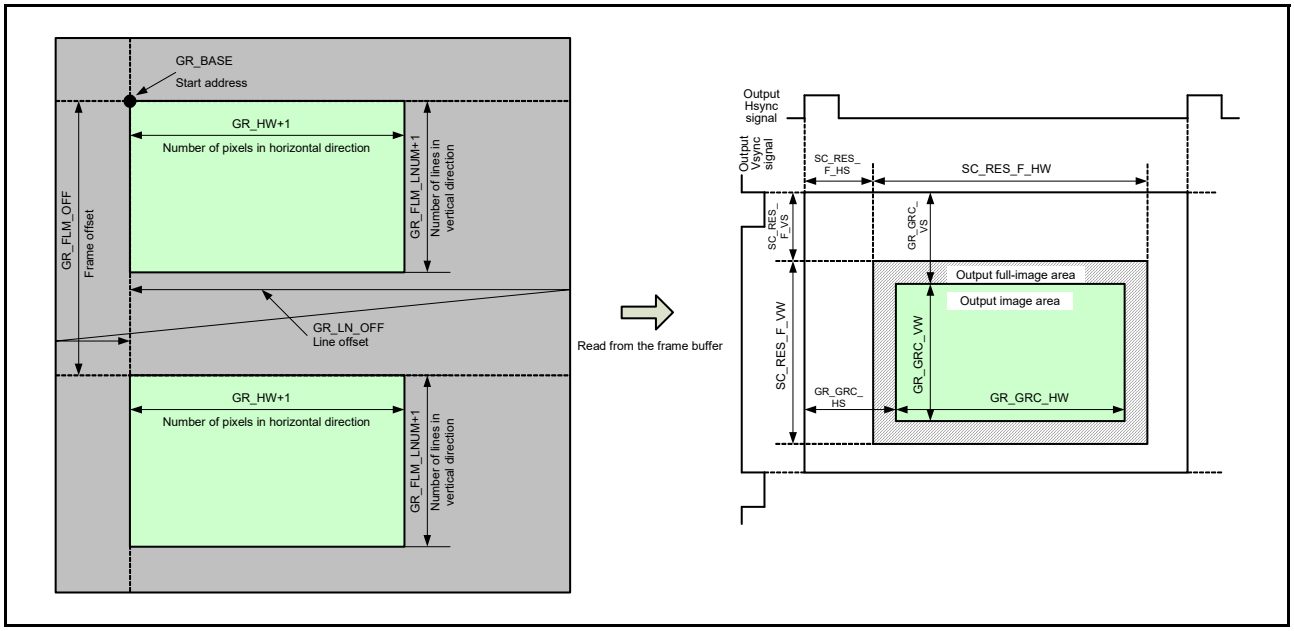

Figure 31.17 Area Setting for Graphics Display

Table 31.36 Scaling-Up Process or Graphics 0 Process Selection

Register Name	Bit Name	Initial Value	Description
SC_SCL0_US8	SC_RES_IBUS_SYNC_SEL	0	Sync Signal Select for Frame Buffer Read Block 0: Sync signals from the scaling-up control block 1: Sync signals from the graphics processing block

The GR_DISP_SEL bits are used to select a display by the scaling-up control block (video image display or enlarged graphics display) or graphics display.

For details on the graphics processing, refer to the section 33., Video Display Controller 5 (5): Image Synthesizer.

31.1.19 Selecting Field for Frame Buffer Reading

For the next frame buffer to be read, the top or bottom field can be selected. This field selection is used in the scaling-up control block.

Table 31.37 Field Specification for Frame Buffer Reading

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_FLD_SEL	0	Enables or disables top or bottom field selection for the next frame buffer to be read. 0: Field selection is disabled. 1: Top or bottom field can be selected.
GR_FLM3	GR_FLD_NXT	0	Selects the top or bottom field for the next frame buffer. 0: Bottom 1: Top

31.1.20 Pointer Buffer and Frame Buffer Reading Processing

(1) Pointer Buffers

The pointer buffers can be used to control the frame buffer for the input video image. They are mainly used to prevent flicker in the output video image, which occurs when the input and output vertical sync signals are asynchronous.

Four pointer buffers are provided and each pointer buffer has a start address register that shows the start location of the frame buffer and a field information register that shows the current field is the top or bottom field. The four pointer buffers are arranged in a ring structure and a write pointer is provided to indicate the pointer buffer corresponding to the location currently being written to. The location pointed to by the write pointer is being written to, and the corresponding pointer buffer value is undetermined. The value in the pointer buffer corresponding to the location being written to and the value in the write pointer are automatically updated when frame data writing is completed.

When the frame buffer address setting signal is linked with the pointer buffer (GR_FLM_SEL = 3), frame buffer reading can be controlled by using the read pointer that indicates the pointer buffer corresponding to the location being read; the start address and field information of the next frame buffer to be read should be read from the pointer buffer and they should be set in the frame buffer base address and field information. The read pointer value is automatically updated at the rising edge of the vertical sync signal on the reading side.

(2) Write Pointer Control

The write pointer is incremented by one every time frame data writing is completed.

(3) Read Pointer Control

The read pointer is updated at the rising edge of the vertical sync signal on the reading side according to the difference between the read and write pointer values as follows.

(A) When (write pointer value) – (read pointer value) ≤ 1

The read pointer value is not updated (the same frame is displayed continuously).

(B) When (write pointer value) – (read pointer value) = 2

The read pointer is incremented by one with the next updating timing.

(C) When (write pointer value) – (read pointer value) ≥ 3

The read pointer is incremented by two with the next updating timing.

(One frame is skipped.)

(4) Frame Buffer Read Control

(A) When SC_RES_WENB = 0

Frame data is not written to the frame buffer, and the frame buffer is not read.

(B) When frame data writing is terminated with SC_RES_WENB = 1

As the pointer buffer value is determined, the frame buffer is read.

Table 31.38 Frame Buffer Control

Register Name	Bit Name	Initial Value	Description
SC_SCL1_PBUF0	SC_BUF0_ADD	0	Start address of the write buffer pointed to by pointer buffer 0
SC_SCL1_PBUF1	SC_BUF1_ADD	0	Start address of the write buffer pointed to by pointer buffer 1
SC_SCL1_PBUF2	SC_BUF2_ADD	0	Start address of the write buffer pointed to by pointer buffer 2
SC_SCL1_PBUF3	SC_BUF3_ADD	0	Start address of the write buffer pointed to by pointer buffer 3
SC_SCL1_PBUF_FLD	SC_FLD_INF0	0	Top or bottom field information pointed to by pointer buffer 0 0: Bottom 1: Top
SC_SCL1_PBUF_FLD	SC_FLD_INF1	0	Top or bottom field information pointed to by pointer buffer 1 0: Bottom 1: Top
SC_SCL1_PBUF_FLD	SC_FLD_INF2	0	Top or bottom field information pointed to by pointer buffer 2 0: Bottom 1: Top
SC_SCL1_PBUF_FLD	SC_FLD_INF3	0	Top or bottom field information pointed to by pointer buffer 3 0: Bottom 1: Top
SC_SCL1_PBUF_CNT	SC_PBUF_RST	0	Reset Control for the Pointer Buffer 0: Pointer buffer is not reset. 1: Pointer buffer is reset.
SC_SCL1_MON1	SC_PBUF_NUM	0	Write pointer indicating the pointer buffer number corresponding to the location currently being written to.
SC_SCL1_WR5	SC_RES_WENB	0	Frame Buffer Write Enable After making the setting to enable writing, writing starts from the second frame. 0: Writing is disabled. 1: Writing is enabled.
GR_FLM1	GR_FLM_SEL	0	Frame Buffer Address Setting Signal Selection 0: Links to scaling-down process. (This setting is prohibited when separate write addresses are specified for the top and bottom fields; that is, SC_RES_TB_ADD_MOD = 1 in SC_SCL1_WR1.) 1: Selects GR0_FLM_NUM. 2: Setting prohibited 3: Links to pointer buffer.
GR_FLM2	GR_BASE	0	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower three bits should be fixed to 000.

For other frame buffer read operation and graphics processing, refer to section 33., Video Display Controller 5 (5): Image Synthesizer.

31.2 Register Descriptions

Table 31.39 shows the register configuration.

- Symbols used in Register Description:

Initial value: Register value after a reset
—: Undefined value
R/W: Readable/writable. The written value can be read.
R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.
R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
R: Read-only. The write value should always be 0.
—/W: Write-only. The read value is undefined.

Table 31.39 Register Configuration of the Scaler

Name	Abbreviation	R/W	Initial Value	Address	Access Size
SCL0 register update control register (SC0)	SC0_SCL0_UPDATE	R/WC1	H'0000 0000	H'FCFF 7500	32

31.2.1 SCL0 Register Update Control Register (SC0_SCL0_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	SC0_SCL0_VEN_D	SC0_SCL0_VEN_C	—	—	—	SC0_SCL0_UPDATE	—	—	—	SC0_SCL0_VEN_B	—	—	—	SC0_SCL0_VEN_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/WC1	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	SC0_SCL0_VEN_D	0	R/WC1	Scaling-Up Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
12	SC0_SCL0_VEN_C	0	R/WC1	Scaling-Down Control and Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC0_SCL0_UPDATE	0	R/WC1	SYNC Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_SCL0_VEN_B	0	R/WC1	Synchronization Control and Scaling-up Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_SCL0_VEN_A	0	R/WC1	Scaling-Down Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

31.2.2 Mask Control Register (SC0_SCL0_FRC1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_RES_VMASK[15:0]															
Initial value:	0	0	0	0	1	0	1	0	1	1	1	1	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_VMASK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SC0_RES_VMASK [15:0]	2800	R/W	Repeated Vsync Signal Masking Period Sets the repeated Vsync signal masking period beginning at a Vsync signal in terms of 128 pixel-clock periods. Masking period [usec] = SC0_RES_VMASK × 128 ÷ pixel clock frequency [MHz]
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_ VMASK_ON	1	R/W	Repeated Vsync Signal Masking Control 0: Repeated Vsync signal masking control is disabled. 1: Repeated Vsync signal masking control is enabled.

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.3 Missing Vsync Compensation Control Register (SC0_SCL0_FRC2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_RES_VLACK[15:0]															
Initial value:	0	0	0	0	1	1	1	0	0	0	0	1	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_VLACK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SC0_RES_ VLACK [15:0]	3600	R/W	Missing-Sync Compensating Pulse Output Wait Time Sets the wait time before outputting a missing-sync compensating pulse after a Vsync signal. Wait time [usec] = SC0_RES_VLACK × 128 ÷ pixel clock frequency [MHz]
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_ VLACK_ON	1	R/W	Missing Vsync Signal Compensation 0: Compensation of missing Vsync signals is disabled. 1: Compensation of missing Vsync signals is enabled.

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.4 Output Sync Select Register (SC0_SCL0_FRC3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_VS_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_VS_SEL	1	R/W	Vsync Signal Output Select 0: Externally input Vsync signal 1: Internally generated free-running Vsync signal

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.5 Free-Running Period Control Register (SC0_SCL0_FRC4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_FV[10:0]										
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	1	1	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_FH[10:0]										
Initial value:	0	0	0	0	0	0	1	1	0	0	0	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_FV [10:0]	524	R/W	Free-Running Vsync Period Setting Free-running Vsync period = (SC0_RES_FV + 1) × horizontal period [usec]
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_FH [10:0]	799	R/W	Hsync Period Setting Hsync period [usec] = (SC0_RES_FH +1) ÷ pixel clock frequency [MHz]

Note: This register is updated when the SC0_SCL0_UPDATE bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.6 Output Delay Control Register (SC0_SCL0_FRC5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SC0_RES_FLD_DLY_SEL	SC0_RES_VSDLY[7:0]							
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC0_RES_ FLD_DLY_SEL	1	R/W	Field Determination Signal Delay Control 0: No delay 1: Delay of one vertical cycle
7 to 0	SC0_RES_ VSDLY[7:0]	1	R/W	Vsync Signal Delay Control Adjusts the Vsync signal delay in the output Hsync period units. Vsync signal delay [usec]: SC0_RES_VSDLY × output Hsync period [usec]

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.7 Full-Screen Vertical Size Register (SC0_SCL0_FRC6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_F_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_F_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_F_VS[10:0]	35	R/W	Vertical Enable Signal Start Position for Full Screen. (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC0_RES_F_VS + SC0_RES_F_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_F_VW[10:0]	480	R/W	Vertical Enable Signal Width for Full Screen (lines) Note: SC0_RES_F_VS + SC0_RES_F_VW should be equal to or less than 2039 (lines).

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.8 Full-Screen Horizontal Size Register (SC0_SCL0_FRC7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_F_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_F_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_F_HS[10:0]	144	R/W	Horizontal Enable Signal Start Position for Full Screen. (HSYNC+H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC0_RES_F_HS + SC0_RES_F_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_F_HW[10:0]	640	R/W	Horizontal Enable Signal Width for Full Screen (pixel-clock cycles) Note 1. SC0_RES_F_HS + SC0_RES_F_HW should be equal to or less than 2015 (clock cycles). Note 2. The set value should be equal to (horizontal signal width for full screen + 2) when serial RGB output is selected as an LCD output signal.

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.9 Vsync Detection Register (SC0_SCL0_FRC9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_QVLOCK	—	—	—	SC0_RES_QVLACK
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_QVLOCK	0	R	Locked Vsync Signal Detection Flag 1: No repeated or missing Vsync signal input has been detected for four or more vertical periods. 0: Repeated or missing Vsync signal input has been detected.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_QVLACK	0	R	Missing Vsync Signal Detection Flag 1: Missing Vsync signal input has been detected. 0: No missing Vsync signal input has been detected.

31.2.10 Status Monitor 0 Register (SC0_SCL0_MON0)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_LIN_STAT[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_LIN_STAT[10:0]	All 0	R	Current location of the image line input to the scaling-down control block.

31.2.11 Interrupt Control Register (SC0_SCL0_INT)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_LINE[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_LINE[10:0]	All 0	R/W	Setting of Interrupt on Image Line Input to Scaling-down Control Block When the location of the image line input to the scaling-down control block matches the SC0_RES_LINE setting, an interrupt signal is output. (Setting prohibited in this product)

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.12 Scaling-Down Control Register (SC0_SCL0_DS1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_DS_V_ON	—	—	—	SC0_RES_DS_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_DS_V_ON	1	R/W	Vertical Scale Down On/Off 0: Off 1: On
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_DS_H_ON	1	R/W	Horizontal Scale Down On/Off 0: Off 1: On

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.13 Vertical Capture Size Register (SC0_SCL0_DS2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_HS [10:0]	244	R/W	Horizontal Position Setting for Video Signal Capturing (HSYNC + H backporch video-image clock cycles) Note: The set value should be 16 or more (clock cycles). SC0_RES_HS + SC0_RES_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_HW [10:0]	1440	R/W	Horizontal Width of Video Signal to be Captured (Video-image clock cycles) Note: SC0_RES_HS + SC0_RES_HW should be equal to or less than 2015 (clock cycles).

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.15 Horizontal Scale Down Register (SC0_SCL0_DS4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	SC0_RES_PFIL_SEL	SC0_RES_DS_H_INTERPOTYP	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_DS_H_RATIO[15:0]															
Initial value:	0	0	1	0	0	1	0	0	0	0	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29	SC0_RES_PFIL_SEL	0	R/W	Prefilter Mode Select for Brightness Signals 0: The prefilter is turned off. 1: The prefilter is turned on. (1/4 + 1/2 + 1/4)
28	SC0_RES_DS_H_INTERPOTYP	1	R/W	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
27 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC0_RES_DS_H_RATIO[15:0]	9224	R/W	Horizontal Scale Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) round(SC0_RES_HW ÷ SC0_RES_OUT_HW × 4096) SC0_RES_DS_H_RATIO < 4096: Setting prohibited SC0_RES_DS_H_RATIO = 4096: 100% scale up SC0_RES_DS_H_RATIO > 4096: Scale down

Note: This register is updated when the SC0_SCL0_VEN_A bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.16 Initial Vertical Phase Register (SC0_SCL0_DS5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	SC0_RES_V_INTERPOTYP	SC0_RES_TOP_INIPHASE[11:0]											
Initial value:	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SC0_RES_BTM_INIPHASE[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	SC0_RES_V_INTERPOTYP	1	R/W	Vertical Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
27 to 16	SC0_RES_TOP_INIPHASE[11:0]	2048	R/W	Vertical Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SC0_RES_BTM_INIPHASE[11:0]	0	R/W	Vertical Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)

Note: This register is updated when the SC0_SCL0_VEN_A and SC0_SCL0_VEN_B bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

31.2.17 Vertical Scaling Register (SC0_SCL0_DS6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_V_RATIO[15:0]															
Initial value:	0	0	0	0	0	1	1	1	1	1	1	1	1	1	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC0_RES_V_RATIO [15:0]	2044	R/W	Vertical Scale Up/Down Ratio ([15:12]: Integer part, [11:0]: Decimal part) For scale down: round (SC0_RES_VW ÷ SC0_RES_OUT_VW × 4096) For scale up: round (SC0_RES_IN_VW ÷ SC0_RES_P_VW × 4096) SC0_RES_V_RATIO < 4096: Scale up SC0_RES_V_RATIO = 4096: 100% scale up SC0_RES_V_RATIO > 4096: Scale down

Note: These bits updated when the SC0_SCL0_VEN_A and SC0_SCL0_VEN_B bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1. Accordingly, even a scaled-up graphics display requires both an input Vsync signal and output Vsync signal.

31.2.18 Scaling-Down Control Block Output Size Register (SC0_SCL0_DS7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_OUT_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_OUT_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_OUT_VW [10:0]	240	R/W	Number of Valid Lines in Vertical Direction Output by Scaling-down Control Block (lines) This bit setting is used for the number of lines to be written to the frame buffer. When SC0_SCL1_WR1.SC0_RES_LOOP is 0 (frame write mode), specify the number of lines for one frame. When SC0_SCL1_WR1.SC0_RES_LOOP is 1 (line write mode), specify the number of lines for repeated write. Note: The SC0_RES_OUT_VW value should be aligned in 4-line units and equal to or smaller than the SC0_RES_VW value.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_OUT_HW [10:0]	640	R/W	Number of Valid Horizontal Pixels Output by Scaling-Down Control Block (video-image clock cycles) Note: The SC0_RES_OUT_HW value should be aligned in 4-pixel units and equal to or smaller than the SC0_RES_HW value.

Note: This register is updated when the SC0_SCL0_VEN_A and SC0_SCL0_VEN_C bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

31.2.19 Scaling-Up Control Register (SC0_SCL0_US1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_US_V_ON	—	—	—	SC0_RES_US_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_US_V_ON	1	R/W	Vertical Scale Up On/Off 0: Off 1: On
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_US_H_ON	1	R/W	Horizontal Scale Up On/Off 0: Off 1: On

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.20 Output Image Vertical Size Register (SC0_SCL0_US2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_P_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_P_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_P_VS[10:0]	35	R/W	Vertical Enable Signal Start Position for Output Image (VSYNC + V backporch lines) Note: The set value should be four or more (lines). SC0_RES_P_VS + SC0_RES_P_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_P_VW[10:0]	480	R/W	Vertical Enable Signal Width for Output Image (lines) Note: SC0_RES_P_VS + SC0_RES_P_VW should be equal to or less than 2039 (lines).

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.21 Output Image Horizontal Size Register (SC0_SCL0_US3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_P_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_P_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_P_HS[10:0]	144	R/W	Horizontal Enable Signal Start Position for Output Image (HSYNC+H backporch pixel-clock cycles) Note: The set value should be 16 or more (clock cycles). SC0_RES_P_HS + SC0_RES_P_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_P_HW[10:0]	640	R/W	Horizontal Enable Signal Width for Output Image (pixel-clock cycles) Note: SC0_RES_P_HS + SC0_RES_P_HW should be equal to or less than 2015 (clock cycles).

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.22 Scaling-Up Control Block Input Size Register (SC0_SCL0_US4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	SC0_RES_IN_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SC0_RES_IN_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SC0_RES_IN_VW[10:0]	240	R/W	Number of Valid Lines in Vertical Direction Input to Scaling-down Control Block (lines)
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SC0_RES_IN_HW[10:0]	640	R/W	Number of Valid Horizontal Pixels Input to Scaling-down Control Block (pixel-clock cycles)

Note: This register is updated when the SC0_SCL0_VEN_B and SC0_SCL0_VEN_D bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.

31.2.23 Horizontal Scale Up Register (SC0_SCL0_US5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_US_H_RATIO[15:0]															
Initial value:	0	0	1	0	0	1	0	0	0	0	0	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	SC0_RES_US_H_RATIO [15:0]	9224	R/W	Horizontal Scale Up Ratio ([15:12]: Integer part, [11:0]: Decimal part) round (SC0_RES_IN_HW ÷ SC0_RES_P_HW × 4096) SC0_RES_US_H_RATIO < 4096: Scale up SC0_RES_US_H_RATIO = 4096: 100% scale up SC0_RES_US_H_RATIO > 4096: Setting prohibited

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.24 Horizontal Scale Up Initial Phase Register (SC0_SCL0_US6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	SC0_RES_US_H_INTERPOTYP	SC0_RES_US_HT_INIPHASE[11:0]											
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	SC0_RES_US_HB_INIPHASE[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	SC0_RES_US_H_INTERPOTYP	1	R/W	Horizontal Interpolation Mode Select 0: Hold interpolation 1: Linear interpolation
27 to 16	SC0_RES_US_HT_INIPHASE[11:0]	0	R/W	Horizontal Interpolation Start Phase for Top Field 0 to 4095 (0 to approx. 1.0)
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 0	SC0_RES_US_HB_INIPHASE[11:0]	0	R/W	Horizontal Interpolation Start Phase for Bottom Field 0 to 4095 (0 to approx. 1.0)

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.25 Trimming Register (SC0_SCL0_US7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_HCUT[7:0]								SC0_RES_VCUT[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	SC0_RES_HCUT[7:0]	0	R/W	Horizontal Amount of Cut-off Post-Scaling Image (Right and Left Parts) Sets the number of pixel-clock cycles.
7 to 0	SC0_RES_VCUT[7:0]	0	R/W	Vertical Amount of Cut-off Post-Scaling Image (Upper and Lower Parts) Sets the number of lines.

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.26 Frame Buffer Read Select Register (SC0_SCL0_US8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_IBUS_SYNC_SEL	—	—	—	SC0_RES_DISP_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_IBUS_SYNC_SEL	0	R/W	Sync Signal Select for Frame Buffer Read Block 0: Sync signals from the scaling-up control block 1: Sync signals from the graphics processing block
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_DISP_ON	0	R/W	Post-Scaling Image Frame Display On/Off 0: Frame display on 1: Frame display off

Note: SC0_RES_IBUS_SYNC_SEL is updated when the SC0_SCL0_VEN_B and SC0_SCL0_VEN_D bits in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) are 1.
SC0_RES_DISP_ON is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.27 Background Color Register (SC0_SCL0_OVR1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	SC0_RES_BK_COL_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_BK_COL_G[7:0]								SC0_RES_BK_COL_B[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	SC0_RES_BK_CLO_R[7:0]	128	R/W	Background Color Setting R/Cr Signal R: 8 bits; unsigned (0 to 255 [LSB]) Cr: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])
15 to 8	SC0_RES_BK_COL_G[7:0]	0	R/W	Background Color Setting G/Y Signal G/Y: 8 bits; unsigned (0 to 255 [LSB])

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SC0_RES_BK_COL_B[7:0]	128	R/W	Background Color Setting B/Cb Signal B: 8 bits; unsigned (0 to 255 [LSB]) Cb: 8 bits; 128 offset binary; unsigned (0 to 255 [LSB])

Note: This register is updated when the SC0_SCL0_VEN_B bit in the SC0_SCL0 register update control register (SC0_SCL0_UPDATE) is 1.

31.2.28 SCL1 Register Update Control Register (SC0_SCL1_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	SC0_SCL1_UPDATE_B	—	—	—	SC0_SCL1_UPDATE_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_SCL1_VEN_B	—	—	—	SC0_SCL1_VEN_A
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	SC0_SCL1_UPDATE_B	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC0_SCL1_UPDATE_A	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated.
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_SCL1_VEN_B	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_SCL1_VEN_A	0	R/WC1	Frame Buffer Write Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

31.2.29 Writing Mode Register (SC0_SCL1_WR1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_WRSWA [2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	SC0_RES_TB_ADD_MOD	SC0_RES_DS_WR_MD[2:0]			SC0_RES_MD[1:0]		SC0_RES_LOOP	SC0_RES_BST_MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
18 to 16	SC0_RES_ WRSWA[2:0]	All 0	R/W	8-Bit, 16-Bit, or 32-Bit Swap Setting These bits control swapping in frame buffer writing as follows. Bit 0 0: Swapped in 8-bit units. 1: Not swapped in 8-bit units. Bit 1 0: Swapped in 16-bit units. 1: Not swapped in 16-bit units. Bit 2 0: Swapped in 32-bit units. 1: Not swapped in 32-bit units. According to the setting of these bits, data is swapped as follows. Each number in parentheses ((1) to (8)) indicates 8-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [Not swapped] 001: (2) (1) (4) (3) (6) (5) (8) (7) [Swapped in 8-bit units] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Swapped in 16-bit units] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Swapped in 16-bit units + 8-bit units] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Swapped in 32-bit units] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Swapped in 32-bit units + 8-bit units] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Swapped in 32-bit units + 16-bit units] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Swapped in 32-bit units + 16-bit units + 8-bit units] Note: When YCbCr422 or RGB565 is selected as a frame buffer video-signal writing format, these bits should be set to 000 [Not swapped].
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	SC0_RES_ TB_ADD_MOD	0	R/W	Top and Bottom Data Write Address Specification Method 0: A write address is specified in common for top and bottom data. 1: Separate write addresses are specified for top and bottom data.
6 to 4	SC0_RES_ DS_WR_MD [2:0]	0	R/W	Frame Buffer Writing Mode for Image Processing 0: Normal 1: Horizontal mirroring 2: 90° rotation 3: 180° rotation 4: 270° rotation 5 to 7: Setting prohibited

Bit	Bit Name	Initial Value	R/W	Description
3, 2	SC0_RES_MD [1:0]	0	R/W	Frame Buffer Video-Signal Writing Format 0: YCbCr422 (16 bits) 1: RGB565 (16 bits) 2: RGB888 (24 (32) bits) 3: YCbCr444 (24 (32) bits)
1	SC0_RES_ LOOP	0	R/W	Frame Buffer Write Mode Select 0: Frame mode 1: Line mode (read as ring buffer)
0	SC0_RES_ BST_MD	0	R/W	Transfer Burst Length for Frame Buffer Writing 0: 32-byte 1: 128-byte

Note: SC0_RES_LOOP and SC0_RES_BST_MD are updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.
SC0_RES_TB_ADD_MOD, SC0_RES_DS_WR_MD, and SC0_RES_MD are updated when the SC0_SCL1_VEN_A and SC0_SCL1_VEN_B bits in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) are 1.
SC0_RES_WRSWA is updated when the SC0_SCL1_UPDATE_A bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.30 Write Address Register 1T (SC0_SCL1_WR2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_RES_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_RES_ BASE [31:0]	0	R/W	Frame Buffer Base Address Sets the start address of the frame buffer to store the frame data for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0. For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.31 Write Address Register 2T (SC0_SCL1_WR3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	SC0_RES_LN_OFF[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_RES_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	SC0_RES_LN_OFF [14:0]	2048	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the line start address for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0. Line 0: SC0_RES_BASE Line 1: SC0_RES_BASE + SC0_RES_LN_OFF × 1 : Line n: SC0_RES_BASE + SC0_RES_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_NUM [9:0]	1	R/W	Number of Frames of Buffer to be Written to Sets the number of frames for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0 Number of frames defined by SC0_RES_FLM_NUM + 1 are used.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.32 Write Address Register 3T (SC0_SCL1_WR4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	SC0_RES_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	SC0_RES_FLM_OFF [22:0]	524288	R/W	Frame Buffer Frame Offset Address Sets the frame offset address for calculating the start address of each frame for the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that for the top and bottom fields when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0. Buffer 0: SC0_RES_BASE Buffer 1: SC0_RES_BASE + SC0_RES_FLM_OFF × 1 : Buffer n: SC0_RES_BASE + SC0_RES_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.33 Frame Sub-Sampling Register (SC0_SCL1_WR5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	SC0_RES_INTER	—	—	SC0_RES_FS_RATE[1:0]		—	—	—	SC0_RES_FLD_SEL	—	—	—	SC0_RES_WENB
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	SC0_RES_INTER	1	R/W	Field Operating Mode Select 0: Progressive 1: Interlace
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	SC0_RES_FS_RATE[1:0]	0	R/W	Writing Rate Sets the frame buffer writing rate to the vertical frequency of the input signal. 0: 1/1 an input signal (The SC0_RES_FLD_SEL setting is invalid.) 1: 1/2 an input signal 2: 1/4 an input signal 3: 1/8 an input signal
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_FLD_SEL	0	R/W	Write Field Select 0: Top field 1: Bottom field
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_WENB	0	R/W	Frame Buffer Write Enable After making the setting to enable writing, writing starts from the second frame. 0: Frame buffer writing is disabled. 1: Frame buffer writing is enabled.

Note: SC0_RES_INTER, SC0_RES_FS_RATE[1:0], and SC0_RES_FLD_SEL are updated when the SC0_SCL1_VEN_A bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.
SC0_RES_WENB is updated when the SC0_SCL1_VEN_A and SC0_SCL1_VEN_B bits in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) are 1.

31.2.34 Bit Reduction Register (SC0_SCL1_WR6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_DTH_ON	—	—	—	SC0_RES_BITDEC_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SC0_RES_DTH_ON	0	R/W	Dither Correction On/Off 0: Off (rounded off) 1: On (2 × 2 dither pattern)
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SC0_RES_BITDEC_ON	0	R/W	Bit Reduction On/Off 0: Off 1: On

Note: This register is updated when the SC0_SCL1_VEN_A bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.35 Write Detection Register (SC0_SCL1_WR7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_RES_OVERFLOW
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_RES_FLM_CNT[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC0_RES_OVERFLOW	0	R	Line Buffer Overflow Detect 1: Line buffer has overflowed. 0: Line buffer has not overflowed.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_CNT[9:0]	0	R	Frame Number of Frame Being Accessed Frame number of the frame being accessed in the top field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1 or that in the top or bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 0.

31.2.36 Write Address Register 1B (SC0_SCL1_WR8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_RES_BASE_B[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_BASE_B[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_RES_BASE_B [31:0]	0	R/W	Frame Buffer Base Address for Bottom Sets the start address of the frame buffer to store the frame data for the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1. For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.37 Write Address Register 2B (SC0_SCL1_WR9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	SC0_RES_LN_OFF_B[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_RES_FLM_NUM_B[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	SC0_RES_LN_OFF_B [14:0]	2048	R/W	Frame Buffer Line Offset Address for Bottom Sets the line offset address for calculating the line start address for the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1. Line 0: SC0_RES_BASE_B Line 1: SC0_RES_BASE_B + SC0_RES_LN_OFF_B × 1 : Line n: SC0_RES_BASE + SC0_RES_LN_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_NUM_B [9:0]	1	R/W	Number of Frames of Buffer to be Written to for Bottom Field Number of frames defined by SC0_RES_FLM_NUM_B + 1 are used when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.38 Write Address Register 3B (SC0_SCL1_WR10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	SC0_RES_FLM_OFF_B[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_RES_FLM_OFF_B[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	SC0_RES_FLM_OFF_B[22:0]	524288	R/W	Frame Buffer Frame Offset Address for Bottom Sets the frame offset address for calculating the start address of each frame for the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1. Buffer 0: SC0_RES_BASE_B Buffer 1: SC0_RES_BASE_B + SC0_RES_FLM_OFF_B × 1 : Buffer n: SC0_RES_BASE_B + SC0_RES_FLM_OFF_B × n For 32-byte transfer: The lower five bits should be fixed to 0_0000. For 128-byte transfer: The lower seven bits should be fixed to 000_0000.

Note: This register is updated when the SC0_SCL1_VEN_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.39 Write Detection Register B (SC0_SCL1_WR11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_RES_FLM_CNT_B[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	SC0_RES_FLM_CNT_B[9:0]	0	R	Frame Number of Frame Being Accessed in Bottom Field Frame number of the frame being accessed in the bottom field when SC0_SCL1_WR1.SC0_RES_TB_ADD_MOD = 1.

31.2.40 Status Monitor 1 Register (SC0_SCL1_MON1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SC0_PBUF_NUM[1:0]		—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	SC0_PBUF_NUM[1:0]	All 0	R	Write pointer indicating the pointer buffer number corresponding to the location currently being written to.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

31.2.41 Pointer Buffer 0 Register (SC0_SCL1_PBUF0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_PBUF0_ADD[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_PBUF0_ADD[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_PBUF0_ADD[31:0]	All 0	R	Start address of the write buffer pointed to by pointer buffer 0.

31.2.42 Pointer Buffer 1 Register (SC0_SCL1_PBUF1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_PBUF1_ADD[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_PBUF1_ADD[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_PBUF1_ ADD[31:0]	All 0	R	Start address of the write buffer pointed to by pointer buffer 1.

31.2.43 Pointer Buffer 2 Register (SC0_SCL1_PBUF2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_PBUF2_ADD[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_PBUF2_ADD[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_PBUF2_ ADD[31:0]	All 0	R	Start address of the write buffer pointed to by pointer buffer 2.

31.2.44 Pointer Buffer 3 Register (SC0_SCL1_PBUF3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SC0_PBUF3_ADD[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SC0_PBUF3_ADD[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SC0_PBUF3_ ADD[31:0]	All 0	R	Start address of the write buffer pointed to by pointer buffer 3.

31.2.45 Pointer Buffer and Field Information Register (SC0_SCL1_PBUF_FLD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	SC0_FLD_INF3	—	—	—	—	—	—	—	SC0_FLD_INF2
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SC0_FLD_INF1	—	—	—	—	—	—	—	SC0_FLD_INF0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	SC0_FLD_ INF3	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 3. 0: Bottom 1: Top
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC0_FLD_ INF2	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 2. 0: Bottom 1: Top
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	SC0_FLD_ INF1	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 1. 0: Bottom 1: Top
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	SC0_FLD_INF0	0	R	Top or bottom field information of the frame buffer pointed to by pointer buffer 0. 0: Bottom 1: Top

31.2.46 Pointer Buffer Control Register (SC0_SCL1_PBUF_CNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SC0_PBUF_RST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SC0_PBUF_RST	0	R/W	Reset Control for Pointer Buffer 0: Pointer buffer is not reset. 1: Pointer buffer is reset.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: This register is updated when the SC0_SCL1_UPDATE_B bit in the SC0_SCL1 register update control register (SC0_SCL1_UPDATE) is 1.

31.2.47 Graphics 0 Register Update Control Register (GR0_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GR0_UPDATE	—	—	—	GR0_P_VEN	—	—	—	GR0_IBUS_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR0_UPDATE	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR0_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_IBUS_VEN	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

31.2.48 Frame Buffer Read Control Register (Graphics 0) (GR0_FLM_RD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR0_R_ENB
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_R_ENB	0	R/W	Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled.

Note: This register is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.49 Frame Buffer Control Register 1 (Graphics 0) (GR0_FLM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_FLD_SEL	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR0_LN_OFF_DIR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR0_FLM_SEL[1:0]		—	—	—	—	—	—	—	GR0_BST_MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	GR0_FLD_SEL	0	R/W	Enables or disables top or bottom field selection for the next frame buffer to be read. 0: Field selection is disabled. 1: Top or bottom field can be selected.
30 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR0_LN_OFF_DIR	0	R/W	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	GR0_FLM_SEL[1:0]	0	R/W	Selects a frame buffer address setting signal. 0: Links to scaling-down process. (This setting is prohibited when separate write addresses are specified for the top and bottom fields; that is, SC0_RES_TB_ADD_MOD = 1 in SC0_SCL1_WR1.) 1: Selects GR0_FLM_NUM. 2: Setting prohibited 3: Links to pointer buffer.
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR0_BST_MD	0	R/W	Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer

Note: GR0_FLD_SEL is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.
GR0_LN_OFF_DIR is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.
GR0_FLM_SEL is updated when the GR0_P_VEN and GR0_IBUS_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.
GR0_BST_MD is updated when the GR0_IBUS_VEN and GR0_P_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

31.2.50 Frame Buffer Control Register 2 (Graphics 0) (GR0_FLM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GR0_BASE [31:0]	0	R/W	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR0_BASE[4:3] and GR0_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower three bits should be fixed to 000.

Note: This register is updated when the GR0_IBUS_VEN and GR0_P_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

31.2.51 Frame Buffer Control Register 3 (Graphics 0) (GR0_FLM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_FLD_NXT	GR0_LN_OFF[14:0]														
Initial value:	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR0_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	GR0_FLD_NXT	0	R/W	Top or Bottom Field Selection for Next Frame Buffer 0: Bottom 1: Top
30 to 16	GR0_LN_OFF[14:0]	2048	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR0_BASE Line 1: GR0_BASE + GR0_LN_OFF × 1 : Line n: GR0_BASE + GR0_LN_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GR0_FLM_NUM[9:0]	1	R/W	Frame Number of Frame Buffer Manually set the frame number when GR0_FLM_SEL = 1.

Note: GR0_FLD_NXT is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.
GR0_LN_OFF[14:0] and GR0_FLM_NUM[9:0] are updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.52 Frame Buffer Control Register 4 (Graphics 0) (GR0_FLM4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GR0_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	GR0_FLM_OFF[22:0]	524288	R/W	Frame Buffer Frame Offset Address Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR0_BASE Buffer 1: GR0_BASE + GR0_FLM_OFF × 1 : Buffer n: GR0_BASE + GR0_FLM_OFF × n For 32-byte transfer: The lower five bits should be fixed to 0 0000. For 128-byte transfer: The lower seven bits should be fixed to 000 0000.

Note: This register is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.53 Frame Buffer Control Register 5 (Graphics 0) (GR0_FLM5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR0_FLM_LNUM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR0_FLM_LOOP[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR0_FLM_ LNUM[10:0]	0	R/W	Sets number of lines in a frame Number of lines is (GR0_FLM_LNUM + 1).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR0_FLM_ LOOP[10:0]	1023	R/W	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. (GR0_FLM_LOOP + 1) lines are read.

Note: This register is updated when the GR0_IBUS_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.54 Frame Buffer Control Register 6 (Graphics 0) (GR0_FLM6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR0_FORMAT[3:0]				—	GR0_HW[10:0]										
Initial value:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR0_YCC_SWAP[2:0]			GR0_RDSWA[2:0]			—	GR0_CNV444_MD	—	—	GR0_STA_POS[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GR0_FORMAT [3:0]	8	R/W	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: YCbCr422 9: YCbCr444 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 16	GR0_HW [10:0]	0	R/W	Sets the width of the horizontal valid period. The width is (GR0_HW + 1) pixels. Note: The set value should be equal to or more than two.
15 to 13	GR0_YCC_SWAP[2:0]	0	R/W	Controls swapping of data read from buffer in the YCbCr422 format. 0: Cb/Y0/Cr/Y1 1: Y0/Cb/Y1/Cr 2: Cr/Y0/Cb/Y1 3: Y0/Cr/Y1/Cb 4: Y1/Cr/Y0/Cb 5: Cr/Y1/Cb/Y0 6: Y1/Cb/Y0/Cr 7: Cb/Y1/Cr/Y0

Bit	Bit Name	Initial Value	R/W	Description
12 to 10	GR0_ RDSWA [2:0]	0	R/W	8-Bit, 16-Bit, or 32-Bit Swap Setting These bits control swapping in frame buffer reading as follows. Bit 0 0: Swapped in 8-bit units. 1: Not swapped in 8-bit units. Bit 1 0: Swapped in 16-bit units. 1: Not swapped in 16-bit units. Bit 2 0: Swapped in 32-bit units. 1: Not swapped in 32-bit units. According to the setting of these bits, data is swapped as follows. Each number in parentheses ((1) to (8)) indicates 8-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [Not swapped] 001: (2) (1) (4) (3) (6) (5) (8) (7) [Swapped in 8-bit units] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Swapped in 16-bit units] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Swapped in 16-bit units + 8-bit units] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Swapped in 32-bit units] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Swapped in 32-bit units + 8-bit units] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Swapped in 32-bit units + 16-bit units] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Swapped in 32-bit units + 16-bit units + 8-bit units]
9	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
8	GR0_ CNV444_ MD	0	R/W	Sets the interpolation mode for YCbCr422 to YCbCr444 conversion. 0: Hold interpolation 1: Average interpolation
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	GR0_STA_ POS[5:0]	0	R/W	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR0_STA_POS is skipped from the start of the line.

Note: GR0_YCC_SWAP, GR0_CNV444, and GR0_STA_POS are updated when GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.
GR0_ RDSWA is updated when the GR0_UPDATE bit in the graphics 0 register update control register (GR0_UPDATE) is 1.
GR0_FORMAT and GR0_HW are updated when GR0_IBUS_VEN and GR0_P_VEN bits in the graphics 0 register update control register (GR0_UPDATE) are 1.

31.2.55 Alpha Blending Control Register 1 (Graphics 0) (GR0_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	GR0_GRC_DISP_ON	—	—	GR0_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR0_GRC_DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	GR0_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display (GR0_BASE) 1: Lower-layer graphics display When displaying video image or enlarged graphics, select this setting. 2: Current graphics display When displaying graphics, select this setting. 3: Blended display of lower-layer graphics and current graphics* Note: * Select this setting whenever chroma-key processing is to proceed. Since only current graphics are to be displayed by chroma-key processing, set the α values for both pixels to be subject to chroma-keying and pixels not to be subject to chroma-keying to 255.

Note: This register is updated when GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.56 Alpha Blending Control Register 2 (Graphics 0) (GR0_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR0_GRC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR0_GRC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR0_GRC_VS[10:0]	0	R/W	Vertical Start Position of Graphics Image Area. Note: The set value should be four or more (lines). GR0_GRC_VS + GR0_GRC_VW should be equal to or less than 2039 (lines).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR0_GRC_VW[10:0]	0	R/W	Vertical Width of Graphics Image Area.

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.57 Alpha Blending Control Register 3 (Graphics 0) (GR0_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR0_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR0_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR0_GRC_HS[10:0]	0	R/W	Horizontal Start Position of Graphics Image Area. Note: The set value should be 16 or more (clock cycles). GR0_GRC_HS + GR0_GRC_HW should be equal to or less than 2015 (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR0_GRC_HW[10:0]	0	R/W	Horizontal Width of Graphics Image Area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR0_HW to 2 and GR0_GRC_HW to 1 (1 pixel) or 2 (2 pixels).

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.2.58 Alpha Blending Control Register 7 (Graphics 0) (GR0_AB7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR0_CLT_SEL	0	R/W	CLUT Table Select Signal 0: Selects CLUT table 0. Referring to the CLUT table 0 value to expand to αRGB8888 The CPU side can read-access or write-access to the CLUT table 1. 1: Selects CLUT table 1. Referring to the CLUT table 1 value to expand to αRGB8888 The CPU side can read-access or write-access to the CLUT table 0.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: This register is updated when the GR0_P_VEN bit in the graphics 0 register update control register (GR0_UPDATE) is 1.

31.3 Usage Method

31.3.1 Scaling Setting Example for 525i Video Input and VGA-Size (640 x 480) Video Output

(1) Angles of View for Input and Output

This section describes an example of setting the signals of the input and output angles of view shown in Table 31.40.

Here, the over-scan rate is assumed to be 100%.

Table 31.40 Input and Output Angles for 525i Video Input and VGA-Size (640 x 480) Video Output

Input Signal	Output Signal	Signal Format	Rotation	Buffer Planes	Scaling Filter
1440 × 240	640 × 480	YCbCr	Normal	Two planes	2-tap linear

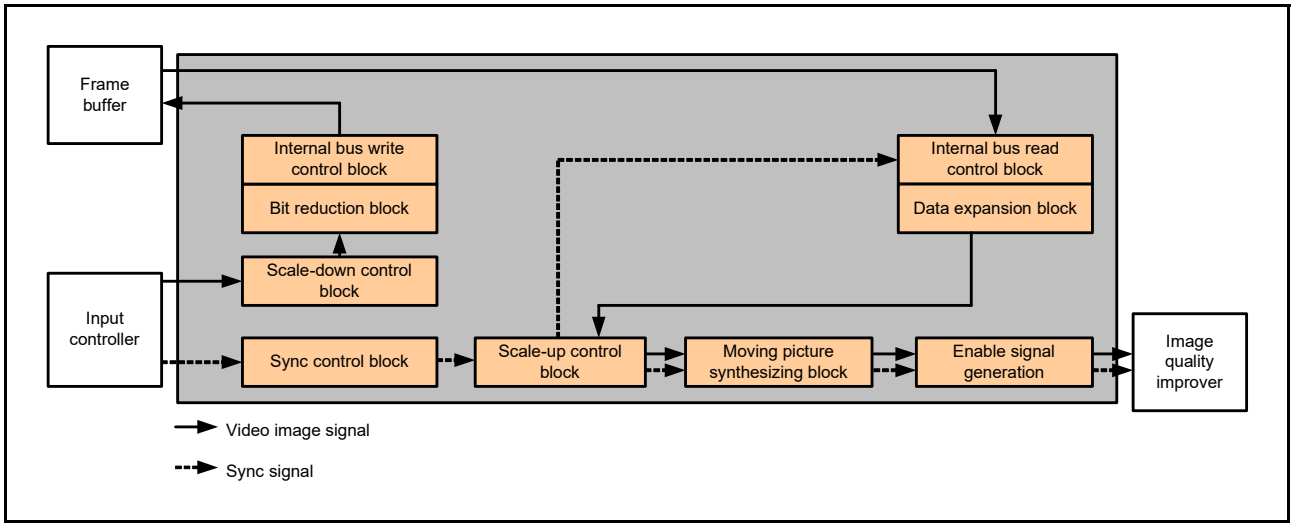

Figure 31.18 Signal Paths for Displaying Input Video Image

(2) Horizontal Scaling (Horizontal Scale Down, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

RATIO_org = round (1440 ÷ 640 × 4096) = 9216

σ = (9216 × (640 − 1) − (1440 − 1) × 4096) ÷ (640 − 1) = −8.01

Horizontal scaling ratio = roundup (9216 − (−8.01)) = 9225

(3) Vertical Scaling (Vertical Scale Up, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

RATIO_org = round (240 ÷ 480 × 4096) = 2048

σ = (2048 × (480 − 1) − (240 − 1) × 4096) ÷ (480 − 1) = 4.27

Vertical scaling ratio = round (2048 − (4.07)) = 2044

(4) Setting Frame Buffer Access Area

Since video data is written to the frame buffer after scaled down, the write size is 640 × 240 pixels.

The frame buffer area required is 640 pixels or more for line offset and line offset × 240 pixels or more for frame offset.

Here, the frame buffer work area is assumed to be 1024 × 256 pixels.

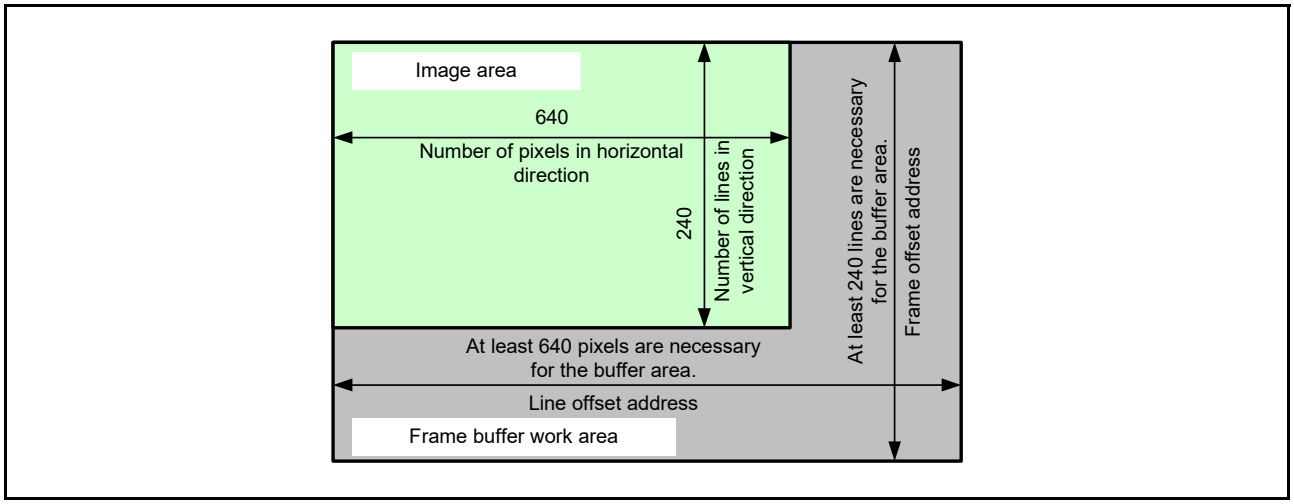

Figure 31.19 Frame Buffer Access Area Setting

Since the frame buffer is accessed in 64-bit units, YCbCr422 (16 bits) is accessed in 4-pixel units.

The line offset address values to be set are:

SC_RES_LN_OFF[14:0] = 1024 × 2 = 2048

GR_LN_OFF[14:0] = 1024 × 2 = 2048

The frame offset address values to be set are:

SC_RES_FLM_OFF[22:0] = SC_RES_LN_OFF[14:0] × 256 = 524288

GR_FLM_OFF[22:0] = GR_LN_OFF[14:0] × 256 = 524288

(5) Register Setting Example

Table 31.41 Register Setting Example for 525i Video Input and VGA-Size Video Output

Register Name	Bit Name	Settings	Remarks
		Synchronization Control	
SC_SCL0_FRC3	SC_RES_VS_SEL	0	External Vsync selected
SC_SCL0_FRC4	SC_RES_FH[10:0]	799	Horizontal period width of output signal (period width = set value + 1)
		Size of Angle of View	
SC_SCL0_DS2	SC_RES_VS[10:0]	15	Vertical capture start position of input signal
SC_SCL0_DS2	SC_RES_VW[10:0]	240	Vertical capture width of input signal
SC_SCL0_DS3	SC_RES_HS[10:0]	244	Horizontal capture start position of input signal
SC_SCL0_DS3	SC_RES_HW[10:0]	1440	Horizontal capture width of input signal
SC_SCL0_FRC6	SC_RES_F_VS[10:0]	35	Vertical valid start position of full screen
SC_SCL0_FRC6	SC_RES_F_VW[10:0]	480	Vertical valid width of full screen
SC_SCL0_FRC7	SC_RES_F_HS[10:0]	144	Horizontal valid start position of full screen
SC_SCL0_FRC7	SC_RES_F_HW[10:0]	640	Horizontal valid width of full screen
SC_SCL0_US2	SC_RES_P_VS[10:0]	35	Vertical valid start position of output image
SC_SCL0_US2	SC_RES_P_VW[10:0]	480	Vertical valid width of output image
SC_SCL0_US3	SC_RES_P_HS[10:0]	144	Horizontal valid start position of output image
SC_SCL0_US3	SC_RES_P_HW[10:0]	640	Horizontal valid width of output image
		Scaling Setting	
SC_SCL0_DS4	SC_RES_DS_H_RATIO [15:0]	9224	Horizontal scaling-down because SC_RES_DS_H_RATIO is equal to or larger than 4096
SC_SCL0_DS1	SC_RES_DS_H_ON	1	Horizontal scaling-down on
SC_SCL0_US1	SC_RES_US_H_ON	0	Horizontal scaling-up off
SC_SCL0_US5	SC_RES_US_H_RATIO [15:0]	4096	Horizontal scaling-up off because SC_RES_US_H_RATIO is equal to or larger than 4096
SC_SCL0_DS1	SC_RES_DS_V_ON	0	Vertical scaling-down off
SC_SCL0_US1	SC_RES_US_V_ON	1	Vertical scaling-up on
SC_SCL0_DS6	SC_RES_V_RATIO[15:0]	2044	Vertical scaling-up because SC_RES_V_RATIO is smaller than 4096
SC_SCL0_DS7	SC_RES_OUT_VW[10:0]	240	Vertical valid input width because the vertical scaling-down function is off
SC_SCL0_DS7	SC_RES_OUT_HW[10:0]	640	Horizontal image size after horizontal scaling-down
SC_SCL0_US4	SC_RES_IN_VW[10:0]	240	Vertical width of frame buffer read
SC_SCL0_US4	SC_RES_IN_HW[10:0]	640	Horizontal width of frame buffer read
		IP Conversion Setting	
SC_SCL0_DS5	SC_RES_TOP_ INIPHASE[11:0]	2048	Top field adjusted by 0.5-line phase
SC_SCL0_DS5	SC_RES_BTM_ INIPHASE[11:0]	0	No phase adjustment for bottom field
SC_SCL0_FRC5	SC_RES_FLD_DLY_SEL	1	IP conversion with two planes of frame buffer used for vertical scaling-up
		Frame Buffer Write Setting	
SC_SCL1_WR1	SC_RES_DS_WR_MD [2:0]	0	Normal write mode for rotation control
SC_SCL1_WR1	SC_RES_MD[1:0]	0	Frame buffer write format YCbCr422 (16 bits)
SC_SCL1_WR2	SC_RES_BASE[31:0]	0	Frame buffer write start address (0 in setting example)
SC_SCL1_WR3	SC_RES_LN_OFF[14:0]	2048	Frame buffer write line offset

Table 31.41 Register Setting Example for 525i Video Input and VGA-Size Video Output

Register Name	Bit Name	Settings	Remarks
SC_SCL1_WR3	SC_RES_FLM_NUM[9:0]	1	Two planes of frame buffer used
SC_SCL1_WR4	SC_RES_FLN_OFF[22:0]	524288	Frame buffer write frame offset
SC_SCL1_WR5	SC_RES_WENB	1	Frame buffer write enabled
Frame Buffer Read Setting

31.3.2 Scaling Setting Example for Graphics Display

(1) Angle of View for Graphics Display

This section describes an example of setting the signals of the input and output angles of view shown in Table 31.42.

Table 31.42 Input and Output Angles of View for Graphics Display

Graphics Size	Output Signal	Graphics Signal Format
640 × 480	640 × 480	RGB888

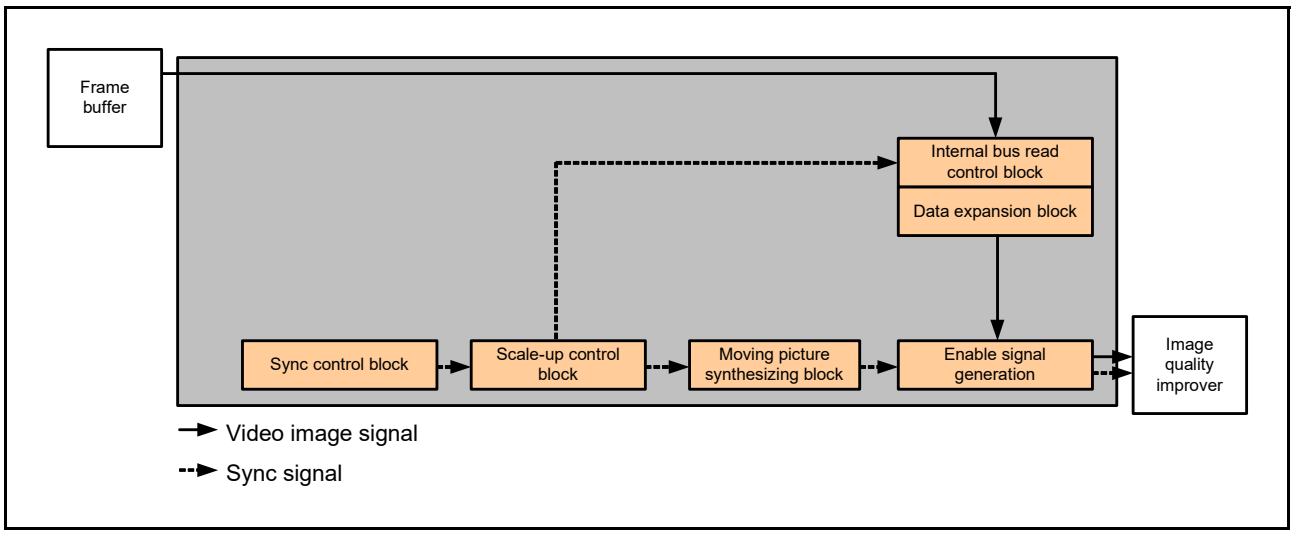

Figure 31.20 Signal Paths for Graphics Display

(2) Setting Frame Buffer Access Area

In the frame buffer in which graphics data is stored, graphics data needs to be expanded in the area of 640 × 480 pixels or larger.

Here, the frame buffer area in which graphics data is expanded is assumed to be 640 × 480 pixels.

Since the frame buffer is accessed in 64-bit units, RGB888 (32 bits) is accessed in 2-pixel units.

The line offset address values to be set are:

GR_LN_OFF[14:0] = 640 × 4 = 2560

The frame offset address values to be set are:

GR_FLM_OFF[22:0] = GR_LN_OFF[14:0] × 480 = 1228800

(3) Register Setting Example

Table 31.43 Register Setting Example for Graphics Display

Register Name	Bit Name	Settings	Remarks
Synchronization Control			
SC_SCL0_FRC3	SC_RES_VS_SEL	1	Free-running Vsync selected (when the appropriate input signal is available, an external sync can also be selected)
SC_SCL0_FRC4	SC_RES_FV[10:0]	524	Vertical period width of output signal (period width = set value + 1)
SC_SCL0_FRC4	SC_RES_FH[10:0]	799	Horizontal period width of output signal (period width = set value + 1)
Size of Angle of View			
SC_SCL0_FRC6	SC_RES_F_VS[10:0]	35	Vertical valid start position of full screen
SC_SCL0_FRC6	SC_RES_F_VW[10:0]	480	Vertical valid width of full screen
SC_SCL0_FRC7	SC_RES_F_HS[10:0]	144	Horizontal valid start position of full screen
SC_SCL0_FRC7	SC_RES_F_HW[10:0]	640	Horizontal valid width of full screen
GR_AB2	GR_GRC_VS[10:0]	35	Vertical valid start position of graphics output
GR_AB2	GR_GRC_VW[10:0]	480	Vertical valid width of graphics output
GR_AB3	GR_GRC_HS[10:0]	144	Horizontal valid start position of graphics output
GR_AB3	GR_GRC_HW[10:0]	640	Horizontal valid width of graphics output
Frame Buffer Read Setting			
GR_FLM1	GR_FLM_SEL[1:0]	1	Frame number setting with register
GR_FLM3	GR_FLM_NUM[9:0]	0	Frame number of frame buffer (0 in setting example)
GR_FLM5	GR_FLM_LNUM[9:0]	479	Number of graphics lines (number of lines = set value + 1)
GR_FLM6	GR_HW[9:0]	639	Horizontal valid width of graphics (valid width = set value + 1)
GR_FLM2	GR_BASE[31:0]	0	Conforming to graphics expansion setting (0 in setting example)
GR_FLM3	GR_LN_OFF[14:0]	2560	Conforming to graphics expansion setting
Frame Buffer Read Setting			
GR_FLM4	GR_FLM_OFF[22:0]	1228800	Conforming to graphics expansion setting
GR_FLM6	GR_FORMAT[3:0]	1	Frame buffer read format RGB888
GR_FLM_RD	GR_R_ENB	1	Frame buffer read enabled

Table 31.43 Register Setting Example for Graphics Display

Register Name	Bit Name	Settings	Remarks
		Scaling-up Selection	
SC_SCL0_US8	SC_RES_IBUS_SYNC_SEL	1	Graphics output displayed
GR_AB1	GR_DISP_SEL[1:0]	2	Graphics display selected

31.3.3 Scaling Setting Example for Scaled-up Graphics Display

(1) Angles of View for Input and Output

This section describes an example of setting the signals of the input and output angles of view shown in Table 31.44.

Table 31.44 Input and Output Angles of View for Scaled-up Graphics Display

Graphics Size	Output Signal	Graphics Signal Format
640 × 480	800 × 600	RGB565

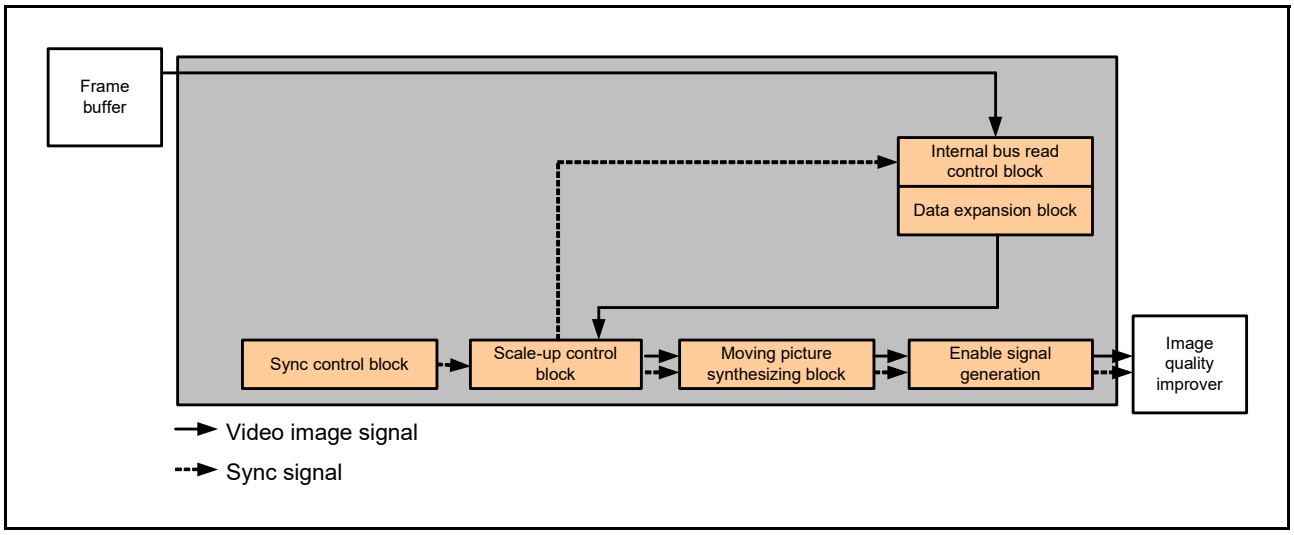

Figure 31.21 Signal Paths for Scaled-up Graphics Display

(2) Horizontal Scaling (Horizontal Scale Up, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

RATIO_org = round (640 ÷ 800 × 4096) = 3277

σ = (3277 × (800 − 1) − (640 − 1) × 4096) ÷ (800 − 1) = 1.23

Horizontal scaling ratio = round (3277 − (1.23)) = 3276

(3) Vertical Scaling (Vertical Scale Up, Scaling Filter: 2-Tap Linear)

The scaling rate for folding can be calculated as shown below.

RATIO_org = round (480 ÷ 600 × 4096) = 3277

σ = (3277 × (600 − 1) − (480 − 1) × 4096) ÷ (600 − 1) = 1.57

Vertical scaling ratio = round (3277 − (1.57)) = 3275

(4) Setting Frame Buffer Access Area

In the frame buffer in which graphics data is stored, graphics data needs to be expanded in the area of 640 × 480 pixels or larger.

Here, the frame buffer area in which graphics data is expanded is assumed to be 640 × 480 pixels.

Since the frame buffer is accessed in 64-bit units, RGB565 (16 bits) is accessed in 4-pixel units.

The line offset address values to be set are:

GR_LN_OFF[14:0] = 640 × 2 = 1280

The frame offset address values to be set are:

GR_FLM_OFF[22:0] = GR_LN_OFF[14:0] × 480 = 614400

(5) Register Setting Example

Table 31.45 Register Setting Example for Scaled-up Graphics Display

Register Name	Bit Name	Settings	Remarks
Synchronization Control			
SC_SCL0_FRC3	SC_RES_VS_SEL	1	Free-running Vsync selected (when the appropriate input signal is available, an external sync can also be selected)
SC_SCL0_FRC4	SC_RES_FV[10:0]	668	Vertical period width of output signal (period width = set value + 1)
SC_SCL0_FRC4	SC_RES_FH[10:0]	1040	Horizontal period width of output signal (period width = set value + 1)
Size of Angle of View			
SC_SCL0_FRC6	SC_RES_F_VS[10:0]	27	Vertical valid start position of full screen
SC_SCL0_FRC6	SC_RES_F_VW[10:0]	600	Vertical valid width of full screen
SC_SCL0_FRC7	SC_RES_F_HS[10:0]	216	Horizontal valid start position of full screen
SC_SCL0_FRC7	SC_RES_F_HW[10:0]	800	Horizontal valid width of full screen

32. Video Display Controller 5 (4): Image Quality Improver

32.1 Image Quality Improver

32.1.1 Overview of Functions

The image quality improver subjects scaled YCbCr signals to black stretching, LTI/sharpness processing, and GBR conversion by using a color matrix.

The image quality improver does not act on RGB signals.

Figure 32.1 is a functional block diagram of the image quality improver. Image quality improver 0 is connected to scaler 0.

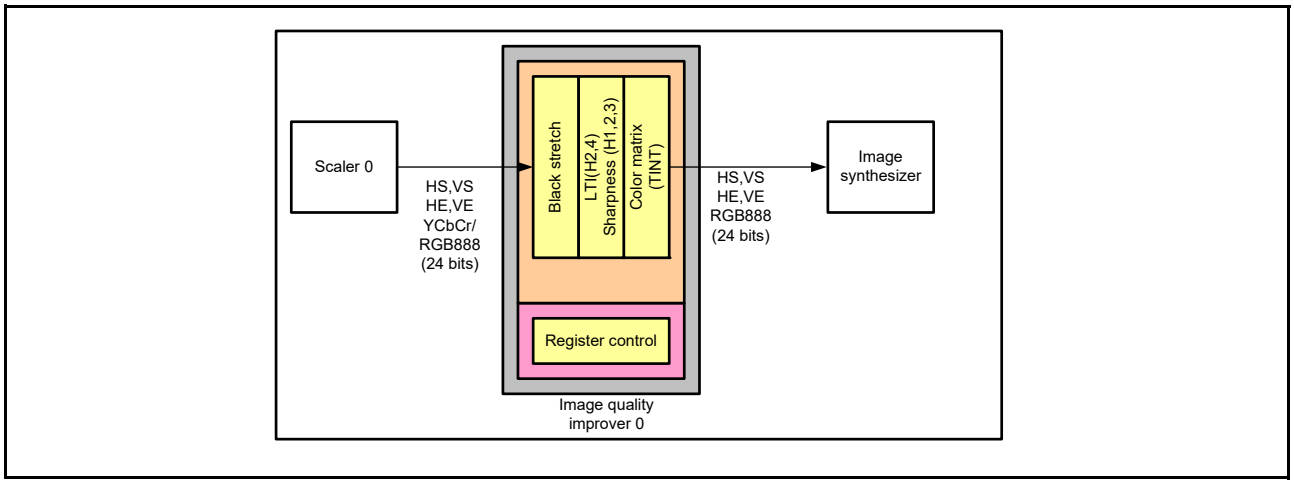

Figure 32.1 Functional Block Diagram of Image Quality Improver

32.1.2 Register Update Control

The control register for image quality improver controls the update timing entirely by vertical synchronous signals.

The vertical synchronous signal launched after the update control register is set to 1 is reflected in various registers, following which the update control register is automatically cleared to 0.

Note that registers for the improver can be identified by the number in the register name like ADJ0_xxxx. In the sections except for Register Description, however, the number is omitted like ADJ_xxxx for convenience sake.

Table 32.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
ADJ_UPDATE	ADJ_VEN	0	Image Quality Improver Register Update 0: Register is not updated. 1: Register is updated by launch of vertical synchronous signal.

32.1.3 Black Stretch

Black stretch refers to the black stretch correction of the Y signal of the input video signal of YCbCr format.

Correction of the Y signal is done by adjusting the time constant, depth (gain), and start point.

Figure 32.2 is a drawing illustrating black stretch correction.

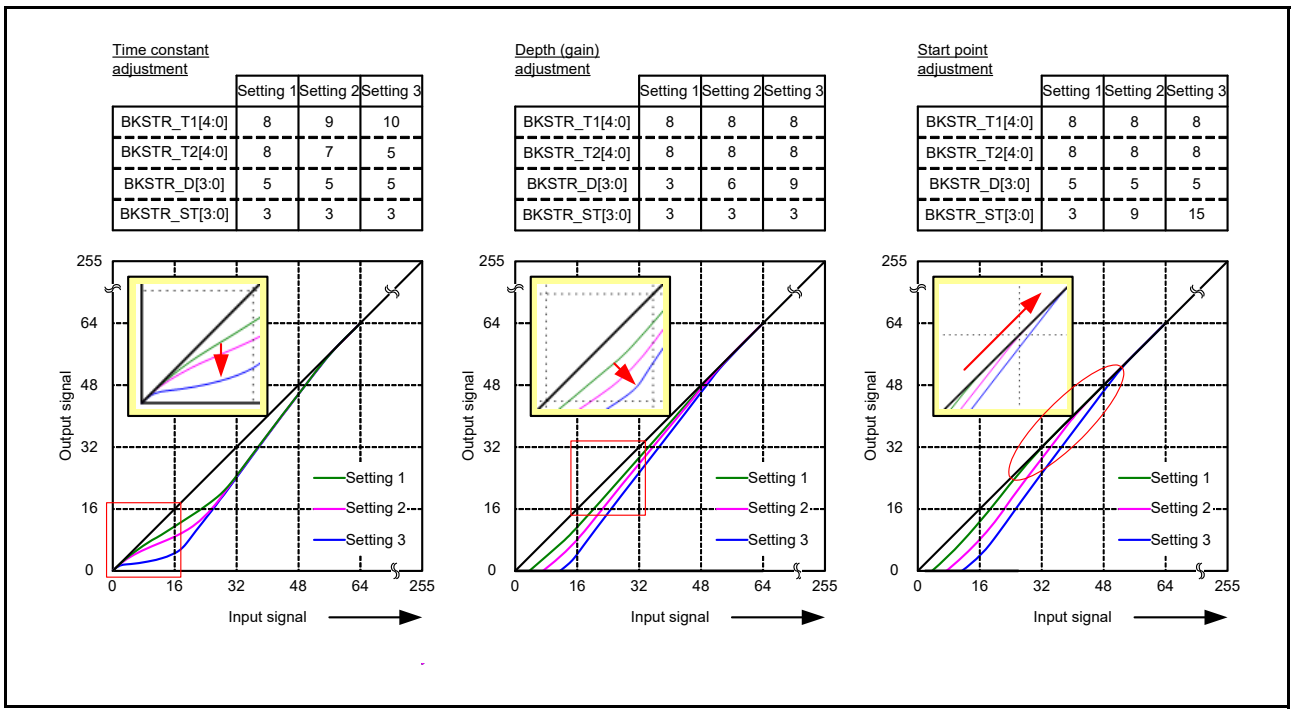

Figure 32.2 Black Stretch Correction (With Sample Settings)

Table 32.2 Black Stretch Control

Register Name	Bit Name	Initial Value	Description
ADJ_BKSTR_SET	BKSTR_ON	0	Black Stretch On/Off Control 0: Black Stretch Off 1: Black Stretch On
ADJ_BKSTR_SET	BKSTR_ST[3:0]	0	Black Stretch Start Point 0 (low) to 15 (high)
ADJ_BKSTR_SET	BKSTR_T1[4:0]	0	Black Stretch Time Constant (T1) 0 (small) to 31 (large)
ADJ_BKSTR_SET	BKSTR_T2[4:0]	0	Black Stretch Time Constant (T2) 0 (small) to 30 (large), 31: Setting prohibited
ADJ_BKSTR_SET	BKSTR_D[3:0]	0	Black Stretch Depth 0 (shallow) to 15 (deep)

32.1.4 Enhancer

The enhancer subjects the scaled Y signal input to transient improvement (LTI) and sharpness processing in the horizontal direction.

(1) Enhancer Area Specification

The operating area of the enhancer is specified with reference to the rising edges of the Hsync signal and Vsync signal. ENH_HS should be set to four or greater clocks, and ENH_VS should be set to two or greater lines. Figure 32.3 shows enhancer area setting.

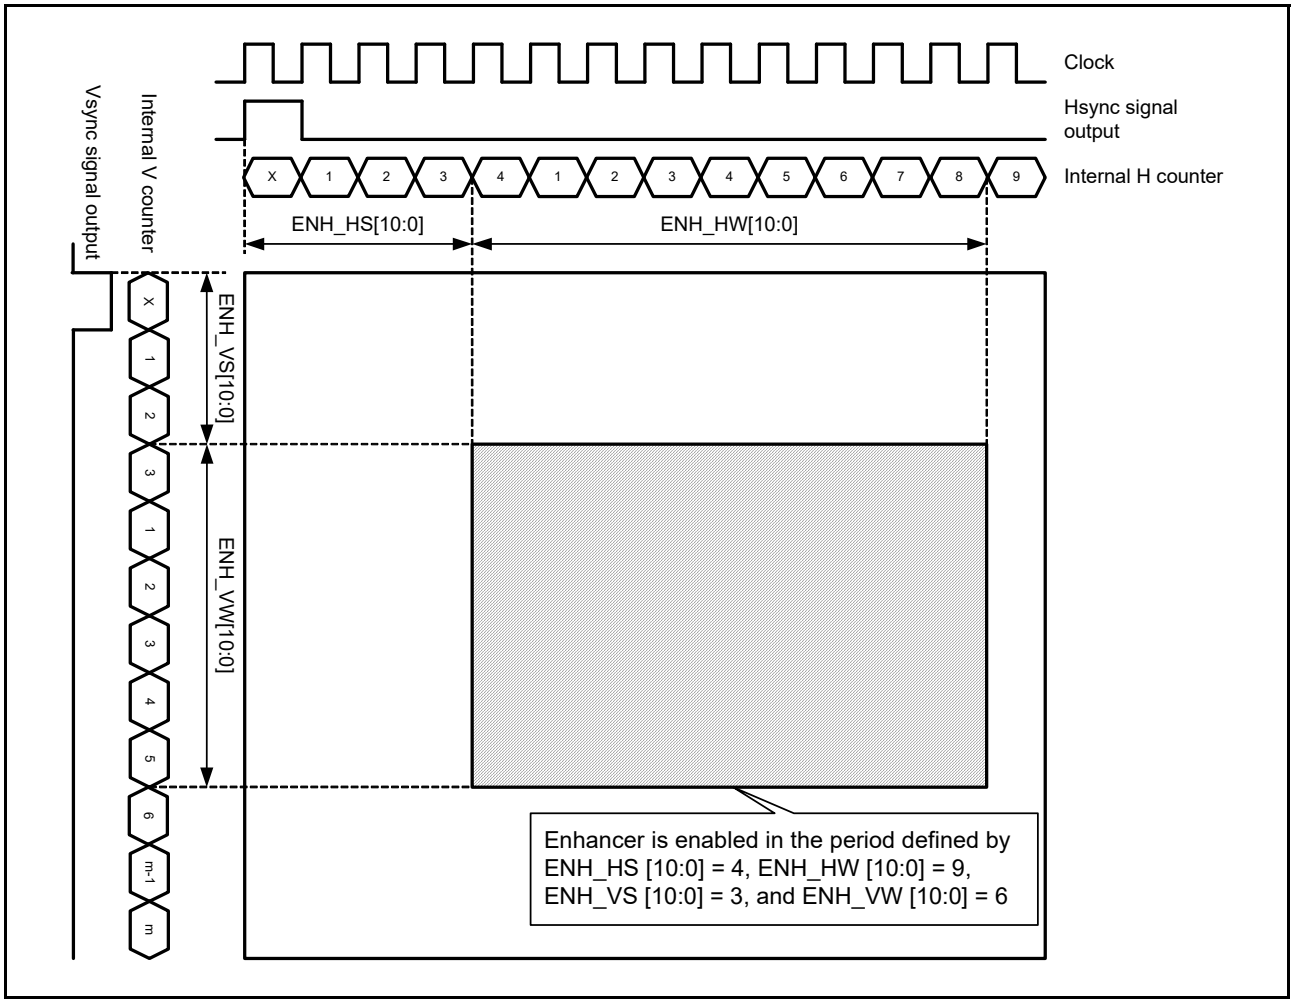

Figure 32.3 Period when Enhancer is Enabled

Setting ENH_DISP_ON to 1 displays the enhancer-enabled area with frame lines.

Table 32.3 Enhancer Area Control

Register Name	Bit Name	Initial Value	Description
ADJ_ENH_TIM1	ENH_MD	1	Operating Mode 0: RGB mode 1: YCbCr mode
ADJ_ENH_TIM2	ENH_VS[10:0]	0	Start Position of Vertical Valid Image Area in Enhancer-Enabled Area Note: Set to 2 or greater lines.
ADJ_ENH_TIM2	ENH_VW[10:0]	0	Width of Vertical Valid Image Area in Enhancer-Enabled Area

Table 32.3 Enhancer Area Control

Register Name	Bit Name	Initial Value	Description
ADJ_ENH_TIM3	ENH_HS[10:0]	0	Start Position of Horizontal Valid Image Area in Enhancer-Enabled Area Note: Set to 4 or greater clocks.
ADJ_ENH_TIM3	ENH_HW[10:0]	0	Width of Horizontal Valid Image Area in Enhancer-Enabled Area
ADJ_ENH_TIM1	ENH_DISP_ON	0	Frame Line Display in Enhancer-Enabled Area 0: Off 1: On

(2) LTI (Luminance Transient Improvement)

The enhancer subjects the Y signal input to transient improvement in the horizontal direction.

Transient improvement of the blanking signal is turned off.

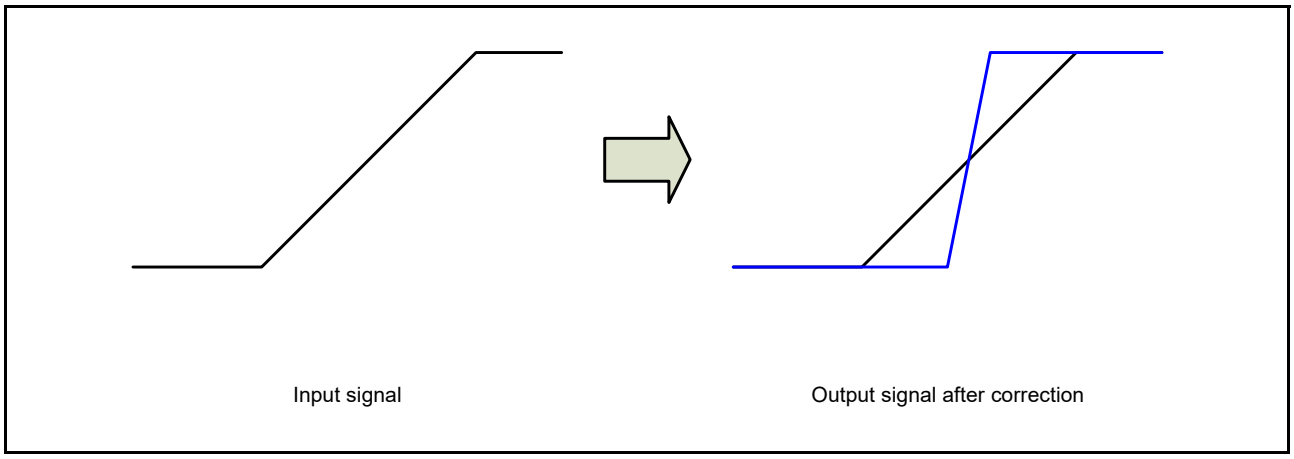

Figure 32.4 LTI Correction

After edge detection of the image, the LTI can be independently controlled in the two horizontal bands.

In LTI, the median filter is inserted after edge detection of the image.

In LTI (H4), the reference pixels of the median filter can be selected.

However, under normal operations, half the tap data (second adjacent pixel) at edge detection is used as reference.

Table 32.4 Reference Pixel Table for LTI

LTI Band	Reference Pixel for Edge Detection	LPF Application	Median Filter Reference Pixels
Horizontal LTI (H2)	Second adjacent pixel used as reference	LPF not applied or LPF (1,2,1)	Adjacent pixel used as reference
Horizontal LTI (H4)	Fourth adjacent pixel used as reference	LPF (1,2,1)	Adjacent pixel or second adjacent pixel used as reference

In LTI, the detection result can be subjected to a coring process.

The core value set in the register is subtracted from the edge detection result, and LTI correction is performed on the coring output after subtraction.

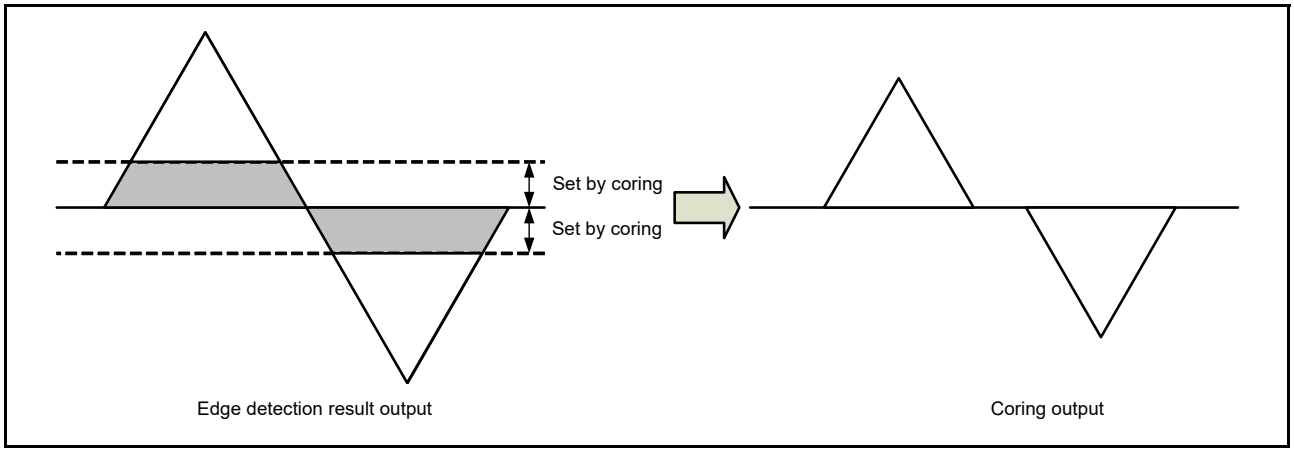

Figure 32.5 LTI Coring

Table 32.5 LTI Control

Register Name	Bit Name	Initial Value	Description
ADJ_ENH_LTI1	LTI_H_ON	0	LTI On/Off Control 0: LTI off 1: LTI on
ADJ_ENH_LTI1	LTI_H2_INC_ZERO [7:0]	10	Median Filter LTI Correction Threshold LTI correction is disabled when: |right TAP value – center TAP value| < LTI1_H2_INC_ZERO or |left TAP value – center TAP value| < LTI1_H2_INC_ZERO.
ADJ_ENH_LTI1	LTI_H2_LPF_SEL	0	LPF Selection for Folding Prevention Before H2 Edge Detection 0: LPF not selected 1: LPF selected
ADJ_ENH_LTI1	LTI_H2_GAIN[7:0]	0	LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times)
ADJ_ENH_LTI1	LTI_H2_CORE[7:0]	0	LTI Coring (Maximum core value of 255) Amplitude smaller than or equal to the value of LTI_H2_CORE is cored from the edge amplitude value. (A core value setting of 128 remains unchanged.)
ADJ_ENH_LTI2	LTI_H4_INC_ZERO[7:0]	10	Median Filter LTI Correction Threshold LTI correction is disabled when: |right TAP value – center TAP value| < LTI1_H4_INC_ZERO or |left TAP value – center TAP value| < LTI1_H4_INC_ZERO.
ADJ_ENH_LTI2	LTI_H4_MEDIAN_TAP_ SEL	0	Median Filter Reference Pixel Select 0: Second adjacent pixel selected as reference 1: Adjacent pixel selected as reference
ADJ_ENH_LTI2	LTI_H4_GAIN[7:0]	0	LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times)
ADJ_ENH_LTI2	LTI_H4_CORE[7:0]	0	LTI Coring (Maximum core value of 255) Amplitude less than or equal to the value of LTI_H4_CORE is cored from the edge amplitude value. (A core value setting of 128 remains unchanged.)

(3) Sharpness Process

The enhancer performs edge enhancement on the Y signal input by adding overshoot and undershoot to the original signal. Edge enhancement of the blanking signal is turned off.

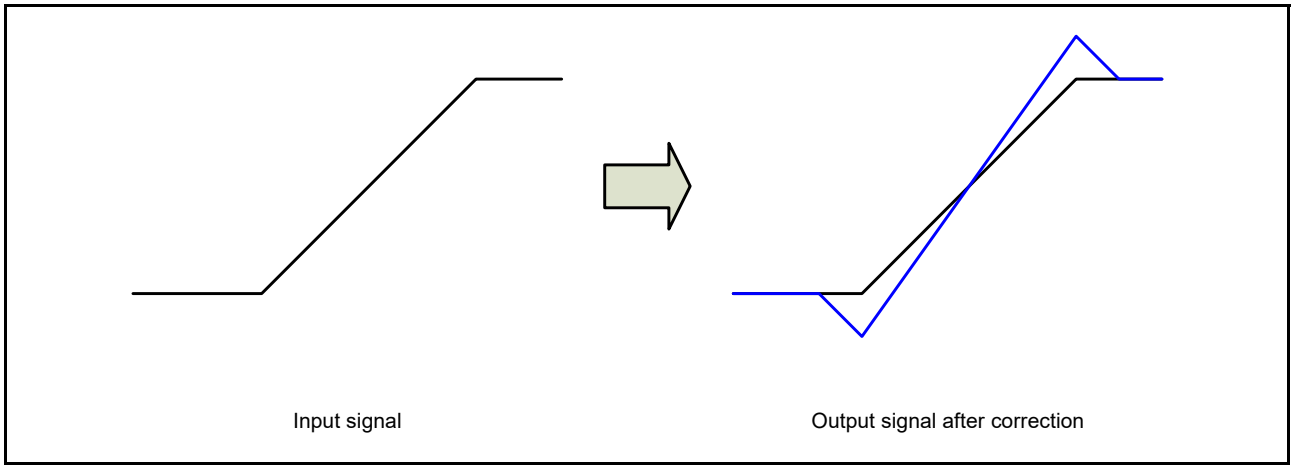

Figure 32.6 Sharpness Correction

After edge detection of the image, the sharpness can be independently controlled in the three horizontal bands.

In horizontal sharpness, a 3-tap low-pass filter (LPF) is inserted before edge detection to prevent folding. The LPF can be turned on or off by register setting.

Table 32.6 Reference Pixel Table for Sharpness

Sharpness Band	Reference Pixel for Edge Detection	LPF Application
Horizontal sharpness (H1)	Adjacent pixel used as reference	LPF not applied
Horizontal sharpness (H2)	Second adjacent pixel used as reference	LPF not applied or LPF (1,2,1)
Horizontal sharpness (H3)	Third adjacent pixel used as reference	LPF (1,2,1)

The edge amplitude of the edge to be enhanced is adjusted according to the value of SHP_CORE.

Edge enhancement is accomplished when the edge detection result of the image is greater than the value of SHP_CORE.

In edge enhancement, a correction value is output by multiplying (edge amplitude value - SHP_CORE) by sharpness gain.

Sharpness is turned off when the edge detection result of the image is smaller than the value of SHP_CORE.

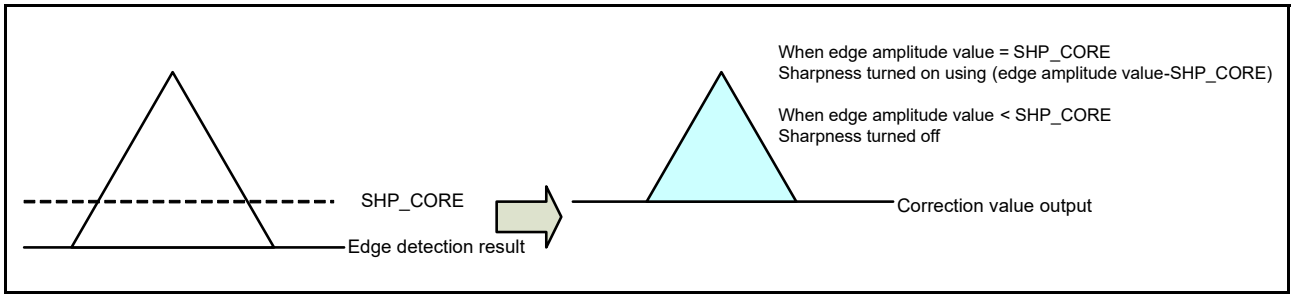

Figure 32.7 Sharpness Characteristics

Table 32.7 Sharpness Control

Register Name	Bit Name	Initial Value	Description
ADJ_ENH_SHP1	SHP_H_ON	0	Sharpness On/Off Control 0: Horizontal sharpness off 1: Horizontal sharpness on
ADJ_ENH_SHP3	SHP_H2_LPF_SEL	0	LPF Selection for Folding Prevention Before H2 Edge Detection 0: LPF not selected 1: LPF selected
ADJ_ENH_SHP2	SHP_H1_CLIP_O[7:0]	0	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H1_CLIP_O

ADJ_ENH_SHP2	SHP_H1_GAIN_O[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H1_GAIN_O × (edge amplitude value – SHP_H1_CORE)
ADJ_ENH_SHP2	SHP_H1_GAIN_U[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H1_GAIN_U × (edge amplitude value – SHP_H1_CORE)
ADJ_ENH_SHP1	SHP_H1_CORE[6:0]	0	Active Sharpness Range Edge amplitude value ≥ SHP_H1_CORE: Sharpness processing on Edge amplitude value < SHP_H1_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.
ADJ_ENH_SHP4	SHP_H2_CLIP_O[7:0]	0	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H2_CLIP_O
ADJ_ENH_SHP4	SHP_H2_CLIP_U[7:0]	0	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H2_CLIP_U
ADJ_ENH_SHP4	SHP_H2_GAIN_O[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_O × (edge amplitude value – SHP_H2_CORE)
ADJ_ENH_SHP4	SHP_H2_GAIN_U[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_U × (edge amplitude value – SHP_H2_CORE)
ADJ_ENH_SHP3	SHP_H2_CORE[6:0]	0	Active Sharpness Range Edge amplitude value ≥ SHP_H2_CORE: Sharpness processing on Edge amplitude value < SHP_H2_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.
ADJ_ENH_SHP6	SHP_H3_CLIP_O[7:0]	0	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H3_CLIP_O
ADJ_ENH_SHP6	SHP_H3_CLIP_U[7:0]	0	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H3_CLIP_U
ADJ_ENH_SHP6	SHP_H3_GAIN_O[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_O × (edge amplitude value – SHP_H3_CORE)
ADJ_ENH_SHP6	SHP_H3_GAIN_U[7:0]	0	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_U × (edge amplitude value – SHP_H3_CORE)
ADJ_ENH_SHP5	SHP_H3_CORE[6:0]	0	Active Sharpness Range Edge amplitude value ≥ SHP_H3_CORE: Sharpness processing on Edge amplitude value < SHP_H3_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.

32.1.5 Color Matrix

Color matrix is performed by adjusting the offset of each input signal and nine-axis gain. This allows YCbCr to GBR conversion.

(1) GBR to GBR Conversion

YGIN_A = YGIN + ADJ_MTX_YG − 128

CBBIN_A = CBBIN + ADJ_MTX_B − 128

CRRIN_A = CRRIN + ADJ_MTX_R − 128

YGOUT = (ADJ_MTX_GG × YGIN_A + ADJ_MTX_GB × CBBIN_A + ADJ_MTX_GR × CRRIN_A) ÷ 256

CBBOUT = (ADJ_MTX_BG × YGIN_A + ADJ_MTX_BB × CBBIN_A + ADJ_MTX_BR × CRRIN_A) ÷ 256

CRROUT = (ADJ_MTX_RG × YGIN_A + ADJ_MTX_RB × CBBIN_A + ADJ_MTX_RR × CRRIN_A) ÷ 256

(2) YCbCr to GBR Conversion

YGIN_A = YGIN + ADJ_MTX_YG − 128

CBBIN_A = CBBIN − 128

CRRIN_A = CRRIN − 128

YGOUT = (ADJ_MTX_GG × YGIN_A + ADJ_MTX_GB × CBBIN_A + ADJ_MTX_GR × CRRIN_A) ÷ 256

CBBOUT = (ADJ_MTX_BG × YGIN_A + ADJ_MTX_BB × CBBIN_A + ADJ_MTX_BR × CRRIN_A) ÷ 256

CRROUT = (ADJ_MTX_RG × YGIN_A + ADJ_MTX_RB × CBBIN_A + ADJ_MTX_RR × CRRIN_A) ÷ 256

Table 32.8 Matrix Coefficients (Standard Values) of SMPTE 293M

	YGIN		CBBIN		CRRIN	
	Coefficient	**Bit Setting**	**Coefficient**	**Bit Setting**	**Coefficient**	**Bit Setting**
YGOUT	1.000	ADJ_MTX_GG = 256	–0.344	ADJ_MTX_GB = 1960	–0.714	ADJ_MTX_GR = 1865
CBBOUT	1.000	ADJ_MTX_BG = 256	1.772	ADJ_MTX_BB = 454	0.000	ADJ_MTX_BR = 0
CRROUT	1.000	ADJ_MTX_RG = 256	0.000	ADJ_MTX_RB = 0	1.402	ADJ_MTX_RR = 359

Table 32.9 Color Matrix Control

Register Name	Bit Name	Initial Value	Description

32.2 Register Description

Table 32.10 shows the register configuration.

[Symbols used in Register Description]

Initial value : Register value after a reset
— : Undefined value
R/W : Readable/writable. The written value can be read.
R/WC0 : Read and write. Bit is initialized if 0 is written, and ignored if 1 is written.
R/WC1 : Read and write. Bit is initialized if 1 is written, and ignored if 0 is written.
R : Read-only. The write value should always be 0.
—/W : Write-only. Read value is undefined.

R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ENH_VS[10:0]	35	R/W	Start Position of Vertical Valid Image Area in Enhancer-Enabled Area Note: Set to 2 or greater lines.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ENH_VW[10:0]	480	R/W	Width of Vertical Valid Image Area in Enhancer-Enabled Area

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.5 Enhancer Timing Adjustment Register 3 (ADJ0_ENH_TIM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	ENH_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ENH_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ENH_HS[10:0]	145	R/W	Start Position of Horizontal Valid Image Area in Enhancer-Enabled Area Note: Set to 4 or greater clocks.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ENH_HW[10:0]	640	R/W	Width of Horizontal Valid Image Area in Enhancer-Enabled Area

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.6 Enhancer Sharpness Register 1 (ADJ0_ENH_SHP1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SHP_H_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SHP_H1_CORE[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SHP_H_ON	0	R/W	Sharpness On/Off Control 0: Horizontal sharpness off 1: Horizontal sharpness on
15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	SHP_H1_CORE[6:0]	0	R/W	Active Sharpness Range Edge amplitude value ≥ SHP_H1_CORE: Sharpness processing on Edge amplitude value < SHP_H1_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.7 Enhancer Sharpness Register 2 (ADJ0_ENH_SHP2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SHP_H1_CLIP_O[7:0]								SHP_H1_CLIP_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SHP_H1_GAIN_O[7:0]								SHP_H1_GAIN_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SHP_H1_CLIP_O [7:0]	0	R/W	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H1_CLIP_O
23 to 16	SHP_H1_CLIP_U [7:0]	0	R/W	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H1_CLIP_U
15 to 8	SHP_H1_GAIN_O [7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+approx. 4 times) Sharpness correction value = SHP_H1_GAIN_O × (edge amplitude value – SHP_H1_CORE)
7 to 0	SHP_H1_GAIN_U [7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+approx. 4 times) Sharpness correction value = SHP_H1_GAIN_U × (Edge amplitude value – SHP_H1_CORE)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.8 Enhancer Sharpness Register 3 (ADJ0_ENH_SHP3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SHP_H2_LPF_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SHP_H2_CORE[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	SHP_H2_LPF_SEL	0	R/W	LPF Selection for Folding Prevention before H2 Edge Detection 0: LPF not selected 1: LPF selected
15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	SHP_H2_CORE[6:0]	0	R/W	Active Sharpness Range Edge amplitude value ≥ SHP_H2_CORE: Sharpness processing on Edge amplitude value < SHP_H2_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.9 Enhancer Sharpness Register 4 (ADJ0_ENH_SHP4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SHP_H2_CLIP_O[7:0]								SHP_H2_CLIP_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SHP_H2_GAIN_O[7:0]								SHP_H2_GAIN_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SHP_H2_CLIP_O[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H2_CLIP_O
23 to 16	SHP_H2_CLIP_U[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H2_CLIP_U
15 to 8	SHP_H2_GAIN_O[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_O × (edge amplitude value – SHP_H2_CORE)
7 to 0	SHP_H2_GAIN_U[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H2_GAIN_U × (edge amplitude value – SHP_H2_CORE)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.10 Enhancer Sharpness Register 5 (ADJ0_ENH_SHP5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	SHP_H3_CORE[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	SHP_H3_CORE[6:0]	0	R/W	Active Sharpness Range Edge amplitude value ≥ SHP_H3_CORE: Sharpness processing on Edge amplitude value < SHP_H3_CORE: Sharpness processing off Sharpness processing is always on when the edge detection value is 128 or greater.

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.11 Enhancer Sharpness Register 6 (ADJ0_ENH_SHP6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SHP_H3_CLIP_O[7:0]								SHP_H3_CLIP_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SHP_H3_GAIN_O[7:0]								SHP_H3_GAIN_U[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	SHP_H3_ CLIP_O[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Overshoot Side) Correction value clipped according to SHP_H3_CLIP_O
23 to 16	SHP_H3_ CLIP_U[7:0]	0	R/W	Sharpness Correction Value Clipping (on the Undershoot Side) Correction value clipped according to SHP_H3_CLIP_U
15 to 8	SHP_H3_ GAIN_O[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Overshoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_O × (Edge amplitude value – SHP_H3_CORE)
7 to 0	SHP_H3_ GAIN_U[7:0]	0	R/W	Sharpness Edge Amplitude Value Gain (on the Undershoot Side) 0 (0 times) to 64 (+1 times) to 255 (+ approx. 4 times) Sharpness correction value = SHP_H3_GAIN_U × (Edge amplitude value – SHP_H3_CORE)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.12 Enhancer LTI Register 1 (ADJ0_ENH_LTI1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LTI_H_ON	—	—	—	—	—	—	LTI_H2_LPF_SEL	LTI_H2_INC_ZERO[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0
R/W:	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LTI_H2_GAIN[7:0]								LTI_H2_CORE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	LTI_H_ON	0	R/W	LTI On/Off Control 0: LTI off 1: LTI on
30 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	LTI_H2_LPF_SEL	0	R/W	LPF Selection for Folding Prevention before H2 Edge Detection 0: LPF not selected 1: LPF selected
23 to 16	LTI_H2_INC_ZERO[7:0]	10	R/W	Median Filter LTI Correction Threshold LTI correction is disabled when | right TAP value – center TAP value | < LTI_H2_INC_ZERO or | left TAP value – center TAP value | < LTI_H2_INC_ZERO
15 to 8	LTI_H2_GAIN[7:0]	0	R/W	LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+ 1 times) to 255 (+ approx. 4 times)
7 to 0	LTI_H2_CORE[7:0]	0	R/W	LTI Coring (Maximum Core value of 255) Amplitude less than or equal to the value of LTI_H2_CORE is cored from the edge amplitude value. (A core value setting of 128 remains unchanged)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.13 Enhancer LTI Register 2 (ADJ0_ENH_LTI2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	LTI_H4_MEDIAN_TAP_SEL	LTI_H4_INC_ZERO[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LTI_H4_GAIN[7:0]								LTI_H4_CORE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	LTI_H4_MEDIAN_TAP_SEL	0	R/W	Median Filter Reference Pixel Select 0: Second adjacent pixel selected as reference 1: Adjacent pixel selected as reference
23 to 16	LTI_H4_INC_ZERO[7:0]	10	R/W	Median Filter LTI Correction Threshold LTI correction is disabled when | right TAP value – center TAP value | < LTI_H4_INC_ZERO or | left TAP value – center TAP value | < LTI_H4_INC_ZERO
15 to 8	LTI_H4_GAIN[7:0]	0	R/W	LTI Edge Amplitude Value Gain 0 (0 times) to 64 (+ 1 times) to 255 (+ approx. 4 times)
7 to 0	LTI_H4_CORE[7:0]	0	R/W	LTI Coring (Maximum Core value of 255) Amplitude less than or equal to the value of LTI_H4_CORE is cored from the edge amplitude value (A core value setting of 128 remains unchanged)

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.14 Matrix Mode Register in Image Quality Improver (ADJ0_MTX_MODE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADJ0_MTX_MD[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	ADJ0_MTX_MD[1:0]	2	R/W	Operating Mode 0: GBR → GBR 1: Setting prohibited 2: YCbCr → GBR 3: Setting prohibited

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.15 Matrix YG Control Register 0 in Image Quality Improver (ADJ0_MTX_YG_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	ADJ0_MTX_YG[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ADJ0_MTX_GG[10:0]										
Initial value:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	ADJ0_MTX_YG[7:0]	128	R/W	Y/G Signal Offset (DC) Adjustment Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ADJ0_MTX_GG[10:0]	256	R/W	Gain Adjustment of Y/G Signal of G Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.16 Matrix YG Control Register 1 in Image Quality Improver (ADJ0_MTX_YG_ADJ1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	ADJ0_MTX_GB[10:0]										
Initial value:	0	0	0	0	0	1	1	1	1	0	1	0	1	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ADJ0_MTX_GR[10:0]										
Initial value:	0	0	0	0	0	1	1	1	0	1	0	0	1	0	0	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ADJ0_MTX_GB [10:0]	1960	R/W	Gain Adjustment of Cb/B Signal of G Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ADJ0_MTX_GR [10:0]	1865	R/W	Gain Adjustment of Cr/R Signal of G Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.17 Matrix CBB Control Register 0 in Image Quality Improver (ADJ0_MTX_CBB_ADJ0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	ADJ0_MTX_B[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ADJ0_MTX_BG[10:0]

R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	ADJ0_MTX_R [7:0]	128	R/W	R Signal Offset (DC) Adjustment Unsigned (0 (-128) to 128 (0) to 255 (+127) [LSB])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ADJ0_MTX_RG [10:0]	256	R/W	Gain Adjustment of Y/G Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.2.20 Matrix CRR Control Register 1 in Image Quality Improver (ADJ0_MTX_CRR_ADJ1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	ADJ0_MTX_RB[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	ADJ0_MTX_RR[10:0]										
Initial value:	0	0	0	0	0	0	0	1	0	1	1	0	0	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	ADJ0_MTX_RB [10:0]	0	R/W	Gain Adjustment of Cb/B Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	ADJ0_MTX_RR [10:0]	359	R/W	Gain Adjustment of Cr/R Signal of R Signal Output Signed (complement of 2) (-1024 to +1023 [LSB], 256 [LSB] = 1.0 [times])

Note: This register is updated when ADJ0_VEN in ADJ0_UPDATE is 1.

32.3 Usage Method

32.3.1 Black Stretch Usage Method

The degree of black stretch can be adjusted by setting the depth (BKSTR_D[3:0]) and the start point (BKSTR_ST[3:0]) of the black stretch. The variation in the black stretch time axis can be adjusted by setting the time constant (BKSTR_T1[4:0] and BKSTR_T2[4:0]). By setting the time constant, changes that occur abruptly due to swapping of the scene can be controlled.

Table 32.11 Black Stretch Setting Register

Register Name	Bit Name	Set Value
ADJ_BKSTR_SET	BKSTR_ON	When black stretch is on: 1
ADJ_BKSTR_SET	BKSTR_D[3:0]	Set the depth of black stretch. The depth increases as the value becomes larger.
ADJ_BKSTR_SET	BKSTR_ST[3:0]	Set the start point of black stretch. The stretching area becomes larger as the value becomes larger.
ADJ_BKSTR_SET	BKSTR_T1[4:0]	Set the time constant of black stretch in the positive direction. The changes are more delayed as the value becomes larger.
ADJ_BKSTR_SET	BKSTR_T2[4:0]	Set the time constant of black stretch in the negative direction. The changes are more delayed as the value becomes larger.

Note: ADJ_VEN in ADJ_UPDATE should be set to 1 after setting the registers.

32.3.2 LTI Processing of Enhancer

Figure 32.8 shows an example of LTI adjustment.

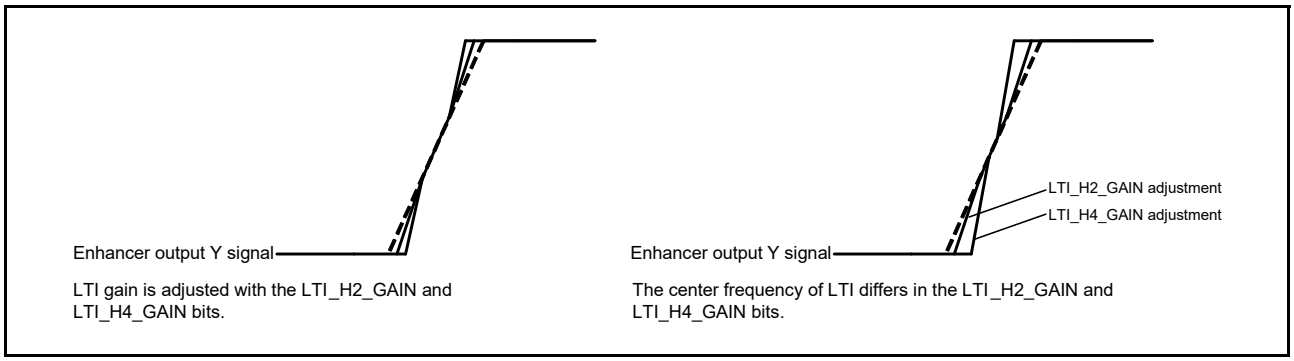

Figure 32.8 Example of LTI Adjustment

32.3.3 Sharpness Processing of Enhancer

Figure 32.9 shows an example of sharpness adjustment.

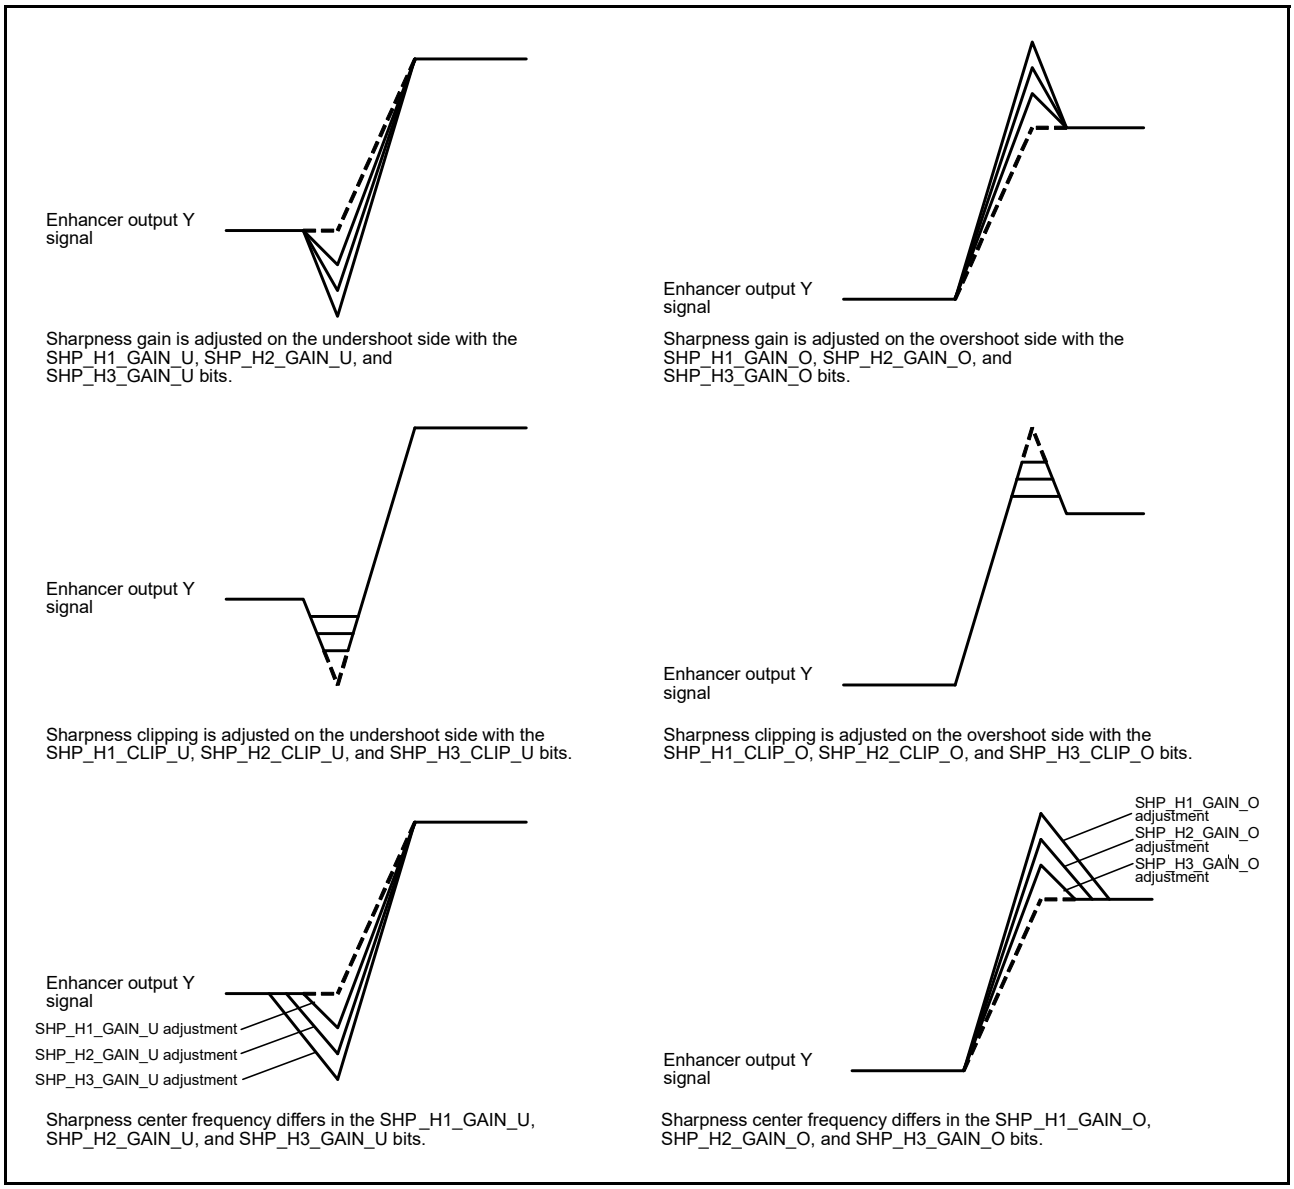

Figure 32.9 Example of Sharpness Adjustment

32.3.4 Setting Method for Color Matrix Data Conversion

GBR signals are assumed to be input to the circuit subsequent to the image quality improver; therefore, the output from the color matrix circuit should be in the GBR format.

Table 32.12 shows an example of GBR conversion setting.

Table 32.12 Recommended Setting Values for Matrix Conversion

		GBR to GBR Conversion	YCBCR to GBR Conversion
Register Name	**Bit Name**	**Recommended Values**	**Recommended Values**
ADJ_MTX_MODE	ADJ_MTX_MD[1:0]	0	2
ADJ_MTX_YG_ADJ0	ADJ_MTX_YG[7:0]	128	128
ADJ_MTX_CBB_ADJ0	ADJ_MTX_B[7:0]	128	128
ADJ_MTX_CRR_ADJ0	ADJ_MTX_R[7:0]	128	128
ADJ_MTX_YG_ADJ0	ADJ_MTX_GG[10:0]	256	256
ADJ_MTX_YG_ADJ1	ADJ_MTX_GB[10:0]	0	1960
ADJ_MTX_YG_ADJ1	ADJ_MTX_GR[10:0]	0	1865
ADJ_MTX_CBB_ADJ0	ADJ_MTX_BG[10:0]	0	256
ADJ_MTX_CBB_ADJ1	ADJ_MTX_BB[10:0]	256	454
ADJ_MTX_CBB_ADJ1	ADJ_MTX_BR[10:0]	0	0
ADJ_MTX_CRR_ADJ0	ADJ_MTX_RG[10:0]	0	256
ADJ_MTX_CRR_ADJ1	ADJ_MTX_RB[10:0]	0	0
ADJ_MTX_CRR_ADJ1	ADJ_MTX_RR[10:0]	256	359

Note: ADJ_VEN in ADJ_UPDATE should be set to 1 after setting the registers.

33. Video Display Controller 5 (5): Image Synthesizer

33.1 Image Synthesizer

33.1.1 Overview of Functions

The image synthesizer reads graphics data from the frame buffer and displays the synthesized image on the screen.

One video plane + two graphics planes, or three graphics planes can be selected for synthesis.

RGB565, RGB888, αRGB1555, αRGB4444, αRGB8888, RGBα5551, RGBα8888, CLUT8, CLUT4, CLUT1, YCbCr422 (for the graphics 0 process), and YCbCr444 (for the graphics 0 process) formats can be used for graphics data, and RGB565, RGB888, YCbCr422, and YCbCr444 formats for video data.

On each of the graphics planes, background color, lower-layer graphics, current graphics, or blended image (for the graphics 2 and 3 processes) of lower-layer graphics and current graphics can be displayed.

It is recommend that the frame buffer is placed in the on-chip large-capacity RAM. Both the on-chip large-capacity RAM and an external SDRAM can be used for the frame buffer, but the bus bandwidth might become short and display might not be possible if an external SDRAM is used for the frame buffer.

The functional block diagram of the image synthesizer is shown below.

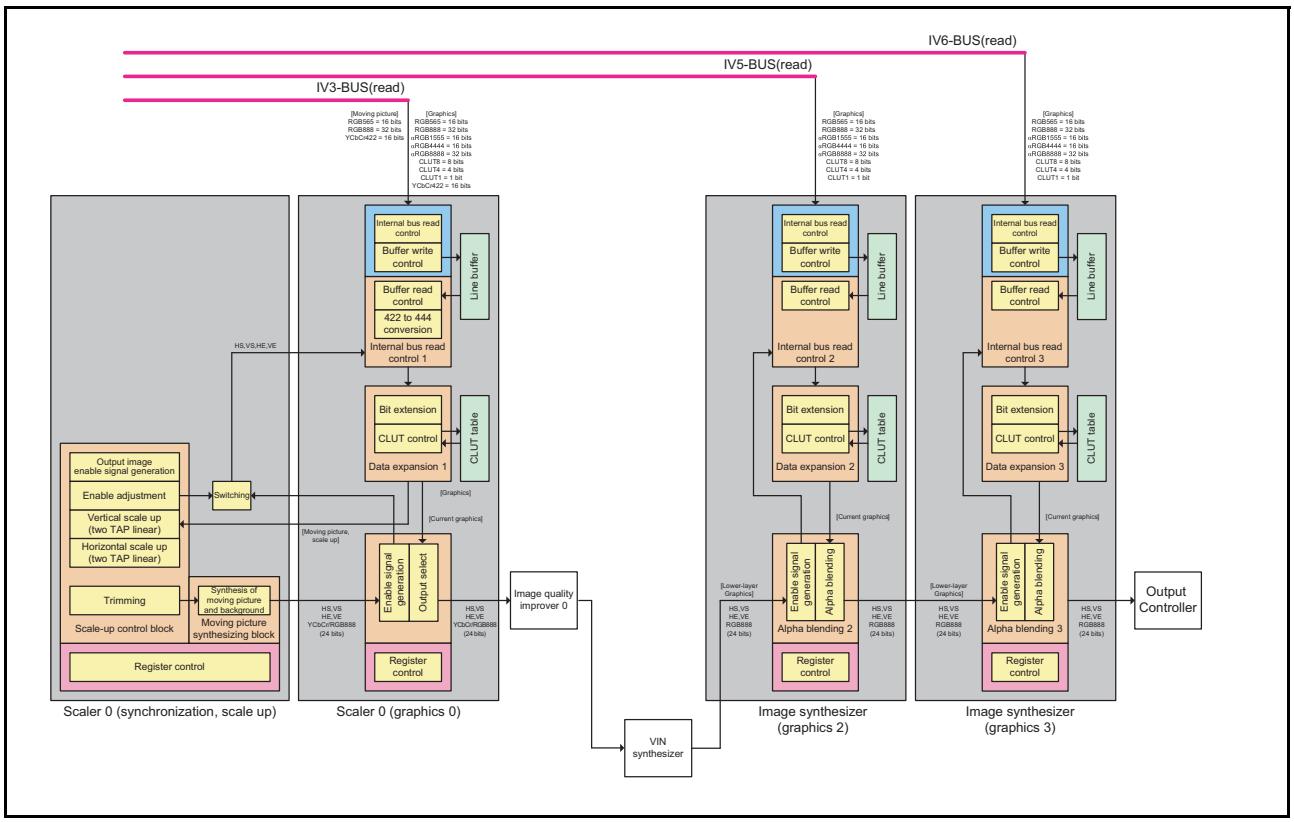

Figure 33.1 Functional Block Diagram of Image Synthesizer

33.1.2 Graphics Data Read Control

Graphics data read can be controlled for the three processes: the graphics 0 process in the scaler 0, and the graphics 2 and 3 processes in the image synthesizer.

The register bits of each process can be identified by the number in the register name like GR0_xxxx, GR2_xxxx, and GR3_xxxx, respectively. In the sections except for Register Descriptions, however, the number is omitted like GR_xxxx for convenience sake.

In the VIN synthesizer, graphics data read is not controlled. In this manual, the name is omitted like GR_xxxx for convenience sake. The synthesizer does not have the read control register (GR_FLM).

(1) Updating Registers

The Vsync signal is used to control the update timing of the registers for graphics display and frame buffer read control, except for some of the registers.

After 1 is set to the bits in the update control register, the contents of the relevant registers are actually modified at the rising edge of the Vsync signal, when the update control register is automatically cleared to 0.

Table 33.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
GR_UPDATE	GR_UPDATE	0	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
GR_UPDATE	GR_P_VEN	0	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GR_UPDATE	GR_IBUS_VEN	0	Frame Buffer Read Register Update* 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

Note: * This bit is not supported for the VIN synthesizer.

(2) Frame Buffer Burst Transfer Mode

Either 32-byte or 128-byte transfer mode can be selected for accessing the frame buffer in which video data and graphics data are stored.

Table 33.2 Frame Buffer Burst Transfer Mode

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_BST_MD	0	Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer

(3) Frame Buffer Control Mode

More than one frame of data is read from the frame buffer.

For graphics data, set the GR_FLM_SEL[1:0] bits to 1, and set the specific display frame number with the GR_FLM_NUM[9:0] bits. For video data, select a mode with the GR_FLM_SEL[1:0] bits depending on the writing process used; the quantity of the frames used for video data is set in the writing process block.

Table 33.3 Frame Buffer Control Mode

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_FLM_SEL[1:0]	0	Frame Buffer Address Setting Signal Select 0: Control linked to scaling-down process, or frame 0 selected.*1 1: Register GR_FLM_NUM selected. 2: Frame 0 selected. 3: Control linked to pointer buffer, or setting prohibited.*2
GR_FLM3	GR_FLM_NUM[9:0]	0	Frame Number of Frame Buffer Manually set the frame number when GR_FLM_SEL = 1.

Notes: 1. For the graphics 0 process, frame buffer control links to the scaling-down process. For the graphics 2 and 3 processes, frame 0 is selected.
2. For the graphics 0 process, frame buffer control links to the pointer buffer. For the graphics 2 and 3 processes, setting is prohibited.

(4) Frame Buffer Read Control

The following bit enables or disables read access to the frame buffer.

Table 33.4 Frame Buffer Read Control

Register Name	Bit Name	Initial Value	Description
GR_FLM_RD	GR_R_ENB	0	Frame Buffer Read Enable 0: Disables read access to the frame buffer. 1: Enables read access to the frame buffer.

(5) Frame Buffer Size

The following bits set the size of the frame buffer to be read.

The numbers of horizontal pixels and of lines in the vertical direction are set with the GR_HW[10:0] and GR_FLM_LNUM[10:0] bits, respectively.

Table 33.5 Frame Buffer Size

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_HW[10:0]	0	Sets the width of the horizontal valid period. The width is (GR_HW + 1) pixels. Note: Set to 2 or greater.
GR_FLM5	GR_FLM_LNUM[10:0]	0	Sets the number of lines in a frame The number of lines is (GR_FLM_LNUM + 1).

(6) Calculating Addresses in Frame Buffer

The data area in the frame buffer is defined using the addresses specified by GR_BASE[31:0], GR_LN_OFF[14:0], and GR_FLM_OFF[22:0] bits and the display frame number.

The GR_LN_OFF[14:0] and GR_FLM_OFF[22:0] bits should be set in units of 32/128 bytes (the lower 5/7 bits should be fixed to 0).

The GR_BASE[31:0] bits should be set in units of 64 bits to set the display data start position (the lower three bits should be fixed).

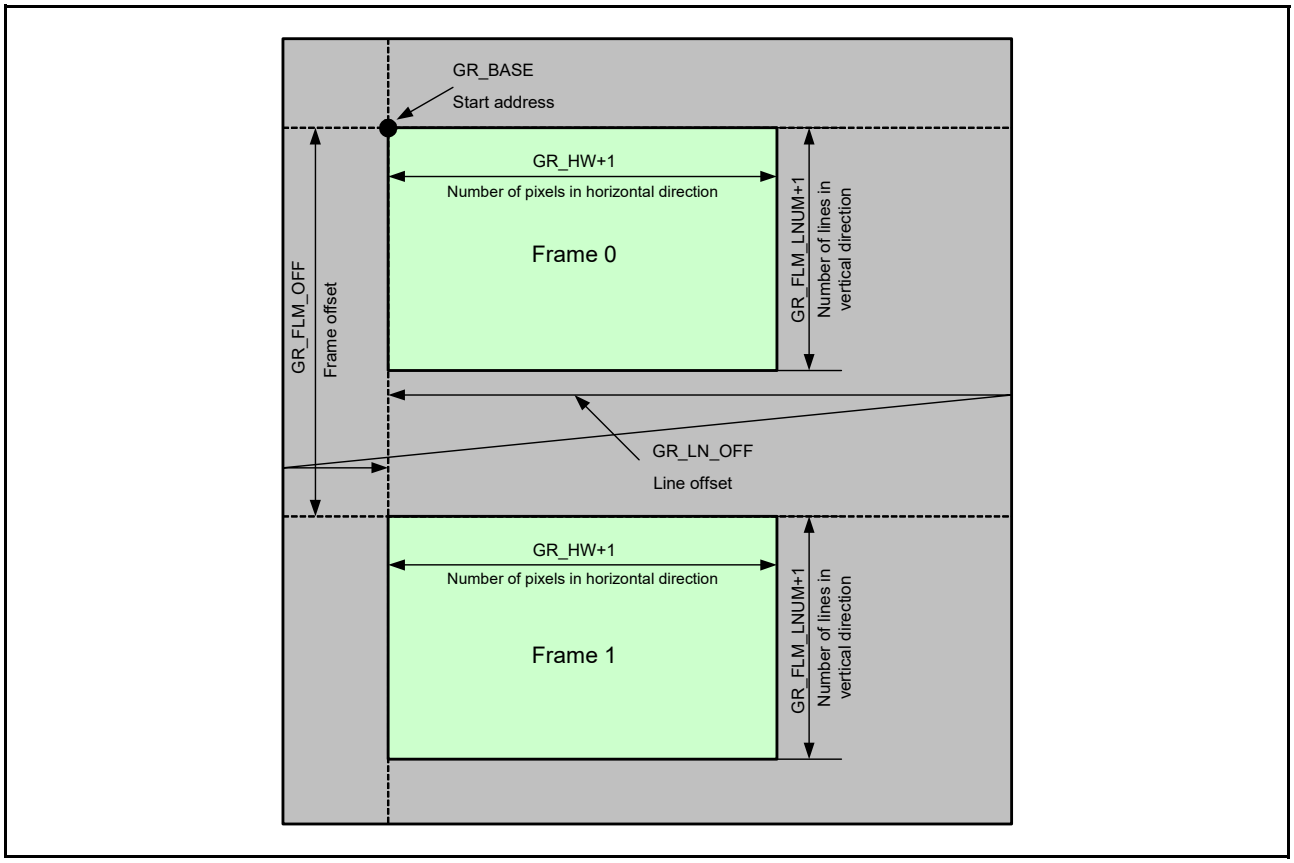

Figure 33.2 Data Arrangement in Frame Buffer

Table 33.6 Calculation of Addresses in Frame Buffer

Register Name	Bit Name	Initial Value	Description
GR_FLM2	GR_BASE[31:0]	0	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower 3 bits should be set to 000.
GR_FLM3	GR_LN_OFF[14:0]	0	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0:GR_BASE Line 1:GR_BASE + GR_LN_OFF × 1 : Line n: GR_BASE + GR_LN_OFF × n For 32-byte transfer, the lower 5 bits should be fixed to 0_0000. For 128-byte transfer, the lower 7 bits should be fixed to 000_0000.
GR_FLM4	GR_FLM_OFF[22:0]	0	Frame Buffer Frame Offset Address (lower) Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR_BASE Buffer 1: GR_BASE + GR_FLM_OFF × 1 : Buffer n: GR_BASE + GR_FLM_OFF × n For 32-byte transfer, the lower 5 bits should be fixed to 0_0000. For 128-byte transfer, the lower 7 bits should be fixed to 000_0000.

(7) Setting Frame Buffer Size Smaller than One Frame

Frame buffer size can be set in one-line units.

When the number of lines set with the GR_FLM_LOOP[10:0] bits is smaller than the value of the GR_FLM_LNUM[10:0] bits, data is again read from the start address of the frame buffer after the number of lines set with the (GR_FLM_LOOP[10:0] + 1) bits have been read.

Table 33.7 Setting of Frame Buffer Size Smaller than One Frame

Register Name	Bit Name	Initial Value	Description
GR_FLM5	GR_FLM_LOOP[10:0]	1023	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. The number of lines is (GR_FLM_LOOP + 1).

(8) Line Offset Control for Frame Buffer

The following bit sets the line offset address direction of the frame buffer.

Table 33.8 Line Offset Address Direction Control for Frame Buffer

Register Name	Bit Name	Initial Value	Description
GR_FLM1	GR_LN_OFF_DIR	0	Selects the line offset address direction of the frame buffer. 0:Increments the address by the line offset address. 1:Decrements the address by the line offset address.

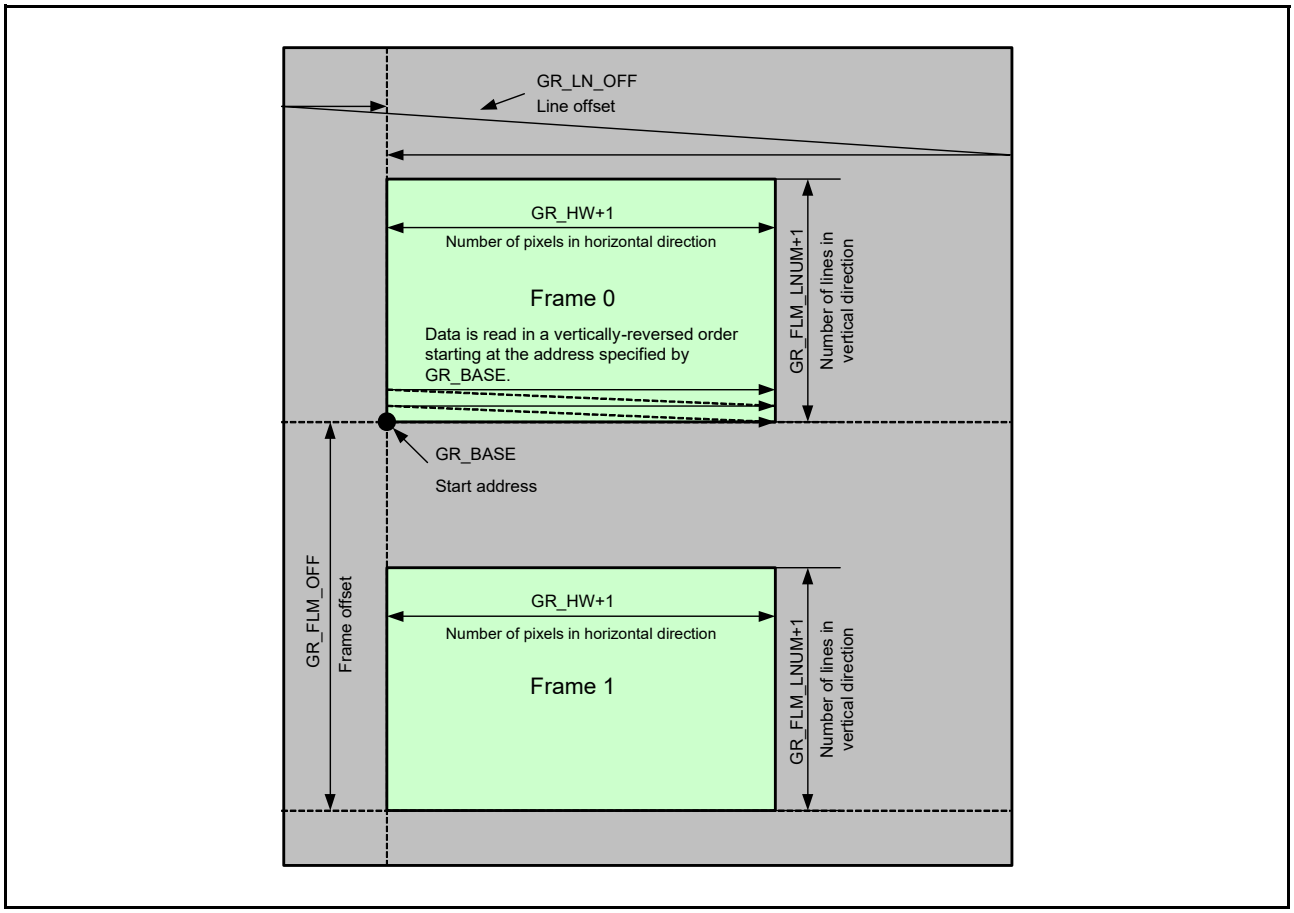

Figure 33.3 Data Arrangement with Line Offset and Decrement Control

(9) Selecting Format of Frame Buffer Read Signal

Signal formats RGB565, RGB888, αRGB1555, αRGB4444, αRGB8888, RGBα5551, RGBα8888, CLUT8, CLUT4 and CLUT1 are supported for the graphics 0, 2, and 3 processes. The YCbCr422 and YCbCr444 formats are also supported for the graphics 0 process.

The GR_FORMAT[3:0] bits select a signal format.

Table 33.9 Format Selection for Frame Buffer Read Signal

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_FORMAT[3:0]	0	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: YCbCr422 or setting prohibited * 9: YCbCr444 or setting prohibited * 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited

Note: * Setting this value selects YCbCr422 and YCbCr444 for the graphics 0 process, and is prohibited for the graphics 2 and 3 processes.

(10) Endian Control

In the frame buffer, data is handled in 64-bit units, and endian of the data to be read can be controlled by setting the GR_RDSWA[2:0] bits. Bit 0 of these bits indicates whether 8-bit data is swapped. Bit 1 indicates whether 16-bit data is swapped. Bit 2 indicates whether 32-bit data is swapped. In the YCbCr422 format, data can be arranged with the GR_YCC_SWAP[2:0] bits.

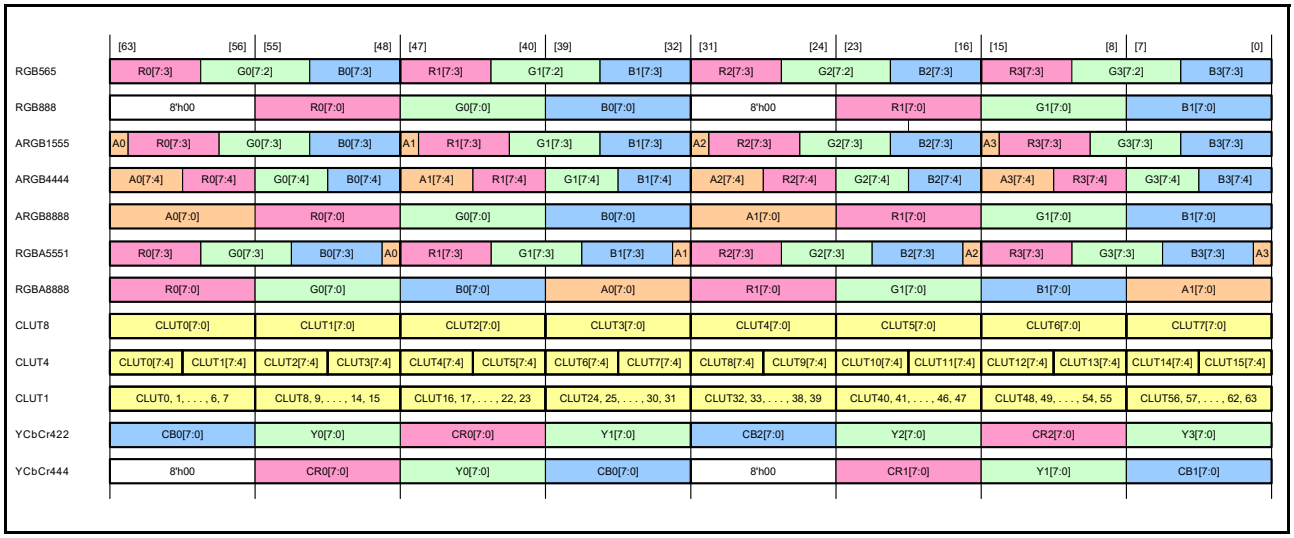

Figure 33.4 Data Arrangement with Endian Control Disabled (GR_RDSWA = 000)

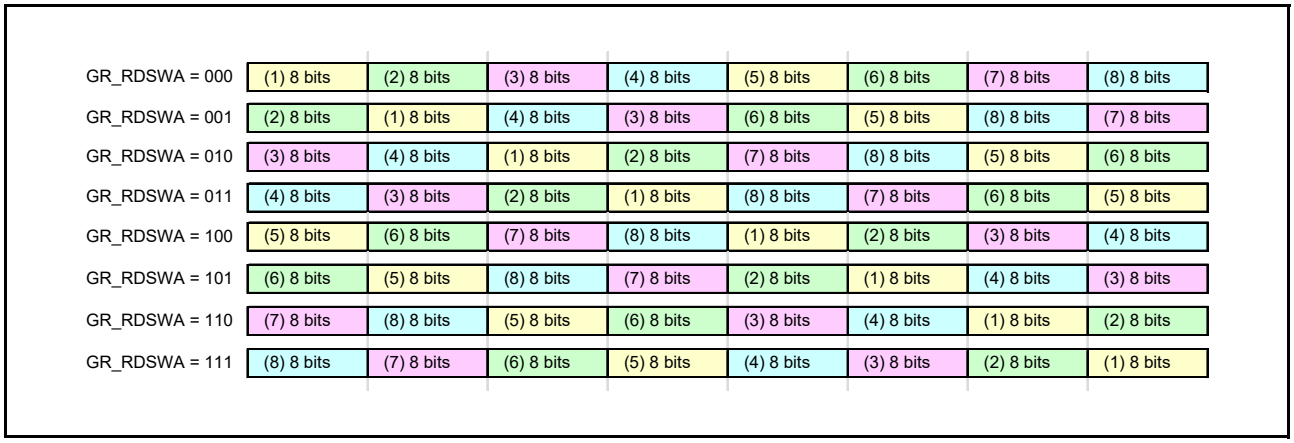

Figure 33.5 Data Arrangement with Endian Control Enabled

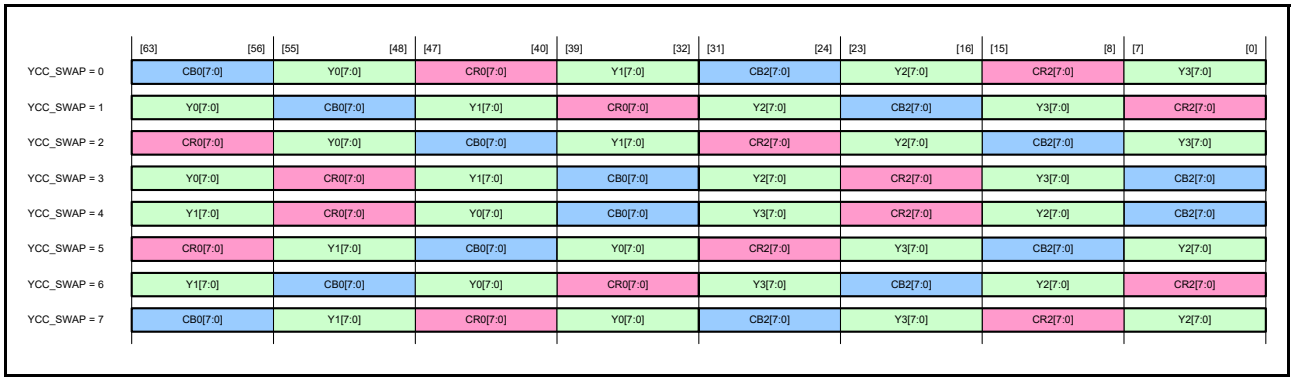

Figure 33.6 YCbCr422 Data Arrangement with Swapping Enabled

Table 33.10 Endian Control

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_RDSWA[2:0]	0	Sets 8-, 16-, and 32-bit swap. These three bits specify the method for swapping the bits of frame buffer read data as follows. Bit 0 0: 8 bits are not swapped. 1: 8 bits are swapped. Bit 1 0: 16 bits are not swapped. 1: 16 bits are swapped. Bit 2 0: 32 bits are not swapped. 1: 32 bits are swapped. When eight bits are put together, they are swapped as follows. Each of (1) to (8) indicates eight-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [No swap] 001: (2) (1) (4) (3) (6) (5) (8) (7) [8-bit swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [16-bit swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [16-bit swap + 8-bit swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [32-bit swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [32-bit swap + 8-bit swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [32-bit swap + 16-bit swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [32-bit swap + 16-bit swap + 8-bit swap]

Table 33.10 Endian Control

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_YCC_SWAP [2:0]	0	Controls swapping of data read from buffer in the YCbCr422 format. * 0: Cb/Y0/Cr/Y1 1: Y0/Cb/Y1/Cr 2: Cr/Y0/Cb/Y1 3: Y0/Cr/Y1/Cb 4: Y1/Cr/Y0/Cb 5: Cr/Y1/Cb/Y0 6: Y1/Cb/Y0/Cr 7: Cb/Y1/Cr/Y0

Note: * These bits are supported for the graphics 0 process only.

(11) Display Start Pixel Setting for Read Data

When a horizontal offset is applied to display the image data in the frame buffer, the display start pixel is set with the GR_BASE[31:0] and GR_STA_POS[5:0] bits. Calculation of the values for the GR_BASE[31:0] and GR_STA_POS[5:0] bits depends on the signal format. The display start pixel can be calculated with the formulas in the table below, where H_OFF is a horizontal offset from the display start pixel.

Table 33.11 Calculation of Display Start Position for Various Signal Formats

Signal Format of Video/Graphics	Number of Bits per Pixel	Calculation Formula *1
RGB888 αRGB8888, RGBα8888 YCbCr422*2 YCbCr444*3	32	GR_BASE[31:3] = t (H_OFF ÷ 2) GR_STA_POS[5:0] = mod (H_OFF ÷ 2)
RGB565 αRGB1555, RGBα5551 αRGB4444	16	GR_BASE[31:3] = int (H_OFF ÷ 4) GR_STA_POS[5:0] = mod (H_OFF ÷ 4)
CLUT8	8	GR_BASE[31:3] = int (H_OFF ÷ 8) GR_STA_POS[5:0] = mod (H_OFF ÷ 8)
CLUT4	4	GR_BASE[31:3] = int (H_OFF ÷ 16) GR_STA_POS[5:0] = mod (H_OFF ÷ 16)
CLUT1	1	GR_BASE[31:3] = int (H_OFF ÷ 64) GR_STA_POS[5:0] = mod (H_OFF ÷ 64)

Notes: 1. The functions int() and mod() output a quotient and a remainder, respectively.
2. The YCbCr422 format is not supported for the graphics 2 and 3 processes.
In the YCbCr422 format, 32 bits are used for two pixels (Cb, Y0, Cr, and Y1 components). Therefore, the start position is controlled in units of 32 bits.
3. The YCbCr444 format is not supported for the graphics 2 and 3 processes.

Table 33.12 Setting of Display Start Pixel of Read Data

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_STA_POS[5:0]	0	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR_STA_POS is skipped from the start of the line.
GR_FLM2	GR_BASE[31:0]	0	Frame Buffer Base Address Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower 3 bits should be fixed to 000.

(12) YCbCr422 to YCbCr444 Conversion

Data format for the graphics 0 process is converted from YCbCr422 to YCbCr444.

This function is not supported for the graphics 2 and 3 processes.

Table 33.13 YCbCr422 to YCbCr444 Conversion

Register Name	Bit Name	Initial Value	Description
GR_FLM6	GR_CNV444_MD	0	Sets the interpolation mode for YCbCr422 to YCbCr444 conversion. * 0: Hold interpolation 1: Average interpolation

Note: * This bit is not provided for the graphics 2 and 3 processes, for which the YCbCr422 format is not supported.

(13) Bit Extension

When the value of the GR_FORMAT[3:0] bits is 0 to 3, the RGB565, RGB888, αRGB1555, and αRGB4444 formats are converted to the αRGB8888 format. When the value of the GR_FORMAT[3:0] bits is 10, the RGBα5551 format is converted to the RGBα8888 format. The RGBα5551 to RGBα8888 format conversion is omitted because it differs from the αRGB5551 to αRGB8888 format conversion only in the position of α.

- RGB565 to αRGB8888 Format Conversion

  After conversion, α[7:0] is fixed to 255.

  After conversion, R[7:0] = R[4:0] × 263 ÷ 32 (round off to an integer), approximation of #R[4:0] × 255 ÷ 31

  After conversion G[7:0] = G[5:0] × 259 ÷ 64 (round off to an integer), approximation of #G[5:0] × 255 ÷ 63

  After conversion, B[7:0] = B[4:0] × 263 ÷ 32 (round off to an integer), approximation of #B[4:0] × 255 ÷ 31

- RGB888 to αRGB8888 Format Conversion

  After conversion, α[7:0] is fixed to 255.

- αRGB1555 to αRGB8888 Format Conversion

  After conversion, α[7:0] is GR_A1 when α input is 1, and GR_A0 when 0.

  After conversion, R[7:0] = R[4:0] × 263 ÷ 32 (round off to an integer), approximation of #R[4:0] × 255 ÷ 31

  After conversion, G[7:0] = G[4:0] × 263 ÷ 32 (round off to an integer), approximation of #G[4:0] × 255 ÷ 31

  After conversion, B[7:0] = B[4:0] × 263 ÷ 32 (round off to an integer), approximation of #B[4:0] × 255 ÷ 31

- αRGB4444 to αRGB8888 Format Conversion

  After conversion, α[7:0] = α[3:0] × 17

  After conversion, R[7:0] = R[3:0] × 17

  After conversion, G[7:0] = G[3:0] × 17

  After conversion, B[7:0] = B[3:0] × 17

(14) Buffer Underflow Processing

When data read from the frame buffer cannot be completed due to bus-traffic related problems, an underflow interrupt signal is output.

33.1.3 Setting Graphics Display Area

The graphics display area is set with the GR_GRC_HS[10:0], GR_GRC_HW[10:0], GR_GRC_VS[10:0], and GR_GRC_VW[10:0] bits based on the rising edges of the Hsync and Vsync signals.

Figure 33.7 shows the graphics display area.

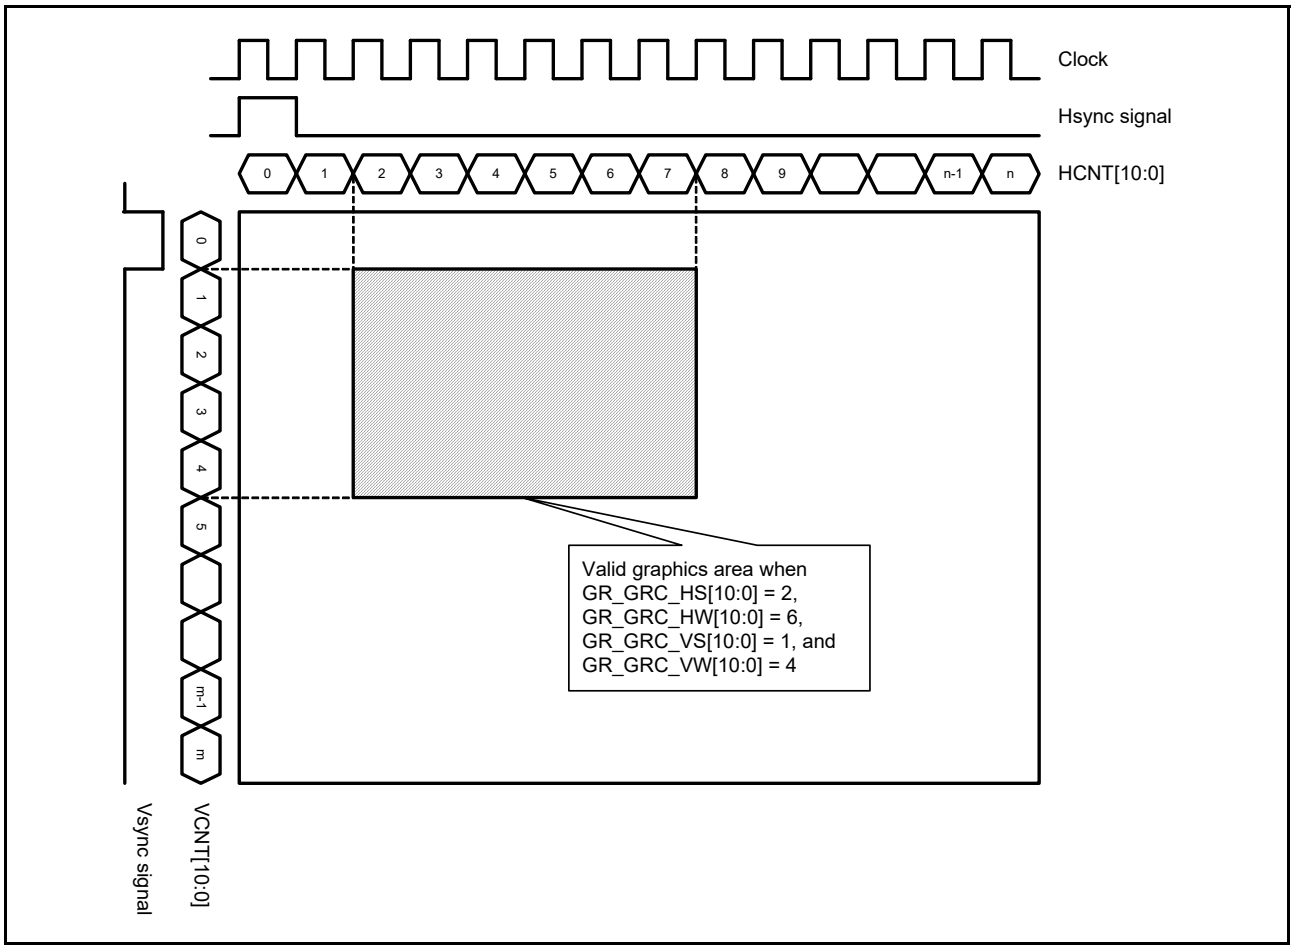

Figure 33.7 Graphics Display Area

The frame line of the graphics area can be displayed by setting the GR_GRC_DISP_ON bit to 1.

Table 33.14 Graphics Image Area Setting

Register Name	Bit Name	Initial Value	Description
GR_AB3	GR_GRC_HS[10:0]	0	Sets the horizontal start position of the graphics image area. Note: Set to 16 or greater clocks and the result of GR_GRC_HS + GR_GRC_HW should be smaller than or equal to 2015 clocks.
GR_AB3	GR_GRC_HW[10:0]	0	Sets the horizontal width of the graphics image area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR_HW to 2 and GR_GRC_HW to 1 (1-pixel) or 2 (2-pixel).
GR_AB2	GR_GRC_VS[10:0]	0	Sets the vertical start position of the graphics image area. Note: Set to 4 or greater lines and the result of GR_GRC_VS + GR_GRC_VW should be smaller than or equal to 2039 lines.
GR_AB2	GR_GRC_VW[10:0]	0	Sets the vertical width of the graphics image area.
GR_AB1	GR_GRC_DISP_ON	0	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on

33.1.4 Interrupt Generation at Specified Line

An interrupt signal can be generated at the line specified with the GR_LINE[10:0] bits.

Table 33.15 Interrupt Generation at Specified Line

Register Name	Bit Name	Initial Value	Description
GR_CLUT_INT	GR_LINE[10:0]	0	Line Interrupt Set * When the number of lines matches the value of the GR_LINE bits, an interrupt signal is output. This function is supported for the graphics 3 process only. This function supported for the graphics 3 process is enabled even when the graphics 3 process is not used.

Note: * This function is supported for the graphics 3 process only; these bits are not supported for the graphics 0 and 2 processes.

33.1.5 Formats of Frame Buffer Read Signals and Corresponding Alpha Blending Types

Setting the GR_FORMAT[3:0] bits selects the format of the signal read from the frame buffer.

Table 33.16 shows the signal formats and the corresponding alpha blending types. The priority of the alpha value is: alpha blending in rectangular area > chroma-key processing > alpha blending in pixel units.

Table 33.16 Formats of Frame Buffer Read Signal and Corresponding Alpha Blending Types

GR_FORMAT[3:0]	Signal Format	Alpha Blending in Rectangular Area	RGB-Index Chroma-Key Processing	CLUT-Index Chroma-Key Processing	Alpha Blending in Pixel Units
0	RGB565	Supported	Supported *1	Not supported	Not supported *2
1	RGB888	Supported	Supported	Not supported	Not supported *2
2	αRGB1555	Supported	Supported *1*3	Not supported	Supported *3
3	αRGB4444	Supported	Supported *1	Not supported	Supported
4	αRGB8888	Supported	Supported	Not supported	Supported
5	CLUT8	Supported	Not supported	Supported	Supported
6	CLUT4	Supported	Not supported	Supported	Supported
7	CLUT1	Supported *4	Not supported	Supported *4	Supported *4
8	YCbCr422	Not supported *5	Not supported *5	Not supported *5	Not supported *5
9	YCbCr444	Not supported *5	Not supported *5	Not supported *5	Not supported *5
10	RGBα5551	Supported	Supported *1*3	Not supported	Supported *3
11	RGBα8888	Supported	Supported	Not supported	Supported

Notes:
1. When each color component of the RGB signal read from the frame buffer is not 8 bits, it is converted to 8 bits by calculation in RGB-index chroma-key processing. (See section 33.1.2 (13) Bit Extension.)
2. Since α value is 255, the current graphics is always displayed.
3. α value for data read from the frame buffer is specified with one bit. This one-bit signal selects one of the two registers, each of which holds an 8-bit α value.
4. CLUT value for the frame buffer signal is specified with one bit. This one-bit signal selects one of the two registers, each of which holds the α, G, B, and R values (8 bits for each value). The CLUT table is not referenced.
5. YCbCr422 and YCbCr444 are supported for the graphics 0 process, but any type of blending and chroma-key processing cannot be used.

33.1.6 Display Selection

The GR_DISP_SEL[1:0] bits select the graphics to be displayed from the background color, the lower-layer graphics, the current graphics, and the blended image of the lower-layer graphics and the current graphics. For blending, alpha blending in a rectangular area, multiplication with current alpha at alpha blending in a rectangular area, RGB-index chroma-key processing, CLUT-index chroma-key processing, alpha blending in one-pixel units, or premultiplication at alpha blending in one-pixel units can be selected.
This function is not supported for the VIN synthesizer.

Table 33.17 shows the settings for various display types.

Table 33.17 Settings for Various Display Types

GR_DISP_SEL [1:0]	GR_ARC_ON	GR_CK_ON	GR_ARC_MUL	GR_ACALC_MD	Processing for Graphics Area	Processing for the Area outside the Graphics Area
0	—	—	—	—	Background color	Background color
1	—	—	—	—	Lower-layer graphics	Lower-layer graphics
2	—	—	—	—	Current graphics	Background color
3	1	—	0	0	Alpha blending in a rectangular area*1	Lower-layer graphics
3	1	—	0	1	Setting prohibited	
3	1	—	1	0	Multiplication with current alpha at alpha blending in a rectangular area*2	Lower-layer graphics
3	1	—	1	1	Multiplication with current alpha at alpha blending in a rectangular area with alpha premultiplied*2	Lower-layer graphics
3	0	1	—	—	RGB-index or CLUT-index chroma-key processing	Lower-layer graphics
3	0	0	—	0	Alpha blending in one-pixel units*2	Lower-layer graphics
3	0	0	—	1	Premultiplication at alpha blending in one-pixel units*2	Lower-layer graphics

Notes: 1. The alpha blending in a rectangular area is not supported for the graphics 0 process in the scaler.
2. The multiplication with current alpha at alpha blending in a rectangular area and alpha blending function in one-pixel units are supported for the graphics 2 and 3 processes only.

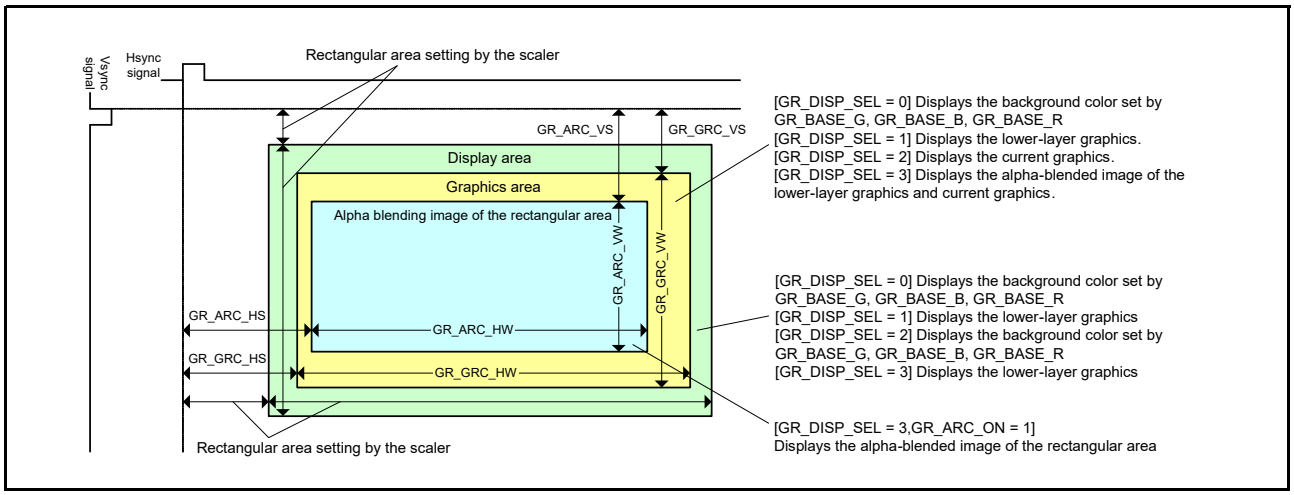

Figure 33.8 Graphic Display Types

Figure 33.9 shows the graphics planes displayed when the GR_DISP_SEL bits are set to 3.

For correspondence between the lower-layer graphics and the current graphics, see Figure 33.1.

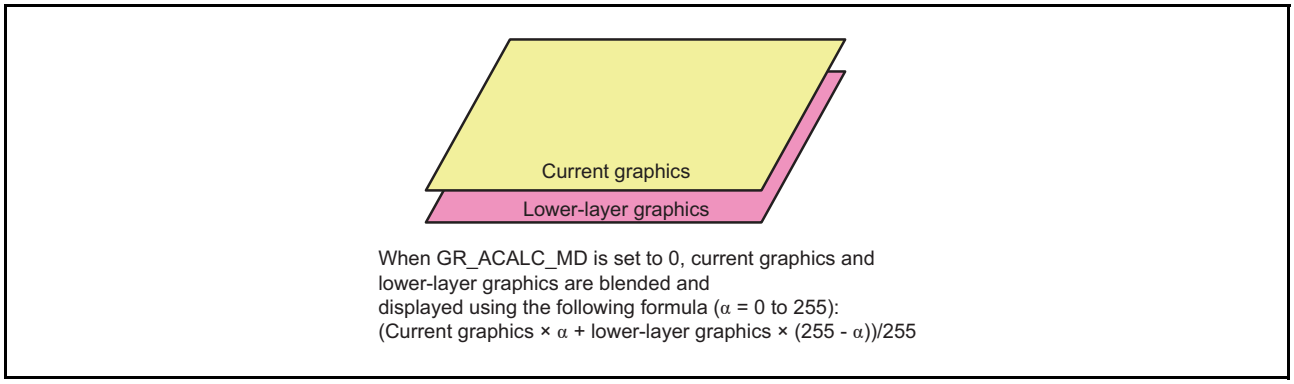

Figure 33.9 Graphics Planes with GR_DISP_SEL Set to 3

Table 33.18 Alpha Blending Setting

Register Name	Bit Name	Initial Value	Description
GR_AB1	GR_DISP_SEL [1:0]	0	Selects the graphics display mode. 0:Background color display 1:Lower-layer graphics display 2:Current graphics display 3:Blended display of lower-layer graphics and current graphics*1
GR_AB1	GR_ARC_ON	0	Turns on/off alpha blending in a rectangular area.*2 0: Off 1: On
GR_AB1	GR_ARC_MUL	0	Turns on/off multiplication processing with current alpha at alpha blending in a rectangular area *3 0: Off 1: On
GR_AB1	GR_ACALC_MD	0	Turns on/off premultiplication processing at alpha blending in one-pixel units *3 0: Off 1: On
GR_AB7	GR_CK_ON	0	Turns on/off CLUT-index/RGB-index chroma-key processing. 0: Off 1: On

Notes: 1. The graphics 0 process supports the chroma-key processing only. When performing chroma-key processing, set the α value for converting the pixels to be subjected to chroma-key processing, and the α value of the pixels not to be subjected to the chroma-key processing to 255 to display the current graphics only.
2. This function is supported only for the graphics 2 and 3 processes. This bit is not provided for the graphics 0 process.
3. This function is supported only for the graphics 2 and 3 processes. This bit is not provided for the graphics 0 process.

33.1.7 Background Color Display Processing

The color set with the GR_BASE_G[7:0], GR_BASE_B[7:0], and GR_BASE_R[7:0] bits is displayed.

G output = GR_BASE_G

B output = GR_BASE_B

R output = GR_BASE_R

Table 33.19 Background Color Setting

Register Name	Bit Name	Initial Value	Description
GR_BASE	GR_BASE_G[7:0]	0	Background color G signal G: 8 bits; unsigned (0 to 255 [LSB])
GR_BASE	GR_BASE_B[7:0]	0	Background color B signal B: 8 bits; unsigned (0 to 255 [LSB])
GR_BASE	GR_BASE_R[7:0]	0	Background color R signal R: 8 bits; unsigned (0 to 255 [LSB])

33.1.8 Lower-Layer Graphics Display Processing

The lower-layer graphics are displayed as follows:

G output = G input of lower-layer graphics

B output = B input of lower-layer graphics

R output = R input of lower-layer graphics

33.1.9 Current Graphics Display Processing

The current graphics are displayed as follows:

G output = G input of current graphics

B output = B input of current graphics

R output = R input of current graphics

33.1.10 Display with Alpha Blending in a Rectangular Area

The rectangular area subjected to alpha blending is set with the GR_ARC_HS[10:0], GR_ARC_HW[10:0], GR_ARC_VS[10:0], and GR_ARC_VW[10:0] bits based on the rising edges of the Hsync and Vsync signals. This function is not supported for the graphics 0 process.

Figure 33.10 shows the rectangular area setting for alpha blending.

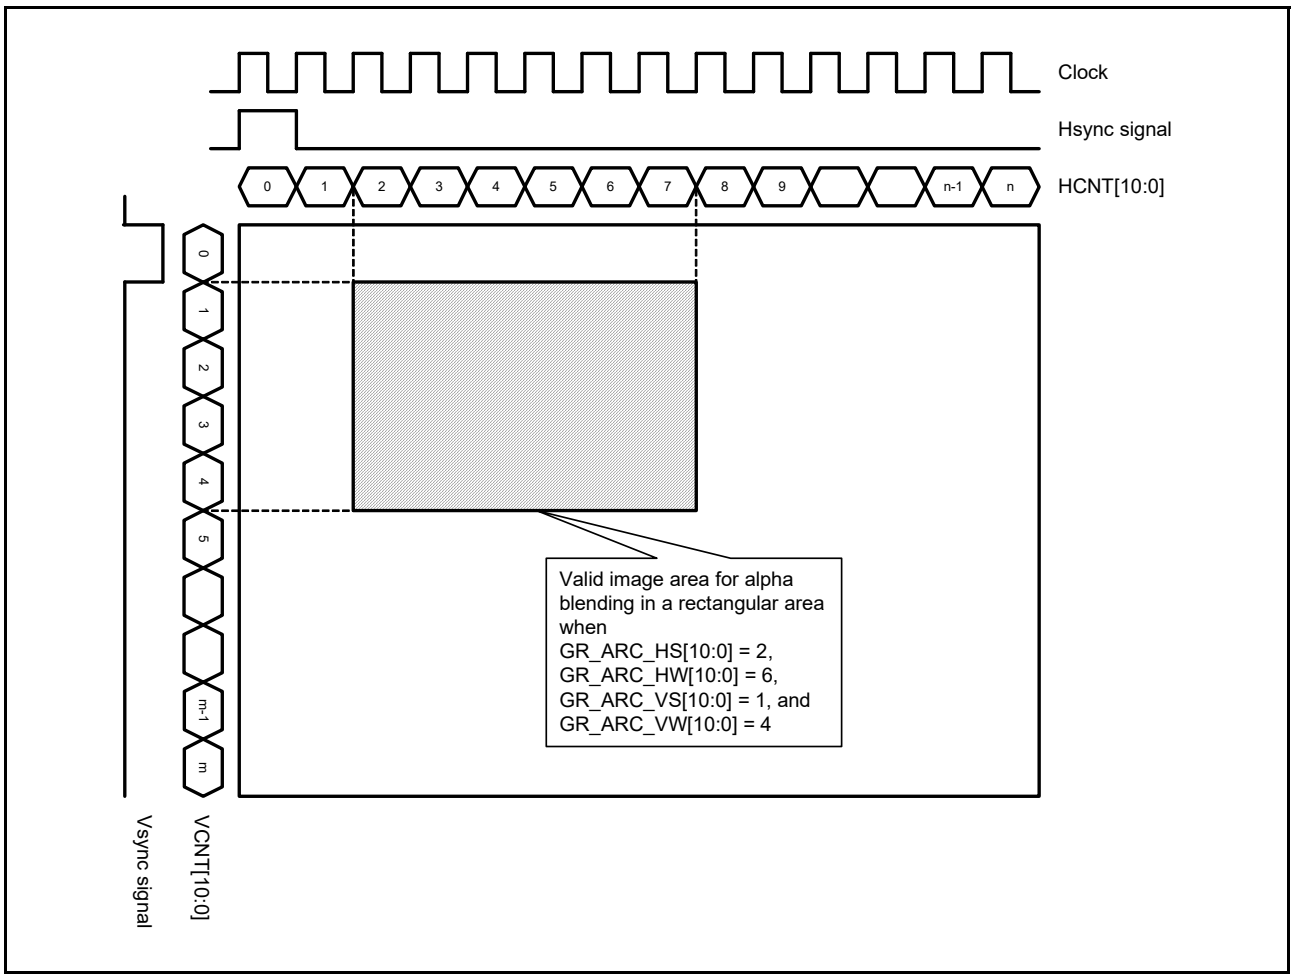

Figure 33.10 Rectangular Area Setting for Alpha Blending

The frame line of graphics area can be displayed by setting the GR_ARC_DISP_ON bit to 1.

Table 33.20 Setting of Rectangular Area for Alpha Blending

Register Name	Bit Name	Initial Value	Description
GR_AB5	GR_ARC_HS[10:0]	0	Sets the horizontal start position of the valid image area for alpha blending in a rectangular area.
GR_AB5	GR_ARC_HW[10:0]	0	Sets the horizontal width of the valid image area for alpha blending in a rectangular area.
GR_AB4	GR_ARC_VS[10:0]	0	Sets the vertical start position of the valid image area for alpha blending in a rectangular area.
GR_AB4	GR_ARC_VW[10:0]	0	Sets the vertical width of the valid image area for alpha blending in a rectangular area.
GR_AB1	GR_ARC_DISP_ON	0	Turns on/off frame-line display of the valid image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on

In alpha blending in a rectangular area, the current graphics are faded in or out by setting the fade-in or fade-out coefficients with the GR_ARC_DEF[7:0], GR_ARC_MODE, GR_ARC_COEF[7:0], and GR_ARC_RATE[7:0] bits.

First, the value of the GR_ARC_DEF[7:0] bits is assigned to the α value.

Then, each time the Vsync signal rises for the number of times set with the GR_ARC_RATE[7:0] bits + 1, the value of the GR_ARC_COEF[7:0] bit is added to or subtracted from the α value.

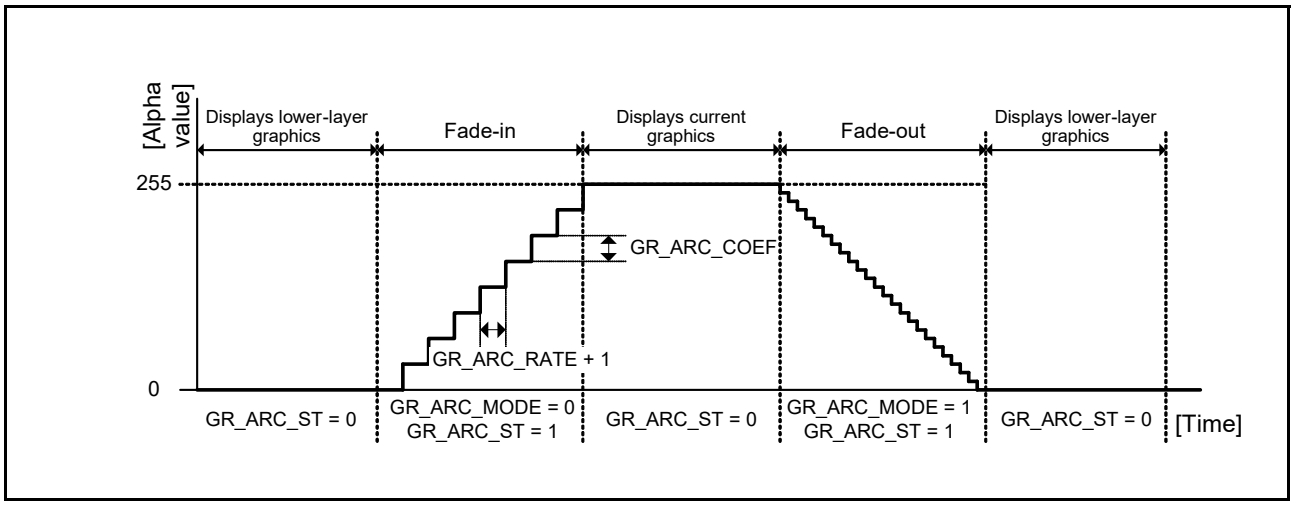

Figure 33.11 Fade In and Fade Out

Table 33.21 Setting for Alpha Blending in a Rectangular Area

Register Name	Bit Name	Initial Value	Description
GR_AB7	GR_ARC_DEF[7:0]	0	Sets the initial alpha value for alpha blending in a rectangular area.
GR_AB6	GR_ARC_MODE	0	Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction
GR_AB6	GR_ARC_COEF[7:0]	0	Sets the alpha coefficient for alpha blending in a rectangular area. (0 to 255) [7:0]: Variation (absolute value)
GR_AB6	GR_ARC_RATE[7:0]	0	Sets the value obtained by subtracting 1 from the frame rate for alpha blending in a rectangular area.
GR_MON	GR_ARC_ST	—	Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress.

The values specified with the following expressions are used in the alpha blending calculation described in section 33.1.14, Alpha Blending Calculation.

α value = Fade-in/out coefficient

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

33.1.11 RGB-Index Chroma-Key Processing

The pixels that satisfy all the expressions below are subjected to RGB-index chroma-key processing.

G input of the current graphics = GR_CK_KG

B input of the current graphics = GR_CK_KB

R input of the current graphics = GR_CK_KR

In RGB-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 33.1.14, Alpha Blending Calculation. This function is not supported in the VIN synthesizer.

α value = GR_CK_A

G value = GR_CK_G

B value = GR_CK_B

R value = GR_CK_R

For the pixels that are not subjected to RGB-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 33.1.14, Alpha Blending Calculation.

α value = α input of the current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

Table 33.22 Setting for RGB-Index Chroma-Key Processing

Register Name	Bit Name	Initial Value	Description
GR_AB8	GR_CK_KG[7:0]	0	G Signal for RGB-Index Chroma-Key Processing G: 8 bits; unsigned (0 to 255 [LSB])
GR_AB8	GR_CK_KB[7:0]	0	B Signal for RGB-Index Chroma-Key Processing B: 8 bits; unsigned (0 to 255 [LSB])
GR_AB8	GR_CK_KR[7:0]	0	R Signal for RGB-Index Chroma-Key Processing R: 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_A[7:0]	0	Replaced Alpha Signal after RGB-Index Chroma-Key Processing* α: 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_G[7:0]	0	Replaced G Signal after RGB-Index Chroma-Key Processing G: 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_B[7:0]	0	Replaced B Signal after RGB-Index Chroma-Key Processing B: 8 bits; unsigned (0 to 255 [LSB])
GR_AB9	GR_CK_R[7:0]	0	Replaced R Signal after RGB-Index Chroma-Key Processing R: 8 bits; unsigned (0 to 255 [LSB])

Note: * To use this function for the graphics 0 process, the alpha value should be set to 255.

33.1.12 CLUT-Index Chroma-Key Processing

The pixels that satisfy the expression below are subjected to CLUT-index chroma-key processing.

CLUT input of the current graphics = GR_CK_KCLUT

In CLUT-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 33.1.14, Alpha Blending Calculation. This function is not supported in the VIN synthesizer.

α value = GR_CK_A

G value = GR_CK_G

B value = GR_CK_B

R value = GR_CK_R

For the pixels that are not subjected to CLUT-index chroma-key processing, the values specified with the following expressions are used in the alpha blending calculation described in section 33.1.14, Alpha Blending Calculation.

α value = α input of the current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

Table 33.23 Setting for CLUT-Index Chroma-Key Processing

Register Name	Bit Name	Initial Value	Description
GR_AB8	GR_CK_ KCLUT[7:0]	0	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: 8 bits; unsigned (0 to 255 [LSB])
GR_AB10	GR_A0[7:0]	0	CLUT1 α0 Signal* Replaced with α signal when in the CLUT1 format and CLUT1= 0. Replaced with α signal when in the αRGB1555 format and α = 0.
GR_AB10	GR_G0[7:0]	0	CLUT1 G0 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 0.
GR_AB10	GR_B0[7:0]	0	CLUT1 B0 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 0.
GR_AB10	GR_R0[7:0]	0	CLUT1 R0 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 0.
GR_AB11	GR_A1[7:0]	0	CLUT1 α1 Signal* Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the αRGB1555 format and α = 1.
GR_AB11	GR_G1[7:0]	0	CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1.
GR_AB11	GR_B1[7:0]	0	CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1.
GR_AB11	GR_R1[7:0]	0	CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1.

Note: * To use this function for the graphics 0 process, the alpha value should be set to 255.

33.1.13 Display with Alpha Blending in One-Pixel Units

In the alpha blending in one-pixel units, the values specified with the following expressions are used in the alpha blending calculation described in section 33.1.14, Alpha Blending Calculation. This function is not supported in the graphics 0 process and the VIN synthesizer.

α value = α input of the current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

33.1.14 Alpha Blending Calculation

Alpha blending of two input signals is performed using the α value as described below (rounded up if the result includes a decimal fraction).

[GR_ACALC_MD = 0]

G output = (G value × α value + G input of the lower-layer graphics × (255 − α value)) ÷ 256

B output = (B value × α value + B input of the lower-layer graphics × (255 − α value)) ÷ 256

R output = (R value × α value + R input of the lower-layer graphics × (255 − α value)) ÷ 256

[GR_ACALC_MD = 1 (premultiplication)]

G output = (G value + G input of the lower-layer graphics × (255 − α value)) ÷ 256

B output = (B value + B input of the lower-layer graphics × (255 − α value)) ÷ 256

R output = (R value + R input of the lower-layer graphics × (255 − α value)) ÷ 256

33.1.15 CLUT Table

When the signal format is CLUT8 or CLUT4, the format is converted to αRGB8888 based on the CLUT table. When the format is CLUT1, it is converted to αRGB8888 based on the register value.

Figure 33.12 shows data arrangement in the CLUT table.

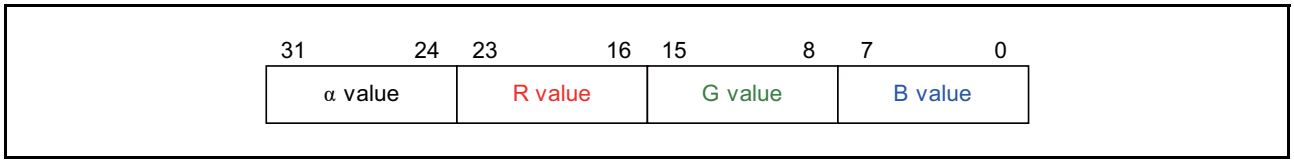

Figure 33.12 Data Arrangement in CLUT Table

The CLUT tables are arranged in the following addresses:

Graphics 0 CLUT table: H'FCFF6000 to H'FCFF63FF
(For CLUT4, addresses H'FCFF6000 to H'FCFF603F are valid.)

Graphics 2 CLUT table: H'FCFF6800 to H'FCFF6BFF
(For CLUT4, addresses H'FCFF6800 to H'FCFF683F are valid.)

Graphics 3 CLUT table: H'FCFF6C00 to H'FCFF6FFF
(For CLUT4, addresses H'FCFF6C00 to H'FCFF6C3F are valid.)

Two CLUT tables (CLUT table 0, CLUT table 1) on the different planes are allocated to the same address and one of the tables is selected with the GR_CLT_SEL bit. This allows rewriting one CLUT table when this module refers to the other CLUT table.
When switching the CLUT after overwriting the CLUT, please execute a dummy read of the CLUT table address.And switch the CLUT table by GR_CLT_SEL after dummy-read.switch the CLUT table by GR_CLT_SEL after dummy-read.

Table 33.24 CLUT Table Selection

Register Name	Bit Name	Initial Value	Description
GR_CLUT	GR_CLT_SEL	0	CLUT Table Select Signal 0: Selects CLUT table 0. The format is converted to αRGB8888 based on the CLUT table 0. CLUT table 1 can be read from or written to by the CPU. 1: Selects CLUT table 1. The format is converted to αRGB8888 based on the CLUT table 1. CLUT table 0 can be read from or written to by the CPU.

33.1.16 Multiplication Processing with Current Alpha at Alpha Blending in Rectangular Area

In multiplication processing with current alpha at alpha blending in a rectangular area, the values specified with the following expressions are used in the alpha blending calculation described in section 33.1.14, Alpha Blending Calculation.

[GR_ARC_MUL = 0]

α value = Fade-in/out coefficient

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

[GR_ARC_MUL = 1 (multiplication)]

α value = Fade-in/out coefficient x α input of current graphics

G value = G input of the current graphics

B value = B input of the current graphics

R value = R input of the current graphics

33.1.17 Selection of Lower-Layer Graphics in VIN Synthesizer

Graphics 0 is allocated to the lower-layer graphics in the VIN synthesizer.

Table 33.25 Selection of Lower-Layer Plane in Scaler

Register Name	Bit Name	Initial Value	Description
GR_VIN_AB1	GR_VIN_SCL_UND_SEL	0	Specifies lower-layer plane in the scaler. 0: Selects graphics 0 as lower-layer graphics. 1: Setting prohibited

33.2 Register Descriptions

Table 33.26 to Table 33.29 show the register configuration.

- Symbols used in Register Description:

Initial value:	Register value after a reset
—:	Undefined value
R/W:	Readable/writable. The written value can be read.
R/WC0:	Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.
R/WC1:	Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
R:	Read-only. The write value should always be 0.
—/W:	Write-only. The read value is undefined.

Table 33.26 shows the register configuration for the graphics 2 process.

Table 33.27 shows the register configuration for the graphics 3 process.

Table 33.28 shows the CLUT table configuration.

Table 33.29 shows the register configuration for the VIN synthesizer.

The register configuration for the graphics 0 process is described in section 31, Video Display Controller 5 (3): Scaler.

Table 33.26 Register Configuration of the Image Synthesizer (Graphics 2 Process)

Name	Abbreviation	R/W	Initial Value	Address	Access Size
Graphics 2 register update control register	GR2_UPDATE	R/WC1	H'0000 0000	H'FCFF 7700	32
Frame buffer read control register (Graphics 2)	GR2_FLM_RD	R/W	H'0000 0000	H'FCFF 7704	32
Frame buffer control register 1 (Graphics 2)	GR2_FLM1	R/W	H'0000 0000	H'FCFF 7708	32
Frame buffer control register 2 (Graphics 2)	GR2_FLM2	R/W	H'0000 0000	H'FCFF 770C	32
Frame buffer control register 3 (Graphics 2)	GR2_FLM3	R/W	H'0000 0000	H'FCFF 7710	32
Frame buffer control register 4 (Graphics 2)	GR2_FLM4	R/W	H'0000 0000	H'FCFF 7714	32
Frame buffer control register 5 (Graphics 2)	GR2_FLM5	R/W	H'0000 03FF	H'FCFF 7718	32
Frame buffer control register 6 (Graphics 2)	GR2_FLM6	R/W	H'0000 0000	H'FCFF 771C	32
Alpha blending control register 1 (Graphics 2)	GR2_AB1	R/W	H'0000 0000	H'FCFF 7720	32
Alpha blending control register 2 (Graphics 2)	GR2_AB2	R/W	H'0000 0000	H'FCFF 7724	32
Alpha blending control register 3 (Graphics 2)	GR2_AB3	R/W	H'0000 0000	H'FCFF 7728	32
Alpha blending control register 4 (Graphics 2)	GR2_AB4	R/W	H'0000 0000	H'FCFF 772C	32
Alpha blending control register 5 (Graphics 2)	GR2_AB5	R/W	H'0000 0000	H'FCFF 7730	32

Status monitor register (Graphics 3)	GR3_MON	R	H'0000 0000	H'FCFF 77D4	32

Table 33.28 CLUT Table Configuration

Name	Abbreviation	R/W	Initial Value	Address	Access Size
Graphics 0 CLUT table	GR0_CLUTT	R/W	—	H'FCFF 6000 to H'FCFF 63FF	32
Graphics 2 CLUT table	GR2_CLUTT	R/W	—	H'FCFF 6800 to H'FCFF 6BFF	32
Graphics 3 CLUT table	GR3_CLUTT	R/W	—	H'FCFF 6C00 to H'FCFF 6FFF	32

Table 33.29 Register Configuration of the VIN Synthesizer

Name	Abbreviation	R/W	Initial Value	Address	Access Size
VIN synthesizer register update control register	GR_VIN_UPDATE	R/WC1	H'0000 0000	H'FCFF 7E00	32
Alpha blending control register 1 (VIN synthesizer)	GR_VIN _AB1	R/W	H'0000 0000	H'FCFF 7E20	32

33.2.1 Graphics 2 Register Update Control Register (GR2_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GR2_UPDATE	—	—	—	GR2_P_VEN	—	—	—	GR2_IBUS_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR2_UPDATE	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR2_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_IBUS_VEN	0	R/WC1	Frame Buffer Read Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

33.2.2 Frame Buffer Read Control Register (Graphics 2) (GR2_FLM_RD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_R_ENB
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_R_ENB	0	R/W	Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled.

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

33.2.3 Frame Buffer Control Register 1 (Graphics 2) (GR2_FLM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_LN_OFF_DIR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR2_FLM_SEL[1:0]		—	—	—	—	—	—	—	GR2_BST_MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR2_LN_OFF_DIR	0	R/W	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	GR2_FLM_SEL[1:0]	0	R/W	Selects a frame buffer address setting signal. 0: Selects frame 0. 1: Selects register GR2_FLM_NUM. 2: Selects frame 0. 3: Setting prohibited
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_BST_MD	0	R/W	Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer

Note: GR2_LN_OFF_DIR and GR2_FLM_SEL are updated when GR2_IBUS_VEN in GR2_UPDATE is 1.
GR2_BST_MD is updated when GR2_IBUS_VEN and GR2_P_VEN in GR2_UPDATE are 1.

33.2.4 Frame Buffer Control Register 2 (Graphics 2) (GR2_FLM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GR2_BASE [31:0]	0	R/W	Frame Buffer Base Address (upper) Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower 3 bits should be fixed to 000.

Note: This register is updated when GR2_IBUS_VEN and GR2_P_VEN in GR2_UPDATE are 1.

33.2.5 Frame Buffer Control Register 3 (Graphics 2) (GR2_FLM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	GR2_LN_OFF[14:0]														
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR2_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	GR2_LN_ OFF[14:0]	0	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR2_BASE Line 1: GR2_BASE + GR2_LN_OFF × 1 : Line n: GR2_BASE + GR2_LN_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GR2_FLM_ NUM[9:0]	0	R/W	Frame Number of Frame Buffer Manually set the frame number when GR2_FLM_SEL = 1.

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

33.2.6 Frame Buffer Control Register 4 (Graphics 2) (GR2_FLM4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GR2_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	GR2_FLM_OFF[22:0]	0	R/W	Frame Buffer Frame Offset Address (upper) Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR2_BASE Buffer 1: GR2_BASE + GR2_FLM_OFF × 1 : Buffer n: GR2_BASE + GR2_FLM_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000.

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

33.2.7 Frame Buffer Control Register 5 (Graphics 2) (GR2_FLM5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_FLM_LNUM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_FLM_LOOP[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_FLM_LNUM[10:0]	0	R/W	Sets number of lines in a frame The number of lines is (GR2_FLM_LNUM + 1).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_FLM_LOOP[10:0]	1023	R/W	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. The number of lines is (GR2_FLM_LOOP + 1).

Note: This register is updated when GR2_IBUS_VEN in GR2_UPDATE is 1.

33.2.8 Frame Buffer Control Register 6 (Graphics 2) (GR2_FLM6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_FORMAT[3:0]				—	GR2_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	GR2_RDSWA[2:0]			—	—	—	—	GR2_STA_POS[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GR2_ FORMAT [3:0]	0	R/W	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: Setting prohibited 9: Setting prohibited 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 16	GR2_HW [10:0]	0	R/W	Sets the width of the horizontal valid period. The width is (GR2_HW + 1) pixels. Note: Set to 2 or greater.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 10	GR2_ RDSWA [2:0]	0	R/W	Sets 8-, 16-, and 32-bit swap. These three bits specify the method for swapping the bits of frame buffer read data as follows. Bit 0 0: 8 bits are not swapped. 1: 8 bits are swapped. Bit 1 0: 16 bits are not swapped. 1: 16 bits are swapped. Bit 2 0: 32 bits are not swapped. 1: 32 bits are swapped. When eight bits are put together, they are swapped as follows. Each of (1) to (8) indicates eight-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [No swap] 001: (2) (1) (4) (3) (6) (5) (8) (7) [8-bit swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [16-bit swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [16-bit swap + 8-bit swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [32-bit swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [32-bit swap + 8-bit swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [32-bit swap + 16-bit swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [32-bit swap + 16-bit swap + 8-bit swap]
9 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
5 to 0	GR2_ STA_POS [5:0]	0	R/W	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR2_STA_POS is skipped from the start of the line.

Note: GR2_STA_POS is updated when GR2_P_VEN in GR2_UPDATE is 1. GR2_RDSWA is updated when GR2_UPDATE in GR2_UPDATE is 1.
GR2_FORMAT and GR2_HW are updated when GR2_IBUS_VEN and GR2_P_VEN in GR2_UPDATE are 1.

33.2.9 Alpha Blending Control Register 1 (Graphics 2) (GR2_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_ARC_MUL	GR2_ACALC_MD	—	GR2_ARC_ON	—	—	—	GR2_ARC_DISP_ON	—	—	—	GR2_GRC_DISP_ON	—	—	GR2_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	GR2_ARC_MUL	0	R/W	Turns on/off multiplication processing with current alpha at alpha blending in a rectangular area. 0: Off 1: On
14	GR2_ACALC_MD	0	R/W	Turns on/off premultiplication processing at alpha blending in one-pixel units. 0: Off 1: On
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	GR2_ARC_ON	0	R/W	Turns on/off alpha blending in a rectangular area. 0: Off 1: On
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR2_ARC_ DISP_ON	0	R/W	Turns on/off frame-line display of the image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR2_GRC_ DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	GR2_DISP_ SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display 1: Lower-layer graphics display 2: Current graphics display 3: Blended display of lower-layer graphics and current graphics

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.10 Alpha Blending Control Register 2 (Graphics 2) (GR2_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_GRC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_GRC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_GRC_ VS[10:0]	0	R/W	Sets the vertical start position of the graphics image area. Note: Set to 4 or greater lines and the result of GR2_GRC_VS + GR2_GRC_VW should be smaller than or equal to 2039 lines.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_GRC_ VW[10:0]	0	R/W	Sets the vertical width of the graphics image area.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.11 Alpha Blending Control Register 3 (Graphics 2) (GR2_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_GRC_HS[10:0]	0	R/W	Sets the horizontal start position of the graphics image area. Note: Set to 16 or greater clocks and the result of GR2_GRC_HS + GR2_GRC_HW should be smaller than or equal to 2015 clocks.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_GRC_HW[10:0]	0	R/W	Sets the horizontal width of the graphics image area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR2_HW to 2 and GR2_GRC_HW to 1 (1-pixel) or 2 (2-pixel).

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.12 Alpha Blending Control Register 4 (Graphics 2) (GR2_AB4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_ARC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_ARC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_ARC_VS[10:0]	0	R/W	Sets the vertical start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_ARC_VW[10:0]	0	R/W	Sets the vertical width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.13 Alpha Blending Control Register 5 (Graphics 2) (GR2_AB5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR2_ARC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR2_ARC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR2_ARC_HS[10:0]	0	R/W	Sets the horizontal start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR2_ARC_HW[10:0]	0	R/W	Sets the horizontal width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.14 Alpha Blending Control Register 6 (Graphics 2) (GR2_AB6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	GR2_ARC_MODE	GR2_ARC_COEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	GR2_ARC_RATE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	GR2_ARC_MODE	0	R/W	Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction
23 to 16	GR2_ARC_COEF[7:0]	0	R/W	Sets the alpha coefficient for alpha blending in a rectangular area. (0 to 255) [7:0]: Variation (absolute value)
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	GR2_ARC_RATE[7:0]	0	R/W	Sets the value obtained by subtracting 1 from the frame rate for alpha blending in a rectangular area.

Note: This bit is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.15 Alpha Blending Control Register 7 (Graphics 2) (GR2_AB7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR2_ARC_DEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_CK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR2_ARC_DEF[7:0]	255	R/W	Sets the initial alpha value for alpha blending in a rectangular area.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_CK_ON	0	R/W	Turns on/off CLUT-index/RGB-index chroma-key processing. 0: Off 1: On

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.16 Alpha Blending Control Register 8 (Graphics 2) (GR2_AB8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_CK_KCLUT[7:0]								GR2_CK_KG[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_CK_KB[7:0]								GR2_CK_KR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_CK_KCLUT[7:0]	0	R/W	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR2_CK_KG[7:0]	0	R/W	G Signal for RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR2_CK_KB[7:0]	0	R/W	B Signal for RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR2_CK_KR[7:0]	0	R/W	R Signal for RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.17 Alpha Blending Control Register 9 (Graphics 2) (GR2_AB9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_CK_A[7:0]								GR2_CK_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_CK_B[7:0]								GR2_CK_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_CK_A [7:0]	0	R/W	Replaced Alpha Signal after RGB/CLUT-Index Chroma-Key Processing α: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR2_CK_G [7:0]	0	R/W	Replaced G Signal after RGB/CLUT-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR2_CK_B [7:0]	0	R/W	Replaced B Signal after RGB/CLUT-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR2_CK_R [7:0]	0	R/W	Replaced R Signal after RGB/CLUT-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.18 Alpha Blending Control Register 10 (Graphics 2) (GR2_AB10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_A0[7:0]								GR2_G0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_B0[7:0]								GR2_R0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_A0 [7:0]	0	R/W	CLUT1 α0 Signal Replaced with α signal when in the CLUT1 format and CLUT1= 0. Replaced with α signal when in the αRGB1555 or RGBα5551 format and α = 0.
23 to 16	GR2_G0 [7:0]	0	R/W	CLUT1 G0 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 0.
15 to 8	GR2_B0 [7:0]	0	R/W	CLUT1 B0 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 0.
7 to 0	GR2_R0 [7:0]	0	R/W	CLUT1 R0 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 0.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.19 Alpha Blending Control Register 11 (Graphics 2) (GR2_AB11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR2_A1[7:0]								GR2_G1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_B1[7:0]								GR2_R1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR2_A1 [7:0]	0	R/W	CLUT1 α1 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the αRGB1555 or RGBα5551 format and α = 1.
23 to 16	GR2_G1 [7:0]	0	R/W	CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1.
15 to 8	GR2_B1 [7:0]	0	R/W	CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1.
7 to 0	GR2_R1 [7:0]	0	R/W	CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.20 Background Color Control Register (Graphics 2) (GR2_BASE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR2_BASE_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR2_BASE_B[7:0]								GR2_BASE_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR2_BASE_G [7:0]	0	R/W	Background Color G Signal G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR2_BASE_B [7:0]	0	R/W	Background Color B Signal B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR2_BASE_R [7:0]	0	R/W	Background Color R Signal R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.21 CLUT Table Control Register (Graphics 2) (GR2_CLUT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_CLT_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR2_CLT_SEL	0	R/W	CLUT Table Select Signal 0: Selects CLUT table 0. The format is converted to αRGB8888 based on the CLUT table 0. CLUT table 1 can be read from or written to by the CPU. 1: Selects CLUT table 1. The format is converted to αRGB8888 based on the CLUT table 1. CLUT table 0 can be read from or written to by the CPU.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: This register is updated when GR2_P_VEN in GR2_UPDATE is 1.

33.2.22 Status Monitor Register (Graphics 2) (GR2_MON)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR2_ARC_ST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR2_ARC_ST	0	R	Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress.

33.2.23 Graphics 3 Register Update Control Register (GR3_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GR3_UPDATE	—	—	—	GR3_P_VEN	—	—	—	GR3_IBUS_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR3_UPDATE	0	R/WC1	Frame Buffer Read Control Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR3_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_IBUS_VEN	0	R/WC1	Frame Buffer Read Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

33.2.24 Frame Buffer Read Control Register (Graphics 3) (GR3_FLM_RD)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_R_ENB
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_R_ENB	0	R/W	Frame Buffer Read Enable 0: Frame buffer reading is disabled. 1: Frame buffer reading is enabled.

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

33.2.25 Frame Buffer Control Register 1 (Graphics 3) (GR3_FLM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_LN_OFF_DIR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR3_FLM_SEL[1:0]		—	—	—	—	—	—	—	GR3_BST_MD
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR3_LN_OFF_DIR	0	R/W	Selects the line offset address direction of the frame buffer. 0: Increments the address by the line offset address. 1: Decrements the address by the line offset address.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	GR3_FLM_SEL[1:0]	0	R/W	Selects a frame buffer address setting signal. 0: Selects frame 0. 1: Selects register GR3_FLM_NUM. 2: Selects frame 0. 3: Setting prohibited
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_BST_MD	0	R/W	Frame Buffer Burst Transfer Mode 0: 32-byte transfer 1: 128- byte transfer

Note: GR3_LN_OFF_DIR and GR3_FLM_SEL are updated when GR3_IBUS_VEN in GR3_UPDATE is 1.
GR3_BST_MD is updated when GR3_IBUS_VEN and GR3_P_VEN in GR3_UPDATE are 1.

33.2.26 Frame Buffer Control Register 2 (Graphics 3) (GR3_FLM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_BASE[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_BASE[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	GR3_BASE [31:0]	0	R/W	Frame Buffer Base Address (upper) Sets the start address of the frame buffer where frame data is to be stored. GR_BASE[4:3] and GR_BASE[6:3] are referred to during 32-byte burst transfer and 128-byte burst transfer, respectively, to skip the start line data. The lower 3 bits should be fixed to 000.

Note: This register is updated when GR3_IBUS_VEN and GR3_P_VEN in GR3_UPDATE are 1.

33.2.27 Frame Buffer Control Register 3 (Graphics 3) (GR3_FLM3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	GR3_LN_OFF[14:0]														
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	GR3_FLM_NUM[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 16	GR3_LN_ OFF[14:0]	0	R/W	Frame Buffer Line Offset Address Sets the line offset address for calculating the start address of each line. Line 0: GR3_BASE Line 1: GR3_BASE + GR3_LN_OFF × 1 : Line n: GR3_BASE + GR3_LN_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GR3_FLM_ NUM[9:0]	0	R/W	Frame Number of Frame Buffer Manually set the frame number when GR3_FLM_SEL = 1.

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

33.2.28 Frame Buffer Control Register 4 (Graphics 3) (GR3_FLM4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	GR3_FLM_OFF[22:16]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_FLM_OFF[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	GR3_FLM_OFF[22:0]	0	R/W	Frame Buffer Frame Offset Address (upper) Specifies the frame offset address used for calculating the start address of each frame buffer when more than one buffer is used. Buffer 0: GR3_BASE Buffer 1: GR3_BASE + GR3_FLM_OFF × 1 : Buffer n: GR3_BASE + GR3_FLM_OFF × n For 32 byte transfer, the lower 5 bits should be fixed to 0_0000. For 128 byte transfer, the lower 7 bits should be fixed to 000_0000.

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

33.2.29 Frame Buffer Control Register 5 (Graphics 3) (GR3_FLM5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_FLM_LNUM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_FLM_LOOP[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_FLM_LNUM[10:0]	0	R/W	Sets number of lines in a frame The number of lines is (GR3_FLM_LNUM + 1).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_FLM_LOOP[10:0]	1023	R/W	Number of lines when reading the addresses repeatedly by returning to the start address after reaching the end address. The number of lines is (GR3_FLM_LOOP + 1).

Note: This register is updated when GR3_IBUS_VEN in GR3_UPDATE is 1.

33.2.30 Frame Buffer Control Register 6 (Graphics 3) (GR3_FLM6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_FORMAT[3:0]				—	GR3_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	GR3_RDSWA[2:0]			—	—	—	—	GR3_STA_POS[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	GR3_ FORMAT [3:0]	0	R/W	Sets the format of the frame buffer read signal. 0: RGB565 1: RGB888 2: αRGB1555 3: αRGB4444 4: αRGB8888 5: CLUT8 6: CLUT4 7: CLUT1 8: Setting prohibited 9: Setting prohibited 10: RGBα5551 11: RGBα8888 12 to 15: Setting prohibited
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 16	GR3_HW [10:0]	0	R/W	Sets the width of the horizontal valid period. The width is (GR3_HW + 1) pixels. Note: Set to 2 or greater.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 10	GR3_ RDSWA [2:0]	0	R/W	Sets 8-, 16-, and 32-bit swap. These three bits specify the method for swapping the bits of frame buffer read data as follows. Bit 0 0: 8 bits are not swapped. 1: 8 bits are swapped. Bit 1 0: 16 bits are not swapped. 1: 16 bits are swapped. Bit 2 0: 32 bits are not swapped. 1: 32 bits are swapped. When eight bits are put together, they are swapped as follows. Each of (1) to (8) indicates eight-bit data. 000: (1) (2) (3) (4) (5) (6) (7) (8) [No swap] 001: (2) (1) (4) (3) (6) (5) (8) (7) [8-bit swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [16-bit swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [16-bit swap + 8-bit swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [32-bit swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [32-bit swap + 8-bit swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [32-bit swap + 16-bit swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [32-bit swap + 16-bit swap + 8-bit swap]
9 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
5 to 0	GR3_STA_POS[5:0]	0	R/W	Sets the amount of data to be skipped through. Specifically data amount equal to the amount indicated by GR3_STA_POS is skipped from the start of the line.

Note: GR3_STA_POS is updated when GR3_P_VEN in GR3_UPDATE is 1. GR3_RDSWA is updated when GR3_UPDATE in GR3_UPDATE is 1.
GR3_FORMAT and GR3_HW are updated when GR3_IBUS_VEN and GR3_P_VEN in GR3_UPDATE are 1.

33.2.31 Alpha Blending Control Register 1 (Graphics 3) (GR3_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_ARC_MUL	GR3_ACALC_MD	—	GR3_ARC_ON	—	—	—	GR3_ARC_DISP_ON	—	—	—	GR3_GRC_DISP_ON	—	—	GR3_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	GR3_ARC_MUL	0	R/W	Turns on/off multiplication processing with current alpha at alpha blending in a rectangular area. 0: Off 1: On
14	GR3_ACALC_MD	0	R/W	Turns on/off premultiplication processing at alpha blending in one-pixel units. 0: Off 1: On
13	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
12	GR3_ARC_ON	0	R/W	Turns on/off alpha blending in a rectangular area. 0: Off 1: On
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR3_ARC_DISP_ON	0	R/W	Turns on/off frame-line display of the image area for alpha blending in a rectangular area. 0: Frame-line display off 1: Frame-line display on
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR3_GRC_DISP_ON	0	R/W	Turns on/off frame-line display of the graphics image area. 0: Frame-line display off 1: Frame-line display on
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	GR3_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display 1: Lower-layer graphics display 2: Current graphics display 3: Blended display of lower-layer graphics and current graphics

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.32 Alpha Blending Control Register 2 (Graphics 3) (GR3_AB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_GRC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_GRC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_GRC_VS[10:0]	0	R/W	Sets the vertical start position of the graphics image area. Note: Set to 4 or greater lines and the result of GR3_GRC_VS + GR3_GRC_VW should be smaller than or equal to 2039 lines.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_GRC_VW[10:0]	0	R/W	Sets the vertical width of the graphics image area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.33 Alpha Blending Control Register 3 (Graphics 3) (GR3_AB3)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_GRC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_GRC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_GRC_HS[10:0]	0	R/W	Sets the horizontal start position of the graphics image area. Note: Set to 16 or greater clocks and the result of GR3_GRC_HS + GR3_GRC_HW should be smaller than or equal to 2015 clocks.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_GRC_HW[10:0]	0	R/W	Sets the horizontal width of the graphics image area. Note: For displaying an image with 1- or 2-pixel horizontal width, set GR3_HW to 2 and GR3_GRC_HW to 1 (1-pixel) or 2 (2-pixel).

Note: All the bits assigned to this address are updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.34 Alpha Blending Control Register 4 (Graphics 3) (GR3_AB4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_ARC_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_ARC_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_ARC_VS[10:0]	0	R/W	Sets the vertical start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_ARC_VW[10:0]	0	R/W	Sets the vertical width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.35 Alpha Blending Control Register 5 (Graphics 3) (GR3_AB5)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_ARC_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_ARC_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_ARC_HS[10:0]	0	R/W	Sets the horizontal start position of the valid image area for alpha blending in a rectangular area.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	GR3_ARC_HW[10:0]	0	R/W	Sets the horizontal width of the valid image area for alpha blending in a rectangular area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.36 Alpha Blending Control Register 6 (Graphics 3) (GR3_AB6)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	GR3_ARC_MODE	GR3_ARC_COEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	GR3_ARC_RATE[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	GR3_ARC_MODE	0	R/W	Alpha Blending Mode in Rectangular Area 0: Addition 1: Subtraction
23 to 16	GR3_ARC_COEF[7:0]	0	R/W	Sets the alpha coefficient for alpha blending in a rectangular area. (0 to 255) [7:0]: Variation (absolute value)
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7 to 0	GR3_ARC_RATE[7:0]	0	R/W	Sets the value obtained by subtracting 1 from the frame rate for alpha blending in a rectangular area.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.37 Alpha Blending Control Register 7 (Graphics 3) (GR3_AB7)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR3_ARC_DEF[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_CK_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR3_ARC_DEF[7:0]	255	R/W	Sets the initial alpha value for alpha blending in a rectangular area.
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_CK_ON	0	R/W	Turns on/off CLUT-index/RGB-index chroma-key processing. 0: Off 1: On

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.38 Alpha Blending Control Register 8 (Graphics 3) (GR3_AB8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_CK_KCLUT[7:0]								GR3_CK_KG[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_CK_KB[7:0]								GR3_CK_KR[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_CK_KCLUT[7:0]	0	R/W	CLUT Signal for CLUT-Index Chroma-Key Processing CLUT: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR3_CK_KG[7:0]	0	R/W	G Signal for RGB-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR3_CK_KB[7:0]	0	R/W	B Signal for RGB-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR3_CK_KR[7:0]	0	R/W	R Signal for RGB-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.39 Alpha Blending Control Register 9 (Graphics 3) (GR3_AB9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_CK_A[7:0]								GR3_CK_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_CK_B[7:0]								GR3_CK_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_CK_A[7:0]	0	R/W	Replaced Alpha Signal after RGB/CLUT-Index Chroma-Key Processing α: Unsigned 8 bits (0 to 255 [LSB])
23 to 16	GR3_CK_G[7:0]	0	R/W	Replaced G Signal after RGB/CLUT-Index Chroma-Key Processing G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR3_CK_B[7:0]	0	R/W	Replaced B Signal after RGB/CLUT-Index Chroma-Key Processing B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR3_CK_R[7:0]	0	R/W	Replaced R Signal after RGB/CLUT-Index Chroma-Key Processing R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.40 Alpha Blending Control Register 10 (Graphics 3) (GR3_AB10)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_A0[7:0]								GR3_G0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_B0[7:0]								GR3_R0[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_A0 [7:0]	0	R/W	CLUT1 α0 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 0. Replaced with α signal when in the αRGB1555 or RGBα5551 format and α = 0.
23 to 16	GR3_G0 [7:0]	0	R/W	CLUT1 G0 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 0.
15 to 8	GR3_B0 [7:0]	0	R/W	CLUT1 B0 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 0.
7 to 0	GR3_R0 [7:0]	0	R/W	CLUT1 R0 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 0.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.41 Alpha Blending Control Register 11 (Graphics 3) (GR3_AB11)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GR3_A1[7:0]								GR3_G1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_B1[7:0]								GR3_R1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GR3_A1 [7:0]	0	R/W	CLUT1 α1 Signal Replaced with α signal when in the CLUT1 format and CLUT1 = 1. Replaced with α signal when in the αRGB1555 or RGBα5551 format and α = 1.
23 to 16	GR3_G1 [7:0]	0	R/W	CLUT1 G1 Signal Replaced with G signal when in the CLUT1 format and CLUT1 = 1.
15 to 8	GR3_B1 [7:0]	0	R/W	CLUT1 B1 Signal Replaced with B signal when in the CLUT1 format and CLUT1 = 1.
7 to 0	GR3_R1 [7:0]	0	R/W	CLUT1 R1 Signal Replaced with R signal when in the CLUT1 format and CLUT1 = 1.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.42 Background Color Control Register (Graphics 3) (GR3_BASE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GR3_BASE_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GR3_BASE_B[7:0]								GR3_BASE_R[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	GR3_BASE_G [7:0]	0	R/W	Background Color G Signal G: Unsigned 8 bits (0 to 255 [LSB])
15 to 8	GR3_BASE_B [7:0]	0	R/W	Background Color B Signal B: Unsigned 8 bits (0 to 255 [LSB])
7 to 0	GR3_BASE_R [7:0]	0	R/W	Background Color R Signal R: Unsigned 8 bits (0 to 255 [LSB])

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.43 CLUT Table and Interrupt Control Register (Graphics 3) (GR3_CLUT_INT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_CLT_SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GR3_LINE[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	GR3_CLT_ SEL	0	R/W	CLUT Table Select Signal 0: Selects CLUT table 0. The format is converted to αRGB8888 based on the CLUT table 0. CLUT table 1 can be read from or written to by the CPU. 1: Selects CLUT table 1. The format is converted to αRGB8888 based on the CLUT table 1. CLUT table 0 can be read from or written to by the CPU.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
10 to 0	GR3_LINE [10:0]	0	R/W	Line Interrupt Set When number of lines matches the value of the GR3_LINE bits, an interrupt signal is output. This function is enabled even when the graphics 3 process is not used.

Note: This register is updated when GR3_P_VEN in GR3_UPDATE is 1.

33.2.44 Status Monitor Register (Graphics 3) (GR3_MON)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GR3_LIN_STAT[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GR3_ARC_ST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	GR3_LIN_ STAT[10:0]	0	R	Line Position of Image being Currently Read
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GR3_ARC_ ST	0	R	Status Flag for Alpha Blending in Rectangular Area 0: Addition or subtraction has been completed. (α value is 0 or 255) 1: Addition or subtraction is in progress.

33.2.45 VIN Synthesizer Register Update Control Register (GR_VIN_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	GR_VIN_UPDATE	—	—	—	GR_VIN_P_VEN	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/WC1	R	R	R	R/WC1	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	GR_VIN_UPDATE	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	GR_VIN_P_VEN	0	R/WC1	Graphics Display Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

33.2.46 Alpha Blending Control Register 1 (VIN Synthesizer) (GR_VIN_AB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	GR_VIN_SCL_UND_SEL	GR_VIN_DISP_SEL[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	GR_VIN_SCL_UND_SEL	0	R/W	Selection of Lower-Layer Plane in Scaler 0: Selects graphics 0 as lower-layer graphics. 1: Setting prohibited
1, 0	GR_VIN_DISP_SEL[1:0]	0	R/W	Selects the graphics display mode. 0: Background color display (fixed to black) 1: Lower-layer graphics display 2: Setting prohibited 3: Setting prohibited

Notes: GR_VIN_SCL_UND_SEL is updated when GR_VIN_UPDATE in GR_VIN_UPDATE is 1. The other bits of this register are updated when GR_VIN_P_VEN in GR_VIN_UPDATE is 1.

33.3 Usage Method

33.3.1 Mute Image

The initial values of the GR0_DISP_SEL[1:0], GR2_DISP_SEL[1:0], GR3_DISP_SEL[1:0], and GR_VIN_DISP_SEL[1:0] bits are all 0. Accordingly, in the initial setting, a background color is displayed both inside and outside the graphics area for the graphics 0, 2, and 3 processes and the VIN synthesizer. Since the default background color is black, the black mute image is displayed in the initial state. Note that the background color for the VIN synthesizer is fixed to black.

33.3.2 Alpha Blending in Rectangular Area

The alpha coefficient and the frame rate can be changed during fade in and fade out by modifying the GR_ARC_MODE, GR_ARC_COEF[7:0] and GR_ARC_RATE[7:0] bits, respectively.

34. Video Display Controller 5 (7): Output Controller

34.1 Output Controller

34.1.1 Overview of Functions

The output controller subjects RGB signals output from the image synthesizer to brightness adjustment, contrast adjustment, gamma correction of individual RGB, dither process, and output format conversion.

Figure 34.1 shows the function block diagram of the output controller.

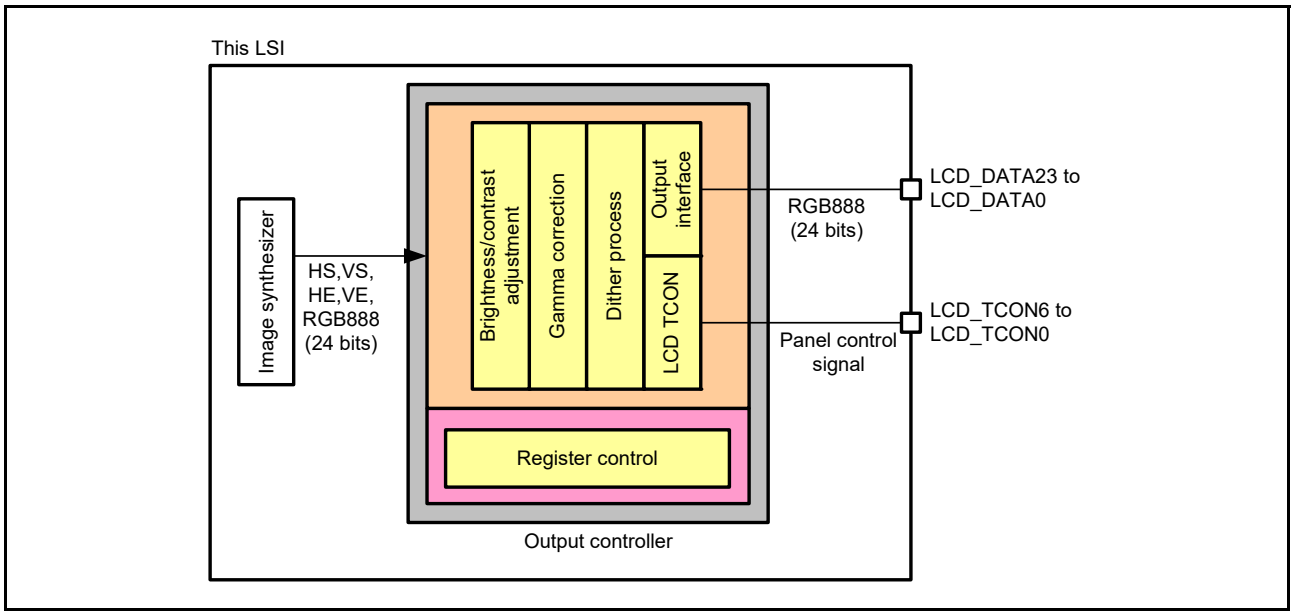

Figure 34.1 Functional Block Diagram of Output Controller

34.1.2 Register Update Control

The Vsync signal is used to control the update timing of all the registers of the output controller.

After 1 is set to the bits in the update control register, the contents of the relevant registers are actually modified at the rising edge of the Vsync signal, when the update control register is automatically cleared to 0.

Table 34.1 Register Update Control

Register Name	Bit Name	Initial Value	Description
OUT_UPDATE	OUTCNT_VEN	0	Brightness/Contrast Control, Dither Process, Output Interface Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GAM_G_UPDATE	GAM_G_VEN	0	Gamma Correction (G) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GAM_B_UPDATE	GAM_B_VEN	0	Gamma Correction (B) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
GAM_R_UPDATE	GAM_R_VEN	0	Gamma Correction (R) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.
TCON_UPDATE	TCON_VEN	0	LCD TCON Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

34.1.3 Route Selection

The processing sequence of the brightness/contrast control and gamma correction control can be swapped according to the settings of the register.

Table 34.2 Route Selection

Register Name	Bit Name	Initial Value	Description
OUT_CLK_PHASE	OUTCNT_ FRONT_GAM	0	Correction Circuit Sequence Control 0: Brightness → contrast → gamma correction 1: Gamma correction → brightness → contrast

34.1.4 Panel Brightness Adjustment

Brightness (DC) adjustment is individually performed for RGB signals from the image synthesizer.

(BRT_R/G/BOUT after brightness adjustment has many bits to prevent overflow or underflow. The overflow or underflow process is performed at contrast calculation.)

(1) Calculation formulas for brightness (DC) adjustment

BRT_GOUT = GIN + PBRT_G − 512

BRT_BOUT = BIN + PBRT_B − 512

BRT_ROUT = RIN + PBRT_R − 512

Table 34.3 Brightness (DC) Adjustment

Register Name	Bit Name	Initial Value	Description
OUT_BRIGHT1	PBRT_G[9:0]	512	Brightness (DC) Adjustment of G Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)
OUT_BRIGHT2	PBRT_B[9:0]	512	Brightness (DC) Adjustment of B Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)
OUT_BRIGHT2	PBRT_R[9:0]	512	Brightness (DC) Adjustment of R Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)

34.1.5 Contrast Adjustment

Contrast is calculated for RGB signals obtained after brightness calculation.

(If an overflow or underflow occurs, contrast is clipped to the maximum or minimum value.)

(1) Calculation formulas for contrast (gain) adjustment

GOUT = BRT_GOUT × CONT_G/128

BOUT = BRT_BOUT × CONT_B/128

ROUT = BRT_ROUT × CONT_R/128

Table 34.4 Contrast (Gain) Adjustment

Register Name	Bit Name	Initial Value	Description
OUT_CONTRAST	CONT_G [7:0]	128	Contrast (Gain) Adjustment of G Signal 0/128 to 255/128 (approx.2 times)
OUT_CONTRAST	CONT_B [7:0]	128	Contrast (Gain) Adjustment of B Signal 0/128 to 255/128 (approx.2 times)
OUT_CONTRAST	CONT_R [7:0]	128	Contrast (Gain) Adjustment of R Signal 0/128 to 255/128 (approx.2 times)

34.1.6 Gamma Correction

Gamma correction is carried out by dividing an input signal having 256 gradation levels into 32 and controlling the gain of each area. Gain coefficient of each area can be set as 0 to approx. 2.0 [times]

(1) Gamma correction formula for each area

$$DOUT = ((DIN - TH_{(n)}) \times GAIN_{(n)} + OFFSET_{(n)})/256$$

DIN: Input signal (8-bit)

DOUT: Output signal (10-bit)

TH(n): Threshold (8-bit)

OFFSET(n): Offset value (19-bit)

GAIN(n): Gain coefficient (11-bit)

(2) Offset calculation formulas for each area

$$OFFSET_{(n)} = OFFSET_{(n-1)} + DEF\_O_{(n)} \text{ (When n = 0, } OFFSET_{(0)} = 0.)$$

$$DEF\_O_{(n)} = (TH_{(n)} - TH_{(n-1)}) \times GAIN_{(n-1)} \text{ (When n = 0, } OFFSET_{(0)} = 0.)$$

OFFSET(n): Offset value of current area (19-bit)

OFFSET(n-1): Offset value of previous area (19-bit)

DEF_O(n): Difference in offset value of Current and previous area (19-bit)

TH(n): Threshold of current area (8-bit)

TH(n-1): Threshold of previous area (8-bit)

GAIN(n-1): Gain coefficient of previous area (11-bit)

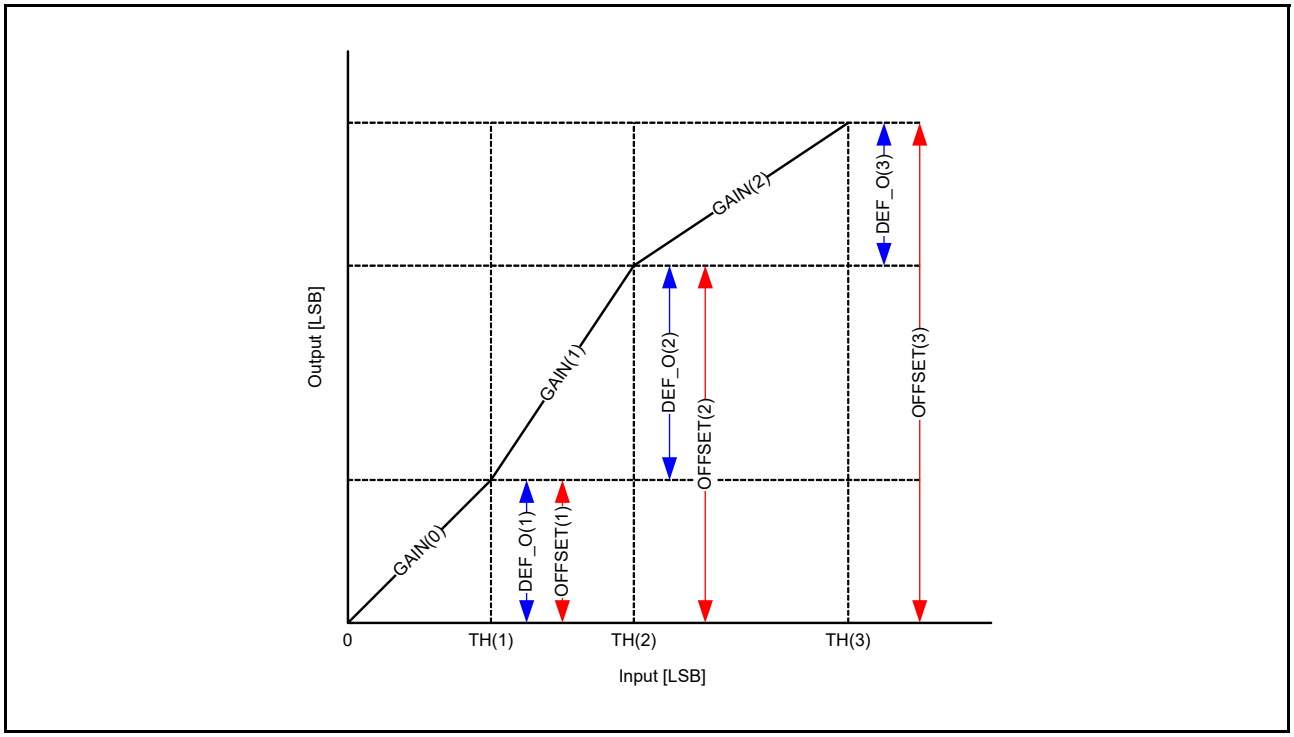

Figure 34.2 Corresponding Chart of Offset Calculation Formulas

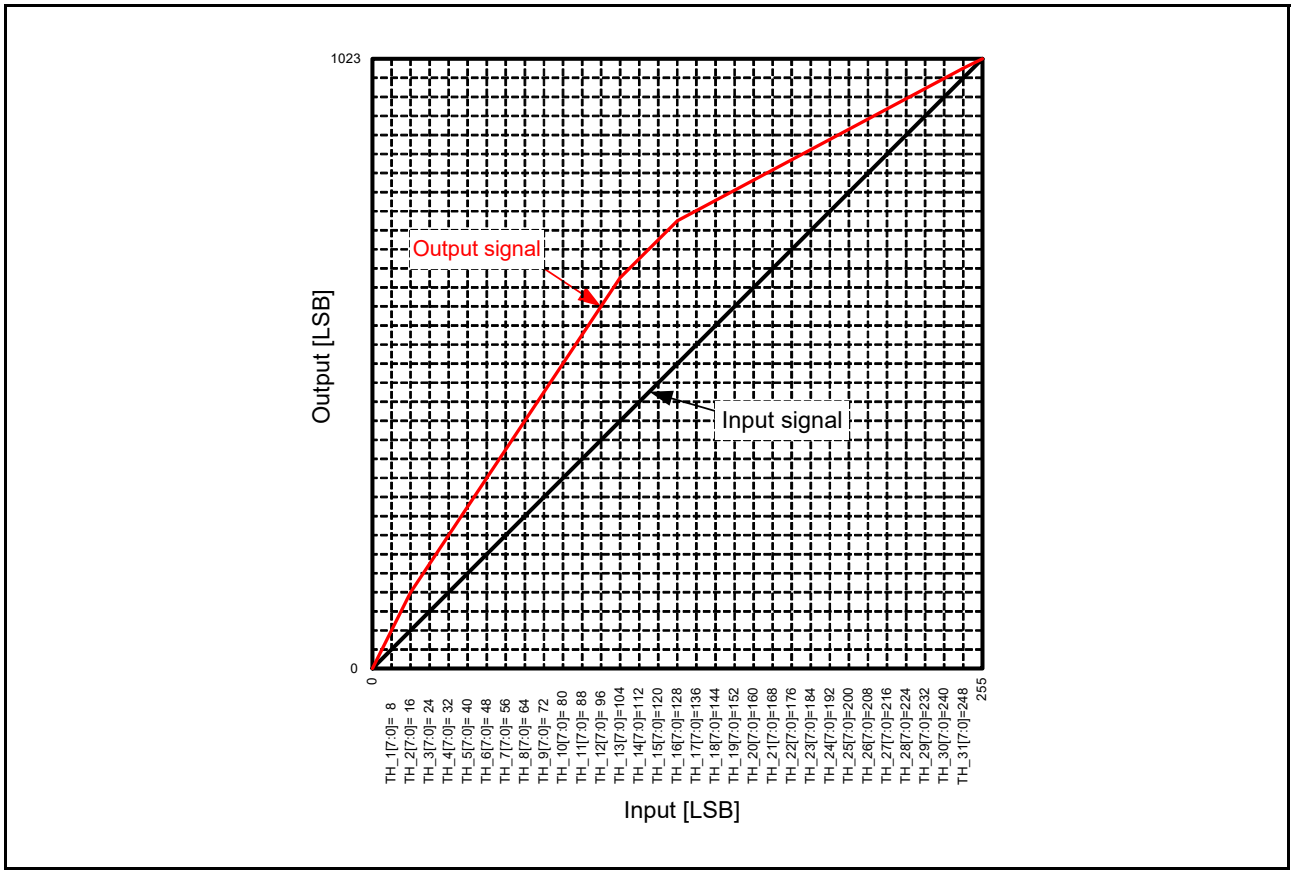

Figure 34.3 Example of Input-Output Characteristics of Gamma Correction

34.1.7 Dither Process

Dither process is carried out by adjusting brightness/contrast or reducing 10-bit RGB signals output from the gamma correction block to 8-bit, 6-bit, or 5-bit RGB signals. The operation mode of dither process can be selected from truncate mode, round-off mode, 2 × 2 pattern dither mode and random pattern dither mode.

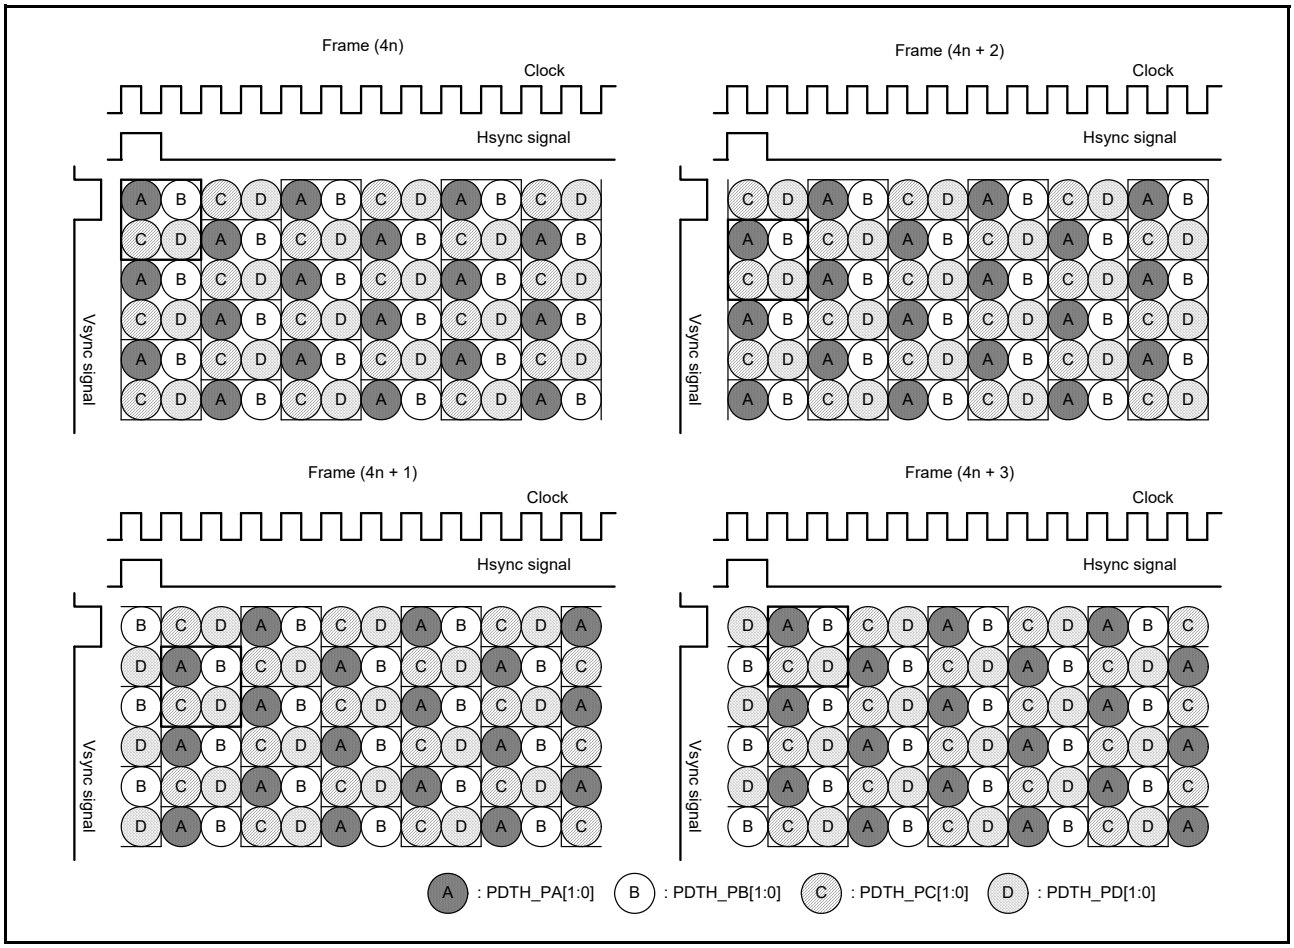

Figure 34.4 Operation Specification of 2 × 2 Pattern Dither

The conversion equations are as follows.

[Truncate mode]

(a) 10 bits to 8 bits

Output RGB data[7:0] = Input RGB data[9:0] ÷ 4 (truncate the number below the decimal point)

(b) 10 bits to 6 bits

Output RGB data[7:2] = Input RGB data[9:0] ÷ 16 (truncate the number below the decimal point)

(c) 10 bits to 5 bits

Output RGB data[7:3] = Input RGB data[9:0] ÷ 32 (truncate the number below the decimal point)

[Round-off mode]

(a) 10 bits to 8 bits

Output RGB data[7:0] = Input RGB data[9:0] ÷ 4 (round off to an integer)

(b) 10 bits to 6 bits

Output RGB data[7:2] = Input RGB data[9:0] ÷ 16 (round off to an integer)

(c) 10 bits to 5 bits

Output RGB data[7:3] = Input RGB data[9:0] ÷ 32 (round off to an integer)

[2 × 2 pattern dither mode, random pattern dither mode]

(a) 10 bits to 8 bits

Output RGB data[7:0] = Input RGB data[9:0] ÷ 4 + pattern value at the first decimal place (truncate the number below the decimal point after addition)

(b) 10 bits to 6 bits

Output RGB data[7:2] = Input RGB data[9:0] ÷ 16 + pattern value at the first decimal place (truncate the number below the decimal point after addition)

(c) 10 bits to 5 bits

Output RGB data[7:3] = Input RGB data[9:0] ÷ 32 + pattern value at the first decimal place (truncate the number below the decimal point after addition)

Table 34.6 Panel Dither Correction

Register Name	Bit Name	Initial Value	Description

OUT_PDTHA	PDTH_PC[1:0]	2	Pattern Value (C) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])
OUT_PDTHA	PDTH_PD[1:0]	1	Pattern Value (D) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])

34.1.8 Output Format Conversion

In output format conversion, the RGB signal after dither process is converted to LCD output signal having any of the following formats, namely, parallel RGB888, parallel RGB666, parallel RGB565, and serial RGB.

Further, converted data can be allocated to LCD output pins as selected.

(1) Bit Allocation of LCD Signals for RGB888 Output

Table 34.7 shows the RGB signal input allocated to the LCD signal output for RGB888 output.

R/G/BIN[7:0] are the RGB internal signals after dither process.

(4) Bit Allocation of LCD Signal for Serial RGB Output

For serial RGB output, RGB signal input shown Table 34.10 is allocated to rgb internal signals and the signals are converted from parallel to serial format and output as LCD signals. R/G/BIN[7:0] are the RGB internal signals after dither process.

The internal signals r[7:0], g[7:0], and b[7:0] are serially output to LCD_DATA7 to LCD_DATA0.

34.1.9 LCD TCON

The LCD TCON generates various timing signals for driving the LCD panel.

Specifically, the timing include two vertical panel driver signals, five horizontal panel driver signals, and one composite signal of the vertical and horizontal panel driver signals. Table 34.13 lists the timing signals that are generated by LCD TCON

Table 34.13 Signals Generated by LCD TCON

Signal Name	Type	Description
STVA/VS	Vertical	• Gate start signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. • Vsync signal The width, position, and polarity of the sync signal can be controlled.
STVB/VE	Vertical	• Gate start signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. • Vertical enable signal The width, position, and polarity of the sync signal can be controlled.
STH/SP/HS	Horizontal	• Source start signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. • Hsync signal The width, position, and polarity of the sync signal can be controlled.
STB/LP/HE	Horizontal	• Source strobe signal The pulse width, pulse position, and pulse polarity of the signal can be controlled. • Horizontal enable signal The width, position, and polarity of the enable signal can be controlled.
CPV/GCK	Horizontal	• Gate clock signal The pulse width, pulse position, and pulse polarity of the signal can be controlled.
POLA	Horizontal	• VCOM voltage polarity control signal The polarity inversion position, and polarity inversion operation (1 × 1, 1 × 2, 2 × 2) can be controlled.
POLB	Horizontal	• VCOM voltage polarity control signal The polarity inversion position, and polarity inversion operation (1 × 1, 1 × 2, 2 × 2) can be controlled.
DE	Horizontal/Vertical	• Data enable signal The width, position, and polarity of the enable signal can be controlled.

(1) Horizontal Reference Offset Control

The horizontal reference offset control enables generation of a reference signal with a clock delay equivalent to the value of TCON_OFFSET[10:0] from the rising edge of the Hsync signal. If a signal that spans across the Hsync signal needs to be generated, such a signal is generated with reference to the offset reference signal.

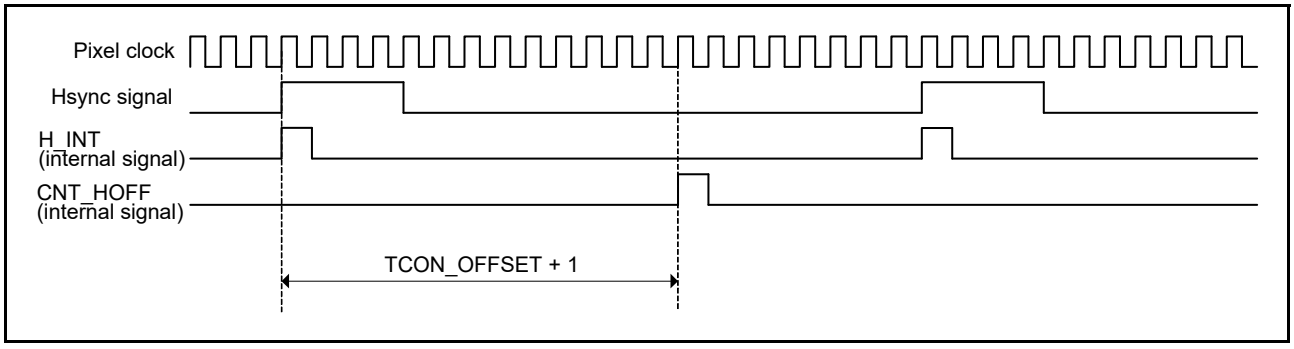

Figure 34.9 Generation of Offset Horizontal Reference (H_OFF) Signal

Table 34.14 Horizontal Reference Signal Selection

Signal Name	Bit Name	Initial Value	Description
TCON_TIM	TCON_OFFSET[10:0]	0	Offset Hsync Signal Timing Sets the clock cycle count from the rising edge of the Hsync signal.
TCON_TIM_STH2	TCON_STH_HS_SEL	0	STH Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_STB2	TCON_STB_HS_SEL	0	STB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_CPV2	TCON_CPV_HS_SEL	0	CPV Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_POLA2	TCON_POLA_HS_SEL	0	POLA Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
TCON_TIM_POLB2	TCON_POLB_HS_SEL	0	POLB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference

Note: When generating the POLA and POLB signals in reverse mode, the bits TCON_POLA_HS_SEL and TCON_POLB_HS_SEL should be set to 0.

(2) Horizontal Panel Driver Signal Generation (A)

Horizontal synchronous panel driver signal generation (A) involves generation of a timing signal that changes twice in a horizontal period according to the values of TCON_xxxx_HS[10:0] and TCON_xxxx_HW[10:0] bits, which set the first changing timing and the second changing timing, respectively.

The internal counter performs the following operations.

1. Resets the counter value at the rising edge of the Hsync signal as the reference.
2. Increments the counter value at the rising edge of the panel clock.

A fixed output value of 0 can be obtained by setting 0 in TCON_xxxx_HW[10:0], which set the second changing timing.

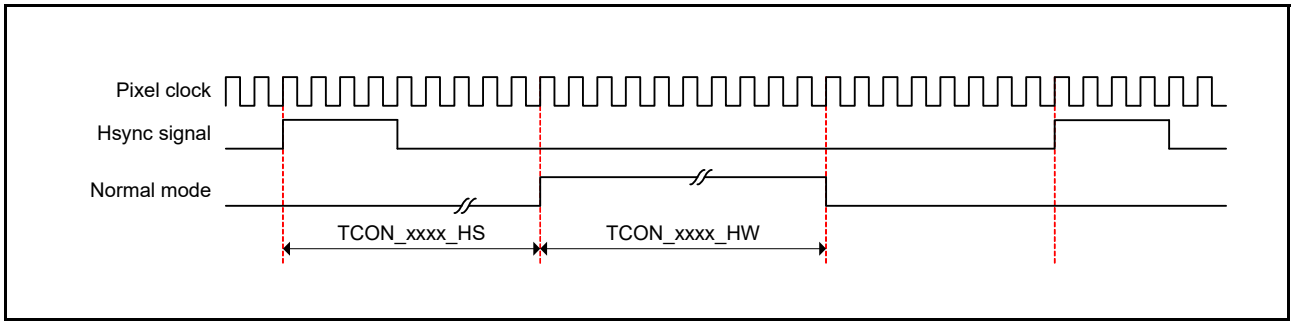

Figure 34.10 Horizontal Panel Driver Signal (in Normal Mode)

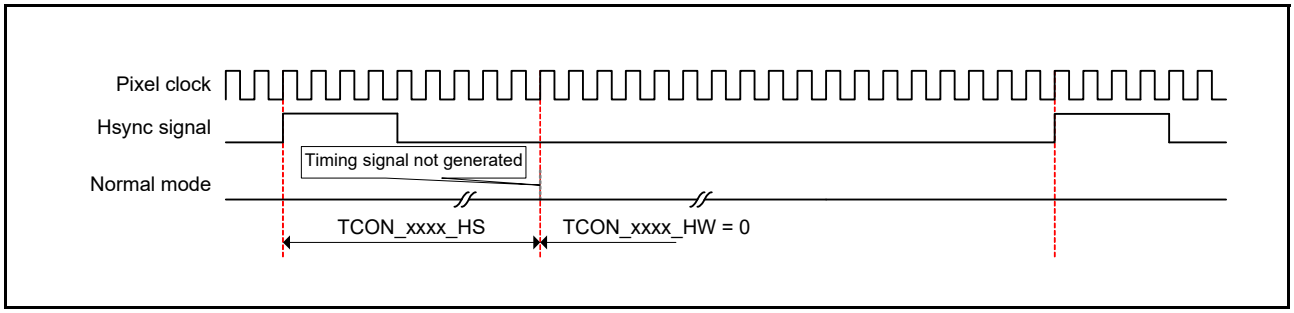

Figure 34.11 Horizontal Panel Driver Signal (in Normal Mode and When TCON_xxxx_HW_ = 0)

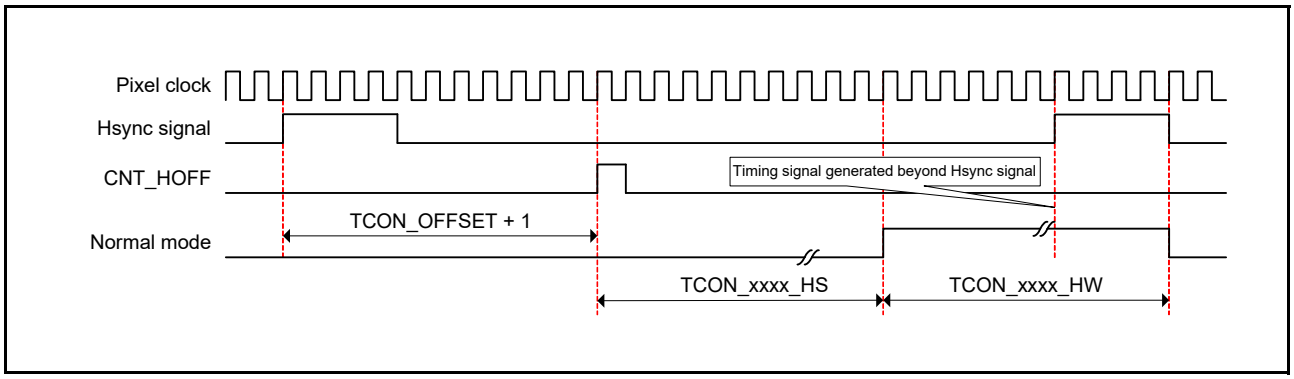

Figure 34.12 Horizontal Panel Driver Signal (in Normal Mode and When Offset Horizontal Reference is Used)

Table 34.15 Settings for Horizontal Panel Driver Signal Generation (A)

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STH1	TCON_STH_HS[10:0]	0	STH Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STH_HS from the rising edge of the Hsync signal (clock cycles)
TCON_TIM_STH1	TCON_STH_HW[10:0]	96	STH Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STH_HW (clock cycles)
TCON_TIM_STB1	TCON_STB_HS[10:0]	144	STB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STB_HS from the rising edge of the Hsync signal (clock cycles)
TCON_TIM_STB1	TCON_STB_HW[10:0]	640	STB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STB_HW (clock cycles)
TCON_TIM_CPV1	TCON_CPV_HS[10:0]	0	CPV Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_CPV_HS from the rising edge of the Hsync signal (clock cycles)
TCON_TIM_CPV1	TCON_CPV_HW[10:0]	0	CPV Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_CPV_HW (clock cycles)

(3) Horizontal Panel Driver Signal Generation (B)

In addition to the normal mode operation described in (2), reverse mode operation, that is, horizontal panel driver signal generation (B) is provided. In reverse mode, operation starts at the rising edge of the Vsync signal as the reference and a signal is generated such that its polarity is inverted every horizontal period in the timing set by the TCON_xxxx_HS[10:0] bits, which set the first changing timing.

In reverse mode, regardless of whether the number of lines in the vertical direction is odd or even, the polarity of the signals generated is inverted every horizontal period. The following three reverse modes are selectable for polarity inversion operation.

Table 34.16 Horizontal Panel Driver Signal Generation Modes

Register Name	Bit Name	Initial Value	Description
TCON_TIM_POLA2	TCON_POLA_MD [1:0]	1	POLA Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.
TCON_TIM_POLB2	TCON_POLB_MD [1:0]	1	POLB Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.

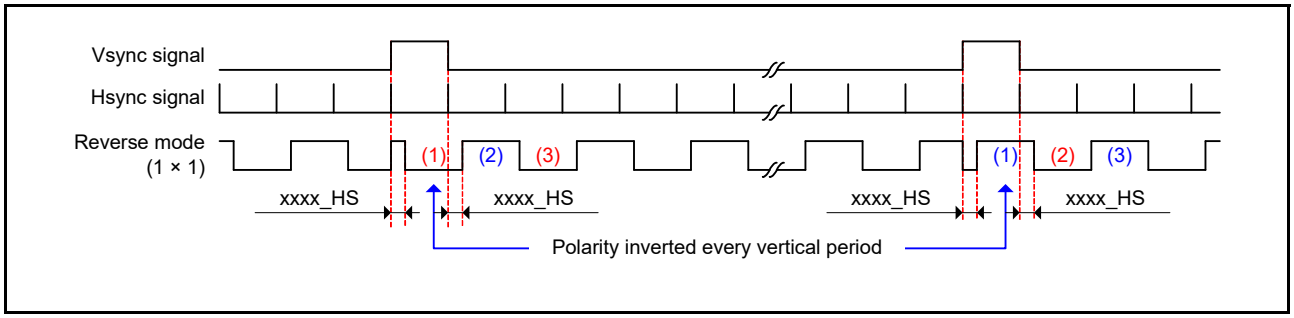

Figure 34.13 Horizontal Panel Driver Signal (in 1 × 1 Reverse Mode)

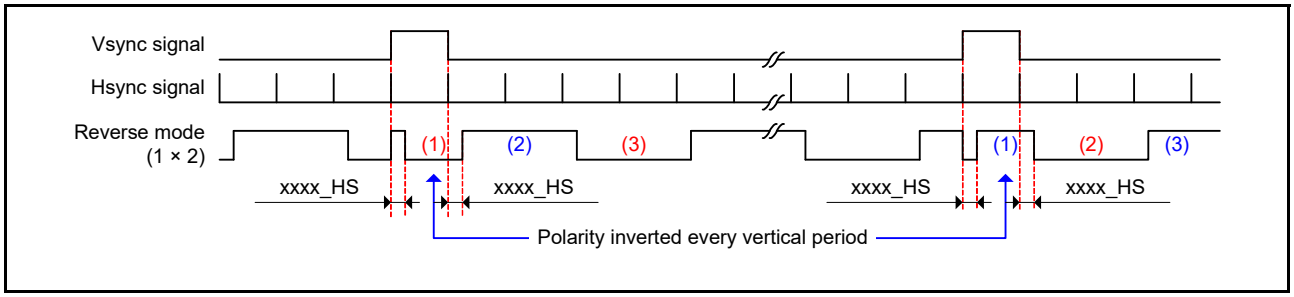

Figure 34.14 Horizontal Panel Driver Signal (in 1 × 2 Reverse Mode)

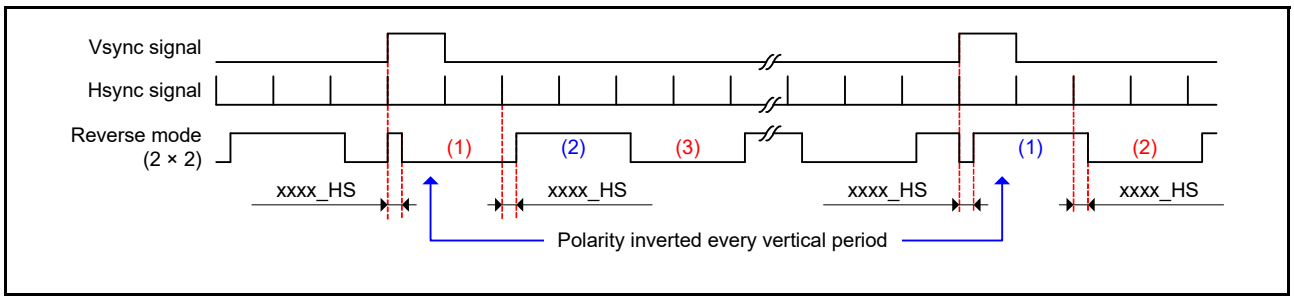

Figure 34.15 Horizontal Panel Driver Signal (in 2 × 2 Reverse Mode)

Table 34.17 Settings of Horizontal Panel Driver Signal Generation (B)

Register Name	Bit Name	Initial Value	Description
TCON_TIM_POLA1	TCON_POLA_HS [10:0]	0	POLA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLA_HS + 1 from the rising edge of the Hsync signal (clock cycles) Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to 1 or greater.
TCON_TIM_POLA1	TCON_POLA_HW [10:0]	0	POLA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLA_HW (clock cycles)
TCON_TIM_POLB1	TCON_POLB_HS [10:0]	0	POLBA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLB_HS + 1 from the rising edge of the Hsync signal (clock cycles) Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to1 or greater.
TCON_TIM_POLB1	TCON_POLB_HW [10:0]	0	POLB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLB_HW (clock cycles)

(4) Vertical Panel Driver Signal Generation

The vertical synchronous panel driver signal generation involves the following operations.

1. Initialization at the rising edge of the Vsync signal
2. Generation of a timing signal that changes twice in a vertical period according to the values of the internal counter, and TCON_xxxx_VS[10:0] and TCON_xxxx_VW[10:0] bits, which set the first changing timing and the second changing timing, respectively.

The internal counter increments the counter value in the following two cases.

1. At the rising edge of the Hsync signal
2. At the point reached after a clock delay specified by the value of TCON_HALF[10:0] from the rising edge of the Hsync signal (normally, 1/2fH is set).

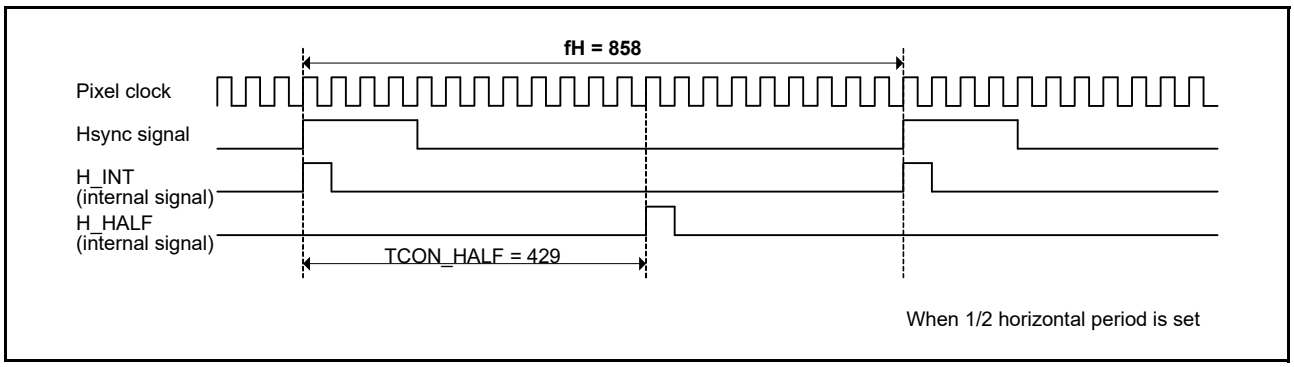

Figure 34.16 1/2 Pulse (H_HALF) Signal Generation

Table 34.18 Settings of 1/2 Pulse (H_HALF) Signal Generation

Register Name	Bit Name	Initial Value	Description
TCON_TIM	TCON_HALF[10:0]	400	1/2fH Timing Specifies the clock count from the rising edge of the Hsync signal as the counting timing of horizontal counter

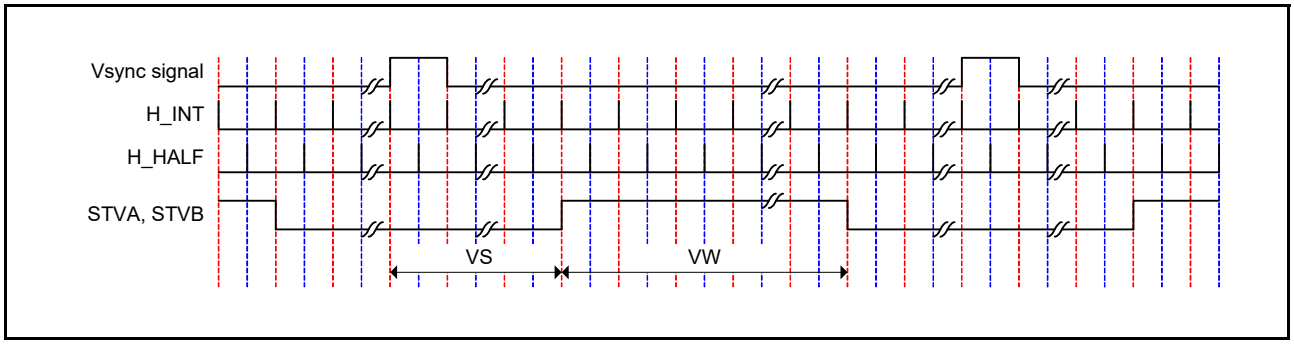

Figure 34.17 Vertical Panel Driver Signal (H_INT Reference Operation)

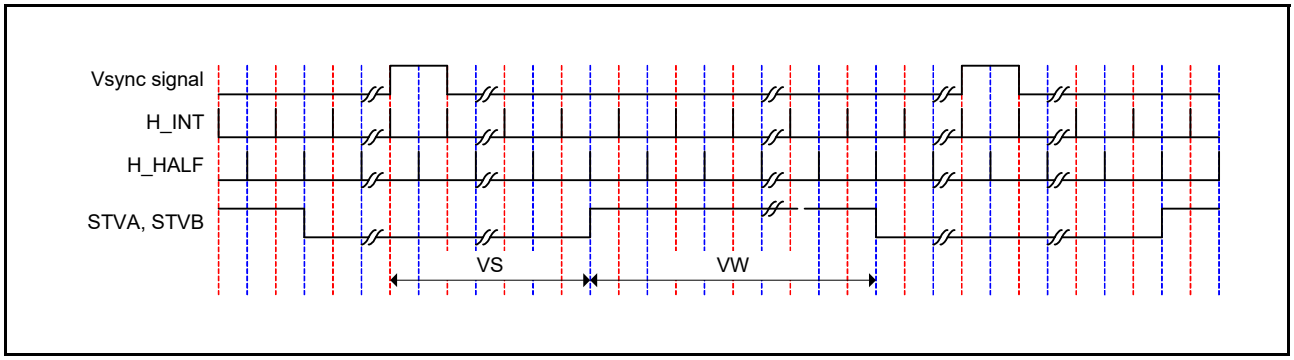

Figure 34.18 Vertical Panel Driver Signal (H_HALF Reference Operation)

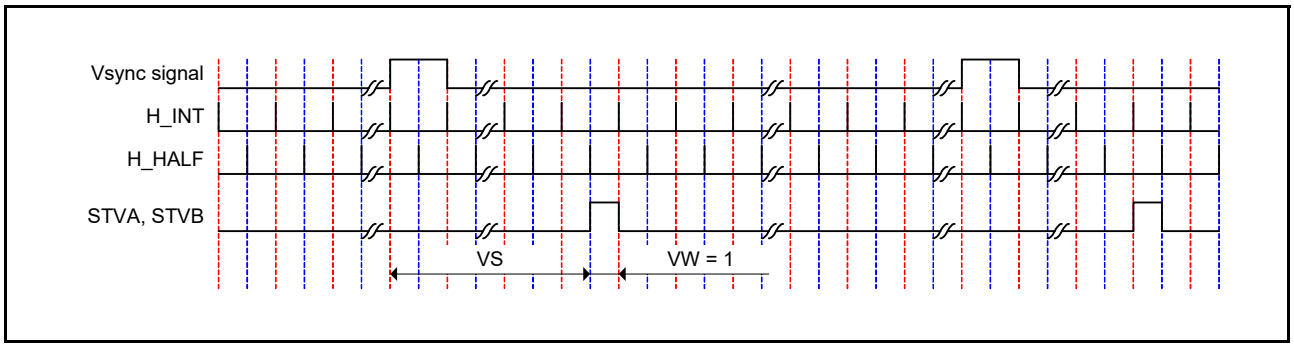

Figure 34.19 Vertical Panel Driver Signal (H_INT and H_HALF Reference Operation)

Table 34.19 Vertical Panel Driver Signal Generation

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STVA1	TCON_STVA_VS[10:0]	0	STVA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVA_HS from the rising edge of the Vsync signal (1/2fH cycles)
TCON_TIM_STVA1	TCON_STVA_VW[10:0]	4	STVA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVA_HW (1/2fH cycles)
TCON_TIM_STVB1	TCON_STVB_VS[10:0]	70	STVB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVB_HS from the rising edge of the Vsync signal (1/2fH cycles)
TCON_TIM_STVB1	TCON_STVB_VW[10:0]	960	STVB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVB_HW (1/2fH cycles)

(5) DE Timing Signal Generation

DE timing signal generation involves generation of data enable signal (DE) that indicates the valid period of the video signal by synthesizing the horizontal panel driver (HE) signal and the vertical panel driver (VE) signal (AND).

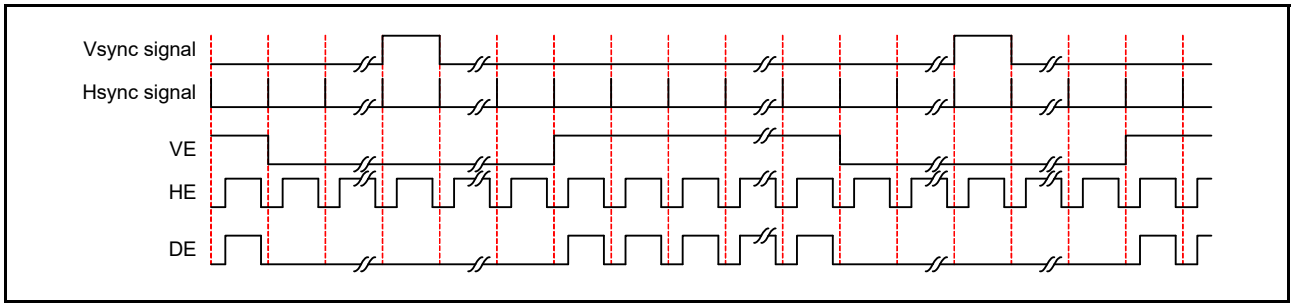

Figure 34.20 Data Enable Signal Generation

(6) Polarity Inversion

Polarity inversion enables inversion of polarity of each signal generated by the signal generating circuit.

Table 34.20 Panel Driver Signal Polarity Inversion Control

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STVA2	TCON_STVA_INV	1	Polarity Inversion Control of STVA Signal 0: Not inverted 1: Inverted
TCON_TIM_STVB2	TCON_STVB_INV	0	Polarity Inversion Control of STVB Signal 0: Not inverted 1: Inverted
TCON_TIM_STH2	TCON_STH_INV	1	Polarity Inversion Control of STH Signal 0: Not inverted 1: Inverted
TCON_TIM_STB2	TCON_STB_INV	0	Polarity Inversion Control of STB Signal 0: Not inverted 1: Inverted
TCON_TIM_CPV2	TCON_CPV_INV	0	Polarity Inversion Control of CPV Signal 0: Not inverted 1: Inverted
TCON_TIM_POLA2	TCON_POLA_INV	0	Polarity Inversion Control of POLA Signal 0: Not inverted 1: Inverted
TCON_TIM_POLB2	TCON_POLB_INV	0	Polarity Inversion Control of POLB Signal 0: Not inverted 1: Inverted
TCON_TIM_DE	TCON_DE_INV	0	Polarity Inversion Control of DE Signal 0: Not inverted 1: Inverted

(7) Output Selection

An output pin is selected for every signal subjected to polarity inversion control.

Table 34.21 Panel Driver Signal Output Selection

Register Name	Bit Name	Initial Value	Description
TCON_TIM_STVA2	TCON_STVA_SEL [2:0]	0	Output Signal Select for LCD_TCON0 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE
TCON_TIM_STVB2	TCON_STVB_SEL [2:0]	1	Output Signal Select for LCD_TCON1 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE
TCON_TIM_STH2	TCON_STH_SEL [2:0]	2	Output Signal Select for LCD_TCON2 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE
TCON_TIM_STB2	TCON_STB_SEL [2:0]	7	Output Signal Select for LCD_TCON3 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE
TCON_TIM_CPV2	TCON_CPV_SEL [2:0]	4	Output Signal Select for LCD_TCON4 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE
TCON_TIM_POLA2	TCON_POLA_SEL [2:0]	5	Output Signal Select for LCD_TCON5 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Table 34.21 Panel Driver Signal Output Selection

Register Name	Bit Name	Initial Value	Description
TCON_TIM_POLB2	TCON_POLB_SEL [2:0]	6	Output Signal Select for LCD_TCON6 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

(8) Output Phase Selection

The output phase can be individually selected for the video output signal and the various timing output signals based on the LCD_CLK (panel clock).

Table 34.22 Panel Output Signal Phase Selection

Register Name	Bit Name	Initial Value	Description
OUT_CLK_PHASE	OUTCNT_LCD_EDGE	0	Output Phase Control of LCD_DATA23 to LCD_DATA0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STVA_EDGE	0	Output Phase Control of LCD_TCON0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STVB_EDGE	0	Output Phase Control of LCD_TCON1 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STH_EDGE	0	Output Phase Control of LCD_TCON2 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_STB_EDGE	0	Output Phase Control of LCD_TCON3 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_CPV_EDGE	0	Output Phase Control of LCD_TCON4 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_POLA_EDGE	0	Output Phase Control of LCD_TCON5 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
OUT_CLK_PHASE	OUTCNT_POLB_EDGE	0	Output Phase Control of LCD_TCON6 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin

34.2 Register Descriptions

Table 34.23 to Table 34.25 show the register configuration.

- Symbols used in Register Description:

  Initial value: Register value after a reset
  —: Undefined value
  R/W: Readable/writable. The written value can be read.
  R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.
  R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
  R: Read-only. The write value should always be 0.
  —/W: Write-only. The read value is undefined.

Brightness (DC) correction register 2	OUT_BRIGHT2	R/W	H'0200 0200	H'FCFF 7A0C	32
Contrast (gain) correction register	OUT_CONTRAST	R/W	H'0080 8080	H'FCFF 7A10	32
Panel dither register	OUT_PDTHA	R/W	H'0000 3021	H'FCFF 7A14	32
Output phase control register	OUT_CLK_PHASE	R/W	H'0000 0000	H'FCFF 7A24	32

34.2.1 Register Update Control Register G in Gamma Correction Block (GAM_G_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GAM_G_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GAM_G_VEN	0	R/WC1	Gamma Correction (G) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

34.2.2 Function Switch Register in Gamma Correction Block (GAM_SW)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GAM_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GAM_ON	0	R/W	Gamma Correction On/Off Control 0: Off 1: On

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

34.2.3 Table Setting Register G1 to G16 in Gamma Correction Block (GAM_G_LUT1 to GAM_G_LUT16)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GAM_G_GAIN_xx[10:0]										
Initial value:	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GAM_G_GAIN_yy[10:0]										
Initial value:	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	*	1024	R/W	GAM_G_LUT1: Gain Adjustment of Area 0 of G Signal GAM_G_LUT2: Gain Adjustment of Area 2 of G Signal GAM_G_LUT3: Gain Adjustment of Area 4 of G Signal GAM_G_LUT4: Gain Adjustment of Area 6 of G Signal GAM_G_LUT5: Gain Adjustment of Area 8 of G Signal GAM_G_LUT6: Gain Adjustment of Area 10 of G Signal GAM_G_LUT7: Gain Adjustment of Area 12 of G Signal GAM_G_LUT8: Gain Adjustment of Area 14 of G Signal GAM_G_LUT9: Gain Adjustment of Area 16 of G Signal GAM_G_LUT10: Gain Adjustment of Area 18 of G Signal GAM_G_LUT11: Gain Adjustment of Area 20 of G Signal GAM_G_LUT12: Gain Adjustment of Area 22 of G Signal GAM_G_LUT13: Gain Adjustment of Area 24 of G Signal GAM_G_LUT14: Gain Adjustment of Area 26 of G Signal GAM_G_LUT15: Gain Adjustment of Area 28 of G Signal GAM_G_LUT16: Gain Adjustment of Area 30 of G Signal Unsigned (0 to 2047 [LSB], 1024 [LSB] = 1.0 [times])
26 to 16	*	1024	R/W	*: Bit Name GAM_G_LUT1: GAM_G_GAIN_00[10:0] GAM_G_LUT2: GAM_G_GAIN_02[10:0] GAM_G_LUT3: GAM_G_GAIN_04[10:0] GAM_G_LUT4: GAM_G_GAIN_06[10:0] GAM_G_LUT5: GAM_G_GAIN_08[10:0] GAM_G_LUT6: GAM_G_GAIN_10[10:0] GAM_G_LUT7: GAM_G_GAIN_12[10:0] GAM_G_LUT8: GAM_G_GAIN_14[10:0] GAM_G_LUT9: GAM_G_GAIN_16[10:0] GAM_G_LUT10: GAM_G_GAIN_18[10:0] GAM_G_LUT11: GAM_G_GAIN_20[10:0] GAM_G_LUT12: GAM_G_GAIN_22[10:0] GAM_G_LUT13: GAM_G_GAIN_24[10:0] GAM_G_LUT14: GAM_G_GAIN_26[10:0] GAM_G_LUT15: GAM_G_GAIN_28[10:0] GAM_G_LUT16: GAM_G_GAIN_30[10:0]
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
10 to 0	*	1024	R/W	GAM_G_LUT1: Gain Adjustment of Area 1 of G Signal GAM_G_LUT2: Gain Adjustment of Area 3 of G Signal GAM_G_LUT3: Gain Adjustment of Area 5 of G Signal GAM_G_LUT4: Gain Adjustment of Area 7 of G Signal GAM_G_LUT5: Gain Adjustment of Area 9 of G Signal GAM_G_LUT6: Gain Adjustment of Area 11 of G Signal GAM_G_LUT7: Gain Adjustment of Area 13 of G Signal GAM_G_LUT8: Gain Adjustment of Area 15 of G Signal GAM_G_LUT9: Gain Adjustment of Area 17 of G Signal GAM_G_LUT10: Gain Adjustment of Area 19 of G Signal
10 to 0	*	1024	R/W	GAM_G_LUT11: Gain Adjustment of Area 21 of G Signal GAM_G_LUT12: Gain Adjustment of Area 23 of G Signal GAM_G_LUT13: Gain Adjustment of Area 25 of G Signal GAM_G_LUT14: Gain Adjustment of Area 27 of G Signal GAM_G_LUT15: Gain Adjustment of Area 29 of G Signal GAM_G_LUT16: Gain Adjustment of Area 31 of G Signal Unsigned (0 to 2047 [LSB], 1024 [LSB] = 1.0 [times]) *: Bit Name GAM_G_LUT1: GAM_G_GAIN_01[10:0] GAM_G_LUT2: GAM_G_GAIN_03[10:0] GAM_G_LUT3: GAM_G_GAIN_05[10:0] GAM_G_LUT4: GAM_G_GAIN_07[10:0] GAM_G_LUT5: GAM_G_GAIN_09[10:0] GAM_G_LUT6: GAM_G_GAIN_11[10:0] GAM_G_LUT7: GAM_G_GAIN_13[10:0] GAM_G_LUT8: GAM_G_GAIN_15[10:0] GAM_G_LUT9: GAM_G_GAIN_17[10:0] GAM_G_LUT10: GAM_G_GAIN_19[10:0] GAM_G_LUT11: GAM_G_GAIN_21[10:0] GAM_G_LUT12: GAM_G_GAIN_23[10:0] GAM_G_LUT13: GAM_G_GAIN_25[10:0] GAM_G_LUT14: GAM_G_GAIN_27[10:0] GAM_G_LUT15: GAM_G_GAIN_29[10:0] GAM_G_LUT16: GAM_G_GAIN_31[10:0]

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

34.2.4 Area Setting Register G1 in Gamma Correction Block (GAM_G_AREA1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	GAM_G_TH_01[7:0]

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_G_TH_26[7:0]								GAM_G_TH_27[7:0]							
Initial value:	1	1	0	1	0	0	0	0	1	1	0	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_G_TH_24 [7:0]	192	R/W	Start Threshold of Area 24 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_G_TH_25 [7:0]	200	R/W	Start Threshold of Area 25 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_G_TH_26 [7:0]	208	R/W	Start Threshold of Area 26 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_G_TH_27 [7:0]	216	R/W	Start Threshold of Area 27 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

34.2.11 Area Setting Register G8 in Gamma Correction Block (GAM_G_AREA8)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAM_G_TH_28[7:0]								GAM_G_TH_29[7:0]							
Initial value:	1	1	1	0	0	0	0	0	1	1	1	0	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GAM_G_TH_30[7:0]								GAM_G_TH_31[7:0]							
Initial value:	1	1	1	1	0	0	0	0	1	1	1	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_G_TH_28 [7:0]	224	R/W	Start Threshold of Area 28 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_G_TH_29 [7:0]	232	R/W	Start Threshold of Area 29 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_G_TH_30 [7:0]	240	R/W	Start Threshold of Area 30 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_G_TH_31 [7:0]	248	R/W	Start Threshold of Area 31 of G Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area ≤ 255

Note: This register is updated when GAM_G_VEN in GAM_G_UPDATE is 1.

34.2.12 Register Update Control Register B in Gamma Correction Block (GAM_B_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	GAM_B_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GAM_B_VEN	0	R/WC1	Gamma Correction (B) Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

34.2.13 Table Setting Register B1 to B16 in Gamma Correction Block (GAM_B_LUT1 to GAM_B_LUT16)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	GAM_B_GAIN_xx[10:0]										
Initial value:	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	GAM_B_GAIN_yy[10:0]										
Initial value:	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	*	1024	R/W	GAM_B_LUT1: Gain Adjustment of Area 0 of B Signal GAM_B_LUT2: Gain Adjustment of Area 2 of B Signal GAM_B_LUT3: Gain Adjustment of Area 4 of B Signal GAM_B_LUT4: Gain Adjustment of Area 6 of B Signal GAM_B_LUT5: Gain Adjustment of Area 8 of B Signal GAM_B_LUT6: Gain Adjustment of Area 10 of B Signal GAM_B_LUT7: Gain Adjustment of Area 12 of B Signal GAM_B_LUT8: Gain Adjustment of Area 14 of B Signal GAM_B_LUT9: Gain Adjustment of Area 16 of B Signal GAM_B_LUT10: Gain Adjustment of Area 18 of B Signal GAM_B_LUT11: Gain Adjustment of Area 20 of B Signal GAM_B_LUT12: Gain Adjustment of Area 22 of B Signal GAM_B_LUT13: Gain Adjustment of Area 24 of B Signal GAM_B_LUT14: Gain Adjustment of Area 26 of B Signal GAM_B_LUT15: Gain Adjustment of Area 28 of B Signal GAM_B_LUT16: Gain Adjustment of Area 30 of B Signal Unsigned (0 to 2047 [LSB], 1024 [LSB] = 1.0 [times])

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	GAM_R_TH_28[7:0]	224	R/W	Start Threshold of Area 28 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
23 to 16	GAM_R_TH_29[7:0]	232	R/W	Start Threshold of Area 29 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
15 to 8	GAM_R_TH_30[7:0]	240	R/W	Start Threshold of Area 30 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area < Threshold of next area
7 to 0	GAM_R_TH_31[7:0]	248	R/W	Start Threshold of Area 31 of R Signal Unsigned (0 to 255 [LSB]) Threshold of previous area < Threshold of current area ≤ 255

Note: This register is updated when GAM_R_VEN in GAM_R_UPDATE is 1.

34.2.32 TCON Register Update Control Register (TCON_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TCON_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	TCON_VEN	0	R/WC1	LCD TCON Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

34.2.33 TCON Reference Timing Setting Register (TCON_TIM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_HALF[10:0]										
Initial value:	0	0	0	0	0	0	0	1	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_OFFSET[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_HALF[10:0]	400	R/W	1/2fH Timing Specifies the clock count from the rising edge of the Hsync signal as the counting timing of horizontal counter.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_OFFSET[10:0]	0	R/W	Offset Hsync Signal Timing Sets the clock cycle count from the rising edge of the Hsync signal.

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.34 TCON Vertical Timing Setting Register A1 (TCON_TIM_STVA1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_STVA_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_STVA_VW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STVA_VS [10:0]	0	R/W	STVA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVA_VS from the rising edge of the Vsync signal (1/2fH cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STVA_VW [10:0]	4	R/W	STVA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVA_VW (1/2fH cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.35 TCON Vertical Timing Setting Register A2 (TCON_TIM_STVA2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TCON_STVA_INV	—	TCON_STVA_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STVA_INV	1	R/W	Polarity Inversion Control of STVA Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STVA_SEL [2:0]	0	R/W	Output Signal Select for LCD_TCON0 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.36 TCON Vertical Timing Setting Register B1 (TCON_TIM_STVB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_STVB_VS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	1	0	0	0	1	1	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_STVB_VW[10:0]										
Initial value:	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STVB_VS [10:0]	70	R/W	STVB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STVB_VS from the rising edge of the Vsync signal (1/2fH cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STVB_VW [10:0]	960	R/W	STVB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STVB_VW (1/2fH cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.37 TCON Vertical Timing Setting Register B2 (TCON_TIM_STVB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TCON_STVB_INV	—	TCON_STVB_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STVB_INV	0	R/W	Polarity Inversion Control of STVB Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STVB_SEL [2:0]	1	R/W	Output Signal Select for LCD_TCON1 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.38 TCON Horizontal Timing Setting Register STH1 (TCON_TIM_STH1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_STH_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_STH_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STH_HS [10:0]	0	R/W	STH Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STH_HS + 1 from the rising edge of the Hsync signal (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STH_HW [10:0]	96	R/W	STH Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STH_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.39 TCON Horizontal Timing Setting Register STH2 (TCON_TIM_STH2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TCON_STH_HS_SEL	—	—	—	TCON_STH_INV	—	TCON_STH_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_STH_HS_SEL	0	R/W	STH Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STH_INV	1	R/W	Polarity Inversion Control of STH Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STH_SEL[2:0]	2	R/W	Output Signal Select for LCD_TCON2 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.40 TCON Horizontal Timing Setting Register STB1 (TCON_TIM_STB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_STB_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	1	0	0	1	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_STB_HW[10:0]										
Initial value:	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_STB_HS [10:0]	144	R/W	STB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_STB_HS + 1 from the rising edge of the Hsync signal (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_STB_HW [10:0]	640	R/W	STB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_STB_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.41 TCON Horizontal Timing Setting Register STB2 (TCON_TIM_STB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TCON_STB_HS_SEL	—	—	—	TCON_STB_INV	—	TCON_STB_SEL[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_STB_HS_SEL	0	R/W	STB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_STB_INV	0	R/W	Polarity Inversion Control of STB Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_STB_SEL[2:0]	7	R/W	Output Signal Select for LCD_TCON3 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.42 TCON Horizontal Timing Setting Register CPV1 (TCON_TIM_CPV1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_CPV_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_CPV_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_CPV_HS [10:0]	0	R/W	CPV Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_CPV_HS + 1 from the rising edge of the Hsync signal (clock cycles).
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_CPV_HW [10:0]	0	R/W	CPV Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_CPV_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.43 TCON Horizontal Timing Setting Register CPV2 (TCON_TIM_CPV2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_CPV_HS_SEL	0	R/W	CPV Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_CPV_INV	0	R/W	Polarity Inversion Control of CPV Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_CPV_SEL[2:0]	4	R/W	Output Signal Select for LCD_TCON4 Pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.44 TCON Horizontal Timing Setting Register POLA1 (TCON_TIM_POLA1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_POLA_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_POLA_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_POLA_HS [10:0]	0	R/W	POLA Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLA_HS from the rising edge of the Hsync signal (clock cycles). Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to1 or greater.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_POLA_HW [10:0]	0	R/W	POLA Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLA_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.45 TCON Horizontal Timing Setting Register POLA2 (TCON_TIM_POLA2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	TCON_POLA_MD[1:0]		—	—	—	TCON_POLA_HS_SEL	—	—	—	TCON_POLA_INV	—	TCON_POLA_SEL[2:0]		
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	1	0	1
R/W:	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	TCON_POLA_MD [1:0]	1	R/W	POLA Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_POLA_HS _SEL	0	R/W	POLA Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_POLA_INV	0	R/W	Polarity Inversion Control of POLA Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_POLA_SEL [2:0]	5	R/W	Output Signal Select for LCD_TCON5 pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.46 TCON Horizontal Timing Setting Register POLB1 (TCON_TIM_POLB1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TCON_POLB_HS[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	TCON_POLB_HW[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	TCON_POLB_HS [10:0]	0	R/W	POLB Signal Pulse Start Position (First Changing Timing) Starts pulse output after the time specified by the value of TCON_POLB_HS from the rising edge of the Hsync signal (clock cycles). Note: When 1 × 1, 1 × 2, or 2 × 2 reverse mode is selected, these bits should be set to1 or greater.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	TCON_POLB_HW [10:0]	0	R/W	POLB Pulse Width (Second Changing Timing) Outputs a pulse of the duration of the value of TCON_POLB_HW (clock cycles).

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.47 TCON Horizontal Timing Setting Register POLB2 (TCON_TIM_POLB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	TCON_POLB_MD[1:0]		—	—	—	TCON_POLB_HS_SEL	—	—	—	TCON_POLB_INV	—	TCON_POLB_SEL[2:0]		
Initial value:	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1	0
R/W:	R	R	R/W	R/W	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	TCON_POLB_MD [1:0]	1	R/W	POLB Signal Generation Mode Select 0: Normal mode Generates the signal that changes twice a horizontal period. 1: 1 × 1 reverse mode Generates the signal whose polarity is inverted every horizontal period. 2: 1 × 2 reverse mode Generates the signal whose polarity is inverted in the first horizontal period and is subsequently inverted every two horizontal periods. 3: 2 × 2 reverse mode Generates the signal whose polarity is inverted every two horizontal periods.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TCON_POLB_HS _SEL	0	R/W	POLB Signal Operating Reference Select 0: Hsync signal reference 1: Offset Hsync signal reference
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	TCON_POLB_INV	0	R/W	Polarity Inversion Control of POLB Signal 0: Not inverted 1: Inverted
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	TCON_POLB_SEL [2:0]	6	R/W	Output Signal Select for LCD_TCON6 pin 0: STVA/VS 1: STVB/VE 2: STH/SP/HS 3: STB/LP/HE 4: CPV/GCK 5: POLA 6: POLB 7: DE

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.48 TCON Data Enable Polarity Setting Register (TCON_TIM_DE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TCON_DE_INV
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	TCON_DE_INV	0	R/W	Polarity Inversion Control of DE Signal 0: Not inverted 1: Inverted

Note: This register is updated when TCON_VEN in TCON_UPDATE is 1.

34.2.49 Register Update Control Register in Output Controller (OUT_UPDATE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OUTCNT_VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/WC1

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	OUTCNT_VEN	0	R/WC1	Brightness/Contrast, Dither Process, Output Interface Register Update 0: Registers are not updated. 1: Registers are updated at the rising edge of the Vsync.

34.2.50 Output Interface Register (OUT_SET)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	OUT_ENDIAN_ON	—	—	—	OUT_SWAP_ON	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	OUT_FORMAT[1:0]		—	—	OUT_FRQ_SEL[1:0]		—	—	—	OUT_DIR_SEL	—	—	OUT_PHASE[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	OUT_ENDIAN_ON	0	R/W	Bit Endian Change On/Off Control 0: Off 1: On
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	OUT_SWAP_ON	0	R/W	B/R Signal Swap On/Off Control 0: Off 1: On
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	OUT_FORMAT[1:0]	0	R/W	Output Format Select 0: RBG888 1: RGB666 2: RGB565 3: Serial RGB
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	OUT_FRQ_SEL[1:0]	0	R/W	Clock Frequency Control 0: 100% speed — (parallel RGB) 1: Triple speed — (serial RGB) 2: Quadruple speed — (serial RGB) 3: Setting prohibited
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	OUT_DIR_SEL	0	R/W	Scan Direction Select 0: Forward scan 1: Reverse scan
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	OUT_PHASE[1:0]	0	R/W	Clock Phase Adjustment During Serial RGB Output Triple speed mode 0: 0 (clk) 1: 1 (clk) 2: 2 (clk) 3: Setting prohibited Quadruple speed mode 0: 0 (clk) 1: 1 (clk) 2: 2 (clk) 3: 3 (clk)

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

34.2.51 Brightness (DC) Correction Register 1 (OUT_BRIGHT1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PBRT_G[9:0]									
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	PBRT_G[9:0]	512	R/W	Brightness (DC) Adjustment of G Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

34.2.52 Brightness (DC) Correction Register 2 (OUT_BRIGHT2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	PBRT_B[9:0]									
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PBRT_R[9:0]									
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	PBRT_B[9:0]	512	R/W	Brightness (DC) Adjustment of B Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	PBRT_R[9:0]	512	R/W	Brightness (DC) Adjustment of R Signal Unsigned (0 (-512) to 512 (0) to 1023 (+511) [LSB], 512 [LSB] with offset)

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

34.2.53 Contrast (Gain) Correction Register (OUT_CONTRAST)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CONT_G[7:0]							
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CONT_B[7:0]								CONT_R[7:0]							
Initial value:	1	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	CONT_G[7:0]	128	R/W	Contrast (Gain) Adjustment of G Signal 0/128 to 255/128 (approx.2 times)
15 to 8	CONT_B[7:0]	128	R/W	Contrast (Gain) Adjustment of B Signal 0/128 to 255/128 (approx.2 times)
7 to 0	CONT_R[7:0]	128	R/W	Contrast (Gain) Adjustment of R Signal 0/128 to 255/128 (approx.2 times)

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

34.2.54 Panel Dither Register (OUT_PDTHA)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	PDTH_SEL[1:0]		—	—	PDTH_FORMAT[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	PDTH_PA[1:0]		—	—	PDTH_PB[1:0]		—	—	PDTH_PC[1:0]		—	—	PDTH_PD[1:0]	
Initial value:	0	0	1	1	0	0	0	0	0	0	1	0	0	0	0	1
R/W:	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21, 20	PDTH_SEL[1:0]	0	R/W	Panel Dither Operation Mode 0: Truncate 1: Round-off 2: 2 × 2 pattern dither 3: Random pattern dither
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	PDTH_FORMAT [1:0]	0	R/W	Panel Dither Output Format Select 0: RGB888 1: RGB666 2: RGB565 3: Setting prohibited
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	PDTH_PA[1:0]	3	R/W	Pattern Value (A) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	PDTH_PB[1:0]	0	R/W	Pattern Value (B) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	PDTH_PC[1:0]	2	R/W	Pattern Value (C) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	PDTH_PD[1:0]	1	R/W	Pattern Value (D) of 2 × 2 Pattern Dither Unsigned (0 to 3 [LSB])

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

34.2.55 Output Phase Control Register (OUT_CLK_PHASE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	OUTCNT_FRONT_GAM	—	—	—	OUTCNT_LCD_EDGE	—	OUTCNT_STVA_EDGE	OUTCNT_STVB_EDGE	OUTCNT_STH_EDGE	OUTCNT_STB_EDGE	OUTCNT_CPV_EDGE	OUTCNT_POLA_EDGE	OUTCNT_POLB_EDGE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	OUTCNT_FRONT_GAM	0	R/W	Correction Circuit Sequence Control 0: Brightness → contrast → gamma correction 1: Gamma correction → brightness → contrast
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	OUTCNT_LCD_EDGE	0	R/W	Output Phase Control of LCD_DATA23 to LCD_DATA0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	OUTCNT_STVA_EDGE	0	R/W	Output Phase Control of LCD_TCON0 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
5	OUTCNT_STVB_EDGE	0	R/W	Output Phase Control of LCD_TCON1 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
4	OUTCNT_STH_EDGE	0	R/W	Output Phase Control of LCD_TCON2 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
3	OUTCNT_STB_EDGE	0	R/W	Output Phase Control of LCD_TCON3 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
2	OUTCNT_CPV_EDGE	0	R/W	Output Phase Control of LCD_TCON4 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
1	OUTCNT_POLA_EDGE	0	R/W	Output Phase Control of LCD_TCON5 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin
0	OUTCNT_POLB_EDGE	0	R/W	Output Phase Control of LCD_TCON6 Pin 0: Output at the rising edge of LCD_CLK pin 1: Output at the falling edge of LCD_CLK pin

Note: This register is updated when OUTCNT_VEN in OUT_UPDATE is 1.

34.3 Usage Methods

34.3.1 Gamma Correction Adjustment Method

The characteristics of G, B, R of each panel to be connected should be measured and gamma correction should be made to suit the panel.

Since the gamma correction adjustment depends on to the characteristics of the panel, there are no recommended setting values.

34.3.2 Dither Usage Method

Dither is used when pseudo contour is appeared on the display screen.

Table 34.26 Dither Settings

Bit Name	Setting Value
PDTH_FORMAT[1:0]	Selects the format. For RGB888: 0 For RGB666: 1 For RGB565: 2
PDTH_SEL[1:0]	When 2 × 2 pattern dither is to be used: 2
PDTH_PA[1:0]	Normally 3 (initial value)
PDTH_PB[1:0]	Normally 0 (initial value)
PDTH_PC[1:0]	Normally 2 (initial value)
PDTH_PD[1:0]	Normally 1 (initial value)

34.3.3 Output Format Adjustment Method

The setting example of the typical output format is shown in Table 34.27 and Table 34.28.

It is necessary to carry out the setting of synchronization system signals of each output format similarly as the setting of output after scaling.

Table 34.27 Setting Example of Synchronizing Signal

Register Name	Bit Name	VGA	SVGA	Description
TCON_TIM	TCON_HALF[10:0]	400	528	Sets the half value of 1H time period in clock units.
Vsync signal				
TCON_TIM_STVA1	TCON_STVA_VS[10:0]	0	0	Sets the pulse generation start position from the rising edge of the internal Vsync signal. A 1/2H time period is set as 1.
TCON_TIM_STVA1	TCON_STVA_VW[10:0]	4	8	Sets the changing point from the above pulse generation start position. A 1/2H time period is set as 1.
TCON_TIM_STVA2	TCON_STVA_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STVA2	TCON_STVA_SEL[2:0]	0	0	For STVA output selection: 0
Vertical enable signal				
TCON_TIM_STVB1	TCON_STVB_VS[10:0]	68	44	Sets the pulse generation start position from the rising edge of the internal Vsync signal. A 1/2H time period is set as 1.
TCON_TIM_STVB1	TCON_STVB_VW[10:0]	960	1200	Sets the changing point from the above pulse generation start position. A 1/2H time period is set as 1.
TCON_TIM_STVB2	TCON_STVB_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STVB2	TCON_STVB_SEL[2:0]	1	1	For STVB output selection: 1
Hsync signal				
TCON_TIM_STH1	TCON_STH_HS[10:0]	0	0	Sets the pulse generation start position from the rising edge of the internal Hsync signal.
TCON_TIM_STH1	TCON_STH_HW[10:0]	96	128	Sets the changing point from the above pulse generation start position.
TCON_TIM_STH2	TCON_STH_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STH2	TCON_STH_SEL[2:0]	2	2	For STH output selection: 2
Horizontal enable signal				
TCON_TIM_STB1	TCON_STB_HS[10:0]	128	192	Sets the pulse generation start position from the rising edge of the internal Hsync signal.
TCON_TIM_STB1	TCON_STB_HW[10:0]	640	800	Sets the changing point from the above pulse generation start position.
TCON_TIM_STB2	TCON_STB_INV	0	0	Sets the output polarity of the above pulse. For inverted output: 1
TCON_TIM_STB2	TCON_STB_SEL[2:0]	3	3	For STB output selection: 3

Table 34.28 Setting Example of Data System

Register Name	Bit Name	RGB888	Serial RGB (Triple Speed)	Description
OUT_SET	OUT_ENDIAN_ON	0	0	When bit endian is changed: 1
OUT_SET	OUT_SWAP_ON	0	0	When B/R is to be swapped: 1
OUT_SET	OUT_PIXEL_INV_ON	0	0	When the function of reducing number of simultaneous changes is to be used: 1
OUT_SET	OUT_SUM_MOVE[4:0]	31	31	When OUT_PIXEL_INV_ON = 1, this register becomes valid. Sets the simultaneous changing threshold.
OUT_SET	OUT_FORMAT[1:0]	0	3	Sets the output format. For RGB888: 0 For RGB666: 1 For RGB565: 2 For serial RGB: 3
OUT_SET	OUT_FRQ_SEL[1:0]	0	1	Sets the output clock. For RGB888, RGB666, RGB565: 0 For triple speed serial RGB output: 1 For quadruple serial RGB output: 2
OUT_SET	OUT_DIR_SEL	0	0	When data arrangement of the serial RGB output is to be reversed: 1
OUT_SET	OUT_PHASE[1:0]	0	0	Sets when output phase of the serial RGB is shifted. Not delayed Delayed by one clock cycle: 1 Delayed by two clock cycles: 2 Delayed by three clock cycles: 3 (applicable only for quadruple speed mode)

35. Video Display Controller 5 (8):System Controller

35.1 System Controller

35.1.1 Overview of Functions

The system controller provides interrupt control, panel clock control, CLUT table read select signal status flag output functions.

35.1.2 Interrupt Control

Ten interrupt signals are output from the scaler and image synthesizer. The system controller controls whether to output these interrupt signals.

One is written to the corresponding INT_STA* bit when an interrupt signal is to be accepted. After 1 has been written to the bit, however, its value is still read out as 0 until the interrupt signal is accepted. Once the interrupt signal has been accepted, the INT_STA* bit is read out as 1.

The bit for an accepted interrupt signal is cleared by writing 0 to the INT_STA* bit. If further interrupt signals are to be accepted after the INT_STA* bit has been cleared, 1 is again written to the bit.

Table 35.1 Interrupt Signals

Request Source Name	Bit Name	Function
S0_VI_VSYNC	INT_STA 0	Vsync signal input to scaler 0
S0_LO_VSYNC	INT_STA 1	Vsync signal output from scaler 0
S0_VSYNCERR	INT_STA 2	Missing Vsync signal for scaler 0
GR3_VLINE	INT_STA 3	Specified line signal for panel output in graphics 3
S0_VFIELD	INT_STA 4	Field end signal for recording function in scaler 0
IV1_VBUFERR	INT_STA 5	Frame buffer write overflow signal for scaler 0
IV3_VBUFERR	INT_STA 6	Frame buffer read underflow signal for graphics 0
IV5_VBUFERR	INT_STA 7	Frame buffer read underflow signal for graphics 2
IV6_VBUFERR	INT_STA 8	Frame buffer read underflow signal for graphics 3
S0_WLINE	INT_STA 9	Write specification line signal input to scaling-down control block in scaler 0 (This signal is not present in this product.)

Table 35.2 Interrupt Clear/Hold Settings

Register Name	Bit Name	Initial Value	Description
SYSCNT_INT1	INT_STA0	0	S0_VI_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA1	0	S0_LO_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA2	0	S0_VSYNCERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA3	0	GR3_VLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA4	0	S0_VFIELD Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA5	0	IV1_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA6	0	IV3_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT1	INT_STA7	0	IV5_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT2	INT_STA8	0	IV6_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
SYSCNT_INT2	INT_STA9	0	S0_WLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. (Setting prohibited in this product) 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.

Table 35.3 Interrupt Output On/Off Settings

Register Name	Bit Name	Initial Value	Description
SYSCNT_INT4	INT_OUT0_ON	0	S0_VI_VSYNC Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT1_ON	0	S0_LO_VSYNC Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT2_ON	0	S0_VSYNCERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT3_ON	0	GR3_VLINE Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT4_ON	0	S0_VFIELD Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT5_ON	0	IV1_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT6_ON	0	IV3_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT4	INT_OUT7_ON	0	IV5_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT5	INT_OUT8_ON	0	IV6_VBUFERR Interrupt Output On/Off 0: Off 1: On
SYSCNT_INT5	INT_OUT9_ON	0	S0_WLINE Interrupt Output On/Off 0: Off 1: On (Setting prohibited in this product)

35.1.3 Panel Clock Control

The video image clock, external clock, or peripheral clock 1 is selectable as the source of the panel clock for supply to this module. The module is also equipped with a divider for scaling the frequency by factors from 1/1 to 1/32. The bits listed in Table 35.4 control the panel clock.

Table 35.4 Panel Clock Control

Register Name	Bit Name	Initial Value	Description
SYSCNT_PANEL_CLK	PANEL_ICKSEL [1:0]	0	Divided Clock Source Select 0: Video image clock (this is DV_CLK if INP_SEL = 1) 1: External clock (LCD0_EXTCLK) 2: Setting prohibited 3: Peripheral clock 1 (P1φ)
SYSCNT_PANEL_CLK	PANEL_ICKEN	0	Panel Clock Operation Enable 0: Disables operation of the panel clock operation block. 1: Enables operation of the panel clock operation block. Note: Set this bit to 0 before changing the value of the PANEL_ICKSEL or PANEL_DCDR bits.
SYSCNT_PANEL_CLK	PANEL_DCDR [5:0]	1	Clock Frequency Division Ratio Refer to Table 35.5 for details on the settings. Note: Settings other than those in Table 35.5 are prohibited.

Table 35.5 I/O Clock Frequency and Divisors

		I/O Clock Frequency (MHz)		
DCDR[5:0]	**Clock Ratio**	**27.00**	**54.00**	**66.67**
000001	1/1	27.00	54.00	66.67
000010	1/2	13.50	27.00	33.33
000011	1/3	9.00	18.00	22.22
000100	1/4	6.75	13.50	16.67
000101	1/5	5.40	10.80	13.33
000110	1/6	4.50	9.00	11.11
000111	1/7	3.86	7.71	9.52
001000	1/8	3.38	6.75	8.33
001001	1/9	3.00	6.00	7.41
001100	1/12	2.25	4.50	5.56
010000	1/16	1.69	3.38	4.17
011000	1/24	1.13	2.25	2.78
100000	1/32	0.84	1.69	2.08

35.1.4 CLUT Table Read Select Signal Status Flag

The CLUT read select signal status can be read using the flags shown in Table 35.6.

Table 35.6 CLUT Table Read Select Signal Status Flags

Register Name	Bit Name	Initial Value	Description
SYSCNT_CLUT	GR0_CLT_SEL_ST	—	Graphics 0 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
SYSCNT_CLUT	GR2_CLT_SEL_ST	—	Graphics 2 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.
SYSCNT_CLUT	GR3_CLT_SEL_ST	—	Graphics 3 CLUT Table Read Select Signal Status Flag 0: CLUT table 0 is read out. 1: CLUT table 1 is read out.

35.2 Register Descriptions

The following register sets are allocated in the SH register map area.

- Symbols used in Register Descriptions

  Initial value: Register value after a reset
  —: Undefined value
  R/W: Readable/writable. The written value can be read.
  R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.
  R/WC1: Readable/writable. Writing 1 initializes the bit. Writing 0 is ignored.
  R: Read-only. The write value should always be 0.
  —/W: Write-only. The read value is undefined.

Table 35.7 Register Configuration of System Controller (CH0)

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Interrupt control register 1	SYSCNT_INT1	R/W	H'0000 0000	H'FCFF 7A80	32
Interrupt control register 2	SYSCNT_INT2	R/W	H'0000 0000	H'FCFF 7A84	32
Interrupt control register 4	SYSCNT_INT4	R/W	H'0000 0000	H'FCFF 7A8C	32
Interrupt control register 5	SYSCNT_INT5	R/W	H'0000 0000	H'FCFF 7A90	32
Panel clock control register	SYSCNT_PANEL_CLK	R/W	H'0001	H'FCFF 7A98	16
CLUT table read select signal status register	SYSCNT_CLUT	R	H'0000	H'FCFF 7A9A	16

35.2.1 Interrupt Control Register 1 (SYSCNT_INT1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	INT_STA7	—	—	—	INT_STA6	—	—	—	INT_STA5	—	—	—	INT_STA4
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	INT_STA3	—	—	—	INT_STA2	—	—	—	INT_STA1	—	—	—	INT_STA0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	INT_STA7	0	R/W	IV5_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	INT_STA6	0	R/W	IV3_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	INT_STA5	0	R/W	IV1_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	INT_STA4	0	R/W	S0_VFIELD Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	INT_STA3	0	R/W	GR3_VLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	INT_STA2	0	R/W	S0_VSYNCERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INT_STA1	0	R/W	S0_LO_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INT_STA0	0	R/W	S0_VI_VSYNC Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.

35.2.2 Interrupt Control Register 2 (SYSCNT_INT2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	INT_STA9	—	—	—	INT_STA8
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	INT_STA9	0	R/W	S0_WLINE Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. (Setting prohibited in this product) 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INT_STA8	0	R/W	IV6_VBUFERR Interrupt Clear/Hold 0(W): Clears the interrupt status. 1(W): Starts interrupt acceptance. 0(R): No interrupt has occurred. 1(R): An interrupt has occurred.

35.2.3 Interrupt Control Register 4 (SYSCNT_INT4)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	INT_OUT7_ON	—	—	—	INT_OUT6_ON	—	—	—	INT_OUT5_ON	—	—	—	INT_OUT4_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	INT_OUT3_ON	—	—	—	INT_OUT2_ON	—	—	—	INT_OUT1_ON	—	—	—	INT_OUT0_ON
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	INT_OUT7_ON	0	R/W	IV5_VBUFERR Interrupt Output On/Off 0: Off 1: On
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	INT_OUT6_ON	0	R/W	IV3_VBUFERR Interrupt Output On/Off 0: Off 1: On
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	INT_OUT5_ON	0	R/W	IV1_VBUFERR Interrupt Output On/Off 0: Off 1: On
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

36. Capture Engine Unit

The capture engine unit (CEU) is a capture module that fetches image data externally input and transfers it to the memory. The CEU is connected to the system bus via bus bridge modules.

36.1 Features of CEU

Lists the features of CEU as follows.

(1) Image data fetch

- Captures an image output from an external module and writes YCbCr data to the memory with it separated into Y data and CbCr data.
- Fetches image data other than YCbCr data, e.g. JPEG data, RGB565, from an externally connected module, such as a camera, and sequentially writes the image data to the memory.
- Fetches an interlace source image in both-field units or one-field units and writes it to the memory. In both-field capture, an image can be stored in the memory as a frame image.

(2) Filter processing

- Performs scale-down and removal of high-frequency components (only in the horizontal direction) for an image using internal filters. Note that the scaled-down image must not exceed VGA. The filter processing can be applied to only YCbCr input data.

(3) Format conversion

- Converts image data input in the YCbCr422 format into the YCbCr420 format and writes it to the memory. Note that the conversion algorithm is simple skipping in which the chrominance component (CbCr) of the even-numbered lines is skipped.

36.2 Functional Overview of CEU

The functional overview of the CEU is shown in Table 36.1, and the main functions and their details are shown in Table 36.1.

Table 36.1 Functional Overview of CEU

Classification	Item	Function	Description	Note
Connectable camera	Size	5 megapixels	2,560 pixels × 1,920 lines	Horizontal: 4-pixel units Vertical: 4-line units The range of the image size that can be input is as follows. Horizontal: 2,560 pixels to 128 pixels Vertical: 1,920 lines to 96 lines [Note] This depends on the AC characteristics of the device to be connected, frame rate of the connected device, and transfer speed to the destination RAM.
		3 megapixels	2,048 pixels × 1,536 lines	
		2 megapixels	1,632 pixels × 1,224 lines	
		UXGA	1,600 pixels × 1,200 lines	
		SXGA (1)	1,280 pixels × 1,024 lines	
		SXGA (2)	1,280 pixels × 960 lines	
		WXGA	1,280 pixels × 768 lines	
		XGA	1,024 pixels × 768 lines	
		SVGA	800 pixels × 600 lines	
		WVGA	800 pixels × 480 lines	
		VGA	640 pixels × 480 lines	
		CIF	352 pixels × 288 lines	
		WQVGA	480 pixels × 240 lines	
		QVGA	320 pixels × 240 lines, 240 pixels × 320 lines	
		QCIF	176 pixels × 144 lines	
		QQVGA	160 pixels × 120 lines	
		Sub-QCIF	128 pixels × 96 lines	
	Input format	YCbCr422 8 bits	Cb_0, Y_0, Cr_0, $Y_{1...}$	Supports clock ratio of 1:1
			Cr_0, Y_0, Cb_0, $Y_{1...}$	
			Y_0, Cb_0, Y_1, $Cr_{0...}$	
			Y_0, Cr_0, Y_1, $Cb_{0...}$	
		Binary data	Specified amount to be fetched on edges of the sync signal	Written sequentially
			Data is fetched with the horizontal sync signal as an enable signal (RZ/A1LU and RZ/A1LC only).	
	Horizontal and vertical sync signal polarities	Arbitrary	High-active and low-active	
	Capture start location	Arbitrary	Can be specified in camera input clock units	Horizontal: 1-cycle units Vertical: 1-HD (horizontal sync signal) units
	Number of captured pixels	Arbitrary	Can be specified in 4-pixel units horizontally and in 4-line units vertically	
	Interlace	Both-field capture	Stored as a field image	Capture: 2-VD (vertical sync signal) units
			Stored as a frame image	
		One-field capture	Top field or bottom field can be specified	Capture: 1-VD units
Memory write	Output format	YCbCr422 YCbCr420	YCbCr420 is realized by simple skipping	
Filter function	No scaling or scale-down	Scale-down of captured display	Desired scaling factor from 1/16 to 1 (scaled-down display must not exceed VGA)	
	Low-pass filter		Removal of high-frequency components	Only in the horizontal direction

Table 36.2 Main Functions of CEU and Their Details

Main Function	Detailed Description
Image data fetch	• Captures an image output from an external module and writes YCbCr data to the memory with it separated into Y data and CbCr data. • Fetches image data other than YCbCr data, e.g. JPEG data, from an externally connected module, such as a camera, and sequentially writes the image data to the memory. • Fetches an interlace source image in both-field units or one-field units and writes it to the memory. In both-field capture, an image can be stored in the memory as a frame image.
Filter processing	Performs scale-down and removal of high-frequency components (only in the horizontal direction) for an image using internal filters. Note that the scaled-down image must not exceed VGA. The filter processing can be applied to only YCbCr input data.
Format conversion	Converts image data input in the YCbCr422 format into the YCbCr420 format and writes it to the memory. Note that the conversion algorithm is simple skipping in which the chrominance component (CbCr) of the even-numbered lines is skipped.

Figure 36.1 shows a block diagram of the CEU.

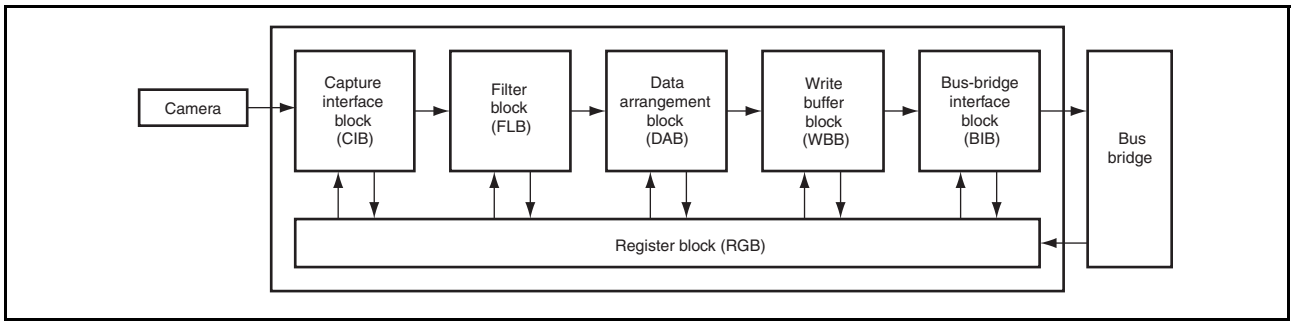

Figure 36.1 Block Diagram of CEU

36.3 Pin Configuration of CEU

The pin configuration of the CEU is shown in Table 36.3.

Table 36.3 Pin Configuration of CEU

Pin Name	Function	I/O	Description
VIO_D7 to VIO_D0*	CEU data bus	Input	Camera image data input to the CEU
VIO_CLK	CEU clock	Input	Camera clock input to the CEU
VIO_VD	CEU vertical sync	Input	Camera vertical sync signal input to the CEU
VIO_HD	CEU horizontal sync	Input	Camera horizontal sync signal input to the CEU
VIO_FLD	Field signal	Input	Field identification signal to the CEU

Note: * When the distinction according to the bus width for the data bus is not needed, VIO_D is used in this manual. Otherwise, VIO_D7 to VIO_D0 are used.

36.4 Register Descriptions of CEU

The register configuration of the CEU is shown in Table 36.4.

Most CEU registers have a 2-plane configuration (plane A and plane B). The CEU switches the planes when using these 2-plane registers. A mirror address, which is an address that can always access the register on the unused plane, is provided for each 2-plane register. Figure 36.2 shows the timing to switch the register planes. The CEU switches the register planes at the same time a VD interrupt is asserted.

In the following register descriptions, "during operation" indicates the period that begins when the CEU is activated by the CE bit in the capture start register (CAPSR) and ends when a capture end interrupt (CPE) of the capture event flag clear register (CETCR) occurs. In the read-only bits in each register, the write value should always be 0. If a value other than 0 is written to any of these bits, correct operation cannot be guaranteed.

Table 36.4 Register Configuration of CEU

			Addresses			
Register Name	**Abbr.**	**R/W**	**Address (Plane A)**	**Address (Plane B)**	**Mirror Address**	**Access Size**
CEU Capture start register	CAPSR	R/W	H'E821 0000	—	—	32

CEU Capture data address C register	CDACR	R/W	H'E821 0040	H'E821 1040	H'E821 2040	32
CEU Capture data bottom-field address Y register	CDBYR	R/W	H'E821 0044	H'E821 1044	H'E821 2044	32
CEU Capture data bottom-field address C register	CDBCR	R/W	H'E821 0048	H'E821 1048	H'E821 2048	32
CEU Capture bundle destination size register	CBDSR	R/W	H'E821 004C	H'E821 104C	H'E821 204C	32
CEU Firewall operation control register	CFWCR	R/W	H'E821 005C	—	—	32
CEU Capture low-pass filter control register	CLFCR	R/W	H'E821 0060	H'E821 1060	H'E821 2060	32
CEU Capture data output control register	CDOCR	R/W	H'E821 0064	H'E821 1064	H'E821 2064	32
CEU Capture event interrupt enable register	CEIER	R/W	H'E821 0070	—	—	32
CEU Capture event flag clear register	CETCR	R/W	H'E821 0074	—	—	32
CEU Capture status register	CSTSR	R	H'E821 007C	—	—	32
CEU Capture data size register	CDSSR	R/W	H'E821 0084	—	—	32
CEU Capture data address Y register 2	CDAYR2	R/W	H'E821 0090	H'E821 1090	H'E821 2090	32
CEU Capture data address C register 2	CDACR2	R/W	H'E821 0094	H'E821 1094	H'E821 2094	32
CEU Capture data bottom-field address Y register 2	CDBYR2	R/W	H'E821 0098	H'E821 1098	H'E821 2098	32
CEU Capture data bottom-field address C register 2	CDBCR2	R/W	H'E821 009C	H'E821 109C	H'E821 209C	32

Note: * After changing the setting of a register (CAMCR or CMCYR) that is determined by the external module characteristics, do not start capture until at least 10 external input clock cycles have elapsed.

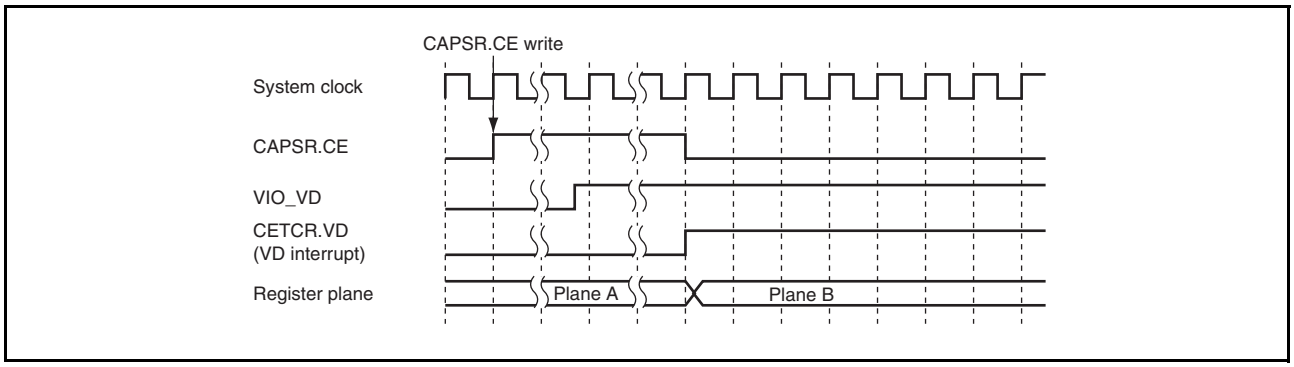

Figure 36.2 Register Plane Switching Timing (VD Polarity is High-Active in Data Enable Fetch Mode)

36.4.1 Capture Start Register (CAPSR)

CAPSR captures data input to the CEU from an external module.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPKIL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	CPKIL	0	R/W	Write 1 to this bit to perform a software reset of capturing. At a software reset, capturing ends immediately without completing capture operation until the end of a frame. Clear the CE bit to 0 when writing 1 to this bit. Processing of the capture software reset is indicated by this bit being set to 1. When this bit is 1, do not start capturing since reset processing is in progress. When restarting capture operations, after referring to the CPTON bit in CSTSR to ensure that the CEU is halted (in the idle state), wait until this bit is cleared to 0. The timing of restarting capture operations is shown in Figure 36.6. When a software reset is generated by this bit, a capture end interrupt (CPE bit in CETCR) may be output immediately after the software reset. However, such kind of interrupt should be ignored. Also, even if the capture end interrupt is not output, the interrupt source (CPE bit) must be cleared before capturing of the next frame. 0: Normal state 1: Software reset of capturing
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	CE	0	R/W	• Single-capture This bit reserves capturing of the next frame. When 1 is written to this bit, the capture of one frame starts from the next VD input, and stops when the one-frame capture end interrupt (CPE bit in CETCR) is asserted (Figure 36.7). To perform capture again, write 1 to this bit. After the VD or HD polarity is changed, do not write 1 to this bit until the next VD interrupt is asserted. As this bit indicates the capture reserve state, this bit is read as 1 after it is set to 1 and until VD is input. When VD is input, this bit returns to 0 and so is read as 0. The capture end is determined by the one-frame capture end interrupt (CPE bit). This is similar in data fetch mode. Registers should be set before the VD interrupt of the frame where capture starts next. The new register settings take effect at the next VD input. When registers are modified during capturing, the register settings take effect from the capture operations of the next VD input. If a setting register to which writing during capturing is prohibited is modified during capturing, an interrupt source (IGRW bit in CETCR) is generated. For details on the interrupt source, see the description on CETCR. • Continuous capture When this bit is set to 1 while the CTNCP bit in CAPCR is set to 1, continuous capture starts from the next frame (Figure 36.8). Note that this bit is not cleared to 0 but remains as 1. To stop capturing, clear this bit to 0; capturing stops after the current frame is completed. Continuous capture operations are possible in only image capture mode. The start address of the memory to which the captured data is written to must be set for each frame. 0: Stops capturing 1: Starts capturing

When both the VD (vertical sync signal) and HD (horizontal sync signal) polarities are high-active, one frame is defined as a period from a VD rising edge to the next VD rising edge, and one line as a period from an HD rising edge to the next HD rising edge. Figure 36.3 shows the timing of one frame (when both the VD and HD polarities are high-active).

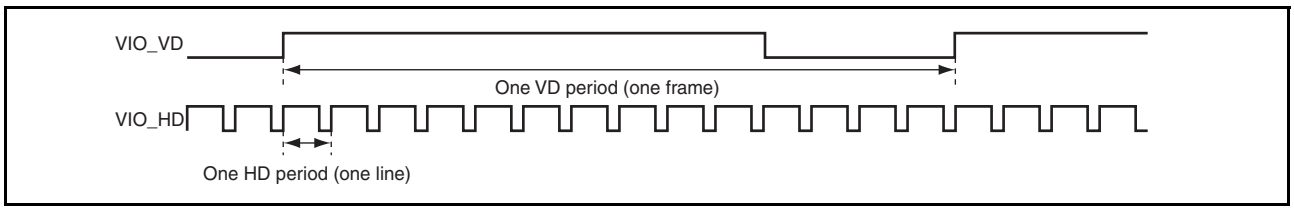

Figure 36.3 Frame Timing

When both the VD and HD polarities are high-active, similar to one frame, one field is defined as follows:

- Period from a VD rising edge to the next VD rising edge
- One line is a period from an HD rising edge to the next HD rising edge

The field identification signal FLD should be fixed for at least 1-HD period from a VD input. Figure 36.4 shows the timing of one field (when both the VD and HD polarities are high-active).

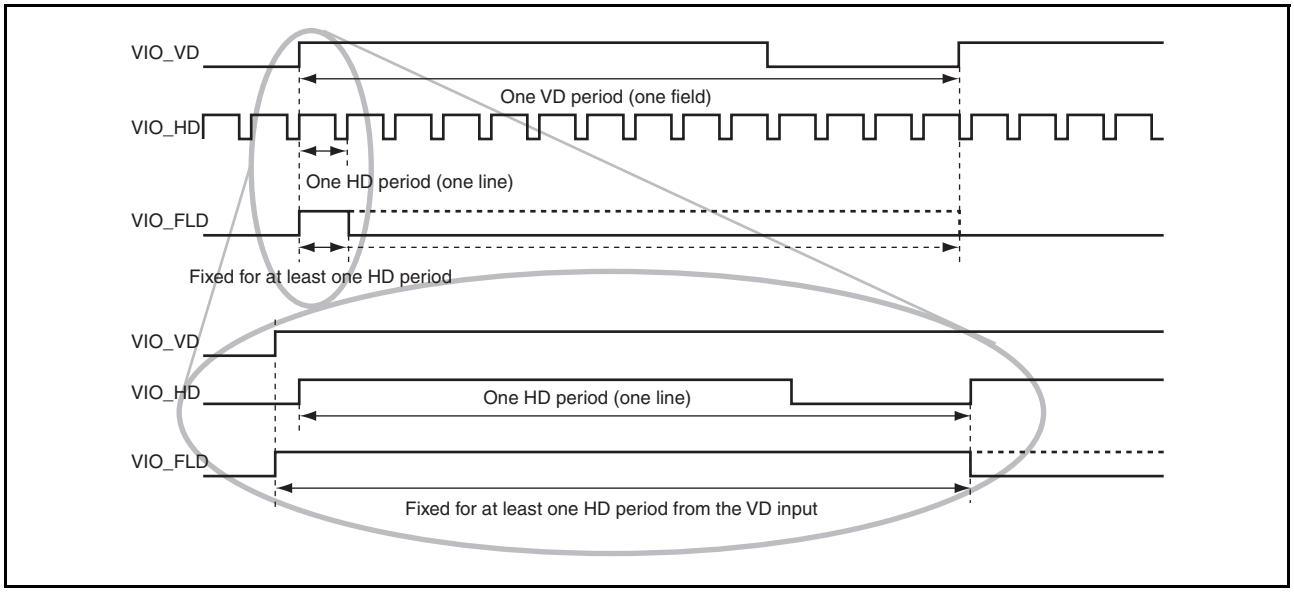

Figure 36.4 One Field Timing

In data enable fetch (RZ/A1LU and RZ/A1LC only), one frame is defined as a period from a VD rising edge to the VD falling edge. With the HD as an enable signal (positive polarity), data of a cycle in which the HD is asserted is fetched while the VD is high. Figure 36.5 shows the timing of one frame for data enable fetch.

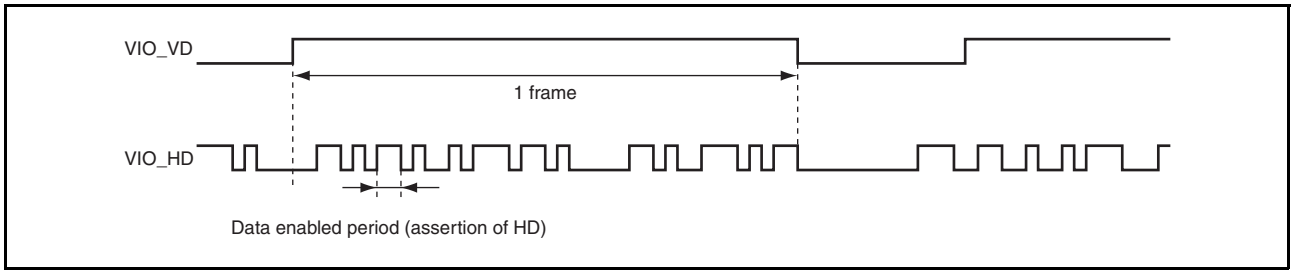

Figure 36.5 Frame Timing (Data Enable Fetch)

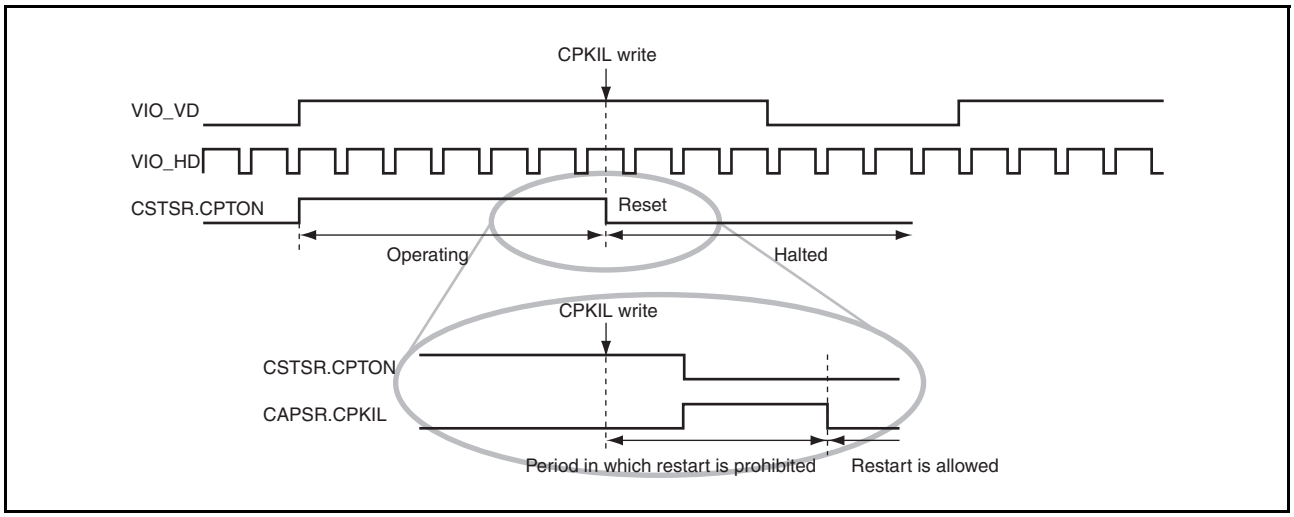

Figure 36.6 Timing of Software Reset and Restart of Capturing

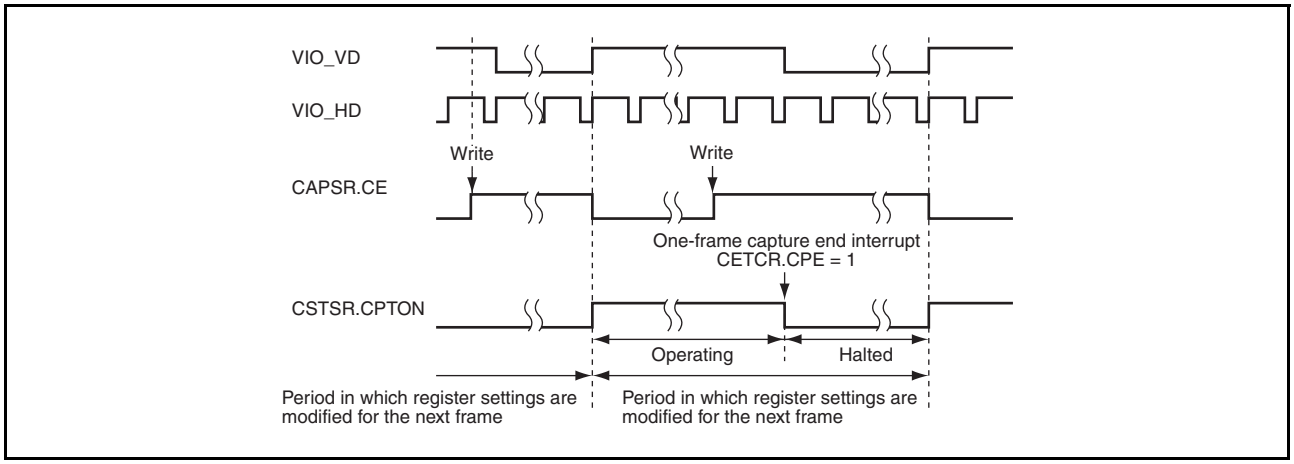

Figure 36.7 Timing of Modifying CE Bit and Register Setting in One Frame Capture

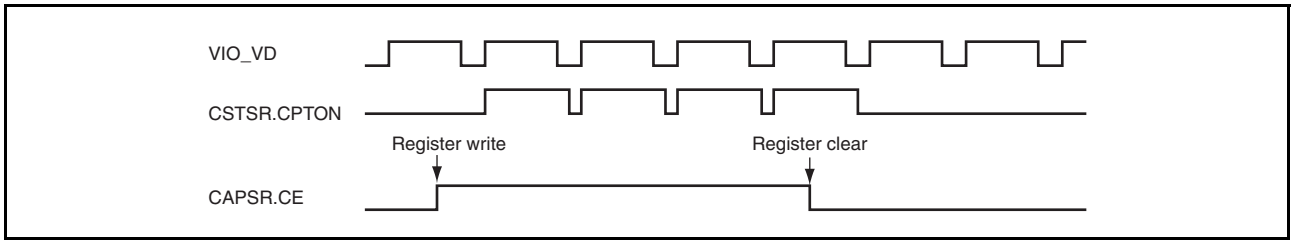

Figure 36.8 Continuous-Frame Capture

36.4.2 Capture Control Register (CAPCR)

CAPCR sets continuous-frame capture and the frame drop intervals.

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FDRP[7:0]								—	—	MTCM[1:0]		—	—	—	CTNCP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	FDRP[7:0]	H'00	R/W	These bits set the frame drop interval in continuous-frame capture. When these bits are cleared to 0, frame drop is not performed, and all frames are captured. Figure 36.9 shows the value set in these bits and the timing of captured frames. The frame drop interval unit differs according to the capture setting. Table 36.5 shows the relationship between the capture setting and frame drop interval unit. The image of the frame drop timing for each capture setting when these bits are set to 2 is shown in Figure 36.10. In both-field capture, capturing is performed continuously for 2-VD periods, regardless of whether the second field is the top field or bottom field. In addition, in both-field capture, the frame drop counter is incremented when the first field has been identified as the top field or bottom field, regardless of whether the second field is the top field or bottom field. When 0 is written to the CE bit in CAPSR, capturing terminates after the current frame has been captured for a capture frame. However, for a drop frame, capturing is forcibly terminated in the CEU so no capture end interrupt (CPE bit in CETCR) is output. While CE bit is 1, do not change the setting of these bits. Note: Do not change the setting of these bits during continuous capture operations. To change the setting of these bits, stop continuous capture (CE bit = 0), clear the CTNCP bit (continuous capture) in CAPCR to 0, and then restart continuous capture. Continuous capture is performed during the period of CAPSR.CE = 1 shown in Figure 36.9.
23, 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
21, 20	MTCM[1:0]	00	R/W	These bits specify the unit for transferring data to a bus bridge module. The efficiency of writing image data can be improved by continuously accessing the addresses. To improve the write efficiency, set these bits to 11. The setting of these bits appear to be unchanged from the outside. 00: Transferred to the bus in 32-byte units 01: Transferred to the bus in 64-byte units 10: Transferred to the bus in 128-byte units 11: Transferred to the bus in 256-byte units (1) Image capture 00: Y data and C data are transferred in 32-byte units 01: Y data and C data are transferred in 64-byte units 10: Y data and C data are transferred in 128-byte units 11: Y data and C data are transferred in 256-byte units (2) Data fetch 00: Data is transferred in 32-byte units 01: Data is transferred in 64-byte units 10: Data is transferred in 128-byte units 11: Data is transferred in 256-byte units
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	CTNCP	0	R/W	When capturing is started with this bit set to 1, capturing continues until the CE bit in CAPSR is cleared to 0 or a software reset is initiated by the CPKIL bit in CAPSR (see Figure 36.8). Continuous capture must be set before capturing is started. This bit is modified only after 0 is written to the CE bit to stop capturing. If this bit is modified during capturing, correct operation cannot be guaranteed. In data fetch mode, clear this bit to 0. 0: One-frame capture when the CE bit is 1 1: Continuous capture until the CE bit is cleared to 0
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

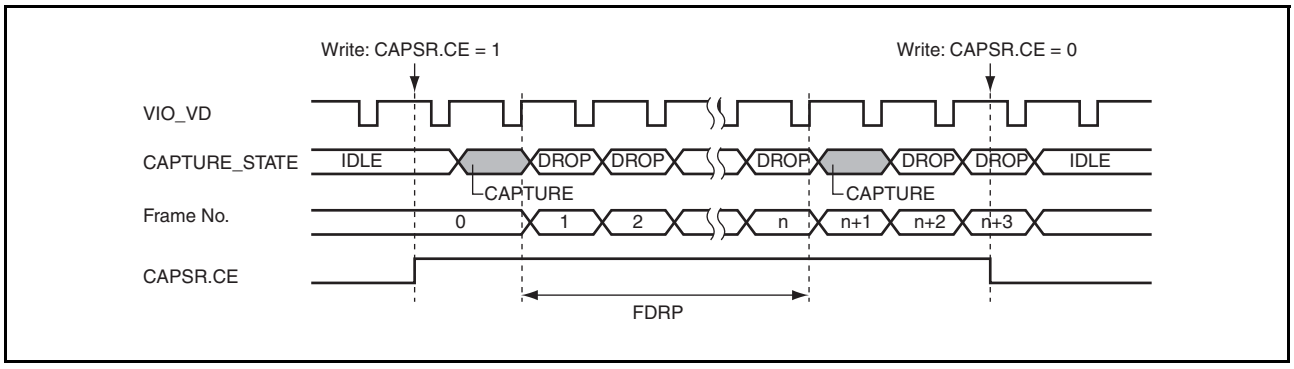

Figure 36.9 Setting of FDRP Bits and Frame Drop Timing

Table 36.5 Relationship between Capture Setting and Frame Drop Interval Unit

Input Mode	Captured Image	First Captured Image	Frame Drop Interval Unit	Capture Setting
Progressive	Frame	Frame immediately after capture start	Frame	A
Interlace	Both-field (2-VD capture)	Field immediately after capture start	2 fields (first capture field count)	B
				C
		Top field	2 fields (top-field count)	D
		Bottom field	2 fields (bottom-field count)	E
	One-field (1-VD capture)	Field immediately after capture start	First capture field	F
				G
		Top field	Top field	H
		Bottom field	Bottom field	I

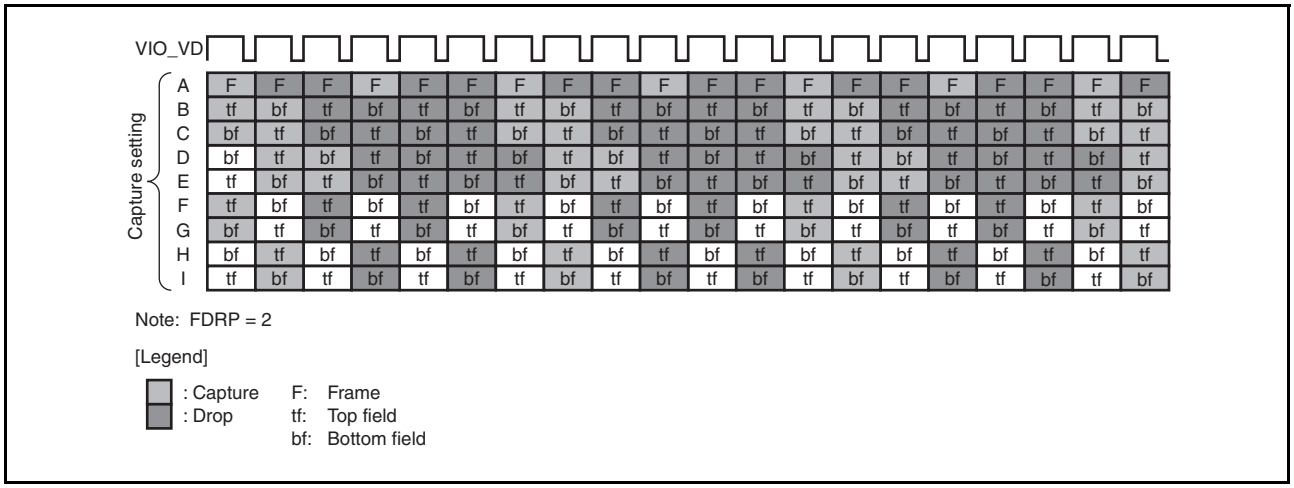

Figure 36.10 Image of Frame Drop Timing for Capture Settings (FDRP Bits = 2)

36.4.3 Capture Interface Control Register (CAMCR)

CAMCR sets the capture interface.

The following items are set by CAMCR.

- Selection between the rising edge or falling edge of the camera clock for signal capture or data fetch operation (RZ/A1LU and RZ/A1LC only)
- Selection between image capture operation or data fetch operation
- Polarities of the vertical and horizontal sync signals
- Input order of image data components (Y, Cb, and Cr) (only for image capture mode)
- Selection of digital image input pins (8 bits only)
- Polarity of the field identification signal

CAMCR must be set according to the module connected. In data fetch mode, set the DTARY bits to B'0. Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

Note: After changing the setting of this register, do not start capture until at least 10 external input clock cycles have elapsed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	VDSEL*	HDSEL*	FLDSEL*	DSEL*	—	—	—	—	—	—	—	FLDPOL

R/W:	R	R	R	R/W	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27	VDSEL*	0	R/W	Sets the edge for capturing the vertical sync signal (VD) from an external module. 0: VD is captured at the rising edge of the camera clock. 1: VD is captured at the falling edge of the camera clock.
26	HDSEL*	0	R/W	Sets the edge for capturing the horizontal sync signal (HD) from an external module. 0: HD is captured at the rising edge of the camera clock. 1: HD is captured at the falling edge of the camera clock.
25	FLDSEL*	0	R/W	Sets the edge for capturing the field identification signal (FLD) from an external module. 0: FLD is captured at the rising edge of the camera clock. 1: FLD is captured at the falling edge of the camera clock.
24	DSEL*	0	R/W	Sets the edge for fetching the image data (D7 to D0) from an external module. 0: D7 to D0 are fetched at the rising edge of the camera clock. 1: D7 to D0 are fetched at the falling edge of the camera clock.
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
16	FLDPOL	0	R/W	Sets the polarity of the field identification signal (FLD) from an external module. 0: When the FLD signal is high-active, the field is detected as the top field and when low-active, the field is detected as the bottom field. 1: When the FLD signal is low-active, the field is detected as the top field and when high-active, the field is detected as the bottom field.
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	DTIF	0	R/W	Sets the digital image input pins from which data is to be captured. The write value should always be 0.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	DTARY[1:0]	00	R/W	These bits set the input order of the luminance component and chrominance component. The order in which the luminance component (Y) and chrominance component (Cb and Cr) are input from an external module differs among modules. The CEU supports the input orders shown in Figure 36.12. Set the corresponding value in these bits. In data fetch mode, set these bits to 00. 00: Image input data is fetched in the order of Cb_0, Y_0, Cr_0, and Y_1 01: Image input data is fetched in the order of Cr_0, Y_0, Cb_0, and Y_1 10: Image input data is fetched in the order of Y_0, Cb_0, Y_1, and Cr_0 11: Image input data is fetched in the order of Y_0, Cr_0, Y_1, and Cb_0
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	JPG[1:0]	00	R/W	These bits select the fetched data type. 00: Image capture mode (input data are separated into Y data and CbCr data for output to the memory) 01: Data synchronous fetch mode (specified size of input data are output to the specified memory addresses in order of input and in synchronization with the sync signal) 10: Data enable fetch mode (RZ/A1LU and RZ/A1LC only) (input data are fetched with HD as an enable signal and output to the specified addresses in memory in order of input)
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	VDPOL	0	R/W	Sets the polarity for detection of the vertical sync signal input from an external module. Figure 36.14 and Figure 36.15 show the relationship between the VIO_VD and VIO_HD signals and VD interrupt when high-active is selected. Since a VD interrupt may occur when this bit value is modified, the VD bit in CETCR must always be cleared to 0 when this bit value is changed. In data enable fetch mode, this bit is not used and the sense for detection is always active high. 0: Vertical sync signal (VD) from an external module is detected as high-active 1: Vertical sync signal (VD) from an external module is detected as low-active
0	HDPOL	0	R/W	Sets the polarity for detection of the horizontal sync signal input from an external module. Figure 36.16 shows the relationship between the HD and HD interrupt when high-active is selected. Since an HD interrupt may occur when this bit value is modified, the HD bit in CETCR must always be cleared to 0 when this bit value is changed. 0: Horizontal sync signal (HD) from an external module is detected as high-active 1: Horizontal sync signal (HD) from an external module is detected as low-active

Note: * This bit is only present in the RZ/A1LU and RZ/A1LC. This is reserved in the RZ/A1L.

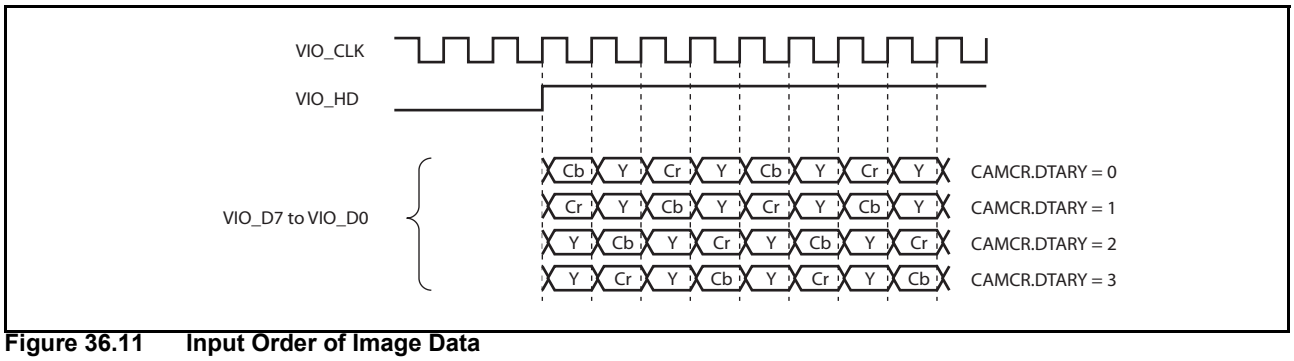

Figure 36.11 Input Order of Image Data

The JPG bit in CAMCR selects whether digital image data is fetched or data such as JPEG is fetched. In addition, when data such as JPEG is fetched, select whether the specified amount of data is continuously fetched in synchronization with the sync signal or data is fetched while the horizontal sync signal is enabled (RZ/A1LU and RZ/A1LC only).

In data enable fetch mode, one frame is defined as a period from the rising edge to the falling edge of the vertical sync signal (VD) for data fetching. The horizontal sync signal (HD) is enabled only when the VD is high and treated as an enable signal. Data input in the cycle in which the HD is asserted (high) is fetched and output to the memory continuously.

This module starts fetching data at the rising edge of the VD and stops fetching data at the falling edge of the VD in data enable fetch mode. Thus, if the VD remains high and does not go low, end processing does not start. In addition, if the VD remains high and the HD also remains asserted, data continues to be fetched.

Figure 36.12 and Figure 36.13 show the interface timing in data enable fetch mode.

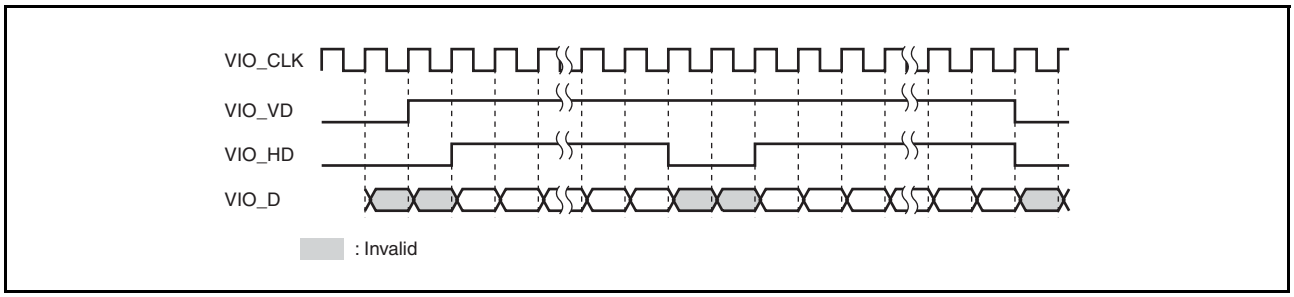

Figure 36.12 Data Enable Fetch Timing (HD Asserted (High) While VD is High)

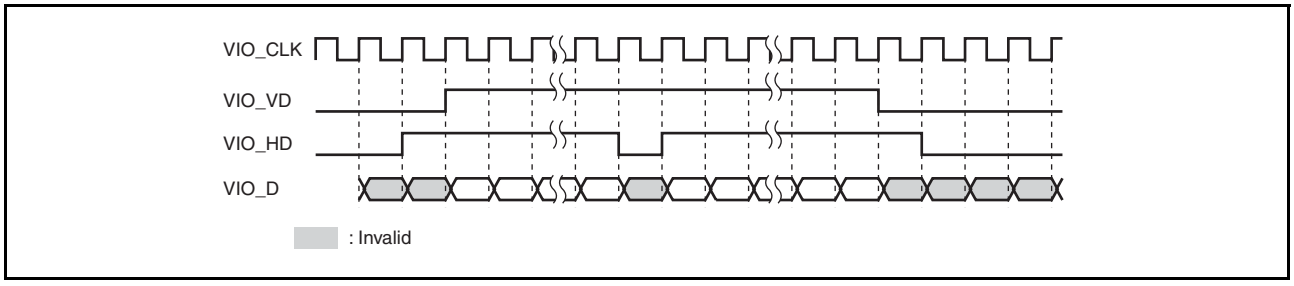

Figure 36.13 Data Enable Fetch Timing (HD Asserted (High) When VD is Not High)

In data enable fetch mode, this module generates a VD interrupt in response to detection of the active level of VD. In image capture mode and data synchronous fetch mode, this module generates a VD interrupt in response to the first detection of the active level of HD following detection of the active level of VD. Note that, when VD and HD are asserted and detected at the same time, this module generates a VD interrupt at that time.

Figures 36.14 to 36.16 show the relationships between the VIO_VD signal and the VD interrupt, the VIO_VD and VIO_HD signals and the VD interrupt, and the VIO_HD signal and the HD interrupt.

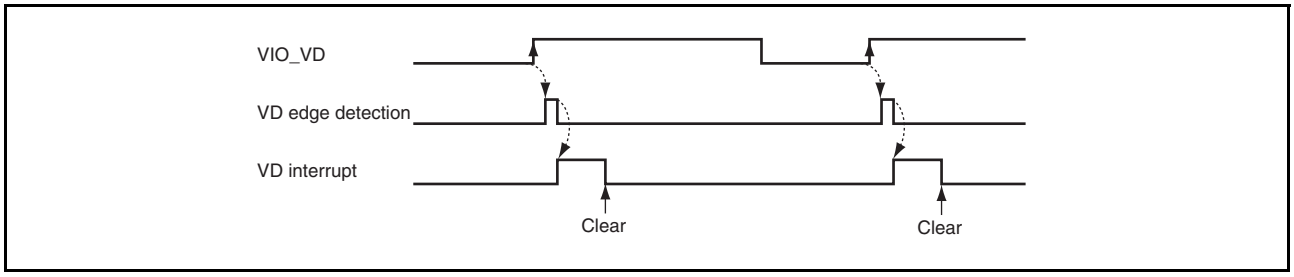

Figure 36.14 Relationship between VIO_VD and VD Interrupt when VD is High-Active (In Data Enable Fetch Mode)

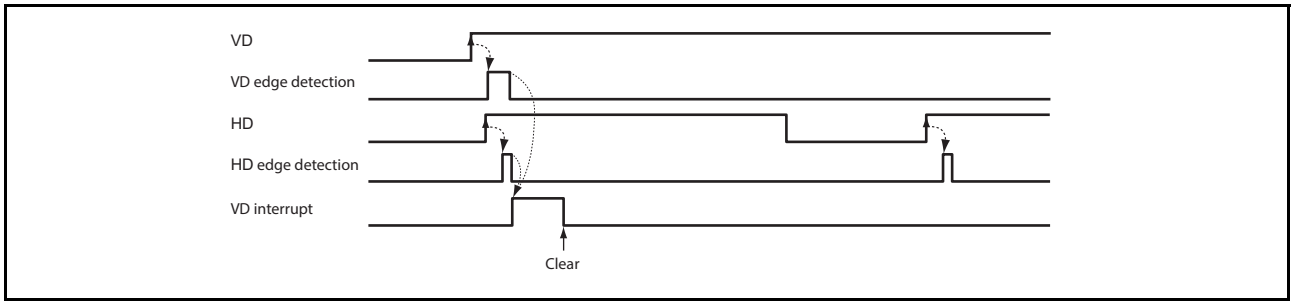

Figure 36.15 Relationship between the VIO_VD and VIO_HD signals and the VD Interrupt when VD and HD are High-Active (in Image Capture Mode or Data Synchronous Fetch Mode)

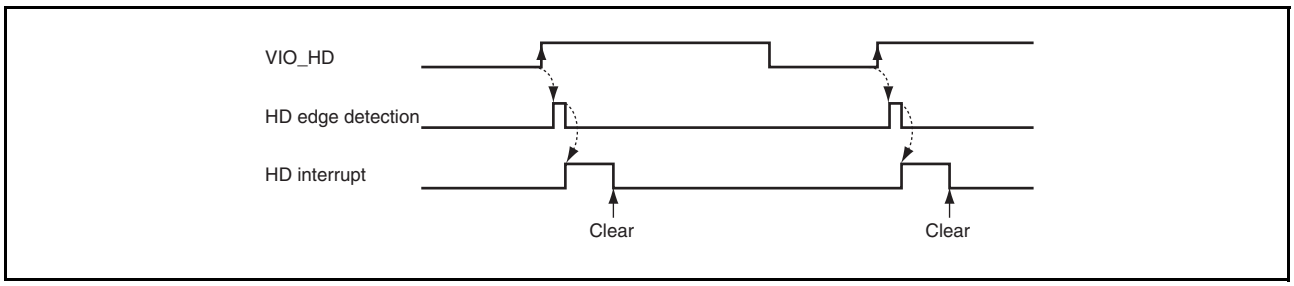

Figure 36.16 Relationship between VIO_HD and HD Interrupt when HD is High-Active

36.4.4 Capture Interface Cycle Register (CMCYR)

CMCYR is used to detect an illegal VD and an illegal HD. For HD, the number of cycles from a rising edge of HD to the next rising edge is set (falling edges when low-active is selected for HD). For VD, the number of HD inputs from a rising edge of VD to the next rising edge is set (falling edges when low-active is selected for VD).

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

Set 0 in all bits of this register, during data enable fetch mode.

Note: After changing the setting of this register, do not start capture until at least 10 external input clock cycles have elapsed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	VCYL[13:0]													
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	HCYL[13:0]													
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 16	VCYL[13:0]	H'0000	R/W	Vertical HD Count of External Module These bits set the number of VD cycles of an external module with the number of HD inputs. The interrupt source bit IGVS in CETCR is set to 1 when the actual number of VD cycles input from the external module differs from this setting. Set these bits for detecting an illegal VD. When these bits are all cleared to 0, the interrupt source bit IGVS in CETCR is not set to 1. Though the interrupt source bit IGVS in CETCR may be set to 1 after the VDPOL bit (VD polarity) in CAMCR is changed, this interrupt should be ignored.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 0	HCYL[13:0]	H'0000	R/W	Horizontal Cycle Count of External Module These bits set the number of HD cycles of an external module. The interrupt source bit IGHS in CETCR is set to 1 when the actual number of HD cycles input from the external module differs from this setting. Set these bits for detecting an illegal HD. When these bits are all cleared to 0, the interrupt source bit IGHS in CETCR is not set to 1. Though the interrupt source bit IGHS in CETCR may be set to 1 after the HDPOL bit (HD polarity) in CAMCR is changed, this interrupt should be ignored.

36.4.5 Capture Interface Offset Register (CAMOR)

CAMOR sets the location to start capturing when capturing images.

Since the number of HD (horizontal sync signal) inputs from a VD (vertical sync signal) input to the start of a valid image period, and the number of clock cycles from an HD input to the start of a valid image period differ among external modules, these must be set in CAMOR. By setting a value greater than the valid image area, part of the image can be clipped for capture. When fetching data, the setting of this register becomes the number of cycles (HD count) up to the start of a valid data period.

This register is not used, during data enable fetch mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	HOFST[12:0]												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 16	VOFST[11:0]	H'000	R/W	These bits specify the capture start location in terms of the HD count from a vertical sync signal (1-HD units). The blanking period from a vertical sync signal differs among external modules. Therefore, the vertical capture start location must be specified by these bits in terms of the HD count from a vertical sync signal so that an image can be captured from the valid image area (see Figure 36.17). Some external modules output a vertical sync signal as a data enable signal. In this case, there is no blanking period so these bits must be cleared to 0 (see Figure 36.18).
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 0	HOFST[12:0]	H'0000	R/W	These bits specify the capture start location in terms of the number of clock cycles from a horizontal sync signal (1-cycle units). The blanking period from a horizontal sync signal differs among external modules. Therefore, the horizontal capture start location must be specified by these bits in terms of external input clock cycles from a horizontal sync signal so that an image can be captured from the valid image area. This is similar in data synchronous fetch mode (see Figure 36.19). Some external modules output a horizontal sync signal as a data enable signal. In this case, there is no blanking period so these bits must be cleared to 0 (see Figure 36.20). Note: The first HD (horizontal sync signal) being input simultaneously or after the first VD (vertical sync signal) is the operating condition of the CEU. These inputs are affected by the polarities (set by the VDPOL and HDPOL bits in CAMCR).

36.4.6 Capture Interface Width Register (CAPWR)

CAPWR sets the fetch (capture) cycle width when capturing images.

The cycle width unit differs according to the interface and the data type to be captured. For each setting unit, see Table 36.6.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	HWDTH[12:0]												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 18 17, 16	VWDTH[11:2] VWDTH[1:0]	H'000	R/W R	These bits specify the vertical capture period (4-HD units). These bits specify the number of lines (HD count) to be captured from the location specified by the VOFST bits in CAMOR. Figure 36.21 shows the timing when the vertical blanking period is 0. The CEU captures only the number of lines (HD count) specified by these bits in the vertical direction. Make a setting in the same way to obtain data synchronization. The maximum value to be set is 1,920 HD (5 megapixels).
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 1 0	HWDTH[12:1] HWDTH[0]	H'0000	R/W R	These bits specify the horizontal capture period. These bits specify the number of cycles to be captured from the location specified by the HOFST bits. Figure 36.22 shows the timing when the horizontal blanking period is 0. The CEU captures for only the number of cycles specified by these bits in the horizontal direction. Make a similar setting for data synchronous fetch. The maximum value to be set is as follows: Image capture (8-cycle units) : 5,120 cycles (2,560 pixels) Data synchronous fetch (4-cycle units) : 2,560 cycles (2,560 bytes) Note: In data synchronous fetch mode, set CFSZR and CDWDR according to the values set in this register. For details, see the descriptions on CFSZR and CDWDR.

Table 36.6 Unit for Setting Fetch (Capture) Cycle Width

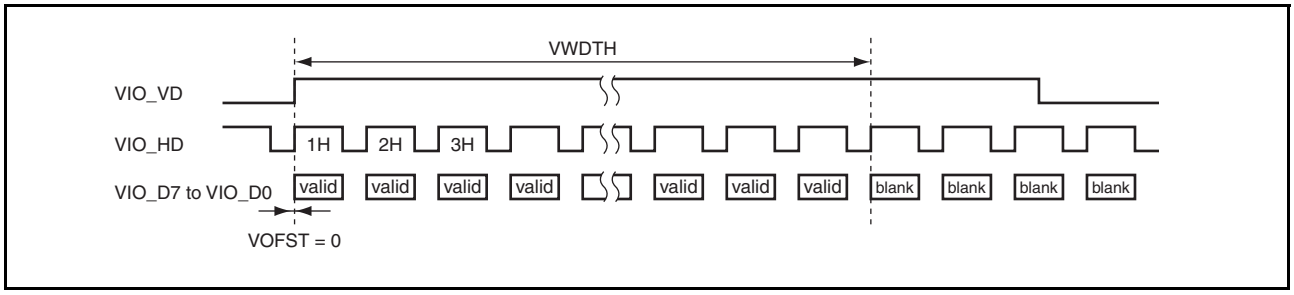

Figure 36.21 Vertical Capture Timing

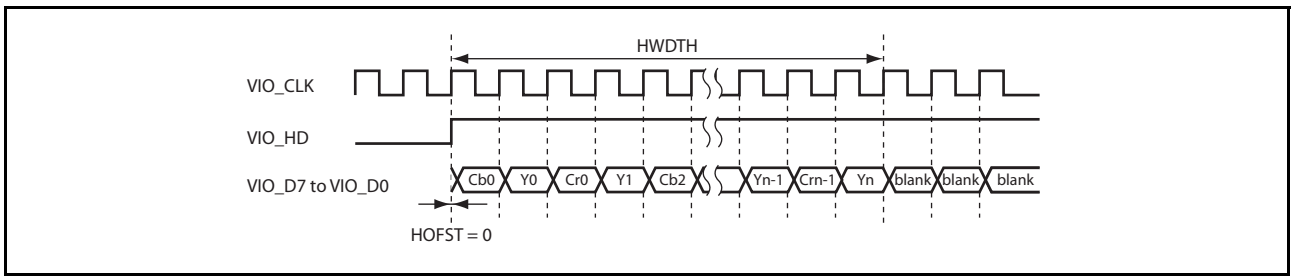

Figure 36.22 Horizontal Capture Timing (Image Capture with 8-bit Interface)

36.4.7 Capture Interface Input Format Register (CAIFR)

CAIFR sets the input mode (progressive or interlace) for capturing images, the images to be captured (frame, both-field, or one-field), and the image from which capturing starts (top field, bottom field, etc.). CAIFR is not used in data fetch mode.

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

The items set by CAIFR are listed in Table 36.7.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	IFS	—	—	—	CIM	—	—	FCI[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	IFS	0	R/W	Sets the input mode for capturing images. 0: Progressive 1: Interlace
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	CIM	0	R/W	Sets the images to be captured. Clear this bit to 0 when the input mode for image capture is progressive (frame image) or when the input mode for image capture is interlace for continuous capture of both the top and bottom fields. Set this bit to 1 when the input mode for image capture is interlace for capture of only a one-field image. 0: Capture of frame image (1 VD) or both-field image (2 VD) 1: Capture of one-field image (1 VD)
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	FCI[1:0]	00	R/W	These bits set the timing to start capturing. The timing to start capturing is set by specifying the image to be captured first. Set these bits to 00 when the input mode is progressive. 00: Capture starts from the VD input immediately after the CEU activation regardless of it being a top or bottom field 01: After the CEU activation, input of a top-field image is waited, and then capture starts from the top field 10: After the CEU activation, input of a bottom-field image is waited, and then capture starts from the bottom field 11: Setting prohibited

Table 36.7 CAIFR Setting Items

Input Mode	IFS Bit	Captured Image	CIM Bit	Image to Start Capture	FCI Bits
Progressive	0	Frame	0	Frame immediately after activation	00
Interlace	1	Both-field (2-VD capture)	0	Field immediately after activation	00
				Top field	01
				Bottom field	10
				Setting prohibited	11
		One-field (1-VD capture)	1	Field immediately after activation	00
				Top field	01
				Bottom field	10
				Setting prohibited	11

In frame image capture and one-field image capture, a one-frame capture end interrupt occurs when capture for 1 VD finishes. In both-field image capture, a one-field capture end interrupt occurs when capture for 1 VD finishes and a one-frame capture end interrupt occurs when capture for 2 VD finishes. At this time, a one-field capture end interrupt occurs simultaneously with a one-frame capture end interrupt. Figure 36.24 shows the timing of a one-frame capture end interrupt and one-field capture end interrupt in both-field image capture.

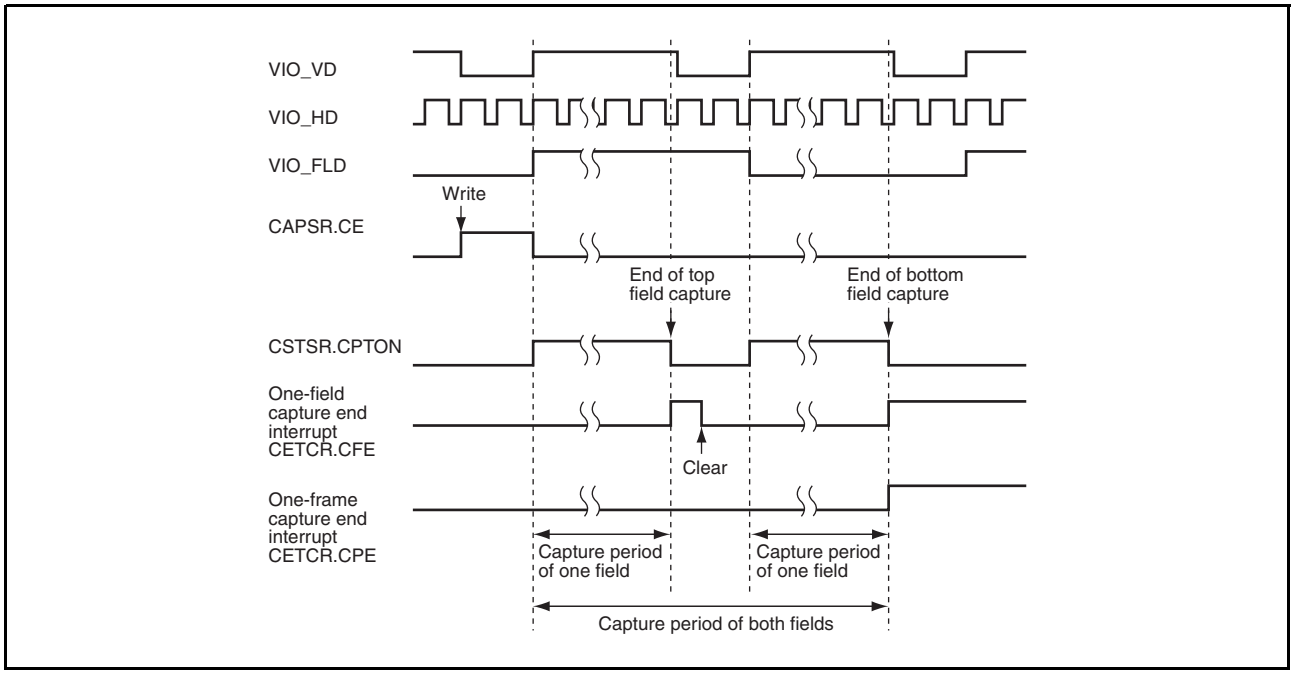

Figure 36.23 One-Frame Capture End Interrupt and One-Field Capture End Interrupt in Both-Field Image Capture

A captured frame image or captured one-field image is stored in the memory from the addresses set in CDAYR and CDACR (Figure 36.24). Captured both-field images are stored in different memory areas depending on whether it is a top-field or bottom-field image. A top-field image is stored in the memory from the addresses set in CDAYR and CDACR whereas a bottom-field image is stored in the memory from the addresses set in CDBYR and CDBCR (Figure 36.25).

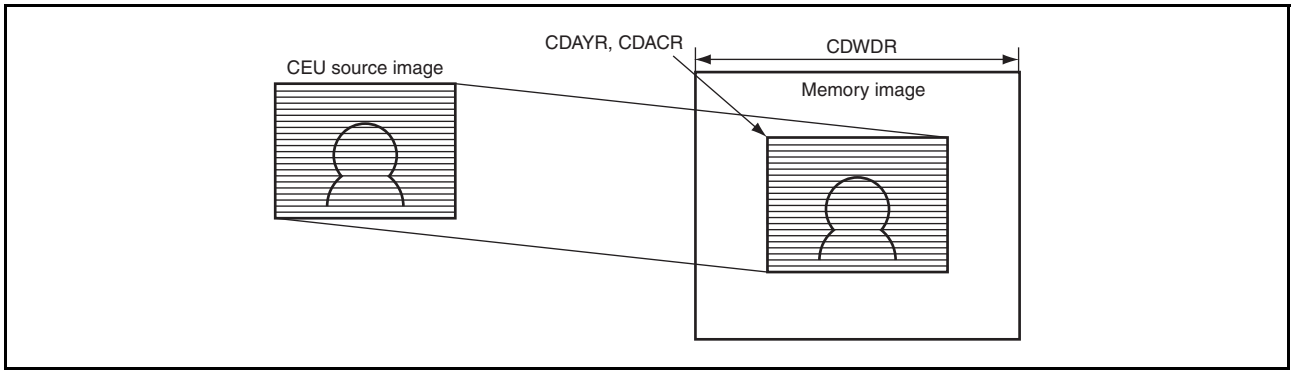

Figure 36.24 Image of Storing Captured Frame Image or Captured One-Field Image in Memory

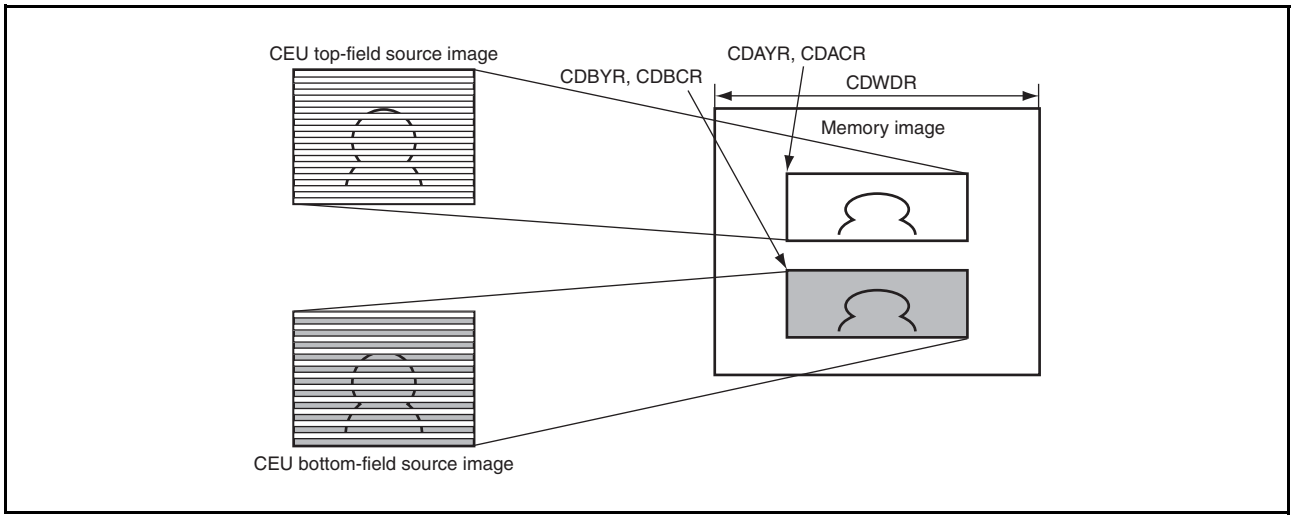

Figure 36.25 Image of Storing Captured Both-Field Images in Memory

If the FCI bits are set to B'00 for continuous capture in interlace input mode, images are continuously captured for 2 VD with the first captured field as the reference in both-field image capture (Figure 36.26). In one-field image capture, only the first captured field is continuously captured for 1 VD (Figure 36.27).

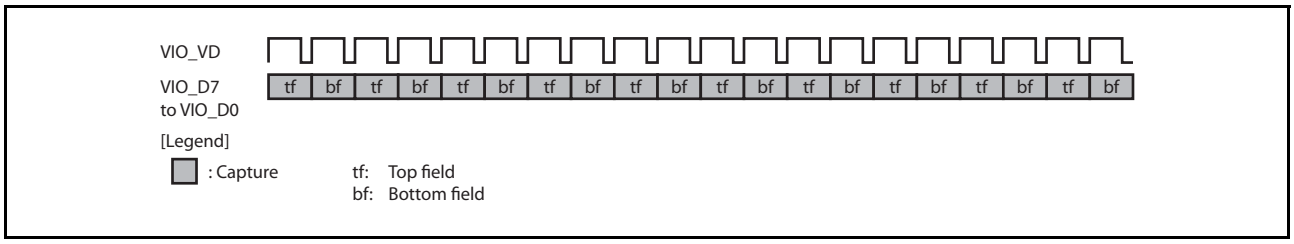

Figure 36.26 Continuous Both-Field Capture in Interlace Mode (Image Immediately after Activation is Top Field (FCI Bits = B'00))

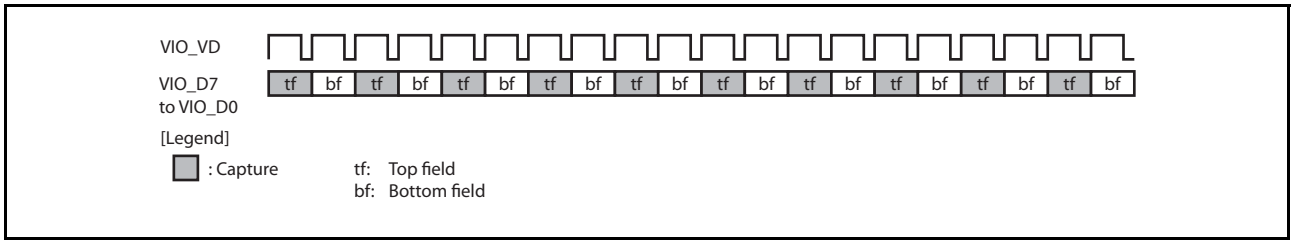

Figure 36.27 Continuous One-Field Capture in Interlace Mode (Image Immediately after Activation is Top Field (FCI Bits = B'00))

(1) Storage of Interlace Input as Frame Image

The CEU can store an interlace source image in the memory as a frame image. To store an interlace source image as a frame image, make the following register settings:

Input mode: Interlace (IFS bit = B'1)
Capture image: Both-field (CIM bit = B'0)
Image to start capture: Any setting other than the prohibited setting (FCI bits = as desired)

Figure 36.28 shows a memory image of capturing both fields of an interlace input and storing it as a frame image in the memory. Set the start addresses of the memory destination for the captured top-field image in CDAYR and CDACR, and the start addresses of the memory destination for the captured bottom-field image in CDBYR and CDBCR. When storing an interlace image as a frame image in the memory, set the horizontal image size of the memory area in CDWDR with the top-field image and bottom-field image placed next to each other as shown in Figure 36.28. In addition, set the number of captured lines of the field image in the VWDTH bits in CAPWR.

A memory image of folding the horizontal image size of the memory area in Figure 36.28 at CDWDR/2 is shown in Figure 36.29. Setting the registers to form the image in Figure 36.28 enables an interlace image to be stored as a frame image in the memory as shown in Figure 36.29.

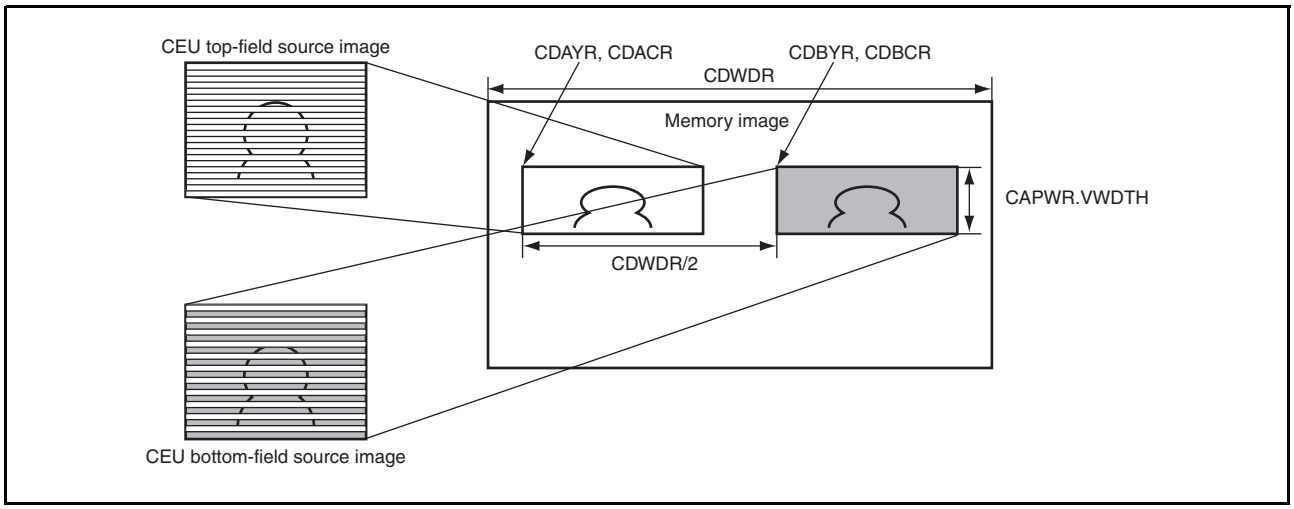

Figure 36.28 Image of Storing Captured Both-Fields of Interlace Input in Memory

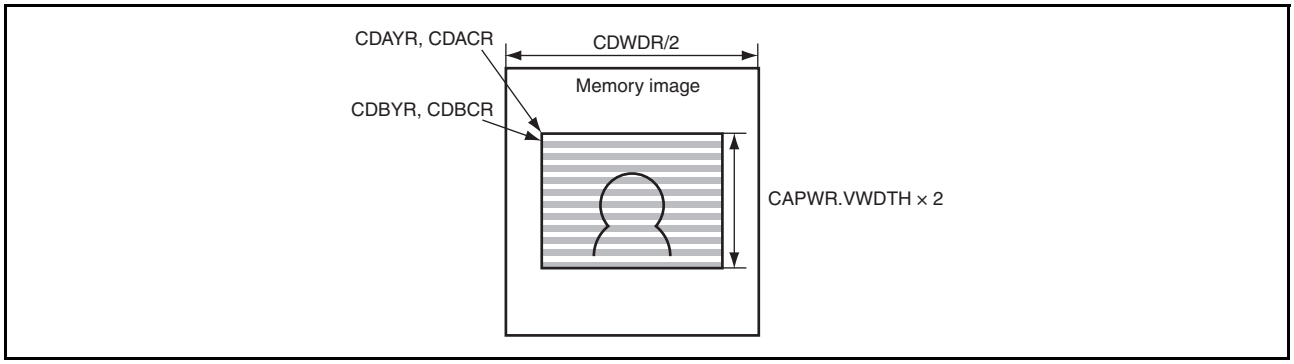

Figure 36.29 Image of Storing Interlace Input as Frame Image in Memory

36.4.8 CEU Register Control Register (CRCNTR)

CRCNTR controls switching of the planes of registers with a 2-plane configuration.

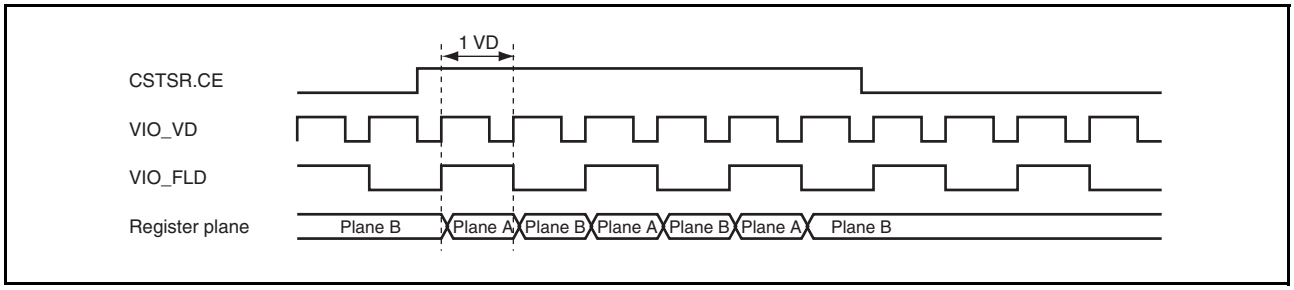

Figure 36.31 Timing for Register Plane Switching when RVS Bit is B'1

36.4.9 CEU Register Forcible Control Register (CRCMPR)

CRCMPR forcibly controls switching of the planes of registers with a 2-plane configuration. Setting this register enables direct control of register plane switching.

Do not modify this register during operation. If this register is modified during operation, correct operation cannot be guaranteed. In addition, the IGRW bit (interrupt source) in CETCR is set to B'1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RA	0	R/W	Indicates the register plane currently specified. This register value automatically changes in synchronization with VD for starting capture. To start capture with plane A of the register when a setting to switch the register plane in synchronization with VD has been made (RC bit in CRCNTR is 1), specify plane B of the register using this bit. 0: Specifies plane A of the register 1: Specifies plane B of the register

36.4.10 Capture Filter Control Register (CFLCR)

CFLCR sets the scale-down factor for the filter to scale images down.

The CEU has an image scale-down filter which can be used to scale down the captured images before storing them in the memory. Set CFLCR to 0 when not performing scale-down (same size output). If a value other than 0 is set in CFLCR, scale-down is performed. In data fetch mode, set CFLCR to 0.

When handling an interlace source image as a frame image, set CFLCR to 0 not to use the filter.

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	VMANT[3:0]	H'0	R/W	Mantissa Part of Vertical Scale-Down Factor The specifiable range is H'0 to H'F. When H'0 is set for the VMANT bits and H'000 is set for the VFRAC bits, the scale-down filter is not used.
27 to 19 18 to 16	VFRAC[11:3] VFRAC[2:0]	H'000	R/W R	Fraction Part of Vertical Scale-Down Factor The specifiable range is H'000 to H'FF8. The fraction of the scale-down factor that cannot be set with only the VMANT bits must be set with these bits.
15 to 12	HMANT[3:0]	H'0	R/W	Mantissa Part of Horizontal Scale-Down Factor The specifiable range is H'0 to H'F. When H'0 is set for the HMANT bits and H'000 is set for the HFRAC bits, the scale-down filter is not used.
11 to 3 2 to 0	HFRAC[11:3] HFRAC[2:0]	H'000	R/W R	Fraction Part of Horizontal Scale-Down Factor The specifiable range is H'000 to H'FF8. The fraction of the scale-down factor that cannot be set with only the HMANT bits must be specified with these bits.

An image scale-down filter is installed in the CEU, and the captured images can be scaled down and stored in the memory.

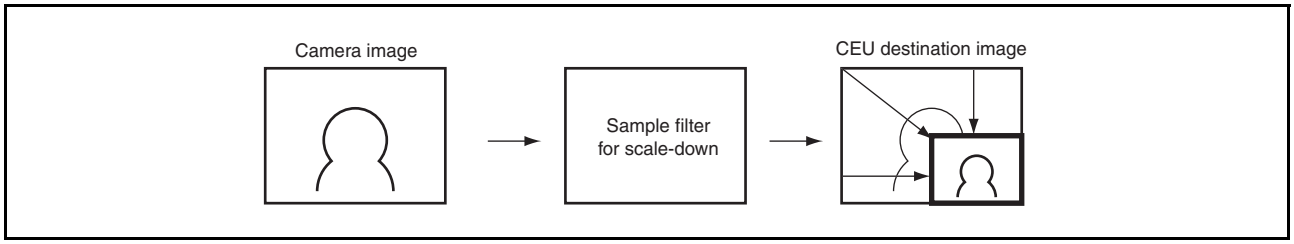

Figure 36.32 Scale-Down of Captured Image

The formulas for obtaining the MANT (VMANT or HMANT) and FRAC (VFRAC or HFRAC) values from the input pixel count and output pixel count of the filter are shown below. Set the MANT and FRAC bits in order to obtain the desired output pixel count from the number of pixels input to the CEU.

First, calculate preliminary MANT and FRAC values. The parameters needed for calculation are defined as follows:

$$\alpha = MANT \times 4096 + FRAC \quad \text{. . . Formula 1}$$

$$SCL\ (\text{scaling factor}) = \frac{4096}{\alpha} \quad \text{. . . Formula 2}$$

Assuming an operator $\lfloor x \rfloor$ which discards fractions of an integer x, the MANT and FRAC values can be temporarily set as follows, according to formula 1 and formula 2.

$$MANT = \left\lfloor \frac{1}{SCL} \right\rfloor, \quad FRAC = \left\lfloor 512 \times \left(\frac{1}{SCL} - MANT \right) \right\rfloor \times 8$$

Here, the scaled-down filter output size ($SIZE_D$) can be calculated using the input image size S_{in} (half of the CAPWR setting) in the following formula.

$$SIZE_D = \left\lfloor 1 + \left(\left\lfloor \frac{1}{2} + \frac{S_{in} - 1}{MANT_{pre}} \right\rfloor - 1 \right) \times \frac{MANT_{pre} \times 4096}{\alpha} \right\rfloor \quad \text{. . . Formula 3}$$

$$\begin{bmatrix} MANT_{pre} = 1 \longrightarrow (0 \le MANT < 2) \\ MANT_{pre} = 2 \longrightarrow (2 \le MANT < 4) \\ MANT_{pre} = 4 \longrightarrow (4 \le MANT < 8) \\ MANT_{pre} = 8 \longrightarrow (8 \le MANT\ ) \end{bmatrix}$$

The number of output pixels can be obtained by substituting the temporarily calculated MANT, FRAC, and input image size into these formulas. If the calculated number of output pixels is smaller than the number of output pixels used to obtain the preliminary MANT and FRAC values, recalculate with a smaller FRAC (α) value, and set the MANT and FRAC values in this register so that a pixel value greater than the desired number of output pixels can be obtained.

Example: Scale down 640 pixels to 480 pixels

SCL = 480/640 = 3/4, and the preliminary settings of MANT = 1, $MANT_{pre}$ = 1, and FRAC = H'550 are made. Substituting these in the following formula results in an output pixel count of 479.

$$SIZE_D = \left\lfloor 1 + \left(\left\lfloor \frac{1}{2} + \frac{S_{in} - 1}{MANT_{pre}} \right\rfloor - 1 \right) \times \frac{MANT_{pre} \times 4096}{\alpha} \right\rfloor \quad \text{. . . Formula 3}$$

Since this output pixel count is smaller than the desired output pixel count of 480, the formula is recalculated with a FRAC value of H'548, a value eight less than the previous time. The obtained result of output pixel count = 480 is equal to the desired output pixel count of 480, so this register is set as MANT = 1 and FRAC = H'548.

Table 36.8 Setting Examples for Each Scale-Down Filter Factor

Scale-Down Factor	FRAC		MANT	Input Pixel Count	Output Pixel Count	Clipping Size (CFSZR)
	Decimal	Hexadecimal				
7/8	576	H'240	1	640	560	560
3/4	1352	H'548	1	640	480	480
5/8	2448	H'990	1	640	400	400
1/2	0	H'0	2	640	320	320
3/8	2728	H'AA8	2	640	240	240
1/3	0.0	H'0	3	640	213	212
1/4	0.0	H'0	4	640	160	160
1/5	0.0	H'0	5	640	128	128
1/6	0.0	H'0	6	640	107	104
1/7	0.0	H'0	7	640	91	88
1/8	0.0	H'0	8	640	80	80
1/16	4088	H'FF8	15	640	40	40

Note: This scale-down filter uses a VGA-size line memory for scale-down. Therefore, when an image larger than the VGA size is input for scale-down, settings must be made so that the output image size is equal to or larger than the SubQCIF size and equal to or smaller than the VGA size. When an image is not scaled down (same size output), this restriction does not apply.

36.4.11 Capture Filter Size Clip Register (CFSZR)

CFSZR sets the clipping size for fine adjustment of the image size output from the filter, and must be set in combination with CFLCR. When clipping the output size of the filter, set the clipping size as a number of pixels, and the setting unit should be four pixels. CFSZR must be set even when scale-down is not performed (same size output).

In data synchronous fetch mode, set CFSZR according to the setting of CAPWR.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	HFCLP[11:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 18 17, 16	VFCLP[11:2] VFCLP[1:0]	H'000	R/W R	These bits set the vertical clipping value of the filter output size (4-pixel units).
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 2 1, 0	HFCLP[11:2] HFCLP[1:0]	H'000	R/W R	These bits specify the horizontal clipping value of the filter output size (4-pixel units).

The scale-down filter in the CEU may output an odd number of pixels or lines depending on the settings. To adjust the output size of the filter, the CEU clips the destination image by using the number of pixels specified in CFSZR, as shown in Figure 36.33. The clipping size must be specified vertically and horizontally in 4-pixel units.

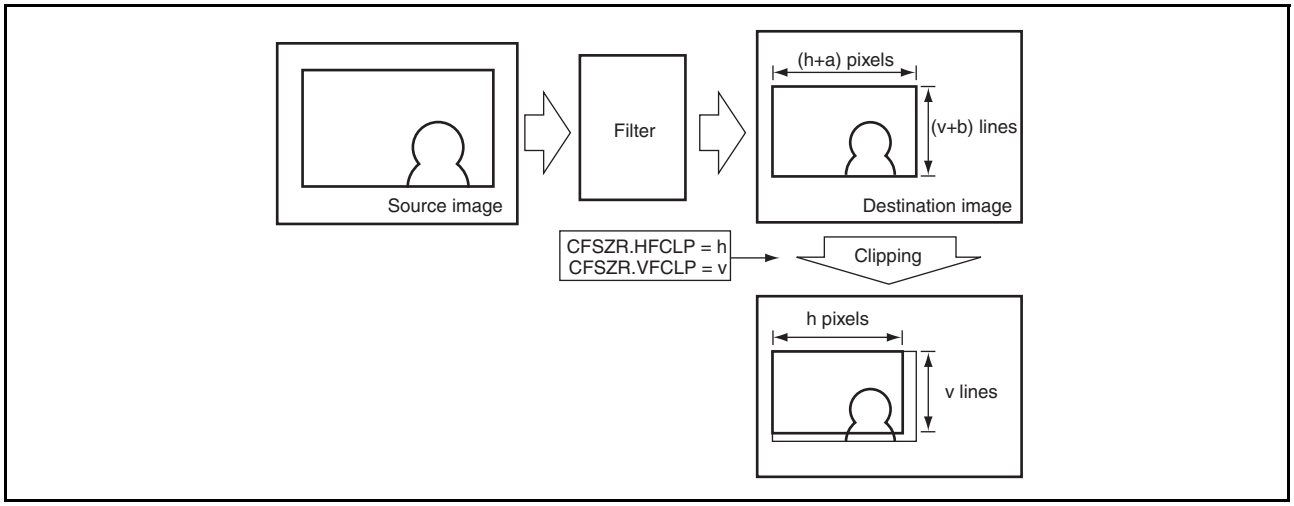

Figure 36.33 Clipping of Image Output from Filter

The pixels to be clipped are counted from the top-left corner of a display. The pixels located to the right of the specified number of pixels or below the specified number of lines are discarded by the clipping function. If the number of pixels specified in CFSZR is larger than that output from the filter, correct operation cannot be guaranteed. To avoid this, the clipping size specified in CFSZR must be equal to or smaller than the number of pixels output from the filter.

Note: In data synchronous fetch mode, the following settings are required. Data cannot be fetched correctly unless the following settings are made.
VFCLP = CAPWR.VWDTH
HFCLP = CAPWR.HWDTH/2

36.4.12 Capture Destination Width Register (CDWDR)

CDWDR sets the horizontal image size in the memory area where the captured image is to be output in 4-byte units (4-pixel units).

In data synchronous fetch mode, set CDWDR according to the setting of CAPWR.

This register is not used, during data enable fetch mode.

R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 2 1, 0	CHDW[12:2] CHDW[1:0]	H'0000	R/W R	These bits specify the horizontal image size in the memory area where the captured image is to be stored (4-byte units). The image data captured by the CEU is stored in the memory. If the right end of the captured image does not match the horizontal image size in the memory area as shown in Figure 36.34, some addresses must be skipped at the right end of the image when storing the captured image. Therefore, the horizontal image size in the memory area where the captured image is to be stored must be set in these bits. The maximum value to be set is 8188 bytes (8188 pixels). In data synchronous fetch mode, set as follows: CHDW = CAPWR.HWDTH

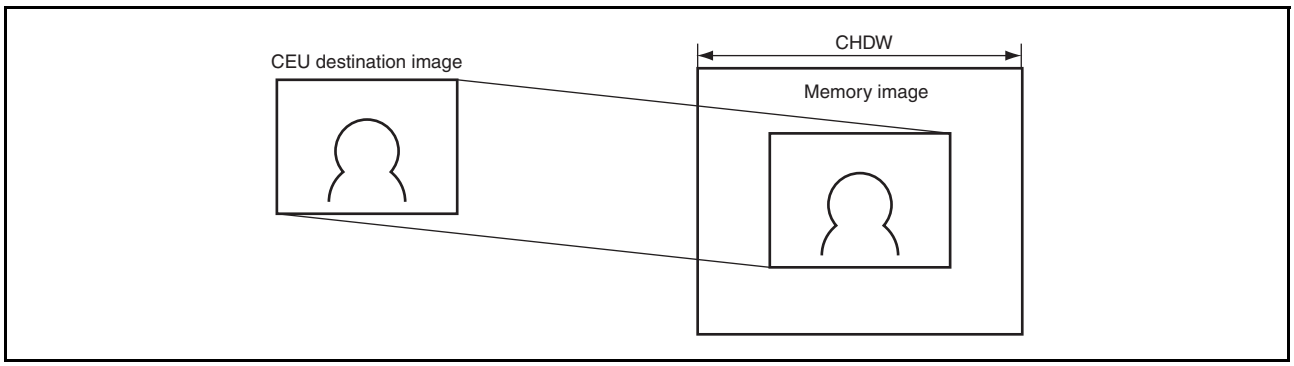

Figure 36.34 Captured Image and Memory Area Image

36.4.13 Capture Data Address Y Register (CDAYR)

CDAYR specifies the address where the luminance (Y) component of the captured data is to be stored in frame image capture or one-field image capture, the address where the luminance (Y) component of the captured top field is to be stored in both-field image capture, and the address where the fetched data is to be stored in data fetch. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the Y (luminance) component of the captured data is to be stored by CDAYR. In both-field image capture, set the start address of the memory area where the Y (luminance) component of the captured top-field image is to be stored by CDAYR. In data fetch, set the start address of the memory area where data is to be stored by CDAYR.

Because the address must be specified in 32 bits, the address set by CDAYR must be in longword units. As the setting is in 4-pixel units for image capture and 4-byte units for data fetch, the lower two bits are always fixed to 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CAYR[31:2]	H'0000 0000	R/W	• Frame image capture: These bits set the address for storing the Y (luminance) component data of the captured data (4-pixel units). • One-field image capture: These bits set the address for storing the Y (luminance) component data of the captured data (4-pixel units). • Both-field image capture: These bits set the address for storing the Y (luminance) component data of the captured top-field data (4-pixel units). • Data fetch: These bits set the address for storing data (4-byte units). • Data enable fetch bundle write: These bits set the address for storing data (32-byte units).
1, 0	CAYR[1:0]		R	

Set the address of the starting point of the memory area where the fetched data is to be stored in this register, as shown in Figure 36.35.

- Frame image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the Y component of the captured top-field image is to be stored.
- Data fetch: Set the address of the starting point of the memory area where the fetched data is to be stored. In data fetch mode, the data is simply stuffed in order from the start address so the end address becomes as follows:

End address = CDAYR + number of fetched bytes

- Data enable fetch bundle write: Set the address in 32-byte units.

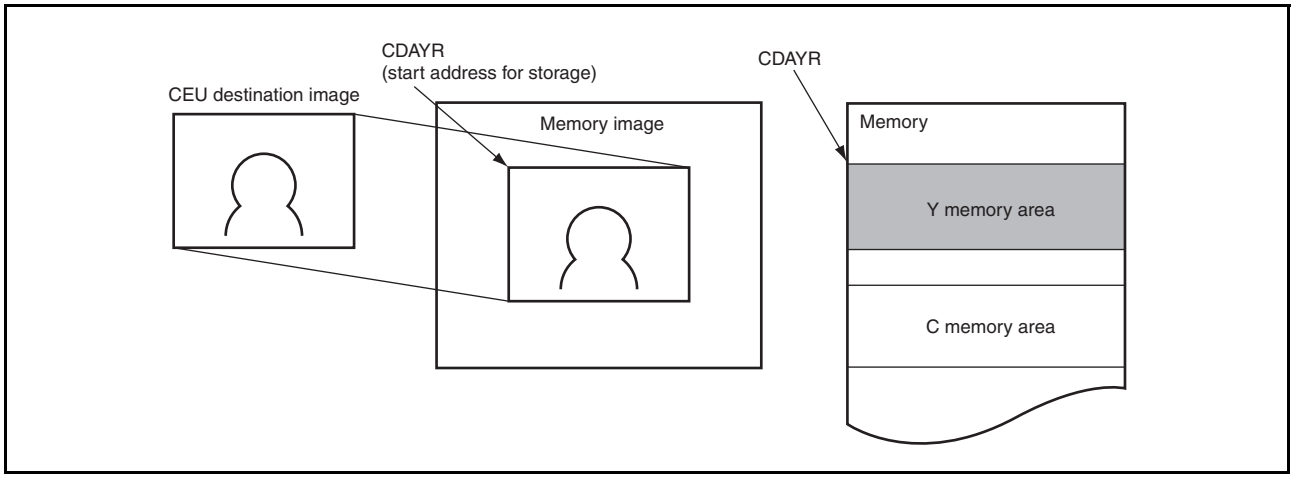

Figure 36.35 Relationship between Captured Image and Y Component Memory Area

36.4.14 Capture Data Address C Register (CDACR)

CDACR specifies the address where the chrominance (C) component of the captured data is to be stored in frame image capture or one-field image capture, and the address where the chrominance (C) component of the captured top field is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the C (chrominance) component of the captured data is to be stored by CDACR. In both-field image capture, set the start address of the memory area where the C (chrominance) component of the captured top-field image is to be stored by CDACR. CDACR is not used in data fetch.

Because the address must be specified in 32 bits, the address set by CDACR must be in longword units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CACR[31:2]	H'0000 0000	R/W	• Frame image capture: These bits set the address for storing the C (chrominance) component data of the captured data (4-pixel units). • One-field image capture: These bits set the address for storing the C (chrominance) component data of the captured data (4-pixel units). • Both-field image capture: These bits set the address for storing the C (chrominance) component data of the captured top-field data (4-pixel units).
1, 0	CACR[1:0]		R	

Set the address of the starting point of the memory area where the C component of the captured image is to be stored in this register, as shown in Figure 36.36. The C component has an output data format like that in Figure 36.37, and is saved in the memory in this format.

- Frame image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the C component of the captured top-field image is to be stored.

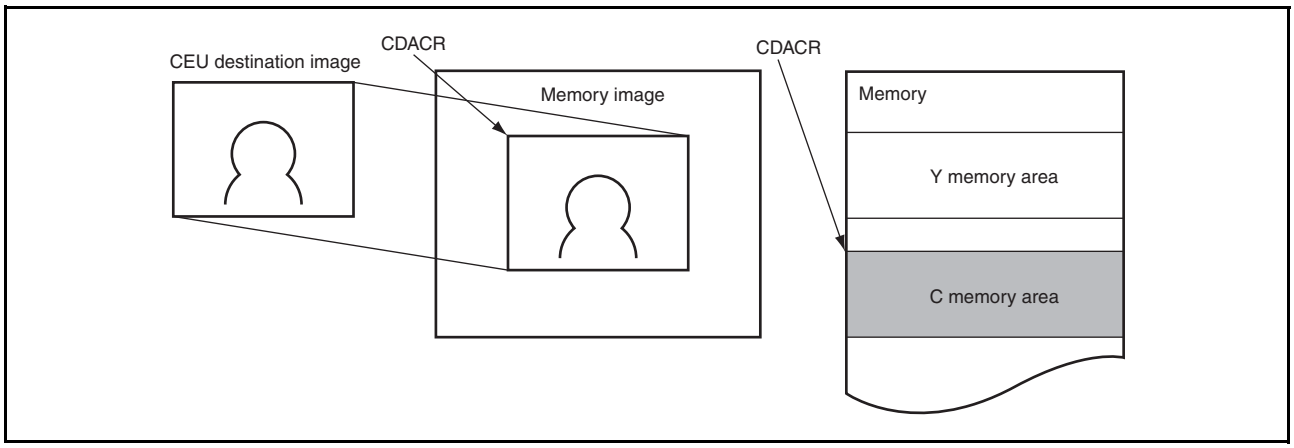

Figure 36.36 Relationship between Captured Image and C Component Memory Area

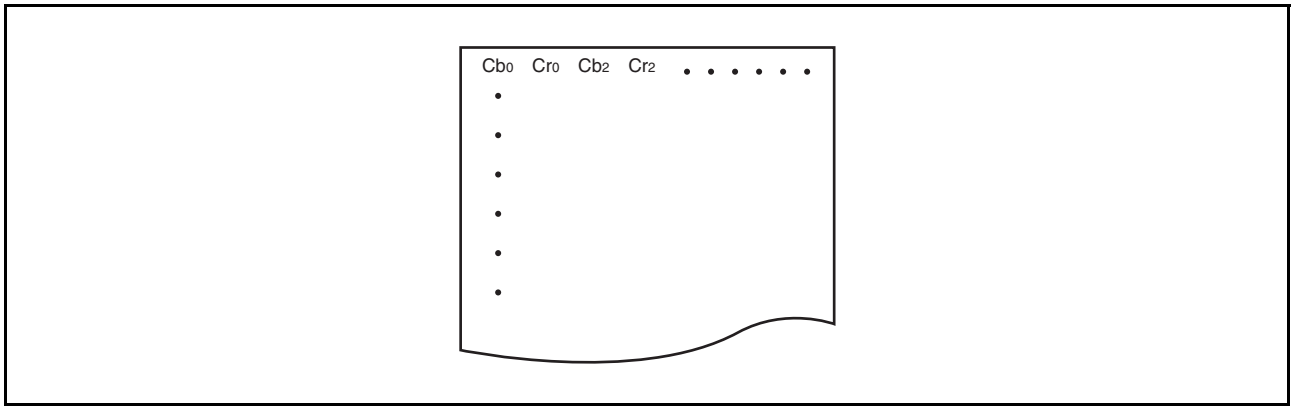

Figure 36.37 Image of Storing C Components in Memory

36.4.15 Capture Data Bottom-Field Address Y Register (CDBYR)

CDBYR specifies the address where the luminance (Y) component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the Y (luminance) component of the captured bottom-field image is to be stored by CDBYR. CDBYR is not used in frame image capture, one-field image capture, or data fetch.

Because the address must be specified in 32 bits, the address set by CDBYR must be in longword units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Set the address of the starting point of the memory area where the Y component of the captured bottom-field image is to be stored in this register, as shown in Figure 36.38.

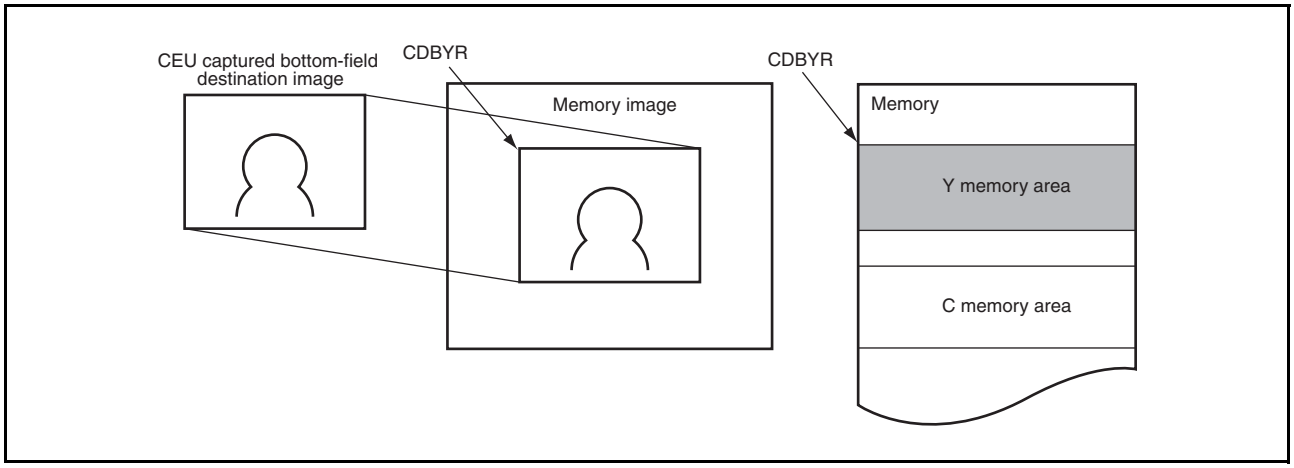

Figure 36.38 Relationship between Captured Bottom-Field Image and Y Component Memory Area

36.4.16 Capture Data Bottom-Field Address C Register (CDBCR)

CDBCR specifies the address where the chrominance (C) component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the C (chrominance) component of the captured bottom-field image is to be stored by CDBCR. CDBCR is not used in frame image capture, one-field image capture, or data fetch.

Because the address must be specified in 32 bits, the address set by CDBCR must be in longword units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

31 to 2	CBCR[31:2]	H'0000 0000	R/W	These bits set the address for storing the C (chrominance) component data of the captured bottom-field data (4-pixel units).
1, 0	CBCR[1:0]		R	

Set the address of the starting point of the memory area where the C component of the captured bottom-field image is to be stored in this register, as shown in Figure 36.39. The C component has an output data format like that in Figure 36.40, and is saved in the memory in this format.

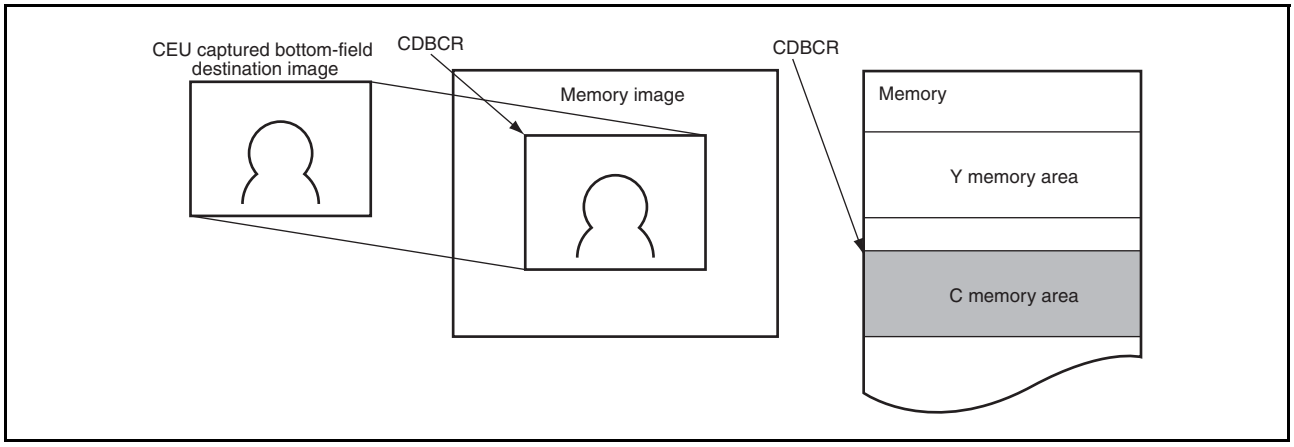

Figure 36.39 Relationship between Captured Bottom-Field Image and C Component Memory Area

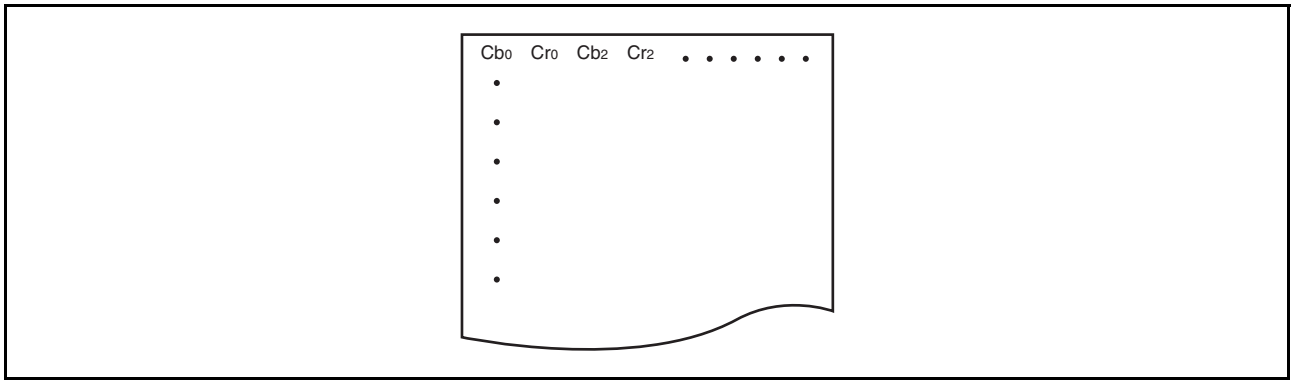

Figure 36.40 Image of Storing C Components in Memory

36.4.17 Capture Bundle Destination Size Register (CBDSR)

CBDSR sets the size of output to memory in a bundle write. The number of output lines should be specified for image capture or data synchronous fetch. The number of bytes should be specified for data enable fetch.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	CBVS[22:16]

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22 to 0	CBVS[22:3] CBVS[2:0]	H'000	R/W R	These bits select the number of lines or number of bytes for output to the memory in a bundle write. Image capture and data synchronous fetch: Number of lines for output to the memory in a bundle write. Unit: 8 lines, min.: 8 lines, max.: 1,920 lines (H'780) Data enable fetch: Number of bytes for output to the memory in a bundle write. Unit: 32 bytes, min.: 512 bytes, max.: 6291456 lines (H'600000)

(a) Image capture and data synchronous fetch

Set the number of lines of captured data to be written to the memory by a bundle write as a multiple of eight. This register is valid only when the CBE bit in CDOCR is 1. When the CBE bit in CDOCR is 1 and this register cleared to H'0, this module operates with the number of lines of captured data to be written to the memory as eight. The maximum number of lines that can be set is 1,920 (H'780). Only bits CBVS[11:3] are valid.

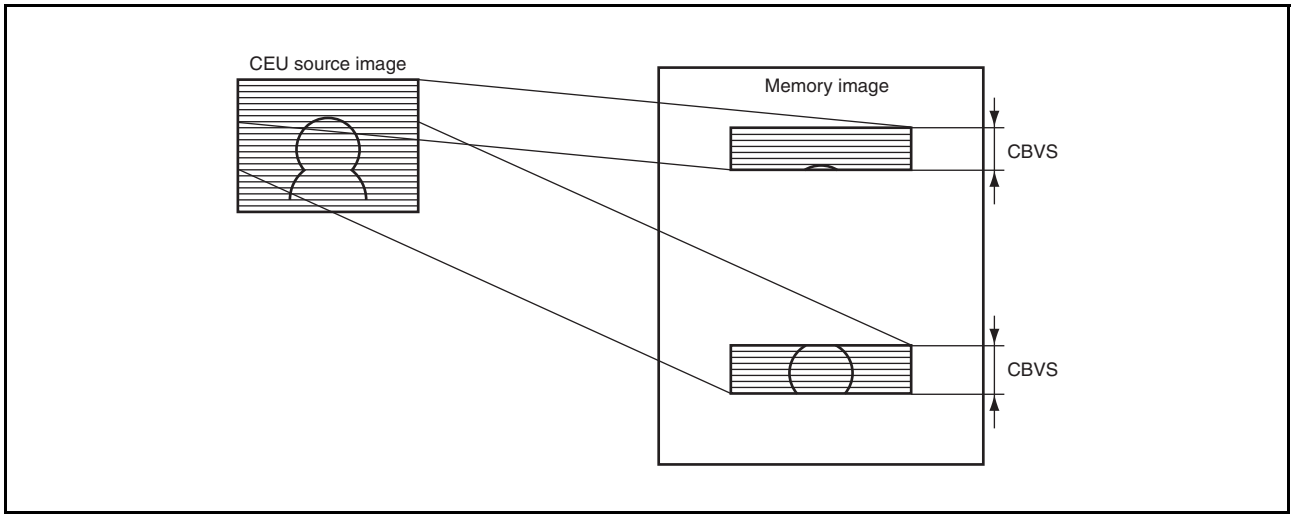

Figure 36.41 Image of Storing Captured Image in Memory by Bundle Write

(b) Data enable fetch

Set the number of bytes of captured data to be written to the memory by a bundle write as a multiple of 32. This register is valid only when the CBE bit in CDOCR is 1. The minimum settable size is 512 bytes. When a number smaller than 512 bytes is specified, operation is not guaranteed.

36.4.18 Capture Low-Pass Filter Control Register (CLFCR)

CLFCR specifies whether or not to operate the low-pass filter. In data fetch mode, clear the LPF bit to B'0.

The characteristic of the low-pass filter installed in the CEU causes the phase location of the image processed by the low-pass filter to be shifted right by one pixel compared to the raw image.

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	LPF	0	R/W	Enables or disables operation of the low-pass filter. The low-pass filter removes high-frequency components from the destination image in the horizontal direction. Clear this bit to 0 in data fetch mode. 0: Low-pass filter not used 1: Low-pass filter used (only in the horizontal direction)

36.4.19 Firewall Operation Control Register (CFWCR)

CFWCR specifies the upper limit of the write addresses in data enable fetch. When the VD input from an external module dose not go low and end notification is not given, this register can prevent writing to memory from being out of control.

This register is enabled only in data enable fetch.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FWV[26:11]

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	FWV[26:0]	H'0000008	R/W	These bits specify the upper limit of a write address. Specify the upper 27 bits of the 32-bit address. The upper limit of an address is FWV[26:0]<<5 + H'1F.
4 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	FWE	0	R/W	With the setting of FWE = 1, when an address exceeds the value set with FWV, the address is retained and an interrupt source FWF is set. After this, the address is not incremented and data is overwritten on the upper limit address. 0: Firewall is not activated. 1: Firewall is activated.

36.4.20 Capture Data Output Control Register (CDOCR)

CDOCR sets the format for outputting captured data to the memory. In data fetch mode, set the CDS bit to B'1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
16	CBE	0	R/W	Controls the number of lines of captured data to be written to the memory. • Image capture This bit controls the number of lines of captured data to be written to the memory. When bundle write is set by this register, captured data is written in line units specified by CBDSR to the addresses specified by CDAYR and CDACR, and CDAYR2 and CDACR2 (CDBYR and CDBCR, and CDBYR2 and CDBCR2 for the bottom field in both-field capture) alternately (Figure 36.42). When captured data has been written for the number of lines set by CBDSR, a write end interrupt corresponding to each address setting register occurs. However, after write for one-frame (one-field) capture ends, a bundle write end interrupt does not occur even when bundle write has finished. • Data synchronous fetch This bit controls the number of lines of captured data to be written to the memory. When bundle write is set by this register, captured data is written in line units specified by CBDSR to the addresses specified by CDAYR and CDAYR2 alternately. When captured data has been written for the number of lines set by CBDSR, a write end interrupt corresponding to each address setting register occurs. However, after write for one-frame capture ends, a bundle write end interrupt does not occur even when bundle write has finished. • Data enable fetch This bit controls the number of bytes of captured data to be written to the memory. When bundle write is set by this register, captured data is written in byte units specified by CBDSR to the addresses specified by CDAYR and CDAYR2 alternately. When captured data has been written for the number of bytes set by CBDSR, a write end interrupt corresponding to each address setting register occurs. Also, only in data enable fetch, a bundle write end interrupt occurs when bundle write has finished after write for one-frame capture ends. Table 36.9 shows the correspondence between address setting registers and write end interrupt sources. Figure 36.43 shows the timing of write end interrupts in image capture and data synchronous fetch. Figure 36.44 shows the timing of write end interrupts in data enable fetch. 0: Normal write 1: Bundle write
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	CDS	0	R/W	Sets the image format when outputting the image data captured in the YCbCr422 format to the memory. When 0 is written to this bit, only the luminance component (Y) is output and no chrominance components (Cb and Cr) are output for the odd-numbered lines. With an interlace source image, similarly only the luminance component (Y) is output and no chrominance components (Cb and Cr) are output for the odd-numbered lines of the field. In data fetch mode, set this bit to 1. 0: Converts the YCbCr422 format to the YCbCr420 format before outputting data to the memory 1: Outputs data in the YCbCr422 format to the memory without conversion
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	COLS	0	R/W	Controls swapping in 32-bit units for data output from the CEU. 0: Data is not swapped in 32-bit units 1: Data is swapped in 32-bit units
1	COWS	0	R/W	Controls swapping in 16-bit units for data output from the CEU. 0: Data is not swapped in 16-bit units 1: Data is swapped in 16-bit units
0	COBS	0	R/W	Controls swapping in 8-bit units for data output from the CEU. 0: Data is not swapped in 8-bit units 1: Data is swapped in 8-bit units

CDBYR2, CDBCR2	CPBE4 bit in CETCR

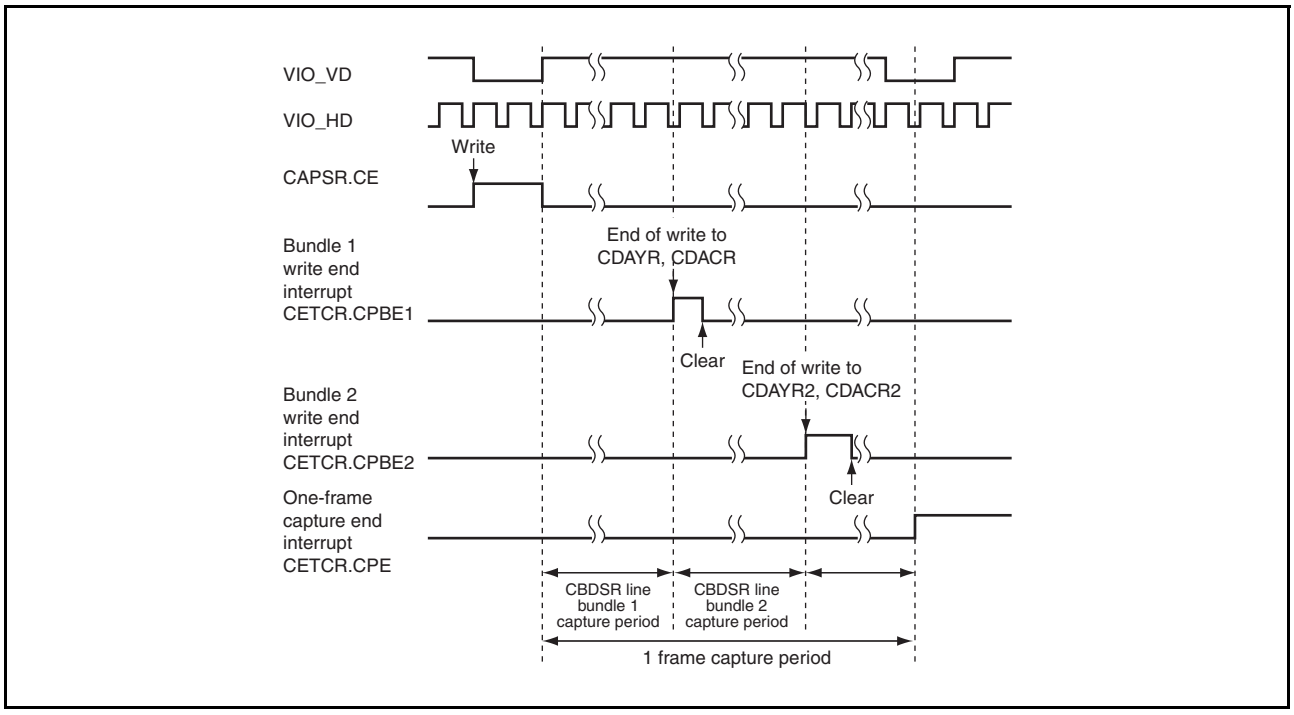

Figure 36.43 Timing of Write End Interrupts (Image Capture, Data Synchronous Fetch)

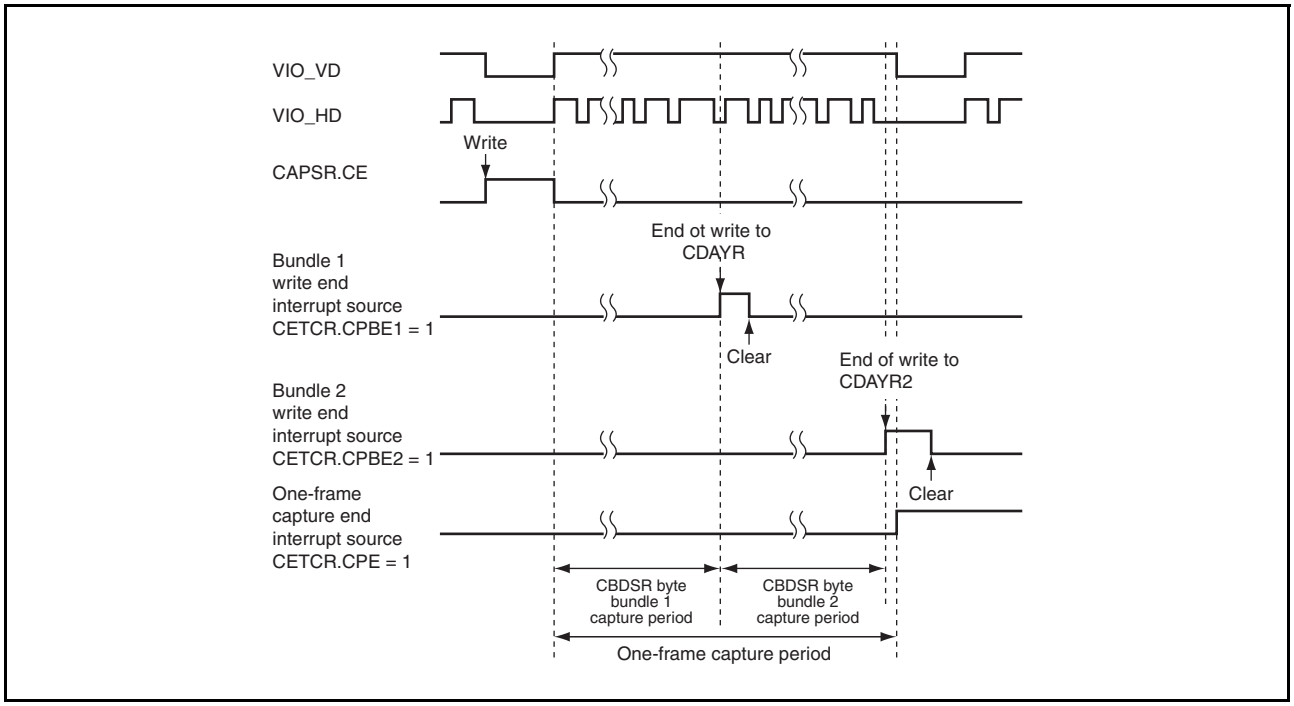

Figure 36.44 Timing of Write End Interrupts (Data Enable Fetch)

For data output from the CEU, the COLS, COWS, and COBS bits control swapping in 32-bit, 16-bit, and 8-bit units, respectively. Set these bits when data is misaligned because of a difference in endian. The data swapping bits are shown below. These bits can be set similarly in data fetch mode.

Data can be swapped in 8-bit, 16-bit, 32-bit units, or in 32 bits, 16 bits and 8 bits, as shown in Figure 36.45. To enable data swapping, set the corresponding control bit to B'1.

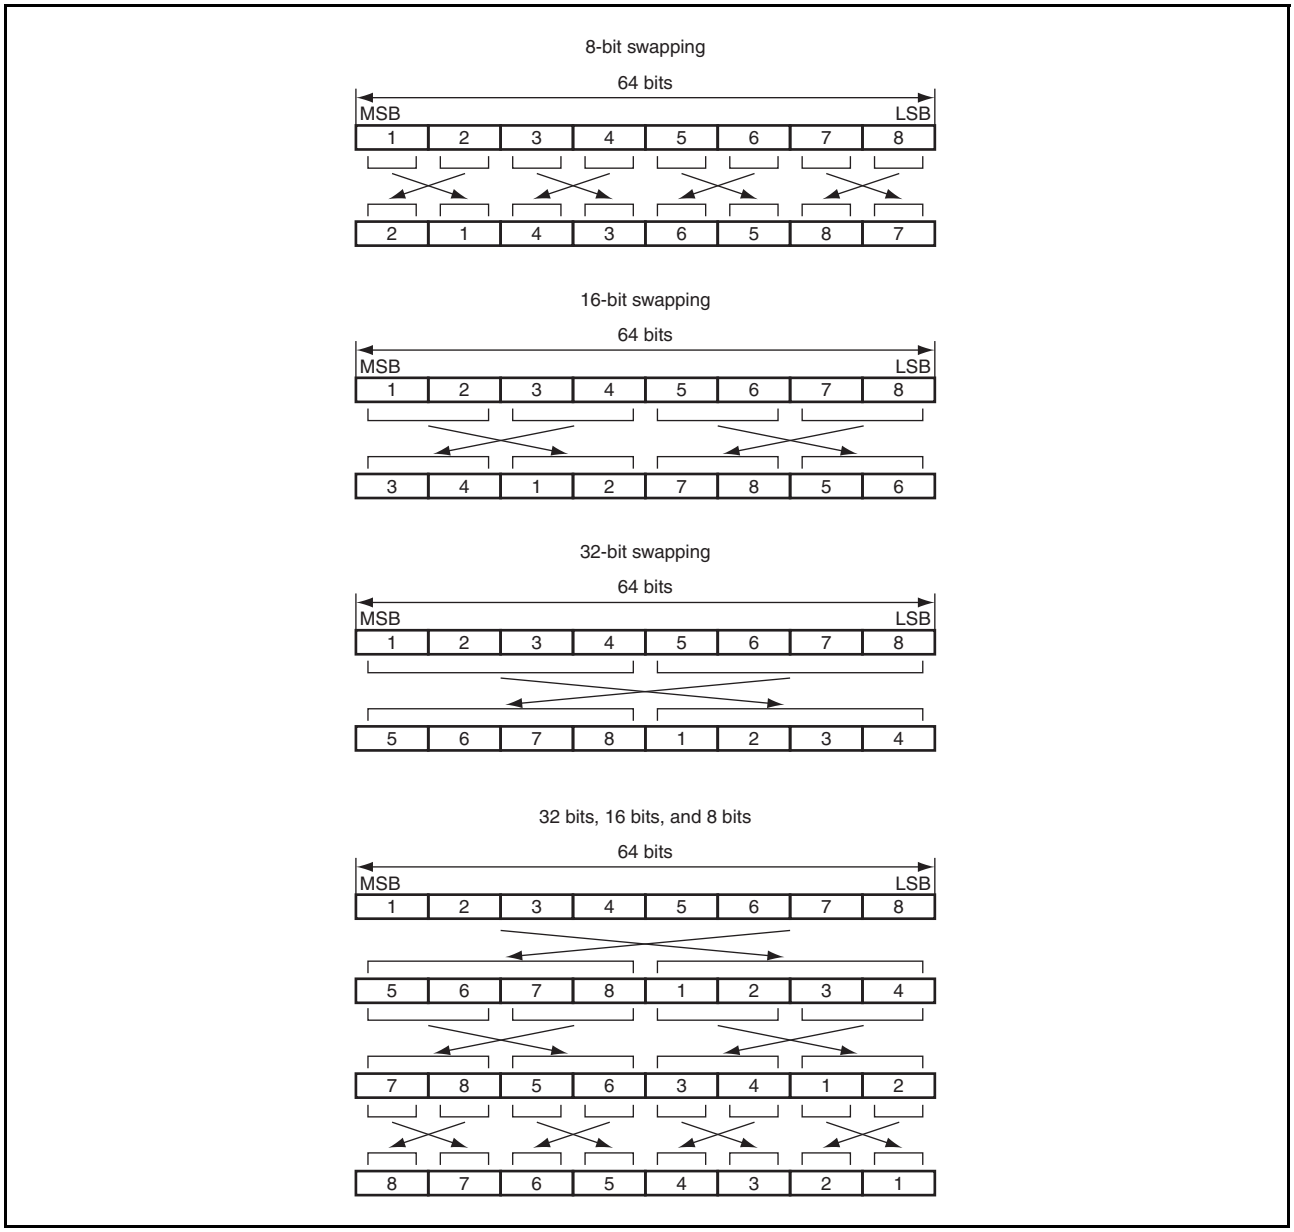

Figure 36.45 Data Swapping by Data Aligner

36.4.21 Capture Event Interrupt Enable Register (CEIER)

CEIER enables or disables interrupts of the event flag register that generates CEU interrupts.

3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1	CFEIE	0	R/W	CFE Interrupt Enable 0: Disables a CFE interrupt 1: Enables a CFE interrupt
0	CPEIE	0	R/W	One-Frame Capture End Interrupt Enable 0: Disables a one-frame capture end interrupt 1: Enables a one-frame capture end interrupt

36.4.22 Capture Event Flag Clear Register (CETCR)

CETCR notifies the CPU of the source of an interrupt that is generated in the CEU. The flags of CETCR can be used as interrupt signals. When the corresponding interrupt is enabled, an interrupt is generated. To clear the interrupt, clear the bit corresponding to the interrupt source to 0. After several cycles have passed after modifying the bit, the interrupt is cleared.

To clear the bit corresponding to the interrupt source to be cleared to 0 and retain that state, write 1 to that bit. For example, to clear only the CPE bit to 0, write H'FFFF FFFE to CETCR.

In CETCR, only bits to which 0 is written are cleared. Bits to which 1 is written retain their current values. To clear an interrupt source, write 0 only to the bit corresponding to the interrupt source to be cleared, and 1 to the other bits.

Note: Since the CETCR value becomes undefined in the following cases, clear all bits in CETCR to 0.

- VD and HD bits immediately after power-on reset or the deep-standby mode is entered
- All bits after the software standby or module standby mode is entered
- VD and HD bits after the polarities of the capture interface sync signals are changed

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	NVD	0	R/W	This bit is used for an interrupt indicating that no VD was input. A non-VD interrupt occurs when the 14-bit internal counter becomes full. Accordingly, this bit is set to 1 when no VD has been input for at least 16,383 lines since the last VD was input.
24	NHD	0	R/W	This bit is used for an interrupt indicating that no HD was input. A non-HD interrupt occurs when the 11-bit internal counter that is incremented every eight cycles becomes full. Accordingly, this bit is set to 1 when no HD has been input for at least 16,376 cycles since the last HD was input. When connecting a camera whose HD is fixed low when VD is low, this bit may be set to 1. Ignore this interrupt during data enable fetch.

Bit	Bit Name	Initial Value	R/W	Description
23	FWF	0	R/W	The interrupt is generated when data is written to the address that exceeds the value specified with CFWCR.FMV. This bit is set to 1 when data is written to the address that exceeds the value specified with CFWCR.FMV while CFWCR.FWE = 1.
22, 21	—	0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	VBP	0	R/W	This bit is used for an interrupt indicating that VD has been input while the CEU holds data (insufficient vertical-sync front porch). The conditions for a VBP interrupt to occur are as follows: • Condition 1 VD is input when there is captured data within the CEU • Condition 2 The last transfer data cannot be internally detected due to a write buffer overflow or an illegal HD so that the end timing is unclear until the next VD (By generating a VBP interrupt at the VD input timing, capture fail can be announced.) When a VBP interrupt occurs, a capture end interrupt (CPE bit in CETCR) does not occur and the image of that frame is not captured correctly. Though a capture end interrupt (CPE bit) will occur on rare occasions, it should be ignored in this case. Capturing cannot be performed until the next VD (even if the CE bit (capture reservation signal) in CAPSR is 1, capturing does not start). In the case of condition 2, instead of waiting for a VBP interrupt to occur, execute a software reset (CPKIL bit in CAPSR) to stop capturing and then restart capturing. In this case, since capture operation is terminated without waiting for the next VD, a VBP interrupt does not occur and capturing can be performed from the next VD.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18	IGVS	0	R/W	This bit is used for an interrupt generated when the number of VD cycles set in CMCYR differ from the number of VD cycles input from an external module. This bit is set to 1 when there is an illegal VD input from an external module. This bit is set to 1 when the number of HD cycles for the VD input to the CEU differs from the value set in the VCYL bits in CMCYR. Note however that when the VCYL bits are cleared to 0, this interrupt does not occur.
17	IGHS	0	R/W	This bit is used for an interrupt generated when the number of HD cycles set in CMCYR differ from the number of HD cycles input from an external module. This bit is set to 1 when there is an illegal HD input from an external module. This bit is set to 1 when the number of clock cycles for the HD input to the CEU differs from the value set in the HCYL bits in CMCYR. Note however that when the HCYL bits are cleared to 0, this interrupt does not occur.
16	CDTOF	0	R/W	This bit is used for an interrupt indicating that data overflowed in the CRAM of the write buffer. Since data is input at realtime from an external module in capture operations, the frame image is overwritten unless the captured data is transferred from the CEU internal buffer to the memory at a certain or higher transfer rate. This bit is set to 1 when writing the data in the CRAM of the CEU internal write buffer to the bus is not performed within time and data has overflowed.
15	CPBE4	0	R/W	This bit is used for an interrupt indicating that writing to CDBYR2 and CDBCR2 in a bundle write has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input. This bit is set to 1 when data for the number of lines set in CBDSR has been captured and the last data transfer to the bus has completed. However, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).
14	CPBE3	0	R/W	This bit is used for an interrupt indicating that writing to CDBYR and CDBCR in a bundle write has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input. This bit is set to 1 when data for the number of lines set in CBDSR has been captured and the last data transfer to the bus has completed. However, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).

Bit	Bit Name	Initial Value	R/W	Description
13	CPBE2	0	R/W	This bit is used for an interrupt indicating that writing to CDAYR2 and CDACR2 in a bundle write has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input. This bit is set to 1 when data for the number of lines (number of bytes in data enable fetch) set in CBDSR has been captured and the last data transfer to the bus has completed. However, in image capture or data synchronous fetch, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).
12	CPBE1	0	R/W	This bit is used for an interrupt indicating that writing to CDAYR and CDACR in a bundle write has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next HD input. This bit is set to 1 when data for the number of lines (number of bytes in data enable fetch) set in CBDSR has been captured and the last data transfer to the bus has completed. However, in image capture or data synchronous fetch, this interrupt does not occur when the last captured data in a bundle write is the last captured data of a frame (field).
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	VD	Undefined	R/W	This bit is used for an interrupt indicating that VD (vertical sync signal) was input from an external module. In data enable fetch mode, this bit is set to 1 when a VD input from an external module is detected. In image capture mode and data synchronous fetch mode, this module generates a VD interrupt in response to the first detection of the active level of HD following detection of the active level of VD from an external module. Note that, when VD and HD are asserted and detected at the same time, this module generates a VD interrupt at that time. Immediately after the VDPOL bit in CAMCR is modified, a pseudo VD is input and this bit is set to 1. The VD interrupt after the VDPOL bit is modified should be ignored.
8	HD	Undefined	R/W	This bit is used for an interrupt indicating that HD (horizontal sync signal) was input from an external module. This bit is set to 1 when an HD input from an external module is detected. Immediately after the HDPOL bit in CAMCR is modified, a pseudo HD is input and this bit is set to 1. The HD interrupt after the HDPOL bit is modified should be ignored.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	IGRW	0	R/W	This bit is used for an interrupt indicating that during capturing, access was attempted to a register to which writing during operation is prohibited. Among the CEU registers, writing during capturing is prohibited for some registers. Table 36.10 shows which registers can/cannot be written to during capturing. This bit is set to 1 when a register to which writing during capturing is prohibited has been written to.
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	CFE	0	R/W	This bit is used for an interrupt indicating that capturing of one field from an external module has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next VD input (see Figure 36.46). This interrupt occurs only in both-field capture mode.
0	CPE	0	R/W	This bit is used for an interrupt indicating that capturing of one frame from an external module has finished. This interrupt is output when the last captured data has been transferred and the end notification received, regardless of the next VD input. This interrupt indicates that capturing of one frame has finished. This bit is set to 1 when the image of the size set in CAPWR is captured and the last data transfer to the bus finished (see Figure 36.47).

36.4.23 Capture Status Register (CSTSR)

CSTSR indicates the internal status of the CEU. CSTSR differs from CETCR in that no interrupt is generated for the events indicated in CSTSR.

The CEU operating/halt state can be confirmed using CSTSR. To confirm the halt state of the CEU, make sure that the status bit (bit 0) indicating that the CEU is operating is cleared to 0 for sure.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	CRST	—	—	—	—	—	—	—	CP FLD

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	CRST	0	R	Indicates which register plane is currently used. 0: Plane A of the register is being used 1: Plane B of the register is being used
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	CPFLD	0	R	Indicates which field is being captured. 0: Bottom field is being captured 1: Top field is being captured
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	CPTON	0	R	Indicates that the CEU is operating. This bit retains 1 during the period that starts from the internal VD at capture start and ends when a one-frame capture end interrupt occurs. Figure 36.48 shows the CEU operating period.

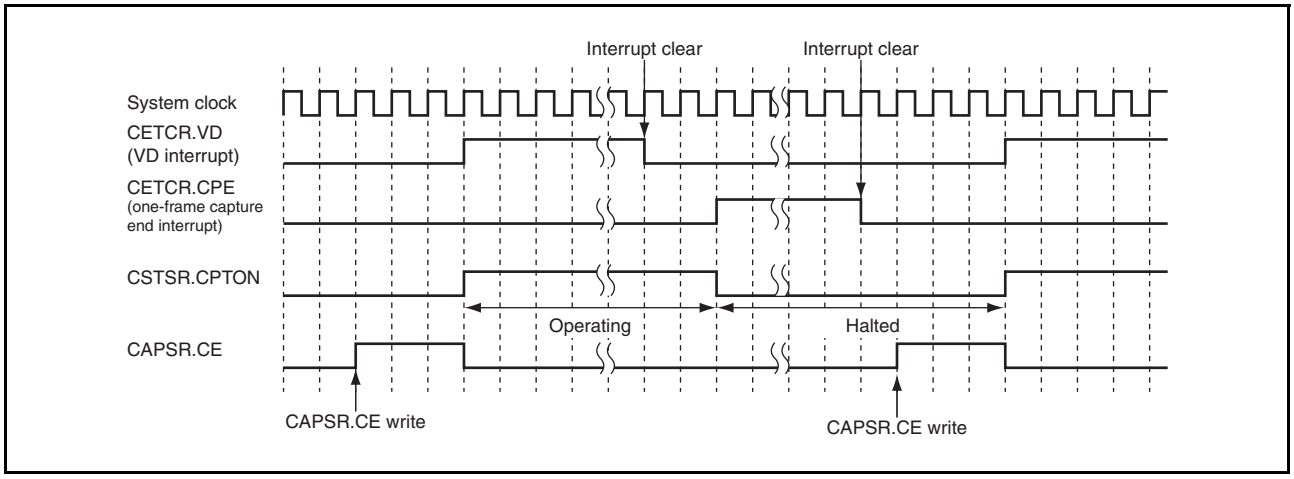

Figure 36.48 Operating Status during Capturing

36.4.24 Capture Data Size Register (CDSSR)

CDSSR indicates the size of data written to the memory in data enable fetch. As this register indicates a correct value at the end of capture, confirm this register when capture is completed.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CDSS[31:16]

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	CDSS[31:0]	H'0000 0000	R	Indicate the size of data written to the memory in data enable fetch. In a bundle write, size of data written to the selected address at the end of one-frame capture is indicated. In a bundle write, as soon as the number of bytes specified by CBDSR is transferred to the bus, address to which data is written is switched. Therefore, if one-frame capture is completed at the same time as a bundle write is completed, this register indicates H'0000 0000. Figure 36.49 and Figure 36.50 show the overall timing of the CDSSR operation in a bundle write.

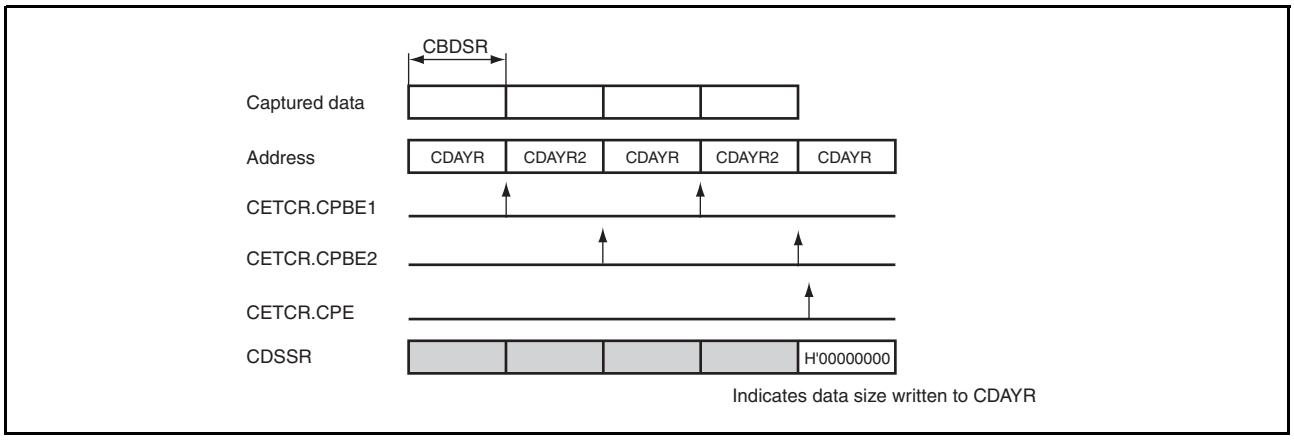

Figure 36.49 Overall Timing of CDSSR Operation in Bundle Write (When Bundle Write End and Capture End Coincide)

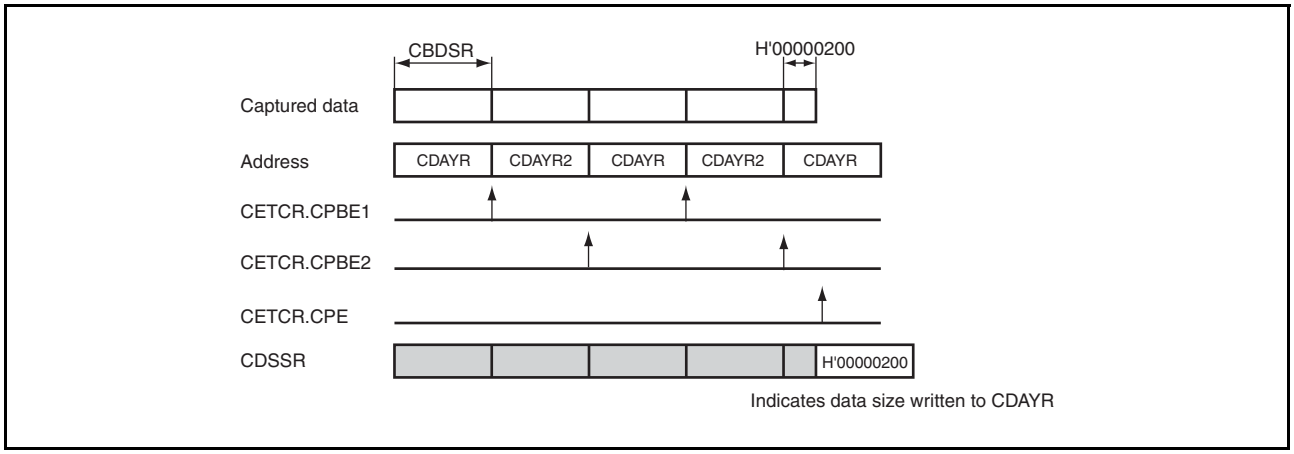

Figure 36.50 Overall Timing of CDSSR Operation in Bundle Write (When Bundle Write End and Capture End Do Not Coincide)

36.4.25 Capture Data Address Y Register 2 (CDAYR2)

CDAYR2 specifies the address for the luminance (Y) component used in a bundle write and the address for data storage in a bundle write in data fetch. CDAYR2 is used only in a bundle write.

CDAYR2 specifies the address where the Y component of the captured data is to be stored in frame image capture or one-field image capture, the address where the Y component of the captured top field is to be stored in both-field image capture, and the address where data is to be stored in data fetch. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the Y component of the captured data is to be stored by CDAYR2. In both-field image capture, set the start address of the memory area where the Y component of the captured top-field image is to be stored by CDAYR2. In data fetch, set the start address of the memory area to be used for data storage.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CAYR2[31:2]	H'0000 0000	R/W	• Frame image capture: These bits set the address for storing the Y component data of the captured data (4-pixel units). • One-field image capture: These bits set the address for storing the Y component data of the captured data (4-pixel units). • Both-field image capture: These bits set the address for storing the Y component data of the captured top-field data (4-pixel units). • Data synchronous fetch: These bits set the address for storing data (4-byte units). • Dana enable fetch: These bits set the address for storing data (32-byte units).
1, 0	CAYR2[1:0]		R	

Set the address of the starting point of the memory area where the Y component of the captured image is to be stored in this register, as shown in Figure 36.51.

- Frame image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the Y component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the Y component of the captured top-field image is to be stored.

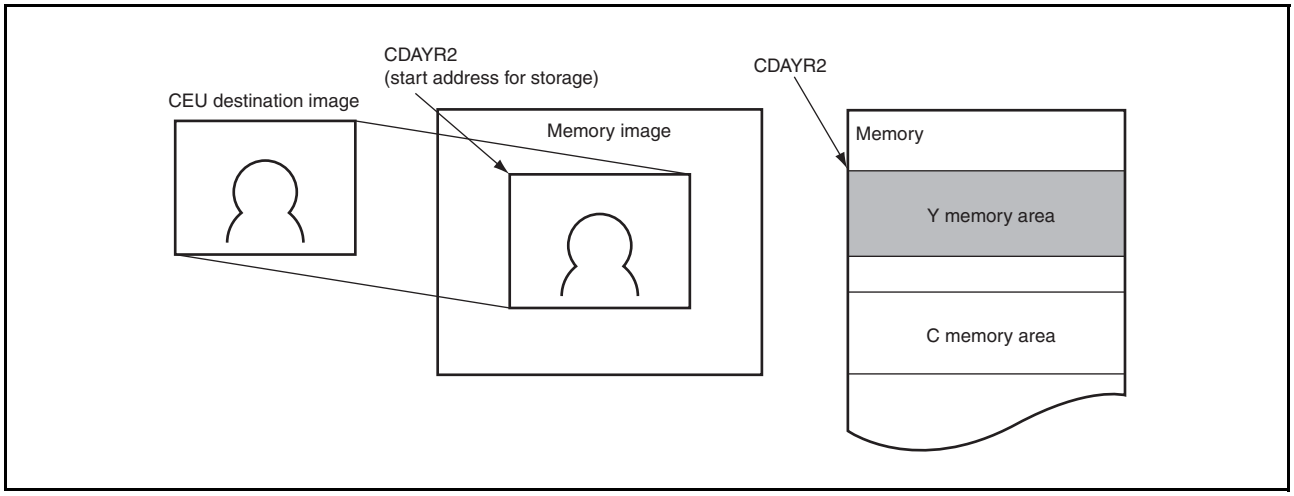

Figure 36.51 Relationship between Captured Image and Y Component Memory Area

36.4.26 Capture Data Address C Register 2 (CDACR2)

CDACR2 specifies the address for the chrominance (C) component used in a bundle write. CDACR2 is used only in a bundle write.

CDACR2 specifies the address where the C component of the captured data is to be stored in frame image capture or one-field image capture, and the address where the C component of the captured top field is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. In frame image capture or one-field image capture, set the start address of the memory area where the C component of the captured data is to be stored by CDACR2. In both-field image capture, set the start address of the memory area where the C component of the captured top-field image is to be stored by CDACR2. CDACR2 is not used in data fetch.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CACR2[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2 1, 0	CACR2[31:2] CACR2[1:0]	H'0000 0000	R/W R	• Frame image capture: These bits set the address for storing the C component data of the captured data (4-pixel units). • One-field image capture: These bits set the address for storing the C component data of the captured data (4-pixel units). • Both-field image capture: These bits set the address for storing the C component data of the captured top-field data (4-pixel units).

In this register, set the address of the starting point of the memory area where the captured data is to be stored in a bundle write, as shown in Figure 36.52. The C component has an output data format as shown in Figure 36.53, and is saved in the memory in this format.

- Frame image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- One-field image capture: Set the address of the starting point of the memory area where the C component of the captured image is to be stored.
- Both-field image capture: Set the address of the starting point of the memory area where the C component of the captured top-field image is to be stored.

The C component has an output data format as shown in Figure 36.52, and is saved in the memory in this format.

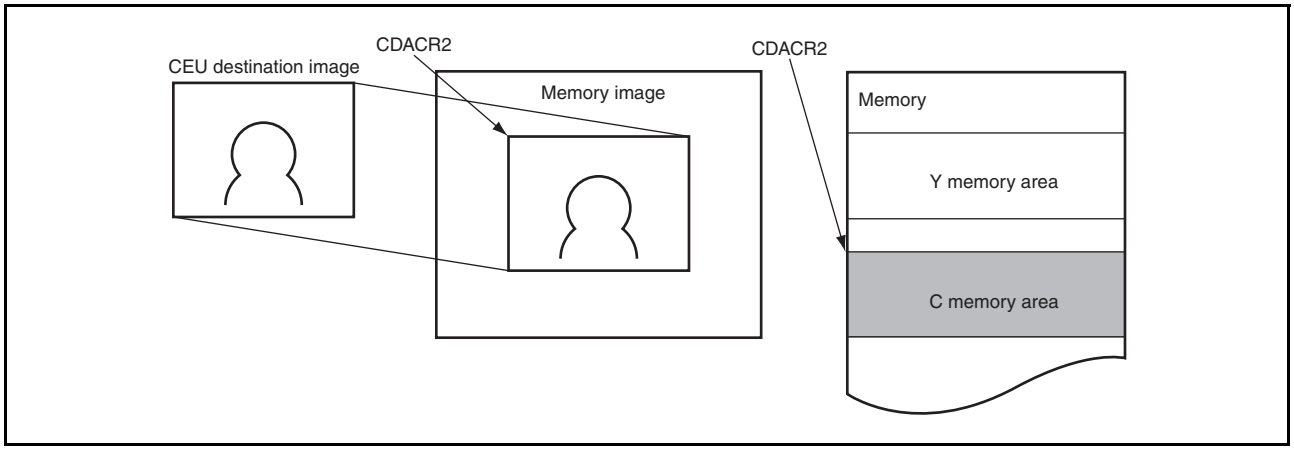

Figure 36.52 Relationship between Captured Image and C Component Memory Area

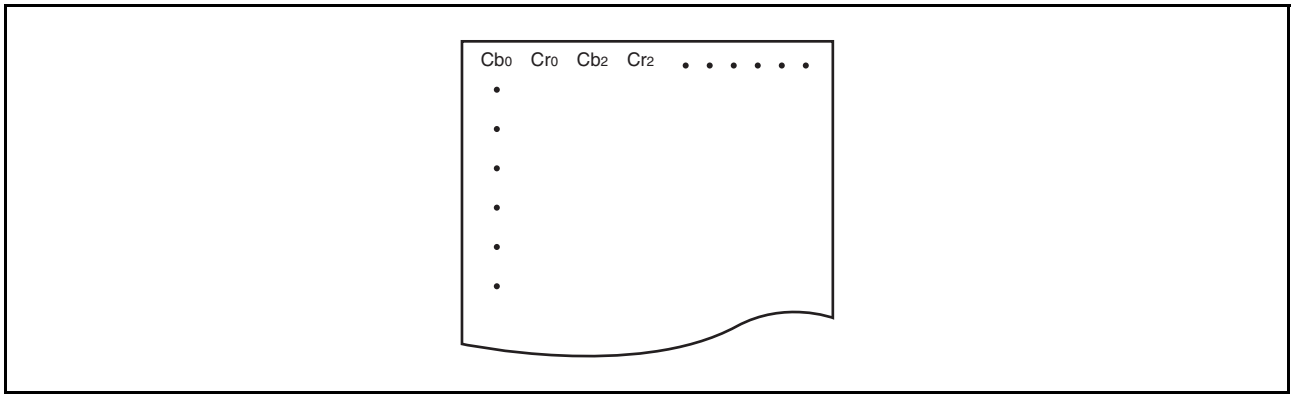

Figure 36.53 Image of Storing C Components in Memory

36.4.27 Capture Data Bottom-Field Address Y Register 2 (CDBYR2)

CDBYR2 specifies the address for the luminance (Y) component of the bottom field used in a bundle write. CDBYR2 is used only in a bundle write.

CDBYR2 specifies the address where the Y component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the Y component of the bottom-field image captured in both-field image capture is to be stored by CDBYR2. CDBYR2 is not used in frame image capture, one-field image capture, or data fetch.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 2	CBYR2[31:2]	H'0000 0000	R/W	These bits set the address for storing the Y component data of the captured bottom-field data (4-pixel units).
1, 0	CBYR2[1:0]		R	

In this register, set the address of the starting point of the memory area where the Y component of the captured bottom-field image is to be stored in a bundle write, as shown in Figure 36.54.

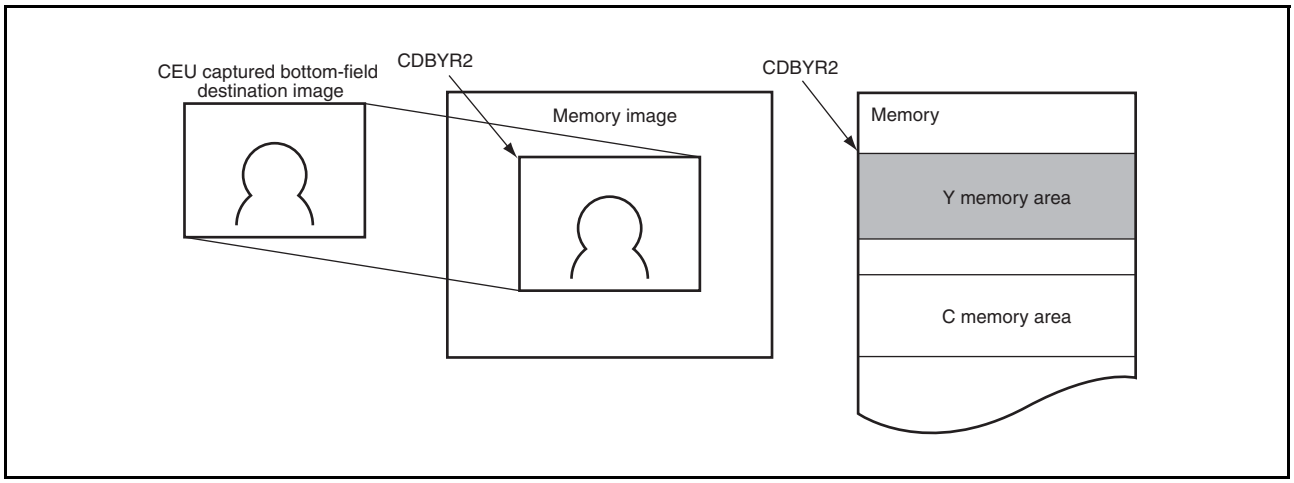

Figure 36.54 Relationship between Captured Bottom-Field Image and Y Component Memory Area

36.4.28 Capture Data Bottom-Field Address C Register 2 (CDBCR2)

CDBCR2 specifies the address for the chrominance (C) component of the bottom field used in a bundle write. CDBCR2 is used only in a bundle write.

CDBCR2 specifies the address where the C component of the captured bottom-field data is to be stored in both-field image capture. The CEU separates the captured image data into the luminance component data (Y) and the chrominance component data (C), and stores them in the memory via the bus. Set the start address of the memory area where the C component of the bottom-field image captured in both-field image capture is to be stored by CDBCR2. CDBCR2 is not used in frame image capture, one-field image capture, or data fetch.

The address specified by this register must be in 32-bit units. As the setting is in 4-pixel units, the lower two bits are always fixed to 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CBCR2[31:16]

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	CBCR2[31:2]	H'0000 0000	R/W	These bits set the address for storing the C component data of the captured bottom-field data (4-pixel units).
1, 0	CBCR2[1:0]		R	

In this register, set the address of the starting point of the memory area where the C component of the captured bottom-field image is to be stored in a bundle write, as shown in Figure 36.55. The C component has an output data format as shown in Figure 36.56, and is saved in the memory in this format.

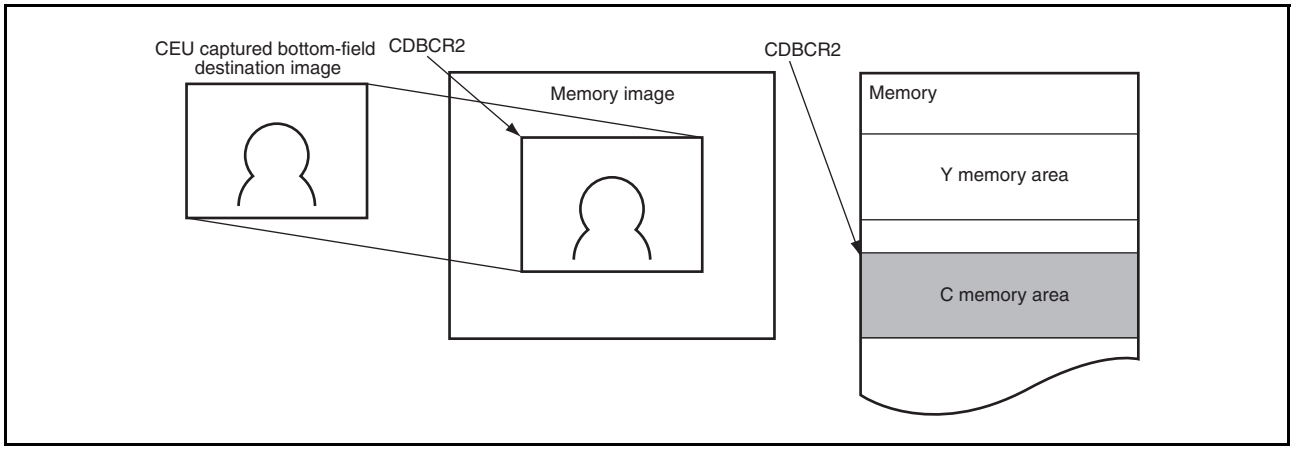

Figure 36.55 Relationship between Captured Bottom-Field Image and C Component Memory Area

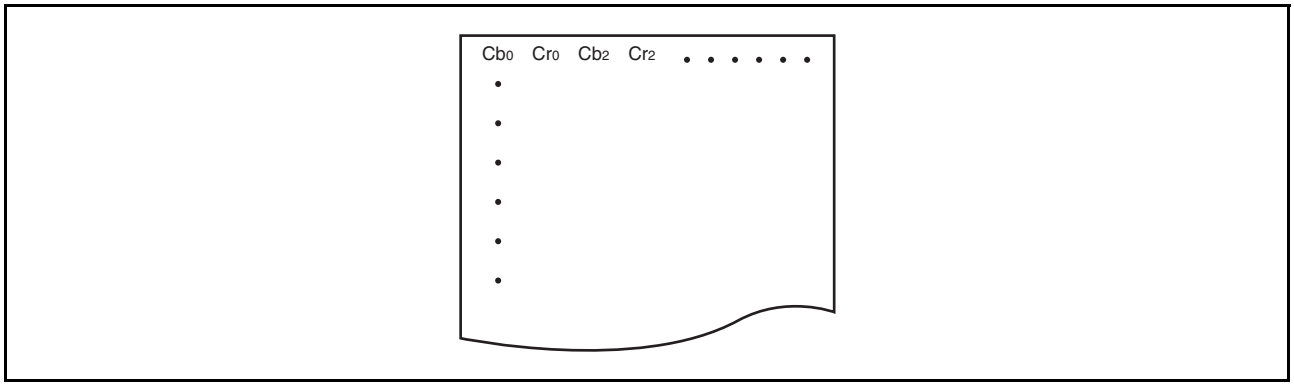

Figure 36.56 Image of Storing C Components in Memory

36.5 Usage Notes for CEU

36.5.1 Conditions for Connection to an External Module

(1) Clock Frequency

The external input clock should have a frequency at most the same as the CEU operating clock frequency (Bφ), with jitter on both sides included.

CEU operating clock frequency (Bφ) ≥ External input clock frequency

(2) Blanking Period

The period from the last valid pixel in each line to the next horizontal sync signal HD must be at least 20 cycles.

(3) Fixed Period of Field Identification Signal

The field identification signal FLD should be fixed for at least 1-HD period since a VD input.

36.5.2 Restrictions on Input/Output Functions

Table 36.11 lists the restrictions regarding the CEU input/output functions.

Table 36.11 Restrictions on CEU Input/Output Functions

Item	Restrictions
External module interface	The operating clock of the external module (VIO_CLK) should always have a frequency at most the same as that of the CEU operating clock (Bφ), with jitter on both sides included.
	Selecting the interface, or modifying the frequency of the external module operating clock or HD/VD polarity must be done when capture operations are halted for sure.
	Specify the capture horizontal size in image capture in 8-cycle units.
	Specify the capture horizontal size in data fetch in 4-cycle units.
	The capture vertical size must be specified in 4-line units.
	The maximum number of cycles in the horizontal sync signal period should be 16,375 cycles of external input clock.
	The maximum number of lines (HD count) in the vertical sync signal should be 16,382 lines.
	The minimum number of captured pixels should be sub-QCIF (128 × 96).
	The maximum number of captured pixels should be 5 megapixels (2,560 × 1,920).
	Captured size in data enable fetch Maximum: 6 Mbytes (2,048 × 1,536 × 2) Minimum: 16 bytes
Memory output	The output address must be specified in 32-bit units.
	The horizontal size of the destination image (memory) must be specified in 4-pixel units.
	The number of horizontal output pixels (= horizontal clipping size) must be specified in 4-pixel units.
	The number of vertical output lines (HD) (= vertical clipping size) must be specified in 4-line (HD) units.
	In data enable fetch bundle write, the output address must be specified in 32-byte units.
Internal processing	The filter clipping size must be specified as a value equal to or lower than the actual output size of the filter.

36.5.3 Cooperation with Video Display Controller 5

Since the input data are written to the memory separately as Y data and CbCr data in image capture mode, the captured data cannot be displayed in the video display controller 5.

36.5.4 Software Reset

For transitions to the software reset state by the CPKIL bit in the CAPSR register, see section 42.3.6, Software Reset. However, where the procedure refers to the SRST bit, read this as the CPKIL bit in the CAPSR register.

37. SCUX

The SCUX consists of sampling converters, digital volume units, and a mixer. It is connected to the SSIF module to have an interface with external modules.

37.1 Features

(1) [SRC] Sampling Rate Conversion

- Asynchronous or synchronous sampling rate conversion is possible*1
- Sampling rate (synchronous mode)*2
  Input [KHz]: 8, 11.025, 12, 16, 22.05, 24, 32, 44.1, 48, 64, 88.2, or 96 is selectable
  Output [KHz]: 8, 16, 24, 32, 44.1, 48, or 96 is selectable
- Sampling rate (asynchronous mode)*2
  Input/output [KHz]: 1 to 96
- Supported bit sizes are 16 bits and 24 bits
- Sound quality: −132 dB or less*3
- 1, 2, 4, 6, or 8 channels are supported*4
- DMA transfer with on-chip memory or external memory and direct transfer with the SSIF module are possible

Note 1. The synchronous mode can be selected only when the SCUX is connected to the FFD and FFU modules. For details, refer to section 37.4.5.
Note 2. The selectable sampling rates depend on the number of used channels and rate ratio. For details, refer to section 37.3.22 and section 37.4.7.
Note 3. The data format is a 24-bit value.
Note 4. The number of selectable channels depends on the sampling rate and route. For details, refer to section 37.4.7.

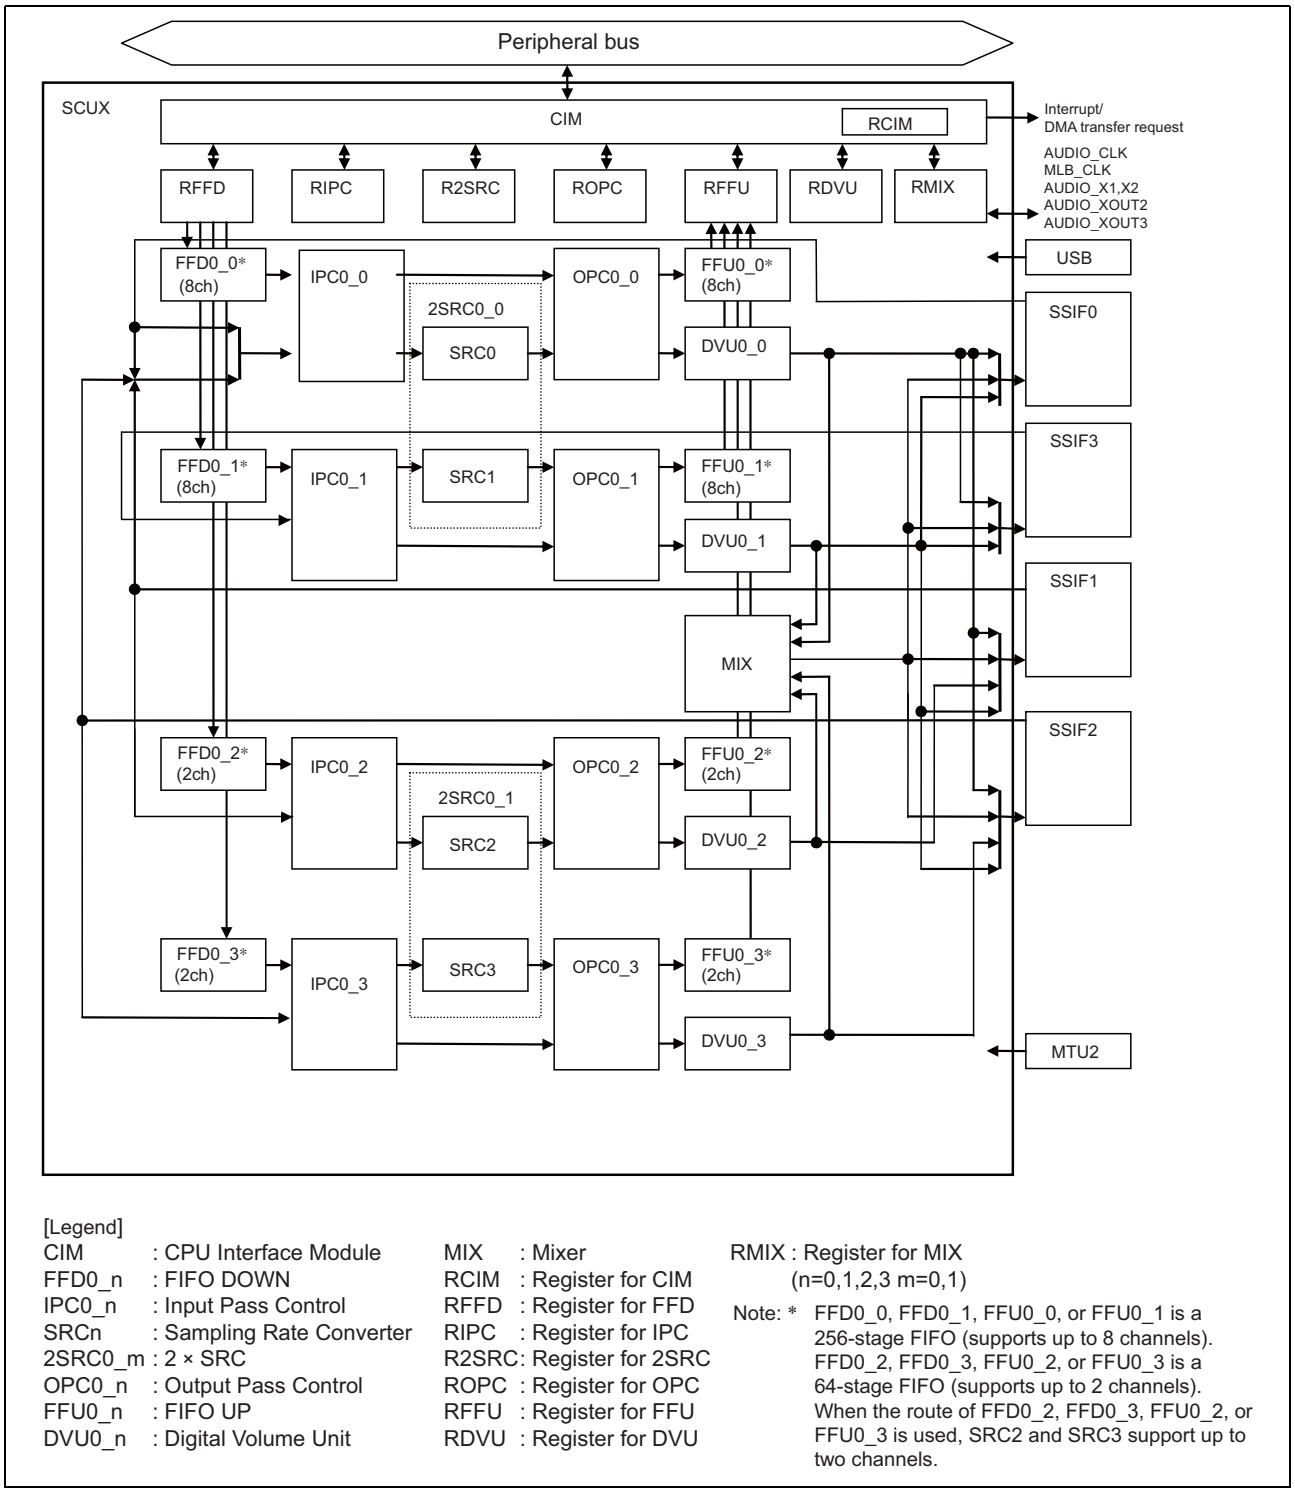
(2) [DVU] Digital Volume and Mute Functions

- Digital volume, volume ramp, and zero cross mute are provided as functions to adjust the volume
- The digital volume is set as a 24-bit fixed-point value within the range from a multiple of 0 to 8 (mute, −120 to 18 dB)
- Volume ramp can be used to perform soft mute, fade in, fade out, and volume change as desired
- The ramp time of volume ramp can be changed and set within the sampling range of 2^0 to 2^{23}
- Zero cross mute turns the sound mute at the zero cross point of audio data
- Direct transfer with the SSIF module and transfer with the mixer are possible

(3) [MIX] Mixer

- Data of two to four source systems can be mixed (added together) into one system
- The ratio to add the sources can be set
- The ratio can be changed dynamically
- Volume ramp enables mixing to be performed (ramp time is variable)
- Only direct transfer with the SSIF module is possible

Figure 37.1 shows a block diagram of the SCUX.



[Legend]

CIM	: CPU Interface Module	MIX	: Mixer	RMIX	: Register for MIX (n=0,1,2,3 m=0,1)
FFD0_n	: FIFO DOWN	RCIM	: Register for CIM		
IPC0_n	: Input Pass Control	RFFD	: Register for FFD		
SRCn	: Sampling Rate Converter	RIPC	: Register for IPC		
2SRC0_m	: 2 × SRC	R2SRC	: Register for 2SRC		
OPC0_n	: Output Pass Control	ROPC	: Register for OPC		
FFU0_n	: FIFO UP	RFFU	: Register for FFU		
DVU0_n	: Digital Volume Unit	RDVU	: Register for DVU		

Note: * FFD0_0, FFD0_1, FFU0_0, or FFU0_1 is a 256-stage FIFO (supports up to 8 channels). FFD0_2, FFD0_3, FFU0_2, or FFU0_3 is a 64-stage FIFO (supports up to 2 channels). When the route of FFD0_2, FFD0_3, FFU0_2, or FFU0_3 is used, SRC2 and SRC3 support up to two channels.

Figure 37.1 Block Diagram of SCUX

37.2 Input/Output Pins

Table 37.1 Pin Configuration

Name	I/O	Function
AUDIO_CLK	Input	External clock for audio Can be used in generating the sampling timing.
MLB_CLK*1	Input	External clock for MLB Can be used in generating the sampling timing.
AUDIO_X1	Input	Crystal resonator/external clock for audio Can be used in generating the sampling timing.
AUDIO_X2	Output	
AUDIO_XOUT2	Output	Output clock of AUDIO_X1 divided into two (Output is toggled once per cycle of the AUDIO_X1 clock.)
AUDIO_XOUT3	Output	Output clock of AUDIO_X1 divided into three (Output is toggled once every 1.5 cycles of the AUDIO_X1 clock.)

Note 1. Since the RZ/A1LU and RZ/A1LC do not have a MLB_CLK external pin, a fixed value (0) is input as the signal in this module.

37.3 Register Descriptions

Table 37.2 shows the register configuration.

Table 37.2 Register Configuration

Block Name	Register Name	Abbreviation	R/W	Initial Value	Address	Access Size

Note 1. Only 0 can be written to clear the flag. Writing 0 is ignored.
Note 2. Address H'E8209708 can be accessed in only 16-bit or 32-bit units.
Note 3. Address H'E820970C can be accessed in only 16-bit or 32-bit units.
Note 4. Address H'E8209710 can be accessed in only 16-bit or 32-bit units.
Note 5. Address H'E8209714 can be accessed in only 16-bit or 32-bit units.
Note 6. Address H'E8209718 can be accessed in only 16-bit or 32-bit units.
Note 7. Address H'E820971C can be accessed in only 16-bit or 32-bit units.
Note 8. Address H'E8209720 can be accessed in only 16-bit or 32-bit units.
Note 9. Address H'E8209724 can be accessed in only 16-bit or 32-bit units.

37.3.1 IPC0_n Initialization Register (IPCIR_IPC0_n) (n = 0, 1, 2, 3)

IPCIR_IPC0_n is a 32-bit readable/writable register that initializes the IPC internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the IPC internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.2 IPC0_n Pass Select Register (IPSLR_IPC0_n) (n = 0, 1, 2, 3)

IPSLR_IPC0_n is a 32-bit readable/writable register that selects the input source and output destination of the input timing signal and audio data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	IPC_PASS_SEL		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	IPC_ PASS_SEL	0	R/W	IPC Pass Select These bits select the pass. 000: No operation 001: Input Timing Signal/Input Audio Data : EXTERNAL(SSIF) → IPC → SRC (Async mode) 010: Reserved 011: Input Timing Signal : EXTERNAL → IPC → FFD/SRC Input Audio Data : FFD → IPC → SRC (Async mode) 100: Input Timing Signal/Input Audio Data : FFD → IPC → SRC (Sync mode) 101 to 111: No operation

37.3.3 OPC0_n Initialization Register (OPCIR_OPC0_n) (n = 0, 1, 2, 3)

OPCIR_OPC0_n is a 32-bit readable/writable register that initializes the OPC internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the OPC internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.4 OPC0_n Pass Select Register (OPSLR_OPC0_n) (n = 0, 1, 2, 3)

OPSLR_OPC0_n is a 32-bit readable/writable register that selects the input source and output destination of the output timing signal and audio data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	OPC_PASS_SEL		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	OPC_ PASS_ SEL	0	R/W	OPC Pass Select These bits select the pass. 000: No operation 001: Output Timing Signal : EXTERNAL → OPC → SRC/DVU Output Audio Data : SRC(Async mode) → OPC → DVU 010: Reserved 011: Output Timing Signal : EXTERNAL → OPC → FFU/SRC Output Audio Data : SRC(Async mode) → OPC → FFU 100: Output Timing Signal : FFU → OPC → SRC Output Audio Data : SRC(Sync mode) → OPC → FFU 101 to 111: No operation

37.3.5 FFD0_n FIFO Download Initialization Register (FFDIR_FFD0_n) (n = 0, 1, 2, 3)

FFDIR_FFD0_n is a 32-bit readable/writable register that initializes the FFD internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the FFD internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.6 FFD0_n FIFO Download Audio Information Register (FDAIR_FFD0_n) (n = 0, 1, 2, 3)

FDAIR_FFD0_n is a 32-bit readable/writable register that sets the number of FFD data channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CHNUM			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM	All 0	R/W	Number of Channels These bits set the number of channels. 0000: Zero (None) 0001: 1 channel 0010: 2 channels* 0011: Reserved 0100: 4 channels* 0101: Reserved 0110: 6 channels* 0111: Reserved 1000: 8 channels* 1001 to 1111: Reserved Note: * These bits are only settable for FFD0_0 and FFD0_1. Setting these bits in the registers for FFD0_2 and FFD0_3 is prohibited.

37.3.7 FFD0_n FIFO Download Request Size Register (DRQSR_FFD0_n) (n = 0, 1, 2, 3)

DRQSR_FFD0_n is a 32-bit readable/writable register that sets the request size of data transfer requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	SIZE			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	SIZE	All 0	R/W	Request Size These bits set the PCM data size per request. The size must be less than the FIFO size. 0000: 256 data. (FFD0_0,FFD0_1), 64 data. (FFD0_2,FFD0_3) *1 0001: 128 data. (FFD0_0,FFD0_1), 32 data. (FFD0_2,FFD0_3) 0010: 64 data. (FFD0_0,FFD0_1), 16 data. (FFD0_2,FFD0_3) 0011: 32 data. (FFD0_0,FFD0_1), 8 data. (FFD0_2,FFD0_3) 0100: 16 data. (FFD0_0,FFD0_1), 4 data. (FFD0_2,FFD0_3) 0101: 8 data. (FFD0_0,FFD0_1), 2 data. (FFD0_2,FFD0_3) 0110: 4 data. (FFD0_0,FFD0_1), 1 data. (FFD0_2,FFD0_3) 0111: 2 data. (FFD0_0,FFD0_1)*2 1000: 1 data. (FFD0_0,FFD0_1)*2 1001 to 1111: Reserved. Notes: 1. If the request size equals the FIFO size, the request size must be a multiple of the number of channels so that the operation is correct. For example, the request size and FIFO size are 256, the number of channels can be set to 1, 2, 4, or 8. If the number of channels is not set to any of the numbers, FIFO overflow may occur. 2. These bits are only settable for FFD0_0 and FFD0_1. Setting these bits in the registers for FFD0_2 and FFD0_3 is prohibited.

37.3.8 FFD0_n FIFO Download Pass Register (FFDPR_FFD0_n) (n = 0, 1, 2, 3)

FFDPR_FFD0_n is a 32-bit readable/writable register that sets the input/output route of audio data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PASS	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	PASS	All 0	R/W	Data Pass Select These bits set the data pass of audio data. 00: No pass selected 01: CIM → FFD → IPC (Async Mode) *1 10: CIM → FFD → IPC (Sync Mode) *2 11: Reserved Notes: 1.- Async mode: The FFD use external timing. 2.- Sync mode: The FFD use the request which is generated by SRC module. Set Sync mode in SRC.

37.3.9 FFD0_n FIFO Download Boot Register (FFDBR_FFD0_n) (n = 0, 1, 2, 3)

FFDBR_FFD0_n is a 32-bit readable/writable register that controls the starting and stopping of data requests sent to RFFD.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	BOOT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BOOT	0	R/W	Data Request Start/Stop This bit controls the start/stop of data request. This bit can be set when the PASS bits in the FFDPR register are set to B'01 or B'10. This bit should be set after setting all FFD registers. 0: Stops the data request. 1: Starts the data request.

37.3.10 FFD0_n FIFO Download Event Mask Register (DEVMR_FFD0_n) (n = 0, 1, 2, 3)

DEVMR_FFD0_n is a 32-bit readable/writable register that controls SCUFDIn interrupt requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DEV MUF	DEV MOF	DEV MOL	DEV MIUF	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DEV MRQ	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	DEVMUF	0	R/W	FFD Underflow Mask This bit sets whether to mask the interrupt request from the DEVCUF bit in the DEVCR register. 0: Disables interrupts. 1: Enables interrupts.
30	DEVMOF	0	R/W	FFD Overflow Mask This bit sets whether to mask the interrupt request from the DEVCOF bit in the DEVCR register. 0: Disables interrupts. 1: Enables interrupts.
29	DEVMOL	0	R/W	FFD Overlap Mask This bit sets whether to mask the interrupt request from the DEVCOL bit in the DEVCR register. 0: Disables interrupts. 1: Enables interrupts.
28	DEVMIUF	0	R/W	FFD Initialization Underflow Mask This bit sets whether to mask the interrupt request from the DEVCIUF bit in the DEVCR register. 0: Disables interrupts. 1: Enables interrupts.
27 to 16	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
15	DEVMRQ	0	R/W	FFD Request Packet Mask This bit sets whether to mask the interrupt request from the DEVCRQ bit in the DEVCR register. 0: Disables interrupts. 1: Enables interrupts.
14 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

37.3.11 FFD0_n FIFO Download Event Clear Register (DEVCR_FFD0_n) (n = 0, 1, 2, 3)

DEVCR_FFD0_n is a 32-bit readable/writable register that clears SCUFDIn interrupt requests. When an interrupt event is generated, the relevant bit in this register is automatically set to 1 and 1 is retained until 0 is written to that bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DEVCUF	DEVCOF	DEVCOL	DEVCIUF	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DEVCRQ	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	DEVCUF	0	R/(W)*1	FFD Underflow Clear This is an interrupt flag to indicate whether DPRAM underflow occurs. When it occurs and the first packet has already been written to DPRAM, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
30	DEVCOF	0	R/(W)*1	FFD Overflow Clear This is an interrupt flag to indicate whether DPRAM overflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
29	DEVCOL	0	R/(W)*1	FFD Overlap Clear This is an interrupt flag to indicate whether FFD overlap occurs. When the next read request occurs while FFD reads data from DPRAM upon the previous read request, the overflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Waiting.
28	DEVCIUF	0	R/(W)*1	FFD Initialization Underflow Clear This is an interrupt flag to indicate whether DPRAM initialization underflow occurs. When it occurs and the first packet has not been written to DPRAM, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
27 to 16	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
15	DEVCRQ	0	R/(W)*1	FFD Request Packet Clear This is an interrupt flag to send a request to write one packet in FFD, to the CPU. When the request occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
14 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

Note 1. Readable/writable. When 0 is written, the bit is initialized. Writing 1 to the bit is ignored. Write 0 only to each bit corresponding to the interrupt source to be cleared; write 1 to other bits.

37.3.12 FFU0_n FIFO Upload Initialization Register (FFUIR_FFU0_n) (n = 0, 1, 2, 3)

FFUIR_FFU0_n is a 32-bit readable/writable register that initializes the FFU internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the FFU internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.13 FFU0_n FIFO Upload Audio Information Register (FUAIR_FFU0_n) (n = 0, 1, 2, 3)

FUAIR_FFU0_n is a 32-bit readable/writable register that sets the number of FFU data channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CHNUM			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM	All 0	R/W	Number of Channels These bits set the number of channels. For details, see below. 0000: Zero (None) 0001: 1 channel 0010: 2 channels* 0011: Reserved 0100: 4 channels* 0101: Reserved 0110: 6 channels* 0111: Reserved 1000: 8 channels* 1001 to 1111: Reserved Note: *These bits are only settable for FFU0_0 and FFU0_1. Setting these bits in the registers for FFU0_2 and FFU0_3 is prohibited.

37.3.14 FFU0_n FIFO Upload Request Size Register (URQSR_FFU0_n) (n = 0, 1, 2, 3)

URQSR_FFU0_n is a 32-bit readable/writable register that sets the request size of data transfer requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	SIZE			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	SIZE	All 0	R/W	Request Size These bits set the PCM data size per request. The size must be less than the FIFO size. 0000: 256 data. (FFU0_0,FFU0_1), 64 data. (FFU0_2,FFU0_3) *1 0001: 128 data. (FFU0_0,FFU0_1), 32 data. (FFU0_2,FFU0_3) 0010: 64 data. (FFU0_0,FFU0_1), 16 data. (FFU0_2,FFU0_3) 0011: 32 data. (FFU0_0,FFU0_1), 8 data. (FFU0_2,FFU0_3) 0100: 16 data. (FFU0_0,FFU0_1), 4 data. (FFU0_2,FFU0_3) 0101: 8 data. (FFU0_0,FFU0_1), 2 data. (FFU0_2,FFU0_3) 0110: 4 data. (FFU0_0,FFU0_1), 1 data. (FFU0_2,FFU0_3) 0111: 2 data. (FFU0_0,FFU0_1)*2 1000: 1 data. (FFU0_0,FFU0_1)*2 1001 to 1111: Reserved. Note 1. If the request size equals the FIFO size, the request size must be a multiple of the number of channels so that the operation is correct. For example, the request size and FIFO size are 256, the number of channels can be set to 1, 2, 4, or 8. If the number of channels is not set to any of the numbers, FIFO overflow may occur. Note 2. These bits are only settable for FFU0_0 and FFU0_1. Setting these bits in the registers for FFU0_2 and FFU0_3 is prohibited.

37.3.15 FFU0_n FIFO Upload Pass Register (FFUPR_FFU0_n) (n = 0, 1, 2, 3)

FFUPR_FFU0_n is a 32-bit readable/writable register that sets the input/output route of audio data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PASS	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	PASS	All 0	R/W	Data Pass Select These bits set the data pass of audio data. 00: No pass selected 01: CIM ← FFU ← OPC (Async Mode) *1 10: CIM ← FFU ← OPC (Sync Mode) *2 11: Reserved Notes: 1. Async mode: The FFU use external timing. 2. Sync mode: The FFU use the request which is generated by SRC module. Set Sync mode in SRC.

37.3.16 FFU0_n FIFO Upload Event Mask Register (UEVMR_FFU0_n) (n = 0, 1, 2, 3)

UEVMR_FFU0_n is a 32-bit readable/writable register that controls SCUFUIn interrupt requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UEVMUF	UEVMOF	UEVMOL	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UEVMRQ	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	UEVMUF	0	R/W	FFU Underflow Mask This bit sets whether to mask the interrupt request from the UEVCUF bit in the UEVCR register. 0: Disables interrupts. 1: Enables interrupts.
30	UEVMOF	0	R/W	FFU Overflow Mask This bit sets whether to mask the interrupt request from the UEVCOF bit in the UEVCR register. 0: Disables interrupts. 1: Enables interrupts.
29	UEVMOL	0	R/W	FFU Overlap Mask This bit sets whether to mask the interrupt request from the UEVCOL bit in the UEVCR register. 0: Disables interrupts. 1: Enables interrupts.
28 to 16	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
15	UEVMRQ	0	R/W	FFU Request Packet Mask This bit sets whether to mask the interrupt request from the UEVCRQ bit in the UEVCR register. 0: Disables interrupts. 1: Enables interrupts.
14 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

37.3.17 FFU0_n FIFO Upload Event Clear Register (UEVCR_FFU0_n) (n = 0, 1, 2, 3)

UEVCR_FFU0_n is a 32-bit readable/writable register that clears SCUFUIn interrupt requests. When an interrupt event is generated, the relevant bit in this register is automatically set to 1 and 1 is retained until 0 is written to that bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UEVCUF	UEVCOF	UEVCOL	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R/(W)*1	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UEVCRQ	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	UEVCUF	0	R/(W)*1	FFU Underflow Clear This is a flag to indicate whether DPRAM underflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
30	UEVCOF	0	R/(W)*1	FFU Overflow Clear This is a flag to indicate whether DPRAM overflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
29	UEVCOL	0	R/(W)*1	FFU Overlap Clear This is a flag to indicate whether DPRAM overlap occurs. When the next write request occurs while FFU writes data upon the previous write request, the overlap occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
28 to 16	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.
15	UEVCRQ	0	R/(W)*1	FFU Request Packet Clear This is an interrupt flag to send a request to read one packet from FFU, to the CPU. When the request occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
14 to 0	—	All 0	R	Reserved. These bits are always read as 0. The write value should always be 0.

Note 1. Readable/writable. When 0 is written, the bit is initialized. Writing 1 to the bit is ignored. Write 0 only to each bit corresponding to the interrupt source to be cleared; write 1 to other bits.

37.3.18 2SRC0_m Initialization Register p (SRCIRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SRCIRp_2SRC0_m is a 32-bit readable/writable register that initializes the SRC internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the SRC internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.19 2SRC0_m Audio Information Register p (SADIRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SADIRp_2SRC0_m is a 32-bit readable/writable register that sets the bit length of data and the number of channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	OTBL				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CHNUM			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	OTBL	All 0	R/W	Bit Length of Output Audio Data 00000: 24 bits 00001 to 00111: Reserved 01000: 16 bits 01001 to 11111: Reserved
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM	All 0	R/W	Number of Channels These bits set the number of channels. 0000: Zero (None) 0001: 1 channel 0010: 2 channels 0011: Reserved 0100: 4 channels 0101: Reserved 0110: 6 channels 0111: Reserved 1000: 8 channels 1001 to 1111: Reserved

37.3.20 2SRC0_m Bypass Register p (SRCBRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SRCBRp_2SRC0_m is a 32-bit readable/writable register that sets the bypass mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	BY PASS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BYPASS	0	R/W	Bypass Mode This bit controls the data pass of SRC. The bypass function is only used in asynchronous SRC mode. Therefore, this bit must be set to 0 when synchronous SRC mode is used (bit SRCMD0 in SRCCRp_2SRC0_m register is 1). 0: SRC function is used. Input data is processed by SRC and then the result data is connected to output data. 1: SRC function is not used. Input data is directly connected to output data.

37.3.21 2SRC0_m IFS Control Register p (IFSCRp_2SRC0_m) (m = 0, 1; p = 0, 1)

IFSCRp_2SRC0_m is a 32-bit readable/writable register that enables or disables usage of the initial value set by INTIFS.

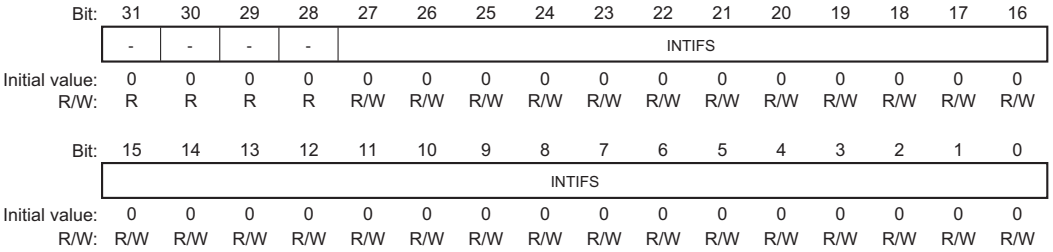
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INT IFSEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INTIFSEN	0	R/W	INTIFS Value Enable This bit is enabled only in asynchronous SRC mode (bit SRCMD in SRCCRp_2SRC0_m register is 0). 0: Disables initial value setting in IFSVR register. 1: Enables initial value setting in IFSVR register.

37.3.22 2SRC0_m IFS Value Setting Register p (IFSVRp_2SRC0_m) (m = 0, 1; p = 0, 1)

IFSVRp_2SRC0_m is a 32-bit readable/writable register that sets the INTIFS value.



Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 0	INTIFS	All 0	R/W	Initial Value of FSI These bits set initial value of FSI. Set the input sampling rate and output sampling rate within the restricted range determined by the number of channels. Example: Fin = 32 kHz Fout = 44.1 kHz FSI = 2^{22} * 32000/44100 = 3043485 = 0x02E709D

When using the SRC in asynchronous mode, INTIFS is given as the initial value of FSI, which is the sampling conversion function. Therefore, after setting the INTIFSEN bit in IFSCRp_2SRC0_m to 1, set the INTIFS bits to the desired value. The SRC automatically detects the input sampling frequency and output sampling frequency. Based on this, the FSI value is calculated so that the following equation is satisfied.

$$\frac{Fin}{Fout} \approx \frac{FSI}{FSO}$$

[Legend]
Fin: Input sampling frequency
Fout: Output sampling frequency
FSI: Input sampling rate
FSO: Output sampling rate (fixed value: 2^{22} = 0x0400000)

When using the SRC in synchronous mode, the value set in INTIFS is used as the FSI value from beginning to end. The value set in INITFS is shown in Table 37.3 to Table 37.8.

Table 37.3 INITFS Setting (Delay Mode: Normal, Number of Channels: 1 or 2)

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 0	MINFS	All 0	R/W	Minimum Value of FS Ratio These bits set the FS ratio to start fading out the output data to mute under the situation that the input timing stops during SRC processing. This setting value should be less than the value of IFSVRp_2SRC0_m register. Example: Fin = 32kHz Fout = 44.1kHz FSI = 2^{22} * 32000/44100 = 3043485 = 0x02E709D MINFS = FSI * 98% = 2982615 = 0x02D82D7 Set the ratio which is out of the range of the jitter. (The recommended value is from 90 to 98 percent.)

37.3.25 2SRC0_m Buffer Size Setting Register p (BFSSRp_2SRC0_m) (m = 0, 1; p = 0, 1)

BFSSRp_2SRC0_m is a 32-bit readable/writable register that sets the buffer size. This register setting is valid only when SRCCRp_2SRC0_m.BUFMD = 1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	BUFDATA	All 0	R/W	Set the buffer size of 1 channel in DATA RAM. Sets 0x80 for low delay mode 1. Sets 0x40 for low delay mode 2.
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	BUFIN	All 0	R/W	Set the buffer size of 1 channel in INDATA RAM. Sets 0x5 for low delay mode.

37.3.26 2SRC0_m SCU2 Status Register p (SC2SRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SC2SRp_2SRC0_m is a 32-bit read-only register that indicates the status of the SRC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SRCWSTS	SC2MUTE	SC2STS		SC2FSI

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	SRCWSTS	0	R	Status of Wait Time Operation of SRC 0: Wait for count up to wait time 1: Reached to wait time
30	SC2MUTE	0	R	SRC Mute Status This bit is only used for debug. 0: SRC output data is not fixed and it should be muted. This happens when SRC cannot synchronize the input sampling rate and output sampling rate. 1: SRC output data is fixed.
29, 28	SC2STS	All 0	R	Status of SRC 00: SRC is reset. 01: SRC is initialized. 10: SRC is processing. 11: Reserved
27 to 0	SC2FSI	All 0	R	Latest value of FSI which is calculated by SRC

37.3.27 2SRC0_m Wait Time Setting Register p (WATSRp_2SRC0_m) (m = 0, 1; p = 0, 1)

WATSRp_2SRC0_m is a 32-bit readable/writable register that sets the wait time for data input to the SRC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	WTIME							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WTIME															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	WTIME	All 0	R/W	These bits set the wait time when WATMD bit of SRCCRp_2SRC0_m register is 1. After the INIT bit of SRCIRp_2SRC0_m register is set to 0, 0 data is stored into the SRC until the number of input data reaches to the setting value of these bits. The data input before the INIT bit is set to 0 is discarded. After the number of input data reaches to the setting value, input data is stored into the SRC.

37.3.28 2SRC0_m Event Mask Register p (SEVMRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SEVMRp_2SRC0_m is a 32-bit readable/writable register that enables or disables SCUAIm interrupt requests. The name of the interrupt source corresponding to the interrupt request from SEVMRp_2SRC0_0 is SCUAI0 and that corresponding to the interrupt request from SEVMRp_2SRC0_1 is SCUAI1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W:	R	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	EVMUF	0	R/W	SRC Underflow Mask This bit sets whether to mask the interrupt request from the EVCUF bit in the SEVCRp_2SRC0_m register. 0: Disables interrupts. 1: Enables interrupts.
30	EVMOF	0	R/W	SRC Overflow Mask This bit sets whether to mask the EVCOF bit in the SEVCRp_2SRC0_m register. 0: Disables interrupts. 1: Enables interrupts.
29 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14	EVMWAIT	0	R/W	SRC Wait Time Mask This bit sets whether to mask the interrupt request from the EVCWAIT bit of SEVCRp_2SRC0_m register. 0: Disables interrupts. 1: Enables interrupts.
13 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

37.3.29 2SRC0_m Event Clear Register p (SEVCRp_2SRC0_m) (m = 0, 1; p = 0, 1)

SEVCRp_2SRC0_m is a 32-bit readable/writable register that clears SCUAIm interrupt requests. When an interrupt event is generated, the relevant bit in this register is automatically set to 1 and 1 is retained until 0 is written to that bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EVCUF	EVCOF	-	-	-	-	-	-	-	-	-	-	-	-	-	-

R/W:	R/(W)*1	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	EVC WAIT	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	EVCUF	0	R/(W)*1	SRC Underflow Clear This is an interrupt flag to indicate whether INDATA RAM underflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
30	EVCOF	0	R/(W)*1	SRC Overflow Clear This is an interrupt flag to indicate whether INDATA RAM overflow occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
29 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14	EVCWAIT	0	R/(W)*1	SRC Wait Time Clear This is an interrupt flag to indicate whether SRC has started processing after the wait time. 0: Clears the flag. 1: Retains the flag.
13 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note 1. Readable/writable. When 0 is written, the bit is initialized. Writing 1 to the bit is ignored. Write 0 only to each bit corresponding to the interrupt source to be cleared; write 1 to other bits.

37.3.30 2SRC0_m Initialization Register RIF (SRCIRR_2SRC0_m) (m = 0, 1)

SRCIRR_2SRC0_m is a 32-bit readable/writable register that initializes COEF-ROMIF which is mounted on 2SRC0_m.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the COEF-ROMIF internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.31 DVU0_n Initialization Register (DVUIR_DVU0_n) (n = 0, 1, 2, 3)

DVUIR_DVU0_n is a 32-bit readable/writable register that initializes the DVU internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the DVU internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.32 DVU0_n Audio Information Register (VADIR_DVU0_n) (n = 0, 1, 2, 3)

VADIR_DVU0_n is a 32-bit readable/writable register that sets the bit length of data and the number of channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	OTBL				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CHNUM			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20 to 16	OTBL	All 0	R/W	Bit Length of Output Audio Data. 00000: 24 bits 00001 to 00111: Reserved 01000: 16 bits 01001 to 11111: Reserved
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM	All 0	R/W	Number of Channels These bits set the number of channels. 0000: Zero (None) 0001: 1 channel 0010: 2 channels 0011: Reserved 0100: 4 channels 0101: Reserved 0110: 6 channels 0111: Reserved 1000: 8 channels 1001 to 1111: Reserved

37.3.33 DVU0_n Bypass Register (DVUBR_DVU0_n) (n = 0, 1, 2, 3)

DVUBR_DVU0_n is a 32-bit readable/writable register that sets the bypass mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	BY PASS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BYPASS	0	R/W	Bypass Mode This bit controls the data pass of DVU. 0: DVU function is used. Input data is processed by DVU and then the result data is connected to output data. 1: DVU function is not used. Input data is directly connected to output data.

37.3.34 DVU0_n Control Register (DVUCR_DVU0_n) (n = 0, 1, 2, 3)

DVUCR_DVU0_n is a 32-bit readable/writable register that selects the DVU mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	VVMD	-	-	-	VRMD	-	-	-	ZCMD

R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	VVMD	0	R/W	Digital Volume Mode Select This bit selects the digital volume function. 0: Disables the digital volume function. 1: Enables the digital volume function.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	VRMD	0	R/W	Volume Ramp Mode Select This bit selects the volume ramp function. 0: Disables the volume ramp function. 1: Enables the volume ramp function.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ZCMD	0	R/W	Zero Cross Mute Mode Select This bit selects the zero cross mute function. 0: Disables the zero cross mute function. 1: Enables the zero cross mute function.

37.3.35 DVU0_n Zero Cross Mute Control Register (ZCMCR_DVU0_n) (n = 0, 1, 2, 3)

ZCMCR_DVU0_n is a 32-bit readable/writable register that controls operation of the zero cross mute function for each channel.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	ZCEN7	ZCEN6	ZCEN5	ZCEN4	ZCEN3	ZCEN2	ZCEN1	ZCEN0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	ZCEN7	0	R/W	Zero Cross Mute Enable for Channel 7 This bit controls the operation of the zero cross mute function for channel 7. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
6	ZCEN6	0	R/W	Zero Cross Mute Enable for Channel 6 This bit controls the operation of the zero cross mute function for channel 6. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
5	ZCEN5	0	R/W	Zero Cross Mute Enable for Channel 5 This bit controls the operation of the zero cross mute function for channel 5. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
4	ZCEN4	0	R/W	Zero Cross Mute Enable for Channel 4 This bit controls the operation of the zero cross mute function for channel 4. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
3	ZCEN3	0	R/W	Zero Cross Mute Enable for Channel 3 This bit controls the operation of the zero cross mute function for channel 3. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
2	ZCEN2	0	R/W	Zero Cross Mute Enable for Channel 2 This bit controls the operation of the zero cross mute function for channel 2. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
1	ZCEN1	0	R/W	Zero Cross Mute Enable for Channel 1 This bit controls the operation of the zero cross mute function for channel 1. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.
0	ZCEN0	0	R/W	Zero Cross Mute Enable for Channel 0 This bit controls the operation of the zero cross mute function for channel 0. 0: Disables the operation of the zero cross mute function. 1: Enables the operation the zero cross mute function.

37.3.36 DVU0_n Volume Ramp Control Register (VRCTR_DVU0_n) (n = 0, 1, 2, 3)

VRCTR_DVU0_n is a 32-bit readable/writable register that controls operation of the volume ramp function.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	VREN7	VREN6	VREN5	VREN4	VREN3	VREN2	VREN1	VREN0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	VREN7	0	R/W	Volume Ramp Enable for Channel 7 This bit controls the operation of the volume ramp function for channel 7. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
6	VREN6	0	R/W	Volume Ramp Enable for Channel 6 This bit controls the operation of the volume ramp function for channel 6. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
5	VREN5	0	R/W	Volume Ramp Enable for Channel 5 This bit controls the operation of the volume ramp function for channel 5. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
4	VREN4	0	R/W	Volume Ramp Enable for Channel 4 This bit controls the operation of the volume ramp function for channel 4. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
3	VREN3	0	R/W	Volume Ramp Enable for Channel 3 This bit controls the operation of the volume ramp function for channel 3. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
2	VREN2	0	R/W	Volume Ramp Enable for Channel 2 This bit controls the operation of the volume ramp function for channel 2. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
1	VREN1	0	R/W	Volume Ramp Enable for Channel 1 This bit controls the operation of the volume ramp function for channel 1. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.
0	VREN0	0	R/W	Volume Ramp Enable for Channel 0 This bit controls the operation of the volume ramp function for channel 0. 0: Disables the operation of the volume ramp function. 1: Enables the operation of the volume ramp function.

37.3.37 DVU0_n Volume Ramp Period Register (VRPDR_DVU0_n) (n = 0, 1, 2, 3)

VRPDR_DVU0_n is a 32-bit readable/writable register that sets the ramp time of volume ramp.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	VRPDUP					-	-	-	VRPDDW

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12 to 8	VRPDUP	All 0	R/W	Volume Ramp Period for Volume Up 00000: 1 [sample] (128 dB/1 step) 00001: 2 [sample] (64 dB/1 step) 00010: 4 [sample] (32 dB/1 step) 00011: 8 [sample] (16 dB/1 step) 00100: 16 [sample] (8 dB/1 step) 00101: 32 [sample] (4 dB/1 step) 00110: 64 [sample] (2 dB/1 step) 00111: 128 [sample] (1 dB/1 step) 01000: 256 [sample] (0.5 dB/1 step) 01001: 512 [sample] (0.25 dB/1 step) 01010: 1024 [sample] (0.125 dB/1 step) 01011: 2048 [sample] (0.125 dB/2 steps) 01100: 4096 [sample] (0.125 dB/4 steps) 01101: 8192 [sample] (0.125 dB/8 steps) 01110: 16384 [sample] (0.125 dB/16 steps) 01111: 32768 [sample] (0.125 dB/32 steps) 10000: 65536 [sample] (0.125 dB/64 steps) 10001: 131072 [sample] (0.125 dB/128 steps) 10010: 262144 [sample] (0.125 dB/256 steps) 10011: 524288 [sample] (0.125 dB/512 steps) 10100: 1048576 [sample] (0.125 dB/1024 steps) 10101: 2097152 [sample] (0.125 dB/2048 steps) 10110: 4194304 [sample] (0.125 dB/4096 steps) 10111: 8388608 [sample] (0.125 dB/8192 steps) 11000 to 11111: Reserved
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
4 to 0	VRPDDW	0	R/W	Volume Ramp Period for Volume Down 00000: 1 [sample] (-128 dB/1 step) 00001: 2 [sample] (-64 dB/1 step) 00010: 4 [sample] (-32 dB/1 step) 00011: 8 [sample] (-16 dB/1 step) 00100: 16 [sample] (-8 dB/1 step) 00101: 32 [sample] (-4 dB/1 step) 00110: 64 [sample] (-2 dB/1 step) 00111: 128 [sample] (-1 dB/1 step) 01000: 256 [sample] (-0.5 dB/1 step) 01001: 512 [sample] (-0.25 dB/1 step) 01010: 1024 [sample] (-0.125 dB/1 step) 01011: 2048 [sample] (-0.125 dB/2 steps) 01100: 4096 [sample] (-0.125 dB/4 steps) 01101: 8192 [sample] (-0.125 dB/8 steps) 01110: 16384 [sample] (-0.125 dB/16 steps) 01111: 32768 [sample] (-0.125 dB/32 steps) 10000: 65536 [sample] (-0.125 dB/64 steps) 10001: 131072 [sample] (-0.125 dB/128 steps) 10010: 262144 [sample] (-0.125 dB/256 steps) 10011: 524288 [sample] (-0.125 dB/512 steps) 10100: 1048576 [sample] (-0.125 dB/1024 steps) 10101: 2097152 [sample] (-0.125 dB/2048 steps) 10110: 4194304 [sample] (-0.125 dB/4096 steps) 10111: 8388608 [sample] (-0.125 dB/8192 steps) 11000 to 11111: Reserved

37.3.38 DVU0_n Volume Ramp Decibel Register (VRDBR_DVU0_n) (n = 0, 1, 2, 3)

VRDBR_DVU0_n is a 32-bit readable/writable register that sets the gain level (decibel units) of volume ramp.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

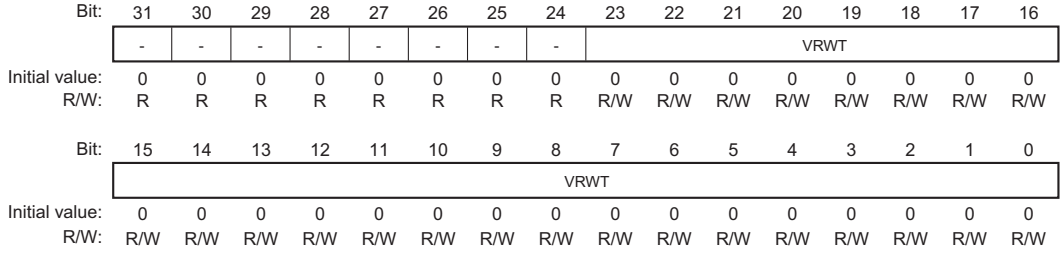
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	VRDB									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	VRDB	All 0	R/W	Decibel of Volume Ramp These bits set the decibel (gain level) of volume ramp. The value can be selected from 1024 points in the range of f0 dB to -∞ dB at intervals of 0.125 dB.

Setting Value	Time	Gain[dB]	Setting Value	Time	Gain[dB]
0x000	1	0	.....	.....	.....
.....	.....	.....	0x091	0.125	-18.125
0x031	0.5	-6.125	.....	.....	.....
.....	.....	.....	0x3FE	4.1×10^{-7}	-127.75
0x061	0.25	-12.125	0x3FF	0 (Mute)	-∞

37.3.39 DVU0_n Volume Ramp Wait Time Register (VRWTR_DVU0_n) (n = 0, 1, 2, 3)

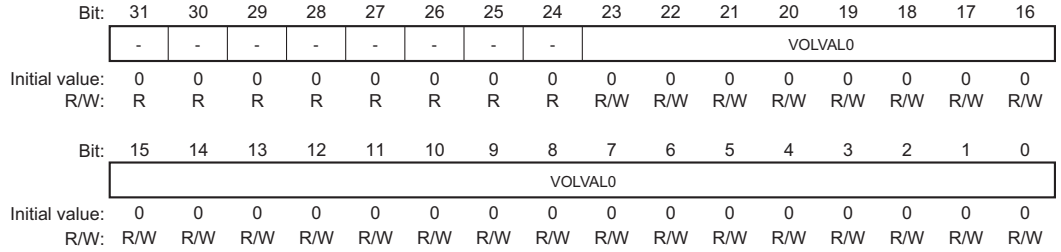
VRWTR_DVU0_n is a 32-bit readable/writable register that sets the wait time before executing the volume ramp function.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	VRWT	All 0	R/W	Volume Ramp Wait Time These bits set the wait time before starting the volume ramp function when the setting of VRDBR register is changed. If the internal counter of the DVU logic reached to the value of these bits, the volume ramp function starts operating to change the volume to the value changed in the VRDBR register as a target.

37.3.40 DVU0_n Volume Value Setting 0 Register (VOL0R_DVU0_n) (n = 0, 1, 2, 3)

VOL0R_DVU0_n is a 32-bit readable/writable register that sets the digital volume value of channel 0.



Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	VOLVAL0	All 0	R/W	Digital Volume Value for Channel 0 These bits set the digital volume of channel 0. The maximum value is octupled gain (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL0[23] : Sign bit VOLVAL0[22:20] : Integer bits VOLVAL0[19:0] : Decimal bits

Setting Value	Time	Gain[dB]	Setting Value	Time	Gain[dB]
0x7F_FFFF	8	18	0x08_0000	0.5	-6
...	...	...	...	...	...

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 0	VOLVAL7	All 0	R/W	Digital Volume Value for Channel7 These bits set the digital volume of channel 7. The maximum value is octupled gain (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL7[23] : Sign bit VOLVAL7[22:20] : Integer bits VOLVAL7[19:0] : Decimal bits

Setting Value	Time	Gain[dB]	Setting Value	Time	Gain[dB]
0x7F_FFFF	8	18	0x08_0000	0.5	-6
...	...	...	...	...	...
0x10_0000	1	0	0x00_0001	9.5×10^{-7}	-120
...	...	...	0x00_0000	0	-∞

37.3.48 DVU0_n Enable Register (DVUER_DVU0_n) (n = 0, 1, 2, 3)

DVUER_DVU0_n is a 32-bit readable/writable register that enables or disables the DVU register settings.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	DVUEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	DVUEN	0	R/W	DVU Register Setting Enable This bit controls the setting of DVU registers (ZCMCR, VRCTR, VRPDR, VRDBR, VOL0R, VOL1R, VOL2R, VOL3R, VOL4R, VOL5R, VOL6R, and VOL7R). 0: Disables the setting of DVU registers. 1: Enables the setting of DVU registers.

37.3.49 DVU0_n Status Register (DVUSR_DVU0_n) (n = 0, 1, 2, 3)

DVUSR_DVU0_n is a 32-bit read-only register that indicates the status of zero cross mute and volume ramp.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	ZSTS7	ZSTS6	ZSTS5	ZSTS4	ZSTS3	ZSTS2	ZSTS1	ZSTS0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	VRSTS

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23	ZSTS7	0	R	Zero Cross Mute Status of Channel 7 This bit indicates the zero cross mute status of channel 7. 0: Not in mute status 1: Mute status
22	ZSTS6	0	R	Zero Cross Mute Status of Channel 6 This bit indicates the zero cross mute status of channel 6. 0: Not in mute status 1: Mute status
21	ZSTS5	0	R	Zero Cross Mute Status of Channel 5 This bit indicates the zero cross mute status of channel 5. 0: Not in mute status 1: Mute status
20	ZSTS4	0	R	Zero Cross Mute Status of Channel 4 This bit indicates the zero cross mute status of channel 4. 0: Not in mute status 1: Mute status
19	ZSTS3	0	R	Zero Cross Mute Status of Channel 3 This bit indicates the zero cross mute status of channel 3. 0: Not in mute status 1: Mute status
18	ZSTS2	0	R	Zero Cross Mute Status of Channel 2 This bit indicates the zero cross mute status of channel 2. 0: Not in mute status 1: Mute status
17	ZSTS1	0	R	Zero Cross Mute Status of Channel 1 This bit indicates the zero cross mute status of channel 1. 0: Not in mute status 1: Mute status
16	ZSTS0	0	R	Zero Cross Mute Status of Channel 0 This bit indicates the zero cross mute status of channel 0. 0: Not in mute status 1: Mute status
15 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	VRSTS	All 0	R	Volume Ramp Status These bits indicate the volume ramp status. 000: Mute status 001: Volume ramp down 010: Volume ramp up 011: Level of volume ramp is in the state of the value of VRDBR register 100: Volume of input data is maintained (Volume is not multiplied). 101 to 111: Reserved

37.3.50 DVU0_n Event Mask Register (VEVMR_DVU0_n) (n = 0, 1, 2, 3)

VEVMR_DVU0_n is a 32-bit readable/writable register that enables or disables SCUDVIn interrupt requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VEVM ZCM7	VEVM ZCM6	VEVM ZCM5	VEVM ZCM4	VEVM ZCM3	VEVM ZCM2	VEVM ZCM1	VEVM ZCM0	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VEV MVR	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	VEVMZCM7	0	R/W	Zero Cross Mute Status Change Mask of Channel 7 This bit sets whether to mask the interrupt request from the VEVCZCM7 bit in the VEVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
30	VEVMZCM6	0	R/W	Zero Cross Mute Status Change Mask of Channel 6 This bit sets whether to mask the interrupt request from the VEVCZCM6 bit in the VEVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
29	VEVMZCM5	0	R/W	Zero Cross Mute Status Change Mask of Channel 5 This bit sets whether to mask the interrupt request from the VEVCZCM5 bit in the VEVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
28	VEVMZCM4	0	R/W	Zero Cross Mute Status Change Mask of Channel 4 This bit sets whether to mask the interrupt request from the VEVCZCM4 bit in the VEVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
27	VEVMZCM3	0	R/W	Zero Cross Mute Status Change Mask of Channel 3 This bit sets whether to mask the interrupt request from the VEVCZCM3 bit in the VEVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
26	VEVMZCM2	0	R/W	Zero Cross Mute Status Change Mask of Channel 2 This bit sets whether to mask the interrupt request from the VEVCZCM2 bit in the VEVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
25	VEVMZCM1	0	R/W	Zero Cross Mute Status Change Mask of Channel 1 This bit sets whether to mask the interrupt request from the VEVCZCM1 bit in the VEVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
24	VEVMZCM0	0	R/W	Zero Cross Mute Status Change Mask of Channel 0 This bit sets whether to mask the interrupt request from the VEVCZCM0 bit in the VEVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.
23 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15	VEVMVR	0	R/W	Volume Ramp Status Change This bit sets whether to mask the interrupt request from the VEVCVR bit in the VEVCR_DVU0_n register. 0: Disables interrupts. 1: Enables interrupts.

Bit	Bit Name	Initial Value	R/W	Description
14 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

37.3.51 DVU0_n Event Clear Register (VEVCR_DVU0_n) (n = 0, 1, 2, 3)

VEVCR_DVU0_n is a 32-bit readable/writable register that clears SCUDVIn interrupt requests. When an interrupt event is generated, the relevant bit in this register is automatically set to 1 and 1 is retained until 0 is written to that bit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VEVCZCM7	VEVCZCM6	VEVCZCM5	VEVCZCM4	VEVCZCM3	VEVCZCM2	VEVCZCM1	VEVCZCM0	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VEVCVR	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*1	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	VEVCZCM7	0	R/(W)*1	Zero Cross Mute Status Change Clear of Channel 7 This is an interrupt flag to indicate whether the zero cross mute status change of channel 7 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
30	VEVCZCM6	0	R/(W)*1	Zero Cross Mute Status Change Clear of Channel 6 This is an interrupt flag to indicate whether the zero cross mute status change of channel 6 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
29	VEVCZCM5	0	R/(W)*1	Zero Cross Mute Status Change Clear of Channel 5 This is an interrupt flag to indicate whether the zero cross mute status change of channel 5 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
28	VEVCZCM4	0	R/(W)*1	Zero Cross Mute Status Change Clear of Channel 4 This is an interrupt flag to indicate whether the zero cross mute status change of channel 4 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
27	VEVCZCM3	0	R/(W)*1	Zero Cross Mute Status Change Clear of Channel 3 This is an interrupt flag to indicate whether the zero cross mute status change of channel 3 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
26	VEVCZCM2	0	R/(W)*1	Zero Cross Mute Status Change Clear of Channel 2 This is an interrupt flag to indicate whether the zero cross mute status change of channel 2 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
25	VEVCZCM1	0	R/(W)*1	Zero Cross Mute Status Change Clear of Channel 1 This is an interrupt flag to indicate whether the zero cross mute status change of channel 1 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
24	VEVCZCM0	0	R/(W)*1	Zero Cross Mute Status Change Clear of Channel 0 This is an interrupt flag to indicate whether the zero cross mute status change of channel 0 occurs. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
23 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
15	VEVCVR	0	R/(W)*1	Volume Ramp Status Change Clear This is an interrupt flag to judge volume ramp mute occurs or not. When it occurs, this bit is set to 1. 0: Clears the flag. 1: Retains the flag.
14 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note 1. Readable/writable. When 0 is written, the bit is initialized. Writing 1 to the bit is ignored. Write 0 only to each bit corresponding to the interrupt source to be cleared; write 1 to other bits.

37.3.52 MIX0_0 Initialization Register (MIXIR_MIX0_0)

MIXIR_MIX0_0 is a 32-bit readable/writable register that initializes the MIX internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INIT
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	INIT	1	R/W	Initialization When this bit is set to 1, the MIX internal circuit is initialized. To cancel the initialization, set this bit to 0 with it set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers)

37.3.53 MIX0_0 Audio Information Register (MADIR_MIX0_0)

MADIR_MIX0_0 is a 32-bit readable/writable register that sets the number of channels.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	CHNUM			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	CHNUM	All 0	R/W	Number of Channels These bits set the number of channels. 0000: Zero (None) 0001: 1 channel 0010: 2 channels 0011: Reserved 0100: 4 channels 0101: Reserved 0110: 6 channels 0111: Reserved 1000: 8 channels 1001 to 1111: Reserved

37.3.54 MIX0_0 Bypass Register (MIXBR_MIX0_0)

MIXBR_MIX0_0 is a 32-bit readable/writable register that sets the bypass mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	BPSYS	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	BY PASS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	BPSYS	All 0	R/W	Bypass System Select This bit selects the input data output from the MIX module when the BYPASS bit is set to 1. 00: Input data of system A 01: Input data of system B 10: Input data of system C 11: Input data of system D
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BYPASS	0	R/W	Bypass Mode This bit controls the data pass of MIX function. 0: MIX function is used. Input data is processed by MIX and then the result data is connected to output data. 1: SRC function is not used. Input data is connected to output data according to the BPSYS bits.

37.3.55 MIX0_0 Mode Register (MIXMR_MIX0_0)

MIXMR_MIX0_0 is a 32-bit readable/writable register that selects the MIX mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MIX MODE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	MIXMODE	0	R/W	MIX mode This bit sets the mix mode. 0: Selects volume step mixer. 1: Selects volume ramp mixer.

37.3.56 MIX0_0 Volume Period Register (MVPDR_MIX0_0)

MVPDR_MIX0_0 is a 32-bit readable/writable register that sets the ramp time of volume ramp.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	MXPDUP				-	-	-	-	MXPDDW			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 8	MXPDUP	0	R/W	Volume Up Period These bits set the decibel which changes per sample during volume up. This setting is used when the MIXMODE bit in the MIXMR register is set to 1. 0000: 128 dB/1 sample 0001: 64 dB/1 sample 0010: 32 dB/1 sample 0011: 16 dB/1 sample 0100: 8 dB/1 sample 0101: 4 dB/1 sample 0110: 2 dB/1 sample 0111: 1 dB/1 sample 1000: 0.5 dB/1 sample 1001: 0.25 dB/1 sample 1010: 0.125 dB/1 sample 1011 to 1111: Reserved
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	MXPDDW	0	R/W	Volume Down Period These bits set the decibel which changes per sample during volume down. This setting is used when the MIXMODE bit in the MIXMR register is set to 1. 0000: -128 dB/1 sample 0001: -64 dB/1 sample 0010: -32 dB/1 sample 0011: -16 dB/1 sample 0100: -8 dB/1 sample 0101: -4 dB/1 sample 0110: -2 dB/1 sample 0111: -1 dB/1 sample 1000: -0.5 dB/1 sample 1001: -0.25 dB/1 sample 1010: -0.125 dB/1 sample 1011 to 1111: Reserved

37.3.57 MIX0_0 Decibel A Register (MDBAR_MIX0_0)

MDBAR_MIX0_0 is a 32-bit readable/writable register that sets the gain level (decibel units) of system A.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

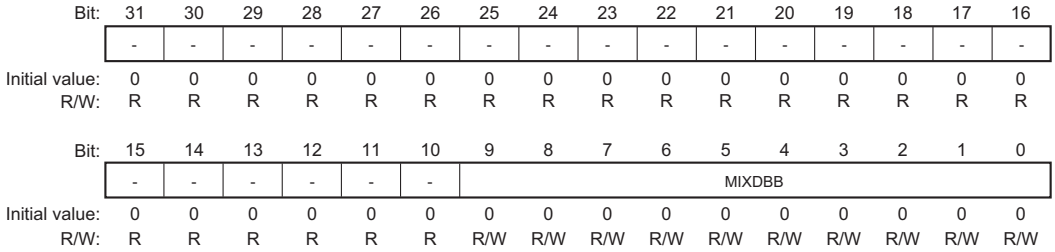
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	MIXDBA									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	MIXDBA	All 0	R/W	dDecibel of System A These bits set the decibel (gain level) of volume ramp. The value can be selected from 1024 points in the range of f0 dB to -∞ dB at intervals of 0.125 dB.

Setting Value	Time	Gain[dB]	Setting Value	Time	Gain[dB]
0x000	1	0	.....	.....	.....
.....	.....	.....	0x091	0.125	-18.125
0x031	0.5	-6.125	.....	.....	.....
.....	.....	.....	0x3FE	4.1×10^{-7}	-127.75
0x061	0.25	-12.125	0x3FF	0 (Mute)	-∞

37.3.58 MIX0_0 Decibel B Register (MDBBR_MIX0_0)

MDBBR_MIX0_0 is a 32-bit readable/writable register that sets the gain level (decibel units) of system B.



Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MIXDBEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	MIXDBEN	0	R/W	MIX Decibel Enable This bit controls the decibel dB set in MDBAR, MDBBR, MDBCR and MDBDR registers. 0: Disables the setting of decibel. 1: Enables the setting of decibel.

37.3.62 MIX0_0 Status Register (MIXSR_MIX0_0)

MIXSR_MIX0_0 is a 32-bit read-only register that indicates the status of the MIX.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	MIXSTS	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	MIXSTS	All 0	R	MIX Status This bit specifies the status of ramp process. 00: Ramp process is unchanged. 01: Ramp down 10: Ramp up

37.3.63 Software Reset Register (SWRSR_CIM)

SWRSR_CIM is a 32-bit readable/writable register that initializes the SCUX internal circuit.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	SWRST
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SWRST	1	R/W	While this bit is set to 0, the SCUX internal circuit is reset. Registers except this register are reset. Therefore, they should be set again after the reset is canceled. 0: The SCUX is reset. 1: The SCUX is operating.

37.3.64 DMA Control Register (DMACR_CIM)

DMACR_CIM is a 32-bit readable/writable register that controls DMA execution.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	DMAM DFFU3	DMAM DFFU2	DMAM DFFU1	DMAM DFFU0	DMAM DFFD3	DMAM DFFD2	DMAM DFFD1	DMAM DFFD0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	—	All 0	R/W	Reserved The write value should always be 0.
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	DMAMDFFU3	0	R/W	FFU0_3 DMA Mode 0: Disables DMA transfer to DMATD3_CIM. 1: Enables DMA transfer to DMATD3_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the UEVMR_FFU0_3.UEVMRQ bit to 0.)
6	DMAMDFFU2	0	R/W	FFU0_2 DMA Mode 0: Disables DMA transfer to DMATD2_CIM. 1: Enables DMA transfer to DMATD2_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the UEVMR_FFU0_2.UEVMRQ bit to 0.)
5	DMAMDFFU1	0	R/W	FFU0_1 DMA Mode 0: Disables DMA transfer to DMATD1_CIM. 1: Enables DMA transfer to DMATD1_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the UEVMR_FFU0_1.UEVMRQ bit to 0.)
4	DMAMDFFU0	0	R/W	FFU0_0 DMA Mode 0: Disables DMA transfer to DMATD0_CIM. 1: Enables DMA transfer to DMATD0_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the UEVMR_FFU0_0.UEVMRQ bit to 0.)
3	DMAMDFFD3	0	R/W	FFD0_3 DMA Mode 0: Disables DMA transfer to DMATD3_CIM. 1: Enables DMA transfer to DMATD3_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the DEVMR_FFD0_3.DEVMRQ bit to 0.)
2	DMAMDFFD2	0	R/W	FFD0_2 DMA Mode 0: Disables DMA transfer to DMATD2_CIM. 1: Enables DMA transfer to DMATD2_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the DEVMR_FFD0_2.DEVMRQ bit to 0.)
1	DMAMDFFD1	0	R/W	FFD0_1 DMA Mode 0: Disables DMA transfer to DMATD1_CIM. 1: Enables DMA transfer to DMATD1_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the DEVMR_FFD0_1.DEVMRQ bit to 0.)
0	DMAMDFFD0	0	R/W	FFD0_0 DMA Mode 0: Disables DMA transfer to DMATD0_CIM. 1: Enables DMA transfer to DMATD0_CIM. Note: When DMA transfer is enabled, disable packet requests sent to the interrupt controller. (Set the DEVMR_FFD0_0.DEVMRQ bit to 0.)

37.3.65 DMA Transfer Register for FFD0_n (DMATDn_CIM) (n = 0, 1, 2, 3)

DMATDn_CIM is a 32-bit register that stores the data to be transmitted to FFD0_n. The data written to DMATDn_CIM is automatically stored in FFD0_n. When the number of idle data bytes in FFD0_n becomes equal to or greater than the value set in DRQSR_FFD0_n.SIZE, a data transfer request is issued. When the DMA controller is used (DMACR_CIM.DMAMDFFDn = 1), a transfer request for the number of counts set in DRQSR_FFD0_n.SIZE is sent to the DMA controller. When the interrupt controller is used (DEVMR_FFD0_n.DEVMRQ = 1), data is written in this register for the number of counts set in DRQSR_FFD0_n.SIZE.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

In the SCUX internal block, audio data is handled in the 24-bit big endian format. When this register is accessed in 32-bit units, the lower eight bits are not used and only the upper 24 bits are used, as shown in Figure 37.2. When the SCUX is used in 16-bit mode, the valid data needs to be located at the MSB of audio data. Therefore, when this register is accessed in 16-bit units, the written data is located in the upper 16 bits of audio data and the lower eight bits are fixed to 0 in the CIM block. When the SCUX is used in 16-bit mode and this register is accessed in 32-bit units, since bits [15:8] of the data to be written is passed to the FFD block without change, 0 should be written to bits [15:8].

DMATD	[31:24]	[23:16]	[15:8]	[7:0]

SCUX audio data	Write data [31:24] Valid data	Write data [23:16] Valid data	Write data [15:8] Write 0 to these bits	

Figure 37.2 Data Alignment of DMATDn_CIM

37.3.66 DMA Transfer Register for FFU0_n (DMATUn_CIM) (n = 0, 1, 2, 3)

DMATUn_CIM is a 32-bit register that stores the data received from FFU0_n. When data is read from DMATUn_CIM, the next data is automatically transferred from FFU0_n. When the number of data bytes in FFU0_n becomes equal to or greater than the value set in URQSR_FFU0_n.SIZE, a data transfer request is issued. When the DMA controller is used (DMACR_CIM.DMAMDFFUn = 1), a transfer request for the number of counts set in URQSR_FFU0_n.SIZE is sent to the DMA controller. When the interrupt controller is used (UEVMR_FFU0_n.UEVMRQ = 1), data is read from this register for the number of counts set in URQSR_FFU0_n.SIZE.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

When this register is accessed in 32-bit units, audio data is located in the upper 24 bits and the lower eight bits are always read as 0, as shown in Figure 37.3. When this register is accessed in 16-bit units, the upper 16 bits of audio data are read as valid data. When the SCUX is used in 16-bit mode and this register is accessed in 32-bit units, the lower eight bits are always read as 0 and bits [15:8] of the read data are read as a value dependent on the internal operation result in the SRC.

16-bit mode, 32-bit access to DMATU				
Read data[31:0]	Audio data [23:16]	Audio data [15:8]	Depends on the operation result*	All 0

Note: * All 1 when the internal operation result of the SRC is 0x7FFFFF; otherwise, all 0.
Even when used in 16-bit mode, operation is performed in 24-bit units.

Figure 37.3 Data Alignment of DMATUn_CIM

37.3.67 SSI Route Select Register (SSIRSEL_CIM)

SSIRSEL_CIM is a 32-bit readable/writable register that selects the SSIF channel to be connected to each SRC during direct transfer with the SSIF module. This register setting has no meaning when a route between the FFD or FFU module is selected. The IPSLR_IPC0_n and OPSLR_OPC0_n registers are used to select connection between the SSIF or FFD/FFU module. The DVUBR_DVU0_n register is used to specify whether the DVU is used or not.

Bit	Bit Name	Initial Value	R/W	Description
31, 30	SISEL3	00	R/W	SRC3 SSIF Input Select These bits select the input route of SRC3. 00: Uses the input from SSIF2. 01, 10, 11: Setting prohibited Note: When the route from the FFD module is selected by the IPSLR_IPC0_3 register, this bit setting has no meaning.
29, 28	SISEL2	00	R/W	SRC2 SSIF Input Select These bits select the input route of SRC2. 00: Uses the input from SSIF1. 01, 10, 11: Setting prohibited Note: When the route from the FFD module is selected by the IPSLR_IPC0_2 register, this bit setting has no meaning.
27, 26	SISEL1	00	R/W	SRC1 SSIF Input Select These bits select the input route of SRC1. 00: Uses the input from SSIF3. 01, 10, 11: Setting prohibited Note: When the route from the FFD module is selected by the IPSLR_IPC0_1 register, this bit setting has no meaning.
25, 24	SISEL0	00	R/W	SRC0 SSIF Input Select These bits select the input route of SRC0. 00: Uses the input from SSIF0. 01: Uses the input from SSIF012.* 10, 11: Setting prohibited Note: When the route from the FFD module is selected by the IPSLR_IPC0_0 register, this bit setting has no meaning. * These bits can be set to 01 only when the SSI1PMD and SSI2PMD bits of the SSIPMD_CIM register are both set to 01 or 10.
23, 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21, 20	—	All 0	R/W	Reserved The write value should always be 0.
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17, 16	—	All 0	R/W	Reserved The write value should always be 0.
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
13, 12	SOSEL3	00	R/W	SSIF3 Output Select These bits select the output route to SSIF3. 00: Uses the output from SRC1 (DVU0_1).*1 01: Uses the output from SRC0 (DVU0_0).*2 10: Uses the output from MIX. 11: Setting prohibited Notes: 1. When the route to the FFU module is selected by the OPSLR_OPC0_1 register, this bit setting has no meaning. 2. When the route to the FFU module is selected by the OPSLR_OPC0_0 register, this bit setting has no meaning.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	SOSEL2	00	R/W	SSIF2 Output Select These bits select the output route to SSIF2. 00: Uses the output from SRC3 (DVU0_3).*1 01: Uses the output from SRC0 (DVU0_0).*2, *4 10: Uses the output from SRC1 (DVU0_1).*3, *4 11: Uses the output from MIX.*4 Notes: 1. When the route to the FFU module is selected by the OPSLR_OPC0_3 register, this bit setting has no meaning. 2. When the route to the FFU module is selected by the OPSLR_OPC0_0 register, this bit setting has no meaning. 3. When the route to the FFU module is selected by the OPSLR_OPC0_1 register, this bit setting has no meaning. 4. Valid only when SSIPMD_CIM.SSI012EN = 1.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	SOSEL1	00	R/W	SSIF1 Output Select These bits select the output route to SSIF1. 00: Uses the output from SRC2 (DVU0_2).*1 01: Uses the output from SRC0 (DVU0_0).*2, *4 10: Uses the output from SRC1 (DVU0_1).*3, *4 11: Uses the output from MIX.*4 Notes: 1. When the route to the FFU module is selected by the OPSLR_OPC0_2 register, this bit setting has no meaning. 2. When the route to the FFU module is selected by the OPSLR_OPC0_0 register, this bit setting has no meaning. 3. When the route to the FFU module is selected by the OPSLR_OPC0_1 register, this bit setting has no meaning. 4. Valid only when SSIPMD_CIM.SSI012EN = 1.
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	SOSEL0	00	R/W	SSIF0 Output Select These bits select the output route to SSIF0. 00: Uses the output from SRC0 (DVU0_0).*1 01: Uses the output from SRC1 (DVU0_1).*2 10: Uses the output from MIX. 11: Setting prohibited. Notes: 1. When the route to the FFU module is selected by the OPSLR_OPC0_0 register, this bit setting has no meaning. 2. When the route to the FFU module is selected by the OPSLR_OPC0_1 register, this bit setting has no meaning.

37.3.68 FFD0_n Timing Select Register (FDTSELn_CIM) (n = 0, 1, 2, 3)

FDTSELn_CIM is a 32-bit readable/writable register that selects the input timing signal to be used in SRCn (n = 0, 1, 2, 3) when asynchronous mode is selected. This register setting is used only when the route with the FFD module is selected.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	SCKDIV										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	DIVEN	-	-	-	MTUSEL	SCKSEL			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	SCKDIV	All 0	R/W	Division Ratio These bits specify the ratio for dividing the input clock specified in the SCKSEL bits to generate the timing signal. Note: Always write 0 to bit 16. (Writing 1 to bit 16 is ignored.) When all of these bits are set to 0, the division ratio is 1. Only the input clock selected by SCKSEL[3] = 0 will be divided. The WS signal selected by SCKSEL[3] = 1 will not be divided. The DIVEN bit must be set to 0 before changing these bits.
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	DIVEN	0	R/W	Division Enable Frequency division starts the moment 1 is written to this bit. 1: Starts frequency division. 0: Outputs 0.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	MTUSEL	0	R/W	MTU Select This bit selects the clock signal specified by setting the SCKSEL bits to 0101 from the multi-function timer pulse unit 2. 0: Uses TIOC3A. 1: Uses TIOC4A
3 to 0	SCKSEL	All 0	R/W	Clock Select These bits select the clock that is used in generating the timing signal. 0000: Uses AUDIO_CLK. 0001: Uses the AUDIO_X1 input. 0010: Uses MLB_CLK. 0011: Uses USB_X1. 0100: Uses the peripheral clock 1 (P1ϕ) divided into 2. 0101: Uses the signal specified by the MTUSEL bit. 0110 and 0111: Setting prohibited 1000: Uses the WS signal of SSIF0. 1001: Uses the WS signal of SSIF1. 1010: Uses the WS signal of SSIF2. 1011: Uses the WS signal of SSIF3. 1100 to 1111: Setting prohibited Note: The DIVEN bit must be set to 0 before changing these bits.

The input timing signal selector has the configuration shown in Figure 37.4.

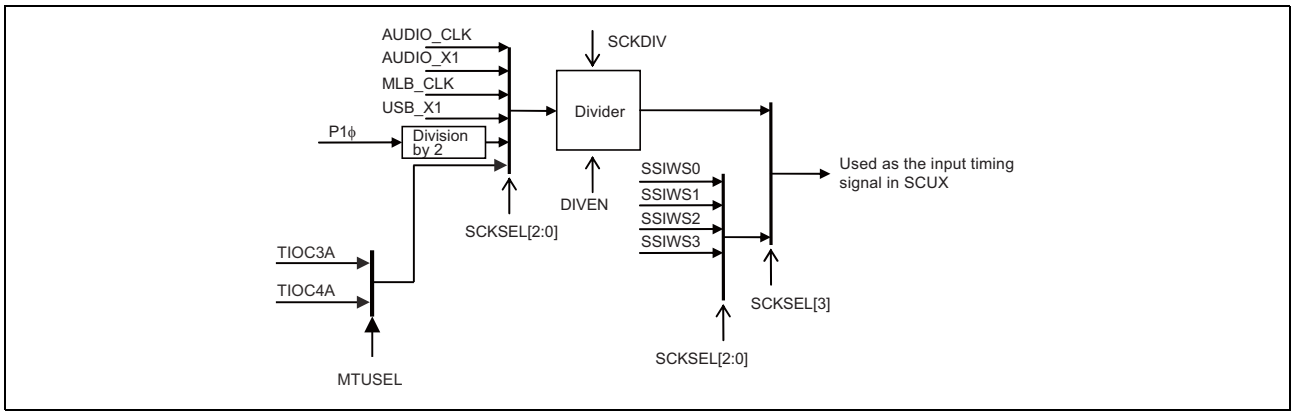

Figure 37.4 Configuration Diagram of Input Timing Signal Selector

37.3.69 FFU0_n Timing Select Register (FDTSELn_CIM) (n = 0, 1, 2, 3)

FUTSELn_CIM is a 32-bit writable register that selects the output timing signal to be used in SRCn (n = 0, 1, 2, 3) when asynchronous mode is selected. This register setting is used when the route with the FFU module is selected or when output to the MIX is selected.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	SCKDIV

R/W:	-	-	-	-	-	W	W	W	W	W	W	W	W	W	W	W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	DIVEN	-	-	-	MTUSEL	SCKSEL			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	-	-	-	-	-	-	-	W	-	-	-	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	—	Reserved The write value should always be 0.
26 to 16	SCKDIV	All 0	W	Division Ratio These bits specify the ratio for dividing the input clock specified in the SCKSEL bits to generate the timing signal. Note: Always write 0 in bit 16. (Writing 1 to bit 16 is ignored.) When all of these bits are set to 0, the division ratio is 1. Only the input clock selected by SCKSEL[3] = 0 will be divided. The WS signal selected by SCKSEL[3] = 1 will not be divided. The DIVEN bit must be set to 0 before changing these bits.
15 to 9	—	All 0	—	Reserved The write value should always be 0.
8	DIVEN	0	W	Division Enable Frequency division starts the moment 1 is written to this bit. 1: Starts frequency division. 0: Outputs 0.
7 to 5	—	All 0	—	Reserved The write value should always be 0.
4	MTUSEL	0	W	MTU Select This bit selects the clock signal specified by setting the SCKSEL bits to 0101 from the multi-function timer pulse unit 2. 0: Uses TIOC3A. 1: Uses TIOC4A.
3 to 0	SCKSEL	All 0	W	Clock Select These bits select the clock that is used in generating the timing signal. 0000: Uses AUDIO_CLK. 0001: Uses AUDIO_X1 input. 0010: Uses MLB_CLK. 0011: Uses USB_X1. 0100: Uses the peripheral clock 1 (P1ϕ) divided into 2. 0101: Uses the signal specified by the MTUSEL bit. 0110 and 0111: Setting prohibited 1000: Uses the WS signal of SSIF0. 1001: Uses the WS signal of SSIF1. 1010: Uses the WS signal of SSIF2. 1011: Uses the WS signal of SSIF3. 1100 to 1111: Setting prohibited Note: The DIVEN bit must be set to 0 before changing these bits.

The output timing signal selector has the configuration shown in Figure 37.5.

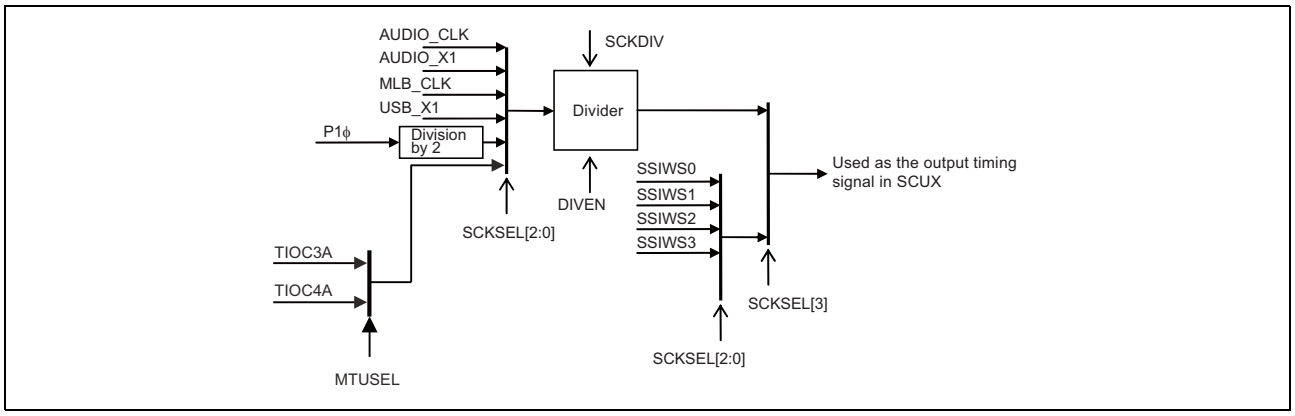

Figure 37.5 Configuration Diagram of Output Timing Signal Selector

37.3.70 SSI Pin Mode Register (SSIPMD_CIM)

SSIPMD_CIM is a 32-bit readable/writable register that sets the pin mode of the SSIF.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	SSI3 CKS	SSI2 CKS	SSI1 CKS	SSI0 CKS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SSI3PMD		-	-	-	-	-	-	-	-	-	SSI 012EN	SSI2PMD		SSI1PMD	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21, 20	—	All 0	R/W	Reserved The write value should always be 0.
19	SSI3CKS	0	R/W	SSIF3 Clock Select This bit selects the clock to be connected to the AUDIO_CLK pin of the SSIF3 module. 0: Selects the AUDIO_CLK input. 1: Selects the MLB_CLK input. Note: When selecting AUDIO_CLK or MLB_CLK as the oversampling clock of the SSIF3 module, SSICR3.CKS = 1 must also be set in the SSIF3 module.
18	SSI2CKS	0	R/W	SSIF2 Clock Select This bit selects the clock to be connected to the AUDIO_CLK pin of the SSIF2 module. 0: Selects the AUDIO_CLK input. 1: Selects the MLB_CLK input. Note: When selecting AUDIO_CLK or MLB_CLK as the oversampling clock of the SSIF2 module, SSICR2.CKS = 1 must also be set in the SSIF2 module.
17	SSI1CKS	0	R/W	SSIF1 Clock Select This bit selects the clock to be connected to the AUDIO_CLK pin of the SSIF1 module. 0: Selects the AUDIO_CLK input. 1: Selects the MLB_CLK input. Note: When selecting AUDIO_CLK or MLB_CLK as the oversampling clock of the SSIF1 module, SSICR1.CKS = 1 must also be set in the SSIF1 module.
16	SSI0CKS	0	R/W	SSIF0 Clock Select This bit selects the clock to be connected to the AUDIO_CLK pin of the SSIF0 module. 0: Selects the AUDIO_CLK input. 1: Selects the MLB_CLK input. Note: When selecting AUDIO_CLK or MLB_CLK as the oversampling clock of the SSIF0 module, SSICR0.CKS = 1 must also be set in the SSIF0 module.
15, 14	SSI3PMD	00	R/W	SSIF3 Pin Mode These bits select connection of the SSISCK3 and SSIWS3 pins. 00: The pins are used independently. 01: The SSIF0 pins are used in common. Both SSIF0 and SSIF3 are slaves. 10: The SSIF0 pins are used in common. SSIF0 is the master and SSIF3 is the slave. 11: Setting prohibited
13	—	All 0	R/W	Reserved This bits is always read as 0. The write value should always be 0.
12 to 8	—	All 0	R/W	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	SSI012EN	0	R/W	SSIF012 Enable This bit selects whether the three modules SSIF0, SSIF1, and SSIF2 are used to provide six channels at transmission. 0: Not handled as six channels. 1: Handled as six channels. Note: This bit can be set to 1 only when the SSI1PMD and SSI2PMD bits of this register are both set to 01 or 10. Usage of six channels at reception can be specified by SSIRSEL_CIM.SISEL0.
3, 2	SSI2PMD	00	R/W	SSIF2 Pin Mode These bits select connection of the SSISCK2 and SSIWS2 pins. 00: The pins are used independently. 01: The SSIF0 pins are used in common. Both SSIF0 and SSIF2 are slaves. 10: The SSIF0 pins are used in common. SSIF0 is the master and SSIF2 is the slave. 11: Setting prohibited
1, 0	SSI1PMD	00	R/W	SSIF1 Pin Mode These bits select connection of the SSISCK1 and SSIWS1 pins. 00: The pins are used independently. 01: The SSIF0 pins are used in common. Both SSIF0 and SSIF1 are slaves. 10: The SSIF0 pins are used in common. SSIF0 is the master and SSIF1 is the slave. 11: Setting prohibited

37.3.71 SSI Control Register (SSICTRL_CIM)

SSIPCTRL_CIM is a 32-bit readable/writable register that controls connection with the SSIF module and starting and stopping of the module.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	SSI3TX	-	-	-	SSI3RX	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	-	W	W	W	-	W	W	W	-	-	-	-	-	-	-	W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	SSI0TX	SSI1TX	SSI2TX	-	SSI0RX	SSI1RX	SSI2RX	-	-	-	-	-	-	SSI 012TEN	SSI 012REN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	-	W	W	W	-	W	W	W	-	-	-	-	-	-	W	W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	—	Reserved The write value should always be 0.
30	SSI3TX	0	W	SSIF3 Direct Transmission 0: Disables direct transmission to SSIF3. 1: Enables direct transmission to SSIF3.
29, 28	—	All 0	W	Reserved The write value should always be 0.
27	—	0	—	Reserved The write value should always be 0.
26	SSI3RX	0	W	SSIF3 Direct Reception 0: Disables direct reception from SSIF3. 1: Enables direct reception from SSIF3.
25, 24	—	All 0	W	Reserved The write value should always be 0.
23 to 18	—	All 0	—	Reserved The write value should always be 0.
17, 16	—	All 0	W	Reserved The write value should always be 0.
15	—	0	—	Reserved The write value should always be 0.
14	SSI0TX	0	W	SSIF0 Direct Transmission 0: Disables direct transmission to SSIF0. 1: Enables direct transmission to SSIF0.
13	SSI1TX	0	W	SSIF1 Direct Transmission 0: Disables direct transmission to SSIF1. 1: Enables direct transmission to SSIF1.
12	SSI2TX	0	W	SSIF2 Direct Transmission 0: Disables direct transmission to SSIF2. 1: Enables direct transmission to SSIF2.
11	—	0	—	Reserved The write value should always be 0.
10	SSI0RX	0	W	SSIF0 Direct Reception 0: Disables direct reception from SSIF0. 1: Enables direct reception from SSIF0.
9	SSI1RX	0	W	SSIF1 Direct Reception 0: Disables direct reception from SSIF1. 1: Enables direct reception from SSIF1.
8	SSI2RX	0	W	SSIF2 Direct Reception 0: Disables direct reception from SSIF2. 1: Enables direct reception from SSIF2.
7 to 2	—	All 0	—	Reserved The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1	SSI012TEN	0	W	SSIF012 Transmission Enable This bit specifies transmission in three modules SSIF0, SSIF1, and SSIF2 to be started or stopped simultaneously. 0: Stops transmission in SSIF0, SSIF1, and SSIF2. 1: Starts transmission in SSIF0, SSIF1, and SSIF2. Note: This function can be used only when SSIPMD_CIM.SSI012EN = 1. When SSIPMD_CIM.SSI012EN = 0, SSIF modules should be controlled using SSICRn.TEN. This bit must be set to 0 when performing direct transmission to SSIF0, SSIF1, or SSIF2.
0	SSI012REN	0	W	SSIF012 Reception Enable This bit specifies reception in three modules SSIF0, SSIF1, and SSIF2 to be started or stopped simultaneously. 0: Stops reception in SSIF0, SSIF1, and SSIF2. 1: Starts reception in SSIF0, SSIF1, and SSIF2. Note: This function can be used only when SSIRSEL_CIM.SISEL0 = 01. When SSIRSEL_CIM.SISEL0 = 00, SSIF modules should be controlled using SSICRn.REN. This bit must be set to 0 when performing direct reception from SSIF0, SSIF1, or SSIF2.

37.3.72 SRCn Route Select Register (SRCRSELn_CIM) (n = 0, 1, 2, 3)

SRCRSEL_CIM is a 32-bit readable/writable register that sets the route for the data that is input to the SRC.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	PLACE7			-	PLACE6			-	PLACE5			-	PLACE4		
Initial value:	0	1	1	1	0	1	1	0	0	1	0	1	0	1	0	0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	PLACE3			-	PLACE2			-	PLACE1			-	PLACE0		
Initial value:	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 28	PLACE7	111	R/W	Place 7 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 7 on the output side. 000: Data at place 0 on the input side is output to place 7 on the output side. 001: Data at place 1 on the input side is output to place 7 on the output side. 010: Data at place 2 on the input side is output to place 7 on the output side. 011: Data at place 3 on the input side is output to place 7 on the output side. 100: Data at place 4 on the input side is output to place 7 on the output side. 101: Data at place 5 on the input side is output to place 7 on the output side. 110: Data at place 6 on the input side is output to place 7 on the output side. 111: Data at place 7 on the input side is output to place 7 on the output side. Note: This bit setting is used when eight channels are set. When six or less channels are set, set these bits to the same value as the initial value.
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 24	PLACE6	110	R/W	Place 6 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 6 on the output side. 000: Data at place 0 on the input side is output to place 6 on the output side. 001: Data at place 1 on the input side is output to place 6 on the output side. 010: Data at place 2 on the input side is output to place 6 on the output side. 011: Data at place 3 on the input side is output to place 6 on the output side. 100: Data at place 4 on the input side is output to place 6 on the output side. 101: Data at place 5 on the input side is output to place 6 on the output side. 110: Data at place 6 on the input side is output to place 6 on the output side. 111: Data at place 7 on the input side is output to place 6 on the output side. Note: This bit setting is used when eight channels are set. When six or less channels are set, set these bits to the same value as the initial value.

Bit	Bit Name	Initial Value	R/W	Description
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22 to 20	PLACE5	101	R/W	Place 5 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 5 on the output side. 000: Data at place 0 on the input side is output to place 5 on the output side. 001: Data at place 1 on the input side is output to place 5 on the output side. 010: Data at place 2 on the input side is output to place 5 on the output side. 011: Data at place 3 on the input side is output to place 5 on the output side. 100: Data at place 4 on the input side is output to place 5 on the output side. 101: Data at place 5 on the input side is output to place 5 on the output side. 110: Data at place 6 on the input side is output to place 5 on the output side. 111: Data at place 7 on the input side is output to place 5 on the output side. Note: This bit setting is used when six or more channels are set. When four or less channels are set, set these bits to the same value as the initial value.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18 to 16	PLACE4	100	R/W	Place 4 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 4 on the output side. 000: Data at place 0 on the input side is output to place 4 on the output side. 001: Data at place 1 on the input side is output to place 4 on the output side. 010: Data at place 2 on the input side is output to place 4 on the output side. 011: Data at place 3 on the input side is output to place 4 on the output side. 100: Data at place 4 on the input side is output to place 4 on the output side. 101: Data at place 5 on the input side is output to place 4 on the output side. 110: Data at place 6 on the input side is output to place 4 on the output side. 111: Data at place 7 on the input side is output to place 4 on the output side. Note: This bit setting is used when six or more channels are set. When four or less channels are set, set these bits to the same value as the initial value.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
14 to 12	PLACE3	011	R/W	Place 3 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 3 on the output side. 000: Data at place 0 on the input side is output to place 3 on the output side. 001: Data at place 1 on the input side is output to place 3 on the output side. 010: Data at place 2 on the input side is output to place 3 on the output side. 011: Data at place 3 on the input side is output to place 3 on the output side. 100: Data at place 4 on the input side is output to place 3 on the output side. 101: Data at place 5 on the input side is output to place 3 on the output side. 110: Data at place 6 on the input side is output to place 3 on the output side. 111: Data at place 7 on the input side is output to place 3 on the output side. Note: This bit setting is used when four or more channels are set. When two or less channels are set, set these bits to the same value as the initial value.
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10 to 8	PLACE2	010	R/W	Place 2 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 2 on the output side. 000: Data at place 0 on the input side is output to place 2 on the output side. 001: Data at place 1 on the input side is output to place 2 on the output side. 010: Data at place 2 on the input side is output to place 2 on the output side. 011: Data at place 3 on the input side is output to place 2 on the output side. 100: Data at place 4 on the input side is output to place 2 on the output side. 101: Data at place 5 on the input side is output to place 2 on the output side. 110: Data at place 6 on the input side is output to place 2 on the output side. 111: Data at place 7 on the input side is output to place 2 on the output side. Note: This bit setting is used when four or more channels are set. When two or less channels are set, set these bits to the same value as the initial value.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
6 to 4	PLACE1	001	R/W	Place 1 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 1 on the output side. 000: Data at place 0 on the input side is output to place 1 on the output side. 001: Data at place 1 on the input side is output to place 1 on the output side. 010: Data at place 2 on the input side is output to place 1 on the output side. 011: Data at place 3 on the input side is output to place 1 on the output side. 100: Data at place 4 on the input side is output to place 1 on the output side. 101: Data at place 5 on the input side is output to place 1 on the output side. 110: Data at place 6 on the input side is output to place 1 on the output side. 111: Data at place 7 on the input side is output to place 1 on the output side.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	PLACE0	000	R/W	Place 0 Stream data is rearranged before it is input to the SRC. These bits select data on the input side to be output to place 0 on the output side. 000: Data at place 0 on the input side is output to place 0 on the output side. 001: Data at place 1 on the input side is output to place 0 on the output side. 010: Data at place 2 on the input side is output to place 0 on the output side. 011: Data at place 3 on the input side is output to place 0 on the output side. 100: Data at place 4 on the input side is output to place 0 on the output side. 101: Data at place 5 on the input side is output to place 0 on the output side. 110: Data at place 6 on the input side is output to place 0 on the output side. 111: Data at place 7 on the input side is output to place 0 on the output side.

37.3.73 MIX Route Select Register (MIXRSEL_CIM)

MIXRSEL_CIM is a 32-bit readable/writable register that sets the route for the data that is output from the MIX.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	PLACE7			-	PLACE6			-	PLACE5			-	PLACE4		
Initial value:	0	1	1	1	0	1	1	0	0	1	0	1	0	1	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	PLACE3			-	PLACE2			-	PLACE1			-	PLACE0		
Initial value:	0	0	1	1	0	0	1	0	0	0	0	1	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
30 to 28	PLACE7	111	R/W	Place 7 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 7 on the output side. 000: Data at place 0 on the input side is output to place 7 on the output side. 001: Data at place 1 on the input side is output to place 7 on the output side. 010: Data at place 2 on the input side is output to place 7 on the output side. 011: Data at place 3 on the input side is output to place 7 on the output side. 100: Data at place 4 on the input side is output to place 7 on the output side. 101: Data at place 5 on the input side is output to place 7 on the output side. 110: Data at place 6 on the input side is output to place 7 on the output side. 111: Data at place 7 on the input side is output to place 7 on the output side. Note: This bit setting is used when eight channels are set. When six or less channels are set, set these bits to the same value as the initial value.
27	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
26 to 24	PLACE6	110	R/W	Place 6 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 6 on the output side. 000: Data at place 0 on the input side is output to place 6 on the output side. 001: Data at place 1 on the input side is output to place 6 on the output side. 010: Data at place 2 on the input side is output to place 6 on the output side. 011: Data at place 3 on the input side is output to place 6 on the output side. 100: Data at place 4 on the input side is output to place 6 on the output side. 101: Data at place 5 on the input side is output to place 6 on the output side. 110: Data at place 6 on the input side is output to place 6 on the output side. 111: Data at place 7 on the input side is output to place 6 on the output side. Note: This bit setting is used when eight channels are set. When six or less channels are set, set these bits to the same value as the initial value.

Bit	Bit Name	Initial Value	R/W	Description
23	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
22 to 20	PLACE5	101	R/W	Place 5 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 5 on the output side. 000: Data at place 0 on the input side is output to place 5 on the output side. 001: Data at place 1 on the input side is output to place 5 on the output side. 010: Data at place 2 on the input side is output to place 5 on the output side. 011: Data at place 3 on the input side is output to place 5 on the output side. 100: Data at place 4 on the input side is output to place 5 on the output side. 101: Data at place 5 on the input side is output to place 5 on the output side. 110: Data at place 6 on the input side is output to place 5 on the output side. 111: Data at place 7 on the input side is output to place 5 on the output side. Note: This bit setting is used when six or more channels are set. When four or less channels are set, set these bits to the same value as the initial value.
19	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
18 to 16	PLACE4	100	R/W	Place 4 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 4 on the output side. 000: Data at place 0 on the input side is output to place 4 on the output side. 001: Data at place 1 on the input side is output to place 4 on the output side. 010: Data at place 2 on the input side is output to place 4 on the output side. 011: Data at place 3 on the input side is output to place 4 on the output side. 100: Data at place 4 on the input side is output to place 4 on the output side. 101: Data at place 5 on the input side is output to place 4 on the output side. 110: Data at place 6 on the input side is output to place 4 on the output side. 111: Data at place 7 on the input side is output to place 4 on the output side. Note: This bit setting is used when six or more channels are set. When four or less channels are set, set these bits to the same value as the initial value.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
14 to 12	PLACE3	011	R/W	Place 3 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 3 on the output side. 000: Data at place 0 on the input side is output to place 3 on the output side. 001: Data at place 1 on the input side is output to place 3 on the output side. 010: Data at place 2 on the input side is output to place 3 on the output side. 011: Data at place 3 on the input side is output to place 3 on the output side. 100: Data at place 4 on the input side is output to place 3 on the output side. 101: Data at place 5 on the input side is output to place 3 on the output side. 110: Data at place 6 on the input side is output to place 3 on the output side. 111: Data at place 7 on the input side is output to place 3 on the output side. Note: This bit setting is used when four or more channels are set. When two or less channels are set, set these bits to the same value as the initial value.
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10 to 8	PLACE2	010	R/W	Place 2 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 2 on the output side. 000: Data at place 0 on the input side is output to place 2 on the output side. 001: Data at place 1 on the input side is output to place 2 on the output side. 010: Data at place 2 on the input side is output to place 2 on the output side. 011: Data at place 3 on the input side is output to place 2 on the output side. 100: Data at place 4 on the input side is output to place 2 on the output side. 101: Data at place 5 on the input side is output to place 2 on the output side. 110: Data at place 6 on the input side is output to place 2 on the output side. 111: Data at place 7 on the input side is output to place 2 on the output side. Note: This bit setting is used when four or more channels are set. When two or less channels are set, set these bits to the same value as the initial value.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
6 to 4	PLACE1	001	R/W	Place 1 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 1 on the output side. 000: Data at place 0 on the input side is output to place 1 on the output side. 001: Data at place 1 on the input side is output to place 1 on the output side. 010: Data at place 2 on the input side is output to place 1 on the output side. 011: Data at place 3 on the input side is output to place 1 on the output side. 100: Data at place 4 on the input side is output to place 1 on the output side. 101: Data at place 5 on the input side is output to place 1 on the output side. 110: Data at place 6 on the input side is output to place 1 on the output side. 111: Data at place 7 on the input side is output to place 1 on the output side.
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	PLACE0	000	R/W	Place 0 Stream data is rearranged after it is output from the MIX. These bits select data on the input side to be output to place 0 on the output side. 000: Data at place 0 on the input side is output to place 0 on the output side. 001: Data at place 1 on the input side is output to place 0 on the output side. 010: Data at place 2 on the input side is output to place 0 on the output side. 011: Data at place 3 on the input side is output to place 0 on the output side. 100: Data at place 4 on the input side is output to place 0 on the output side. 101: Data at place 5 on the input side is output to place 0 on the output side. 110: Data at place 6 on the input side is output to place 0 on the output side. 111: Data at place 7 on the input side is output to place 0 on the output side.

37.4 Operation

37.4.1 Initial Setting Procedure

Figure 37.6 to Figure 37.8 show the initial setting procedure of the SCUX. For details on register setting, refer to section 37.3, Register Descriptions.

37.4.2 Transfer Start Procedure and Stop Procedure

Figure 37.9 to Figure 37.11 show the transfer start procedure and stop procedure of the SCUX. For details on register setting, refer to section 37.3, Register Descriptions.

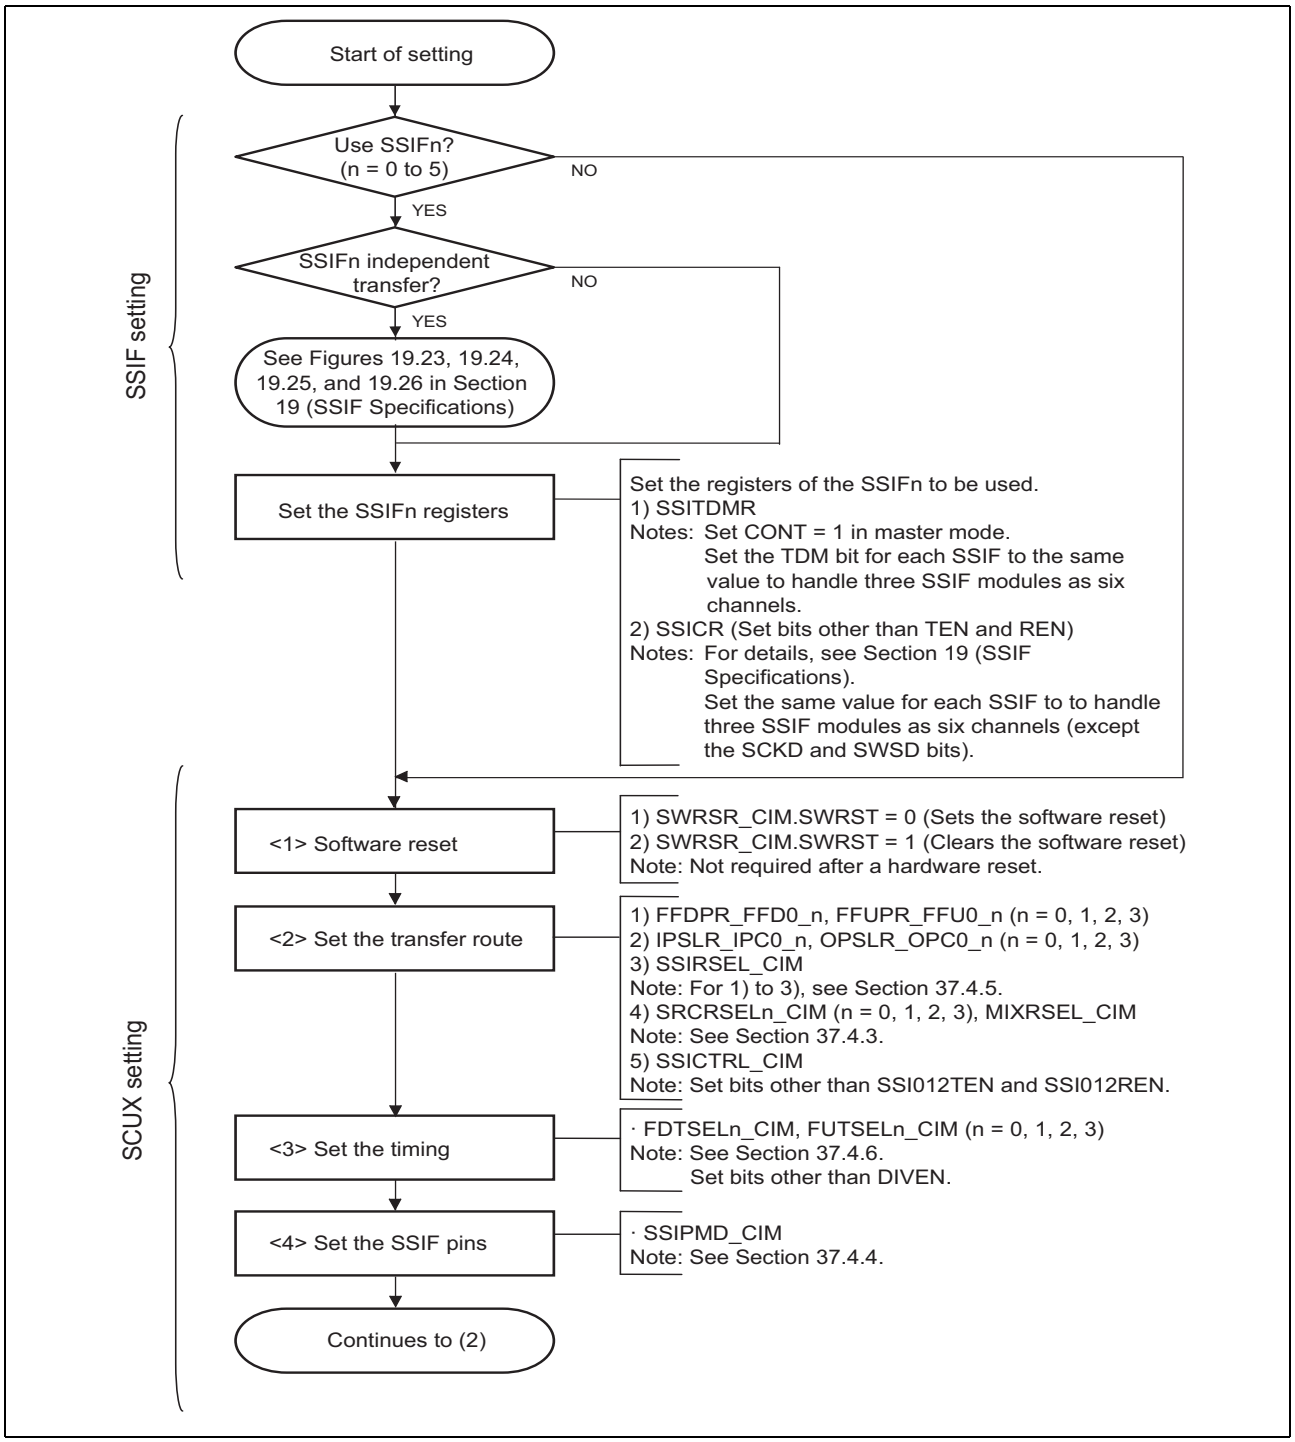

Figure 37.6 Initial Setting Procedure of SCUX (1)

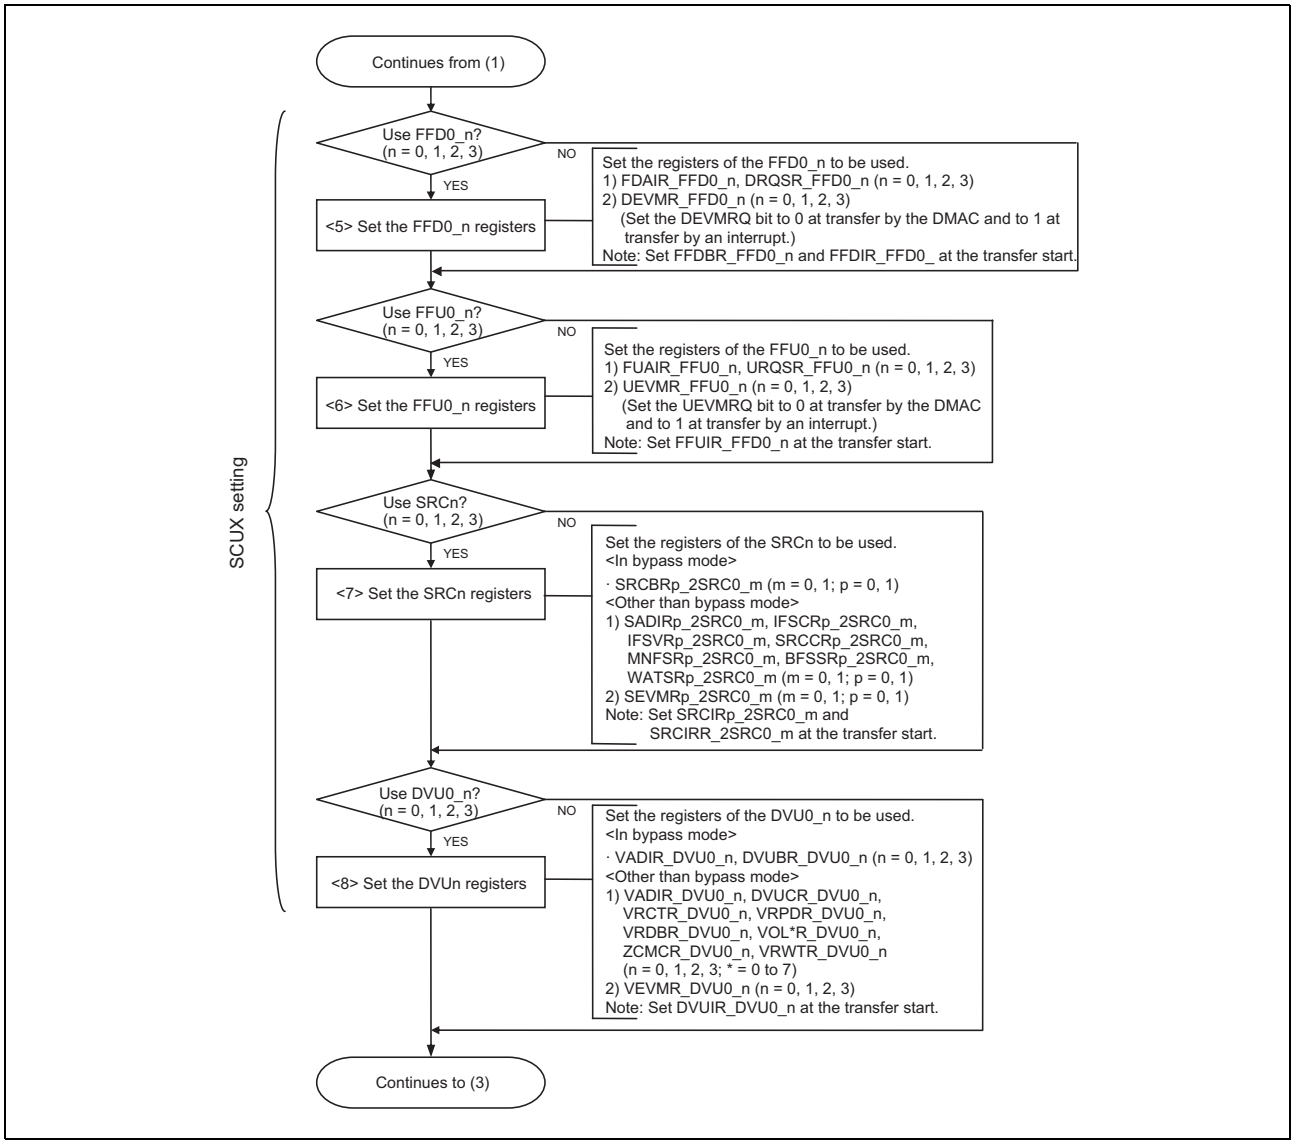

Figure 37.7 Initial Setting Procedure of SCUX (2)

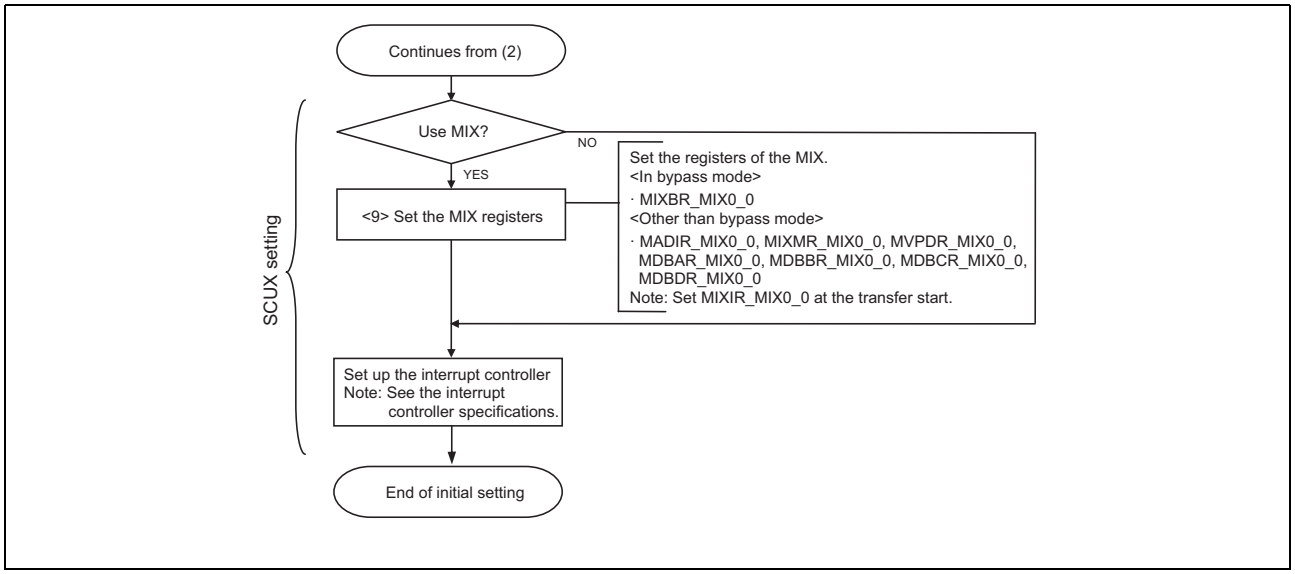

Figure 37.8 Initial Setting Procedure of SCUX (3)

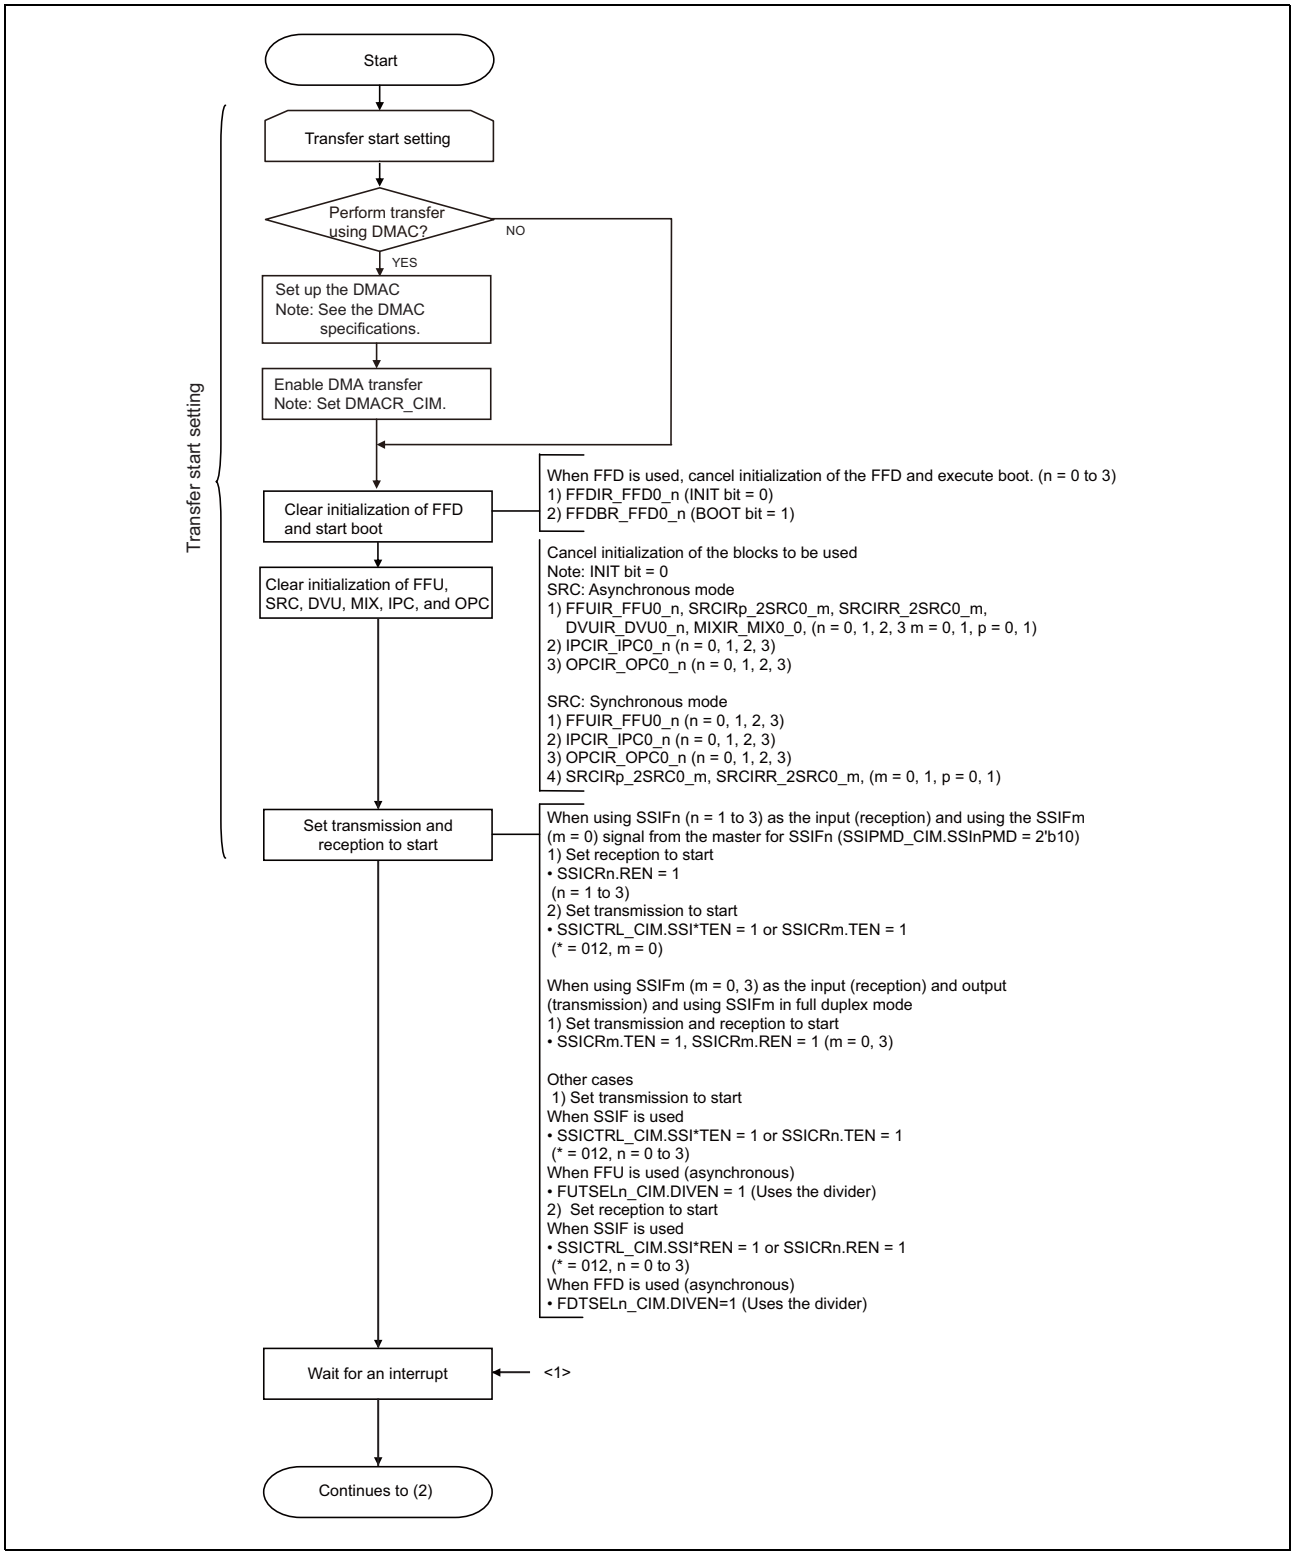

Figure 37.9 Transfer Start Procedure and Stop Procedure of SCUX (1)

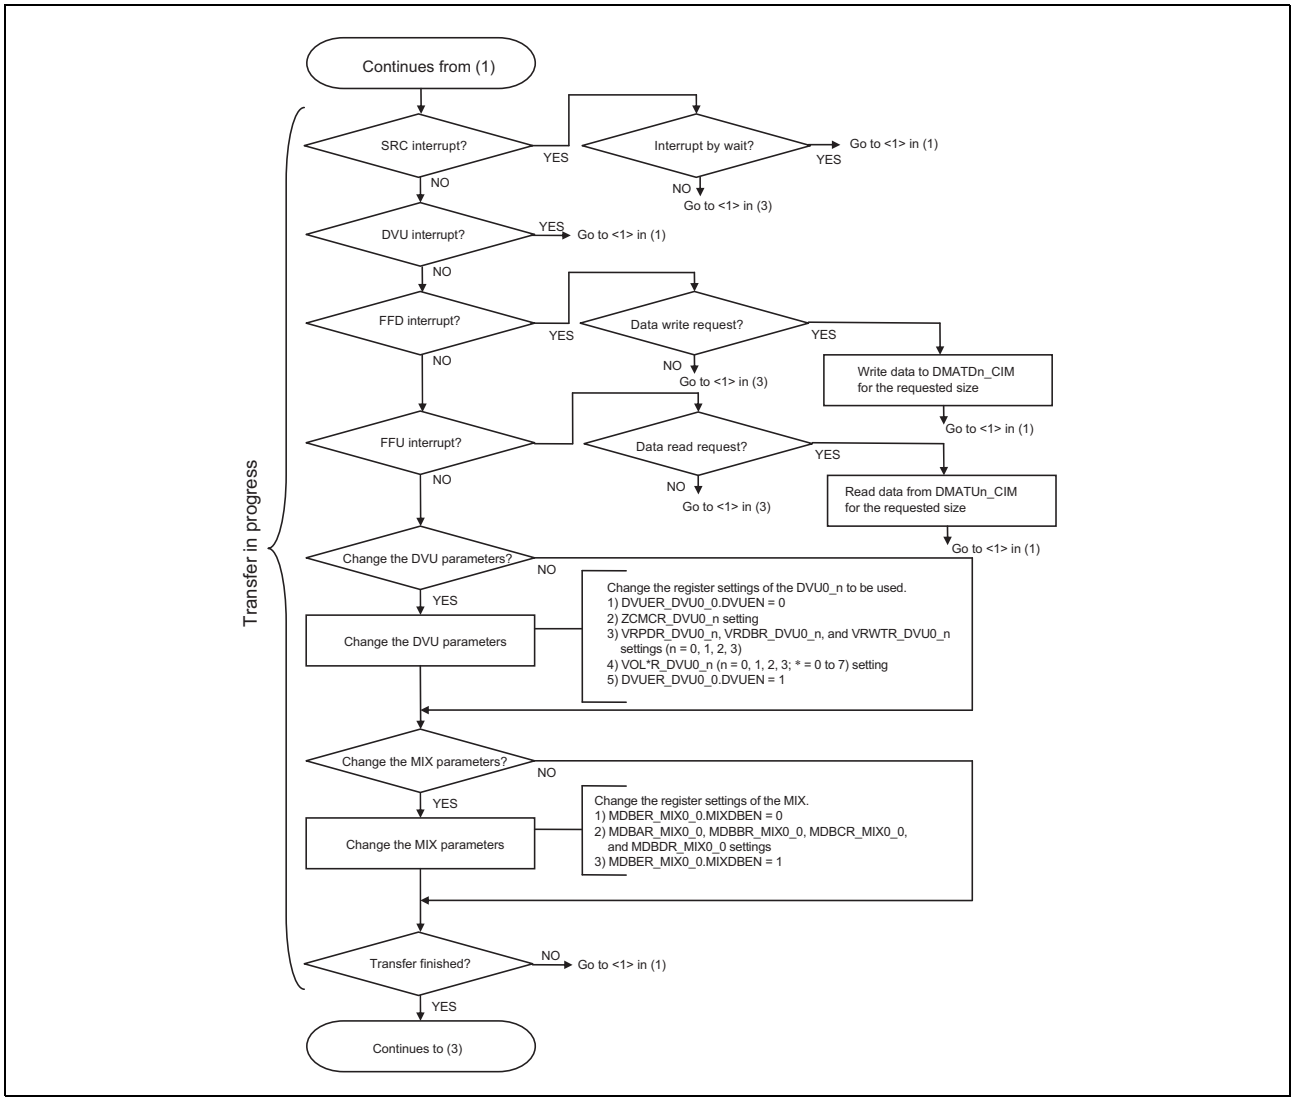

Figure 37.10 Transfer Start Procedure and Stop Procedure of SCUX (2)

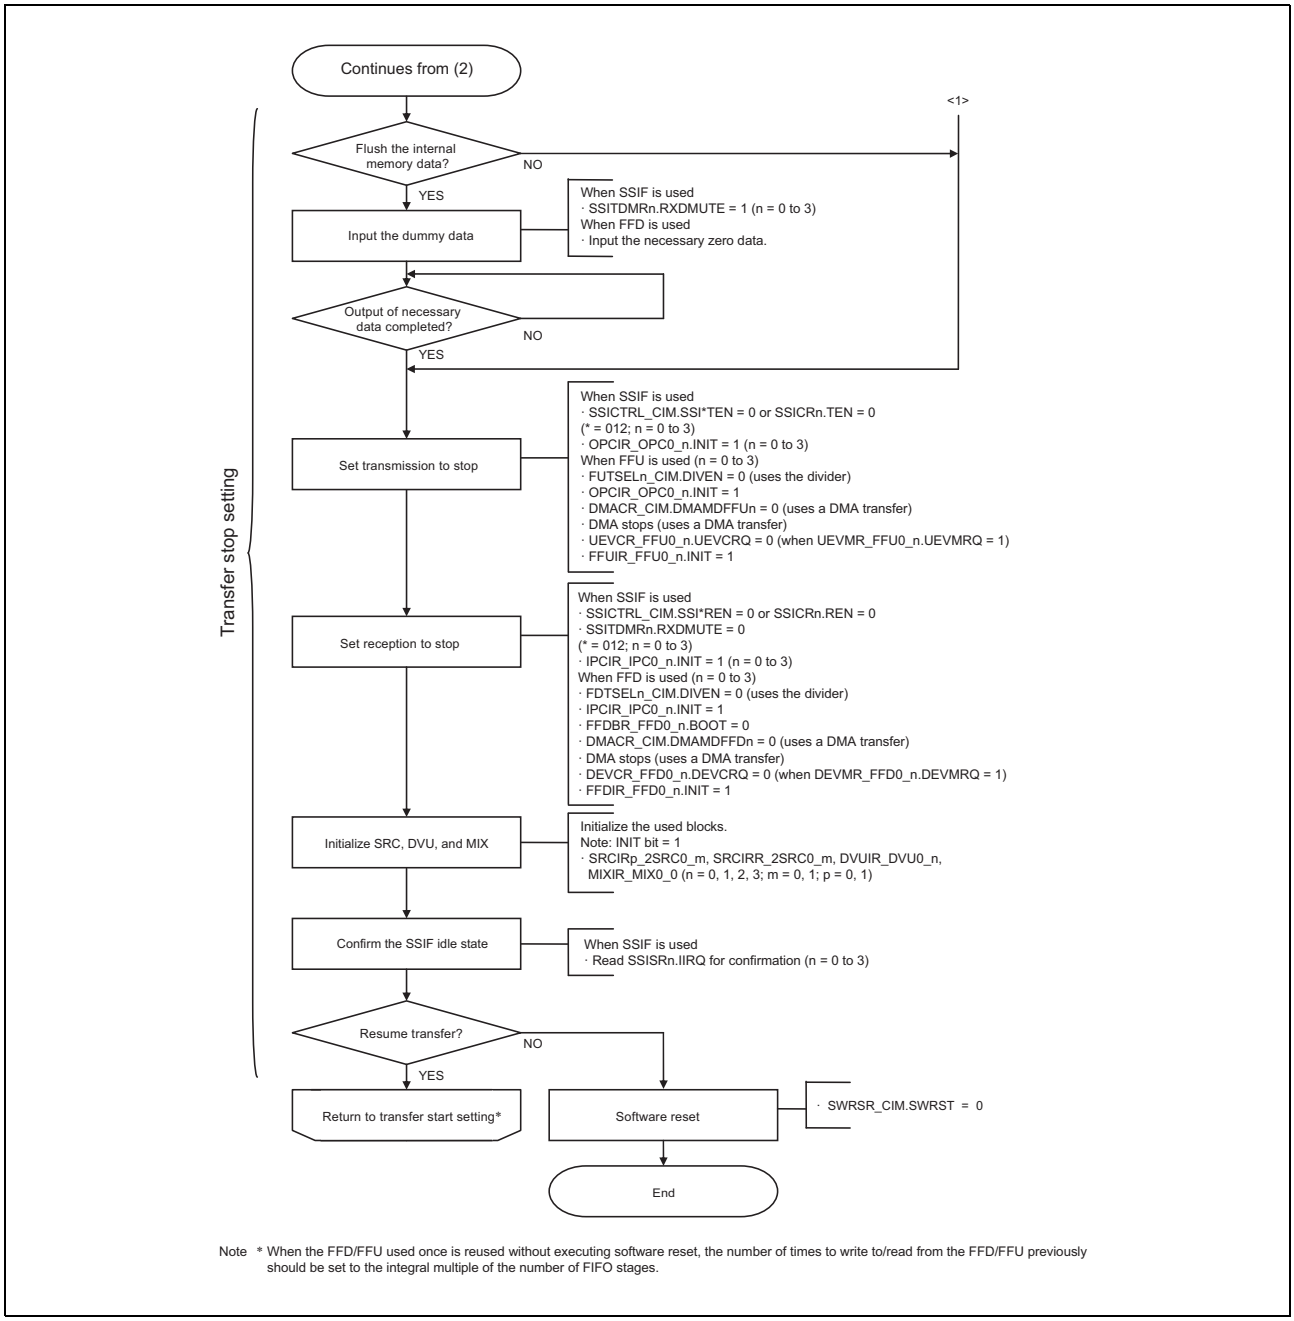

Note * When the FFD/FFU used once is reused without executing software reset, the number of times to write to/read from the FFD/FFU previously should be set to the integral multiple of the number of FIFO stages.

Figure 37.11 Transfer Start Procedure and Stop Procedure of SCUX (3)

37.4.3 Data Rearrangement for Each Channel

Data can be rearranged independently for each channel in the SCUX. Data rearrangement can be performed immediately before input to the SRC and immediately after output from the MIX. Table 37.9 to Table 37.11 show definition of data places. Data rearrangement immediately before the SRC is performed as described in section 37.3.72, SRCn Route Select Register (SRCRSELn_CIM) (n = 0, 1, 2, 3). Data rearrangement immediately after the MIX is performed as described in section 37.3.73, MIX Route Select Register (MIXRSEL_CIM).

37.4.4 Pin Connection Specifications of SSIF

SSIF0 to SSIF3 can be operated in synchronization with the same SSISCK and SSIWS signals. The AUDIO_CLK input to the SSIF can be selected between external pins AUDIO_CLK and MLB_CLK. These settings are made as described in section 37.3.70, SSI Pin Mode Register (SSIPMD_CIM). Figure 37.12 shows the pin connection specifications of each SSIF module.

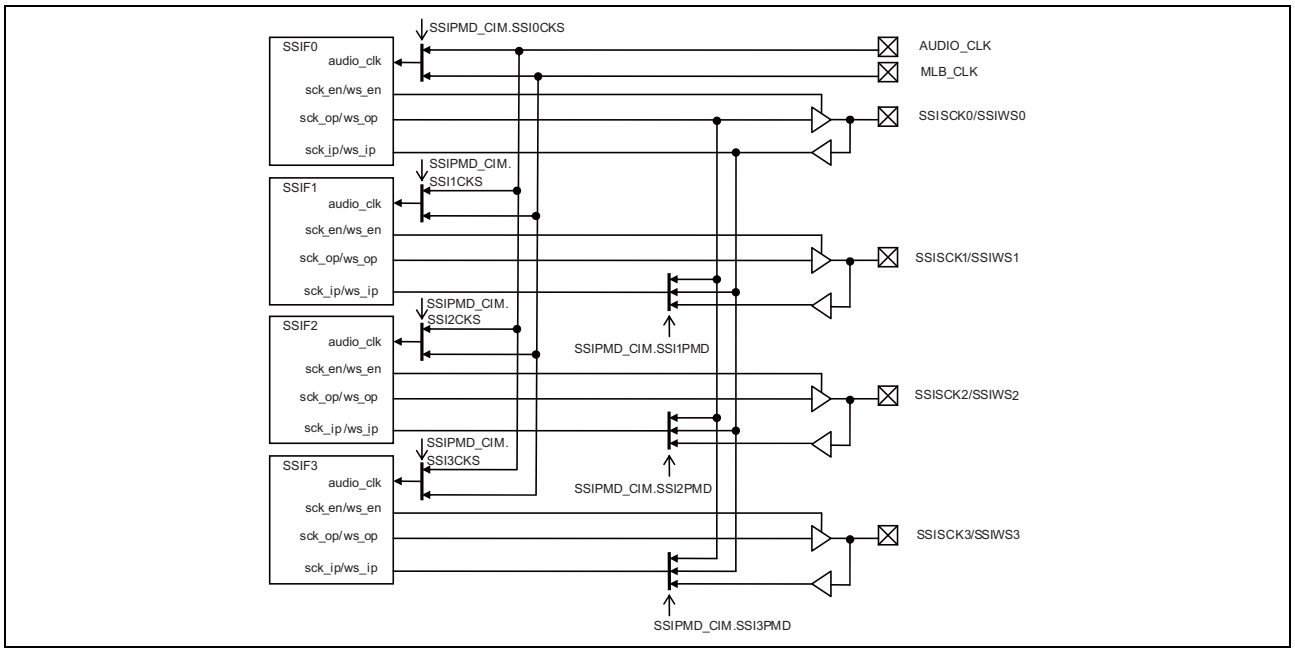

Figure 37.12 Pin Connection Specifications of SSIF

37.4.5 Data Transfer Route

Table 37.12 to Table 37.14 list the data transfer routes that can be selected by the SCUX.
Table 37.15 to Table 37.17 show the necessary register settings for selecting each transfer route.
The 2SRC0_m bypass register p and DVU0_n bypass register should be set appropriately to bypass the SRC and DVU, respectively.

Table 37.12 Data Transfer Routes (1)

Route	No.	SSIF (SRC)	FFD	SRC + DVU	MIX	SSIF (DST)	FFU
SSIF → SRC → SSIF	1	SSIF0	—	SRC0*1 + DVU0_0	—	SSIF0	—

37.4.6 Input Timing Signal and Output Timing Signal

The input timing signal and output timing signal need to be set when using the SRC or MIX. Table 37.18 to Table 37.20 show the input/output timing setting necessary for each transfer route in Table 37.12 to Table 37.14. When direct connection between the SRC and SSIF is selected, the WS signal of the relevant SSIF is automatically selected regardless of the setting of the FFD0_n/FFU0_n timing select register. When direct connection between the MIX and SSIF is selected, set the prescribed value in the FFU0_n timing select register. When connection between the FFD and SRC or connection between the SRC and FFU is selected, a desired value can be set in the FFD0_n/FFU0_n timing select register and timing signals corresponding to the setting are used.

Table 37.18 Input/Output Timing Setting (1)

Route	No.	Input Timing Setting						Output Timing Setting

Note 1. Automatically selected regardless of the FDTSELn_CIM and FUTSELn_CIM settings.
Note 2. When connection to an SRCm for a given route is not being selected by the SOSELn bits of register SSIRSEL_CIM, SSInTX may be set to 1 (m = 0 to 3; n = 0 to 3).
Note 3. When connection to SRCm and MIX for a given route is not being selected by the SOSELn bits of register SSIRSEL_CIM, SSInTX may be set to 1 (m = 0 to 3; n = 0, 3).
Note 4. When connection to a MIX for a given route is not being selected by the SOSELn bits of register SSIRSEL_CIM, SSInTX may be set to 1 (n = 0, 3).

37.4.7 2SRC (SRC) Block

The 2SRC block consists of two SRCs (Sampling Rate Converters) which implement the sampling rate conversion function. Each SRC has two modes allowing either synchronous or asynchronous sampling rate conversion to be performed.

- Asynchronous or synchronous sampling rate conversion is possible*1
- Sampling rate (synchronous mode)*2
  Input [KHz]: 8, 11.025, 12, 16, 22.05, 24, 32, 44.1, 48, 64, 88.2, or 96 is selectable
  Output [KHz]: 8, 16, 24, 32, 44.1, 48, or 96 is selectable
- Sampling rate (asynchronous mode)*2
  Input/output [KHz]: 1 to 96
- The supported number of bits is 16 bits and 24 bits
- Sound quality: −132 dB or less*3
- Supports 1, 2, 4, 6, or 8 channels*4
- DMA transfer with on-chip memory or external memory and direct transfer with the SSIF module are possible

Note 1. The synchronous mode can be selected only when the SCUX is connected to the FFD and FFU modules.
Note 2. The selectable sampling rates depend on the number of used channels and rate ratio.
Note 3. The data format is a 24-bit value.
Note 4. The number of selectable channels depends on the sampling rate and route.

Figure 37.13 shows a block diagram of the 2SRC (SRC) block. Input audio data indicates the data before executing the SRC function and output audio data indicates the data after executing the SRC function.
In synchronous SRC mode, the 2SRC (SRC) block outputs the input request signal to the FFD block and outputs the output request signal to the FFU block. In asynchronous SRC mode, the 2SRC (SRC) block receives the input timing signal and output timing signal from an external module and automatically detects the input sampling rate and output sampling rate from these timing signals.
Each SRC in the 2SRC (SRC) block can simultaneously process audio data for a maximum of eight channels. However, the maximum sampling rate that can be handled depends on the number of channels used. When SRC2 or SRC3 is used by the route from the FFD or the route to the FFU, the maximum number of processable channels is two. The number of channels is set by SADIRp_2SRC0_m.CHNUM. When not in bypass mode (SRCBRp_2SRC0_m.BYPASS = 0), unused channels always output 0 after initialization (SRCIRp_2SRC0_m.INIT = 1) unless the CHNUM setting is changed. In bypass mode, the input audio data is output one cycle later in all channels regardless of the CHNUM setting.
The bit width of output audio data can be set to 16 bits or 24 bits by SADIRp_2SRC0_m.OTBL. For input audio data, audio data with the same bit width as the OTBL bit setting in Table 37.21 should be input.

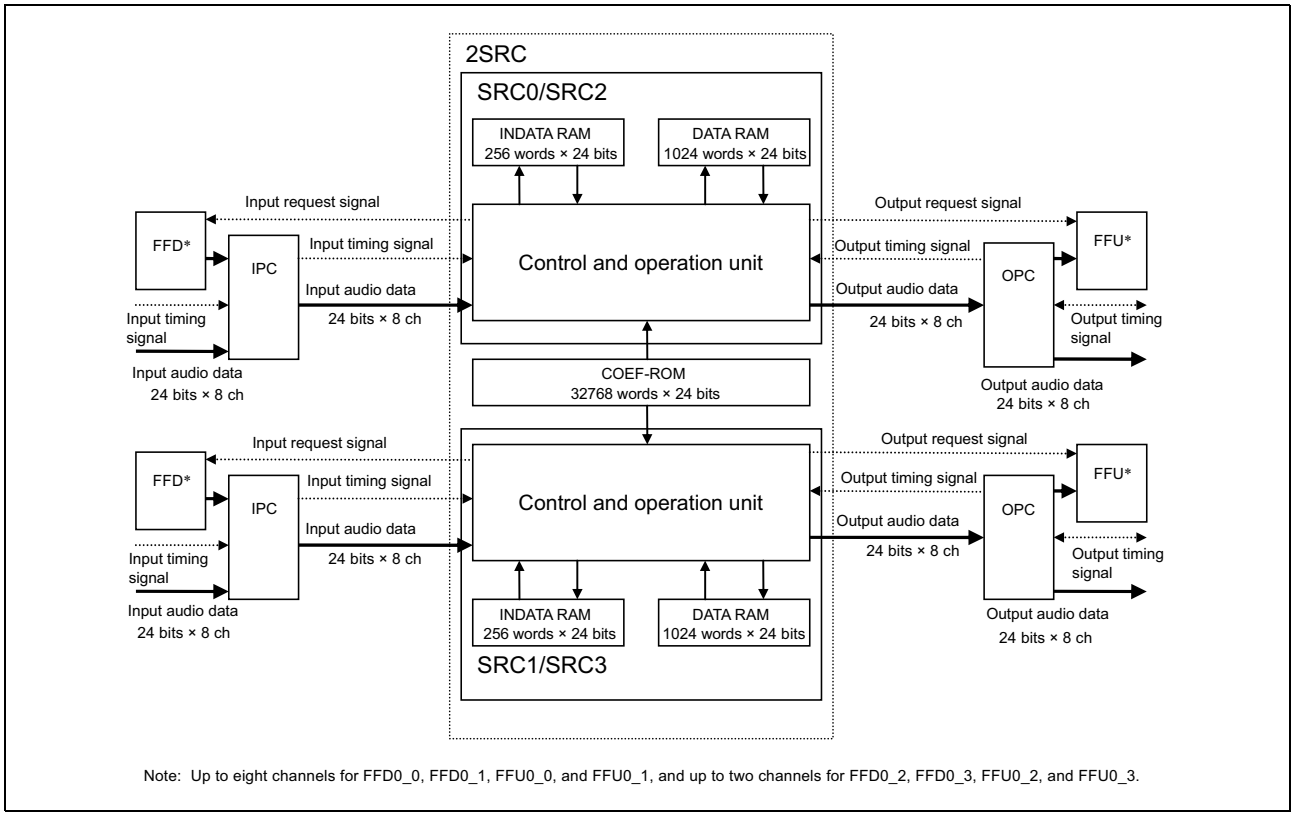

Figure 37.13 Block Diagram of 2SRC Block

Table 37.21 Combinations of Bit Width of Input/Output Audio Data

SADIRp_2SRC0_m.OTBL	Bit Width of Input Audio Data	Bit Width of Output Audio Data
00000 = 24 bits	24 bits	24 bits
01000 = 16 bits	16 bits	16 bits

Table 37.22 shows the functions of the 2SRC (SRC) block.

Table 37.22 2SRC (SRC) Block Functions

Item	Performance					
Type of SRC	Asynchronous SRC/synchronous SRC					
Operation frequency	66 MHz					
Delay mode	Normal				Low delay 1	Low delay 2
Channel number	1 or 2	4	6	8	1 or 2	1 or 2
Sampling rate of input source	8k to 96k [Hz]	8k to 96k [Hz]	8k to 66k [Hz]	8k to 49k [Hz]	8k to 96k [Hz]	8k to 96k [Hz]
Sampling rate of output source	8k to 96k [Hz]	8k to 96k [Hz]	8k to 66k [Hz]	8k to 49k [Hz]	8k to 96k [Hz]	8k to 96k [Hz]
Ratio of input and output sampling rate (FSO/FSI)	16 to 0.125 [time]	16 to 0.25 [time]	16 to 0.375 [time]	16 to 0.5 [time]	16 to 0.5 [time]	16 to 1 [time]
Sound quality	–132 dB					

Table 37.23 shows the latency of the 2SRC (SRC) block.

Table 37.23 2SRC (SRC) Block Latency

Item	Bypass	Normal					Low Delay 1		Low Delay 2	
Channel number	Any	1	2	4	6	8	1	2	1	2
Processing delay	0	641	321	161	102	81	81	81	49	49
Logic delay	1	3	3	3	3	3	3	3	3	3
Output delay	Output delay [sample] = (Processing delay) * (FSO/FSI ratio) + (Logic delay)									

37.4.8 DVU Block

The DVU block is used to control volume and mute. This block can simultaneously process data for a maximum of eight channels.

- Digital volume, volume ramp, and zero cross mute are provided as functions to adjust the volume
- The digital volume is set as a 24-bit fixed-point value within the range from a multiple of 0 to 8 (mute, −120 to 18 dB)
- Volume ramp can be used to perform soft mute, fade in, fade out, and volume change as desired
- The ramp time of volume ramp can be changed and set within the sampling range of 2^0 to 2^{23}
- Zero cross mute turns the sound mute at the zero cross point of audio data
- Direct transfer with the SSIF module and transfer with the mixer are possible

The number of channels is set by VADIR_DVU0_n.CHNUM. For unused channels, the input data that is input to the corresponding channels is output one cycle later. In bypass mode, the input data is output one cycle later in all channels regardless of the CHNUM setting.
Figure 37.14 shows the processing image of the DVU block.

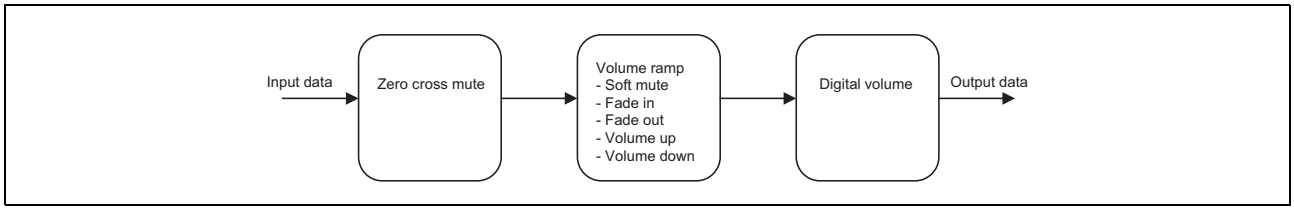

Figure 37.14 Processing Image of DVU Block

Table 37.24 shows the functions of the DVU block.

Table 37.24 DVU Block Functions

Item	Performance
Digital volume	Range: –120 dB to 18 dB (9.5×10^{-7}-time to 8-time)
Volume ramp	Volume ramp use for many kinds of operation (soft mute, fade in, fade out, volume change by ramp) Ramp time: 2^0/fso to 2^{23}/fso Example: (1/fso: –128 dB/1 step) (2/fso: –64 dB/1 step) (4/fso: –32 dB/1 step) ..... (128/fso: –1 dB/1 step) (256/fso: –0.5 dB/1 step) (512/fso: –0.25 dB/1 step) (1024/fso: –0.125 dB/1 step) (2048/fso: –0.125 dB/2 steps) (4096/fso: –0.125 dB/4 steps) ..... (8388608/fso: –0.125 dB/8192 steps)
Zero cross mute	Mute the signal at zero cross point

Figure 37.15 shows the image of digital volume operation.

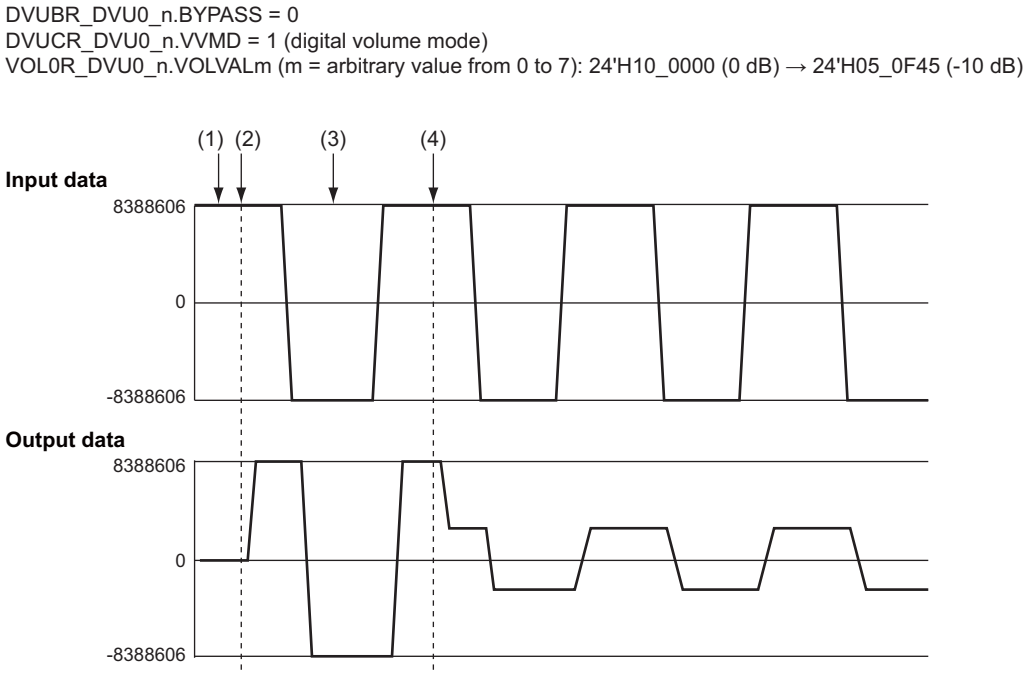

Figure 37.15 Digital Volume Operation

Operation

(1) In the initialized state (DVUIR_DVU0_n.INIT = 1), set the VVMD bit in DVUCR_DVU0_n to 1 (digital volume mode) and the VOLVALm bit in VOL0R_DVU0_n to 24'H10_0000 (0 dB). Until the initialized state is cleared, the DVU does not start operation and its output data is 0.

(2) When the initialized state is cleared (DVUIR_DVU0_n.INIT = 0), the DVU starts operation. Since the VOLVALm bit is set to 0 dB, the output data is the same size as the input data.

(3) Set the DVUEN bit in DVUER_DVU0_n to 0 and the VOLVAL0 bit in VOL0R_DVU0_n to 24'H05_0F45 (-10 dB).

(4) The setting to the VOLVAL0 bit in (3) is enabled by setting the DVUEN bit in DVUER_DVU0_n to 1. The output data is the value obtained by attenuating the input data by -10 dB.

Figure 37.16 shows the image of volume ramp operation.

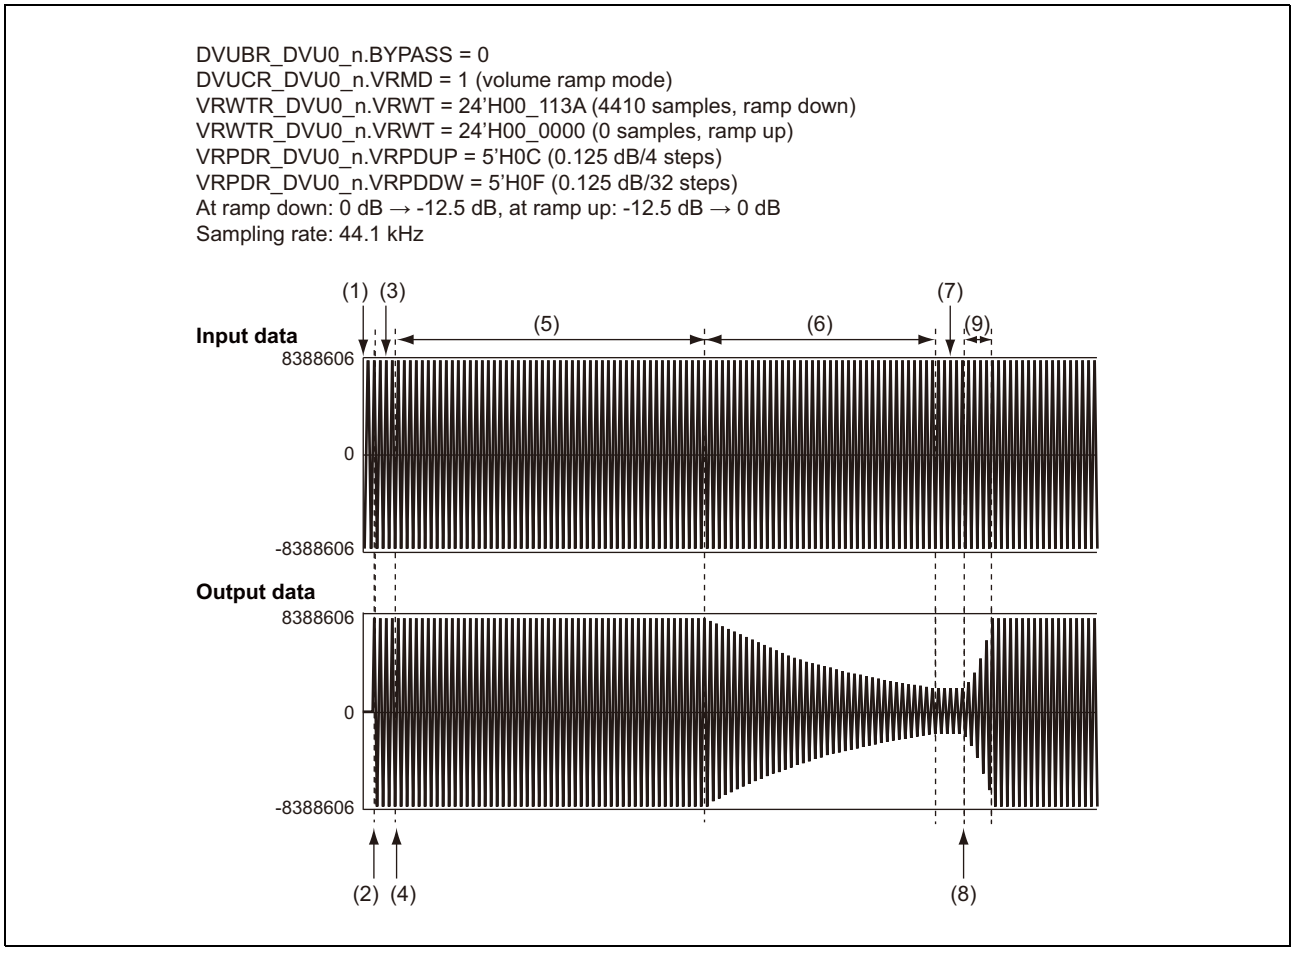

Figure 37.16 Volume Ramp Operation

Operation

(1) In the initialized state (DVUIR_DVU0_n.INIT = 1), set the VRMD bit in DVUCR_DVU0_n to 1 (volume ramp mode) and the VRENm (m: arbitrary value from 0 to 7) bit in VRCTR_DVU0_n to 1. Until the initialized state is cleared, the DVU does not start operation and its output data is 0.

(2) When the initialized state is cleared (DVUIR_DVU0_n.INIT = 0), the DVU starts operation.
Note: Changes to the settings of the VRDB bit of the VRDBR_DVU0_n register made in the INIT state rapidly become applicable on release from the INIT state (independently of the setting of VRWTR_DVU0_n and VRPDR_DVU0_n).

(3) Set the DVUEN bit in DVUER_DVU0_n to 0, the VRPDDW bit in VRPDR_DVU0_n to 5'H0F (0.125 dB/32 steps), the VRDB bit in VRDBR_DVU0_n to 10'H064 (-12.5 dB), and the VRWT bit in VRWTR_DVU0_n to 24'H00_113A (4410 samples).

(4) The setting in (3) is enabled by setting the DVUEN bit in DVUER_DVU0_n to 1.

(5) The VDU waits to start the volume ramp operation for 4410/44100 = 0.1 second because the sampling rate is set to 44.1 kHz with VRWTR_DVU0_n.VRWT = 24'H00_113A (4410 samples).

(6) The VDU starts volume ramp operation after the wait time in (5).
The output data is the value obtained by attenuating the input data by -12.5 dB after 12.5 × 32/0.125 = 3200 steps because the VRPDDW bit in VRPDR_DVU0_n is set to 5'H0F (0.125 dB/32 steps) according to 0d B to -12.5 dB ramp down.

(7) Set the DVUEN bit in DVUER_DVU0_n to 0, the VRPDUP bit in VRPDR_DVU0_n to 5'H0C (0.125 dB/4 steps), the VRDB bit in VRDBR_DVU0_n to 10'H000 (0 dB), and the VRWT bit in VRWTR_DVU0_n to 24'H00_0000 (0 sample).

(8) The setting in (7) is enabled by setting the DVUEN bit in DVUER_DVU0_n to 1.

(9) The VDU starts volume ramp operation without delay because the VRWT bit in VRWTR_DVU0_n is set to 24'H00_0000 (0 sample).
The output data is the same size as the input data after 12.5 × 4/0.125 = 400 steps because the VRPDUP bit in VRPDR_DVU0_n is set to 5'H0C (0.125 dB/4 steps) according to -12.5 dB to 0 dB ramp up.

Table 37.25 shows the latency of the DVU block.

Table 37.25 DVU Block Latency

Item	Bypass	DVU Operation
Output delay	1	2

37.4.9 MIX Block

The MIX block is used to mix (add together) the input audio data from a maximum of four systems into one system. Each system can simultaneously process data for a maximum of eight channels.

- Data of two to four source systems can be mixed (added together) into one system
- The ratio to add the sources can be set
- The ratio can be changed dynamically
- Volume ramp enables mixing to be performed (ramp time is variable)
- Only direct transfer with the SSIF module is possible

The number of channels is set by MADIR_MIX0_0.CHNUM. When not in bypass mode (MIXBR_MIX0_0.BYPASS = 0), unused channels always output 0 after initialization (MIXIR_MIX0_0.INIT = 1) unless the CHNUM setting is changed. In bypass mode, the input data is output one cycle later in all channels regardless of the CHNUM setting.
Figure 37.17 shows a block diagram of the MIX block.

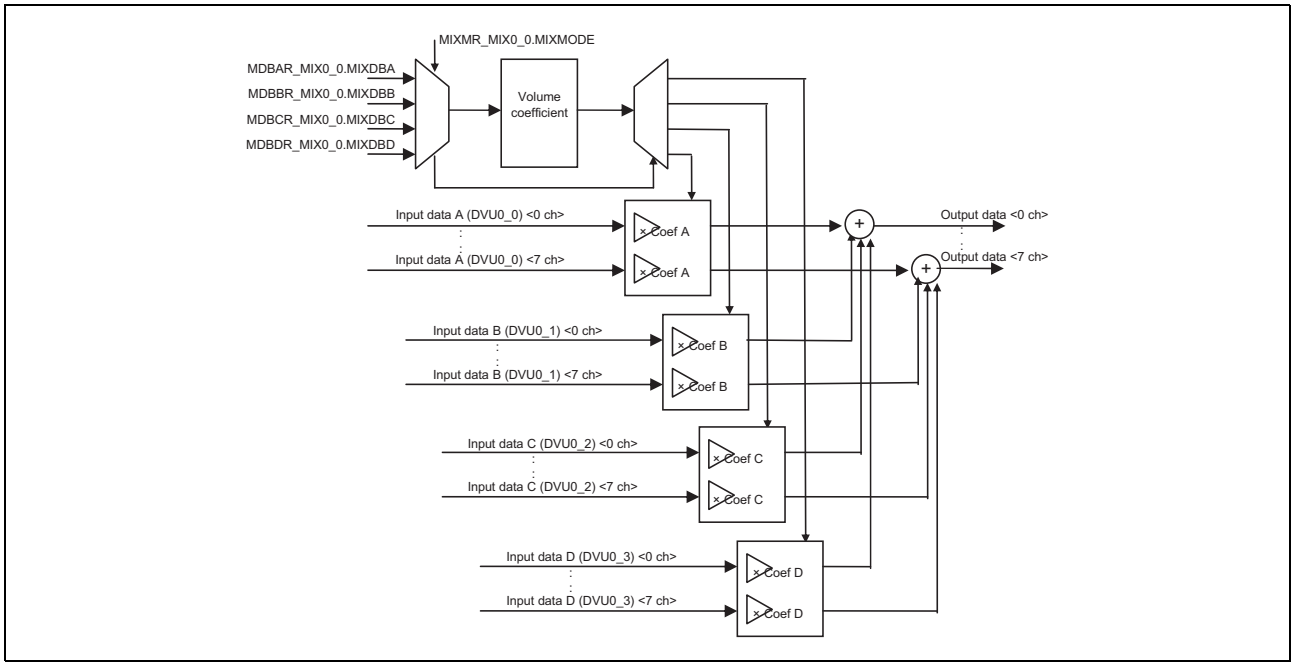

Figure 37.17 Block Diagram of MIX Block

Table 37.26 shows the functions of the MIX block.

Table 37.26 MIX Block Functions

Item	Performance
Volume step mixer	Mix the data of four systems into one system. The volume of each system can be adjusted by step change.
Volume ramp mixer	Mix the data of four systems into one system. The volume of each system can be adjusted by ramp.

Figure 37.18 shows the image of volume step operation for 1-system data. This figure explains about the operation when the volume is changed from 0 dB to −∞ dB. The volume can change the target dB for one step each. In the case of the volume step mixer, the volume of four systems can be adjusted at each step change (one sample).
Figure 37.19 shows the image of volume ramp operation for 1-system data. This figure explains about the operation when the volume is changed from 0 dB to −∞ dB. The volume can be changed by 0.125-dB/step each and it takes 1024 samples to reach −∞ dB in the maximum case for each system. In the case of the volume ramp mixer, the volume of four

systems can be adjusted at each ramp. In addition, the volume ramp mixer has a mechanism to reduce the noise. If the direction of volume is different among the four systems, it operates from the volume-down systems and after that operates on the volume-up systems automatically. In the case of the same direction, it changes the volume at the same timing.

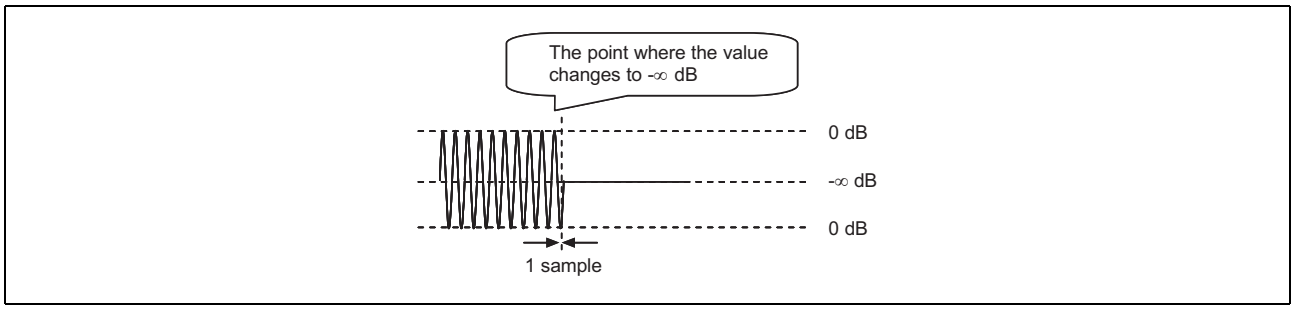

Figure 37.18 Volume Step Operation

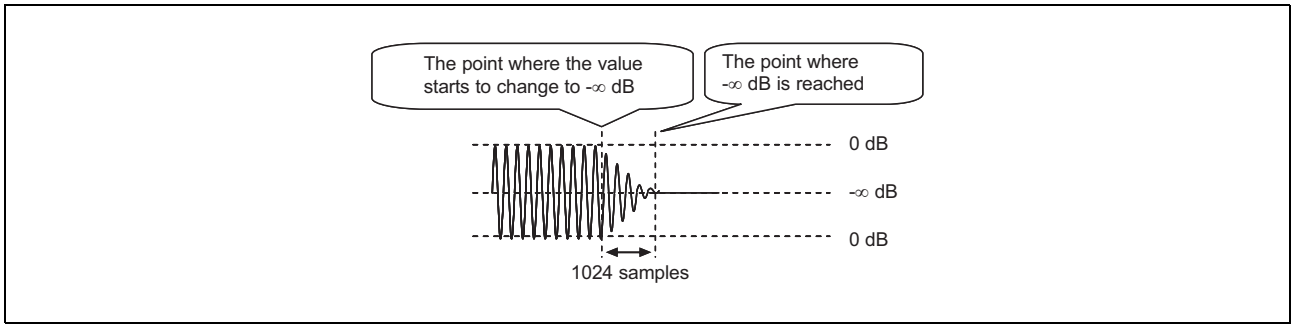

Figure 37.19 Volume Ramp Operation

Figure 37.20 shows the image of volume ramp operation for 4-system data.

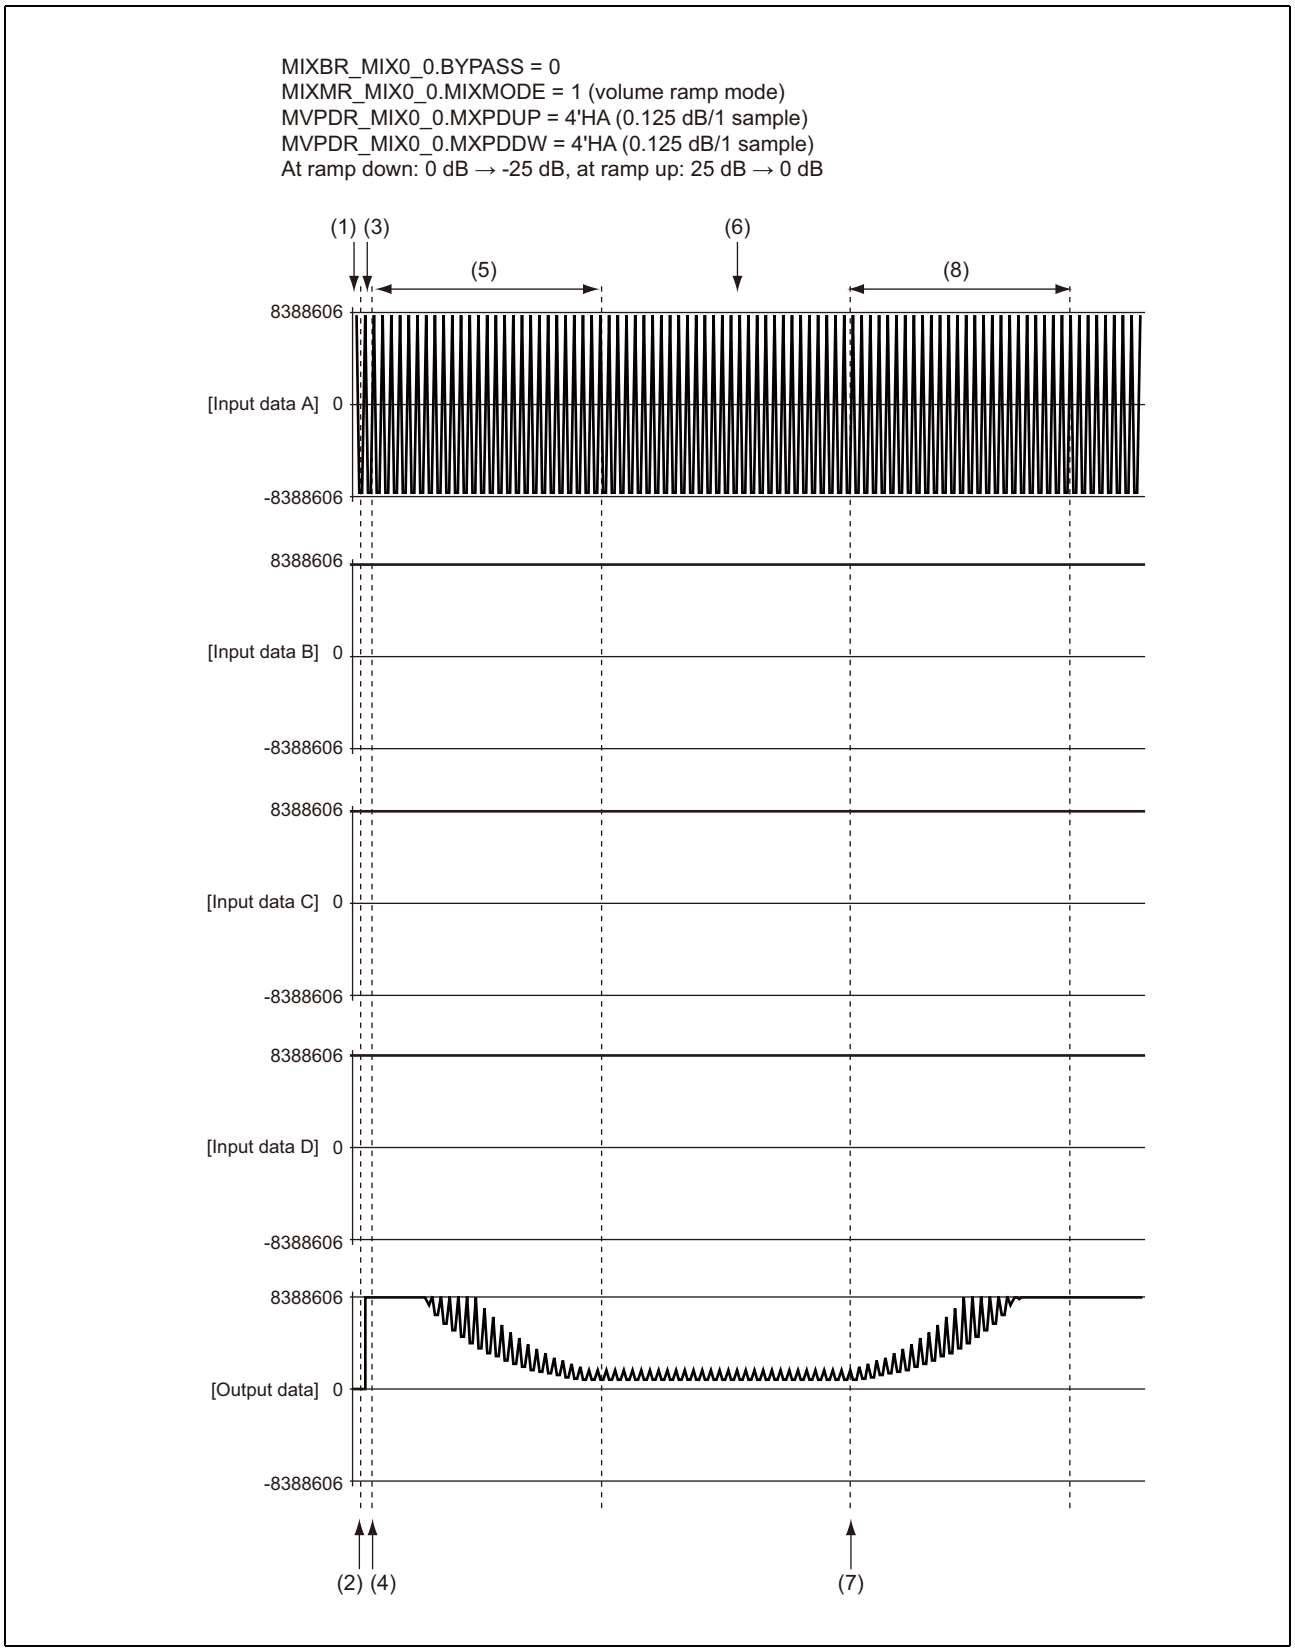

Figure 37.20 Volume Ramp Operation for 4-System Data

Operation

(1) In the initialized state (MIXIR_MIX0_0.INIT = 1), set the MIXMODE bit in MIXMR_MIX0_0 to 1 (volume ramp mode) and the MXPDDW bit in MVPDR_MIX0_0 to 4'HA (0.125 dB/1 sample).
Until the initialized state is cleared, the MIX does not start operation and its output data is 0.

(2) When the initialized state is cleared (MIXIR_MIX0_0.INIT = 0), the MIX starts operation.
Note: Changes to the settings of the MIXDBA bits of the MDBAR_MIX0_0 register, MIXDBB bits of the MDBBR_MIX0_0 register, MIXDBC bits of the MDBCR_MIX0_0 register, and MIXDBD bits of the MDBDR_MIX0_0 register made in the INIT state rapidly become applicable on release from the INIT state (independently of the setting of MVPDR_MIX0_0).

(3) Set as follows:
MDBER_MIX0_0.MIXDBEN = 0
MDBAR_MIX0_0.MIXDBA = 10'H0C8 (-25 dB)
MDBBR_MIX0_0.MIXDBB = 10'H0C8 (-25 dB)
MDBCR_MIX0_0.MIXDBC = 10'H0C8 (-25 dB)
MDBDR_MIX0_0.MIXDBD = 10'H0C8 (-25 dB)

(4) The setting in (3) is enabled by setting the MIXDBEN bit in MDBER_MIX0_0 to 1.

(5) The output data is the value obtained by attenuating and mixing the input data of each system by -25 dB after 25/0.125 = 200 steps because the MXPDDW bit in MVPDR_MIX0_0 is set to 4'HA (0.125 dB/1 sample) according to 0 dB to -25 dB ramp down for each system.

(6) Set as follows:
MDBER_MIX0_0.MIXDBEN = 0
MDBAR_MIX0_0.MIXDBA = 10'H000 (0 dB)
MDBBR_MIX0_0.MIXDBB = 10'H000 (0 dB)
MDBCR_MIX0_0.MIXDBC = 10'H000 (0 dB)
MDBDR_MIX0_0.MIXDBD = 10'H000 (0 dB)

(7) The setting in (6) is enabled by setting the MIXDBEN bit in MDBER_MIX0_0 to 1.

(8) The output data is the value obtained by boosting and mixing the input data of each system by 25 dB after 25/0.125 = 200 steps because the MXPDUP bit in MVPDR_MIX0_0 is set to 4'HA (0.125 dB/1 sample) according to -25 dB to 0 dB ramp up for each system.

Table 37.27 shows the latency of the MIX block.

Table 37.27 MIX Block Latency

Item	Bypass	MIX Operation
Output delay	1	2

37.5 Usage Note

37.5.1 Software Reset

When initializing the internal circuits of this module by clearing the SWRST bit in the SWRSR_CIM register or setting the INIT bit in the IPCIR_IPC0_n, OPCIR_OPC0_n, FFDIR_FFD0_n, FFUIR_FFU0_n, SRCIRp_2SRC0_m, SRCIRR_2SRC0_m, DVUIR_DVU0_n, or MIXIR_MIX0_0 register, be sure to follow the procedures specified in section 37.4.1, Initial Setting Procedure or section 37.4.2, Transfer Start Procedure and Stop Procedure.

38. SD Host Interface

The details of this section are available upon non-disclosure agreement. For details, contact Renesas Electronics Corporation's sales office.

Note: • SD Host/Ancillary Product License Agreement (SD HALA) is required to develop SD host-related products.

38.1 Overview

38.1.1 Features

- SD memory/IO card interface (1-bit/4-bit SD bus)
- SD memory card: SD, SDHC, SDXC
- Transfer mode: Default mode, High-Speed mode
- SD clock (SD_CLK) frequency = $1/2^n$ P1φ (Peripheral clock 1) frequency (n = 1 to 9)
- Error check function: CRC7 (for command/response), CRC16 (for data)
- Three interrupt requests
- DMA transfer request: SD_BUF read/write
- Card detect function
- Write protect support

38.1.2 Block Diagram

Figure 38.1 shows a block diagram of the SD host interface.

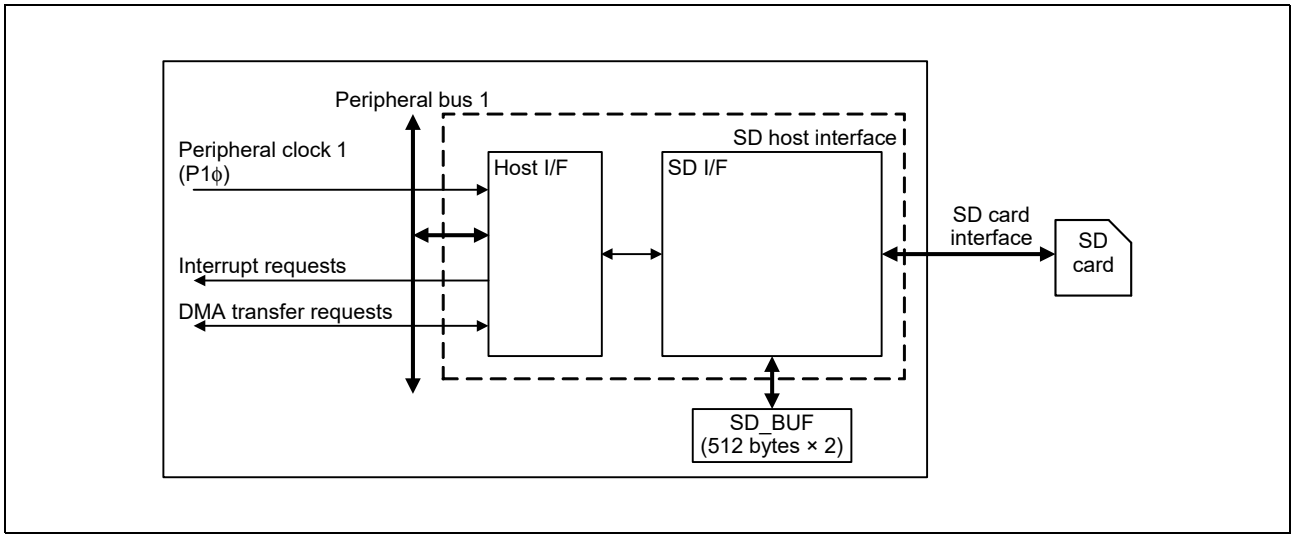

Figure 38.1 Block Diagram of SD Host Interface

38.1.3 Input/Output Pins

Table 38.1 lists the input and output pins used by the SD host interface.

Table 38.1 Pin Configuration

Pin Name	Signal Name	I/O	Function
SD_CLK[1:0]*1	SDCLK	Output	SD clock
SD_CMD[1:0]*1	SDCMD	I/O	Command/response
SD_D0[1:0]*1	SDDAT0	I/O	Data[bit 0]
SD_D1[1:0]*1	SDDAT1	I/O	Data[bit 1]/SDIO interrupt
SD_D2[1:0]*1	SDDAT2	I/O	Data[bit 2]/Read wait
SD_D3[1:0]*1	SDDAT3	I/O	Data[bit 3]
SD_CD[1:0]*1	ISDCD	Input	Card detect*2
SD_WP[1:0]*1	ISDWP	Input	Write protect*2

Note 1. [1:0] indicates the SD Host Interface channel number.
Note 2. When a pin is not in use, fix the corresponding signal to 1.

38.1.4 SD Card Hardware Interface

For details on the SD card hardware interface, see the detailed version of the SD host interface manual.

38.2 Register Descriptions

Table 38.2 summaries the registers of the SD host interface.

Table 38.2 Register Configuration

Channel	Register Name	Abbreviation	Address	Access Size
0	Command type register	SD_CMD	H'E804E000	16
	SD command argument registers	SD_ARG0	H'E804E004	16
		SD_ARG1	H'E804E006	16
	Data stop register	SD_STOP	H'E804E008	16
	Block count register	SD_SECCNT	H'E804E00A	16
	SD card response registers	SD_RSP00	H'E804E00C	16
		SD_RSP01	H'E804E00E	16
		SD_RSP02	H'E804E010	16
		SD_RSP03	H'E804E012	16
		SD_RSP04	H'E804E014	16
		SD_RSP05	H'E804E016	16
		SD_RSP06	H'E804E018	16
		SD_RSP07	H'E804E01A	16
	SD card interrupt flag register 1	SD_INFO1	H'E804E01C	16
	SD card interrupt flag register 2	SD_INFO2	H'E804E01E	16
	SD_INFO1 interrupt mask register	SD_INFO1_MASK	H'E804E020	16
	SD_INFO2 interrupt mask register	SD_INFO2_MASK	H'E804E022	16
	SD clock control register	SD_CLK_CTRL	H'E804E024	16
	Transfer data length register	SD_SIZE	H'E804E026	16
	SD card access control option register	SD_OPTION	H'E804E028	16
	SD error status register 1	SD_ERR_STS1	H'E804E02C	16
	SD error status register 2	SD_ERR_STS2	H'E804E02E	16
	SD buffer read/write register	SD_BUF0	H'E804E030	32
	SDIO mode control register	SDIO_MODE	H'E804E034	16
	SDIO interrupt flag register	SDIO_INFO1	H'E804E036	16
	SDIO_INFO1 interrupt mask register	SDIO_INFO1_MASK	H'E804E038	16
	DMA mode enable register	CC_EXT_MODE	H'E804E0D8	16
	Software reset register	SOFT_RST	H'E804E0E0	16
	Version register	VERSION	H'E804E0E2	16
	Swap control register	EXT_SWAP	H'E804E0F0	16

Channel	Register Name	Abbreviation	Address	Access Size
1	Command type register	SD_CMD	H'E804E800	16
	SD command argument registers	SD_ARG0	H'E804E804	16
		SD_ARG1	H'E804E806	16
	Data stop register	SD_STOP	H'E804E808	16
	Block count register	SD_SECCNT	H'E804E80A	16
	SD card response registers	SD_RSP00	H'E804E80C	16
		SD_RSP01	H'E804E80E	16
		SD_RSP02	H'E804E810	16
		SD_RSP03	H'E804E812	16
		SD_RSP04	H'E804E814	16
		SD_RSP05	H'E804E816	16
		SD_RSP06	H'E804E818	16
		SD_RSP07	H'E804E81A	16
	SD card interrupt flag register 1	SD_INFO1	H'E804E81C	16
	SD card interrupt flag register 2	SD_INFO2	H'E804E81E	16
	SD_INFO1 interrupt mask register	SD_INFO1_MASK	H'E804E820	16
	SD_INFO2 interrupt mask register	SD_INFO2_MASK	H'E804E822	16
	SD clock control register	SD_CLK_CTRL	H'E804E824	16
	Transfer data length register	SD_SIZE	H'E804E826	16
	SD card access control option register	SD_OPTION	H'E804E828	16
	SD error status register 1	SD_ERR_STS1	H'E804E82C	16
	SD error status register 2	SD_ERR_STS2	H'E804E82E	16
	SD buffer read/write register	SD_BUF0	H'E804E830	32
	SDIO mode control register	SDIO_MODE	H'E804E834	16
	SDIO interrupt flag register	SDIO_INFO1	H'E804E836	16
	SDIO_INFO1 interrupt mask register	SDIO_INFO1_MASK	H'E804E838	16
	DMA mode enable register	CC_EXT_MODE	H'E804E8D8	16
	Software reset register	SOFT_RST	H'E804E8E0	16
	Version register	VERSION	H'E804E8E2	16
	Swap control register	EXT_SWAP	H'E804E8F0	16

38.2.1 Command Type Register (SD_CMD)

The command type register (SD_CMD) selects the command type and response type. The command sequence is started by writing to SD_CMD. For details on the SD_CMD setting, refer to section 38.4.11, Example of SD_CMD Register Setting.

Do not write to SD_CMD while the SCLKDIVEN bit in SD_INFO2 is set to 0.

Bit	Bit Name	Initial Value	R/W	Description
15	MD7	0	R/W	Multiple Block Transfer Mode (enabled at multiple block transfer) 00: CMD12 is automatically issued at multiple block transfer. 01: CMD12 is not automatically issued at multiple block transfer. 10: Setting prohibited 11: Setting prohibited
14	MD6	0	R/W	
13	MD5	0	R/W	Single/Multiple Block Transfer (enabled when the command with data is handled) 0: Single block transfer 1: Multiple block transfer
12	MD4	0	R/W	Write/Read Mode (enabled when the command with data is handled) 0: Write (SD host interface → SD card) 1: Read (SD host interface ← SD card)
11	MD3	0	R/W	Data Mode (Command Type) 0: Command without data transfer (bc, bcr, ac) 1: Command with data transfer (adtc)
10	MD2	0	R/W	Mode/Response Type 000: Normal mode The response type and the transfer mode are selected by SD_CMD[7:0], and the SD_CMD[15:11] setting is disabled. 001: Setting prohibited 010: Setting prohibited 011: Extended mode/No response 100: Extended mode/SD card R1, R5, R6, R7 response 101: Extended mode/SD card R1b response 110: Extended mode/SD card R2 response 111: Extended mode/SD card R3, R4 response As some commands cannot be used in normal mode, see section 38.4.11, Example of SD_CMD Register Setting to select mode/response type.
9	MD1	0	R/W	
8	MD0	0	R/W	
7	C1	0	R/W	00: CMD 01: ACMD 10: Setting prohibited 11: Setting prohibited
6	C0	0	R/W	
5	CF45	0	R/W	Command Index These bits specify Command Format[45:40] (command index). [Examples] CMD6: SD_CMD[7:0] = 8'b00_000110 CMD18: SD_CMD[7:0] = 8'b00_010010 ACMD13: SD_CMD[7:0] = 8'b01_001101
4	CF44	0	R/W	
3	CF43	0	R/W	
2	CF42	0	R/W	
1	CF41	0	R/W	
0	CF40	0	R/W	

Note: • SD_CMD cannot be written to when the CBSY bit in SD_INFO2 is 1.

38.2.2 SD Command Argument Registers (SD_ARG)

The SD command argument registers (SD_ARG) set the command argument of SD card. Set the command argument before writing to SD_CMD.

- SD_ARG0

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	CF23 to CF8	All 0	R/W	Set command format[23:8] (argument)

- SD_ARG1

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	CF39 to CF24	All 0	R/W	Set command format[39:24] (argument)

38.2.3 Data STOP Register (SD_STOP)

The data stop register (SD_STOP) is used to enable or disable block counting at multiple block transfer, and to control the issuing of CMD12 within command sequences.

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	All 0	R	Fixed 0
8	SEC	0*1	R/W	Block Count Enable*2 0: Disables SD_SECCNT setting value. 1: Enables SD_SECCNT setting value. Set SEC to 1 at multiple block transfer. When SD_CMD is set as follows to start the command sequence while SEC is set to 1, CMD12 is automatically issued. 1. CMD18 or CMD25 in normal mode (SD_CMD[10:8] = 000) 2. SD_CMD[15:13] = 001 in extended mode (CMD12 is automatically issued, multiple block transfer) When the command sequence is halted because of a communications error or timeout, CMD12 is not automatically issued.
7 to 1	—	All 0	R	Fixed 0
0	STP	0*1	R/W	Stop*3 • When STP is set to 1 during multiple block transfer, CMD12 is issued to halt the transfer through the SD host interface. For details on the CMD12 issue timing, see the detailed version of the SD host interface manual. However, if a command sequence is halted because of a communications error or timeout, CMD12 is not issued. Although continued buffer access is possible even after STP has been set to 1, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly. • When STP has been set to 1 during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD12 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD12 having been issued. • When STP has been set to 1 during transfer for single block read, the access end flag is set immediately after setting of the STP bit and CMD12 is not issued. • When STP is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD12 having been issued. • When STP is set to 1 after a command sequence has been completed, CMD12 is not issued and the access end flag is not set.

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
Note 2. Do not change the value of this bit when the SCLKDIVEN bit in SD_INFO2 is set to 0.
Note 3. Do not change the value of this bit from 1 to 0 when the SCLKDIVEN bit in SD_INFO2 is set to 0.

38.2.4 Block Count Register (SD_SECCNT)

The block count register (SD_SECCNT) specifies the number of transfer blocks at multiple block transfer.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	CNT15 to CNT0	All 0	R/W	Number of Transfer Blocks*1 When 0x0001 is set, the number of transfer blocks is 1. : When 0xFFFF is set, the number of transfer blocks is 65535. However, when 0x0000 is set, the number of transfer blocks is 65536.

Note 1. Do not change the value of this bit when the SCLKDIVEN bit in SD_INFO2 is set to 0.

38.2.5 SD Card Response Registers (SD_RSP)

The SD card response registers (SD_RSP) store the response from the SD card.

- SD_RSP00

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	R23 to R8	All 0	R	Store the response from the SD card

- SD_RSP01

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	R39 to R24	All 0	R	Store the response from the SD card

- SD_RSP02

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	R55 to R40	All 0	R	Store the response from the SD card

- SD_RSP03

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	R71 to R56	All 0	R	Store the response from the SD card

- SD_RSP04

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	R87 to R72	All 0	R	Store the response from the SD card

- SD_RSP05

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	R103 to R88	All 0	R	Store the response from the SD card

- SD_RSP06

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	R119 to R104	All 0	R	Store the response from the SD card

- SD_RSP07

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	—	All 0	R	Fixed 0
7 to 0	R127 to R120	All 0	R	Store the response from the SD card

Table 38.3 lists the response types and corresponding SD_RSP registers.

Table 38.3 Response Types and Corresponding SD_RSP Registers

Response Types	SD_RSP Registers
R1, R1b[39:8]	SD_RSP01 and SD_RSP00
R2[127:8]	SD_RSP07 to SD_RSP00
R3[39:8]	SD_RSP01 and SD_RSP00
R4[39:8]	SD_RSP01 and SD_RSP00
R5[39:8]	SD_RSP01 and SD_RSP00
R6[39:8]	SD_RSP01 and SD_RSP00
R7[39:8]	SD_RSP01 and SD_RSP00

38.2.6 SD Card Interrupt Flag Register 1 (SD_INFO1)

The SD card interrupt flag register 1 (SD_INFO1) indicates the response end and access end in the command sequence. This register also indicates the card detect/write protect state.
For CMD12 and CMD52 (SDIO abort) at multiple block transfer, INFO0 is not set but only INFO2 is set.
Even if the command sequence is halted because of a communications error or timeout, INFO0 or INFO2 is set.
INFO10, INFO9, and INFO8 change depending on the SD_D3 state after a reset is released and continue to change in 4-bit transfer mode.
To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Fixed 0
10	INFO10	Unknown	R	Indicates the SD_D3 state. 1: SD_D3 is set to 1. 0: SD_D3 is set to 0.
9	INFO9	0	R/W*1	SD_D3 set [Setting condition] After change in SD_D3 from 0 to 1, two cycles of P1φ has elapsed with SD_D3 held 1. [Clearing condition] When 0 is written to INFO9
8	INFO8	0	R/W*1	SD_D3 clear [Setting condition] After change in SD_D3 from 1 to 0, two cycles of P1φ has elapsed with SD_D3 held 0. [Clearing condition] When 0 is written to INFO8
7	INFO7	Unknown	R	Write Protect Indicates the SD_WP state. 1: SD_WP is set to 0. 0: SD_WP is set to 1.
6	—	0	R	Fixed 0
5	INFO5	Unknown	R	Indicates the SD_CD state. 1: Indicates that Ncycle has elapsed with SD_CD held 0. 0: Indicates that Ncycle has elapsed with SD_CD held 1. Ncycle is set by bits 3 to 0 in SD_OPTION.
4	INFO4	0	R/W*1	SD_CD Card Insertion [Setting condition] After change in SD_CD from 1 to 0, Ncycle has elapsed with SD_CD held 0. [Clearing condition] When 0 is written to INFO4 Ncycle is set by bits 3 to 0 in SD_OPTION.
3	INFO3	0	R/W*1	SD_CD Card Removal [Setting condition] After change in SD_CD from 0 to 1, Ncycle has elapsed with SD_CD held 1. [Clearing condition] When 0 is written to INFO3 Ncycle is set by bits 3 to 0 in SD_OPTION.

Bit	Bit Name	Initial Value	R/W	Description
2	INFO2	0*2	R/W*1	Access End [Setting conditions] • When read access to the buffer is completed in the case of transfer for single block read • When read access to the buffer for the last block of data is completed in the case of transfer for multiple block read • When read access to the buffer and reception of the response to CMD12 are completed in the case of transfer for multiple block read with automatic issuing of CMD12 • When reception of the busy state after reception of the CRC status is completed in the case of transfer for single block write • When reception of the busy state after reception of the CRC status of the last block of data is completed in the case of transfer for multiple block write • When reception of the response busy state for CMD12 is completed in the case of transfer for multiple block write with automatic issuing of CMD12 • When reception of the response to CMD12 that was issued by setting the STP bit to1 is completed in the case of transfer for multiple block read • When reception of the response busy state for CMD12 that was issued by setting the STP bit to1 is completed in the case of transfer for multiple block write • When reception of the response to CMD52 that was issued by setting the IOABT bit to1 is completed in the case of transfer for multiple block read • When reception of the response to CMD52 that was issued by setting the IOABT bit to1 is completed in the case of transfer for multiple block write In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout. [Clearing condition] When 0 is written to INFO2
1	—	0	R	Fixed 0
0	INFO0	0*2	R/W*1	Response End [Setting conditions] • When reception of the response is completed • When transmission of a command without response is completed • When reception of the busy state after R1b response is completed • When reception of the response to CMD52 that was issued by setting the C52PUB bit to1 is completed in the case of transfer for multiple block read • When reception of the response to CMD52 that was issued by setting the C52PUB bit to1 is completed in the case of transfer for multiple block write In addition to the above conditions, this bit is set when a command sequence is halted because of a communications error or timeout. [Clearing condition] When 0 is written to INFO0

Note 1. It is effective only if 0 is written.
Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.

38.2.7 SD Card Interrupt Flag Register 2 (SD_INFO2)

The SD card interrupt flag register 2 (SD_INFO2) indicates the access status of the SD buffer (SD_BUF) and SD card. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
15	ILA	0*2	R/W*1	Illegal Access Error [Setting conditions] • When data is written to SD_CMD within a command sequence • When SD_CMD[10:8] = 3'b011 (no response) and SD_CMD[11] = 1'b1 (command with data transfer) are set in SD_CMD • When SD_CMD[11] = 1'b1 (command with data transfer) and SD_CMD[7:0] = 8'b00001100 (CMD12) are set in SD_CMD [Clearing condition] When 0 is written to ILA
14	CBSY	0*2	R	Command Type Register Busy 1: The command sequence is being executed. 0: The command sequence is ended.
13	SCLKDIVEN	1*2	R	SD Bus Busy 1: SD buses (CMD and DAT) are not busy. 0: SD buses (CMD and DAT) are busy. When a command sequence is started by writing to SD_CMD, CBSY is set to 1. At the same time, SCLKDIVEN is set to 0. After CBSY has been set to 0 at the end of the command sequence, SCLKDIVEN is set to 1 when 8 cycles of SD_CLK elapses.
12	—	0	R	Fixed 0
11	—	0*2	R/W*1	Reserved. The write value should always be 1.
10	—	0	R	Fixed 0
9	BWE	0*2	R/W*1	SD_BUF Write Enable 1: Data can be written in SD_BUF0. 0: Data cannot be written in SD_BUF0. [Setting conditions] • When SD_BUF is empty at single block transfer • When either bank 1 or bank 2 of SD_BUF is empty at multiple block transfer [Clearing condition] • When 0 is written to BWE When data is written to SD_BUF0 by the CPU, clear BWE and then write amount of data specified by SD_SIZE*3. Note that this bit is not set when the SD_BUF read/write DMA transfer is enabled by setting the DMASDRW bit in CC_EXT_ MODE to 1.
8	BRE	0*2	R/W*1	SD_BUF Read Enable 1: Data can be read from SD_BUF0. 0: Data cannot be read from SD_BUF0. [Setting conditions] • When data set in SD_SIZE is stored in SD_BUF at single block transfer • When data set in SD_SIZE is stored in either bank 1 or bank 2 of SD_BUF at multiple block transfer [Clearing condition] • When 0 is written to BRE When data is read from SD_BUF0 by the CPU, clear BRE and then read amount of data specified by SD_SIZE*3. Note that this bit is not set when the SD_BUF read/write DMA transfer is enabled by setting the DMASDRW bit in CC_EXT_ MODE to 1. Even if a CRC error or an END error occurs while block data is read, data is stored in SD_BUF and BRE is set.

Bit	Bit Name	Initial Value	R/W	Description
7	DAT0	Unknown	R	SD_D0 Indicates the SD_D0 state 1: SD_D0 is set to 1. 0: SD_D0 is set to 0. If the data timeout (ERR3) is set but the response timeout (ERR6) is not set after the Erase command has been issued, the end of the Erase sequence (DAT0 = 1) is confirmed by polling DAT0. If a communications error or timeout occurs during a write sequence, the DAT0 bit may retain the value 0.
6	ERR6	0*2	R/W*1	Response Timeout [Setting condition] When a response is not received though a longer time than 640 cycles of SD_CLK has elapsed [Clearing condition] When 0 is written to ERR6 The command sequence is halted by the response timeout.*4
5	ERR5	0*2	R/W*1	SD_BUF Illegal Read Access [Setting conditions] • When SD_BUF is empty while SD_BUF0 is read • When data with a CRC error or END error is read from SD_BUF0 [Clearing condition] When 0 is written to ERR5
4	ERR4	0*2	R/W*1	SD_BUF Illegal Write Access [Setting conditions] • When data is written to SD_BUF0 while it is not in the data read/write command state • When data is written to SD_BUF0 while SD_BUF is full. • When data is written to SD_BUF0 while an error occurs in the CRC status or CRC status length. • When data is written to SD_BUF0 while a busy state after the CRC status continues for longer than Ncycle [Clearing condition] When 0 is written to ERR4 Ncycle is set by bits 7 to 4 in SD_OPTION.
3	ERR3	0*2	R/W*1	Data Timeout (except response timeout) [Setting conditions] • After R1b response, the busy state (SD_D0 = 0) continues for longer than Ncycle. • After CRC status, the busy state (SD_D0 = 0) continues for longer than Ncycle. • After write data, the CRC status is not received though Ncycle has elapsed. • After read command, read data is not received though a longer time than Ncycle has elapsed. • After CMD12 has been issued within a command sequence, the busy state (SD_D0 = 0) for longer than Ncycle continues. • After the reception of read data, read data for the next block are not received though a longer time than Ncycle has elapsed. • After release of the read wait state, read data for the next block are not received though a longer time than Ncycle has elapsed. [Clearing condition] • When 0 is written to ERR3 Ncycle is set by bits 7 to 4 in SD_OPTION. The command sequence is halted by the data timeout.

Bit	Bit Name	Initial Value	R/W	Description
2	ERR2	0*2	R/W*1	END Error [Setting conditions] • When an error occurs in the response length (and the end bit has not been detected) • When an error occurs in the read data length (and the end bit has not been detected among the valid bits) • When an error occurs in the CRC status length (and the end bit has not been detected) [Clearing condition] When 0 is written to ERR2 The command sequence is halted by the End error.*4
1	ERR1	0*2	R/W*1	CRC Error [Setting conditions] • When an error occurs in the CRC status • When a CRC error occurs in the read data • When a CRC error occurs in the response [Clearing condition] When 0 is written to ERR1 The command sequence is halted by the CRC error.*4
0	ERR0	0*2	R/W*1	CMD Error [Setting condition] When the command index of the transmitted command differed from the command index of the received response [Clearing condition] When 0 is written to ERR0 The command sequence is halted by the CMD error.*4

Note 1. It is effective only if 0 is written.
Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
Note 3. The single byte or three bytes from the fraction of a full 32-bit unit are regarded as excess data due to an odd value for the number of bytes setting in SD_SIZE, or the two bytes from the fraction of a full 32-bit unit are regarded as excess data due if the value for the number of bytes setting in SD_SIZE is even but is not on a four-byte boundary.
Note 4. After the C52PUB bit in SDIO_MODE has been set to 1, if a communications error or timeout for response occurs in response to the CMD52 that is issued, since the command sequence has not been completed, complete the sequence with error processing as in usage examples in Figure 38.17 under section 38.4.8, IO_RW_EXTENDED Command (CMD53/Multiple Block Read) or in Figure 38.20 under section 38.4.9, IO_RW_EXTENDED Command (CMD53/Multiple Block Write).

38.2.8 SD_INFO1 Interrupt Mask Register (SD_INFO1_MASK)

The SD_INFO1 interrupt mask register (SD_INFO1_MASK) enables or disables the SD_INFO1 interrupt. When 0 is set in SD_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Fixed 0
9	IMASK9	1	R/W	INFO9 interrupt masked
8	IMASK8	1	R/W	INFO8 interrupt masked
7 to 5	—	All 0	R	Fixed 0
4	IMASK4	1	R/W	INFO4 interrupt masked
3	IMASK3	1	R/W	INFO3 interrupt masked
2	IMASK2	1	R/W	INFO2 interrupt masked
1	—	0	R	Fixed 0
0	IMASK0	1	R/W	INFO0 interrupt masked

38.2.9 SD_INFO2 Interrupt Mask Register (SD_INFO2_MASK)

The SD_INFO2 interrupt mask register (SD_INFO2_MASK) enables or disables the SD_INFO2 interrupt. When 0 is set in SD_INFO2_MASK while the corresponding flag in SD_INFO2 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
15	IMASK	1	R/W	ILA interrupt masked
14 to 12	—	All 0	R	Fixed 0
11	—	1	R/W	Reserved. The write value should always be 1.
10	—	0	R	Fixed 0
9	BMASK1	1	R/W	BWE interrupt masked
8	BMASK0	1	R/W	BRE interrupt masked
7	—	0	R	Fixed 0
6	EMASK6	1	R/W	ERR6 interrupt masked
5	EMASK5	1	R/W	ERR5 interrupt masked
4	EMASK4	1	R/W	ERR4 interrupt masked
3	EMASK3	1	R/W	ERR3 interrupt masked
2	EMASK2	1	R/W	ERR2 interrupt masked
1	EMASK1	1	R/W	ERR1 interrupt masked
0	EMASK0	1	R/W	ERR0 interrupt masked

38.2.10 SD Clock Control Register (SD_CLK_CTRL)

The SD clock control register (SD_CLK_CTRL) controls the SD clock (SD_CLK) output and sets the frequency. Set SCLKEN to 1 before writing to SD_CMD to issue a command.
Do not write to SD_CLK_CTRL while the SCLKDIVEN bit in SD_INFO2 is set to 0.

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Fixed 0
9	SDCLKOFFEN	0	R/W	SD Clock (SD_CLK) Output Automatic Control Enable 0: Automatic control for SD clock (SD_CLK) output is disabled. 1: Automatic control for SD clock (SD_CLK) output is enabled. This function of automatic control for SD clock (SD_CLK) output causes SD_CLK output only within a command sequence. The timing with which SD_CLK output starts and stops is as follows. SD_CLK output starts after writing to SD_CMD. SD_CLK output stops when 8 cycles of SD_CLK have elapsed after the end of the command sequence. In addition, automatic control for SD clock (SD_CLK) output is enabled when SCLKEN in SD_CLK_CTRL is 1.
8	SCLKEN	0*1	R/W*2	SD Clock (SD_CLK) Output Control Enable 0: SD clock (SD_CLK) output is disabled. The SD_CLK signal is fixed 0. 1: SD clock (SD_CLK) output is enabled.
7	DIV7	0	R/W*2	SD Clock (SD_CLK) 10000000: P1φ/512 01000000: P1φ/256 00100000: P1φ/128 00010000: P1φ/64 00001000: P1φ/32 00000100: P1φ/16 00000010: P1φ/8 00000001: P1φ/4 00000000: P1φ/2 Other settings are prohibited.
6	DIV6	0	R/W*2	
5	DIV5	1	R/W*2	
4	DIV4	0	R/W*2	
3	DIV3	0	R/W*2	
2	DIV2	0	R/W*2	
1	DIV1	0	R/W*2	
0	DIV0	0	R/W*2	

Note 1. This initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
Note 2. Writing is impossible when the CBSY bit in SD_INFO2 is 1.

38.2.11 Transfer Data Length Register (SD_SIZE)

The transfer data length register (SD_SIZE) specifies the transfer data size.

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	All 0	R	Fixed 0
11, 10	—	All 0	R	Reserved
9 to 0	LEN9 to LEN0	1000000000	R/W	Transfer Data Size*1 These bits specify a size between 1 and 512 bytes for the transfer of single blocks. In cases of multiple block transfer with automatic issuing of CMD12 (CMD18 and CMD25), the only specifiable transfer data size is 512 bytes. Furthermore, in cases of multiple block transfer without automatic issuing of CMD12, as well as 512 bytes, 32, 64, 128, and 256 bytes are specifiable. However, in the reading of 32, 64, 128, and 256 bytes for the transfer of multiple blocks, this is restricted to cases of multiple block transfer by CMD53. Additionally, if a command accompanies data transfer, do not set these bits to 0.

Note 1. Do not change the values of these bits when the SCLKDIVEN bit in SD_INFO2 is 0.

38.2.12 SD Card Access Control Option Register (SD_OPTION)

The SD card access control option register (SD_OPTION) sets the bus width and timeout counter.

Bit	Bit Name	Initial Value	R/W	Description
15	WIDTH	0*1	R/W	Bus Width*2 0: 4-bit width 1: 1-bit width
14	—	1	R	Fixed 1
13 to 8	—	All 0	R	Fixed 0
7	TOP27	1*1	R/W	Timeout Counter*2 1111: Setting prohibited 1110: SD_CLK × 2^{27} 1101: SD_CLK × 2^{26} : 0001: SD_CLK × 2^{14} 0000: SD_CLK × 2^{13}
6	TOP26	1*1	R/W	
5	TOP25	1*1	R/W	
4	TOP24	0*1	R/W	
3	CTOP24	1*1	R/W	Card Detect Time Counter 1111: Setting prohibited 1110: P1φ × 2^{24} 1101: P1φ × 2^{23} : 0001: P1φ × 2^{11} 0000: P1φ × 2^{10}
2	CTOP23	1*1	R/W	
1	CTOP22	1*1	R/W	
0	CTOP21	0*1	R/W	

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
Note 2. Do not change the values of these bits when the SCLKDIVEN bit in SD_INFO2 is 0.

38.2.13 SD Error Status Register 1 (SD_ERR_STS1)

The SD error status register 1 (SD_ERR_STS1) indicates the CRC status, CRC error, End error, and CMD error.

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Fixed 0
14	E14	0*1	R	These bits store the CRC status. (normal: 010)
13	E13	1*1	R	
12	E12	0*1	R	
11	E11	0*1	R	Set to 1 when an error occurs in the CRC status
10	E10	0*1	R	Set to 1 when a CRC error occurs in the read data
9	E9	0*1	R	Set to 1 when a CRC error occurs in the response to a command*2 issued within a command sequence. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E8.
8	E8	0*1	R	Set to 1 when a CRC error occurs in a response (other than a response to a command*2 issued within a command sequence)
7, 6	—	All 0	R	Fixed 0
5	E5	0*1	R	Set to 1 when an error occurs in the CRC status length (and the end bit has not been detected)
4	E4	0*1	R	Set to 1 when an error occurs in the read data length (and the end bit has not been detected among the valid bits)
3	E3	0*1	R	Set to 1 when an error occurs in the response length to a command*2 issued within a command sequence. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2.
2	E2	0*1	R	Set to 1 when an error occurs in the response length (other than a response to a command*2 issued within a command sequence)
1	E1	0*1	R	Set to 1 when an error occurs in the command index of the response to a command*2 issued within a command sequence. In cases where CMD12 is issued by setting a command index in SD_CMD, this is Indicated in E0.
0	E0	0*1	R	Set to 1 when an error occurs in the command index of a response (other than a response to a command*2 issued within a command sequence).

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
Note 2. "Command issued within a command sequence" refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

38.2.14 SD Error Status Register 2 (SD_ERR_STS2)

The SD error status register 2 (SD_ERR_STS2) indicates the timeout state. Ncycle is set by bits 7 to 4 in SD_OPTION.

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	All 0	R	Fixed 0
6	E6	0*1	R	Set to 1 when the busy state continues for longer than Ncycle after the CRC status
5	E5	0*1	R	Set to 1 when the CRC status is not received though a longer time than Ncycle has elapsed after data writing
4	E4	0*1	R	Set to 1 when read data is not received though a longer time than Ncycle has elapsed after read command. Set to 1 when read data for the next block are not received though a longer time than Ncycle has elapsed after the reception of read data. Set to 1 when read data for the next block are not received though a longer time than Ncycle has elapsed after release of the read wait state.
3	E3	0*1	R	Set to 1 when the busy state for longer than Ncycle continues after CMD12 has been issued within a command sequence. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E2.
2	E2	0*1	R	Set to 1 when the busy state for longer than Ncycle continues after R1b response
1	E1	0*1	R	Set to 1 when the response to a command*2 issued within a command sequence is not received though a longer time than 640 cycles of SD_CLK has elapsed. In cases where CMD12 is issued by setting a command index in SD_CMD, this is indicated in E0.
0	E0	0*1	R	Set to 1 when the response (other than a response to a command*2 issued within a command sequence) is not received though a longer time than 640 cycles of SD_CLK has elapsed.

Note 1. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
Note 2. "Command issued within a command sequence" refers to CMD12 when automatic issuing is enabled for multiple block transfer by the setting in SD_CMD, CMD12 when the STP bit in SD_STOP is set to 1, or CMD52 when the C52PUB or IOABT bit in SDIO_MODE is set to 1.

38.2.15 SD Buffer Read/Write Register (SD_BUF0)

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	BUF31 to BUF0	Unknown	R/W	When writing to the SD card, the write data is written to this register. When reading from the SD card, the read data is read from this register. This register is internally connected to two 512-byte (128-word) buffers.

38.2.16 SDIO Mode Control Register (SDIO_MODE)

The SDIO mode control register (SDIO_MODE) controls the CMD52 issuance and the read wait state at multiple block transfer, and the reception of SDIO interrupt. C52PUB and IOABT should not be set to 1 simultaneously.

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Fixed 0
9	C52PUB	0	R/W	SDIO None Abort*2 • When C52PUB is set to 1 in the CMD53 (multiple block) write sequence, CMD52 is automatically issued if SD_BUF becomes empty and between the current one-block and next-block. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1. • When C52PUB and RWREQ are set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state between the current one-block and next-block and CMD52 is automatically issued. C52PUB is automatically cleared to 0 after reception of the response to CMD52 is completed. Additionally, if C52PUB is set to 1 while the last block is being transferred, CMD52 is not issued. In this case, C52PUB is automatically cleared to 0 after the access end flag has been set to 1. • If C52PUB is set to 1 in the CMD53 (multiple block) read sequence, be sure to set RWREQ to 1 as well as C52PUB. • Set SD_ARG before setting C52PUB to 1.
8	IOABT	0	R/W	SDIO Abort*2 • When IOABT is set to 1 in the CMD53 (multiple block) sequence, the CMD53 sequence is halted and CMD52 is issued. For details on the CMD52 issue timing, see the detailed version of the SD host interface manual. However, if a command sequence is halted because of a communications error or timeout, CMD52 is not issued. Although continued buffer access is possible even after IOABT has been set to 1, the buffer access error bit (ERR5 or ERR4) in SD_INFO2 will be set accordingly. Set SD_ARG before setting IOABT to 1. • When IOABT has been set to 1 during transfer for single block write, the access end flag is set when SD_BUF becomes empty, and CMD52 is not issued. If SD_BUF does contain data, the access end flag is set on completion of reception of the busy state without CMD52 having been issued. • When IOABT has been set to 1 during transfer for single block read, the access end flag is set immediately after setting of IOABT and CMD52 is not issued. • When IOABT is set to 1 during reception of the busy state after an R1b response, the access end flag is set on completion of reception of the busy state without CMD52 having been issued. • When IOABT is set to 1 after a command sequence has been completed, CMD52 is not issued and the access end flag is not set.
7 to 3	—	All 0	R	Fixed 0

Bit	Bit Name	Initial Value	R/W	Description
2	RWREQ	0	R/W	Read Wait Request When RWREQ is set to 1 in the CMD53 (multiple block) read sequence, the block transfer enters the read wait state (SD_D2 changes from 1 to 0) between the current one-block and next-block. [Read wait state releasing] • The read wait state is released, when RWREQ is cleared to 0 in the read wait state.*3 • When IOABT is set to 1 in the read wait state, RWREQ is automatically cleared to 0 after CMD52 has been issued, and then the read wait state is released. • When C52PUB and RWREQ are set to 1 simultaneously in the CMD53 (multiple block) read sequence, the read wait state is not automatically released. Therefore, after the CMD52 response is received, clear RWREQ. (Be sure to set RWREQ and C52PUB simultaneously.) When RWREQ is set to 1 while the last block in the CMD53 (multiple block) read sequence is transferred, the read wait state is not entered and RWREQ is automatically cleared to 0 by setting access end.
1	—	0	R	Fixed 0
0	IOMOD	0	R/W	SDIO Mode*1 1: Enables the SD host interface to receive SDIO interrupt from the SDIO card. 0: Disables the SD host interface to receive SDIO interrupt from the SDIO card.

Note 1. Do not change the value of this bit when the SCLKDIVEN bit in SD_INFO2 is set to 0.
Note 2. Do not change the values of these bits from 1 to 0 when the SCLKDIVEN bit in SD_INFO2 is set to 0.
Note 3. Clear this bit after reception of the response to CMD52 is completed.

38.2.17 SDIO Interrupt Flag Register (SDIO_INFO1)

The SDIO interrupt flag register (SDIO_INFO1) indicates the status regarding to the SDIO card access. To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Bit	Bit Name	Initial Value	R/W	Description
15	EXWT	0*2	R/W*1	[Setting condition] While the last block in the CMD53 (multiple block) read sequence is transferred, RWREQ in SDIO_MODE is set to 1. [Clearing condition] When 0 is written to EXWT
14	EXPUB52	0*2	R/W*1	[Setting conditions] • While the last block in the CMD53 (multiple block) sequence is transferred, C52PUB in SDIO_MODE is set to 1. • While C52PUB is set to 1 in the CMD53 (multiple block) write sequence, the last block is transferred. [Clearing condition] When 0 is written to EXPUB52
13 to 3	—	All 0	R	Fixed 0
2, 1	—	0*2	R/W*1	Reserved The write value should always be 1.
0	IOIRQ	0*2	R/W*1	SD IO Interrupt [Setting condition] When SDIO interrupt from an SDIO card is received while IOMOD in SDIO_MODE is set to 1 [Clearing condition] When 0 is written to IOIRQ*3

Note 1. It is effective only if 0 is written.
Note 2. The initial value is applied at a reset and when the SDRST bit in SOFT_RST is 0.
Note 3. Before clearing this bit, access the SDIO card to negate the SDIO interrupt signal from the SDIO card (after CMD25 has been issued and the response received). If the interrupt signal is not negated, this bit may be set again.

38.2.18 SDIO_INFO1 Interrupt Mask Register (SDIO_INFO1_MASK)

The SDIO_INFO1 interrupt mask register (SDIO_INFO1_MASK) enables or disables the SD_INFO1 interrupt. When 0 is set in SDIO_INFO1_MASK while the corresponding flag in SD_INFO1 is set, an interrupt occurs.

Bit	Bit Name	Initial Value	R/W	Description
15	MEXWT	1	R/W	EXWT interrupt masked
14	MEXPUB52	1	R/W	EXPUB52 interrupt masked
13 to 3	—	All 0	R	Fixed 0
2, 1	—	All 1	R/W	Reserved The write value should always be 1.
0	IOMSK	1	R/W	IOIRQ interrupt masked

38.2.19 DMA Mode Enable Register (CC_EXT_MODE)

The DMA mode enable register (CC_EXT_MODE) enables the DMA transfer.

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Fixed 0
12	—	1	R	Reserved
11, 10	—	All 0	R	Fixed 0
9, 8	—	All 0	R	Reserved
7 to 5	—	All 0	R	Fixed 0
4	—	1	R	Reserved
3, 2	—	All 0	R	Reserved
1	DMASDRW	0	R/W	SD_BUF Read/Write DMA Transfer*1 1: The SD_BUF read/write DMA transfer is enabled. 0: The SD_BUF read/write DMA transfer is disabled. At the SD_BUF read/write DMA transfer, set DMASDRW to 1 before setting SD_CMD.
0	—	0	R	Reserved

Note 1. Do not change the values of these bits when the SCLKDIVEN bit in SD_INFO2 is set to 0.

38.2.20 Software Reset Register (SOFT_RST)

The software reset register (SOFT_RST) sets a software reset. Make sure to release the reset before using the SD host interface.

Bit	Bit Name	Initial Value	R/W	Description
15 to 3	—	All 0	R	Fixed 0
2	—	1	R	Reserved
1	—	1	R	Reserved
0	SDRST	0	R/W	Software Reset of SD I/F Unit 0: Reset 1: Reset released

38.2.21 Version Register (VERSION)

The version register (VERSION) indicates the version of the SD host interface.

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	1000	R	Reserved
11 to 8	UR3 to UR0	4'h2	R	Version of Renesas IP
7 to 0	IP7 to IP0	8'h0B	R	Version of adopted IP

38.2.22 Swap Control Register (EXT_SWAP)

The swap control register (EXT_SWAP) can replace data when SD_BUF0 is accessed.

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R/W	Reserved The write value should always be 0.
14, 13	—	All 0	R	Reserved
12, 11	—	All 0	R/W	Reserved The write value should always be 0.
10, 9	—	All 0	R	Fixed 0
8	DMASEL	0	R/W	DMA Transfer Size Select Selects the transfer unit for SD_BUF read/write DMA transfer. Set this bit in combination with the transfer size set in the DMA Channel Configuration register. 0: 4-byte (longword) unit 1: 64-byte (longword × 16) unit Note: • For DMA transfer in 64-byte units, set address H'E804E000 (channel 0) / H'E804E800 (channel 1) as the destination or source of DMA transfer instead of the SD buffer read/write register (SD_BUF0). Moreover, if a communications error or timeout occurs during the 64-byte unit DMA transfer, this bit should be set to 0 and re-setting again before using DMA transfer. If a software reset occurs during the 64-byte unit DMA transfer, this bit should be set to 0 and re-setting again before using DMA transfer.
7	SDBRSWAP	0	R/W	SD_BUF0 Swap Read*1 When reading from SD_BUF0, data stored in SD_BUF0 can be replaced and then read.*2 0: The current data is read without replacement. 1: Data replacement for reading proceeds in bytes.
6	SDBWSWAP	0	R/W	SD_BUF0 Swap Write*1 When writing to SD_BUF0, data to be written can be replaced and then stored in SD_BUF0.*2 0: The current data is written without replacement. 1: Data replacement for writing proceeds in bytes.
5	—	0	R	Fixed 0
4, 3	—	All 0	R/W	Reserved The write value should always be 0.
2	—	0	R	Fixed 0
1	—	0	R/W	Reserved The write value should always be 0.
0	—	0	R	Fixed 0

Note 1. Do not change the values of these bits when the SCLKDIVEN bit in SD_INFO2 is set to 0.
Note 2. Details on SD_BUF0 access with data replacement or non-replacement are indicated in (1) SD Data Format in section 38.3.1, SD I/F.

38.3 Operation

38.3.1 SD I/F

(1) SD Data Format

When data is read from the SD card, the procedure is as follows.

1. The SD host interface receives data from the SD card via the SD_D signal. (SD_D signal: see Figure 38.2 and Figure 38.3.)
2. The receive data is stored in SD_BUF of the SD host interface. (SD_BUF store data: see Figure 38.4)
3. The data stored in SD_BUF is read by SD_BUF0. (Reading from SD_BUF0: see Figure 38.5)

When data is written to the SD card, the above procedure will be reversed.
When accessing SD_BUF0, caution should be taken for the transfer order in SD_D and the store order in SD_BUF. In addition, data stored in SD_BUF0 can be replaced in bytes with the EXT_SWAP. (See Figure 38.5)

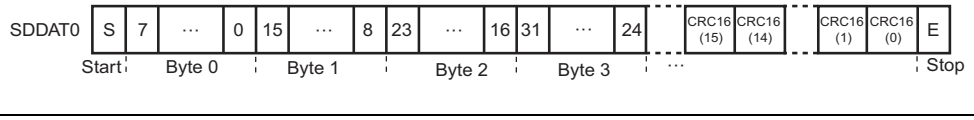

Figure 38.2 SD_D0 in 1-Bit Width Mode

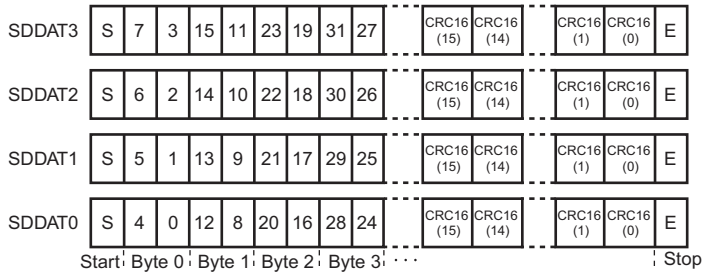

Figure 38.3 SD_D3 to SD_D0 in 4-Bit Width Mode

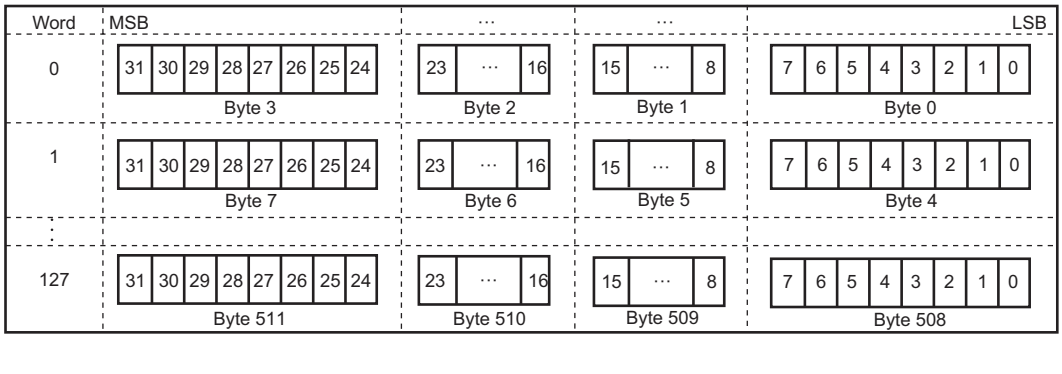

Figure 38.4 SD_BUF Store Data

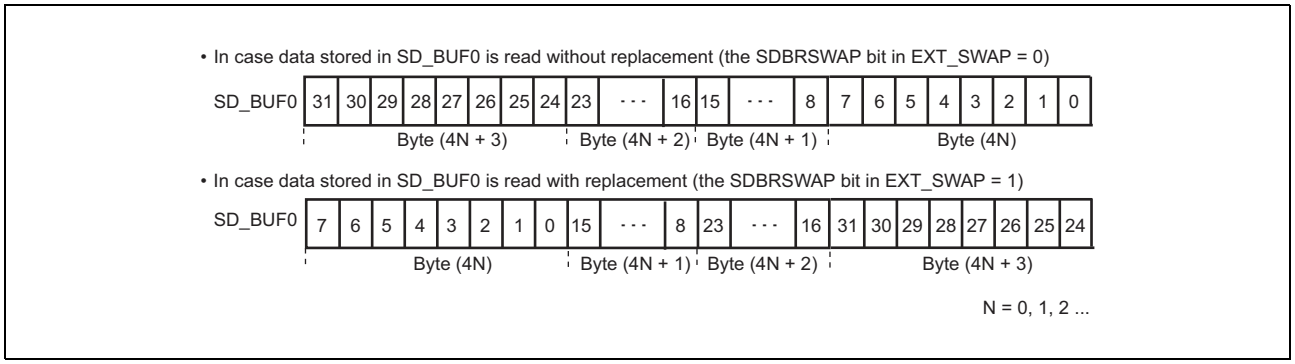

Figure 38.5 Reading from SD_BUF

(2) Command Issue Timing within the Command Sequence

- CMD12 issue timing (multiple block read)
  For details on the CMD12 issue timing (multiple block read), see the detailed version of the SD host interface manual.

- CMD12 issue timing (multiple block write)
  For details on the CMD12 issue timing (multiple block write), see the detailed version of the SD host interface manual.

- CMD52 (SDIO abort) issue timing (SDIO multiple block read/write)
  For details on the CMD52 (SDIO abort) issue timing (SDIO multiple block read/write), see the detailed version of the SD host interface manual.

- CMD52 (SDIO none abort) issue timing (SDIO multiple block read/write)
  For details on the CMD52 (SDIO none abort) issue timing (SDIO multiple block read/write), see the detailed version of the SD host interface manual.

(3) SDIO Interrupt

For details on the SDIO interrupt, see the detailed version of the SD host interface manual.

38.3.2 Card Detect/Write Protect

(1) Card Detect

The SD host interface has two types of card detect functions as described in the following.

- Card detect with SD_CD
  Figure 38.6 shows the timing chart of card detect using SD_CD. SD_CD is connected to the card socket and pulled up on the host device. The resistance of the pull-up resistor is decided by the specification of the SD host device.

[Card insertion]
SD_CD is pulled down when a card is inserted. At this time, if SD_CD has been pulled down for the Ncycle period (set in SD_OPTION), INFO4 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)
[Card removal]
SD_CD is pulled up when a card is removed. At this time, if SD_CD has been pulled up for the Ncycle period (set in SD_OPTION), INFO3 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

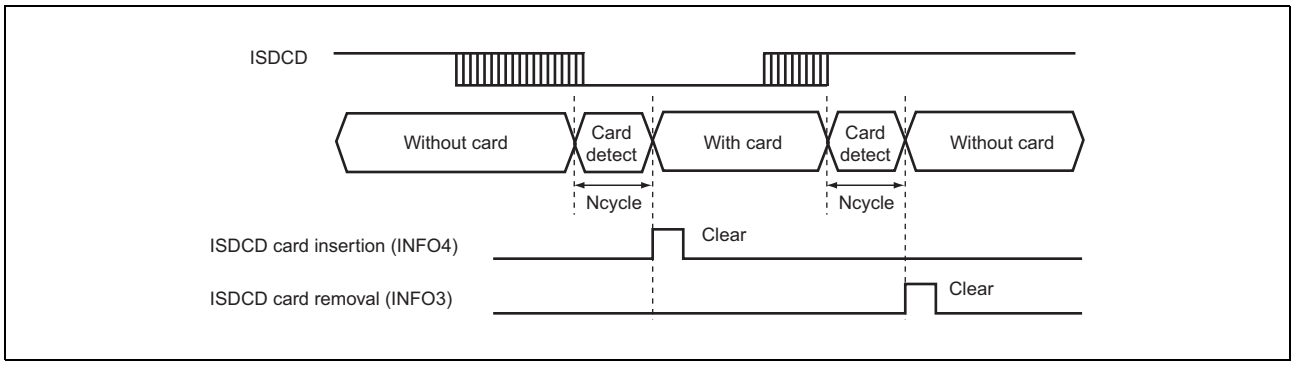

Figure 38.6 Example of Card Detect with SD_CD

- SD card detect with SD_D3
  Figure 38.7 shows the timing chart when the SD card is detected with SD_D3. In addition, SD_D3 is pulled down by the host device, and the resistance value for pulling down is decided by the specification of SD host device.

[Card insertion]
When an SD card is inserted, SD_D3 is pulled up. Accordingly, INFO9 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)
[Card removal]
When an SD card is removed, SD_D3 is pulled down. Accordingly, INFO8 in SD_INFO1 is set to 1. (It is cleared to by writing 0.)

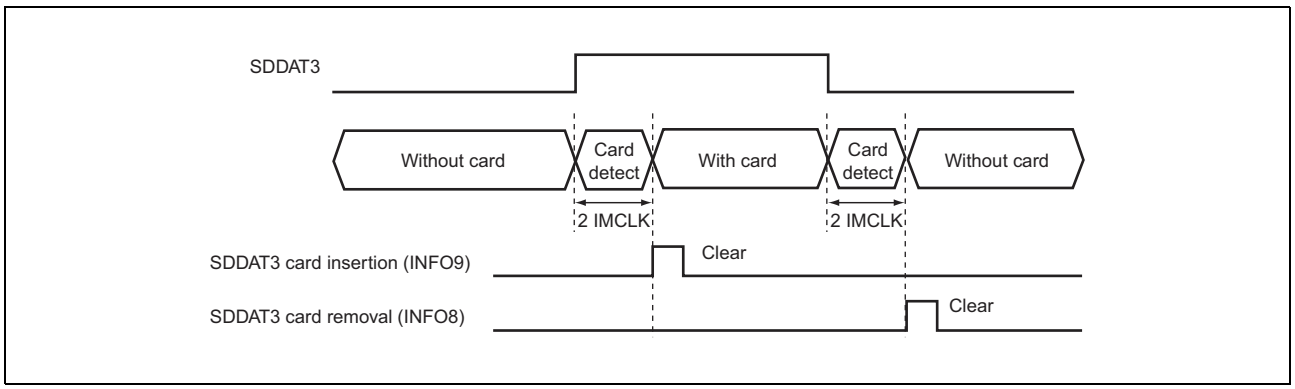

Figure 38.7 SD Card Detect with SD_D3

- Power-Down mode at Card removal
  SD Host Interface module is halted by the MSTP123 bit to MSTP120 bit in Standby Control Register 12 (STBCR12). If these bits of each channel in STBCR12 are set to 10, low power consumption is achieved at Card removal. See section 42, Power-Down Modes.

Bit	Bit Name	Initial Value	R/W	Description
3	MSTP123	1	R/W	SD Host Interface 0 Module Stop 00: SD Host Interface 0 Module runs. 01: Setting prohibited 10: Only card detect block in SD Host Interface 0 Module runs. 11: Clock supply to SD Host Interface 0 Module is halted.
2	MSTP122	1		
1	MSTP121	1	R/W	SD Host Interface 1 Module Stop 00: SD Host Interface 1 Module runs. 01: Setting prohibited 10: Only card detect block in SD Host Interface 1 Module runs. 11: Clock supply to SD Host Interface 1 Module is halted.
0	MSTP120	1		

(2) Write Protect

The SD host interface has two types of write protect functions.

- Write protect with SD_WP
  SD_WP is connected to the card socket, and pulled up or pulled down by the card insertion. The selection of pulling up or pulling down and the resistance value is decided by the specification of SD host device. As the SD_WP state is reflected to INFO7 in SD_INFO1, the write protect is decided after the SD card is inserted.
- Write protect with command
  The card's internal write protection and the card lock/unlock operation are realized by the command.

38.3.3 Interrupt Request and DMA Transfer Request

(1) Interrupt Request

The SD host interface has three interrupt requests. Table 38.4 shows the relationship between the interrupt flag registers and the interrupt mask registers. When a bit in an interrupt mask register is set to 0, an interrupt occurs by setting the corresponding bit in the interrupt flag register to 1.
To clear a flag, write 0 to the bit to be cleared and 1 to the other bits.

Table 38.4 Interrupt Request

	Interrupt Flag Register		Interrupt Mask Register	
Interrupt Request	**Register Name**	**Bit Name**	**Register Name**	**Bit Name**
Card access interrupt (SDHI0)	SD_INFO1	INFO2	SD_INFO1_MASK	IMASK2
		INFO0		IMASK0
	SD_INFO2	ILA	SD_INFO2_MASK	IMASK
		BWE		BMASK1
		BRE		BMASK0
		ERR6		EMASK6
		ERR5		EMASK5
		ERR4		EMASK4
		ERR3		EMASK3
		ERR2		EMASK2
		ERR1		EMASK1
		ERR0		EMASK0
SDIO access interrupt (SDHI1)	SDIO_INFO1	EXWT	SDIO_INFO1_MASK	MEXWT
		EXPUB52		MEXPUB52
		IOIRQ		IOMSK
Card detect interrupt (SDHI3)	SD_INFO1	INFO9	SD_INFO1_MASK	IMASK9
		INFO8		IMASK8
		INFO4		IMASK4
		INFO3		IMASK3

(2) DMA Transfer Request

The SD host interface has two types of DMA transfer requests. The DMA transfer requests are described in the following passages.

- SD_BUF write DMA transfer request
  - When the buffer is empty while the DMASDRW bit in CC_EXT_MODE is set to 1, the SD_BUF write DMA transfer request is asserted.
  - The SD_BUF write DMA transfer request is negated when the last data in one block (= the transfer data size set in SD_SIZE) is transferred. The SD_BUF write DMA transfer request is also negated by clearing the SDRST bit in SOFT_RST to 0 or setting the STP bit in SD_STOP to 1. Note that if a communications error or timeout occurs at the DMA transfer, the SD_BUF write DMA transfer request is not negated.
  - The number of DMA transfers should be n x one block. (n = integer, one block = the transfer data size set in SD_SIZE)
  - When the IOABT bit in SDIO_MODE is set to 1, the SD_BUF write DMA transfer request is negated.
  - The DMA transfer request is also negated by clearing the DMASDRW bit to 0. However, note that the DMA transfer request is asserted again when the DMASDRW bit is set to 1 before writing to SD_CMD.
- SD_BUF read DMA transfer request
  - When the buffer is full while the DMASDRW bit in CC_EXT_MODE is set to 1, the SD_BUF read DMA transfer request is asserted.
  - The SD_BUF read DMA transfer request is negated when the last data in one block (= the transfer data size set in SD_SIZE) is transferred. The SD_BUF read DMA transfer request is also negated by clearing the SDRST bit in SOFT_RST to 0 or setting the STP bit in SD_STOP to 1. Note that if a communications error or timeout occurs at the DMA transfer, the SD_BUF read DMA transfer request is not negated.
  - The number of DMA transfers should be n x one block. (n = integer, one block = the transfer data size set in SD_SIZE)
  - When the IOABT bit in SDIO_MODE is set to 1, the SD_BUF read DMA transfer request is negated.
  - The DMA transfer request is also negated by clearing the DMASDRW bit to 0. However, note that the DMA transfer request is asserted again when the DMASDRW bit is set to 1 before writing to SD_CMD.
  - The number of cycles at one DMA transfer will be more than P1φ × 10. If SD_CLK is high frequency and SD_BUF is not empty, SD_CLK is stopped until SD_BUF is empty.

38.3.4 Communications Errors and Timeouts

- Communications Errors and Timeouts
  Table 38.5 and Table 38.6 show the relationships between the SD card interrupt flag register and SD error status register for communications errors and timeouts, respectively. When a bit in the SD card interrupt flag register is set to 1, the corresponding bit in the SD error status register is set to 1. The values of the SD error status register are cleared by writing to SD_CMD or writing 0 to the SDRST bit in SOFT_RST.

Table 38.5 Communications Errors

	SD Card Interrupt Flag Register		SD Error Status Register		
Communication Error	**Register Name**	**Bit Name**	**Register Name**	**Bit Name**	**Description**
END error	SD_INFO2	ERR2	SD_ERR_STS1	E5	When an error occurs in the CRC status length
				E4	When an error occurs in read data length
				E3	When an error occurs in the response length to a command issued within a command sequence
				E2	When an error occurs in the response length (other than a response to a command issued within a command sequence)
CRC error		ERR1		E11	When an error occurs in the CRC status
				E10	When a CRC error occurs in the read data
				E9	When a CRC error occurs in the response to a command issued within a command sequence
				E8	When a CRC error occurs in the response (other than a response to a command issued within a command sequence)
CMD error		ERR0		E1	The command index of the transmitted command differed from the command index of the received response (for a command issued within a command sequence).
				E0	The command index of the transmitted command differed from the command index of the received response (for a command issued other than within a command sequence)

Table 38.6 Timeouts

Timeout	SD Card Interrupt Flag Register		SD Error Status Register		Description
	Register Name	Bit Name	Register Name	Bit Name	
Response timeout	SD_INFO2	ERR6	SD_ERR_STS2	E1	When the response to a command issued within a command sequence is not received though a longer time than 640 cycles of SD_CLK has elapsed
				E0	When the response (other than a response to a command issued within a command sequence) is not received though a longer time than 640 cycles of SD_CLK has elapsed
Data timeout (other than response timeout)		ERR3		E6	When the busy state (SD_D0 = 0) continues for longer than Ncycle after the CRC status
				E5	When the CRC status is not received though a longer time than Ncycle has elapsed after data writing
				E4	When read data is not received though a longer time than Ncycle has elapsed after read command
					When read data for the next block are not received though a longer time than Ncycle has elapsed after the reception of read data
					When read data for the next block are not received though a longer time than Ncycle has elapsed after release of the read wait state
				E3	When the busy state (SD_D0 = 0) for longer than Ncycle continues after CMD12 has been issued within a command sequence.
				E2	When the busy state (SD_D0 = 0) for longer than Ncycle continues after R1b response

38.4 Usage Example

38.4.1 Card Detect

(1) Operation Example

For details on the operation example, see the detailed version of the SD host interface manual.

(2) Register Setting Examples

For details on the register setting examples, see the detailed version of the SD host interface manual.

38.4.2 Command without Data Transfer

(1) Flowchart

Figure 38.8 and Figure 38.9 show flowchart examples.

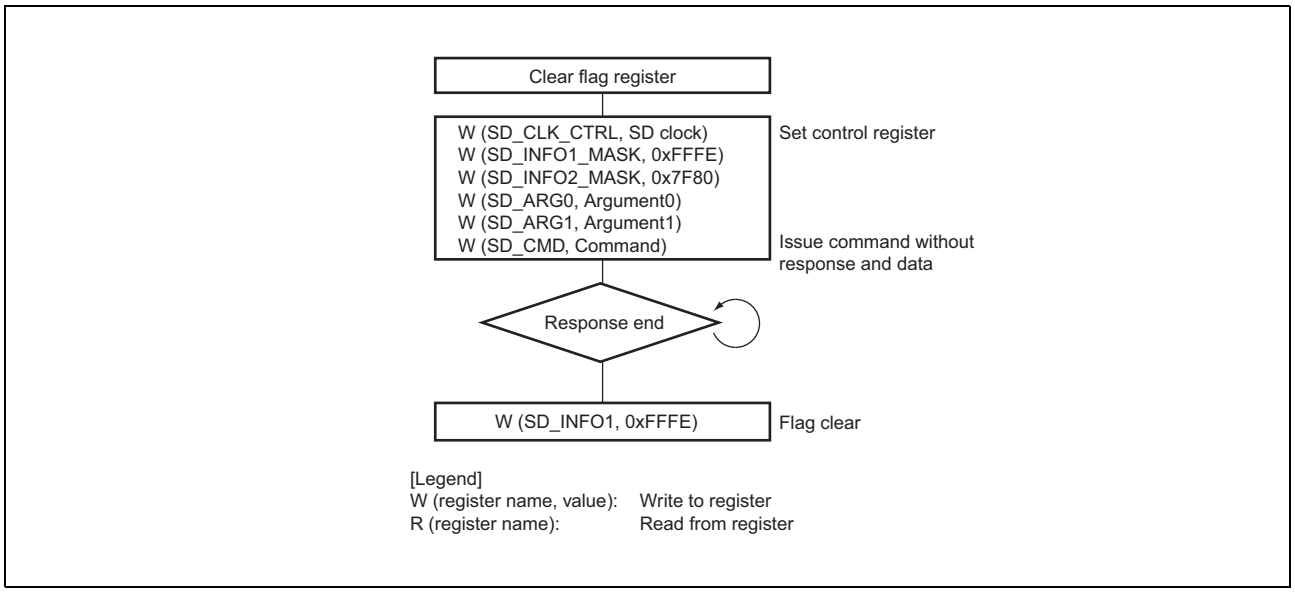

Figure 38.8 Flow Example of Command Without Response and Data

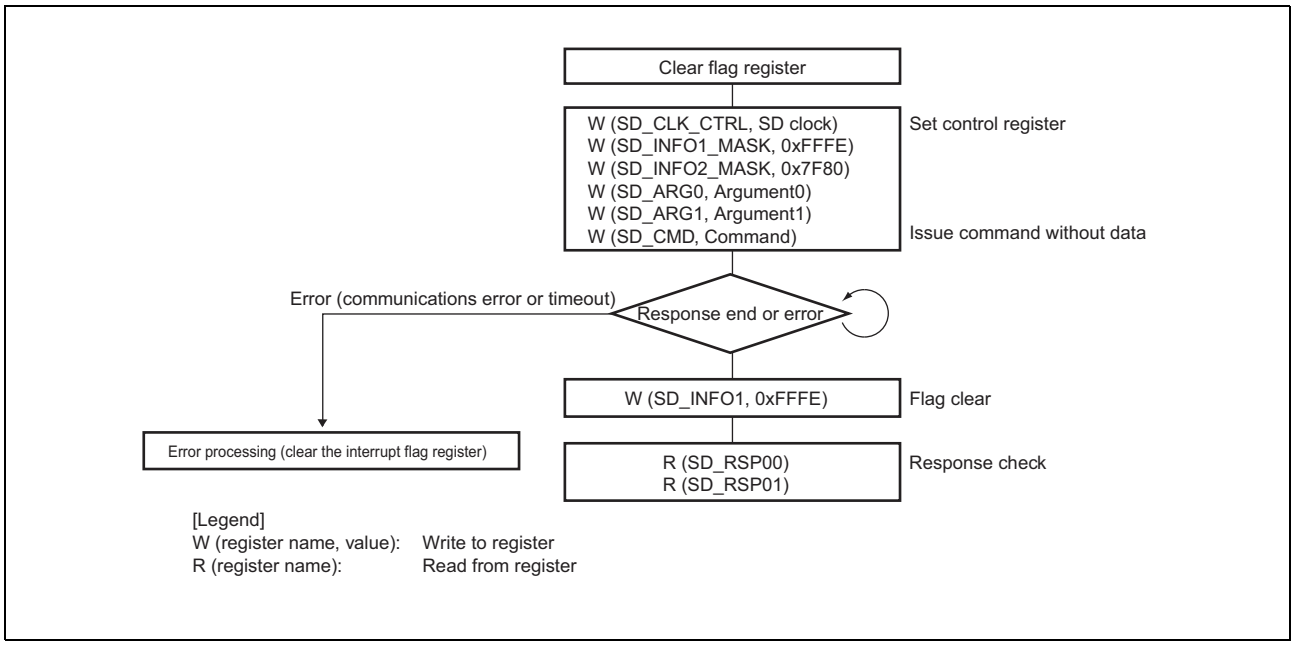

Figure 38.9 Flow Example of Command Without Data

(2) Operation Example

For details on the operation example, see the detailed version of the SD host interface manual.

(3) Operation for Command without Data Transfer: The operation of the command without data transfer is described in the following.

- Command without response and data
  - Flag register clear
    First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
  - Control register set
    Set the SD clock (SD_CLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
  - Command issue
    Set CMD Argument in SD_ARG0 and SD_ARG1 and write to SD_CMD.
    Accordingly, CMD is issued, and the operation is started.
  - Flag clear
    When transmission of a command is completed, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.

- Command without data
  - Flag register clear
    First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)
  - Control register set
    Set the SD clock (SD_CLK), interrupt mask, and so on. (SD_CLK_CTRL, SD_INFO1_MASK, and SD_INFO2_MASK)
  - Command issue
    Set CMD Argument in SD_ARG0 and SD_ARG1 and write to the SD_CMD.
    Accordingly, CMD is issued, and the operation is started.
  - Flag clear
    When a response is received, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0.
  - Read a response from SD_RSP00 and SD_RSP01.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

38.4.3 Single Block Read

(1) Flowchart

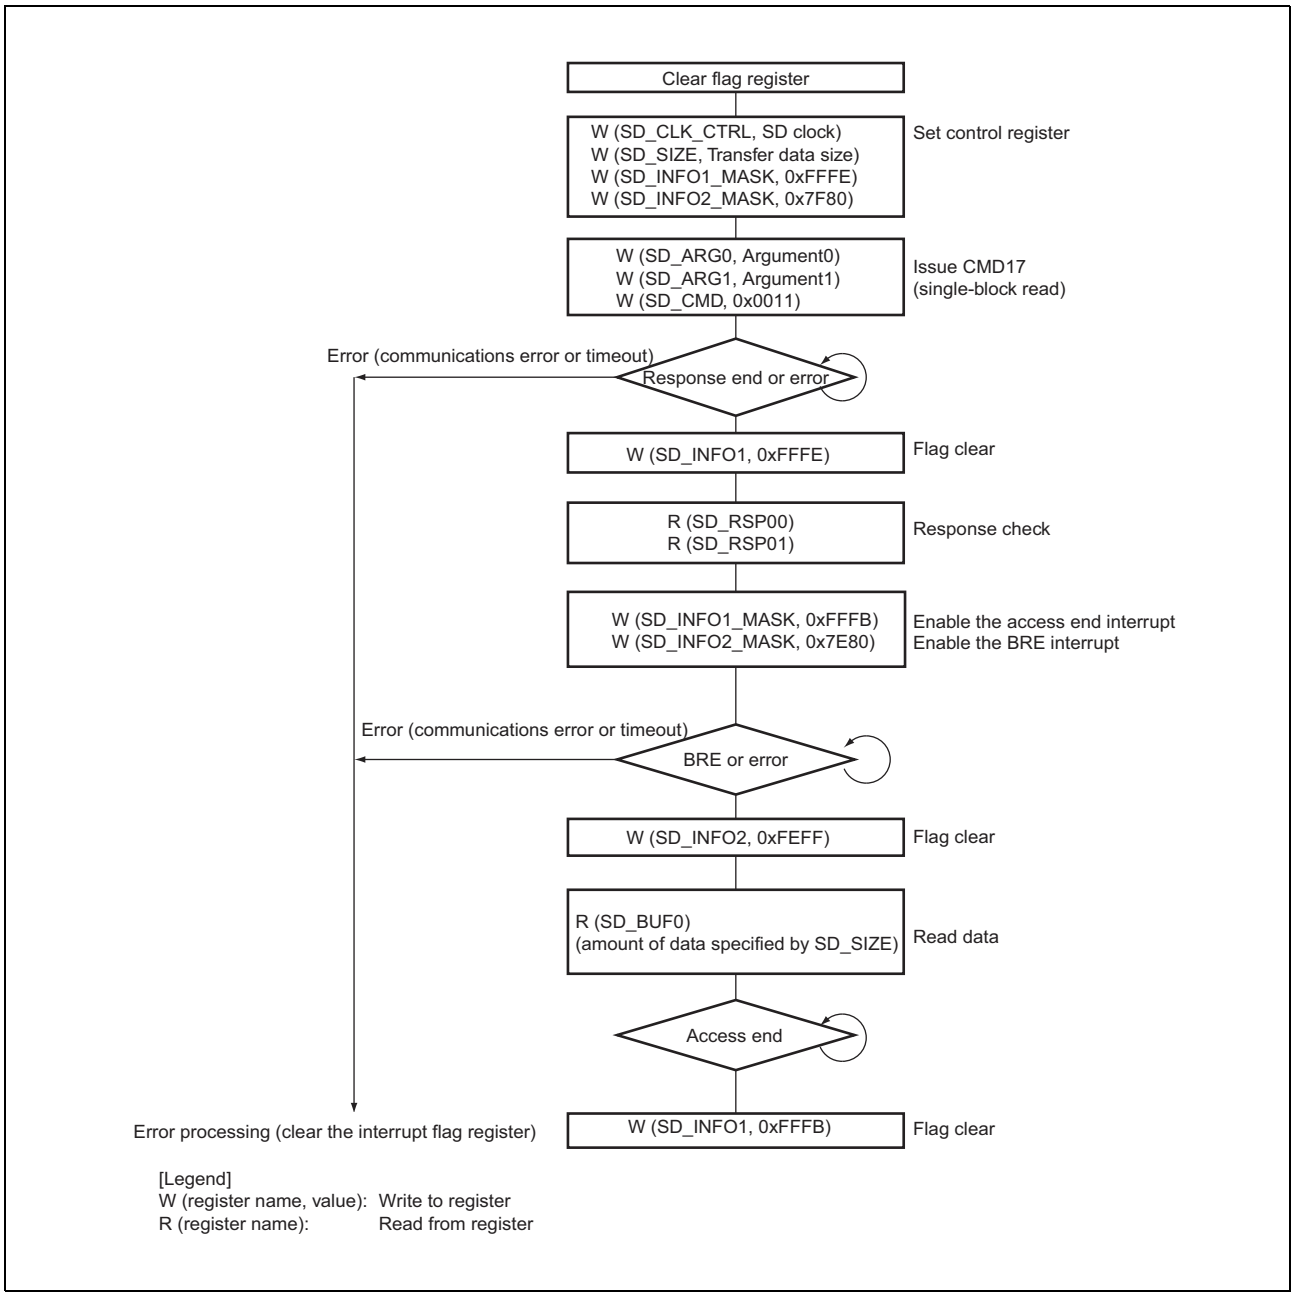

Figure 38.10 Single Block Read Flowchart Example

(2) Operation Example

For details on the operation example, see the detailed version of the SD host interface manual.

(3) Operation for Single Block Read: The operation of the single block read is described in the following.

– Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)

– Control register set
Set the SD clock (SD_CLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)

– Command issue (CMD17)
Set CMD17 Argument in SD_ARG0 and SD_ARG1 and write 0x0011 to SD_CMD.
Accordingly, CMD17 is issued, and the single block read operation is started.

– Response check
On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP00 and SD_RSP01.
If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
If the INFO2 bit (access end) in SD_INFO has been set, halting the command sequence will also lead to the generation of an interrupt.

– Data receive from SD card and data read
Write 0xFFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0x7E80 to SD_INFO2_MASK to enable the BRE interrupt. When the data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0.
However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress.

– Operation complete
When the data read from SD_BUF0 is completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to end the single block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

38.4.4 Single Block Write

(1) Flowchart

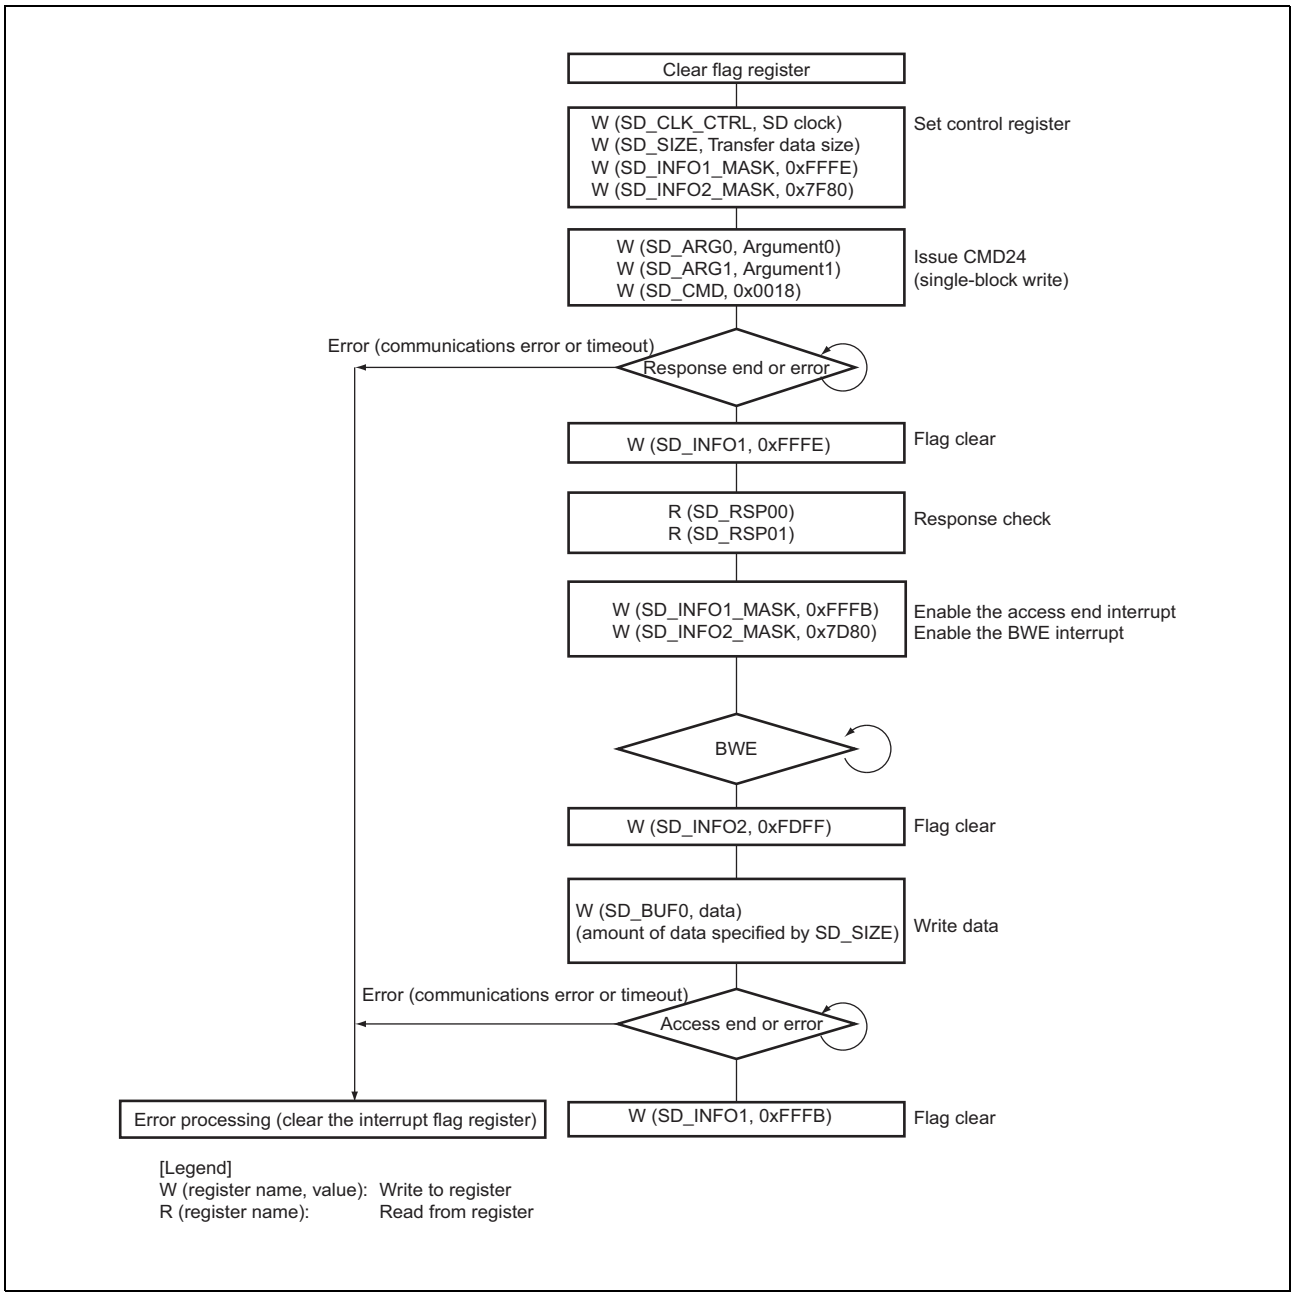

Figure 38.11 Single Block Write Flowchart Example

(2) Operation Example

For details on the operation example, see the detailed version of the SD host interface manual.

(3) Operation for Single Block Write: The operation of the single block write is described in the following.

– Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)

– Control register set
Set the SD clock (SD_CLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)

– Command issue (CMD24)
Set CMD24 Argument in SD_ARG0 and SD_ARG1 and write 0x0018 to SD_CMD.
Accordingly, CMD24 is issued, and the single block write operation is started.

– Response check
On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP00 and SD_RSP01.
If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP or the IOABT bit in SDIO_MODE to 1. Furthermore, this causes CMD12 and CMD52 to not be issued.
If the INFO2 bit (access end) in SD_INFO has been set, halting the command sequence will also lead to the generation of an interrupt.

– Data write and data transmit to SD card
Write 0xFFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0x7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card.
However, a communications error or timeout may be generated if data are being transmitted after writing to SD_BUF0.

– Operation complete
When the CRC status and busy state are received from the SD card, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to end the single block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

38.4.5 Multiple Block Read

(1) Flowchart

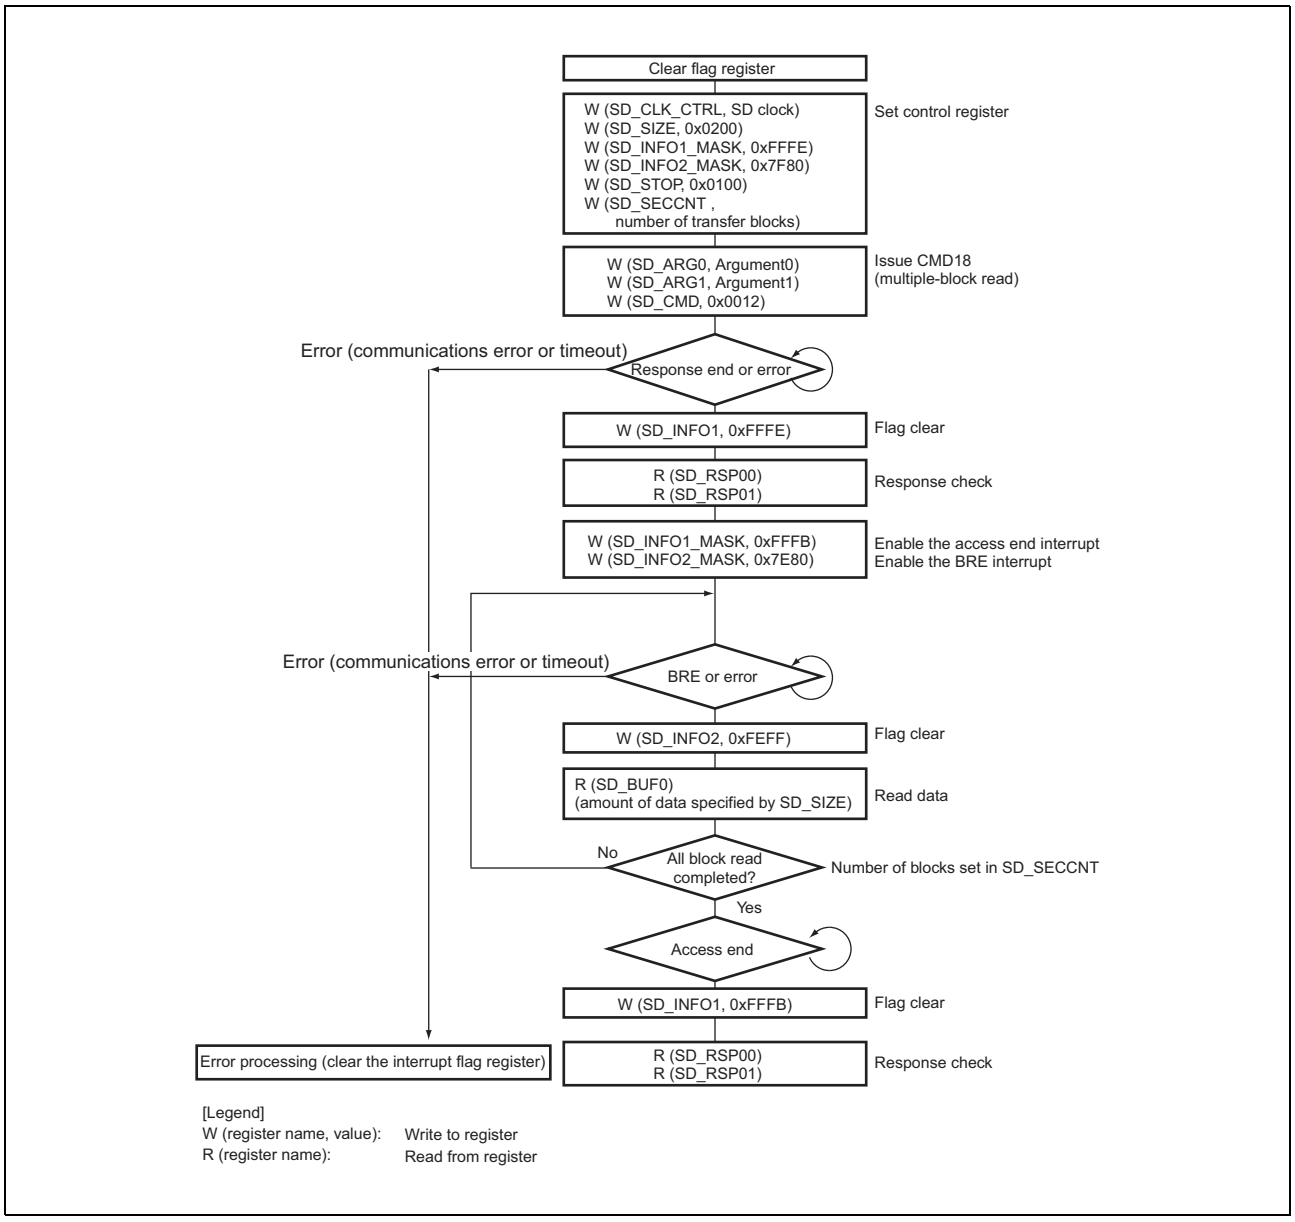

Figure 38.12 Multiple Block Read Flowchart Example

(2) Operation Example

For details on the operation example, see the detailed version of the SD host interface manual.

(3) Operation for Multiple Block Read: The operation of the multiple block read is described in the following.

– Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)

– Control register set
Set the SD clock (SD_CLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
Set SEC in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.

– Command issue (CMD18)
Set CMD18 Argument in SD_ARG0 and SD_ARG1 and write 0x0012 to SD_CMD.
Accordingly, CMD18 is issued, and the multiple block read operation is started.

– Response check
On receiving the response, INFO0 (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO0 to 0 and read the response from SD_RSP00 and SD_RSP01.
If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. When this happens, the arguments for the CMD12 command are set in SD_ARG0 and SD_ARG1. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed.
Clear the INFO2 bit to 0 and read the response.

– Data receive from SD card and data read
Write 0xFFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0x7E80 to SD_INFO2_MASK to enable the BRE interrupt. When one-block data receive from the SD card is completed, the BRE bit in SD_INFO2 is set to 1 to generate an interrupt. Clear the BRE bit to 0 and read the amount of data specified by SD_SIZE from SD_BUF0. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error or timeout may be generated if data are being received while reading of SD_BUF0 is in progress. When reception of the last block of data is completed, CMD12 is automatically issued and the response is received.
At this point, the arguments of CMD12 are reflected as the arguments of CMD18.

– Operation complete
When all-block data read and the CMD12 response receive are completed, INFO2 (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear INFO2 to 0 to read the response. This is the end of multiple block read operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

38.4.6 Multiple Block Write

(1) Flowchart

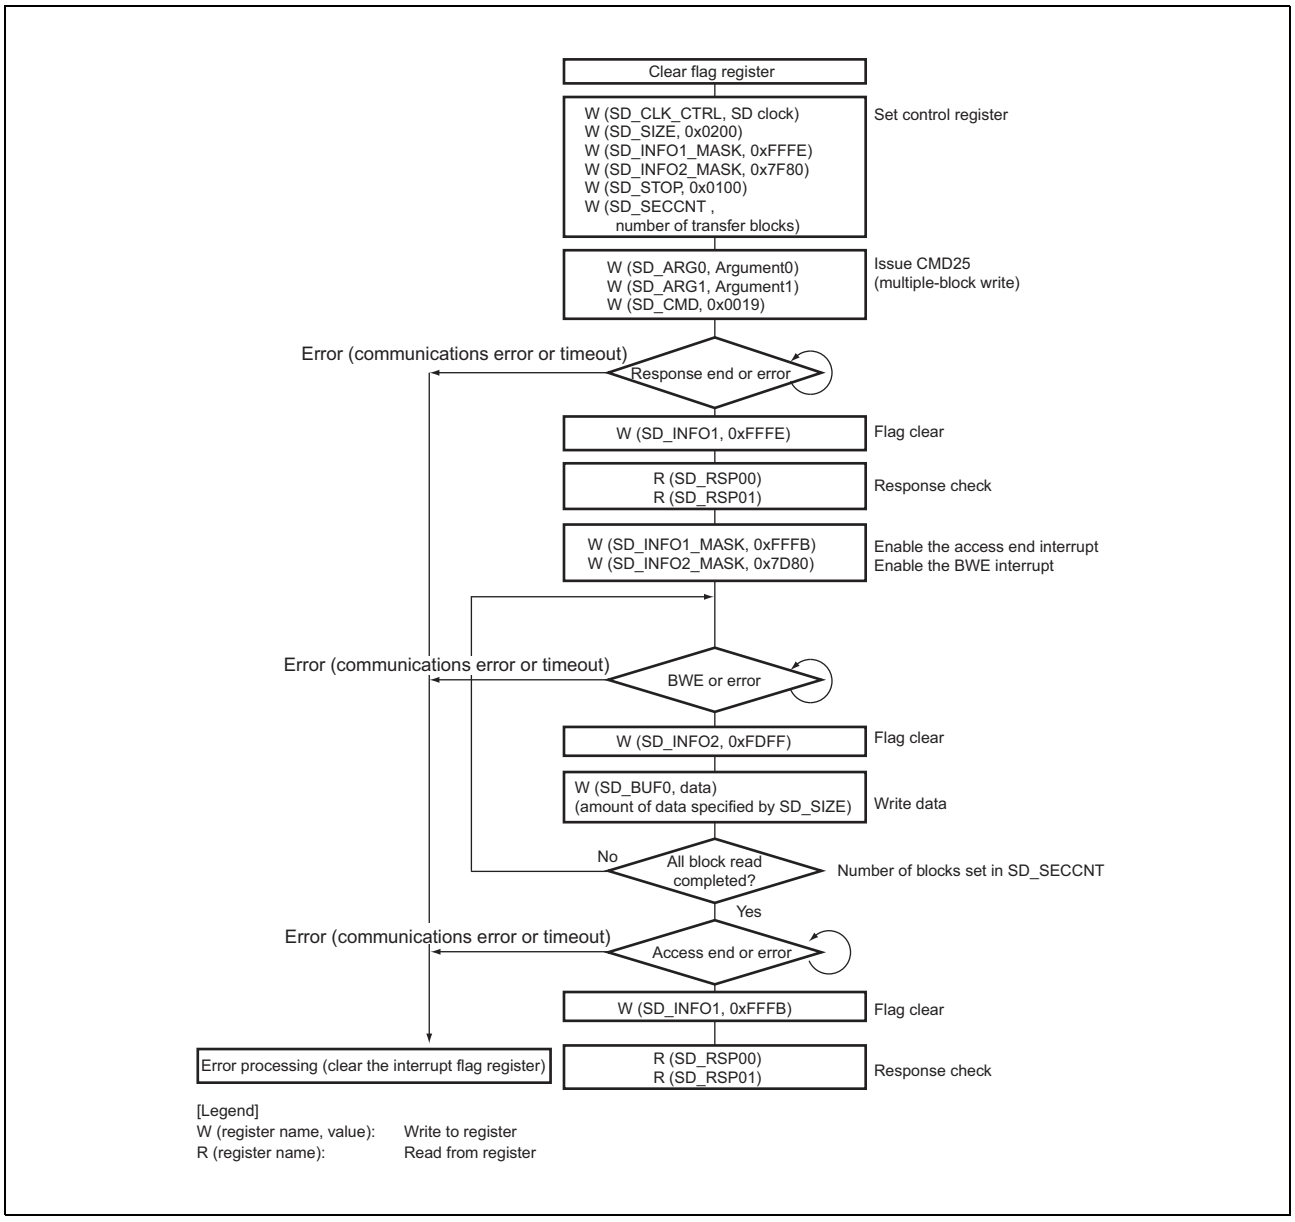

Figure 38.13 Multiple Block Write Flowchart Example

(2) Operation Example

For details on the operation example, see the detailed version of the SD host interface manual.

(3) Operation for Multiple Block Write: The operation of the multiple block write is described in the following.

– Flag register clear
First, clear the bits in the flag register. (SD_INFO1 and SD_INFO2)

– Control register set
Set the SD clock (SD_CLK), transfer data size, interrupt mask, and so on. (SD_CLK_CTRL, SD_SIZE, SD_INFO1_MASK, and SD_INFO2_MASK)
Set the SEC bit in SD_STOP to 1, and set the number of transfer blocks in SD_SECCNT.

– Command issue (CMD25)
Set CMD25 Argument in SD_ARG0 and SD_ARG1 and write 0x0019 to SD_CMD.
Accordingly, CMD25 is issued, and the multiple block write operation is started.

– Response check
On receiving the response, the INFO0 bit (response end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO0 bit to 0 and read the response from SD_RSP00 and SD_RSP01.
If the result of response decoding is an error, the command sequence can be halted by setting the STP bit in SD_STP to 1. Setting the STP bit to 1 also causes CMD12 to be issued and the response received. When this happens, the arguments for the CMD12 command are set in SD_ARG0 and SD_ARG1. If the command sequence is halted because the access end interrupt has been enabled, an interrupt will be generated by setting of the INFO2 bit (access end) bit in SD_INFO1 to 1 when reception of the response has been completed.
Clear the INFO2 bit to 0 and read the response.

– Data write and data transmit to SD card
Write 0xFFFB to SD_INFO1_MASK to enable the access end interrupt. In addition, write 0x7D80 to SD_INFO2_MASK to enable the BWE interrupt. When SD_BUF0 is ready for the data to be written, the BWE bit in the SD_INFO2 resister is set to 1 to generate an interrupt. Clear the BWE bit to 0 and write the amount of data specified by SD_SIZE to SD_BUF0. When the data write to SD_BUF0 is completed, data is transmitted to the SD card. Then, the CRC status and busy state are received from the SD card. Doing this repeats transfer of the number of blocks set in SD_SECCNT. However, a communications error or timeout may be generated if data are being received while writing to SD_BUF0 is in progress. When reception of the last block of data is completed, CMD12 is automatically issued and the response is received.
At this point, the arguments of CMD12 are reflected as the arguments of CMD25.

– Operation complete
When all-block data transmit and the CRC status receive are completed, the INFO2 bit (access end) in SD_INFO1 is set to 1 to generate an interrupt. Clear the INFO2 bit to 0 to read the response. This is the end of multiple block write operation.

Furthermore, perform error processing (clear the interrupt flag register) if an error occurs (a communications error or timeout).

38.4.7 IO_RW_DIRECT Command (CMD52)

(1) Flowchart

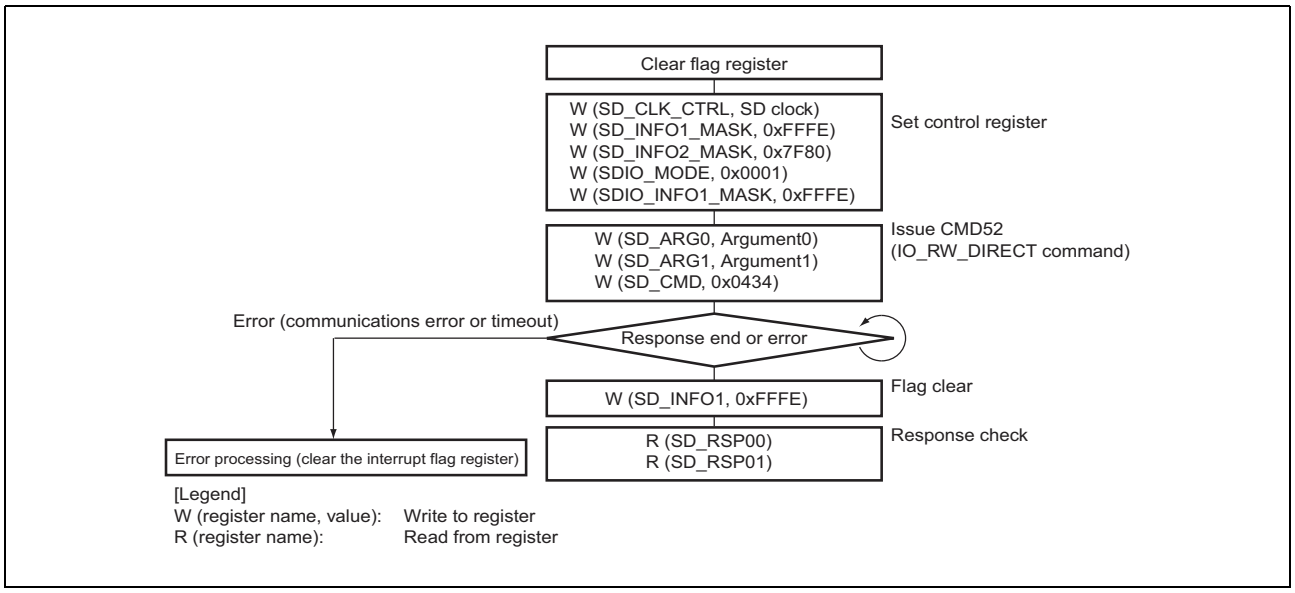

Figure 38.14 IO_RW_DIRECT Command (CMD52) Flowchart Example

(2) Operation Example

For details on the opeartion example, see the detailed version of the SD host interface manual.

38.4.8 IO_RW_EXTENDED Command (CMD53/Multiple Block Read)

(1) Flowchart

Figure 38.15 shows a flowchart example for CMD53 (multiple block read).

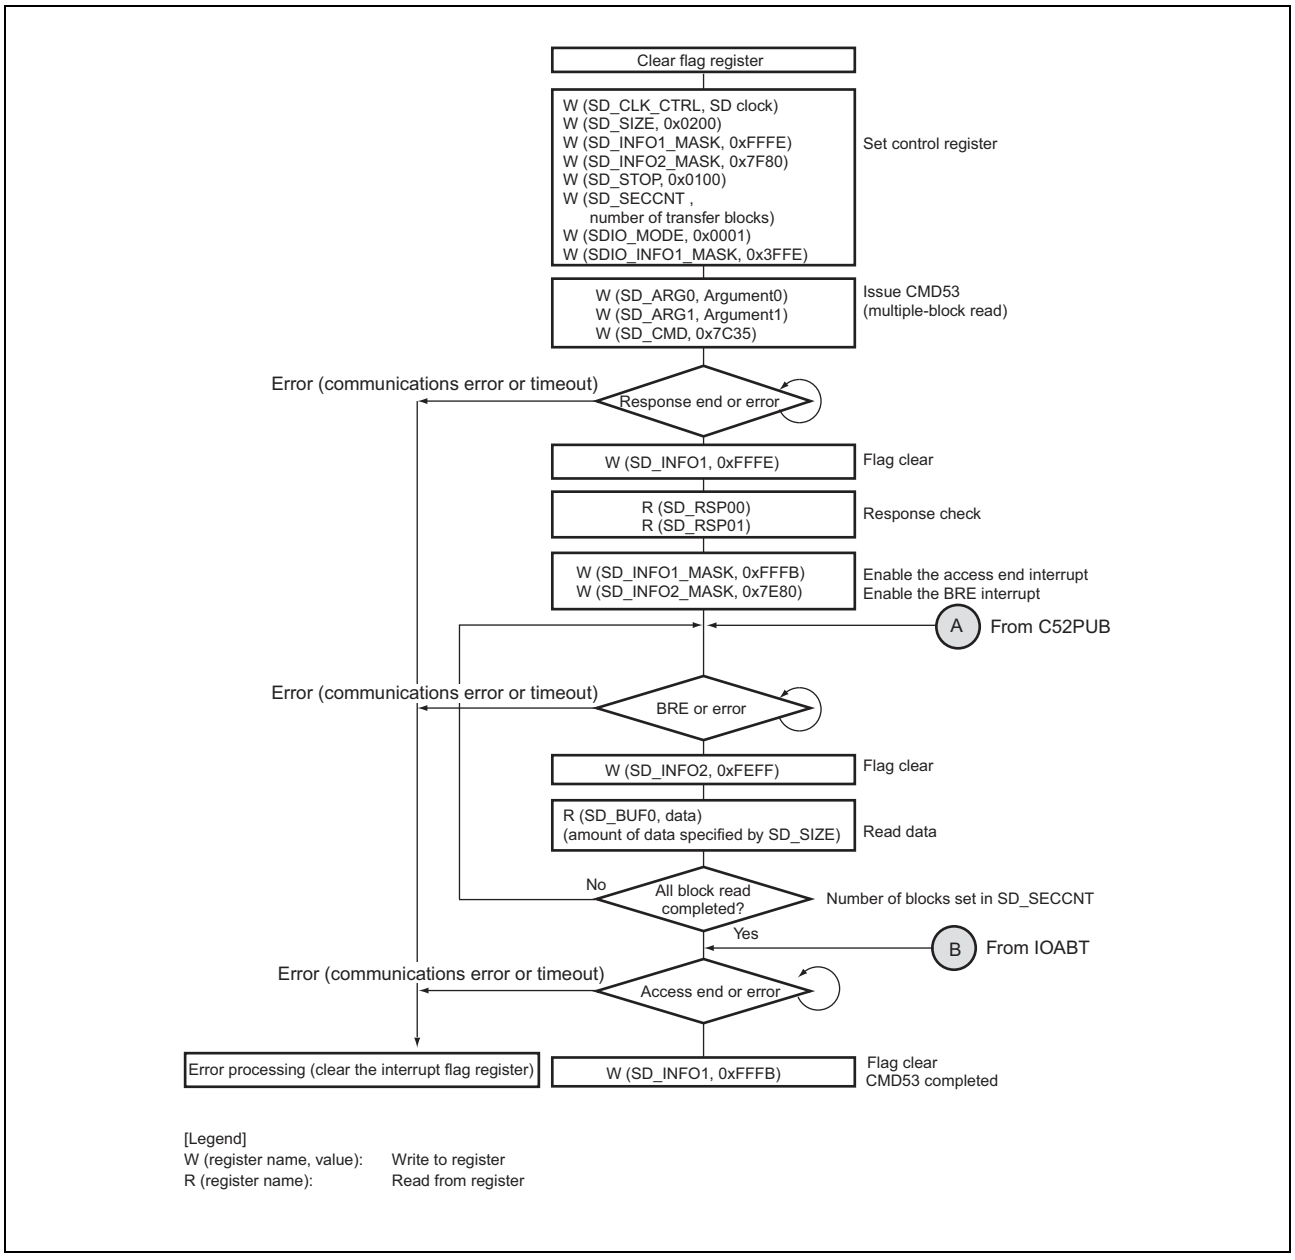

Figure 38.15 CMD53 (Multiple Block Read) Flowchart Example

Figure 38.16 shows a flowchart example when CMD52 (SDIO abort) is issued at CMD53 (multiple block read).

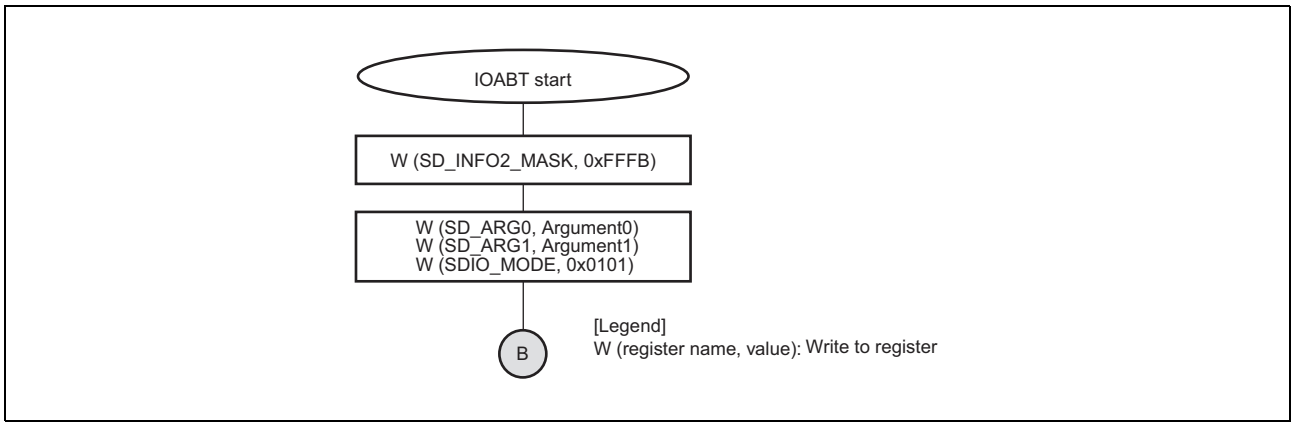

Figure 38.16 Flowchart Example when CMD52 (SDIO Abort) is Issued at CMD53 (Multiple Block Read)

Figure 38.17 shows a flowchart example when CMD52 (SDIO none abort) is issued at CMD53 (multiple block read) while the SD host interface is in the read wait state.

	ACMD13	0x004D	
	ACMD22	0x0056	
	ACMD23	0x0057	
	ACMD41	0x0069	
	ACMD42	0x006A	
	ACMD51	0x0073	

38.5 Usage Note

(1) SD_BUF Illegal Write Access

When writing data to SD_BUF0 after the single block write or multi block write command is issued, the data of the size specified by SD_SIZE must be written to.
If the data of the size which exceeds the size specified by SD_SIZE is written to, the ERR4 bit in SD_INFO2 is set to 1. In addition, the data written to SD_BUF0 may not be transmitted and it causes the SCLKDIVEN bit in SD_INFO2 to hold the value of 0. In such cases, clearing the SDRST bit in SOFT_RST to 0 and then restoring its value to 1 clears the SCLKDIVEN bit to 1.
However, for the single byte or three bytes when the number of bytes setting in SD_SIZE is odd, or the fraction of bytes when the number of bytes setting in SD_SIZE is even, since the portion of dummy data writing is regarded as excess data and ignored, it is not within the scope of the above description (the fraction of bytes: the two bytes that are not in a four-byte unit).

(2) Block Number Limitation for Multiple Block Read

When performing a multiple block read of one or two blocks, depending on the timing with which the response register is read, the response value may not be read properly. When receiving one or two blocks of data, use single block read operation.
Figure 38.23 shows the processing flows of SD host interface (hardware) operation and software operation when a multiple block read is performed on two blocks. As shown in the incorrect operation of Figure 38.23, when an interrupt is generated on reception of the CMD18 response and the timing with which the response register is read by the interrupt is delayed, the data during the CMD12 response reception or the CMD12 response may be read. In the case of a multiple block read of three or more blocks, CMD12 is not issued until the block of data has been read, so this problem does not arise. Furthermore, in the case of a multiple block write, since the CMD25 response is read before the block of data is sent, the problem does not arise.

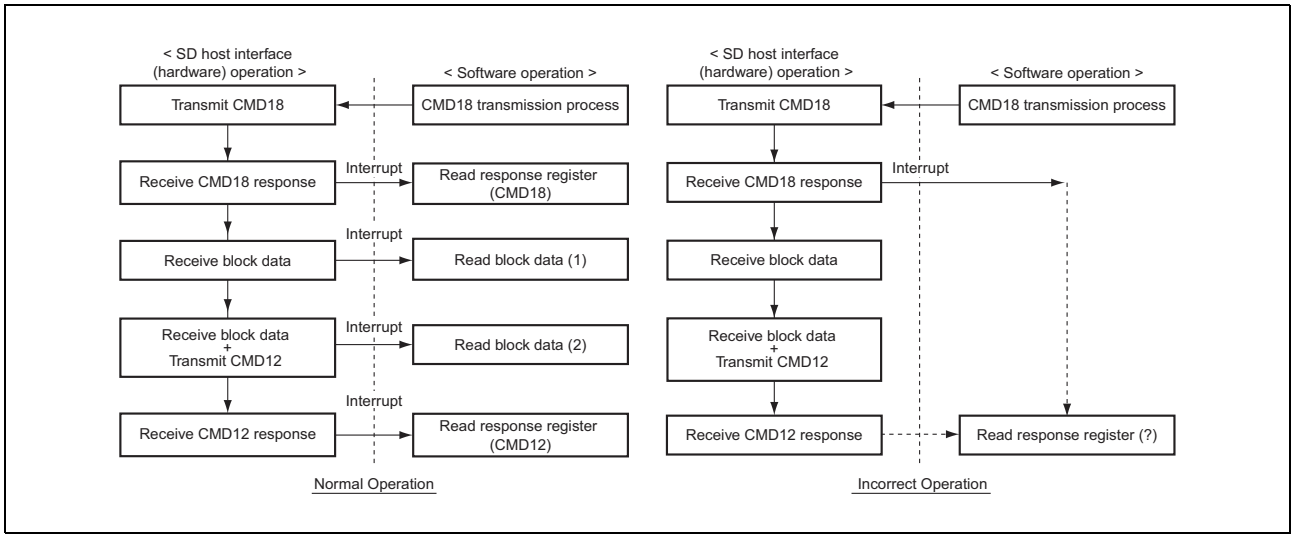

Figure 38.23 Flowcharts for Multiple Block Read Operation (Two Blocks)

(3) Automatic Control of SD_CLK Output

In the SD Card standard, 74 cycles of SD_CLK must be output before initialization of the card. For this reason, use automatic control of SD_CLK output after 74 cycles of SD_CLK have been output. Furthermore, if automatic control of SD_CLK output was in use, SD_CLK output is stopped on completion of the sequence for a communications error or timeout. Thus, in cases where state transitions within the SD card are necessary and so on after completion of the sequence, release automatic control of SD_CLK output and restart supply of SD_CLK to the SD card.

(4) Control of the C52PUB Setting for Multiple Block Write

If the C52PUB bit in SDIO_MODE is set to 1 during a sequence of multiple block write due to CMD53, CMD52 is not issued until SD_BUF becomes empty. For this reason, set the C52PUB bit after suspending writing to SD_BUF by following the appropriate procedure below.

- When DMA transfer is not in use

1. Before setting the C52PUB bit, suspend writing to SD_BUF by making the setting in SD_INFO2 to disable BWE interrupts.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by making the setting in SD_INFO2 to enable BWE interrupts.

- When DMA transfer is in use

1. Every time DMA transfer of the value set in SD_SIZE × n blocks (where n = 1, 2, ...) proceeds, suspend writing to SD_BUF by DMA transfer before the C52PUB bit is set.
2. Set the C52PUB bit in SDIO_MODE to 1 (so that CMD52 is issued when SD_BUF becomes empty).
3. After the INFO0 interrupt processing in SD_INFO1 due to the issuing of CMD52 has been completed, restart writing to SD_BUF by DMA transfer.

(5) Erroneous Detection of SDIO interrupts

The SD host interface erroneously detects an SDIO interrupt when all of the following conditions are satisfied.

1. SDIO access
2. The SDIO device supports the SDIO interrupt (an optional part of the standard).
3. The SDIO device supports 4-bit width multi-block read of CMD53 (an optional part of the standard).
4. The SDIO device does not support the SDIO interrupt between 4-bit width data blocks (an optional part of the standard).

Avoid this problem by following the procedure below when the values of the SMB and S4MI bits in the card capability register of the SDIO device are 1 and 0, respectively.

1. Immediately before executing the multiple block read command, clear (to 0) the IOMOD bit of the SDIO_MODE register.
2. Execute the command.
3. Set (to 1) the IOMOD bit of the SDIO_MODE register immediately after multiple block read operation is completed.

(6) Setting STP bit during multiple read

During multiple block read with auto CMD12 setting 1 to SEC bit of SD_STOP, if performing a force-quit by setting 1 to STP bit of SD_STOP, the command sequence is not terminated depending on the timing of setting 1 to STP bit of SD_STOP.
To avoid this, if setting STP bit of SD_STOP during multiple block transfer, setting 0 to SEC bit of SD_STOP at the same time.
Switching the value of SEC bit of SD_STOP from 1 to 0, even if CBSY bit of SD_INFO2 is 1.
In case the command sequence is not terminated because of not setting 0 to SEC bit of SD_STOP at the same time, setting SDRST bit of SOFT_RST is also available to terminate the command sequence.
If performing a force-quit by setting 1 to IOABT bit of SDIO_MODE during CMD53 multiple block transfer, leave the value (=1) of SEC bit of SD_STOP as it is.

(7) Software Reset

For transitions to the software reset state by the SDRST bit in the SOFT_RST register, see section 42.3.6, Software Reset. However, where the procedure refers to the SRST bit, read this as the SDRST bit in the SOFT_RST register.

38.6 Electrical Characteristics

Table 38.8 shows AC characteristics of the SD host interface. For items of the electrical characteristics other than AC characteristics, see section 47, Electrical Characteristics.

Table 38.8 SD Host Interface Timing

Item	Symbol	Min.	Max.	Unit
SD_CLK clock cycle	t_{SDPP}	$2 \times t_{p1cyc}$	—	ns

Note: • t_{p1cyc} indicates peripheral clock 1 (P1φ) cycle.

For details on the SD host interface timing, see the detailed version of the SD host interface manual.

39. MMC Host Interface

The MMC host interface is a host controller conforming to the JEDEC Standard JESD84-A441 that allows connection with devices with the MMC interface.

39.1 Features

- Supports 1/4/8-bit MMC bus
- Supports the Single Data Rate only
- MMC clock frequency = P1ϕ frequency/2^n (n = 1 to 10)
- Supports High Priority Interrupt (HPI)*
- Supports background operation
- Data buffer: 512 bytes × 2
- Three types of interrupt requests: normal operation, error/timeout, card detection
- DMA transfer requests: buffer write and buffer read
- Card detection function

Note: * Supports HPI in the sequences of CMD6, CMD24, CMD25 (pre-defined), and CMD38.

Figure 39.1 shows a block diagram of this module.

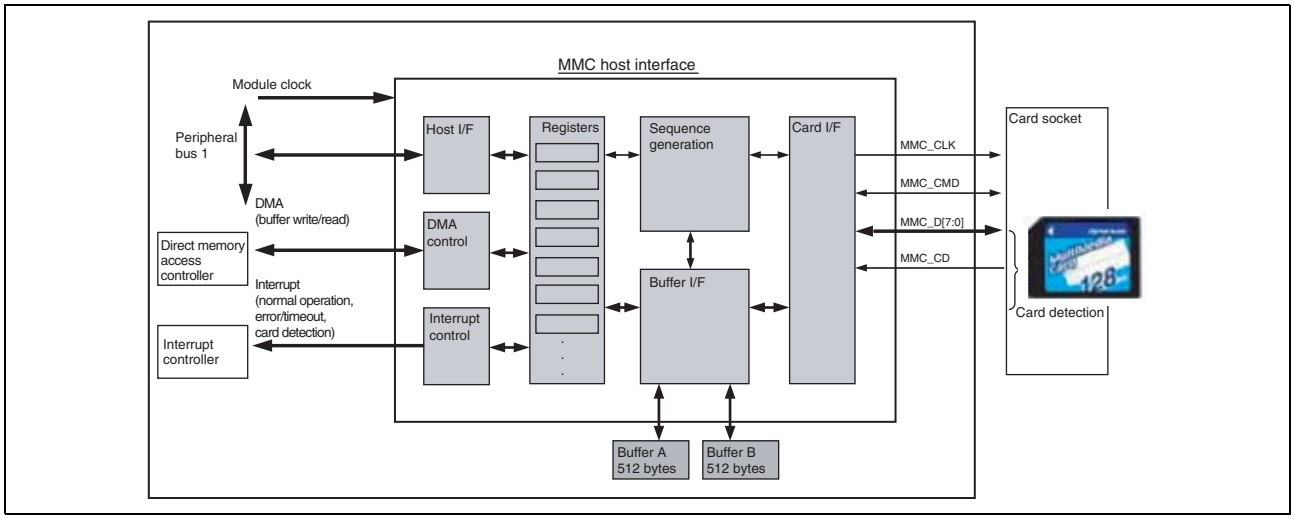

Figure 39.1 Block Diagram of MMC Host Interface

39.2 Input/Output Pins

Table 39.1 shows the pin configuration of this module.

Table 39.1 Pin Configuration

Pin Name	I/O	Function
MMC_CLK	Output	MMC clock
MMC_CMD	Input/output	Command/response
MMC_D[7:0]	Input/output	Transmit/receive data
MMC_CD	Input	Card detection*1

Note 1. Check the specifications of the card socket to be used before connection.

39.3 Register Descriptions

Table 39.2 shows the register configuration of this module.

Table 39.2 Register Configuration

Register Name	Abbreviation	R/W	Address	Access Size
Command setting register	CE_CMD_SET	R/W	H'E804C800 H'E804C802	16 16
Argument register	CE_ARG	R/W	H'E804C808	32
Argument register for automatically-issued CMD12	CE_ARG_CMD12	R/W	H'E804C80C	32
Command control register	CE_CMD_CTRL	R/W	H'E804C810	32
Transfer block setting register	CE_BLOCK_SET	R/W	H'E804C814	32
Clock control register	CE_CLK_CTRL	R/W	H'E804C818	32
Buffer access configuration register	CE_BUF_ACC	R/W	H'E804C81C	32
Response register 3	CE_RESP3	R	H'E804C820	32
Response register 2	CE_RESP2	R	H'E804C824	32
Response register 1	CE_RESP1	R	H'E804C828	32
Response register 0	CE_RESP0	R	H'E804C82C	32
Response register for automatically-issued CMD12	CE_RESP_CMD12	R	H'E804C830	32
Data register	CE_DATA	R/W	H'E804C834	32
Interrupt flag register	CE_INT	R/W	H'E804C840	32
Interrupt enable register	CE_INT_EN	R/W	H'E804C844	32
Status register 1	CE_HOST_STS1	R	H'E804C848	32
Status register 2	CE_HOST_STS2	R	H'E804C84C	32
DMA mode setting register	CE_DMA_MODE	R/W	H'E804C85C	32
Card detection/port control register	CE_DETECT	R/W	H'E804C870	32
Special mode setting register	CE_ADD_MODE	R/W	H'E804C874	32
Version register	CE_VERSION	R/W	H'E804C87C	32

Note: • Do not access registers other than those shown above.

39.3.1 Command Setting Register (CE_CMD_SET)

CE_CMD_SET sets a command sequence.
The command sequence starts when the settings have been made in bits 31 to 16. Note that writing to CE_CMD_SET is disabled while a command sequence is proceeding (i.e., the value of CMDSEQ in CE_HOST_STS1 is 1).
CE_CMD_SET should be set according to the description in section 39.7.12, Setting Values of CE_CMD_SET. This register should be accessed in 16 bits. (The address of bits 31 to 16 is H'E804C800 and that of bits 15 to 0 is H'E804C802.)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	CMD[5:0]						RTYP[1:0]		RBSY	—	WDAT	DWEN	CMLTE	CMD12EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RIDXC[1:0]		RCRC7C[1:0]		—	CRC16C	—	CRCSTE	TBIT	OPDM	—	—	SBIT	—	DATW[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R	R/W	R/W	R/W	R	R	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	00	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 24	CMD[5:0]	All 0	R/W	Command Index These bits set a command index ([45:40]). Note: Setting a command index in these bits initiates the command sequence.
23, 22	RTYP[1:0]	00	R/W	Response Type 00: No response 01: 6-byte response (R1, R1b, R3, R4, R5) 10: 17-byte response (R2) 11: Setting prohibited
21	RBSY	0	R/W	Response Busy Select Selects whether “busy” is involved in response reception. 0: No response busy 1: Response busy involved (R1b)
20	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
19	WDAT	0	R/W	Presence/Absence of Data 0: No data 1: With data
18	DWEN	0	R/W	Read/Write (valid when “with data” is selected) 0: Read from the card 1: Write to the card
17	CMLTE	0	R/W	Single/Multi Block Transfer Select (valid when “with data” is selected) 0: Single-block transfer 1: Multi-block transfer
16	CMD12EN	0	R/W	Automatic CMD12 Issuance (valid when multi-block transfer is selected)* 0: Does not issue CMD12 automatically. 1: Issues CMD12 automatically (= automatic CMD12) For details of automatic CMD12 issuance, see section 39.6.4, Automatic CMD12 Issuance. Note: Set the transfer block size to 512 bytes. Set RBSY to 0.

Bit	Bit Name	Initial Value	R/W	Description
15, 14	RIDXC[1:0]	00	R/W	Response Index Check Specify the items to be checked for [45:40] of a 6-byte response or [133:128] of a 17-byte response. 00: Checks the response index (ensure that the response index matches the command index.) 01: Checks the check bits (ensure that the bits are all 1.) 10: No checking 11: Setting prohibited
13, 12	RCRC7C [1:0]	00	R/W	Response CRC7 Check Specify the items to be checked for [7:1] of a 6-byte response or a 17-byte response. 00: Checks CRC7 (set the response type to 01) 01: Checks the check bits (set the response type to 01) 10: Checks internal CRC7 (R2 only) (set the response type to 10) 11: No checking
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10	CRC16C	0	R/W	CRC16 Check in Reception (valid when “with data” and “read” are selected) 0: Checks CRC16 1: Does not check CRC16 (use when CMD14)
9	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
8	CRCSTE	0	R/W	CRC Status Reception (valid when “with data” and “write” are selected) 0: Receives CRC status 1: Does not receive CRC status (use when CMD19)
7	TBIT	0	R/W	Transmission Bit Setting 0: Sets the transmission bit ([46]) to 1. 1: Sets the transmission bit ([46]) to 0.
6	OPDM	0	R/W	Open-Drain Output Mode 0: Normal output 1: Open-drain output Note: This setting is only applied to the MMC_CMD line.
5, 4	—	00	R	Reserved These bits are always read as 0. The write value should always be 0.
3	SBIT	0	R/W	Read Data Start Bit Detection (valid when "with data" and "read" are selected) 0: Detects the start bit when the MMC_D signals set by DATW are all 0. 1: Detects the start bit when MMC_D[0] is 0.
2	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
1, 0	DATW[1:0]	00	R/W	Data Bus Width Setting (valid when "with data" is selected) 00: 1 bit 01: 4 bits 10: 8 bits 11: Setting prohibited

Note: * When HPI is executed, use multi-block transfer (pre-defined) without setting this bit to 1.

39.3.2 Argument Register (CE_ARG)

CE_ARG sets the argument for the command to be transmitted. Set CE_ARG before starting the command sequence.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ARG[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ARG[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ARG[31:0]	H'00000000	R/W	These bits set [39:8] of a command. Note: Set the argument of automatically-issued CMD12 by CE_ARG_CMD12.

39.3.3 Argument Register for Automatically-Issued CMD12 (CE_ARG_CMD12)

CE_ARG_CMD12 is used to set the argument for the automatically-issued CMD12 in multi-block transfer. For the automatically-issued CMD12, see section 39.6.4, Automatic CMD12 Issuance. Set CE_ARG_CMD12 before starting the command sequence.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	C12ARG[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	C12ARG[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	C12ARG[31:0]	H'00000000	R/W	These bits set [39:8] of the automatically-issued CMD12.

39.3.4 Command Control Register (CE_CMD_CTRL)

CE_CMD_CTRL is used to terminate a command sequence forcibly.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BREAK
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	BREAK	0	R/W	Forcible Termination of Command Sequence To discontinue the current command sequence, write 1 to this bit while the bit is 0 and then write 0. After the above procedure, check if the value of the CMDSEQ bit in CE_HOST_STS1 has become 0 and then perform a software reset. Note: Since a software reset returns the register value to the initial value, the register needs be set again.

39.3.5 Transfer Block Setting Register (CE_BLOCK_SET)

CE_BLOCK_SET specifies the size of the block and the number of blocks for the data to be transferred. Set CE_BLOCK_SET before starting the command sequence.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BLKCNT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BLKSIZ[15:0]															
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	BLKCNT [15:0]	H'0000	R/W	Number of Blocks for Transfer Note: This setting is valid for multi-block transfer.
15 to 0	BLKSIZ [15:0]	H'0200	R/W	Transfer Block Size Note: Transfer block size should be set as follows. • Single-block transfer: 1 to 512 bytes • Multi-block transfer: 512 bytes

39.3.6 Clock Control Register (CE_CLK_CTRL)

CE_CLK_CTRL controls the MMC clock and sets timeout values. Do not change the setting of this register while a command sequence is in progress.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	CLKEN	—	—	—	—	CLKDIV[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	SRSPTO[1:0]		SRBSYTO[3:0]				SRWDTO[3:0]				—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	CLKEN	0	R/W	MMC Clock Output Control 0: Does not output the MMC clock (tied to low level) 1: Outputs the MMC clock
23 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 16	CLKDIV[3:0]	0000	R/W	MMC Clock Frequency Setting 0000: P1ϕ/2 0001: P1ϕ/2^2 0111: P1ϕ/2^8 1000: P1ϕ/2^9 1001: P1ϕ/2^{10} 1010 to 1111: Setting prohibited
15, 14	—	00	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	SRSPTO [1:0]	00	R/W	Response Timeout Setting Specifies the timeout period for the RSPTO bit of CE_INT. 00: 64 MMC clock cycles 01: 128 MMC clock cycles 10: 256 MMC clock cycles 11: Setting prohibited
11 to 8	SRBSYTO [3:0]	0000	R/W	Response Busy Timeout Setting Specifies the timeout period for the RBSYTO bit of CE_INT. 0000: 2^{14} MMC clock cycles 0001: 2^{15} MMC clock cycles : 1110: 2^{28} MMC clock cycles 1111: 2^{29} MMC clock cycles
7 to 4	SRWDTO [3:0]	0000	R/W	Write Data/Read Data Timeout Setting Specifies the timeout period for the WDATTO and RDATTO bits of CE_INT. 0000: 2^{14} MMC clock cycles 0001: 2^{15} MMC clock cycles : 1110: 2^{28} MMC clock cycles 1111: 2^{29} MMC clock cycles
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

39.3.7 Buffer Access Configuration Register (CE_BUF_ACC)

CE_BUF_ACC configures the method of accessing data registers and mode of DMA transfer. Do not change the setting of this register while a command sequence is in progress. For explanation of the buffers, see section 39.6.3, Buffer Structure and Buffer Accesses.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	DMAWEN	DMAREN	—	—	—	—	—	—	—	ATYP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25	DMAWEN	0	R/W	Buffer Write DMA Transfer Request Enable 0: Disables DMA transfer request for buffer writing 1: Enables DMA transfer request for buffer writing
24	DMAREN	0	R/W	Buffer Read DMA Transfer Request Enable 0: Disables DMA transfer request for buffer reading 1: Enables DMA transfer request for buffer reading
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	ATYP	0	R/W	Buffer Access Select 0: When not swapped byte-wise. 1: When swapped byte-wise. Note: For explanation of buffer access, see section 39.6.3, Buffer Structure and Buffer Accesses.
15 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

39.3.8 Response Registers 3 to 0 (CE_RESP3 to CE_RESP0)

CE_RESP3 to CE_RESP0 are the registers for storing the response that has been received. For the formats of response values, see section 39.6.1, Command/Response Formats.

- CE_RESP3

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSP[127:112]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RSP[111:96]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RSP[127:96]	H'00000000	R	[127:96] of a 17-byte response are stored.

- CE_RESP2

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSP[95:80]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RSP[79:64]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RSP[95:64]	H'00000000	R	[95:64] of a 17-byte response are stored.

- CE_RESP1

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSP[63:48]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RSP[31:0]	H'00000000	R	[39:8] of a 6-byte response or [31:0] of a 17-byte response are stored. Note: The response to the automatically-issued CMD12 is stored in CE_RESP_CMD12.

39.3.9 Response Register for Automatically-Issued CMD12 (CE_RESP_CMD12)

CE_RESP_CMD12 is the register for storing the response to the automatically-issued CMD12.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSP12[31:16]

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RSP12[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	RSP12[31:0]	H'00000000	R	[39:8] of a response to the automatically-issued CMD12 are stored.

39.3.10 Data Register (CE_DATA)

CE_DATA is used to access the buffers of this module.

For the write/read data formats, see section 39.6.2, Data Block Format.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

31 to 0	DATA[31:0]	H'00000000	R/W	Buffer write/read data [31:0]

39.3.11 Interrupt Flag Register (CE_INT)

CE_INT indicates various status during execution of a command sequence. Each bit is set to 1 when its setting condition has been met. To clear flag(s), write 0 only to the bit(s) to be cleared and write 1 to the other bits.

For the operation in the case of an error or timeout, see section 39.6.7, Operation in the Case of Error/Timeout.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bets are always read as 0. The writing value should always be 0.
26	CMD12DRE	0	R/W*1	Automatic CMD12 Issuance & Buffer Read Complete [Setting condition] Response busy for automatically-issued CMD12 and buffer reading have been completed. [Clearing condition] Writing a 0 to this bit Note: When CMD12DRE has been set, CMD12RBE, CMD12CRE, and BUFRE have also been set. So, these bits should be cleared as well.
25	CMD12RBE	0	R/W*1	Automatic CMD12 Issuance Response Busy Complete [Setting condition] Reception of the response and response busy for an automatically-issued CMD12 have been completed. [Clearing condition] Writing a 0 to this bit Note: When CMD12RBE is set, CMD12CRE is also set. So, clear the bit as well. When CMD12RBE is set during a multi-block write, DTRANE is also set. So clear the bit as well.
24	CMD12CRE	0	R/W*1	Automatic CMD12 Response Complete [Setting condition] The response to an automatically-issued CMD12 has been received. [Clearing condition] Writing a 0 to this bit
23	DTRANE	0	R/W*1	Data Transmission Complete [Setting conditions] Transmission of all blocks of data has been completed. • When configured to receive CRC status: Completion of busy (data busy) after reception of CRC status • When configured not to receive CRC status: Completion of data transmission [Clearing condition] Writing a 0 to this bit
22	BUFRE	0	R/W*1	Buffer Read Complete [Setting condition] All blocks of data have been received and the data have been read from the buffer [Clearing condition] Writing a 0 to this bit

Bit	Bit Name	Initial Value	R/W	Description
21	BUFWEN	0	R/W*1	Buffer Write Ready [Setting condition] The buffer has become empty and ready for writing. [Clearing condition] Writing a 0 to this bit Note: When data is written to CE_DATA by the CPU, clear this bit first, and then write the amount of data equivalent to the block size set in the CE_BLOCK_SET register. Note that this bit is not set when DMA transfer request for buffer writing is enabled.
20	BUFREN	0	R/W*1	Buffer Read Ready [Setting condition] Transfer block size of data have been stored in the buffer and it has become ready for reading [Clearing condition] Writing a 0 to this bit Note: When data is read from CE_DATA by the CPU, clear this bit first, and then read the amount of data equivalent to the block size set in the CE_BLOCK_SET register. Note that this bit is not set when DMA transfer request for buffer reading is enabled.
19, 18	—	00	R	Reserved These bits are always read as 0.The write value should always be 0.
17	RBSYE	0	R/W*1	Response Busy Complete [Setting condition] Reception of a response and response busy have been completed [Clearing condition] Writing a 0 to this bit Note: When RBSYE has been set, CRSPE has also been set. So, this bit should be cleared as well. Completion of reception of the response and response busy for automatically-issued CMD12 is reflected in CMD12RBE.
16	CRSPE	0	R/W*1	Command/Response Complete [Setting conditions] A command has been transmitted or a response has been received • When configured not to receive response: A command has been transmitted • When configured to receive 6- or 17-byte response: A response has been received [Clearing condition] Writing a 0 to this bit Note: Completion of reception of the response to automatically-issued CMD12 is reflected in CMD12CRE.
15	CMDVIO	0	R/W*1	Command Issuance Error [Setting conditions] Illegal setting has been made in CE_CMD_SET or CE_BLOCK_SET • During execution of a command sequence: Writing to CMD[5:0] in CE_CMD_SET (The command sequence is not stopped automatically.) • At the start of command sequence: Writing to CMD[5:0] in CE_CMD_SET when the registers have been set for one of the following combinations of selection - No response + response busy - No response + with data - No data + automatic CMD12 issuance - With data + single-block transfer + automatic CMD12 issuance - With data + response busy + automatic CMD12 issuance - With data + transfer block size = 0 - With data + transfer block size ≥ 513 - With data + multi-block transfer + number of blocks for transfer = 0 [Clearing condition] Writing a 0 to this bit

Bit	Bit Name	Initial Value	R/W	Description
14	BUFVIO	0	R/W*1	Buffer Access Error [Setting conditions] Illegal buffer access has been attempted. • CE_ DATA has been accessed exceeding the block size set in BLKSIZ[15:0] in CE_BLOCK_SET • While data is being read from the card: CE_DATA has been accessed with BUFREN not set (when DMA is used, with no DMA transfer request asserted for buffer reading) • While data is being written to the card: CE_DATA has been accessed with BUFWEN not set (when DMA is used, with no DMA transfer request asserted for buffer writing) [Clearing condition] Writing a 0 to this bit Note: When BUFVIO is set, the command sequence is not stopped automatically. When an error occurs, this bit may be set.
13, 12	—	00	R	Reserved These bits are always read as 0. The write value should always be 0.
11	WDATERR	0	R/W*1	Write Data Error [Setting conditions] Error is found in the data that has been written. • Error is in the status of the CRC status • Error is in the end bit of the CRC status [Clearing condition] Writing a 0 to this bit Note: When WDATERR is set, the command sequence is stopped automatically.
10	RDATERR	0	R/W*1	Read Data Error [Setting conditions] Error is found in the read data. • Error is in CRC16 of the read data • Error is in the end bit of the read data [Clearing condition] Writing a 0 to this bit Note: When RDATERR is set, the command sequence is stopped automatically.
9	RIDXERR	0	R/W*1	Response Index Error [Setting condition] Error has been found in the index value of the response. • When an error has been found in [45:40] of a 6-byte response (including automatically-issued CMD12) or [133:128] of a 17-byte response (The items to be checked are set by RIDXC in CE_CMD_SET.) [Clearing condition] Writing a 0 to this bit Note: When RIDXERR is set, the command sequence is stopped automatically.
8	RSPERR	0	R/W*1	Response Error [Setting conditions] Error has been found in the response values of the response. • Transmission bit in the response is high • Error is in the end bit of the response • When an error has been found in [7:1] of a 6-byte response (including automatically-issued CMD12) or a 17-byte response (The items to be checked are set by RCRC7C in CE_CMD_SET.) [Clearing condition] Writing a 0 to this bit Note: When RSPERR is set, the command sequence is stopped automatically.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
4	CRCSTO	0	R/W*1	CRC Status Timeout [Setting condition] CRC status could not be received [Clearing condition] Writing a 0 to this bit Note: The command sequence is not stopped even if CRCSTO is set.
3	WDATTO	0	R/W*1	Write Data Timeout [Setting condition] The busy status remains unchanged after the period set by SRWDTO in CE_CLK_CTRL after the CRC status was received. [Clearing condition] Writing a 0 to this bit Note: The command sequence is not stopped even if WDATTO is set.
2	RDATTO	0	R/W*1	Read Data Timeout [Setting conditions] • Read data could not be received within the period set by SRWDTO in CE_CLK_CTRL after the read command was transmitted • Read data could not be received within the period set by SRWDTO in CE_CLK_CTRL after the read data was received. [Clearing condition] Writing a 0 to this bit Note: The command sequence is not stopped even if RDATTO is set.
1	RBSYTO	0	R/W*1	Response Busy Timeout [Setting condition] The busy status remains unchanged after the period set by SRBSYTO in CE_CLK_CTRL after the command (including automatically-issued CMD12) was transmitted. [Clearing condition] Writing a 0 to this bit Note: The command sequence is not stopped even if RBSYTO is set.
0	RSPTO	0	R/W*1	Response Timeout [Setting condition] Response could not be received within the period set by SRSPTO in CE_CLK_CTRL after the command (including automatically-issued CMD12) was transmitted. [Clearing condition] Writing a 0 to this bit Note: The command sequence is not stopped even if RSPTO is set.

Note 1. A 0 is the only value that can be written to the bit. Writing a 1 is ignored.

39.3.12 Interrupt Enable Register (CE_INT_EN)

CE_INT_EN controls output of the CE_INT-related interrupt signals. If a flag in CE_INT is set to 1 while its corresponding bit in CE_INT_EN is set to 1, an interrupt request is output. For details on interrupt requests, see section 39.4, Interrupt Requests.

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	CMDSEQ	0	R	Command Sequence Status 0: Command sequence is in the initial state 1: Command sequence is being executed
30	CMDSIG	Undefined	R	MMC_CMD Line Status Indicates the state on the MMC_CMD line.
29 to 24	RSPIDX [5:0]	H'00	R	Response Index Indicate [45:40] of a 6-byte response or [133:128] of a 17-byte response.
23 to 16	DATSIG [7:0]	Undefined	R	MMC_D Status Indicate the states on the MMC_D[7:0] lines. Note: When an error or timeout occurs, MMCDAT[0] may remain 0.
15 to 0	RCVBLK [15:0]	H'0000	R	Number of Transferred Blocks Indicate the number blocks that have been transferred. • When the DWEN bit in CE_CMD_SET is 0 Number of blocks read from the card • When the DWEN bit in CE_CMD_SET is 1 Number of blocks written to the card

39.3.14 Status Register 2 (CE_HOST _STS2)

CE_HOST _STS2 indicates timeout and error status.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CRC STE	CRC 16E	AC12 CRCE	RSP CRC7E	CRC STEBE	RDAT EBE	AC12R EBE	RSP EBE	AC12 IDXE	RSP IDXE	—	—	—	CRCST[2:0]

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	CRCSTE	0	R	CRC Status Error This bit is set to 1 when an error is found in the CRC status value.
30	CRC16E	0	R	Read Data CRC16 Error This bit is set to 1 when an error is found in CRC16 in the read data.
29	AC12CRCE	0	R	Automatic CMD12 Response CRC7 Error This bit is set to 1 when an error is found in [7:1] of the response to the automatically-issued CMD12. Note: The items to be checked are set by RCRC7C in CE_CMD_SET.
28	RSPCRC7E	0	R	Command Response CRC7 Error (other than automatically-issued CMD12) This bit is set to 1 when an error is found in [7:1] of a 6-byte response or a 17-byte response. Note: The items to be checked are set by RCRC7C in CE_CMD_SET.
27	CRCSTEBE	0	R	CRC Status End Bit Error This bit is set to 1 when an error is found in the end bit in CRC status.
26	RDATEBE	0	R	Read Data End Bit Error This bit is set to 1 when an error is found in the end bit in the read data.
25	AC12REBE	0	R	Automatic CMD12 Response End Bit Error This bit is set to 1 when an error is found in the end bit of the response to the automatically-issued CMD12.
24	RSPEBE	0	R	Command Response End Bit Error (other than automatically-issued CMD12) This bit is set to 1 when an error is found in the end bit of the response.
23	AC12IDXE	0	R	Automatic CMD12 Response Index Error This bit is set to 1 when an error is found in [45:40] of the response to the automatically-issued CMD12. Note: The items to be checked are set by RIDXC in CE_CMD_SET.
22	RSPIDXE	0	R	Command Response Index Error (other than automatically-issued CMD12) This bit is set to 1 when an error is found in [45:40] of a 6-byte response or [133:128] of a 17-byte response. Note: The items to be checked are set by RIDXC in CE_CMD_SET.
21 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
18 to 16	CRCST [2:0]	000	R	CRC Status Indicate the value of the CRC status that has been received.
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	STRDATTO	0	R	Read Data Timeout • This bit is set to 1 if read data is not received within the period set by the SRWDTO bits in CE_CLK_CTRL after a read command was transmitted. • This bit is set to 1 if read data is not received within the period set by the SRWDTO bits in CE_CLK_CTRL after a read data was received.

Bit	Bit Name	Initial Value	R/W	Description
13	DATBSYTO	0	R	Data Busy Timeout This bit is set to 1 if busy status remains unchanged after the period set by the SRWDTO bits in CE_CLK_CTRL after the CRC status was received.
12	CRCSTTO	0	R	CRC Status Timeout This bit is set to 1 if CRC status could not be received.
11	AC12BSYTO	0	R	Automatic CMD12 Response Busy Timeout This bit is set to 1 if busy state remains unchanged after the period set by the SRBSYTO bits in CE_CLK_CTRL after the automatically-issued CMD12 was transmitted.
10	RSPBSYTO	0	R	Response Busy Timeout This bit is set to 1 if busy state remains unchanged after the period set by the SRBSYTO bits in CE_CLK_CTRL after a command (other than automatically-issued CMD12) was transmitted.
9	AC12RSPTO	0	R	Automatic CMD12 Response Timeout This bit is set to 1 if the response is not received within the period set by the SRSPTO bits in CE_CLK_CTRL after the automatically-issued CMD12 was transmitted.
8	STRSPTO	0	R	Response Timeout This bit is set to 1 if the response is not received within the period set by the SRSPTO bits in CE_CLK_CTRL after a command (other than automatically-issued CMD12) was transmitted.
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

39.3.15 DMA Mode Setting Register (CE_DMA_MODE)

CE_DMA_MODE sets the transfer unit for DMA transfer.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMA SEL
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	DMASEL	0	R/W	DMA Transfer Size Select Selects the transfer unit for CE_DATA read/write DMA transfer. Set this bit in combination with the transfer size set in the DMA channel configuration register. 0: 2-byte (word) or 4-byte (longword) unit 1: 64-byte (longword × 16) unit Note: For DMA transfer in 64-byte units, set address H'E804C800 as the destination or source of DMA transfer instead of the data register (CE_DATA). Moreover, when a transfer error or timeout occurs during DMA transfer in 64-byte units, leading to the forced termination of transfer, write 0 to this bit and then set it to 1 again. Also do this whenever a software reset is used.

39.3.16 Card Detection/Port Control Register (CE_DETECT)

CE_DETECT controls card detection. For details on interrupt requests by card detection, see section 39.4, Interrupt Requests.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Initial value:	0	—	0	0	0	—	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W*	R/W*	R	R	R	R	R	R	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14	CDSIG	Undefined	R	MMC_CD Pin Status Indication Indicates the MMC_CD pin status.
13	CDRISE	0	R/W*1	MMC_CD Pin Rise Detection Flag [Setting condition] The MMC_CD pin level changes from low to high. [Clearing condition] Writing a 0 to this bit
12	CDFALL	0	R/W*1	MMC_CD Pin Fall Detection Flag [Setting condition] The MMC_CD pin level changes from high to low. [Clearing condition] Writing a 0 to this bit
11	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
10	—	Undefined	R	Reserved The write value should always be 0.
9 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	MCDRISE	0	R/W	CDRISE Interrupt Enable 0: Disables interrupt output by the CDRISE flag. 1: Enables interrupt output by the CDRISE flag.
4	MCDFALL	0	R/W	CDFALL Interrupt Enable 0: Disables interrupt output by the CDFALL flag. 1: Enables interrupt output by the CDFALL flag.
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note 1. A 0 is the only value that can be written to the bit. Writing a 1 is ignored.

39.3.17 Special Mode Setting Register (CE_ADD_MODE)

CE_ADD_MODE controls the internal clock.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	CLK MAIN	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19	CLKMAIN	0	R/W	Internal Clock Control 0: Normal mode 1: Low power consumption mode (only card detection is enabled)
18 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

39.3.18 Version Register (CE_VERSION)

CE_VERSION indicates the version number and controls software reset of this module.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SW RST	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VERSION[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31	SWRST	0	R/W	Software Reset 0: Software reset cleared (normal operation) 1: Executes software reset. When SWRST is set to 1, all the register values are reset to the initial values. (SWRST is not reset to the initial value)
30 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 0	VERSION [15:0]	H'0003	R	Version Information Indicates the version number of this module.

39.4 Interrupt Requests

Table 39.3 shows the interrupt request specifications of this module.
This module generates three types of interrupt requests: normal operation, error/timeout, and card detection. When an interrupt flag is set to 1 and also the corresponding interrupt is enabled, an interrupt request is asserted.

Table 39.3 Specifications of Interrupt Requests

Flag Register	Bit	Mask Register	Bit	Interrupt Request
CE_INT	CMD12DRE	CE_INT_EN	MCMD12DRE	Normal operation interrupt (MMC2)
	CMD12RBE		MCMD12RBE	
	CMD12CRE		MCMD12CRE	
	DTRANE		MDTRANE	
	BUFRE		MBUFRE	
	BUFWEN		MBUFWEN	
	BUFREN		MBUFREN	
	RBSYE		MRBSYE	
	CRSPE		MCRSPE	
	CMDVIO		MCMDVIO	Error/timeout interrupt (MMC1)
	BUFVIO		MBUFVIO	
	WDATERR		MWDATERR	
	RDATERR		MRDATERR	
	RIDXERR		MRIDXERR	
	RSPERR		MRSPERR	
	CRCSTO		MCRCSTO	
	WDATTO		MWDATTO	
	RDATTO		MRDATTO	
	RBSYTO		MRBSYTO	
	RSPTO		MRSPTO	
CE_DETECT	CDRISE	CE_DETECT	MCDRISE	Card detection interrupt (MMC0)
	CDFALL		MCDFALL	

39.5 DMA Specifications

This module provides two channels for DMA transfer requests: one for buffer reading and the other for buffer writing.

39.5.1 DMA for Buffer Writing

The DMA transfer request is asserted for buffer writing when the buffer has become empty while the DMAWEN bit in CE_BUF_ACC is 1.

The DMA transfer request stays asserted for the amount of data specified by BLKSIZ (the block size set in CE_BLOCK_SET) × BLKCNT (the number of blocks for transfer set in CE_BLOCK_SET), and negated after the last block has been transferred. Note that the BUFWEN bit in CE_INT will not be asserted in this case.

If an error occurs during DMA transfer or DMA transfer is forcibly terminated, the command sequence is stopped automatically, which causes the DMA transfer request to be negated.

39.5.2 DMA for Buffer Reading

The DMA transfer request is asserted for buffer reading when the buffer stores data of the block size specified in CE_BLOCK_SET while the DMAREN bit in CE_BUF_ACC is 1.

The DMA transfer request stays asserted for the amount of data specified by BLKSIZ (the block size set in CE_BLOCK_SET) × BLKCNT (the number of blocks for transfer set in CE_BLOCK_SET), and negated after the last block has been transferred. Note that the BUFREN bit in CE_INT will not be asserted in this case.

If an error occurs during DMA transfer or DMA transfer is forcibly terminated, the command sequence is stopped automatically, which causes the DMA transfer request to be negated.

39.6 Operation

39.6.1 Command/Response Formats

Figure 39.2 shows the format of the command to be transferred. The command index that is set in CMD[5:0] of CE_CMD_SET and the argument set in ARG[31:0] of CE_ARG are reflected in the command.

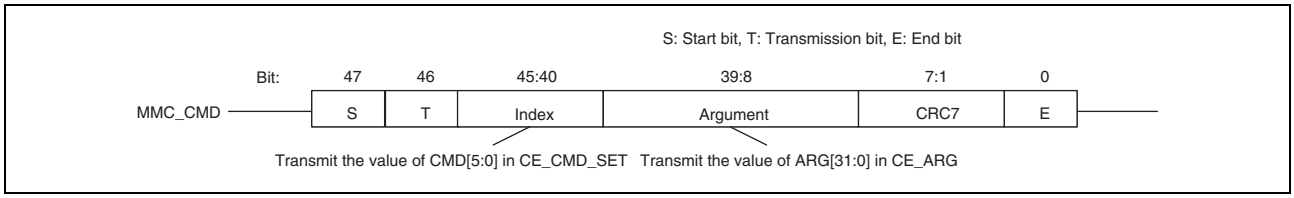

Figure 39.2 Command Format

Figure 39.3 and Figure 39.4 show the formats when a 6-byte response and 17-byte response (R2) are received, respectively. The response index is stored in RSPIDX[5:0] of CE_HOST_STS1, and the status value of the response is stored to CE_RESP0 or CE_RESP3 to CE_RESP0.

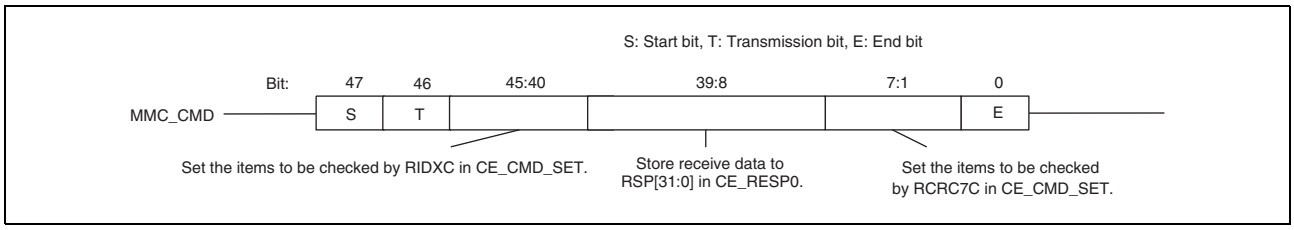

Figure 39.3 Format of 6-Byte Response

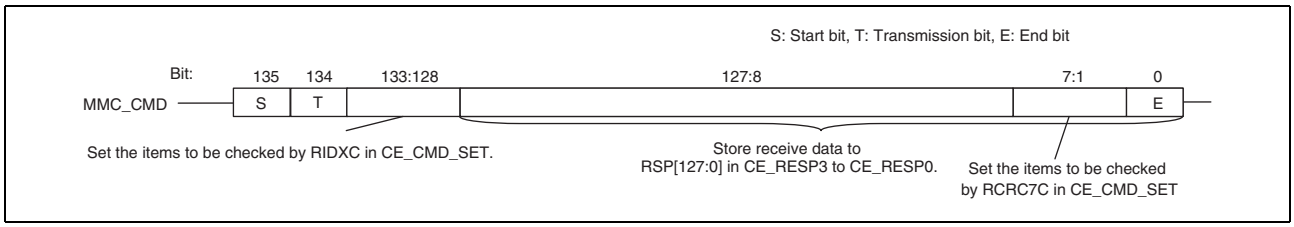

Figure 39.4 Format of 17-Byte Response (R2)

39.6.2 Data Block Format

Figure 39.5 shows the format of data blocks. For details on D0 to D3 in Figure 39.5, see section 39.6.3, Buffer Structure and Buffer Accesses. When data is written to a card, data stored in the buffer is transmitted. When data is read from a card, receive data is stored to the buffer.

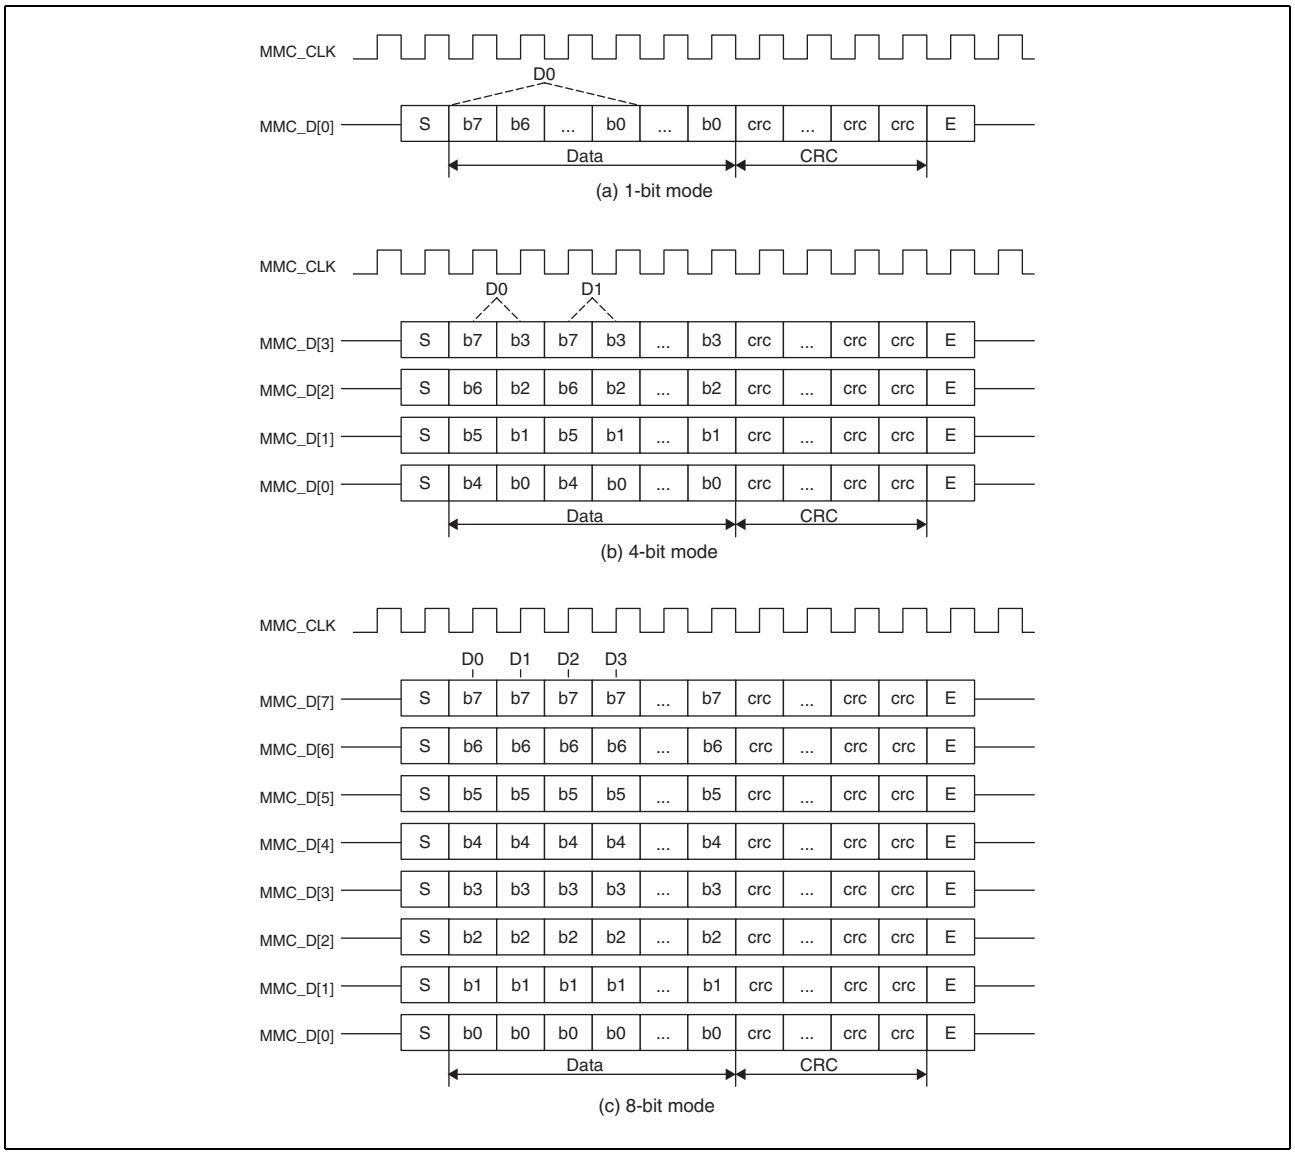

Figure 39.5 Data Block Format

39.6.3 Buffer Structure and Buffer Accesses

This module has two units of 512-byte RAM as shown in Figure 39.6. Therefore, for multi-block writing, if one block of data (512 bytes) stored in one buffer has been transmitted but the other buffer is full, the next block of data can be continuously transmitted. For multi-block reading, if one block of receive data (512 bytes) has been stored in one buffer but the other buffer is empty, the next block of receive data can be continuously stored in the buffer.

If neither of the buffers is empty for multi-block reading, the MMC clock is stopped and reception is suspended. When one of the buffers becomes empty, the MMC clock supply is started to start reception.

The buffer is accessed with CE_DATA. CE_DATA should be accessed for 4 × (n + 1) bytes (n = 0, 1, 2, 3, …, 127).

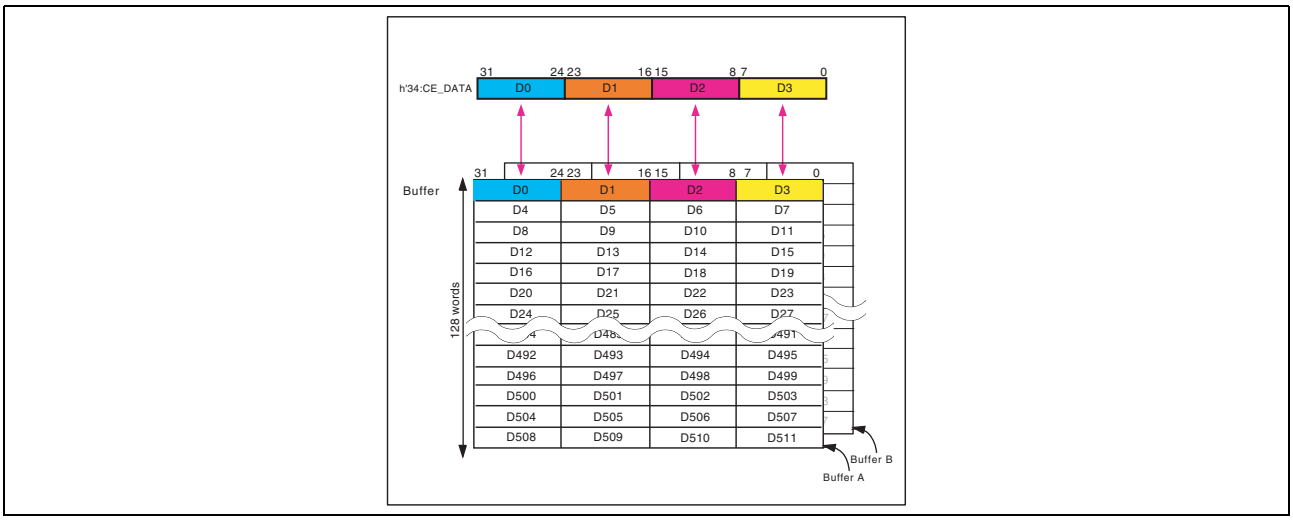

Figure 39.6 Double Buffer Structure

The buffer access select function allows byte-wise swapping of data when the buffer is accessed by writing to or reading from CE_DATA. This function is enabled by the setting of CE_BUFF_ACC. Figure 39.7 shows the specification of byte-wise swapping.

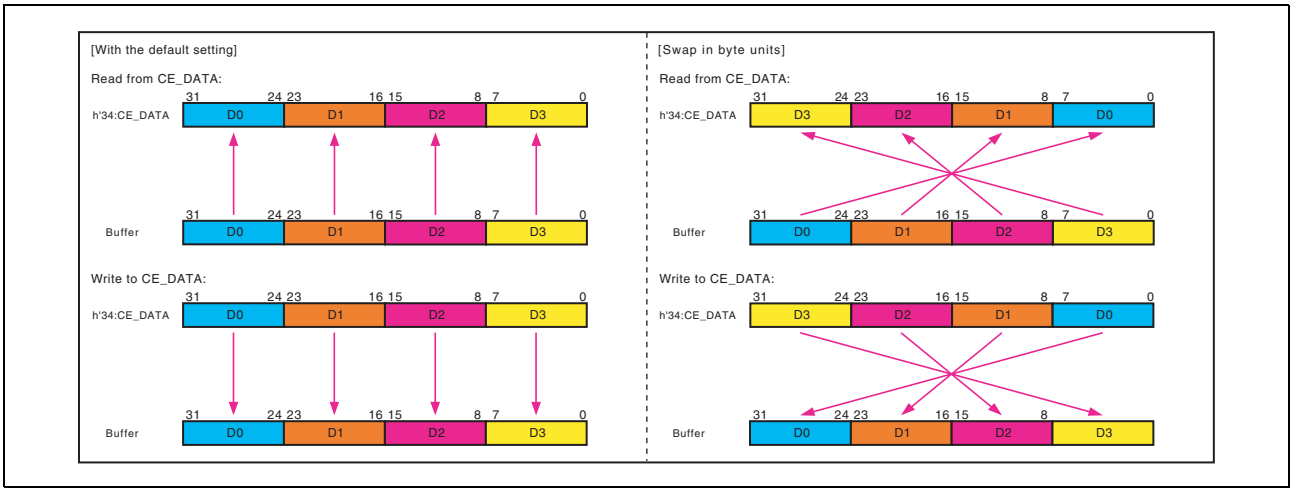

Figure 39.7 Specification of Byte-Wise Swapping

39.6.4 Automatic CMD12 Issuance

This module automatically issues CMD12 when multi-block transfer is performed with the CMD12EN bit in CE_CMD_SET set to 1.

Figure 39.8 shows the timing of automatic CMD12 issuance in multi-block read. CMD12 is issued such that the end bit of the command is sent two bits before the end bit of the data during reception of the last block.

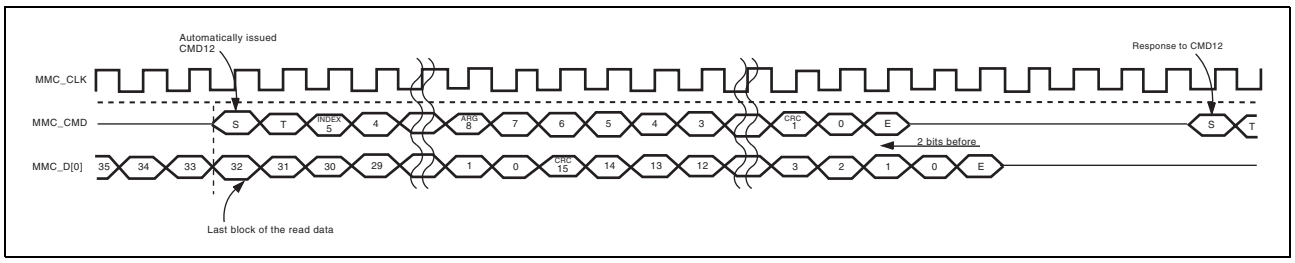

Figure 39.8 Timing of Automatically-Issued CMD12 in Multi-Block Read (1-Bit Mode)

Figure 39.9 shows the timing of automatic CMD12 issuance in multi-block write. CMD12 is issued after the data busy after transmission of the last block has ended.

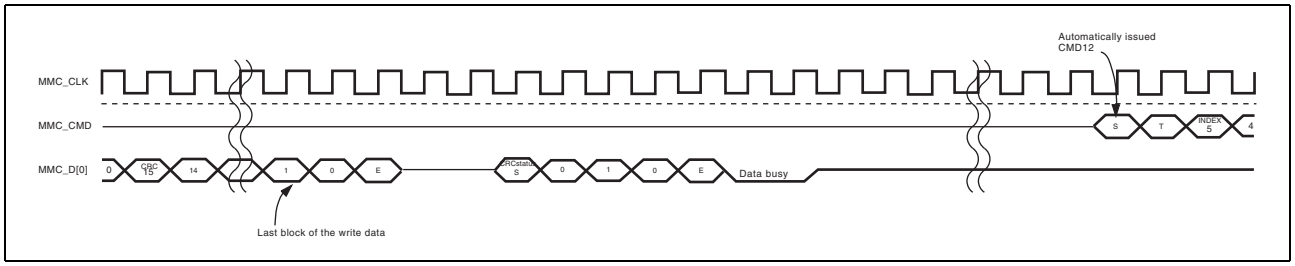

Figure 39.9 Timing of Automatically-Issued CMD12 in Multi-Block Write (1-Bit Mode)

The argument of the automatically-issued CMD12 is set by CE_ARG_CMD12. The value of [39:8] of the response to CMD12 is stored to CE_RESP_CMD12. The busy status on response reception is received.

39.6.5 High Priority Interrupt (HPI)

HPI should be executed as described below with reference to section 39.3, Register Descriptions and section 39.7, Examples of Setting.

(1) When HPI is executed during a write to the device

(a) Terminate the command sequence forcibly.
(b) Wait for the CMDSEQ bit in CE_HOST_STS1 to be cleared to 0.
(c) Issue CMD12 (R1) to make the device in the rcv state enter the prg state. Note that the device does not output the response when the device is in the prg state before issuance of CMD12(R1).
(d) Issue CMD13 (R1).
(e) Issue the HPI command.

(2) When HPI is executed during response busy while not writing to the device

(a) Terminate the command sequence forcibly.
(b) Wait for the CMDSEQ bit in CE_HOST_STS1 to be cleared to 0.
(c) Issue CMD13 (R1).
(d) Issue the HPI command*.

The procedure above is for HPI generated in the CMD6, CMD24, CMD25 (Pre-defined), or CMD38 sequence.

Note: * CMD12 (R1b) or CMD13 (R1b) depending on the device connected

39.6.6 Background Operation

Background operation should be executed as described below with reference to section 39.3, Register Descriptions and section 39.7, Examples of Setting.

To execute background operation, issue CMD6 (R1) to write to the BKOPS_START byte in the EXT_CSD register of the device.

Completion of background operation can be determined by checking the device state with CMD13 (R1) issued after CMD6 (R1) or by polling MMCDAT[0]. When the device state is indicated as “tran” or MMCDAT[0] is high, background operation is determined to be completed.

To suspend background operation, use HPI described in section 39.6.5.

39.6.7 Operation in the Case of Error/Timeout

This module may not be stopped in case of error occurrence. If the command sequence is in progress when an error occurs (check the CMDSEQ bit in CE_HOST_STS1), terminate the sequence forcibly and perform a software reset. The data for transmission or received data that had been stored in the buffers at the time of error occurrence are not guaranteed.

This module is not stopped when a timeout has occurred. To execute the next command after a timeout error has occurred, terminate the sequence forcibly, perform a software reset.

For forcible termination, refer to section 39.7.11, Forcible Termination.

39.7 Examples of Setting

This section shows the procedures for executing typical command sequences.

39.7.1 Legends

Figure 39.10 shows the legends for the symbols used in the figures in the following subsections.

	R1	0	0	111000	01	0	0	1	1	0	0	00	00	0	0	0	0	0	0	0	0	0	*	**	Read

Note: • This module does not support CMD11 and CMD20.

39.8 Usage Note

39.8.1 Card Detection

The CDRISE and CDFALL bits in CE_DETECT which are used for the card detection function do not have a chattering elimination function. The chattering elimination processing should be implemented by software.

39.8.2 Multi-Block Transfer

When HPI is executed, use pre-defined multi-block transfer.

39.8.3 Software Reset

For transitions to the software reset state by the SWRST bit in the CE_VERSION register, see section 42.3.6, Software Reset. However, where the procedure refers to the SRST bit, read this as the SWRST bit in the CE_VERSION register.

40. On-Chip RAM

This LSI has an on-chip large-capacity RAM for display area and work area (128 Kbytes of this RAM are shared with the on-chip data retention RAM) and an on-chip data retention RAM, which can retain data in deep standby mode. These memory units can be used to store instructions or data.
The operation and write access to the large-capacity RAM (including on-chip data retention RAM) can be enabled or disabled through the RAM enable bits and RAM write enable bits.
The on-chip data retention RAM is assigned to page 0 in the on-chip large-capacity RAM. Retention or non-retention of data by the on-chip data retention RAM in deep standby mode is selectable on a per-page basis.

40.1 Features

- Page
  - The on-chip large-capacity RAM consists of five pages (four pages in the RZ/A1LC).
  - The on-chip data retention RAM consists of four pages. Page 0 has 16-Kbytes, page 1 has 16-Kbytes, page 2 has 32-Kbytes, and page 3 has 64-Kbytes.
- Memory map
  The on-chip RAM is located in the address spaces shown in Table 40.1 and Table 40.2. Pages 0 to 3 of the large-capacity RAM each have a capacity of 512 Kbytes, and page 4 of the large-capacity RAM has a capacity of 1 Mbyte.

Table 40.1 Address Spaces of On-Chip Large-Capacity RAM

Page	Address	Mirror Address
Page 0 (512KB)	H'20000000 to H'2007FFFF	H'60000000 to H'6007FFFF
Page 1 (512KB)	H'20080000 to H'200FFFFF	H'60080000 to H'600FFFFF
Page 2 (512KB)	H'20100000 to H'2017FFFF	H'60100000 to H'6017FFFF
Page 3 (512KB)	H'20180000 to H'201FFFFF	H'60180000 to H'601FFFFF
Page 4 (1024KB)*	H'20200000 to H'202FFFFF	H'60200000 to H'602FFFFF

Note: * Reserved in the RZ/A1LC.

Table 40.2 Address Spaces of On-Chip Data Retention RAM

Page	Address	Mirror Address
Page 0 (16KB)	H'20000000 to H'20003FFF	H'60000000 to H'60003FFF
Page 1 (16KB)	H'20004000 to H'20007FFF	H'60004000 to H'60007FFF
Page 2 (32KB)	H'20008000 to H'2000FFFF	H'60008000 to H'6000FFFF
Page 3 (64KB)	H'20010000 to H'2001FFFF	H'60010000 to H'6001FFFF

- Ports
  Each page of the on-chip large-capacity RAM has one read and write port and is connected to the AXI bus. The on-chip RAM for data retention, which has a port independent of the port in page 0, is shared with the read and write port in four pages.
- Method of arbitration
  When the same port of the on-chip large-capacity RAM is accessed from different masters simultaneously, the AXI bus performs arbitration in round-robin mode.
- Number of access cycles
  The number of cycles for access to read or write is one cycle of Bϕ.

40.2 Usage Notes

40.2.1 Page Conflict

When the same page of the on-chip large-capacity RAM is accessed from different masters simultaneously, a conflict on the page occurs. Although each access is completed correctly, this kind of conflict degrades the memory access speed. Therefore, it is advisable to provide software measures to prevent such conflicts as far as possible. For example, no conflict will arise if different pages are accessed by each master.

40.2.2 Data Retention

Data in the large-capacity RAM (including on-chip data retention RAM) are retained in the states other than power-on reset and deep standby mode. In power-on reset and deep standby mode, these RAMs operate as described below.

(1) Power-on Reset

(a) On-Chip Large-Capacity RAM (Excluding On-Chip Data Retention RAM)

Data are retained on a power-on reset by disabling the setting of either the VRAME or VRAMWE bit.
Data are not retained when the setting of the VRAME and VRAMWE bits are both enabled.

(b) On-Chip Data Retention RAM

Data are retained on a power-on reset by disabling the setting of any of the VRAME, VRAMWE, or RRAMWE, excluding the case that deep standby mode is canceled by power-on reset.
Data are not retained when the setting of the VRAME, VRAMWE and RRAMWE bits are all enabled.

(2) Deep Standby Mode

(a) On-Chip Large-Capacity RAM (Excluding On-Chip Data Retention RAM)

Data are not retained.

(b) On-Chip Data Retention RAM

Data are retained in deep standby mode by enabling the setting of the RRAMKP bit, excluding the case that deep standby mode is canceled by power-on reset. In the case that deep standby mode is canceled by interrupt or pins for cancelling, power-on reset exception handling is executed, but the data are retained.

41. Ports

41.1 Features

The 176-pin package of this LSI has nine ports: JP0, P0 to P7. The 208-pin package of this LSI has eleven ports: JP0, P0 to P9. Each port pin is multiplexed with other peripheral module pin functions, and by setting the control registers, multiplexed pin functions (alternative functions) can be selectable.

41.1.1 Port group

This LSI has the following number of port groups.

Table 41.1 Port Group

Package	Number	Name
RZ/A1L 176-pin	9	P0 to P7, JP0
RZ/A1L 208-pin	11	P0 to P9, JP0

41.1.2 Port group index n

Throughout this section, the individual port groups are identified by the index "n" (n = 0 to 9), for example PMCn for the port mode control register, which is used for the Pn pin. The JTAG port has only the index 0.

41.1.3 Base address

The address of a register used to control a JTAG port is given as the base address <JPORTn_base> and the offset address from the base address. The address of a register other than the ones used to control JTAG ports is given as the base address <PORTn_base> and the offset address from the base address.

Table 41.2 Base Addresses <PORTn_base> and <JPORTn_base>

<PORTn_base> address	<JPORTn_base> address
H'FCFE 3000	H'FCFE 7B00

41.2 Functional Overview

41.2.1 Mode of Pin Functions

Pins can operate in three modes.

- Port mode (PMCn.PMCnm bit = 0)
  A pin in port mode operates as a general purpose input/output port.
  The I/O mode is selected by setting the PMn.PMnm bit.
- Software I/O control alternative mode (PMCn.PMCnm bit = 1, PIPCn.PIPCnm bit = 0)
  In this mode, the pins operate as alternative functions.
  The I/O mode is selected by setting the PMn.PMnm bit by using software.
- Direct I/O control alternative mode (PMCn.PMCnm bit = 1, PIPCn.PIPCnm bit = 1)
  In this mode, the pins operate as alternative functions.
  Unlike the software I/O alternative mode, however, the I/O mode is selected by the alternative function.

An overview of the register settings is given in the tables below.

Table 41.3 Pin Function Configuration Overview

	Register				
Mode	**PMCn.PMCnm**	**PMn.PMnm**	**PIBCn.PIBCnm**	**PIPCn.PIPCnm**	**I/O**
Port mode	0	0	X	X	O
		1	0		—
			1		I
Software I/O control alternative mode*	1	0	X	0	O
		1			I
Direct I/O control alternative mode*		X		1	Controlled by the alternative function

Caution: When the pins are in alternative mode (PMCn.PMCnm = 1), one of the eight alternative functions is selected by the PFCn, PFCEn, and PFCAEn registers. For details, see Table 41.6, Alternative Mode Selection.

41.2.2 Pin Data Input/Output

The registers used for data input/output are described below. The location that is read via the PPRn register differs depending on the pin mode.

- Output data
  In port mode (PMCn.PMCnm = 0), the value of the Pn.Pnm bit is output from the Pn_m pin.

- Input data
  When the PPRn register is read, either the level of the Pn_m pin, the value of the Pn.Pnm bit, or the value output by the alternative function is returned. Which value is returned depends on the pin mode and setting of several control bits. Table 41.4 shows the different PPRn read values.

Table 41.4 PPRn.PPRnm Bit Read Values

	Register				
Mode	**PMCn.PMCnm**	**PMn.PMnm**	**PIBCn.PIBCnm**	**PIPCn.PIPCnm**	**PPRn.PPRnm Bit Read Value**
Port mode	0	0	X	X	Pn.Pnm bit*
			0		Pn.Pnm bit
		1	1		Pn_m pin
Software I/O control alternative mode	1	0	X	0	Value output by the alternative function*
		1			Pn_m pin
Direct I/O control alternative mode		X		1	• Input: Pn_m pin • Output: Value output by the alternative function*

Caution: When PBDCn.PBDCnm = 1, the level of the Pn_m pin is returned as the read value of the PPRn.PPRnm bit.

41.3 Register Description

The following registers are used for setting the individual pins of the port groups:

Table 41.5 Register Configuration

Symbol	Register Name	R/W	16 Bit Access	32 Bit Access	Address
Pn	Port register	R/W	√	—	<PORTn_base> + 0000H + n × 4
PSRn	Port set/reset register	R/W	—	√	<PORTn_base> + 0100H + n × 4
PPRn	Port pin read register	R	√	—	<PORTn_base> + 0200H + n × 4
PMn	Port mode register	R/W	√	—	<PORTn_base> + 0300H + n × 4
PMCn	Port mode control register	R/W	√	—	<PORTn_base> + 0400H + n × 4
PFCn	Port function control register	R/W	√	—	<PORTn_base> + 0500H + n × 4
PFCEn	Port function control expansion register	R/W	√	—	<PORTn_base> + 0600H + n × 4
PNOTn	Port NOT register	W	√	—	<PORTn_base> + 0700H + n × 4
PMSRn	Port mode set/reset register	R/W	—	√	<PORTn_base> + 0800H + n × 4
PMCSRn	Port mode control set/reset register	R/W	—	√	<PORTn_base> + 0900H + n × 4
PFCAEn	Port Function Control Additional Expansion register	R/W	√	—	<PORTn_base> + 0A00H + n × 4
PIBCn	Port input buffer control register	R/W	√	—	<PORTn_base> + 4000H + n × 4
PBDCn	Port bi-direction control register	R/W	√	—	<PORTn_base> + 4100H + n × 4
PIPCn	Port IP control register	R/W	√	—	<PORTn_base> + 4200H + n × 4
JPPR0	Port pin read register	R	√	—	<JPORTn_base> + 0020H
JPMC0	Port mode control register	R/W	√	—	<JPORTn_base> + 0040H
JPMCSR0	Port mode control set/reset register	R/W	—	√	<JPORTn_base> + 0090H
JPIBC0	Port input buffer control register	R/W	√	—	<JPORTn_base> + 0400H
SNCRn	Serial sound interface noise canceler control register	R/W	—	√	<PORTn_base> + 0C00H

41.3.1 Port Register (Pn)

In port output mode (PMCn.PMCnm = 0 and PMn.PMnm = 0), this register sets the level of the Pn_m pin.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Pn15	Pn14	Pn13	Pn12	Pn11	Pn10	Pn9	Pn8	Pn7	Pn6	Pn5	Pn4	Pn3	Pn2	Pn1	Pn0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	Pn[15:0]	These bits set the output level of the Pn_m pin (m = 0 to 15). 0: Outputs low level 1: Outputs high level

41.3.2 Port Set and Reset Register (PSRn)

This register provides an alternative method for writing data to the Pn register.
The higher 16 bits of the PSRn register specify whether data can be written to the Pn.Pnm bit specified by the lower 16 bits of the PSRn register.
When reading, the higher 16 bits are read as 0000H. The lower 16 bits are read as the value of the Pn register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PSRn 31	PSRn 30	PSRn 29	PSRn 28	PSRn 27	PSRn 26	PSRn 25	PSRn 24	PSRn 23	PSRn 22	PSRn 21	PSRn 20	PSRn 19	PSRn 18	PSRn 17	PSRn 16
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PSRn 15	PSRn 14	PSRn 13	PSRn 12	PSRn 11	PSRn 10	PSRn 9	PSRn 8	PSRn 7	PSRn 6	PSRn 5	PSRn 4	PSRn 3	PSRn 2	PSRn 1	PSRn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
31 to 16	PSRn[31:16]	These are enable bits that specify whether the value of the corresponding lower bit of the PSRn.PSRnm bit is written to the corresponding Pn.Pnm bit. 0: Pn.Pnm is independent of PSRn.PSRnm. 1: Pn.Pnm becomes the value of the PSRn.PSRnm bit. Example: If PSRn.PSRn31 = 1, the value of PSRn.PSRn15 is written to Pn.Pn15.
15 to 0	PSRn[15:0]	These are data bits that specify the value of the Pn.Pnm bit if the corresponding higher bit, PSRn.PSRn (m+16), is 1. 0: Pn.Pnm = 0 1: Pn.Pnm = 1

41.3.3 Port Pin Read Register (PPRn/JPPR0)

The PPRn register reflects the level of the Pn_m pin, the value of the Pn.Pnm bit, or the value output by the alternative function. The read value depends on register settings as described in Table 41.4, PPRn.PPRnm Bit Read Values.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PPRn 15	PPRn 14	PPRn 13	PPRn 12	PPRn 11	PPRn 10	PPRn 9	PPRn 8	PPRn 7	PPRn 6	PPRn 5	PPRn 4	PPRn 3	PPRn 2	PPRn 1	PPRn 0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit Position	Bit Name	Function
15 to 0	PPRn[15:0]	The level of the Pn_m pin, the value of the Pn.Pnm bit, or the value output by the alternative function.

Note: 1. For the PPRn register read value, see section 41.2.2, Pin Data Input/Output.
2. The JPPR0[1:0] bits are control bits in the JTAG port pin read register (JPPR0).

41.3.4 Port Mode Register (PMn)

This register specifies whether the Pn_m pin is in input mode or in output mode.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMn 15	PMn 14	PMn 13	PMn 12	PMn 11	PMn 10	PMn 9	PMn 8	PMn 7	PMn 6	PMn 5	PMn 4	PMn 3	PMn 2	PMn 1	PMn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PMn[15:0]	Specifies input/output mode of the corresponding pin: 0: Output mode (output enabled) 1: Input mode (output disabled)

Caution: To use the Pn_m pin in port input mode (PMCn.PMCnm = 0 and PMn.PMnm = 1), the PIBCn.PIBCnm bit must be set to 1 so that the input buffer is enabled.

Note: After the register is reset (PIPCn.PIPCnm bit is 0), the PMn.PMnm bit specifies the I/O direction in port mode (PMCn.PMCnm = 0) and alternative mode (PMCn.PMCnm = 1). For the pins that are automatically configured in boot mode (see Table 8.3, Initial States by Areas in Boot Modes 0 and 1 to 3), the alternative function (not the PMn register) is used to control the I/O direction.

41.3.5 Port Mode Control Register (PMCn/JPMC0)

This register specifies whether the Pn_m pin is in port mode or in alternative mode.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMCn 15	PMCn 14	PMCn 13	PMCn 12	PMCn 11	PMCn 10	PMCn 9	PMCn 8	PMCn 7	PMCn 6	PMCn 5	PMCn 4	PMCn 3	PMCn 2	PMCn 1	PMCn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PMCn[15:0]	Specifies the operation mode of the corresponding pin: 0: Port mode 1: Alternative mode

Caution: The input/output control is not performed just by setting alternative mode (PMCn.PMCnm). Set 1 in the PIPCn.PIPCnm bit too when the I/O control is to be performed by using the alternative function.

Note: The JPMC0[1:0] bits are control bits in the JTAG port mode control register (JPMC0).

41.3.6 Port Function Control Register (PFCn)

This register, together with the PFCEn and PFCAEn register, specifies the alternative function of the pins.
The I/O direction of several alternative functions can be controlled directly by using the Pn_m pin. For these alternative functions, the PIPCn.PIPCnm bit must be set to “1”.
For all other alternative functions, the I/O direction is specified by using the PMn.PMnm bit.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCn 15	PFCn 14	PFCn 13	PFCn 12	PFCn 11	PFCn 10	PFCn 9	PFCn 8	PFCn 7	PFCn 6	PFCn 5	PFCn 4	PFCn 3	PFCn 2	PFCn 1	PFCn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PFCn[15:0]	Specifies the alternative function of a pin.

Table 41.6 Alternative Mode Selection

PMCn. PMCnm	PFCAEn. PFCAEnm	PFCEn. PFCEnm	PFCn. PFCnm	PMn. PMnm	Function*2
0	X	X	X	1	Port mode/input
				0	Port mode/output
1*1	0	0	0	1	Alternative mode/1st alternative function/input
				0	Alternative mode/1st alternative function/output
			1	1	Alternative mode/2nd alternative function/input
				0	Alternative mode/2nd alternative function/output
		1	0	1	Alternative mode/3rd alternative function/input
				0	Alternative mode/3rd alternative function/output
			1	1	Alternative mode/4th alternative function/input
				0	Alternative mode/4th alternative function/output
	1	0	0	1	Alternative mode/5th alternative function/input
				0	Alternative mode/5th alternative function/output
			1	1	Alternative mode/6th alternative function/input
				0	Alternative mode/6th alternative function/output
		1	0	1	Alternative mode/7th alternative function/input
				0	Alternative mode/7th alternative function/output
			1	1	Alternative mode/8th alternative function/input
				0	Alternative mode/8th alternative function/output

Cautions:1. When the PIPCn.PIPCnm bit is set to 1, the I/O direction is directly controlled by the alternative function and the setting of the PMn.PMnm bit becomes invalid.

2. Use alternative functions that are open to the public. If a mode to which no alternative function is assigned is selected, correct operation is not guaranteed.

41.3.7 Port Function Control Expansion Register (PFCEn)

This register, together with the PFCn and PFCAEn register, specifies the alternative function of the pins.
The I/O direction of several alternative functions can be controlled directly by using the Pn_m pin. For these alternative functions, the PIPCn.PIPCnm bit must be set to “1”.
For all other alternative functions, the I/O direction is specified by using the PMn.PMnm bit.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCEn 15	PFCEn 14	PFCEn 13	PFCEn 12	PFCEn 11	PFCEn 10	PFCEn 9	PFCEn 8	PFCEn 7	PFCEn 6	PFCEn 5	PFCEn 4	PFCEn 3	PFCEn 2	PFCEn 1	PFCEn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PFCEn[15:0]	Specifies the alternative function of a pin.

41.3.8 Port NOT Register (PNOTn)

This register allows the Pn.Pnm bit to be inverted without directly writing to the Pn register.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PNOTn 15	PNOTn 14	PNOTn 13	PNOTn 12	PNOTn 11	PNOTn 10	PNOTn 9	PNOTn 8	PNOTn 7	PNOTn 6	PNOTn 5	PNOTn 4	PNOTn 3	PNOTn 2	PNOTn 1	PNOTn 0
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit Position	Bit Name	Function
15 to 0	PNOTn[15:0]	Specifies whether to invert Pn.Pnm. 0: Pn.Pnm is not inverted (Pnm → Pnm) 1: Pn.Pnm is inverted ($\overline{\text{Pnm}}$ → Pnm)

41.3.9 Port Mode Set and Reset Register (PMSRn)

This register provides an alternative method for writing data to the PMn register.
The higher 16 bits of the PMSRn register specify whether data can be written to the PMn.PMnm bit specified by the lower 16 bits of the PMSRn register.
When reading, the higher 16 bits are read as 0000H. The lower 16 bits are read as the value of the PMn register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PMSRn 31	PMSRn 30	PMSRn 29	PMSRn 28	PMSRn 27	PMSRn 26	PMSRn 25	PMSRn 24	PMSRn 23	PMSRn 22	PMSRn 21	PMSRn 20	PMSRn 19	PMSRn 18	PMSRn 17	PMSRn 16
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMSRn 15	PMSRn 14	PMSRn 13	PMSRn 12	PMSRn 11	PMSRn 10	PMSRn 9	PMSRn 8	PMSRn 7	PMSRn 6	PMSRn 5	PMSRn 4	PMSRn 3	PMSRn 2	PMSRn 1	PMSRn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
31 to 16	PMSRn[31:16]	These are enable bits that specify whether the value of the corresponding lower bit of the PMSRn.PMSRnm bit is written to the corresponding PMn.PMnm bit. 0: PMn.PMnm does not depend on the PMSRn.PMSRnm bit. 1: PMn.PMnm becomes the value of the PMSRn.PMSRnm bit. Example: If PMSRn.PMSRn31 = 1, the value of PMSRn.PMSRn15 is written to PMn.PMn15.
15 to 0	PMSRn[15:0]	These are data bits that specify the value of the PMn.PMnm bit if the corresponding higher bit, PMSRn.PMSRn (m + 16), is 1. 0: PMn.PMnm = 0 1: PMn.PMnm = 1

41.3.10 Port Mode Control Set and Reset Register (PMCSRn/JPMCSR0)

This register provides an alternative method for writing data to the PMCn register.

The higher bits of the PMCSRn register specify whether data can be written to the PMCn.PMCnm bit specified by the lower bits of the PMCSRn register.

When reading, the higher 16 bits are read as 0000H. The lower 16 bits are read as the value of the PMCn register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PMCSRn31	PMCSRn30	PMCSRn29	PMCSRn28	PMCSRn27	PMCSRn26	PMCSRn25	PMCSRn24	PMCSRn23	PMCSRn22	PMCSRn21	PMCSRn20	PMCSRn19	PMCSRn18	PMCSRn17	PMCSRn16
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMCSRn15	PMCSRn14	PMCSRn13	PMCSRn12	PMCSRn11	PMCSRn10	PMCSRn9	PMCSRn8	PMCSRn7	PMCSRn6	PMCSRn5	PMCSRn4	PMCSRn3	PMCSRn2	PMCSRn1	PMCSRn0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
31 to 16	PMCSRn[31:16]	These are enable bits that specify whether the value of the corresponding lower bit of the PMCSRn.PMCSRnm bit is written to the corresponding PMCn.PMCnm bit. 0: PMCn.PMCnm does not depend on the PMCSRn.PMCSRnm bit. 1: PMCn.PMCnm becomes the value of the PMCSRn.PMCSRnm bit. Example: If PMCSRn.PMCSRn31 = 1, the value of PMCSRn.PMCSRn15 is written to PMCn.PMCn15.
15 to 0	PMCSRn[15:0]	These are data bits that specify the value of the PMCn.PMCnm bit if the corresponding higher bit, PMCSRn.PMCSRn (m+16), is 1. 0: PMCn.PMCnm = 0 1: PMCn.PMCnm = 1

Note: The JPMCSR0[1:0] bits are control bits in the JTAG port mode control set and reset register (JPMCSR0).

41.3.11 Port Function Control Additional Expansion Register (PFCAEn)

This register, together with the PFCn and PFCEn register, specifies the alternative function of the pins.

The I/O direction of several alternative functions can be controlled directly by using the Pn_m pin. For these alternative functions, the PIPCn.PIPCnm bit must be set to “1”.

For all other alternative functions, the I/O direction is specified by using the PMn.PMnm bit.

Use the PFCn.PFCnm, PFCEn.PFCEnm, and PFCAEn.PFCAEnm bits to select the alternative functions, and then set the PMCn.PMCnm bit to 1.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCAEn15	PFCAEn14	PFCAEn13	PFCAEn12	PFCAEn11	PFCAEn10	PFCAEn9	PFCAEn8	PFCAEn7	PFCAEn6	PFCAEn5	PFCAEn4	PFCAEn3	PFCAEn2	PFCAEn1	PFCAEn0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PFCAEn[15:0]	Specifies the alternative function of a pin.

Caution: Although some alternative functions are assigned to multiple pins in this LSI, only one of the pins can be used for each alternative function. Do not set the same alternative function in multiple pins. For example, when the a/b/c pin is used as the b pin, the b/d/e pin cannot be used as the b pin. Before using the b/d/e pin, set the pin as an alternative function other than b.

Note: For the allocation of the alternative functions, see the table of the pin functions of each port.

41.3.12 Port Input Buffer Control Register (PIBCn/JPIBC0)

This register specifies whether to enable or disable the Pn_m pin's input buffer in port input mode (PMCn.PMCnm = 0 and PMn.PMnm = 1 or JPMC0.JPMC0 = 0).

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIBCn 15	PIBCn 14	PIBCn 13	PIBCn 12	PIBCn 11	PIBCn 10	PIBCn 9	PIBCn 8	PIBCn 7	PIBCn 6	PIBCn 5	PIBCn 4	PIBCn 3	PIBCn 2	PIBCn 1	PIBCn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PIBCn[15:0]	These bits enable or disable the input buffer. 0: Input buffer disabled 1: Input buffer enabled

Note: When the input buffer is disabled, through current does not flow even when the pin level is Hi-Z. Thus the pin does not need to be fixed to a high or low level externally (except for P2_0, P2_2, P2_7, P2_9, P5_8, P5_9, P5_10, P6_7, P7_2, P7_3, P7_6, and P7_9).
The JPIBC0[1:0] bits are control bits in the JTAG port input buffer control register (JPIBC0).

Caution: The input buffer is enabled regardless of the settings in this register when the output buffer is enabled and PBDCn.PBDCnm = 1.

41.3.13 Port Bidirection Control Register (PBDCn)

This register specifies whether to enable or disable the input buffers when the output buffers are enabled. If the PBDCn.PBDCnm bit is set to "1" when the output buffers are enabled, bidirectional mode is enabled, and the level of the Pn_m pin is always read via the PPRn.PPRnm bit.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PBDCn 15	PBDCn 14	PBDCn 13	PBDCn 12	PBDCn 11	PBDCn 10	PBDCn 9	PBDCn 8	PBDCn 7	PBDCn 6	PBDCn 5	PBDCn 4	PBDCn 3	PBDCn 2	PBDCn 1	PBDCn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PBDCn[15:0]	Enables/disables bidirectional mode of the corresponding pin: 0: Bidirectional mode disabled 1: Bidirectional mode enabled

Caution: When using the Pn_m pin as an alternative function (PMCn.PMCnm = 1 and PMn.PMnm = 0), the level of the Pn_m pin can be read at the PPRn.PPRnm bit by setting PBDCn.PBDCnm to 1. Note, however, that in this case, the level of the Pn_m pin will be input to the alternative function that the Pn_m pin is being used as.

41.3.14 Port IP Control Register (PIPCn)

This register specifies whether the I/O direction of the Pn_m pin is controlled by the PMn.PMnm bit or by the alternative function in alternative mode (PMCn.PMCnm = 1). Set the PIPCn.PIPCnm bit to 0 to use the alternative functions listed in Table 41.7. Set the PIPCn.PIPCnm bit to 1 to use the alternative functions not listed in Table 41.7. If the PIPCn.PIPCnm bit is set to 1, the I/O direction is controlled by the alternative function, and the setting of the PMn.PMnm bit becomes invalid.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PIPCn 15	PIPCn 14	PIPCn 13	PIPCn 12	PIPCn 11	PIPCn 10	PIPCn 9	PIPCn 8	PIPCn 7	PIPCn 6	PIPCn 5	PIPCn 4	PIPCn 3	PIPCn 2	PIPCn 1	PIPCn 0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
15 to 0	PIPCn[15:0]	These bits specify how the I/O direction is controlled in alternative mode. 0: The I/O direction is controlled by the PMn.PMnm bit (software I/O control). 1: The I/O direction is controlled by the alternative function (direct I/O control).

Table 41.7 Alternative Functions for Which the PIPCn.PIPCnm Bit Should be Set to 0

Function	Pin Name	Remark
Multi-function timer pulse unit 2	TIOC0A	Set the PIPCn.PIPCnm bit to 0, and specify input or output by using the PMn.PMnm bit.
	TIOC0B	
	TIOC0C	
	TIOC0D	
	TIOC1A	
	TIOC1B

	TIOC3C	
	TIOC3D	
	TIOC4A	
	TIOC4B	
	TIOC4C	
	TIOC4D	
Serial sound interface	SSITxD0	Set the PIPCn.PIPCnm bit and the PMn.PMnm bit to 0.
	SSITxD1	
	SSITxD3	
Watchdog timer	$\overline{\text{WDTOVF}}$	Set the PIPCn.PIPCnm bit and the PMn.PMnm bit to 0.

41.3.15 Serial Sound Interface Noise Canceler Control Register (SNCR)

This register controls the noise canceler in the input route from the LSI pin to a serial sound interface and the pins for MII supported in the Ethernet. Four lower-order bits can be set only when slave mode is selected for the corresponding channel of the serial sound interface.
In master mode, the bit corresponding to the channel of the serial sound interface must be set to 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	ETSEL*	—	—	SSI3NCE	SSI2NCE	SSI1NCE	SSI0NCE
R/W:	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W

Bit Position	Bit Name	Function
6	ETSEL*	Enables or disables the Ethernet controller and EthernetAVB with respect to the pins for MII supported in the Ethernet. 0: The Ethernet controller is enabled and the EthernetAVB is disabled. 1: The EthernetAVB is enabled and the Ethernet controller is disabled.
5, 4	—	Reserved The write value should always be 0.
3	SSI3NCE	Serial Sound Interface Channel 3 Noise Canceler Enable Enables or disables the noise canceler of SSISCK3, SSIWS3, and SSIRxD3. 0: Noise canceler is disabled. 1: Noise canceler is enabled.
2	SSI2NCE	Serial Sound Interface Channel 2 Noise Canceler Enable Enables or disables the noise canceler of SSISCK2, SSIWS2, and SSIDATA2. 0: Noise canceler is disabled. 1: Noise canceler is enabled.
1	SSI1NCE	Serial Sound Interface Channel 1 Noise Canceler Enable Enables or disables the noise canceler of SSISCK1, SSIWS1, and SSIRxD1. 0: Noise canceler is disabled. 1: Noise canceler is enabled.
0	SSI0NCE	Serial Sound Interface Channel 0 Noise Canceler Enable Enables or disables the noise canceler of SSISCK0, SSIWS0, and SSIRxD0. 0: Noise canceler is disabled. 1: Noise canceler is enabled.

Note: * This bit is only present in the RZ/A1LU. For the RZ/A1L and RZ/A1LC, the write value should always be 0.

41.4 Port Function

Table 41.8 Number and Function of Ports

Port	Pin Name	Size (Number of Ports)	Input/Output	Note
JTAG Port 0	JP0_0, JP0_1	2 bits	input	
Port 0	P0_0 to P0_3	4 bits	input	
Port 1	P1_0 to P1_15	16 bits	input/open-drain output	Output of only the P1_0 to P1_7 pins is open-drain output.
Port 2	P2_0 to P2_9	10 bits	input/output	
Port 3	P3_0 to P3_15	16 bits	input/output	
Port 4	P4_0 to P4_7	8 bits	input/output	
Port 5	P5_0 to P5_15	16 bits	input/output	
Port 6	P6_0 to P6_15	16 bits	input/output	
Port 7	P7_0 to P7_11	12 bits	input/output	
Port 8	P8_0 to P8_15	16 bits	input/output	208-pin package only
Port 9	P9_0 to P9_5	6 bits	input/output	208-pin package only

41.5 JTAG Port 0 (JP0)

Table 41.9 Pin Function (JP0)

Port Mode		Alternative Mode	
Input	Output	Input	Output
JP0_0		TDI	
JP0_1			TDO

Caution: Only input in port mode.

Table 41.10 Control Registers (JP0)

Register	Register Size	Valid Bit Location	Valid Bit R/W	Offset Address <JPORTn_base>	Initial Value
JPPR0	16	1 and 0	R	H'0020	H'0000
JPMC0	16	1 and 0	R/W	H'0040	H'FFFF
JPMCSR0	32	17 and 16, 1 and 0	W, R/W	H'0090	H'0000_FFFF
JPIBC0	16	1 and 0	R/W	H'0400	H'0000

Caution: An initial value is read if the bit is invalid. The write value should always be the initial value.

41.6 Port 0 (P0)

Table 41.11 Pin Function (P0)

Port Mode		Alternative Mode							
		1st Alternative		2nd Alternative		3rd Alternative		4th Alternative	
Input	Output	Input	Output	Input	Output	Input	Output	Input	Output
P0_0				RxD0		IRQ4			
P0_1				RxD2		SSIRxD3		$\overline{\text{ADTRG}}$	
P0_2				RxD1		IRQ7			
P0_3				RxD3		SPDIF_IN			

Cautions: 1. Only input in port mode.

2. P0_0, P0_1, P0_2, P0_3 pins are MD_BOOT0, MD_BOOT1, MD_CLK, MD_CLKS functions in the state of $\overline{\text{RES}}$ = L.

Table 41.12 Control Registers (P0)

Register	Register Size	Valid Bit Location	Valid Bit R/W	Offset Address <PORTn_base>	Initial Value
PPR0	16	3 to 0	R	H'0200	H'0000
PMC0	16	3 to 0	R/W	H'0400	H'0000
PFC0	16	3 to 0	R/W	H'0500	H'0000
PFCE0	16	3 to 0	R/W	H'0600	H'0000
PMCSR0	32	19 to 16, 3 to 0	W, R/W	H'0900	H'0000_0000
PFCAE0	16	3 to 0	R/W	H'0A00	H'0000
PIBC0	16	3 to 0	R/W	H'4000	H'0000

Caution: An initial value is read if the bit is invalid. The write value should always be the initial value.

41.7 Port 1 (P1)

Table 41.13 Pin Function (P1)

Port Mode		Alternative Mode							
		1st Alternative		2nd Alternative		3rd Alternative		4th Alternative	
Input	Output	Input	Output	Input	Output	Input	Output	Input	Output
P1_0	P1_0	RIIC0SCL		IRQ4		ET_RXD0		DV0_DATA0	
P1_1	P1_1	RIIC0SDA		IRQ5		ET_RXD1		DV0_DATA1	
P1_2	P1_2	RIIC1SCL		IRQ6		ET_RXD2		DV0_DATA2	
P1_3	P1_3	RIIC1SDA		IRQ7		ET_RXD3		DV0_DATA3	
P1_4	P1_4	RIIC2SCL		IRQ0		DREQ0		VIO_D0	
P1_5	P1_5	RIIC2SDA		IRQ1				VIO_D1	
P1_6	P1_6	RIIC3SCL		IRQ2		SSIRxD0		VIO_D2	
P1_7	P1_7	RIIC3SDA		IRQ3		RxD2		VIO_D3	
P1_8		AN0		IRQ0		RxD0		DV0_DATA4	
P1_9		AN1		IRQ1		RxD1		DV0_DATA5	
P1_10		AN2		IRQ2		RxD2		DV0_DATA6	
P1_11		AN3		IRQ3		RxD3		DV0_DATA7	
P1_12		AN4		IRQ4		ET_RXD0		VIO_D4	
P1_13		AN5		IRQ5		ET_RXD1		VIO_D5	
P1_14		AN6		IRQ6		ET_RXD2		VIO_D6	
P1_15		AN7		IRQ7		ET_RXD3		VIO_D7	

Caution: P1_0 to P1_7 pins are input with open-drain output. P1_8 to P1_15 pins are only input.

Table 41.14 Control Registers (P1)

Register	Register Size	Valid Bit		Offset Address <PORTn_base>	Initial Value
		Location	R/W		
P1	16	7 to 0	R/W	H'0004	H'0000
PSR1	32	23 to 16, 7 to 0	W, R/W	H'0104	H'0000_0000
PPR1	16	15 to 0	R	H'0204	H'0000
PM1	16	7 to 0	R/W	H'0304	H'FFFF*2
PMC1	16	15 to 0	R/W	H'0404	H'0000
PFC1	16	15 to 0	R/W	H'0504	H'0000
PFCE1	16	15 to 0	R/W	H'0604	H'0000
PNOT1	16	7 to 0	W	H'0704	H'0000
PMSR1	32	23 to 16, 7 to 0	W, R/W	H'0804	H'0000_FFFF
PMCSR1	32	23 to 16, 7 to 0	W, R/W	H'0904	H'0000_0000
PFCAE1	16	15 to 0	R/W	H'0A04	H'0000
PIBC1	16	15 to 0	R/W	H'4004	H'0000
PBDC1	16	15 to 0	R/W	H'4104	H'0000
PIPC1	16	7 to 0	R/W	H'4204	H'FF00*2

Cautions: 1. An initial value is read if the bit is invalid. The write value should always be the initial value.

2. The values of bits 8 to 15 of the PM1 and PIPC1 registers are fixed. When read, all of these bits are always read as 1.

41.8 Port 2 (P2)

Table 41.15 Pin Function (P2)

Port Mode		Alternative Mode									
		1st Alternative		2nd Alternative		3rd Alternative		4th Alternative		5th Alternative	
Input	Output	Input	Output	Input	Output	Input	Output	Input	Output	Input	Output

41.16 Port Control Logical Diagram

The figure below is a logical diagram of the port control function.
Note: This figure shows the logic for reference, not the circuit.

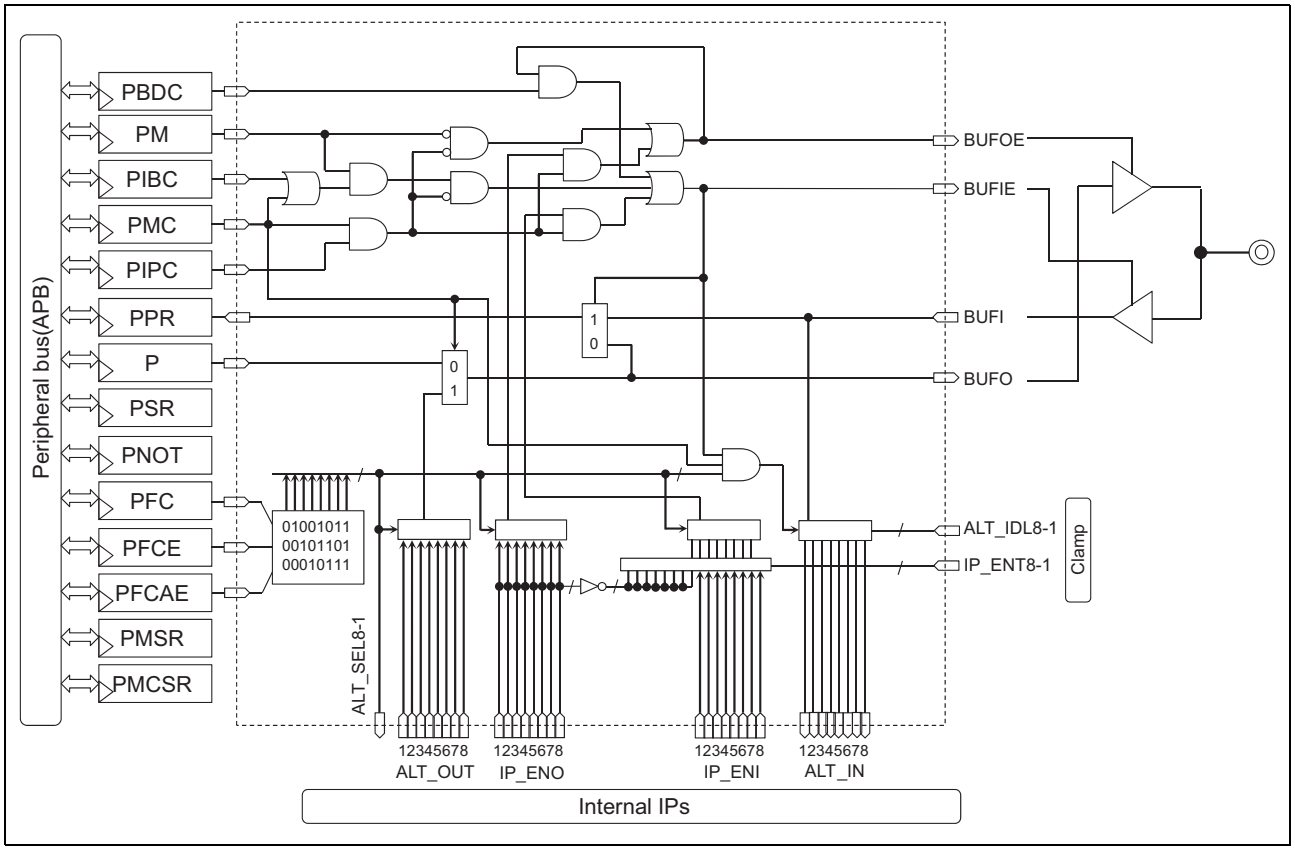

Figure 41.1 Port Control Logical Diagram

41.17 Flowchart Examples of Port Setting

(a) shows an example flow of setting the Pn_m pin to port mode. (b) shows an example flow of setting the Pn_m pin to software I/O control alternative mode. (c) shows an example flow of setting the Pn_m pin to direct I/O control alternative mode.

(a) In Port Mode

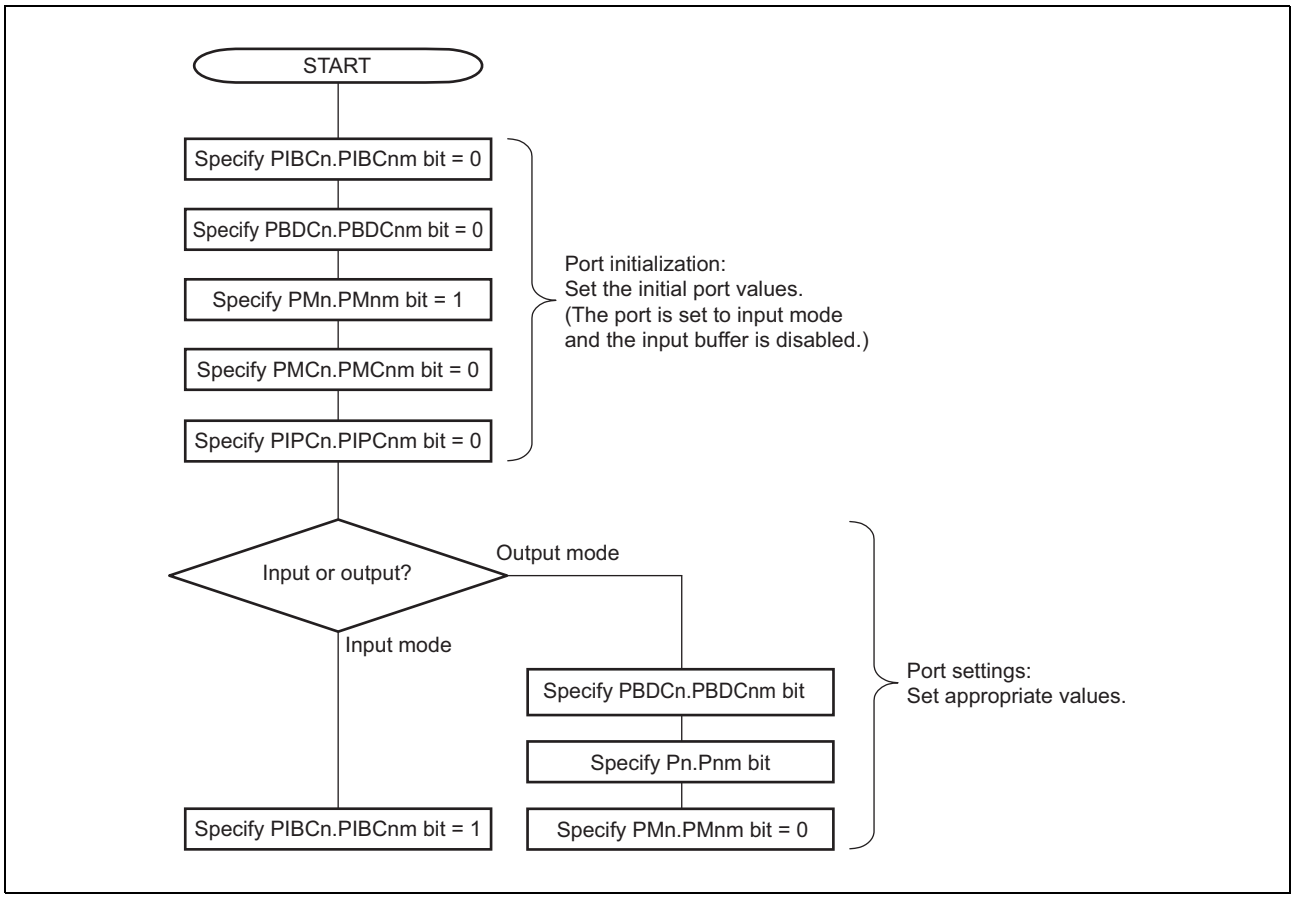

Figure 41.2 Example Flow of Port Settings (in Port Mode) (a)

(b) In Software I/O Control Alternative Mode

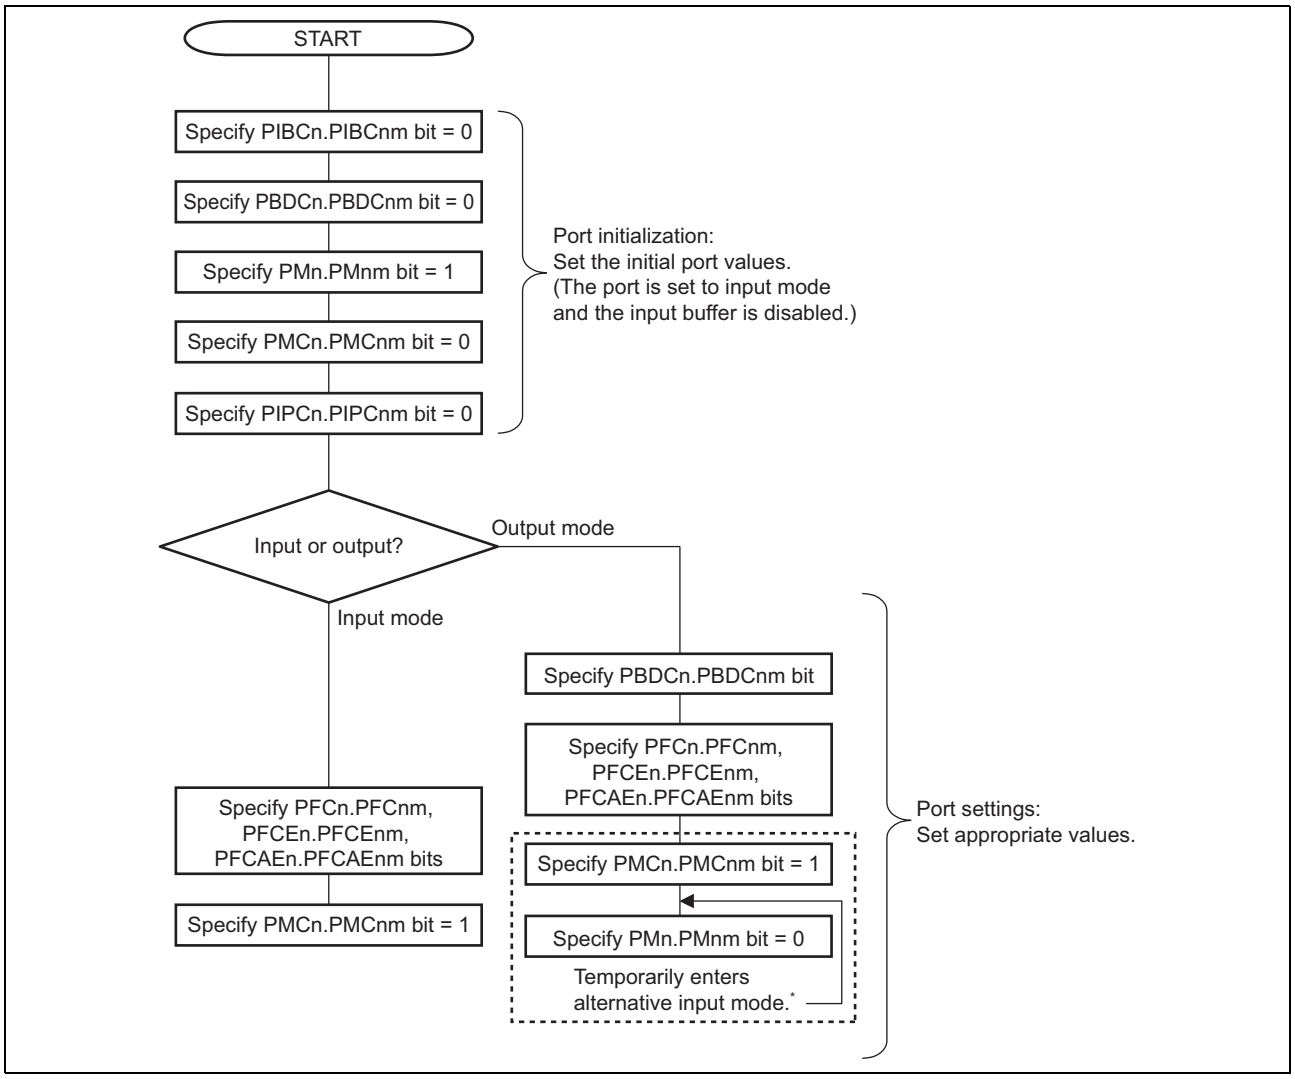

Figure 41.3 Example Flow of Port Settings (in Software I/O Control Alternative Mode) (b)

Caution: When the Pn_m pin is set to the output mode of the software I/O control alternative mode, alternative input mode is temporarily enabled during the period from when the PMCn.PMCnm bit is set to 1 to when the PMn.PMnm bit is set to 0. Therefore, if a signal regarding interrupt has been set for the port alternative function, configure the setting so that interrupt does not occur or becomes invalid.

(c) In Direct I/O Control Alternative Mode

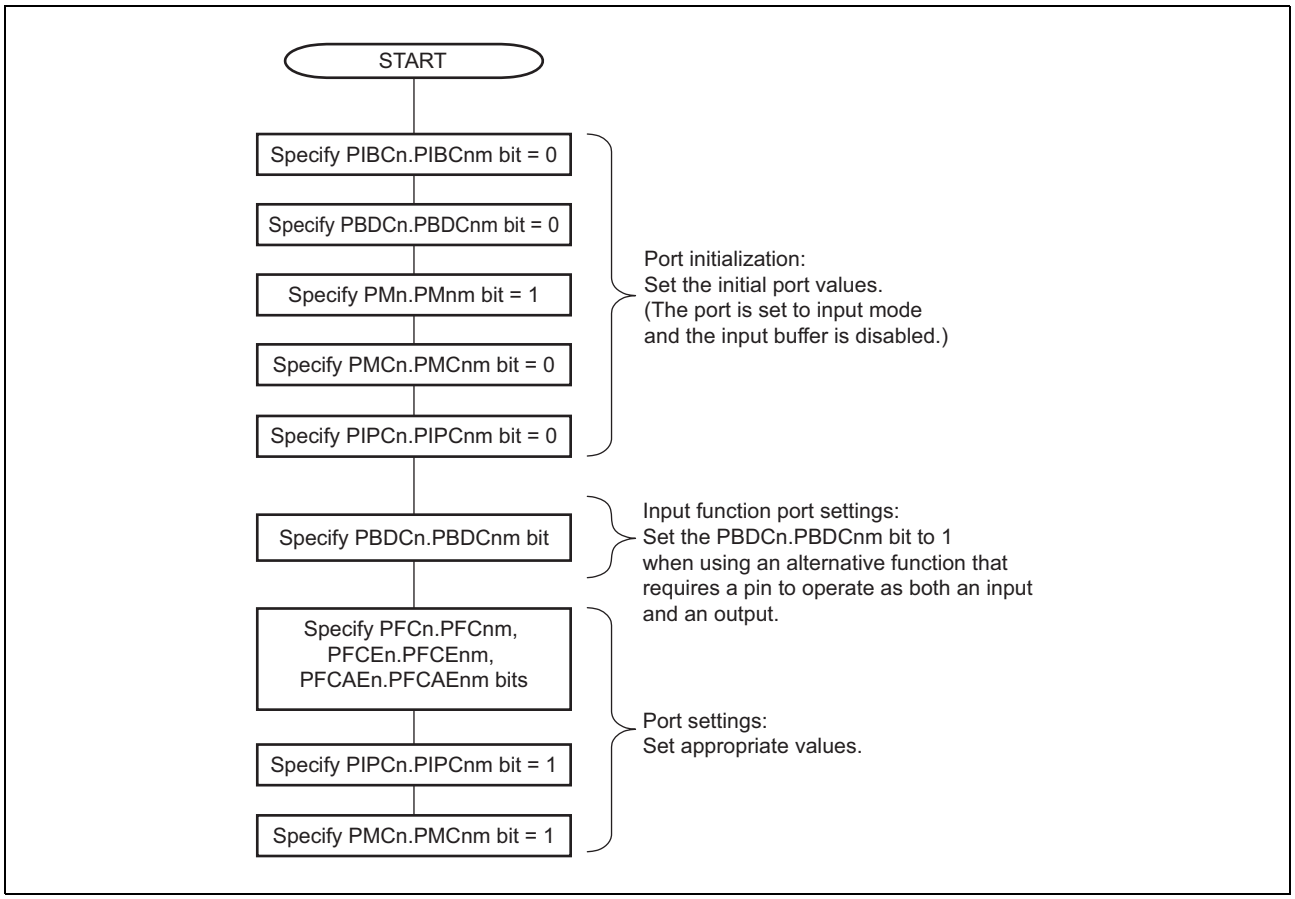

Figure 41.4 Example Flow of Port Settings (in Direct I/O Control Alternative Mode) (c)

42. Power-Down Modes

This LSI supports sleep mode, software standby mode, deep standby mode, and module standby mode. In power-down modes, functions of CPU, clocks, on-chip memory, or part of on-chip peripheral modules are halted or the power-supply is turned off, through which low power consumption is achieved. These modes are canceled by a reset or interrupt.

42.1 Features

42.1.1 States of Processing and Power-Down Modes

(1) States of processing

This LSI has three general states of processing: the reset state, the program execution state, and the power-down modes. Figure 42.1 shows transitions between these states.

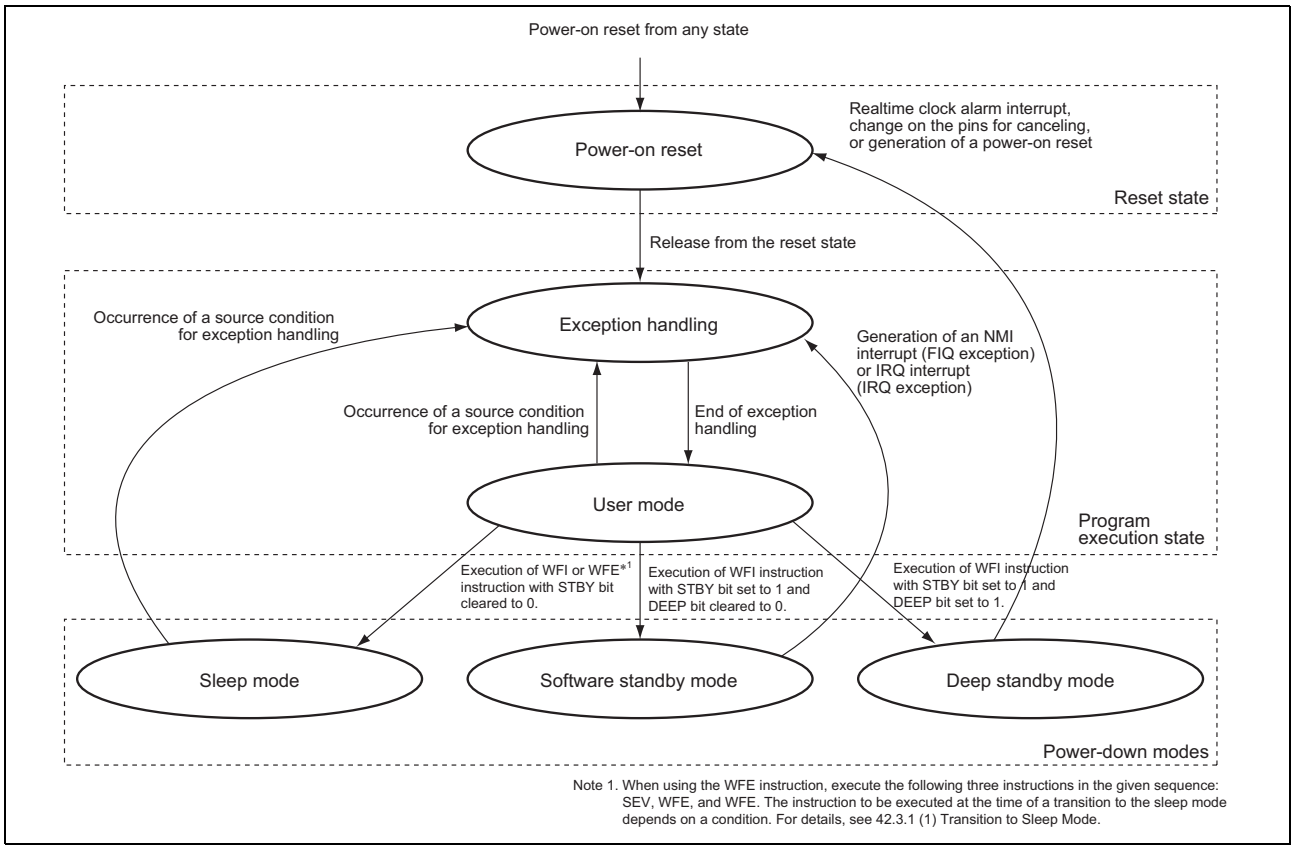

Figure 42.1 Transitions between Processing States

(2) Power-down modes

This LSI has the following power-down modes and function:

1. Sleep mode
2. Software standby mode
3. Deep standby mode
4. Module standby function

Table 42.1 shows the transition conditions for entering the modes from the program execution state, as well as the CPU and peripheral module states in each mode and the procedures for canceling each mode.

Table 42.1 States of Power-Down Modes

Power-Down Mode	Transition Conditions	State: CPU, CPU Register, Primary Cache, TLB	State: Secondary Cache	State: Large-Capacity On-Chip RAM (including on-chip data-retention RAM)	State: On-Chip Peripheral Modules	State: Realtime Clock	State: Internal Power Supply	State: External Memory	Canceling Procedure
Sleep mode	Execute WFI or WFE*6 instruction with STBY bit in STBCR1 cleared to 0	Halted Contents are held.*4	Running	Running	Running	Running*1	Applied	Auto-refresh	• Interrupt • Power-on reset
Software standby mode	Execute WFI instruction with STBY and DEEP bits in STBCR1 set to 1 and 0, respectively	Halted Contents are held.*4	Halted Contents are held.*4	Halted Contents are held.*5	Halted	Running*1	Applied	Self-refresh	• NMI or IRQ interrupt • Power-on reset
Deep standby mode	Execute WFI instruction with STBY and DEEP bits in STBCR1 set to 1	Halted Contents are not held.	Halted Contents are not held.	Halted Contents in on-chip data-retention RAM are held*2, and the other contents in large-capacity on-chip RAM are not held.	Halted	Running*1	Shut off	Self-refresh	• Power-on reset*3 • Realtime clock alarm interrupt*3 • Change on the pins for canceling*3
Module standby mode	Set the MSTP bits in STBCR2 to STBCR12 to 1	Running	Running	Running	Specified module halted	Halted	Applied	Auto-refresh	• Clear MSTP bit to 0

Note 1. The realtime clock operates when the START bit in the RCR2 register is set to 1. For details, see section 13, Realtime Clock. When deep standby mode is canceled by a power-on reset, the running state cannot be retained. Make the initial setting for the realtime clock again.

Note 2. Setting the bits RRAMKP3 to RRAMKP0 in the RRAMKP register to 1 enables to retain the data in the corresponding area on the on-chip data-retention RAM during the transition to deep standby mode. When the deep standby mode is canceled by a power-on reset, the retained contents are initialized.

Note 3. Deep standby mode can be canceled by a power-on reset, a realtime clock alarm interrupt, or change on the pins for canceling (P2_0, P2_2, P2_7, P2_9, P5_8, P5_9, P5_10, P6_7, P7_2, P7_3, P7_6, P7_9, and NMI). Even when deep standby mode is canceled by a source other than a power-on reset, the reset exception handling is executed instead of the interrupt exception handling.

Note 4. When sleep mode or software standby mode is canceled by a power-on reset, the retained contents are initialized.

Note 5. By setting the VRAME bit in the SYSCR1 register or VRAMWE bit in the SYSCR2 register to enable accesses, the retained contents are initialized when software standby mode is canceled by a power-on reset. By setting the VRAME bit in the SYSCR1 register or VRAMWE bit in the SYSCR2 register to disable accesses, contents in the large-capacity on-chip RAM (including on-chip data-retention RAM) can be retained when software standby mode is canceled by a power-on reset. Note that the area at addresses from H'2002_0000 to H'2002_3FFF is used as working memory for the boot program in boot modes 1 to 3. In boot modes 2 and 3, a 28-Kbyte program is transferred from the external flash memory to the area at addresses from H'2002_4000 to H'2002_AFFF. For details, see section 3, Boot Mode.

Note 6. When using the WFE instruction, execute the following three instructions in the given sequence: SEV, WFE, and WFE. The instruction to be executed at the time of a transition to the sleep mode depends on a condition. For details, see section 42.3.1, (1) Transition to Sleep Mode.

42.2 Register Descriptions

Table 42.2 shows the register configuration.

Table 42.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Standby control register 1	STBCR1	R/W	H'00	H'FCFE0020	8
Standby control register 2	STBCR2	R/W	H'6A	H'FCFE0024	8
Standby control register 3	STBCR3	R/W	H'FD	H'FCFE0420	8
Standby control register 4	STBCR4	R/W	H'FF	H'FCFE0424	8
Standby control register 5	STBCR5	R/W	H'FF	H'FCFE0428	8
Standby control register 6	STBCR6	R/W	H'FE	H'FCFE042C	8
Standby control register 7	STBCR7	R/W	H'3F	H'FCFE0430	8
Standby control register 8	STBCR8	R/W	H'FF	H'FCFE0434	8
Standby control register 9	STBCR9	R/W	H'FF	H'FCFE0438	8
Standby control register 10	STBCR10	R/W	H'FF	H'FCFE043C	8
Standby control register 11	STBCR11	R/W	H'FF	H'FCFE0440	8
Standby control register 12	STBCR12	R/W	H'FF	H'FCFE0444	8
Software reset control register 1	SWRSTCR1	R/W	H'00	H'FCFE0460	8
Software reset control register 2 (RZ/A1LU only)	SWRSTCR2	R/W	H'00	H'FCFE0464	8
System control register 1	SYSCR1	R/W	H'FF	H'FCFE0400	8
System control register 2	SYSCR2	R/W	H'FF	H'FCFE0404	8
System control register 3	SYSCR3	R/W	H'00	H'FCFE0408	8
CPU status register	CPUSTS	R	H'00	H'FCFE0018	8
Standby request register 1	STBREQ1	R/W	H'00	H'FCFE0030	8
Standby request register 2	STBREQ2	R/W	H'00	H'FCFE0034	8
Standby acknowledge register 1	STBACK1	R	H'00	H'FCFE0040	8
Standby acknowledge register 2	STBACK2	R	H'00	H'FCFE0044	8
On-chip data-retention RAM area setting register	RRAMKP	R/W	H'00	H'FCFF1800	8
Deep standby control register	DSCTR	R/W	H'00	H'FCFF1802	8
Deep standby cancel source select register	DSSSR	R/W	H'0000	H'FCFF1804	16
Deep standby cancel edge select register	DSESR	R/W	H'0000	H'FCFF1806	16
Deep standby cancel source flag register	DSFR	R/W	H'0000	H'FCFF1808	16
XTAL crystal oscillator gain control register	XTALCTR	R/W	H'00	H'FCFF1810	8

42.2.1 Standby Control Register 1 (STBCR1)

STBCR1 is an 8-bit readable/writable register that specifies the state of the power-down mode.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	STBY	DEEP	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	STBY	0	R/W	Software Standby, Deep Standby
6	DEEP	0	R/W	Specifies transition to software standby mode or deep standby mode. 0x: Executing WFI or WFE*1 instruction puts chip into sleep mode. 10: Executing WFI instruction puts chip into software standby mode.*2 11: Executing WFI instruction puts chip into deep standby mode.*2 Note 1. When using the WFE instruction, execute the following three instructions in the given sequence: SEV, WFE, and WFE. The instruction to be executed at the time of a transition to the sleep mode depends on a condition. For details, see section 42.3.1, (1) Transition to Sleep Mode. Note 2. Do not execute the WFE instruction while the STBY bit in STBCR1 is 1.
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

[Legend]
x: Don't care

42.2.2 Standby Control Register 2 (STBCR2)

STBCR2 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	HIZ	-	-	-	-	-	-	MSTP20
Initial value:	0	1	1	0	1	0	1	0
R/W:	R/W	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	HIZ	0	R/W	Port High Impedance Selects whether the state of specific output pin is retained or high impedance in software standby mode or deep standby mode. As to which pins are controlled, see section 48.1, Pin States in section 48, States and Handling of Pins. 0: The pin state is retained in software standby mode or deep standby mode. 1: The pin is set to high-impedance in software standby mode or deep standby mode.
6, 5	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
4	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
3	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
2	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
1	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
0	MSTP20	0	R/W	Module Stop 20*1 [not for disclosure] When the MSTP20 bit is set to 1, the clock supply to CoreSight is halted. 0: CoreSight runs. 1: Clock supply to CoreSight is halted.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 42.3.5, Module Standby Function.

42.2.3 Standby Control Register 3 (STBCR3)

STBCR3 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP 37*1	MSTP 36	MSTP 35*1	—	MSTP 33	MSTP 32	MSTP 31	—
Initial value:	1	1	1	1	1	1	0	1
R/W:	R/W	R/W	R/W	R	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP37*1	1	R/W	Module Stop 37 When the MSTP37 bit is set to 1, the clock supply to the IEBus™ controller is halted. 0: The IEBus™ controller runs. 1: Clock supply to the IEBus™ controller is halted.
6	MSTP36	1	R/W	Module Stop 36 When the MSTP36 bit is set to 1, the clock supply to serial communication interface (IrDA) is halted. 0: Serial communication interface (IrDA) runs. 1: Clock supply to serial communication interface (IrDA) is halted.
5	MSTP35*1	1	R/W	Module Stop 35 When the MSTP35 bit is set to 1, the clock supply to the LIN interface channel 0 is halted. 0: The LIN interface channel 0 runs. 1: Clock supply to the LIN interface channel 0 is halted.
4	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
3	MSTP33	1	R/W	Module Stop 33 When the MSTP33 bit is set to 1, the clock supply to the multi-function timer pulse unit 2 is halted. 0: The multi-function timer pulse unit 2 runs. 1: Clock supply to the multi-function timer pulse unit 2 is halted.
2	MSTP32	1	R/W	Module Stop 32 When the MSTP32 bit is set to 1, the clock supply to the CAN interface is halted. 0: The CAN interface runs. 1: Clock supply to the CAN interface is halted.
1	MSTP31	0	R/W	Module Stop 31 When the MSTP31 bit is set to 1, the clock supply to the A/D converter is halted and the analog power supply to the A/D converter is shut off. 0: Clock signal and analog voltage are supplied to the A/D converter. 1: Supply of clock signal and analog voltage to the A/D converter is shut off.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

Note 1. This bit is only present in the RZ/A1L. For the RZ/A1LU and RZ/A1LC, the write value should always be 1.

42.2.4 Standby Control Register 4 (STBCR4)

STBCR4 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP47	MSTP46	MSTP45	MSTP44	MSTP43	—	—	—
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP47	1	R/W	Module Stop 47 When the MSTP47 bit is set to 1, the clock supply to channel 0 of the serial communication interface with FIFO is halted. 0: Channel 0 of the serial communication interface with FIFO runs. 1: Clock supply to channel 0 of the serial communication interface with FIFO is halted.
6	MSTP46	1	R/W	Module Stop 46 When the MSTP46 bit is set to 1, the clock supply to channel 1 of the serial communication interface with FIFO is halted. 0: Channel 1 of the serial communication interface with FIFO runs. 1: Clock supply to channel 1 of the serial communication interface with FIFO is halted.
5	MSTP45	1	R/W	Module Stop 45 When the MSTP45 bit is set to 1, the clock supply to channel 2 of the serial communication interface with FIFO is halted. 0: Channel 2 of the serial communication interface with FIFO runs. 1: Clock supply to channel 2 of the serial communication interface with FIFO is halted.
4	MSTP44	1	R/W	Module Stop 44 When the MSTP44 bit is set to 1, the clock supply to channel 3 of the serial communication interface with FIFO is halted. 0: Channel 3 of the serial communication interface with FIFO runs. 1: Clock supply to channel 3 of the serial communication interface with FIFO is halted.
3	MSTP43	1	R/W	Module Stop 43 When the MSTP43 bit is set to 1, the clock supply to channel 4 of the serial communication interface with FIFO is halted. 0: Channel 4 of the serial communication interface with FIFO runs. 1: Clock supply to channel 4 of the serial communication interface with FIFO is halted.
2 to 0	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.

42.2.5 Standby Control Register 5 (STBCR5)

STBCR5 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP57	MSTP56	—	—	—	—	MSTP51	MSTP50
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP57	1	R/W	Module Stop 57 When the MSTP57 bit is set to 1, the clock supply to channel 0 of the serial communication interface (SCI) is halted. 0: Channel 0 of the serial communication interface (SCI) runs. 1: Clock supply to channel 0 of the serial communication interface (SCI) is halted.
6	MSTP56	1	R/W	Module Stop 56 When the MSTP56 bit is set to 1, the clock supply to channel 1 of the serial communication interface (SCI) is halted. 0: Channel 1 of the serial communication interface (SCI) runs. 1: Clock supply to channel 1 of the serial communication interface (SCI) is halted.
5 to 2	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
1	MSTP51	1	R/W	Module Stop 51 When the MSTP51 bit is set to 1, the clock supply to channel 0 of the OS timer is halted. 0: Channel 0 of the OS timer runs. 1: Clock supply to channel 0 of the OS timer is halted.
0	MSTP50	1	R/W	Module Stop 50 When the MSTP50 bit is set to 1, the clock supply to channel 1 of the OS timer is halted. 0: Channel 1 of the OS timer runs. 1: Clock supply to channel 1 of the OS timer is halted.

42.2.6 Standby Control Register 6 (STBCR6)

STBCR6 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP67	MSTP66	—	—	—	—	MSTP61*2	MSTP60
Initial value:	1	1	1	1	1	1	1	0
R/W:	R/W	R/W	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP67	1	R/W	Module Stop 67 When the MSTP67 bit is set to 1, the clock supply to the A/D converter is halted. 0: The A/D converter runs. 1: Clock supply to channel 0 of the A/D converter is halted.
6	MSTP66	1	R/W	Module Stop 66*1 When the MSTP66 bit is set to 1, the clock supply to the capture engine unit is halted. 0: The capture engine unit runs. 1: Clock supply to the capture engine unit is halted.
5 to 2	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
1	MSTP61*2	1	R/W	Module Stop 61*1 When the MSTP61 bit is set to 1, the clock supply to the JPEG codec unit is halted. 0: The JPEG codec unit runs. 1: Clock supply to the JPEG codec unit is halted.
0	MSTP60	0	R/W	Module Stop 60 When the MSTP60 bit is set to 1, the clock supply to the realtime clock is halted. 0: The realtime clock runs. 1: Clock supply to the realtime clock is halted. Note: When the realtime clock is halted, set the bits in registers shown below. • Set bit RTCEN in the control register 2 (RCR2) to 0. • Set bits RCKSEL[1:0] in the control register 5 (RCR5) to 00. After the settings above, set bit MSTP60 to 1.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 42.3.5, Module Standby Function.

Note 2. This bit is only present in the RZ/A1LU. For the RZ/A1L and RZ/A1LC, the write value should always be 1.

42.2.7 Standby Control Register 7 (STBCR7)

STBCR7 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	MSTP 74	—	—	MSTP 71	MSTP 70
Initial value:	0	0	1	1	1	1	1	1
R/W:	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
4	MSTP74	1	R/W	Module Stop 74*1 When the MSTP74 bit is set to 1, the clock supply to the Ethernet controller is halted. 0: The Ethernet controller runs. 1: Clock supply to the Ethernet controller is halted.
3, 2	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
1	MSTP71	1	R/W	Module Stop 71 When the MSTP71 bit is set to 1, the clock supply to channel 0 of the USB 2.0 host/function module is halted. 0: Channel 0 of the USB 2.0 host/function module runs. 1: Clock supply to channel 0 of the USB 2.0 host/function module is halted.
0	MSTP70	1	R/W	Module Stop 70 When the MSTP70 bit is set to 1, the clock supply to channel 1 of the USB 2.0 host/function module is halted. 0: Channel 1 of the USB 2.0 host/function module runs. 1: Clock supply to channel 1 of the USB 2.0 host/function module is halted.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 42.3.5, Module Standby Function.

42.2.8 Standby Control Register 8 (STBCR8)

STBCR8 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	MSTP84	MSTP83*2	MSTP82*3	MSTP81	—
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R	R/W	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
4	MSTP84	1	R/W	Module Stop 84 When the MSTP84 bit is set to 1, the clock supply to the MMC host interface is halted. 0: The MMC host interface runs. 1: Clock supply to the MMC host interface is halted.
3	MSTP83*2	1	R/W	Module Stop 83*1 When the MSTP83 bit is set to 1, the clock supply to the media local bus is halted. 0: The media local bus runs. 1: Clock supply to the media local bus is halted.
2	MSTP82*3	1	R/W	Module Stop 82*1 When the MSTP82 bit is set to 1, the clock supply to the EthernetAVB is halted. 0: The EthernetAVB runs. 1: Clock supply to the EthernetAVB is halted.
1	MSTP81	1	R/W	Module Stop 81 When the MSTP81 bit is set to 1, the clock supply to SCUX is halted. 0: SCUX runs. 1: Clock supply to SCUX is halted.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 42.3.5, Module Standby Function.
Note 2. This bit is only present in the RZ/A1L. For the RZ/A1LU and RZ/A1LC, the write value should always be 1.
Note 3. This bit is only present in the RZ/A1LU. For the RZ/A1L and RZ/A1LC, the write value should always be 1.

42.2.9 Standby Control Register 9 (STBCR9)

STBCR9 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP97	MSTP96	MSTP95	MSTP94	MSTP93	—	MSTP91	—
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP97	1	R/W	Module Stop 97 When the MSTP97 bit is set to 1, the clock supply to channel 0 of the I²C bus interface is halted. 0: Channel 0 of the I²C bus interface runs. 1: Clock supply to channel 0 of the I²C bus interface is halted.
6	MSTP96	1	R/W	Module Stop 96 When the MSTP96 bit is set to 1, the clock supply to channel 1 of the I²C bus interface is halted. 0: Channel 1 of the I²C bus interface runs. 1: Clock supply to channel 1 of the I²C bus interface is halted.
5	MSTP95	1	R/W	Module Stop 95 When the MSTP95 bit is set to 1, the clock supply to channel 2 of the I²C bus interface is halted. 0: Channel 2 of the I²C bus interface runs. 1: Clock supply to channel 2 of the I²C bus interface is halted.
4	MSTP94	1	R/W	Module Stop 94 When the MSTP94 bit is set to 1, the clock supply to channel 3 of the I²C bus interface is halted. 0: Channel 3 of the I²C bus interface runs. 1: Clock supply to channel 3 of the I²C bus interface is halted.
3	MSTP93	1	R/W	Module Stop 93 When the MSTP93 bit is set to 1, the clock supply to channel 0 of the SPI multi I/O bus controller is halted. 0: Channel 0 of the SPI multi I/O bus controller runs. 1: Clock supply to channel 0 of the SPI multi I/O bus controller is halted.
2	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
1	MSTP91	1	R/W	Module Stop 91*1 When the MSTP91 bit is set to 1, the clock supply to the video display controller 5 is halted. 0: The video display controller 5 runs. 1: Clock supply to the video display controller 5 is halted.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

Note 1. The transition to and release from module stop mode proceed in the steps described in section 42.3.5, Module Standby Function.

42.2.10 Standby Control Register 10 (STBCR10)

STBCR10 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP 107	MSTP 106	MSTP 105	—	—	MSTP 102*1	MSTP 101	—
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R	R	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP107	1	R/W	Module Stop 107 When the MSTP107 bit is set to 1, the clock supply to channel 0 of the Renesas serial peripheral interface is halted. 0: Channel 0 of the Renesas serial peripheral interface runs. 1: Clock supply to channel 0 of the Renesas serial peripheral interface is halted.
6	MSTP106	1	R/W	Module Stop 106 When the MSTP106 bit is set to 1, the clock supply to channel 1 of the Renesas serial peripheral interface is halted. 0: Channel 1 of the Renesas serial peripheral interface runs. 1: Clock supply to channel 1 of the Renesas serial peripheral interface is halted.
5	MSTP105	1	R/W	Module Stop 105 When the MSTP105 bit is set to 1, the clock supply to channel 2 of the Renesas serial peripheral interface is halted. 0: Channel 2 of the Renesas serial peripheral interface runs. 1: Clock supply to channel 2 of the Renesas serial peripheral interface is halted.
4, 3	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
2	MSTP102*1	1	R/W	Module Stop 102 When the MSTP102 bit is set to 1, the clock supply to the CD-ROM decoder is halted. 0: The CD-ROM decoder runs. 1: Clock supply to the CD-ROM decoder is halted.
1	MSTP101	1	R/W	Module Stop 101 When the MSTP101 bit is set to 1, the clock supply to the Renesas SPDIF interface is halted. 0: The Renesas SPDIF interface runs. 1: Clock supply to the Renesas SPDIF interface is halted.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

Note 1. This bit is only present in the RZ/A1L. For the RZ/A1LU and RZ/A1LC, the write value should always be 1.

42.2.11 Standby Control Register 11 (STBCR11)

STBCR11 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	MSTP115	MSTP114	MSTP113	MSTP112	—	—
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
5	MSTP115	1	R/W	Module Stop 115 When the MSTP115 bit is set to 1, the clock supply to channel 0 of the serial sound interface is halted. 0: Channel 0 of the serial sound interface runs. 1: Clock supply to channel 0 of the serial sound interface is halted.
4	MSTP114	1	R/W	Module Stop 114 When the MSTP114 bit is set to 1, the clock supply to channel 1 of the serial sound interface is halted. 0: Channel 1 of the serial sound interface runs. 1: Clock supply to channel 1 of the serial sound interface is halted.
3	MSTP113	1	R/W	Module Stop 113 When the MSTP113 bit is set to 1, the clock supply to channel 2 of the serial sound interface is halted. 0: Channel 2 of the serial sound interface runs. 1: Clock supply to channel 2 of the serial sound interface is halted.
2	MSTP112	1	R/W	Module Stop 112 When the MSTP112 bit is set to 1, the clock supply to channel 3 of the serial sound interface is halted. 0: Channel 3 of the serial sound interface runs. 1: Clock supply to channel 3 of the serial sound interface is halted.
1, 0	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.

42.2.12 Standby Control Register 12 (STBCR12)

STBCR12 is an 8-bit readable/writable register that controls the operation of each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	MSTP123	MSTP122	MSTP121	MSTP120
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
3	MSTP123	1	R/W	Module Stop 123 When the MSTP123 bit is set to 1, the SD host interface 00 is halted. 0: The SD host interface 00 runs. 1: Clock supply to the SD host interface 00 is halted.
2	MSTP122	1	R/W	Module Stop 122 When the MSTP122 bit is set to 1, the SD host interface 01 is halted. 0: The SD host interface 01 runs. 1: Clock supply to the SD host interface 01 is halted.
1	MSTP121	1	R/W	Module Stop 121 When the MSTP121 bit is set to 1, the SD host interface 10 is halted. 0: The SD host interface 10 runs. 1: Clock supply to the SD host interface 10 is halted.
0	MSTP120	1	R/W	Module Stop 120 When the MSTP120 bit is set to 1, the SD host interface 11 is halted. 0: The SD host interface 11 runs. 1: Clock supply to the SD host interface 11 is halted.

Note: For details on this register, see section 38.3.2, Card Detect/Write Protect.

42.2.13 Software Reset Control Register 1 (SWRSTCR1)

SWRSTCR1 is an 8-bit readable/writable register that controls a software reset for the serial sound interface and the operation of the crystal resonator for audio.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	AXT ALE	SRST 16	SRST 15	SRST 14	SRST 13	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	AXTALE	0	R/W	AUDIO_X1 Clock Control Controls the function of AUDIO_X1 pin. 0: Runs the on-chip crystal oscillator/enables the external clock input. 1: Halts the on-chip crystal oscillator/disables the external clock input.
6	SRST16	0	R/W	Serial Sound Interface Channel 0 Software Reset Controls the serial sound interface channel 0 reset with software. 0: The serial sound interface channel 0 reset is canceled. 1: The serial sound interface channel 0 is reset.
5	SRST15	0	R/W	Serial Sound Interface Channel 1 Software Reset Controls the serial sound interface channel 1 reset with software. 0: The serial sound interface channel 1 reset is canceled. 1: The serial sound interface channel 1 is reset.
4	SRST14	0	R/W	Serial Sound Interface Channel 2 Software Reset Controls the serial sound interface channel 2 reset with software. 0: The serial sound interface channel 2 reset is canceled. 1: The serial sound interface channel 2 is reset.
3	SRST13	0	R/W	Serial Sound Interface Channel 3 Software Reset Controls the serial sound interface channel 3 reset with software. 0: The serial sound interface channel 3 reset is canceled. 1: The serial sound interface channel 3 is reset.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

42.2.14 Software Reset Control Register 2 (SWRSTCR2)

This register is only provided in the RZ/A1LU.

SWRSTCR2 is an 8-bit readable/writable register that controls a software reset for each module.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	SRST21	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	SRST21	0	R/W	JPEG Codec Unit Software Reset Controls the JPEG codec unit reset with software. 0: The JPEG codec unit reset is canceled. 1: The JPEG codec unit is reset.
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

42.2.15 System Control Register 1 (SYSCR1)

SYSCR1 is an 8-bit readable/writable register that enables or disables access (read and write) to a specified page in the large-capacity on-chip RAM.

When a VRAMEn (n = 0 to 4) bit in SYSCR1 is set to 1, access to page n is enabled. When a VRAMEn bit is cleared to 0, page n cannot be accessed. In this case, an undefined value is returned when reading data or fetching an instruction from page n, and writing to page n is ignored. The initial value of a VRAMEn bit is 1.

SYSCR1 should be set with a program located in an area other than the large-capacity on-chip RAM. Furthermore, an instruction to read SYSCR1 should be located immediately after the instruction to write to SYSCR1. If not, normal access is not guaranteed.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	VRAME 4	VRAME 3	VRAME 2	VRAME 1	VRAME 0
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
4	VRAME4	1	R/W	RAM Enable 4 (corresponding area: page 4*1 in large-capacity on-chip RAM) 0: Access to page 4 is disabled. 1: Access to page 4 is enabled.
3	VRAME3	1	R/W	RAM Enable 3 (corresponding area: page 3*1 in large-capacity on-chip RAM) 0: Access to page 3 is disabled. 1: Access to page 3 is enabled.
2	VRAME2	1	R/W	RAM Enable 2 (corresponding area: page 2*1 in large-capacity on-chip RAM) 0: Access to page 2 is disabled. 1: Access to page 2 is enabled.
1	VRAME1	1	R/W	RAM Enable 1 (corresponding area: page 1*1 in large-capacity on-chip RAM) 0: Access to page 1 is disabled. 1: Access to page 1 is enabled.
0	VRAME0	1	R/W	RAM Enable 0 (corresponding area: page 0*1 in large-capacity on-chip RAM) 0: Access to page 0 is disabled. 1: Access to page 0 is enabled.

Note 1. For addresses in each page, see section 40, On-Chip RAM.

42.2.16 System Control Register 2 (SYSCR2)

SYSCR2 is an 8-bit readable/writable register that enables or disables writing to a specified page in the large-capacity on-chip RAM.

When a VRAMWEn (n = 0 to 4) bit in SYSCR2 is set to 1, writing to page n is enabled. When a VRAMWEn bit is cleared to 0, writing to page n is ignored. The initial value of a VRAMWEn bit is 1.

SYSCR2 should be set with a program located in an area other than the large-capacity on-chip RAM. Furthermore, an instruction to read SYSCR2 should be located immediately after the instruction to write to SYSCR2. If not, normal access is not guaranteed.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	VRAM WE4	VRAM WE3	VRAM WE2	VRAM WE1	VRAM WE0
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
4	VRAMWE4	1	R/W	RAM Write Enable 4 (corresponding area: page 4*1 in large-capacity on-chip RAM) 0: Writing to page 4 is disabled. 1: Writing to page 4 is enabled.
3	VRAMWE3	1	R/W	RAM Write Enable 3 (corresponding area: page 3*1 in large-capacity on-chip RAM) 0: Writing to page 3 is disabled. 1: Writing to page 3 is enabled.
2	VRAMWE2	1	R/W	RAM Write Enable 2 (corresponding area: page 2*1 in large-capacity on-chip RAM) 0: Writing to page 2 is disabled. 1: Writing to page 2 is enabled.
1	VRAMWE1	1	R/W	RAM Write Enable 1 (corresponding area: page 1*1 in large-capacity on-chip RAM) 0: Writing to page 1 is disabled. 1: Writing to page 1 is enabled.
0	VRAMWE0	1	R/W	RAM Write Enable 0 (corresponding area: page 0*1 in large-capacity on-chip RAM) 0: Writing to page 0 is disabled. 1: Writing to page 0 is enabled.

Note 1. For addresses in each page, see section 40, On-Chip RAM.

42.2.17 System Control Register 3 (SYSCR3)

SYSCR3 is an 8-bit readable/writable register that enables or disables writing to a specified page in the on-chip data-retention RAM.

When a RRAMWEn (n = 0 to 3) bit in SYSCR3 is set to 1, writing to page n is enabled. When a RRAMWEn bit is cleared to 0, writing to page n is ignored. The initial value of a RRAMWEn bit is 0.

SYSCR3 should be set with a program located in an area other than the on-chip data-retention RAM.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	RRAMWE3	RRAMWE2	RRAMWE1	RRAMWE0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	RRAMWE3	0	R/W	RAM Write Enable 3 (corresponding area: page 3*2 in on-chip data-retention RAM) 0: Writing to page 3 is disabled. 1: Writing to page 3 is enabled.
2	RRAMWE2	0	R/W	RAM Write Enable 2 (corresponding area: page 2*2 in on-chip data-retention RAM) 0: Writing to page 2 is disabled. 1: Writing to page 2 is enabled.
1	RRAMWE1	0	R/W	RAM Write Enable 1 (corresponding area: page 1*2 in on-chip data-retention RAM) 0: Writing to page 1 is disabled. 1: Writing to page 1 is enabled.
0	RRAMWE0	0	R/W	RAM Write Enable 0 (corresponding area: page 0*2 in on-chip data-retention RAM) 0: Writing to page 0 is disabled. 1: Writing to page 0 is enabled.

Note 1. For addresses in each page, see section 40, On-Chip RAM.

Note 2. When the VRAME0 bit in SYSCR1 is cleared to 0 (access to page 0 in large-capacity on-chip RAM is invalid), the on-chip data-retention RAM cannot be accessed (read and written), regardless of the setting of this bit.
When the VRAMWE0 bit in SYSCR2 is cleared to 0 (writing to page 0 in large-capacity on-chip RAM is invalid), the on-chip data-retention RAM cannot be written, regardless of the setting of this bit.

42.2.18 CPU Status Register (CPUSTS)

CPUSTS is an 8-bit readable register that indicates the status of the CPU.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	ISBUSY	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 0	R	Reserved These bits are always read as 0.
4	ISBUSY	0	R	State during Changing of the Frequency of CPU and Return from Software Standby Indicates that the frequency of CPU is being changed or that return from software standby is in progress. Do not execute a WFI instruction while this bit is 1. 0: The frequency of CPU is not being changed and returning from software standby is not in progress 1: The frequency of CPU is being changed or return from software standby is in progress
3 to 0	—	All 0	R	Reserved These bits are always read as 0.

42.2.19 Standby Request Register 1 (STBREQ1)

This register is used to request notification of whether a CPU or peripheral module is ready for standby. The CPU or peripheral module returns a standby acknowledgement on receipt of a request for notification if it is ready for standby.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	STBRQ 15	—	STBRQ 13*2	STBRQ 12*2	—	STBRQ 10
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R	R/W	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	STBRQ15	0	R/W	Standby Request to CoreSight 0: The standby request to CoreSight is invalid. 1: The standby request to CoreSight is valid.*1
4	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
3	STBRQ13*2	0	R/W	Standby Request to JPEG Codec Unit 0: The standby request to the JPEG codec unit is invalid. 1: The standby request to the JPEG codec unit is valid.*1
2	STBRQ12*2	0	R/W	Standby Request to EthernetAVB 0: The standby request to the EthernetAVB is invalid. 1: The standby request to the EthernetAVB is valid.*1
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
0	STBRQ10	0	R/W	Standby Request to Capture Engine Unit 0: The standby request to the capture engine unit is invalid. 1: The standby request to the capture engine unit is valid.*1

Note 1. When the MSTP bit for the corresponding module is 1, writing 1 to the STBRQ bit has no effect.
Note 2. This bit is only present in the RZ/A1LU. For the RZ/A1L and RZ/A1LC, the write value should always be 0.

42.2.20 Standby Request Register 2 (STBREQ2)

This register is used to request notification of whether a peripheral module is ready for standby. The peripheral module returns a standby acknowledgement on receipt of a request for notification if it is ready for standby.

Note: • When writing to this register, see section 42.4, Usage Notes.

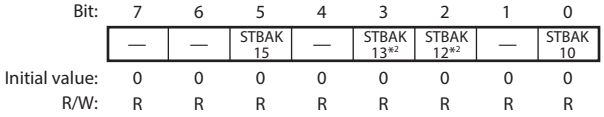
Bit:	7	6	5	4	3	2	1	0
	STBRQ 27*2	STBRQ 26	STBRQ 25	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	STBRQ27*2	0	R/W	Standby Request to the media local bus 0: The standby request to the media local bus is invalid. 1: The standby request to the media local bus is valid.*1
6	STBRQ26	0	R/W	Standby Request to Ethernet Controller 0: The standby request to the Ethernet controller is invalid. 1: The standby request to the Ethernet controller is valid.*1
5	STBRQ25	0	R	Standby Request to Video Display Controller 5 0: The standby request to the video display controller 5 is invalid. 1: The standby request to of the video display controller 5 is valid.*1
4 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note 1. When the MSTP bit for the corresponding module is 1, writing 1 to the STBRQ bit has no effect.
Note 2. This bit is only present in the RZ/A1L. For the RZ/A1LU and RZ/A1LC, the write value should always be 0.

42.2.21 Standby Acknowledge Register 1 (STBACK1)

This register is used to provide notification that a CPU or peripheral module is in the standby ready state. The CPU or peripheral module returns a standby acknowledgement on reception of a standby notification request if it is ready for standby. This register is a read-only register.



Bit:	7	6	5	4	3	2	1	0
	—	—	STBAK 15	—	STBAK 13*2	STBAK 12*2	—	STBAK 10
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0.
5	STBAK15	0	R	Standby Acknowledgement from CoreSight 0: The standby acknowledgement from CoreSight is invalid. 1: The standby acknowledgement from CoreSight is valid.*1
4	—	0	R	Reserved This bit is always read as 0.
3	STBAK13*2	0	R	Standby Acknowledgement from JPEG Codec Unit 0: The standby acknowledgement from the JPEG codec unit is invalid. 1: The standby acknowledgement from the JPEG codec unit is valid.*1
2	STBAK12*2	0	R	Standby Acknowledgement from EthernetAVB 0: The standby acknowledgement from the EthernetAVB is invalid. 1: The standby acknowledgement from the EthernetAVB is valid.*1
1	—	0	R	Reserved This bit is always read as 0.
0	STBAK10	0	R	Standby Acknowledgement from Capture Engine Unit 0: The standby acknowledgement from the capture engine unit is invalid. 1: The standby acknowledgement from the capture engine unit is valid.*1

Note 1. The bits in STBACK1 are set to 1 when a standby acknowledgement is transmitted from the module while the MSTP bit for the corresponding module is set to 0.
Note 2. This bit is only present in the RZ/A1LU.

42.2.22 Standby Acknowledge Register 2 (STBACK2)

This register is used to provide notification that a peripheral module is in the standby ready state. The peripheral module returns a standby acknowledgement on reception of a standby notification request if it is ready for standby. This register is a read-only register.

Bit:	7	6	5	4	3	2	1	0
	STBAK 27*2	STBAK 26	STBAK 25	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	STBAK27*2	0	R	Standby Acknowledgement from the media local bus 0: The standby acknowledgement from the media local bus is invalid. 1: The standby acknowledgement from the media local bus is valid.*1
6	STBAK26	0	R	Standby Acknowledgement from Ethernet Controller 0: The standby acknowledgement from the Ethernet controller is invalid. 1: The standby acknowledgement from the Ethernet controller is valid.*1
5	STBAK25	0	R	Standby Acknowledgement from Video Display Controller 5 0: The standby acknowledgement from the video display controller 5 is invalid. 1: The standby acknowledgement from the video display controller 5 is valid.*1
4 to 0	—	All 0	R	Reserved These bits are always read as 0.

Note 1. The bits in STBACK2 are set to 1 when a standby acknowledgement is transmitted from the module while the MSTP bit for the corresponding module is set to 0.
Note 2. This bit is only present in the RZ/A1L.

42.2.23 On-Chip Data-Retention RAM Area Setting Register (RRAMKP)

RRAMKP is an 8-bit readable/writable register that selects whether the contents of the corresponding area of the on-chip data-retention RAM are retained or not in deep standby mode.

When the RRAMKP3 to RRAMKP0 bits are set to 1, the contents of the corresponding area of the on-chip data-retention RAM are retained in deep standby mode. When these bits are cleared to 0, the contents of the corresponding area of the on-chip data-retention RAM are not retained in deep standby mode.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	RRAMKP3	RRAMKP2	RRAMKP1	RRAMKP0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	RRAMKP3	0	R/W	On-Chip Data-Retention RAM Storage Area 3 (corresponding area: page 3*1 in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode.
2	RRAMKP2	0	R/W	On-Chip Data-Retention RAM Storage Area 2 (corresponding area: page 2*1 in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode.
1	RRAMKP1	0	R/W	On-Chip Data-Retention RAM Storage Area 1 (corresponding area: page 1*1 in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode.
0	RRAMKP0	0	R/W	On-Chip Data-Retention RAM Storage Area 0 (corresponding area: page 0*1 in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode.

Note 1. For addresses in each page, see section 40, On-Chip RAM.

42.2.24 Deep Standby Control Register (DSCTR)

DSCTR is an 8-bit readable/writable register that selects whether the states of the external memory control pins are retained or not when returning from deep standby mode and specifies the method to start the LSI.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	EBUS KEEPE	RAM BOOT	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	EBUSKEEPE	0	R/W	Retention of External Memory Control Pin State 0: The state of the external memory control pins is not retained when returning from deep standby mode. 1: The state of the external memory control pins is retained when returning from deep standby mode. Note: The following setting is prohibited: (EBUSKEEPE, RAMBOOT) = (1, 0).
6	RAMBOOT	0	R/W	Selection of Method after Returning from Deep Standby Mode Selects an activation method after returning from deep standby mode. 0: Activated according to the boot mode specified for a reset. 1: The program is read from the on-chip data-retention RAM. Instruction fetch from H'20000000 Note: The following setting is prohibited: (EBUSKEEPE, RAMBOOT) = (1, 0).
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

42.2.25 Deep Standby Cancel Source Select Register (DSSSR)

DSSSR is a 16-bit readable/writable register that consists of the bits for selecting a source to cancel deep standby mode. The realtime clock alarm interrupt or change on the pins for canceling (P2_0, P2_2, P2_7, P2_9, P5_8, P5_9, P5_10, P6_7, P7_2, P7_3, P7_6, P7_9, NMI) can be selected as a cancel source. The pins for canceling can be used for canceling deep standby, regardless of pin function settings in the general I/O port.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	P2_0	P7_6	P7_9	P5_10	P2_2	P7_2	NMI	—	RTCAR	P5_9	P7_3	P5_8	P2_7	P2_9	P6_7
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

42.2.26 Deep Standby Cancel Edge Select Register (DSESR)

DSESR is a 16-bit readable/writable register that consists of the bits for selecting an edge to be detected for the pin specified as a deep standby cancel source with DSSSR. This register setting is always valid for canceling deep standby, regardless of the interrupt controller setting.

Note: • When writing to this register, see section 42.4, Usage Notes.

42.2.27 Deep Standby Cancel Source Flag Register (DSFR)

DSFR is a 16-bit readable/writable register composed of two types of bits. One is the flag that confirms which source canceled deep standby mode. The other is the bit that releases the state of pins after canceling deep standby mode. When deep standby mode is canceled by an interrupt (NMI or realtime clock alarm interrupt) and changes on the pins for canceling, this register retains the previous data although power-on reset exception handling is executed. When deep standby mode is canceled by a power-on reset, this register is initialized to H'0000.
All flags must be cleared immediately before transition to deep standby mode.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

0	P6_7F	0	R/(W)*1	P6_7 Flag 0: No change on the P6_7 pin 1: Change on the P6_7 pin

Note 1. Only 0 can be written after reading 1 to clear the flag.

42.2.28 XTAL Crystal Oscillator Gain Control Register (XTALCTR)

XTALCTR is an 8-bit readable/writable register that controls the gain of the crystal oscillator for XTAL.
If the realtime clock uses the EXTAL input, the GAIN0 bit retains the previous value when software standby mode or deep standby mode is canceled by a source other than a power-on reset. If the realtime clock does not use the EXTAL input, this bit is initialized to 0 when software standby or deep standby mode is entered.
This register is initialized to H'00 when software standby or deep standby mode is canceled by a power-on reset.

Note: • When writing to this register, see section 42.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0

42.3 Operation

42.3.1 Sleep Mode

(1) Transition to Sleep Mode

When causing the device to make a transition from the program execution state to sleep mode, follow procedure (a) or (b) depending on the condition described following the description of the procedures.

(a) Execute the WFI instruction while the STBY bit in STBCR1 is 0.
(b) While the STBY bit in STBCR1 is 0 and bits I and F in the current program status register (CPSR) corresponding to the interrupt source to trigger release from the sleep mode are 0 (mask disabled), execute the following three instructions in the given sequence: SEV, WFE, and WFE.

When the following condition is met, follow procedure (b) and do not use the WFI instruction other than to initiate a transition to software standby or deep standby.

- Software standby is also being used.
- When software standby is not being used, deep standby is being used, and the procedure (a) in 42.3.4 (1) Transition to Deep Standby Mode is followed to initiate the transition to deep standby.

Although the CPU halts immediately after a transition to the sleep mode, the contents of its internal registers remain unchanged. The on-chip peripheral modules continue to run. The clock output from the CKIO pin is continued.

Note: • When writing to STBCR1 register, see section 42.4, Usage Notes.

(2) Canceling Sleep Mode

Sleep mode is canceled by an interrupt (NMI, IRQ, and on-chip peripheral module) or a power-on reset.

- Canceling by an interrupt
  When an NMI, IRQ, or on-chip peripheral module interrupt occurs, sleep mode is canceled and interrupt exception handling is executed. When the priority level of the generated interrupt is lower than the setting of the interrupt controller execution priority register, or the interrupt by the on-chip peripheral module is disabled on the module side, the interrupt request is not accepted and sleep mode is not canceled. When procedure (a) in 42.3.1 (1) Transition to Sleep Mode is followed and an interrupt request occurs with an interrupt masked by bits 6 (the FIQ mask bit) and 7 (the IRQ mask bit) in the CPSR register in the CPU, sleep mode is canceled but interrupt exception handling is not executed.
- Canceling by a reset
  Sleep mode is canceled by a power-on reset.

42.3.2 Software Standby Mode

(1) Transition to Software Standby Mode

The LSI switches from a program execution state to software standby mode by executing the WFI instruction when the STBY bit and DEEP bit in STBCR1 are 1 and 0 respectively. In software standby mode, not only the CPU but also the clock and on-chip peripheral modules halt. The clock output from the CKIO pin also stops.
The contents of the CPU and cache registers remain unchanged. Some registers of on-chip peripheral modules are, however, initialized. As for the states of on-chip peripheral module registers in software standby mode, see section 46.3, Register States.
The CPU takes one cycle to finish writing to STBCR1, and then executes processing for the next instruction. However, it takes one or more cycles to actually write. Therefore, execute a WFI instruction after reading STBCR1 to have the values written to STBCR1 by the CPU to be definitely reflected in the WFI instruction.
After a WFI instruction is issued, the hardware automatically stops the bus master following the wait for completion of the issuing-finished request from the bus master and the transition to software standby proceeds. Since the transition to software standby is not possible if completion of the issuing-finished request is not possible at this time, do not proceed with access to the registers of modules in the module-standby state and so on. Furthermore, as the issuing of unintended requests by the bus master is inhibited, using software to stop all bus masters in preparation for the procedure for the transition to software standby is also effective.

The procedure for switching to software standby mode is as follows:

1. Set the standby_mode_en bit of the power control register in the PL310 to 1. For the details of this register, see CoreLink Level 2 Cache Controller L2C-310 Technical Reference Manual issued by Arm Ltd.
2. Clear the TME bit in the watchdog timer control/status register (WTCSR) of the watchdog timer to 0 to stop the watchdog timer.
3. Set the CKS[2:0] bits of the WTCSR register and the watchdog timer counter (WTCNT) to appropriate values so that the watchdog timer overflow period will be at least the oscillation settling time on return from standby.
4. After setting the STBY and DEEP bits in STBCR1 to 1 and 0 respectively, read STBCR1. Then, execute a WFI instruction.

(2) Canceling Software Standby Mode

Software standby mode is canceled by interrupts (NMI or IRQ) or a reset (power-on reset). Clock signal starts to be output from the CKIO pin.

- Canceling by an interrupt
  When the falling edge or rising edge of the NMI pin (selected by the NMI edge select bit (NMIE) in the interrupt control register 0 (ICR0) of the interrupt controller) or the falling edge or rising edge of an IRQ pin (IRQ7 to IRQ0) (selected by the IRQn sense select bits (IRQn1S and IRQn0S) in interrupt control register 1 (ICR1) of the interrupt controller) is detected, clock oscillation is started. This clock pulse is supplied only to the oscillation settling counter (watchdog timer) used to count the oscillation settling time.
  After the elapse of the time set in the clock select bits (CKS[2:0]) in the watchdog timer control/status register (WTCSR) of the watchdog timer before the transition to software standby mode, the watchdog timer overflow occurs. Since this overflow indicates that the clock has been stabilized, the clock pulse will be supplied to the entire chip after this overflow. Software standby mode is thus cleared and NMI interrupt exception handling (IRQ interrupt exception handling in case of IRQ) is started. If the priority level of the generated interrupt is lower than the setting of the interrupt controller execution priority register, the interrupt request is not accepted and sleep mode is entered. So, cancel software standby mode by an interrupt whose priority level is higher than the setting of the interrupt controller execution priority register.
  When canceling software standby mode by the NMI interrupt or IRQ interrupt, set the CKS[2:0] bits so that the watchdog timer overflow period will be equal to or longer than the oscillation settling time.
  The clock output phase of the CKIO pin may be unstable immediately after detecting an interrupt and until software standby mode is canceled.
- Canceling by a reset
  When the $\overline{\text{RES}}$ pin is driven low, software standby mode is canceled and the LSI enters the power-on reset state. After that, if the $\overline{\text{RES}}$ pin is driven high, the power-on reset exception handling is started.
  Keep the $\overline{\text{RES}}$ pin low until the clock oscillation settles. The internal clock will continue to be output to the CKIO pin.

(3) Note on Transition to Software Standby Mode

Release from software standby mode is triggered by interrupts (NMI or IRQ) or a power-on reset. If, however, a WFI instruction and an interrupt other than NMI and IRQ are generated at the same time, software standby mode may be canceled due to acceptance of the interrupt.
When initiating a transition to software standby mode, make settings so that interrupts other than NMI and IRQ are not generated before execution of the WFI instruction.

(4) Note on Canceling Software Standby Mode

After software standby mode is canceled, unstable clock pulses are output from the CKIO pin during oscillation settling time. To prevent malfunction due to the unstable pulses, the CKOEN[1:0] bits in FRQCR should be modified.

42.3.3 Software Standby Mode Application Example

This example describes a transition to software standby mode on the falling edge of the NMI signal, and cancellation on the rising edge of the NMI signal. The timing is shown in Figure 42.2.
When the NMI pin is changed from high to low level while the NMI edge select bit (NMIE) in the interrupt control register 0 (ICR0) is set to 0 (falling edge detection), the NMI interrupt is accepted. When the NMIE bit is set to 1 (rising edge detection) by the NMI exception service routine, the STBY and DEEP bits in STBCR1 are set to 1 and 0 respectively, and a WFI instruction is executed, software standby mode is entered. Thereafter, software standby mode is canceled when the NMI pin is changed from low to high level.

Note: • When writing to STBCR1 register, see section 42.4, Usage Notes.

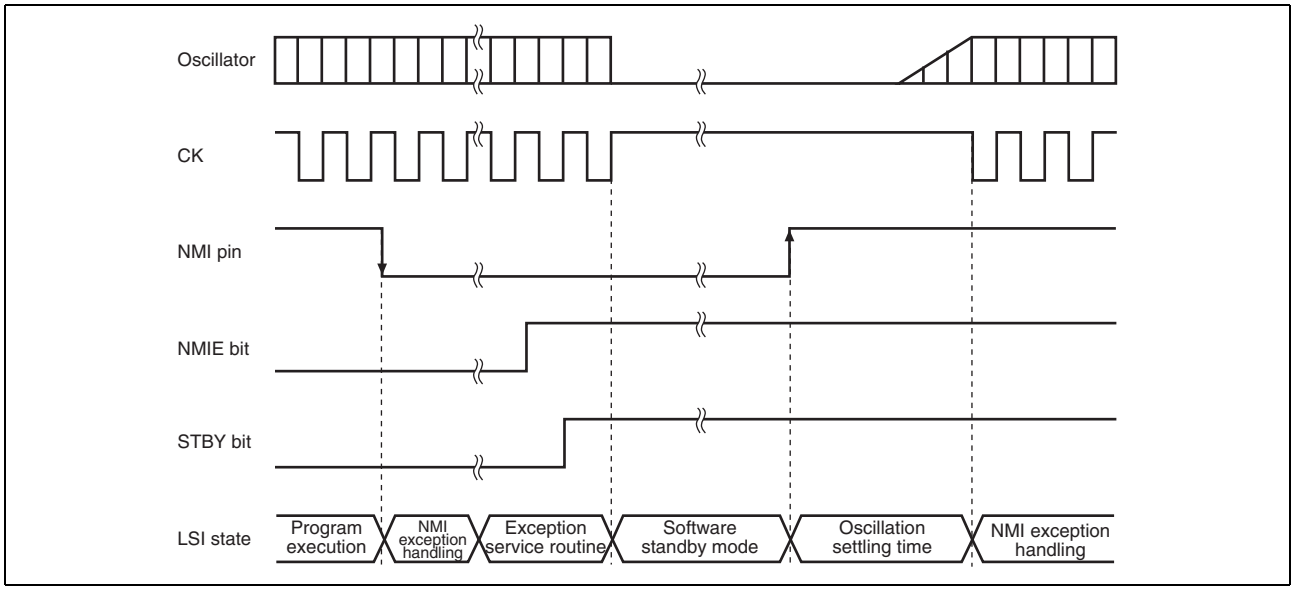

Figure 42.2 NMI Timing in Software Standby Mode (Application Example)

42.3.4 Deep Standby Mode

(1) Transition to Deep Standby Mode

The LSI switches from a program execution state to deep standby mode by executing the WFI instruction when the STBY bit and DEEP bit in STBCR1 are set to 1. In deep standby mode, not only the CPU, clocks, and on-chip peripheral modules but also power supply is turned off excluding the on-chip data-retention RAM area specified by the RRAMKP3 to RRAMKP0 bits in RRAMKP and realtime clock. This can significantly reduce power consumption. Therefore, data in the registers of the CPU, cache, and on-chip peripheral modules are not retained. Pin state values immediately before the transition to deep standby mode are retained.
The CPU takes one cycle to finish writing to STBCR1, and then executes processing for the next instruction. However, it actually takes one or more cycles to write. Therefore, execute a WFI instruction after reading STBCR1 to reflect the values written to STBCR1 by the CPU in the WFI instruction without fail.
After a WFI instruction is issued, the hardware automatically stops the bus master following the wait for completion of the issuing-finished request from the bus master and the transition to deep standby proceeds. Since the transition to deep standby is not possible if completion of the issuing-finished request is not possible at this time, do not proceed with access to the registers of modules in the module-standby state and so on. Furthermore, as the issuing of unintended requests by the bus master is inhibited, using software to stop all bus masters in preparation for the procedure for the transition to deep standby is also effective.

The procedure for switching to deep standby mode is as follows. Figure 42.3 also shows its flowchart.

1. Set the standby_mode_en bit of the power control register in the PL310 to 1. For the details of this register, see CoreLink Level 2 Cache Controller L2C-310 Technical Reference Manual issued by Arm Ltd.
2. Set the RRAMKP3 to RRAMKP0 bits in RRAMKP for the corresponding on-chip data-retention RAM area that must be retained. Transfer the programs to be retained to the specified areas of the on-chip data-retention RAM.
3. Set the RAMBOOT and EBUSKEEPE bits in DSCTR to specify the activation method for returning from deep standby mode and to select whether the external memory control pin status is retained or not.
4. When canceling deep standby mode by an interrupt, set the corresponding bit in DSSSR to select the pin or source to cancel deep standby mode. In this case, specify the input signal detection mode for the selected pin with the corresponding bit in DSESR.
5. Execute read and write of an arbitrary but the same address for each page in the on-chip data-retention RAM area. When this is not executed, data last written may not be written to the on-chip data-retention RAM. If there is a write to the on-chip data-retention RAM after this time, execute this processing after the last write to the on-chip data-retention RAM.

The procedures for steps 6 to 8 are as listed under (a) or (b), and which procedure is correct depends on the condition described after the procedures.

(a)

6. Set the STBY and DEEP bits in the STBCR1 register to 1, and then read this register.
7. Clear the flag in the DSFR register.
8. Set the CPU interface control register (ICCICR) of the interrupt controller to 0 so that the CPU is not notified of interrupts other than NMIs. Then, read the ICCICR register.

(b)

6. Clear the flag in the DSFR register.
7. Set the CPU interface control register (ICCICR) of the interrupt controller to 0 so that the CPU is not notified of interrupts other than NMIs. Then, read the ICCICR register.
8. Set the STBY and DEEP bits in the STBCR1 register to 1, and then read this register.

When the condition below is met, follow procedure (b).

- Software standby is not being used, the sleep mode is being used, and procedure (a) in section 42.3.1, (1) Transition to Sleep Mode is followed to initiate the transition to sleep mode.

9. Execute the WFI instruction.
10. The conflict between the instruction and the NMI interrupt may prevent transition to deep standby mode. After executing the WFI instruction, locate the branch instruction to return to step 9.

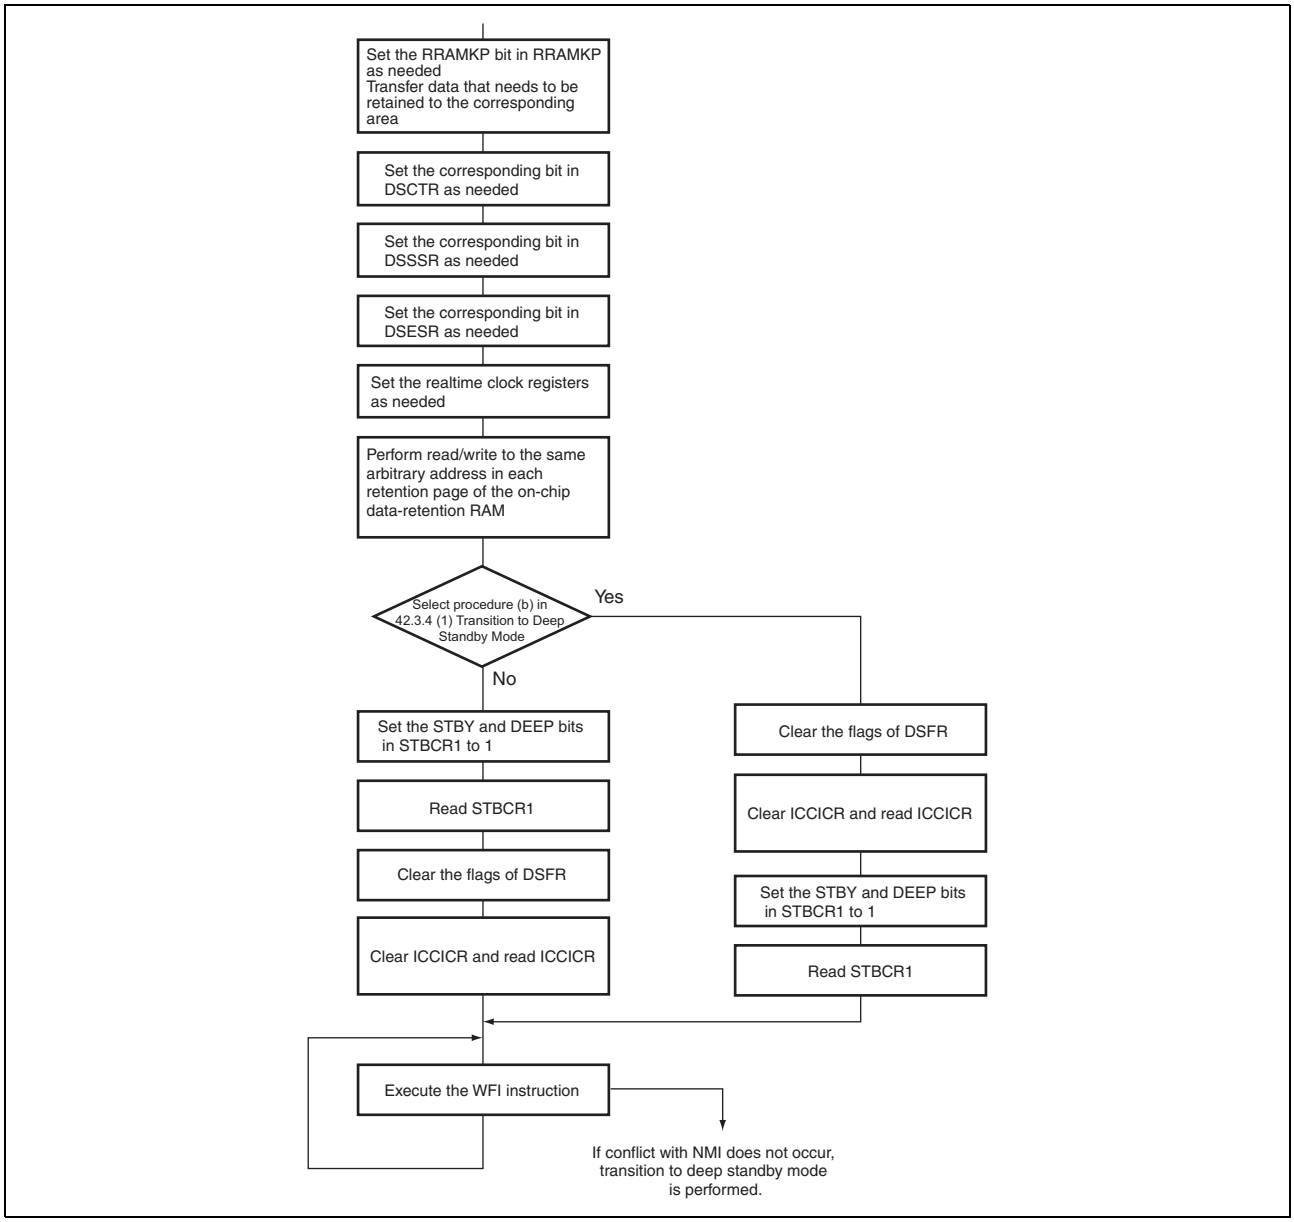

Figure 42.3 Flowchart of Transition to Deep Standby Mode

(2) Canceling Deep Standby Mode

Deep standby mode is canceled by interrupts (NMI or realtime clock alarm interrupt), change on the pins for canceling, or a reset (power-on reset). The realtime clock alarm interrupt can always cancel deep standby mode regardless of the settings of the execution priority register for the interrupt controller and of the alarm interrupt enable flag (RCR1.AIE) . This interrupt can also always cancel this mode do regardless of the states of bit 6 (the FIQ mask bit) and bit 7 (the IRQ mask bit) in the CPSR register of the CPU. When canceling the mode by a source other than a reset, a power-on reset exception handling is executed instead of an interrupt exception handling.
Figure 42.4 shows the flowchart of canceling deep standby mode.

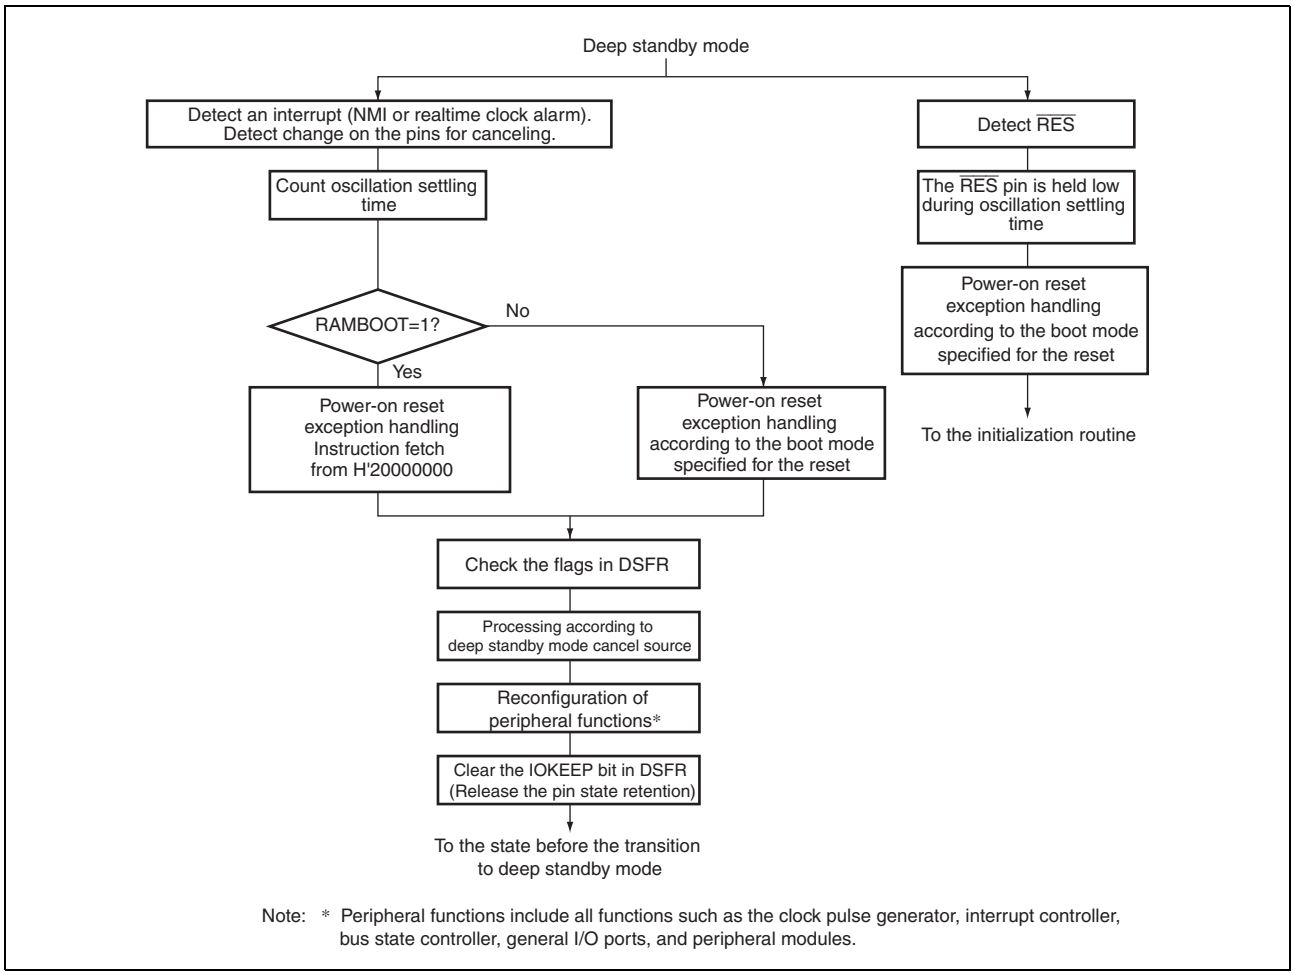

Figure 42.4 Flowchart of Canceling Deep Standby Mode

- Canceling by a source other than a reset
  When the falling or rising edge of the NMI pin (selected by a corresponding bit in DSESR) or falling or rising edge of the pins for canceling (selected by a corresponding bit in DSESR) is detected or the realtime clock alarm interrupt (see section 13.4.4, Alarm Function) is generated, clock oscillation is started after the wait time for the oscillation settling time. After the oscillation settling time has elapsed, deep standby mode is cancelled and the power-on reset exception handling is executed.
  The clock output phase of the CKIO pin may be unstable immediately after detecting a cancel source and until deep standby mode is canceled.
  The detecting of the NMI pin, the pins for canceling, and the realtime clock alarm interrupt becomes enable when the corresponding bits in DSSSR are set. The detected cancel sources are kept, but they are reflected to DSFR after canceling the deep standby mode. When the CPU accepts any interrupts and reads the interrupt response register (ICCIAR), all of the cancel sources that are kept are cleared. When the CPU enters the deep standby mode as the

detected cancel sources are kept, the deep standby mode is canceled immediately after the CPU enters the deep standby mode.

- Canceling with a reset
  Driving the $\overline{\text{RES}}$ pin low cancels deep standby mode and causes a transition to the power-on reset state. After this, driving the $\overline{\text{RES}}$ pin high initiates power-on reset exception handling. Output of the internal clock from the CKIO pin also starts by driving the $\overline{\text{RES}}$ pin low.
  Keep the $\overline{\text{RES}}$ pin low until the clock oscillation has settled.

(3) Operation after Canceling Deep Standby Mode

After canceling deep standby mode, the LSI can be activated through the external memory or from the on-chip data-retention RAM, which can be selected by setting the RAMBOOT bit in DSCTR. By setting the EBUSKEEPE bit, the states of the external memory control pins can be retained even after cancellation of deep standby mode. Table 42.3 shows the pin states after cancellation of deep standby mode according to the setting of each bit. Table 42.4 lists the external memory control pins.

Table 42.3 Pin States after Cancellation of Deep Standby Mode and System Activation Method by the DSCTR Settings

EBUSKEEPE Bit	RAMBOOT Bit	Activation Method	Pin States After Cancellation of Deep Standby Mode
0	0	External memory	The states of the external memory control pins are not retained. For other pins, the retention of their states is cancelled when the IOKEEP bit is cleared.
0	1	On-chip data-retention RAM	The states of the external memory control pins are not retained. After cancellation of deep standby mode, the retention of the external memory control pin states is cancelled. For other pins, the retention of their states is cancelled when the IOKEEP bit is cleared.
1	0	—	Setting prohibited.
1	1	On-chip data-retention RAM	The states of the external memory control pin are retained. The retention of the states of the external memory control pins and other pins is cancelled when the IOKEEP bit is cleared.

Table 42.4 External Memory Control Pins in Different Modes

Boot Mode 0 (CS0 Area: Bus Width: 16 Bits)	Boot Mode 1 (Serial Flash Boot)	Boot Mode 2 (eSD Boot)	Boot Mode 3 (eMMC Boot)
A[20:1] D[15:0] $\overline{\text{CS0}}$, $\overline{\text{RD}}$, CKIO	SPBCLK_0, SPBSSL_0, SPBMO0_0, SPBMI0_0	SD_CLK_0, SD_CMD_0, SD_D[3:0]_0	MMC_CLK, MMC_CMD, MMC_D[3:0]

When deep standby mode is canceled by interrupts (NMI or realtime clock alarm) or changes on the pins for canceling, the deep standby cancel source flag register (DSFR) can be used to confirm which source has canceled the mode.
Pins retain the state immediately before the transition to deep standby mode. However, in system activation through the external memory, the retention of the states of the external memory control pins is cancelled so that programs can be fetched after cancellation of deep standby mode. Other pins, after cancellation of deep standby mode, continue to retain the pin states until writing 0 to the IOKEEP bit in DSFR after reading 1 from the same bit. In system activation from the on-chip data-retention RAM, after cancellation of deep standby mode, both the external memory control pins and other pins continues to retain the pin states until writing 0 to the IOKEEP bit in DSFR after reading 1 from the same bit.
Reconfiguration of peripheral functions is required to return to the previous state of deep standby mode. Peripheral functions include all functions such as the clock pulse generator, interrupt controller, general I/O ports, and peripheral modules. After the reconfiguration, the retention of the pin state can be canceled and the LSI returns to the state prior to the transition to deep standby mode by reading 1 from the IOKEEP bit in DSFR and then writing 0 to it.

(4) Notes on Transition to Deep Standby Mode

If multiple canceling sources have been specified and multiple canceling sources are input, multiple cancel source flags will be set.

42.3.5 Module Standby Function

(1) Transition to Module Standby Function

Setting an MSTP bit in a standby control register to 1 halts supply of the clock signal to the corresponding on-chip peripheral module. This function can be used to reduce power consumption both while a program is running and in sleep mode. Disable a module before placing it in the module standby state. If interrupt requests are enabled, set the respective register in the target module or in the interrupt controller to disable interrupt requests. If DMA transfer requests are enabled, set the respective register in the target module to disable DMA transfer requests from the module and then set the respective register in the direct memory access controller to stop DMA transfers. In addition, do not attempt to access a module's registers while it is in the module standby state. The procedure for transitions to the module standby state depends on whether the STBREQ register has a bit for the corresponding module.

(a) Procedure for transition to module standby of modules for which the STBREQ register does not have a corresponding bit

1. Set the MSTP bit of the corresponding module to 1.

(b) Procedure for transition to module standby of modules for which the STBREQ register has a corresponding bit

1. Set the corresponding bit in the STBREQ register to 1 to generate a request to stop the module.
2. Confirm that the module is ready to be stopped by the corresponding bit in the STBACK register being set to 1.
3. Set the MSTP bit of the corresponding module to 1.

For states of registers in the module standby function, see section 46.3, Register States.

(2) Canceling Module Standby Function

Release from the module standby state can be achieved in two ways: starting the module by a power-on reset while the MSTP bit is set to 1, then clearing the MSTP bit to 0, or setting the MSTP bit to 0 to activate the module, setting the MSTP bit to 1 to place the module in the standby state, and then setting the MSTP bit to 0 again. If you use the latter approach, the procedure for release from module standby depends on whether the STBREQ register has a bit for the corresponding module.

- Release from the module standby state after the activation of the module by a power-on reset while the MSTP bit is set to 1

1. Clear the MSTP bit to 0.
2. After that, dummy-read the same register.

- Release from the module standby state after a transition to standby following activation of the module

(a) Procedure for release from module standby of modules for which the STBREQ register does not have a corresponding bit

1. Clear the MSTP bit to 0, then dummy-read the same register.

(b) Procedure for release from module standby of modules for which the STBREQ register has a corresponding bit

1. Clear the MSTP bit to 0, then dummy-read the same register.
2. Clear the corresponding bit in the STBREQ register to 0 to cancel the request to stop the module.
3. Confirm that the corresponding bit in the STBACK register has been cleared to 0, indicating the completion of release from standby.

42.3.6 Software Reset

Initialization equivalent to a power-on reset is only applied to the selected modules. The procedure for transitions to the software reset state varies according to whether the STBREQ register has a bit for the corresponding module. Follow the procedures below according to whether this is or is not the case. If DMA transfer requests are enabled, make the settings to stop the DMA transaction for the corresponding channel before transitions to the software reset state. For stopping the DMA transaction, see section 9.7.11, Transfer Status.

(1) Transition to Software Reset State

(a) Procedure for transition to the software reset state of modules for which the STBREQ register does not have a corresponding bit

1. Set the SRST bit of the corresponding module to 1, then dummy-read the same register.

(b) Procedure for transition to the software reset state of modules for which the STBREQ register has a corresponding bit

1. Set the corresponding bit in the STBREQ register to 1 to generate a request to stop the module.
2. Confirm that the corresponding bit in the STBACK register has been set to 1.
3. Set the SRST bit of the corresponding module to 1, then dummy-read the same register.

(2) Canceling Software Reset

(a) Procedure for release from the software reset state of modules for which the STBREQ register does not have a corresponding bit

1. Clear the SRST bit of the corresponding module to 0, then dummy-read the same register.

(b) Procedure for release from the software reset state of modules for which the STBREQ register has a corresponding bit

1. Clear the SRST bit of the corresponding module to 0, then dummy-read the same register.
2. Clear the corresponding bit in the STBREQ register to 0 to cancel the request to stop the module.
3. Confirm that the corresponding bit in the STBACK register has been cleared to 0.

42.3.7 Adjustment of XTAL Crystal Oscillator Gain

The gain of the crystal oscillator for XTAL can be adjusted using the GAIN0 bit in XTALCTR. To modify the gain of the signal on the EXTAL or XTAL pin, PLL settling time is needed. The settling time is counted using the on-chip watchdog timer.

After a change to the value of the GAIN0 bit, the hardware automatically stops the bus master following the wait for completion of the issuing-finished request from the bus master and the change to the gain for the crystal oscillator in use with XTAL proceeds. Since the change to the gain for the crystal oscillator in use with XTAL cannot start if completion of the issuing-finished request is not possible at this time, do not proceed with access to the registers of modules in the module-standby state and so on. Furthermore, as the issuing of unintended requests by the bus master is inhibited, using software to stop all bus masters in preparation for the procedure to change the gain for the crystal oscillator in use with XTAL is also effective.

1. The large gain is selected in the initial state.
2. Set the standby_mode_en bit of the power control register in the PL310 to 1. For the details of this register, see CoreLink Level 2 Cache Controller L2C-310 Technical Reference Manual issued by Arm Ltd.
3. Set the watchdog timer so that the specified settling time should be obtained and stop the watchdog timer.
   Specifically, the following settings are necessary:
   TME in WTCSR = 0: Stop the watchdog timer.
   CKS[2:0] in WTCSR: Division ratio for watchdog timer count clock
   WTCNT: Initial counter value
   (The watchdog timer starts counting on the set clock.)

4. Set the GAIN0 bit to the desired value.
5. The LSI is internally stopped and the watchdog timer starts counting. The clock is supplied only to the watchdog timer and other internal clocks are stopped. In this state, the CKIO pin continues to output an unstable clock. To avoid malfunction due to the unstable clock, modify the CKOEN2 bit in FRQCR appropriately. Since this state is equivalent to the software standby mode state, some registers of on-chip peripheral modules are initialized. For details, see section 46.3, Register States.
6. When an overflow occurs on the watchdog timer, the specified clock supply is started and the LSI starts operation. The watchdog timer stops after an overflow.

42.4 Usage Notes

42.4.1 Usage Notes on Setting Registers

When writing to the registers related to power-down modes, note the following.
When writing to the register related to power-down modes, the CPU, after executing a write instruction, executes the next instruction without waiting for the write operation to complete.
Therefore, to reflect the change specified by writing to the register while the next instruction is executed, insert a dummy read of the same register between the register write instruction and the next instruction.

42.4.2 Usage Notes when the Realtime Clock is not Used

When the realtime clock is not used, set the MSTP60 bit in STBCR6 to 1 after setting the bits in registers of the realtime clock. For details, see section 42.2.6, Standby Control Register 6 (STBCR6).

- Set the RTCEN bit in the control register 2 (RCR2) to 0
- Set the RCKSEL[1:0] bits in the control register 5 (RCR5) to 00.

42.4.3 Usage Notes Applying when the USB_X1 Pin is not to be Used

When a 48 MHz clock is not being supplied to the USB_X1 pin, set registers according to the below procedure in the initial settings after release from the power-on reset state or deep standby mode.

(1) When the USB2.0 host/function module is not to be used

1. Set the MSTP71 bit in the STBCR7 register to 0 and dummy-read STBCR7.
2. Set the UCKSEL bit in the SYSCFG0_0 register to 1.
3. Wait for at least 20 cycles of the EXTAL clock.
4. Set the MSTP71 bit in the STBCR7 register to 1 and dummy-read STBCR7.

(2) When the USB2.0 host/function module is to be used

1. Set the MSTP71 bit* in the STBCR7 register to 0 and dummy-read STBCR7.
2. Set the UCKSEL bit in the SYSCFG0_0 register to 1.
3. Follow the procedure of example 1 in section 28.4.1 (5) Setting the Clock Supply for the USB Module.
4. Make the initial settings of the USB2.0 host/function module.

Note: * When channel 1 of the USB2.0 host/function module is to be used, also set the MSTP70 bit to 0.

42.4.4 Notes on Using IRQ Pins as Triggers for Release from Standby when Software Standby is in Use

To use an IRQ pin as the trigger for release from standby when software standby is in use, see section 7.8.4, Notes on Using IRQ Pins as Triggers for Release from Standby when Software Standby is in Use.

43. Debugger Interface

This LSI incorporates a debugger interface to support the boundary scan function and connection to the emulator.

43.1 Features

The debugger interface is a serial input/output interface which has a JTAG (Joint Test Action Group, IEEE Std.1149.1 and IEEE Standard Test Access Port and Boundary-Scan Architecture) interface and CoreSight debug interface.

This module has TAP controllers for the boundary scan and CoreSight debug function.

Driving the BSCANP pin high selects the boundary-scan TAP controller, and driving the BSCANP pin low selects the CoreSight debug TAP controller.

Figure 43.1 is a block diagram of this module and Table 43.1 shows the JTAG pin mode.

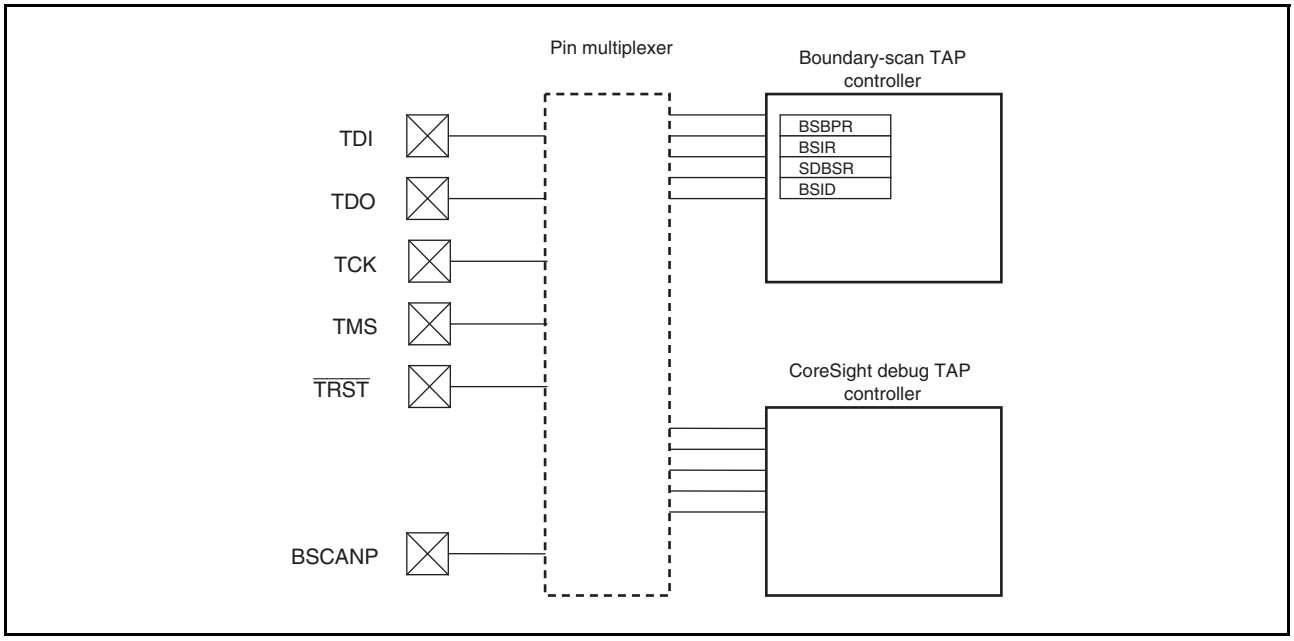

Figure 43.1 Block Diagram

Table 43.1 JTAG Pin Mode

BSCANP	JTAG Pin Mode
0	Normal operation (CoreSight debug mode)
1	Boundary-scan mode

The following lists the features of CoreSight.

- JTAG interface
  Supports JTAG and serial wire debug mode (SWD)
- Trace interface
  Outputs 4-bit × 66-Mbps (33-MHz DDR) trace data
  4-Kbyte Embedded Trace FIFO (ETF)
- Controls by ICE registers
  Control of resetting, debug-enable signal supplied to the CPU, and disabling power shut-off in deep-standby mode during debugging (fake debug mode)

Figure 43.2 is a block diagram of CoreSight, Table 43.2 to Table 43.5 show the input/output pins of the cross-trigger interface (CTI), and Table 43.6 shows the address map for CoreSight. For details of CoreSight other than ICE registers, see the technical reference manual issued by Arm Ltd.

43.2 Input/Output Pins

Table 43.7 shows the pin configuration of the debugger interface.

Table 43.7 Pin Configuration

Name	Pin Name	Input/ Output	Function
Test clock	TCK/SWDCLK	Input	Data is input in serial to this module via the data input pin (TDI) or data is output via the data output pin (TDO) in synchronization with this signal. Functions as the SWDCLK pin in serial wire debug (SWD) mode.
Test mode select	TMS/SWDIO	Input, Input/ Output	Changing this signal in synchronization with the TCK signal determines the state of the TAP controller circuit. Its protocol conforms to the subset of the JTAG standard (IEEE standard 1149.1). Functions as the SWDIO pin in serial wire debug (SWD) mode.
Test reset	$\overline{\text{TRST}}$*1	Input	This signal is received asynchronously with the TCK signal. Asserting this signal resets this module. When power is supplied, this pin should be asserted for a given period regardless of whether or not this module function is used. For details on resetting, see section 43.5.2, Reset Signal Setting.
Test data input	TDI	Input	Data is sent to this module by changing this signal in synchronization with the TCK signal.
Test data output	TDO	Output	Data is read from this module by reading this signal in synchronization with the TCK signal. This pin also functions as an output pin in the serial wire debug (SWD) mode. However, a fixed value (the high level) is output because this product does not support the SWO function.
Boundary scan setting	BSCANP	Input	Input a high-level signal during boundary-scan testing. Input a low-level signal during normal use.
Clock output	TRACECLK	Output	Trace clock output pin
Enable output	TRACECTL	Output	Trace enable output pin
Data output	TRACEDAT3 to TRACEDATA0	Output	Trace data output pins

Note 1. When designing a board that can use an emulator, the $\overline{\text{RES}}$ and $\overline{\text{TRST}}$ pin circuits should be designed so that they can be set low and the $\overline{\text{TRST}}$ pin can be controlled independently at power-on. When the $\overline{\text{TRST}}$ pin is not in use, it should be either fixed to low level or connected to the $\overline{\text{RES}}$ pin (or another pin which operates in the same manner as the $\overline{\text{RES}}$ pin).

43.3 Registers for Boundary-Scan TAP Controller

The boundary-scan TAP controller has the following registers.

Table 43.8 List of Registers of Boundary-Scan TAP Controller

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Bypass register	BSBPR	—	—	—	—
Instruction register	BSIR	—	H'55	—	—
Boundary scan register	SDBSR	—	—	—	—
ID register	BSID	—	H'081A6447*1 H'082F4447*2	—	—

Note 1. RZ/A1L
Note 2. RZ/A1LU and RZ/A1LC

43.3.1 Bypass Register (BSBPR)

BSBPR is a 1-bit register that cannot be accessed by the CPU. When the BSIR register is set to BYPASS mode, BSBPR is connected between the TDI and TDO pins. The initial value is undefined.

43.3.2 Instruction Register (BSIR)

BSIR is an 8-bit register. This register is initialized by TRST assertion or in the TAP test-logic-reset state. BSIR cannot be accessed by the CPU.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	TI[7:0]	01010101	—	Test Instruction The instructions of this module are transferred to BSIR by a serial input. For commands, see Table 43.9.

Table 43.9 Commands Supported for Boundary-Scan TAP Controller

Bits 7 to 0								
TI7	TI6	TI5	TI4	TI3	TI2	TI1	TI0	Description
0	0	0	0	0	0	0	0	EXTEST
0	1	0	0	0	0	0	0	SAMPLE/PRELOAD
0	1	0	1	0	1	0	1	IDCODE (Initial value)
1	1	0	1	0	0	0	0	CLAMP
1	0	0	0	0	0	0	0	HIGHZ
1	1	1	1	1	1	1	1	BYPASS
Other than above								Reserved

43.3.3 Boundary Scan Register (SDBSR)

SDBSR is a shift register, located on the PAD, for controlling the input/output pins of this LSI. The initial value is undefined.

Using the EXTEST, SAMPLE/PRELOAD, CLAMP, and HIGHZ commands, a boundary scan test conforming to the JTAG standard can be carried out. Table 43.10 shows the correspondence between this LSI's pins and boundary scan register bits.

Table 43.10 Correspondence between Pins of this LSI and Boundary Scan Registers

3	3	P2_4	INPUT
2	2	P2_5	OUTPUT
1	1	P2_5	CONTROL
0	0	P2_5	INPUT

Note 1. The pin names are as listed in the “Port function/dedicated function” column of Table 1.4, List of Pins in section 1.6, List of Pins.
Note 2. Open-drain pin. Setting the data bit for the pin to 0 makes the pin output a low-level signal and setting the data bit for the pin to 1 places the pin in the hi-Z state.
Note 3. Bits of type “control” are active low. When the control bit is at the low level, the corresponding pin becomes an output.

43.3.4 ID Register (BSID)

BSID is a 32-bit read-only register that cannot be accessed by the CPU. BSID can be only be read from the pins when the IDCODE command is set.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DID[31:16]

*: RZ/A1LU and RZ/A1LC	0	0	0	0	1	0	0	0	0	0	1	0	1	1	1	1
	0	1	0	0	0	1	0	0	0	1	0	0	0	1	1	1

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DID[31:0]	H'081A6447*1 H'082F4447*2	—	Device IDCODE This is the ID register stipulated by JTAG. Note that the higher-order four bits may be changed depending on the version of the chip.

Note 1. RZ/A1L
Note 2. RZ/A1LU and RZ/A1LC

43.4 ICE Registers

The debugger interface has the following ICE registers.
ICE registers are exclusively for use in debugging. Do not use these registers other than for debugging.

Table 43.11 Configuration of ICE Registers

Register Name	Abbreviation	R/W	Initial Value	Address		Access Size
				Viewed from CPU	Viewed from Debugger	
Mode reset control register	ICEREGMDRSTCTL	R/W	H'0000111E	H'FC00F000	H'8000F000	32
JTAG trace select register	ICEREGJTTRCSEL	R/W	H'00800000	H'FC00F004	H'8000F004	32
Clock power control register	ICEREGCLKPWRCTRL	R/W	H'00000000	H'FC00F014	H'8000F014	32
Lock access register	ICEREGLOCKACCES	W	—	H'FC00FFB0	H'8000FFB0	32

43.4.1 Mode Reset Control Register (ICEREGMDRSTCTL)

ICEREGMDRSTCTL is used to set the debug mode and to perform software reset.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	NIDEN_CPU0	—	—	—	DBGEN_CPU0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	RSTRB_CPU0_DERSTZ	—	—	—	RSTRB_CPU0_CPURSTZ	—	—	—	RSTRB_SYS_SYSRSTZ	—	RSTRB_CPU_PRSTDBGZ	RSTRB_CPU_SYSRSTZ	—
Initial value:	0	0	0	1	0	0	0	1	0	0	0	1	1	1	1	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 21	—	All 0	R	Reserved The read value is always 0.
20	NIDEN_CPU0	0	R/W	CPU Noninvasive Debug Enable Controls the noninvasive debug enable signal (NIDEN/SPNIDEN) supplied to the CPU. This bit is only effective when the PINSETEN bit in ICEREGJTTRCSEL is set to 0.
19 to 17	—	All 0	R	Reserved The read value is always 0.
16	DBGEN_CPU0	0	R/W	CPU Debug Enable Controls the debug enable signal (DBGEN/SPIDEN) supplied to the CPU. This bit is only effective when the PINSETEN bit in ICEREGJTTRCSEL is set to 0.
15 to 13	—	All 0	R	Reserved The read value is always 0.
12	RSTRB_CPU0_DERSTZ	1	R/W	NEON Reset (low-active) Resets the NEON unit in the CPU.
11 to 9	—	All 0	R	Reserved The read value is always 0.
8	RSTRB_CPU0_CPURSTZ	1	R/W	CPU Reset (low-active) Resets all systems on the CPU block other than debugging resources.

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 0	R	Reserved The read value is always 0.
4	RSTRB_SYS_SYSRSTZ	1	R/W	System Reset (low-active) Resets all systems on the chip other than debugging resources.
3	—	1	R/W	Reserved The read value is always 1. The write value should always be 1.
2	RSTRB_CPU_PRSTDBGZ	1	R/W	CPU Subsystem Debug Peripheral Reset (low-active) Resets the debug-APB block in the CPU subsystem.
1	RSTRB_CPU_SYSRSTZ	1	R/W	CPU Subsystem Reset (low-active) Resets the CPU subsystem other than those for debugging.
0	—	0	R	Reserved The read value is always 0.

43.4.2 JTAG Trace Select Register (ICEREGJTTRCSEL)

ICEREGJTTRCSEL is used to control trace data output to the respective pins and debug enable signal supplied to the CPU.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	PINSETEN	—	—	TRCMUX_SEL	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved The read value is always 0.
23	PINSETEN	1	R/W	Selects control method of debug enable signal supplied to the CPU. 0: Supply of the DBGEN and NIDEN signals is determined by the ICEREGMDRSTCTL register. 1: Supply of the DBGEN and NIDEN signals is determined by the BSCANP pin.
22, 21	—	All 0	R	Reserved The read value is always 0.
20	TRCMUX_SEL	0	R/W	Sets the priority of the function multiplexed on the pins to which trace output is assigned. 0: The function of the pins depends on the general I/O port setting. 1: The pins act as trace outputs regardless of the general I/O port setting.
19 to 0	—	All 0	R	Reserved The read value is always 0.

43.4.3 Clock Power Control Register (ICEREGCLKPWRCTRL)

ICEREGCLKPWRCTRL is used to set the fake debug mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	FAKEDBGCTRL	—	—	—	—	—	—	FAKEDBG
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved The read value is always 0.
7	FAKEDBGCTRL	0	R/W	Enables or disables the fake debug mode. 0: The power control is determined by the standby control register 1 (STBCR1). 1: The power control is determined by this register.
6 to 1	—	All 0	R	Reserved The read value is always 0.
0	FAKEDBG	0	R/W	Selects whether or not to stop the power supply in deep standby mode. 0: The power supply is actually stopped in deep standby mode. 1: The power supply is not stopped even in deep standby mode.

43.4.4 Lock Access Register (ICEREGLOCKACCESS)

ICEREGLOCKACCESS is used to enable access to ICE registers by the CPU.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ICEREGLOCKACCESS															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ICEREGLOCKACCESS															
Initial value:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W:	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ICEREGLOCKACCESS	—	W	To enable access to ICE registers by the CPU, first write H'C5AC CE55 to this register.

43.5 Operation

43.5.1 TAP Controller

Figure 43.3 shows the internal states of the TAP controller. State transitions basically conform to the JTAG standard.

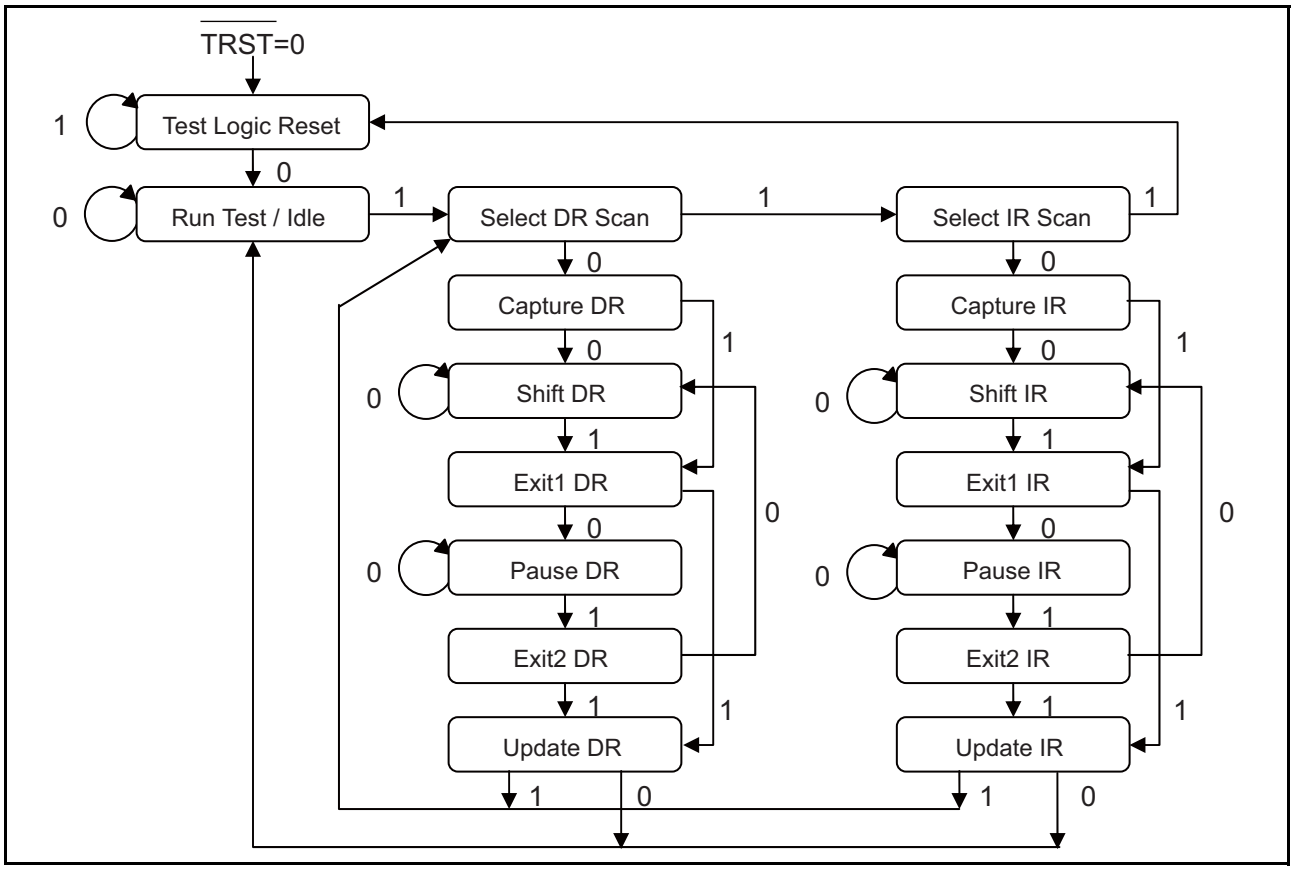

Figure 43.3 State Transitions of TAP Controller

Note: State transition occur according to the TMS value at the rising edge of the TCK signal. The TDI value sampled at the rising edge of the TCK signal and shifted at the falling edge of the TCK signal. TDO value is output at the rising edge of the TCK signal. The TDO signal is in a Hi-Z state for TAP controller states other than Shift-DR and Shift-IR. A transition to the Test-Logic-Reset state by clearing $\overline{\text{TRST}}$ to 0 is performed asynchronously with the TCK signal.

43.5.2 Reset Signal Setting

Table 43.12 Reset Signal Setting

$\overline{\text{RES}}$	$\overline{\text{TRST}}$	Chip State
L	L	The chip is power-on reset and this module is reset.*1
	H	The chip is power-on reset.*1
H	L	This module is only reset.*2
	H	Normal operation*2

Note 1. By asserting the $\overline{\text{RES}}$ and $\overline{\text{TRST}}$ signals, the CPU and CoreSight enter the reset state. Set the debugging function while asserting the $\overline{\text{RES}}$ signal after negating the $\overline{\text{TRST}}$ signal.

Note 2. Do not negate the $\overline{\text{TRST}}$ signal while the $\overline{\text{RES}}$ signal is at the high-level.

Note 3. When the $\overline{\text{TRST}}$ pin is to be negated, make sure that the specification for $\overline{\text{RES}}$ input rise time (t_{RSr}) or $\overline{\text{RES}}$ negating hold time (t_{RSNH}) in Table 47.6, Control Signal Timing, is satisfied.

43.6 Boundary Scan

Commands can be set in BSIR by this module to place this module's pins in boundary scan mode stipulated by JTAG.

43.6.1 Supported Instructions

This LSI supports three mandatory instructions stipulated by JTAG standard (BYPASS, SAMPLE/PRELOAD, and EXTEST) and three option instructions (IDCODE, CLAMP, and HIGHZ).

(1) BYPASS

BYPASS is a mandatory instruction that operates the bypass register. This instruction is used to shorten the shift path to speed up serial data transfer involving other LSI on the printed circuit board. This LSI's system circuits are not affected by execution of this instruction.

(2) SAMPLE/PRELOAD

SAMPLE/PRELOAD is used to input data from this LSI’s internal circuit to the boundary scan register, outputs data from the scan path, and loads data onto the scan path. While this instruction is being executed, signals input to this LSI pins are transmitted directly to the internal circuit, and the values of the internal circuit are directly output externally from the output pins. This LSI's system circuits are not affected by execution of this instruction.

In a SAMPLE operation, a snapshot of a value to be transferred from an input pin to the internal circuit, or a value to be transferred from the internal circuit to an output pin, is latched into the boundary scan register and read from the scan path. Snapshot latching is performed in synchronization with the rising edge of the TCK signal in the Capture-DR state. Snapshot latching does not affect normal operation of this LSI.

In a PRELOAD operation, an initial value is set in the parallel output latch of the boundary scan register from the scan path prior to the EXTEST instruction. Without a PRELOAD operation, when the EXTEST instruction was executed an undefined value would be output from the output pin until completion of the initial scan sequence (transfer to the output latch) (with the EXTEST instruction, the parallel output latch value is constantly output to the output pin).

(3) EXTEST

This instruction is provided to test external circuit when this LSI is mounted on a printed circuit board. When this instruction is executed, output pins are used to output test data (previously set by the SAMPLE/PRELOAD instruction) from the boundary scan register to the printed circuit board, and input pins are used to latch test results into the boundary scan register from the printed circuit board. If testing is carried out by using the EXTEST instruction N times, the Nth test data is scanned-in when test data (N-1) is scanned out. The data loaded into the output pin boundary scan register in the Capture-DR state are not used for external circuit testing (data are replaced by the shift operation).

(4) IDCODE

Commands can be set in BSIR via pins of this module to place the module’s pins in the IDCODE mode stipulated by JTAG. When this module is initialized ($\overline{\text{TRST}}$ is asserted or TAP is in the Test-Logic-Reset state), the IDCODE mode is entered.

(5) CLAMP, HIGHZ

Commands can be set in BSIR via pins of this module to place the module’s pins in the CLAMP or HIGHZ mode stipulated by JTAG.

43.6.2 Points for Attention

1. Boundary scan mode does not cover clock-related signals (EXTAL, XTAL, CKIO, AUDIO_X1, AUDIO_X2, USB_X1, USB_X2, RTC_X1, and RTC_X2).
2. Boundary scan mode does not cover reset-related signal ($\overline{\text{RES}}$).
3. Boundary scan mode does not cover this module's signals (TCK, TDI, TDO, TMS, $\overline{\text{TRST}}$, and BSCANP).
4. Boundary scan mode does not cover USB-related signals (DP0, DP1, DM0, DM1, VBUS0, VBUS1, and REFRIN).
5. Boundary scan mode does not cover P0_3.

43.7 Usage Notes

1. Once a command of this module is set, it will not be modified unless another command is reissued. If the same command is given continuously, the command must be set after a command (BYPASS, etc.) that does not affect LSI operations is once set.
2. Regardless of whether or not this module is to be used, it should be initialized by asserting the $\overline{\text{TRST}}$ signal when power is supplied and on release from deep standby mode (excluding fake debug mode) through assertion of the $\overline{\text{RES}}$ signal.
3. Be sure to wait for at least 200 ns after negating the $\overline{\text{TRST}}$ signal before starting TAP controller operation.
4. Be sure to fix the TMS pin to the high level until 200 ns have elapsed after negation of the $\overline{\text{TRST}}$ signal.

44. JPEG Codec Unit

This module is only incorporated in the RZ/A1LU.
The JPEG codec unit (JCU) incorporates a JPEG codec conforming to the JPEG baseline compression and decompression standard to provide high-speed compression of image data and high-speed decoding of JPEG data.

44.1 Features

The JPEG codec unit has the following features:

- Conforms to the JPEG baseline standard within the range described in this document.
  This module does not support the following basic features:
  Scanning with two elements
  Non-interleave scanning with multiple elements
- Operational precision: Conforming to JPEG Part 2, ISO-IEC10918-2
- Image input/output system: Block interleave method
- Pixel format:
  Compression: YCbCr422 (H = 2:1:1, V = 1:1:1)
  Decompression: YCbCr444 (H = 1:1:1, V = 1:1:1), YCbCr422 (H = 2:1:1, V = 1:1:1), YCbCr411 (H = 4:1:1, V = 1:1:1), YCbCr420 (H = 2:1:1, V = 2:1:1)
  Output pixel format to the buffer: YCbCr422, ARGB8888, RGB565
- Four quantization tables provided
- Four Huffman tables provided (two tables for AC coefficients and two tables for DC coefficients)
- Markers supported: SOI (start of image), SOF0 (start of frame type 0), SOS (start of scan), DQT (define quantization tables), DHT (define Huffman tables), DRI (define restart interval), RSTm (restart marks), and EOI (end of image)
- Image data rate: Max. 133.34 Mbytes/s (at 66.67-MHz operation)
- The buffer size can be reduced by using the mode in which data transfer is temporarily stopped each time the specified number of lines or the specified amount of data is transferred during image data or coded data input/output.
- Processing unit: 8-byte address boundary units can be set
- Image sizes that can be processed: Sizes divisible by the minimum coded unit (MCU): 8 lines by 8 pixels in YCbCr444; 8 lines by 16 pixels in YCbCr422; 8 lines by 32 pixels in YCbCr411; 16 lines by 16 pixels in YCbCr420

Note: • Compression and decompression processing of images in unsupported pixel formats or unsupported image sizes should be avoided.

Figure 44.1 shows a block diagram.

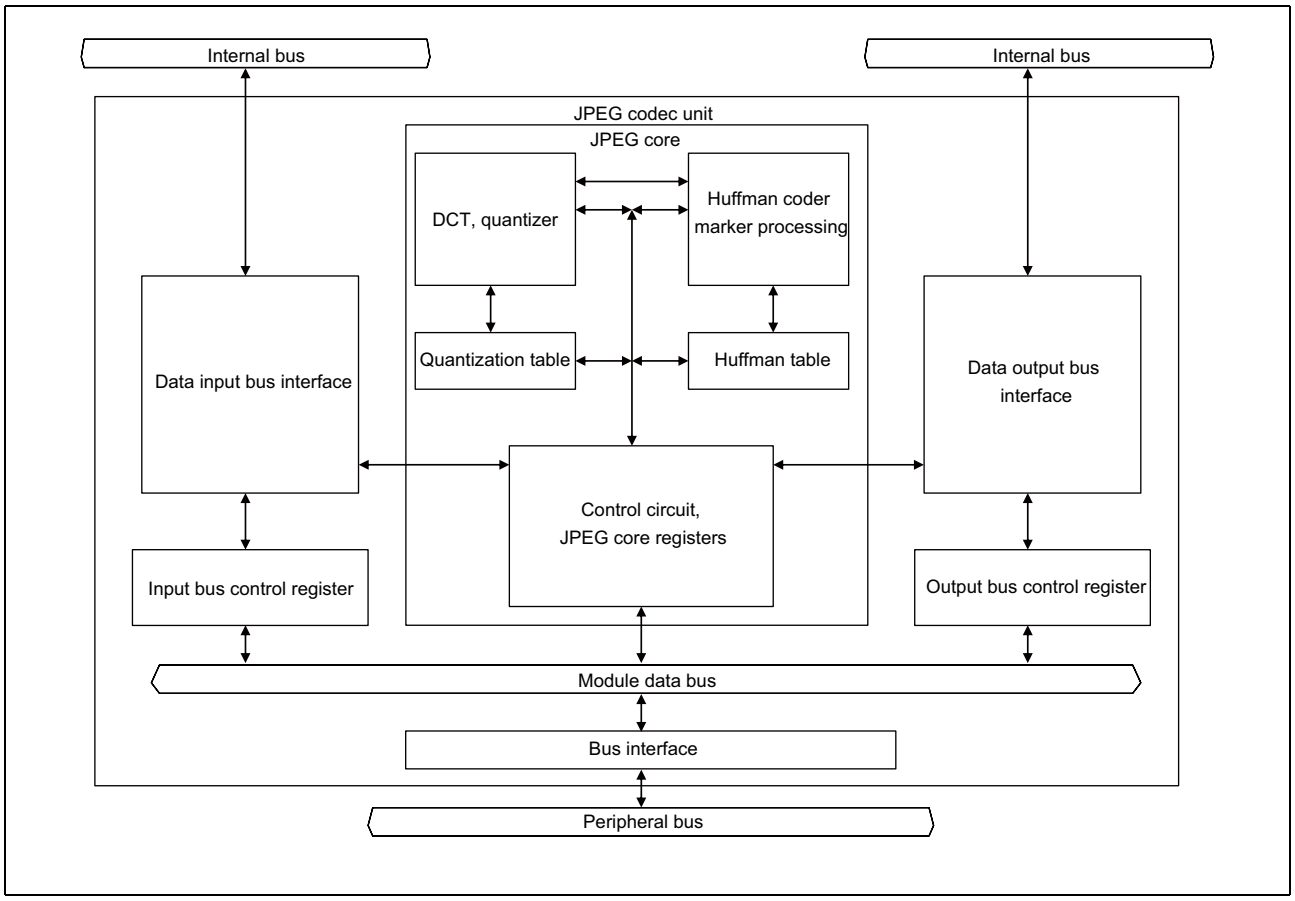

Figure 44.1 Block Diagram

44.2 Register Descriptions

Table 44.1 shows the JCU registers.

Table 44.1 Register Configuration

Register Name	Abbreviation	R/W	Address	Access Size
JPEG code mode register	JCMOD	R/W	H'E801 7000	8
JPEG code command register	JCCMD	R/W	H'E801 7001	8
JPEG code quantization table number register	JCQTN	R/W	H'E801 7003	8
JPEG code Huffman table number register	JCHTN	R/W	H'E801 7004	8
JPEG code DRI upper register	JCDRIU	R/W	H'E801 7005	8
JPEG code DRI lower register	JCDRID	R/W	H'E801 7006	8
JPEG code vertical size upper register	JCVSZU	R/W	H'E801 7007	8
JPEG code vertical size lower register	JCVSZD	R/W	H'E801 7008	8
JPEG code horizontal size upper register	JCHSZU	R/W	H'E801 7009	8
JPEG code horizontal size lower register	JCHSZD	R/W	H'E801 700A	8
JPEG code data count upper register	JCDTCU	R	H'E801 700B	8
JPEG code data count middle register	JCDTCM	R	H'E801 700C	8
JPEG code data count lower register	JCDTCD	R	H'E801 700D	8
JPEG interrupt enable register 0	JINTE0	R/W	H'E801 700E	8
JPEG interrupt status register 0	JINTS0	R/W	H'E801 700F	8
JPEG code decode error register	JCDERR	R/W	H'E801 7010	8

JPEG code quantization table 2 register	JCQTBL2	R/W	H'E801 7180 to H'E801 71BF	8
JPEG code quantization table 3 register	JCQTBL3	R/W	H'E801 71C0 to H'E801 71FF	8

Table 44.1 Register Configuration

Register Name	Abbreviation	R/W	Address	Access Size
JPEG code Huffman table DC0 register	JCHTBD0	W	H'E801 7200 to H'E801 721B	8
JPEG code Huffman table AC0 register	JCHTBA0	W	H'E801 7220 to H'E801 72D1	8
JPEG code Huffman table DC1 register	JCHTBD1	W	H'E801 7300 to H'E801 731B	8
JPEG code Huffman table AC1 register	JCHTBA1	W	H'E801 7320 to H'E801 73D1	8

Note: • For the settings of the JPEG code quantization table and JPEG code Huffman table, see section 44.3.1 (4), Table Setting.

44.2.1 JPEG Code Mode Register (JCMOD)

JCMOD sets the operating mode before the JCU starts operation.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	DSP	REDU[2:0]		
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R	R	R/W	R/W	R/W	R/W
R/W(decompress):	R	R	R	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 4	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
3	DSP	0	R/W		Compression/Decompression Set 0: Compression process 1: Decompression process Note: • When changing between processing for compression and for decompression, be sure to reset this module in advance by setting the SRST21 bit in the software reset control register 2 (SWRSTCR2) of the power-down modes.
2 to 0	REDU[2:0]	000	R/W	R	Pixel Format [Compression] 001: YCbCr422 Other than above: Setting prohibited. [Decompression] 000: YCbCr444 001: YCbCr422 110: YCbCr411 010: YCbCr420 Other than above: Error (JCU cannot process normally.)

44.2.2 JPEG Code Command Register (JCCMD)

JCCMD sets commands. Bits of this register need not be cleared to 0 after setting a command. Multiple commands must not be set simultaneously.

Bit:	7	6	5	4	3	2	1	0
	BRST	—	—	—	—	JEND	JRST	JSRT
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R*/W	R	R	R	R	R*/W	Undefined	R*/W
R/W(decompress):	R*/W	R	R	R	R	R*/W	R*/W	R*/W

Note: * Values read from these bits are undefined.

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7	BRST	0	R*/W		Bus Reset Setting this bit to 1 resets the internal circuits. While the JCU is in operation (from setting the JPEG core process start command to writing the last output coded/image data), do not set this bit to 1. For the bus reset processing, see section 44.5, Bus Reset Processing.
6 to 3	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
2	JEND	0	R*/W		Interrupt Request Clear Command This bit is valid only for the interrupt sources corresponding to bits INS6, INS5, and INS3 in JINTS0. To clear an interrupt request, set this bit to 1.
1	JRST	0	Invalid	R*/W	JPEG Core Process Stop Clear Command To clear the process-stopped state caused by requests to read the image size and pixel format (enabled by the INT3 bit in JINTE0), set this bit to 1.
0	JSRT	0	R*/W		JPEG Core Process Start Command To start JPEG core processing, set this bit to 1. Do not write this bit to 1 again while the JCU is in operation.

Note: * Values read from these bits are undefined.

44.2.3 JPEG Code Quantization Table Number Register (JCQTN)

JCQTN sets the quantization table number before compression process is started.

- To use quantization table No. 0 (JCQTBL0) as the first color component, set QT1 to B'00
- To use quantization table No. 1 (JCQTBL1) as the first color component, set QT1 to B'01
- To use quantization table No. 2 (JCQTBL2) as the first color component, set QT1 to B'10
- To use quantization table No. 3 (JCQTBL3) as the first color component, set QT1 to B'11

Bit:	7	6	5	4	3	2	1	0
	—	—	QT3[1:0]		QT2[1:0]		QT1[1:0]	
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R/W	R/W	R/W	R/W	R/W	R/W
R/W(decompress):	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7, 6	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
5, 4	QT3[1:0]	00	R/W	R	Quantization table number for the third color component
3, 2	QT2[1:0]	00	R/W	R	Quantization table number for the second color component
1, 0	QT1[1:0]	00	R/W	R	Quantization table number for the first color component

44.2.4 JPEG Code Huffman Table Number Register (JCHTN)

JCHTN sets the Huffman table number (AC/DC) before compression process is started.

- To use DC/AC Huffman table No. 0 (JCHTBD0 and JCHTBA0) as the first color component, set bits HTA1 and HTD1 to B'0
- To use DC/AC Huffman table No. 1 (JCHTBD1 and JCHTBA1) as the first color component, set bits HTA1 and HTD1 to B'1

Bit:	7	6	5	4	3	2	1	0
	—	—	HTA3	HTD3	HTA2	HTD2	HTA1	HTD1
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R/W	R/W	R/W	R/W	R/W	R/W
R/W(decompress):	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7, 6	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
5	HTA3	0	R/W	R	Huffman table number (AC) for the third color component
4	HTD3	0	R/W	R	Huffman table number (DC) for the third color component
3	HTA2	0	R/W	R	Huffman table number (AC) for the second color component
2	HTD2	0	R/W	R	Huffman table number (DC) for the second color component
1	HTA1	0	R/W	R	Huffman table number (AC) for the first color component
0	HTD1	0	R/W	R	Huffman table number (DC) for the first color component

44.2.5 JPEG Code DRI Upper Register (JCDRIU)

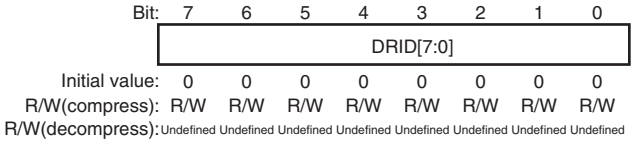
JCDRIU sets the upper bytes of the minimum coded units (MCUs) preceding an RST marker.

Bit:	7	6	5	4	3	2	1	0
	DRIU[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
R/W(decompress):	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	DRIU[7:0]	H'00	R/W	Invalid	Upper Bytes of MCUs Preceding RST Marker When both upper and lower bytes are set to H'00, neither a DRI nor an RST marker is placed.

44.2.6 JPEG Code DRI Lower Register (JCDRID)

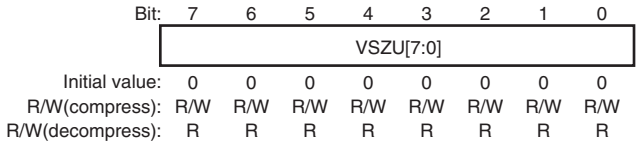
JCDRID sets the lower bytes of MCUs preceding an RST marker.



Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	DRID[7:0]	H'00	R/W	Invalid	Lower Bytes of MCUs Preceding RST Marker When both upper and lower bytes are set to H'00, neither a DRI nor an RST marker is placed.

44.2.7 JPEG Code Vertical Size Upper Register (JCVSZU)

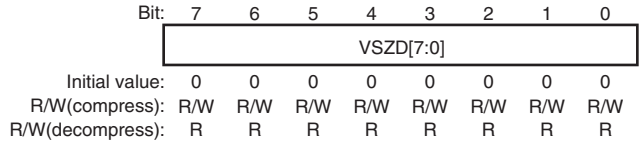
JCVSZU sets the upper bytes of the vertical image size.



Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	VSZU[7:0]	H'00	R/W	R	Upper Bytes of Vertical Image Size In decompression process, a downloaded value from the JPEG coded data is set.

44.2.8 JPEG Code Vertical Size Lower Register (JCVSZD)

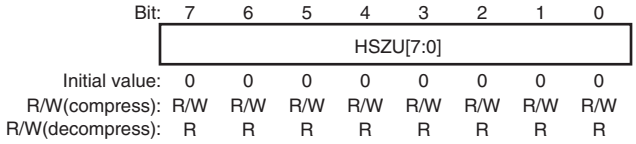
JCVSZD sets the lower bytes of the vertical image size.



Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	VSZD[7:0]	H'00	R/W	R	Lower Bytes of Vertical Image Size In decompression process, a downloaded value from the JPEG coded data is set.

44.2.9 JPEG Code Horizontal Size Upper Register (JCHSZU)

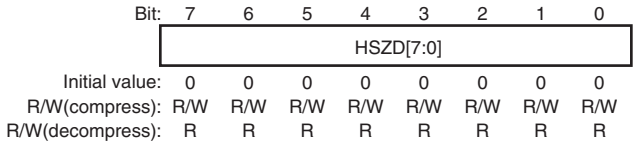
JCHSZU sets the upper bytes of the horizontal image size.



Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	HSZU[7:0]	H'00	R/W	R	Upper Bytes of Horizontal Image Size In decompression process, a downloaded value from the JPEG coded data is set.

44.2.10 JPEG Coded Horizontal Size Lower Register (JCHSZD)

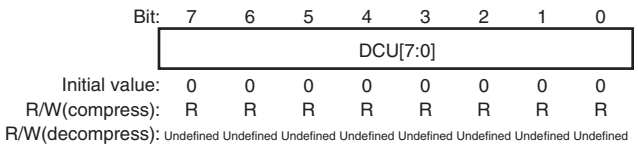
JCHSZD sets the lower bytes of the horizontal image size.



Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	HSZD[7:0]	H'00	R/W	R	Lower Bytes of Horizontal Image Size In decompression process, a downloaded value from the JPEG coded data is set.

44.2.11 JPEG Code Data Count Upper Register (JCDTCU)

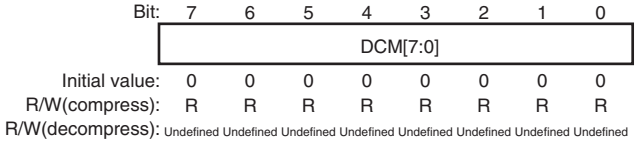
The upper bytes for the counted amount of data to be compressed are set to JCDTCU. The values of this register are reset before compression starts.



Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	DCU[7:0]	H'00	R	Invalid	Upper bytes of the counted amount of data to be compressed

44.2.12 JPEG Code Data Count Middle Register (JCDTCM)

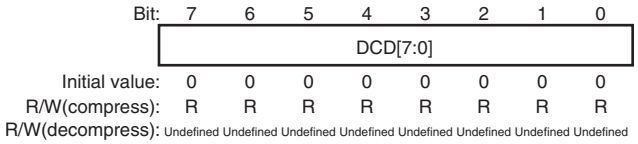
The middle bytes for the counted amount of data to be compressed are set to JCDTCM. The values of this register are reset before compression starts.



Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	DCM[7:0]	H'00	R	Invalid	Middle bytes of the counted amount of data to be compressed

44.2.13 JPEG Code Data Count Lower Register (JCDTCD)

The lower bytes for the counted amount of data to be compressed are set to JCDTCD. The values of this register are reset before compression starts.



Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 0	DCD[7:0]	H'00	R	Invalid	Lower bytes of the counted amount of data to be compressed

44.2.14 JPEG Interrupt Enable Register 0 (JINTE0)

JINTE0 enables interrupts.

When any of bits INT7 to INT5 is set to B'1, the INS5 bit in JINTS0 indicates B'1 as the error status upon occurrence of the compression data error, and the ERR bit in JCDERR indicates the particular error code.

Bit:	7	6	5	4	3	2	1	0
	INT7	INT6	INT5	—	INT3	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	Undefined	Undefined	Undefined	R	Undefined	R	R	R
R/W(decompress):	R/W	R/W	R/W	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7	INT7	0	Invalid	R/W	This bit enables an interrupt to be generated when the number of data in the restart interval of the Huffman-coding segment is not correct in decompression. When this bit is not set to enable interrupt generation, an error code is not returned.
6	INT6	0	Invalid	R/W	This bit enables an interrupt to be generated when the total number of data in the Huffman-coding segment is not correct in decompression. When this bit is not set to enable interrupt generation, an error code is not returned.
5	INT5	0	Invalid	R/W	This bit enables an interrupt to be generated when the final number of MCU data in the Huffman-coding segment is not correct in decompression. When this bit is not set to enable interrupt generation, an error code is not returned.
4	—	0		R	Reserved This bit is always read as 0. The write value should always be 0.
3	INT3	0	Invalid	R/W	This bit enables an interrupt to be generated when it has been determined that the image size and the subsampling setting of the compressed data can be read through analyzing the data.
2 to 0	—	All 0		R	Reserved These bits are always read as 0. The write value should always be 0.

44.2.15 JPEG Interrupt Status Register 0 (JINTS0)

JINTS0 identifies the interrupt sources.
The interrupt sources of this register should be cleared by clearing the corresponding interrupt status bits to 0 and setting the relevant bit in JCCMD appropriately.

Bit:	7	6	5	4	3	2	1	0
	—	INS6	INS5	—	INS3	—	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R	R/W*	Undefined	R	Undefined	R	R	R
R/W(decompress):	R	R/W*	R/W*	R	R/W*	R	R	R

Note: * Clear this bit by writing 0 to it.
Do not write 1 to this bit.

Bit	Bit Name	Initial Value	R/W: Compression	R/W: De-compression	Description
7	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
6	INS6	0	R/W*		This bit is set to 1 when the JCU completes compression process normally.
5	INS5	0	Invalid	R/W*	This bit is set to 1 when a compressed data error occurs.
4	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
3	INS3	0	Invalid	R/W*	This bit is set to 1 when the image size and pixel format can be read. When an interrupt occurs, this module stops processing and the state is indicated by the JCRST register. To make the JCU resume processing, set the JPEG core process stop clear command bit (JRST) in JCCMD.
2 to 0	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.

Note: * Clear this bit by writing 0 to it. Do not write 1 to this bit.

44.2.16 JPEG Code Decode Error Register (JCDERR)

JCDERR indicates the error code to identify the type of the error which has occurred in the compressed data analysis for decompression. The values of this register are reset before the JCU starts decompression.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	ERR[3:0]			
Initial value:	0	0	0	0	1	0	1	0
R/W(compress):	R	R	R	R	Undefined	Undefined	Undefined	Undefined
R/W(decompress):	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W: Compression	R/W: De-compression	Description
7 to 4	—	All 0	R		Reserved These bits are always read as 0.
3 to 0	ERR[3:0]	1010	Invalid	R/W	Error Code (See tables 44.3 and 44.4.)

44.2.17 JPEG Code Reset Register (JCRST)

JCRST indicates a processing-stopped state caused by requests to read the image size and pixel format (enabled by the INT3 bit in JINTE0). To resume processing, set the JPEG core process stop clear command bit (JRST) in JCCMD.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	RST
Initial value:	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R	R	R	R	R	Undefined
R/W(decompress):	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
7 to 1	—	All 0	R		Reserved These bits are always read as 0.
0	RST	0	Invalid	R/W	Operating State 0: State other than below 1: Suspended state caused by interrupt sources of JINTE0

44.2.18 JPEG Interface Compression Control Register (JIFECNT)

JIFECNT controls the compression process.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

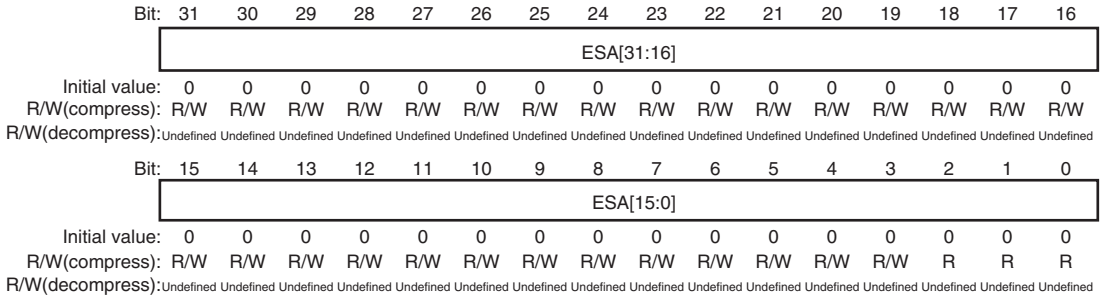
R/W(decompress):	R	Undefined	Undefined	Undefined	R	Undefined	Undefined	Undefined	R	Undefined	Undefined	Undefined	R	Undefined	Undefined	Undefined

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 15	—	All 0		R	Reserved These bits are always read as 0. The write value should always be 0.
14	JOUTRINI	0	R/W	Invalid	Address Initialization when Output Coded Data is Resumed This bit is only valid when the count mode for stopping the output of coded data is on. Set this bit before writing 1 to the data resume command bit. 0: The transfer address is not initialized when the output of coded data is restarted. 1: The transfer address is initialized when the output of coded data is restarted.
13	JOUTR CMD	0	R/W	Invalid	Output Coded Data Resume Command This bit is only valid when the count mode for stopping the output of coded data is on. Setting this bit to 1 resumes writing output coded data. This bit is always read as 0.
12	JOUTC	0	R/W	Invalid	Count Mode Setting for Stopping Output Coded Data 0: Count mode for stopping the output of coded data is off. 1: Count mode for stopping the output of coded data is on.
11	—	0		R	Reserved This bit is always read as 0. The write value should always be 0.
10 to 8	JOUT SWAP[2:0]	000	R/W	Invalid	Byte/Word/Longword Swap Output coded data in compression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap]
7	—	0		R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
6	DINRINI	0	R/W	Invalid	Address Initialization when Resuming Input of Image Data Lines This bit is only valid when the count mode for stopping the input of image data lines is on. Set this bit before writing 1 to the data-line resume command bit. 0: The transfer address is not initialized when the input of image data lines is restarted. 1: The transfer address is initialized when the input of image data lines is restarted.
5	DINRCMD	0	R/W	Invalid	Input Image Data Lines Resume Command This bit is valid only when the count mode for stopping the input of image data lines is on. Setting this bit to 1 resumes reading input image data. This bit is always read as 0.
4	DINLC	0	R/W	Invalid	Count Mode Setting for Stopping Input Image Data Lines 0: Count mode for stopping the input of image data lines is off. 1: Count mode for stopping the input of image data lines is on.
3	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	DINSWAP [2:0]	000	R/W	Invalid	Byte/Word Swap Input image data in compression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap]

44.2.19 JPEG Interface Compression Source Address Register (JIFESA)

JIFESA sets the source address of the input image data. This register should be set in 8-byte units.



Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 3	ESA[31:3]	H'0000	R/W	Invalid	Input Image Data Source Address (in 8-byte units)
2 to 0	ESA[2:0]	0000	R		The lower three bits should be set to 0.

44.2.20 JPEG Interface Compression Line Offset Register (JIFESOFST)

JIFESOFST sets the line offset of the input image data (refer to section 44.3.4, Storing Image Data). This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W: Compression	R/W: De-compression	Description
31 to 3	EDA[31:3]	H'0000	R/W	Invalid	Output Coded Data Destination Address (in 8-byte units)
2 to 0	EDA[2:0]	0000	R		The lower three bits should be set to 0.

44.2.22 JPEG Interface Compression Source Line Count Register (JIFESLC)

JIFESLC sets the number of input image data lines when the count mode for stopping the input of image data lines is on (the DINLC bit in JIFECNT is set to 1). This register should be set in 8-line units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W(decompress):	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 16	—	H'FFF8	R		Reserved Values read from these bits are undefined. The write value should always be 0.
15 to 3	LINES[15:3]	H'FFF8	R/W	Invalid	Number of Input Image Data Lines to be Read (in 8-line units)
2 to 0	LINES[2:0]		R		The lower three bits should be set to 0.

44.2.23 JPEG Interface Compression Destination Count Register (JIFEDDC)

JIFEDDC sets the amount of output coded data when the count mode for stopping the output of coded data is on (the JOUTC bit in JIFECNT is set to 1). This register should be set in 8-byte units.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W(decompress):	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 16	—	H'FFF8	R	Invalid	Reserved Values read from these bits are undefined. The write value should always be 0.
15 to 3	JDATAS[15:3]	H'FFF8	R/W	Invalid	Amount of Output Coded Data to be Written (in 8-byte units)
2 to 0	JDATAS[2:0]		R		The lower three bits should be set to 0.

44.2.24 JPEG Interface Decompression Control Register (JIFDCNT)

JIFDCNT controls the decompression process.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	VINTER[1:0]		HINTER[1:0]		OPF[1:0]		—	—	—	—	—	—	—	—

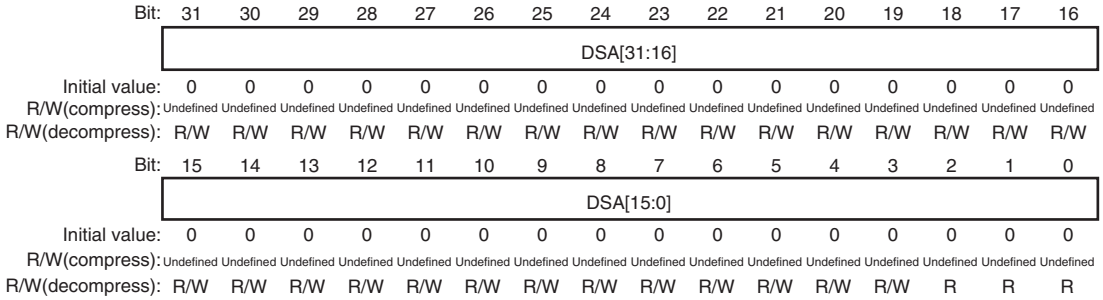
R/W(compress):	R	Undefined			R	Undefined			R	Undefined			R	Undefined		
R/W(decompress):	R	R/W			R	R/W			R	R/W			R	R/W		

Bit	Bit Name	Initial Value	R/W: Compression	R/W: De-compression	Description
31, 30	—	All 0		R	Reserved These bits are always read as 0. The write value should always be 0.
29, 28	VINTER[1:0]	00	Invalid	R/W	Vertical Subsampling Subsamples vertical output image data. 00: No subsampling 01: Subsamples output data into 1/2. 10: Subsamples output data into 1/4. 11: Subsamples output data into 1/8.
27, 26	HINTER[1:0]	00	Invalid	R/W	Horizontal Subsampling Subsamples horizontal output image data. 00: No subsampling 01: Subsamples output data into 1/2. 10: Subsamples output data into 1/4. 11: Subsamples output data into 1/8.
25, 24	OPF[1:0]	00	Invalid	R/W	Specifies output image data pixel format. 00: YCbCr422 01: ARGB8888 10: RGB565 11: Setting prohibited
23 to 15	—	All 0		R	Reserved These bits are always read as 0. The write value should always be 0.
14	JINRINI	0	Invalid	R/W	Address Initialization when Input Coded Data is Resumed This bit is only valid when the count mode for stopping the input of coded data is on. Set this bit before writing 1 to the data resume command bit. 0: The transfer address is not initialized when the input of coded data is restarted. 1: The transfer address is initialized when the input of coded data is restarted.
13	JINRCMD	0	Invalid	R/W	Input Coded Data Resume Command This bit is valid only when the count mode for stopping the input of coded data is on. Setting this bit to 1 resumes reading input coded data. This bit is always read as 0.
12	JINC	0	Invalid	R/W	Count Mode Setting for Stopping Input Coded Data 0: Count mode for stopping the input of coded data is off. 1: Count mode for stopping the input of coded data is on.
11	—	0		R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
10 to 8	JINSWAP [2:0]	000	Invalid	R/W	Byte/Word/Longword Swap Input coded data in decompression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap]
7	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
6	DOUTRINI	0	Invalid	R/W	Address Initialization when Resuming Output of Image Data Lines This bit is only valid when the count mode for stopping the output of image data lines is on. Set this bit before writing 1 to the data-line resume command bit. 0: The transfer address is not initialized when the output of lines of image data is restarted. 1: The transfer address is initialized when the output of lines of image data is restarted.
5	DOUTRCMD	0	Invalid	R/W	Output Image Data Lines Resume Command This bit is valid only when the count mode for stopping the output of image data lines is on. Setting this bit to 1 resumes writing image data. This bit is always read as 0.
4	DOUTLC	0	Invalid	R/W	Count Mode for Stopping Output Image Data Lines 0: Count mode for stopping the output of image data lines is off. 1: Count mode for stopping the output of image data lines is on.
3	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	DOUTSWAP [2:0]	000	Invalid	R/W	Byte/Word Swap Output image data in decompression is swapped. 000: (1) (2) (3) (4) (5) (6) (7) (8) 001: (2) (1) (4) (3) (6) (5) (8) (7) [Byte swap] 010: (3) (4) (1) (2) (7) (8) (5) (6) [Word swap] 011: (4) (3) (2) (1) (8) (7) (6) (5) [Word - byte swap] 100: (5) (6) (7) (8) (1) (2) (3) (4) [Longword swap] 101: (6) (5) (8) (7) (2) (1) (4) (3) [Longword - byte swap] 110: (7) (8) (5) (6) (3) (4) (1) (2) [Longword - word swap] 111: (8) (7) (6) (5) (4) (3) (2) (1) [Longword - word - byte swap]

44.2.25 JPEG Interface Decompression Source Address Register (JIFDSA)

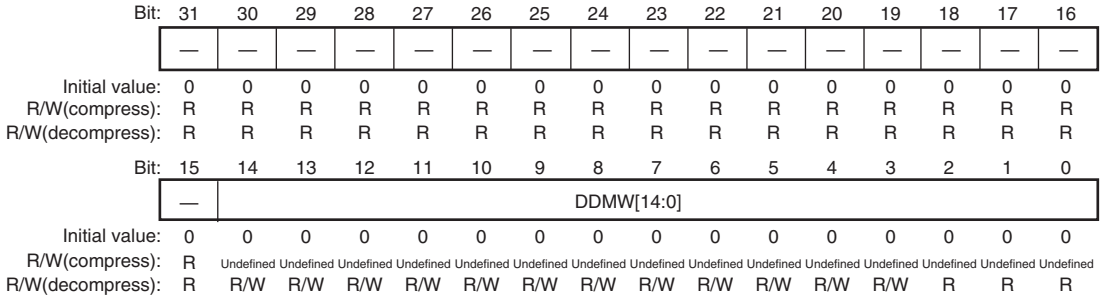
JIFDSA sets the source address of the input coded data. This register should be set in 8-byte units.



Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 3	DSA[31:3]	H'0000 0000	Invalid	R/W	Input Coded Data Source Address (in 8-byte units)
2 to 0	DSA[2:0]			R	The lower three bits should be set to 0.

44.2.26 JPEG Interface Decompression Line Offset Register (JIFDDOFST)

JIFDDOFST sets the line offset of the output image data to be transferred to the external buffer (refer to section 44.3.4, Storing Image Data). This register should be set in 8-byte units.



Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 16	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
15 to 3	DDMW[14:3]	H'0000	Invalid	R/W	Output Image Data Lines Offset (in 8-byte units)
2 to 0	DDMW[2:0]			R	The lower three bits should be set to 0.

44.2.27 JPEG Interface Decompression Destination Address Register (JIFDDA)

JIFDDA sets the destination address of the output image data. This register should be set in 8-byte units.

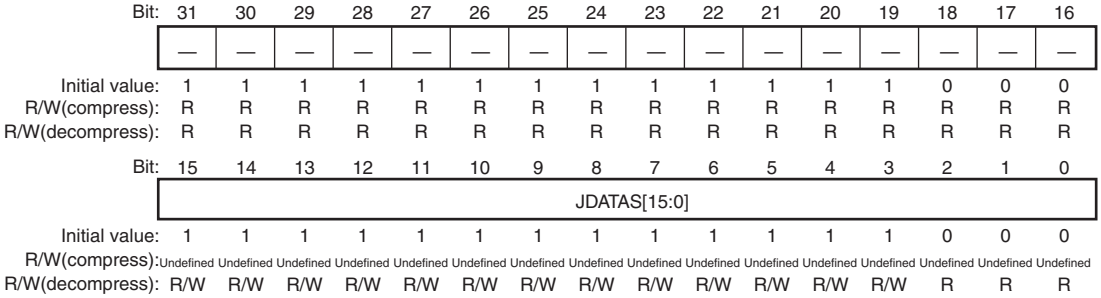
Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DDA[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(compress):	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
R/W(decompress):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DDA[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(compress):	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
R/W(decompress):	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 3	DDA[31:3]	H'0000 0000	Invalid	R/W	Output Image Data Destination Address (in 8-byte units)
2 to 0	DDA[2:0]			R	The lower three bits should be set to 0.

44.2.28 JPEG Interface Decompression Source Data Count Register (JIFDSDC)

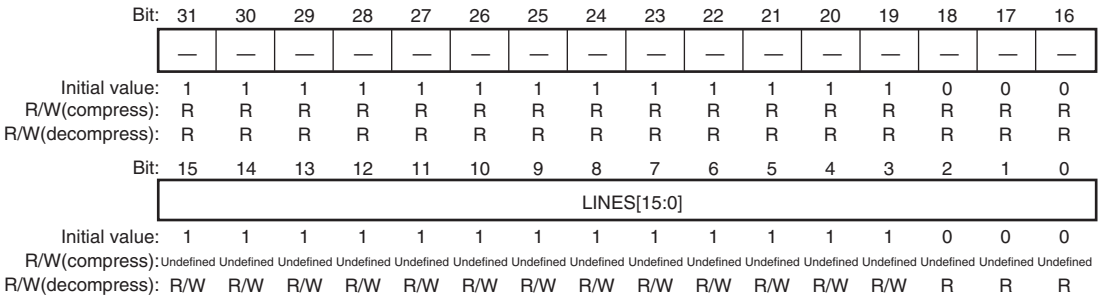
JIFDSDC sets the amount of input coded data when the count mode for stopping the input of coded data is on (the JINC bit in JIFDCNT is set to 1). This register should be set in 8-byte units.



Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 16	—	H'FFF8	R		Reserved Values read from these bits are undefined. The write value should always be 0.
15 to 3 2 to 0	JDATAS[15:3] JDATAS[2:0]	H'FFF8	Invalid	R/W R	Amount of Input Coded Data to be Read (in 8-byte units)The lower three bits should be set to 0.

44.2.29 JPEG Interface Decompression Destination Line Count Register (JIFDDLC)

JIFDDLC sets the number of lines of output image data when the count mode for stopping the output of image data lines is on (the DOUTLC bit in JIFECNT is set to 1). This register is used to set the number of lines of output image data in MCU units.



Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 16	—	H'FFF8	R		Reserved Values read from these bits are undefined. The write value should always be 0.
15 to 3 2 to 0	LINES[15:3] LINES[2:0]	H'FFF8	Invalid	R/W R	Specify the number of lines of output image data to be written. The setting is in MCU units. When data are to be output in YCbCr444, YCbCr422 or YCbCr411 format, the number of lines of output image data is <this setting> x 1. When data are to be output in YCbCr420 format, the number of lines of output image data is <this setting> x 2. The lower three bits should be set to 0.

44.2.30 JPEG Interface Decompression α Set Register (JIFDADT)

JIFDADT is used to set the α value when output is in ARGB8888 format.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W(decompress):	R	R	R	R	R	R	R	R	R	Undefined	Undefined	Undefined	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W: Compression	R/W: De-compression	Description
31 to 7	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
6	CBTEN	0	R/W	Invalid	Enables or disables a data transfer processing interrupt request (JDTI) when the CBTF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
5	DINLEN	0	R/W	Invalid	Enables or disables a data transfer processing interrupt request (JDTI) when the DINLF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
4	JOUTEN	0	R/W	Invalid	Enables or disables a data transfer processing interrupt request (JDTI) when the JOUTF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
3	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
2	DBTEN	0	Invalid	R/W	Enables or disables a data transfer processing interrupt request (JDTI) when the DBTF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
1	JINEN	0	Invalid	R/W	Enables or disables a data transfer processing interrupt request (JDTI) when the JINF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.
0	DOUTLEN	0	Invalid	R/W	Enables or disables a data transfer processing interrupt request (JDTI) when the DOUTLF bit in JINTS1 is set to 1. 0: Disables an interrupt request. 1: Enables an interrupt request.

44.2.32 JPEG Interrupt Status Register 1 (JINTS1)

JINTS1 indicates the interrupt sources.

The interrupt sources of this register should be cleared by writing 0 to this register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—	—	CBTF	DINLF	JOUTF	—	DBTF	JINF	DOUTLF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R	R	R	R	R	R	R	R/W*	R/W*	R/W*	R	Undefined	Undefined	Undefined
R/W(decompress):	R	R	R	R	R	R	R	R	R	Undefined	Undefined	Undefined	R	R/W*	R/W*	R/W*

Note: * When the bit is read as 1, write 0 to clear it.
When the bit is read as 0, write 1 to it.

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 7	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
6	CBTF	0	R/W*	Invalid	This bit is set to 1 when the last output coded data is written in compression.
5	DINLF	0	R/W*	Invalid	This bit is set to 1 when the number of input image data lines indicated by JIFESLC is read in compression. This bit is valid only when the DINLC bit in JIFECNT is set to 1.
4	JOUTF	0	R/W*	Invalid	This bit is set to 1 when the amount of output coded data indicated by JIFEDDC is written in compression. This bit is valid only when the JOUTC bit in JIFECNT is set to 1.
3	—	0	R		Reserved This bit is always read as 0. The write value should always be 0.
2	DBTF	0	Invalid	R/W*	This bit is set to 1 when the last output image data is written in decompression.
1	JINF	0	Invalid	R/W*	This bit is set to 1 when the amount of input coded data indicated by JIFDSDC is read in decompression. This bit is valid only when the JINC bit in JIFDCNT is set to 1.
0	DOUTLF	0	Invalid	R/W*	In decompression, this bit is set to 1 when the number of lines of output image data indicated by JIFDDLC have been written. This bit is only valid when the DOUTLC bit in JIFDCNT is set to 1.

Note: * When the bit is read as 1, write 0 to clear it.
When the bit is read as 0, write 1 to it.

44.2.33 JPEG Input Image Data CbCr Range Setting Register (JIFESVSZ)

JIFESVSZ sets the CbCr range of input image data.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(compress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(decompress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W(decompress):	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DOUTYCHG	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W(compress):	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
R/W(decompress):	Undefined	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W		Description
			Compression	De-compression	
31 to 16	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.
15	DOUTYCHG	0	Invalid	R/W	Output Image Data CbCr Range Setting 0: Range from -128 to 127 1: Range from 0 to 255
14 to 0	—	All 0	R		Reserved These bits are always read as 0. The write value should always be 0.

44.3 Operation

44.3.1 Compression

(1) Overview of Processing

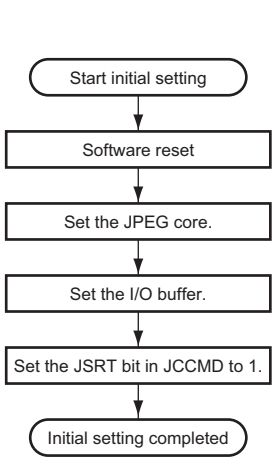
The compression process flows are described below.

1. The JPEG core is activated.
   A marker is output. (After a marker is output, image data can be input.)
   Approximately 30,000 cycles (necessary for making SOI to SOS markers)
2. Image data is transferred in MCUs from the external buffer to the JCU.
   If the count mode for stopping the input of image data lines is on, reading is stopped each time the number of lines set in JIFESLC is read. Reading is resumed by setting the DINRCMD bit in JIFECNT to 1.
   When the DINRINI bit in JIFECNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
   When the DINRINI bit is one, the address set in JIFESA is used on resumption.
   Reading is also stopped when one frame of image data is completely transferred.
   If the count mode for stopping the input of image data lines is off, reading is continued until one frame of image data is completely transferred.
3. Image data is input to the JPEG core.
   The input data is processed in MCUs at any time in the JPEG core.
4. Coded data is transferred from the JCU to the external buffer.
   When the count mode for stopping the output of coded data is on, writing is stopped each time the amount of coded data set in JIFEDDC is written. Writing is resumed by setting the JOUTRCMD bit in JIFECNT to 1.
   When the JOUTRINI bit in JIFECNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.
   When the JOUTRINI bit is one, the address set in JIFEDA is used on resumption.
   Writing is also stopped when one frame of coded data is completely transferred.
   If the count mode for stopping the output of coded data is off, writing is continued until one frame of coded data is completely transferred.
5. Compression is completed after one frame of data is processed completely.

(2) Flowchart (Compression)

(a) Initial Settings

After completing the JPEG core settings and input/output buffer settings and transferring image data to the external buffer, activate this module by setting the JSRT bit in JCCMD to 1. After the JCU has been activated, the JPEG markers (SOI to SOS) are generated and output. It takes approximately 30,000 cycles to generate the markers.



Software reset
Reset this module in advance by setting the SRST21 bit in SWRSTCR2 of the power-down modes.

JPEG core settings

Pixel format setting:	REDU bits in JCMOD
Compression setting:	DSP bit in JCMOD
Quantization table number setting:	JCQTN
Huffman table number setting:	JCHTN
DRI setting:	JCDRIU, JCDRID
Vertical image size setting:	JCVSZU, JCVSZD
Horizontal image size setting:	JCHSZU, JCHSZD
Quantization table setting:	JCQTBL0 to JCQTBL3
Huffman table setting:	JCHTBD0, JCHTBD1, JCHTBA0, JCHTBA1

I/O buffer settings

Byte/word/longword swap setting:	JOUTSWAP, DINSWAP bits in JIFECNT
Input data line stop count mode setting:	DINLC bit in JIFECNT
Address initialization setting for resumption of input image data:	DINRINI bit in JIFECNT
Output coded data stop count mode setting:	JOUTC bit in JIFECNT
Address initialization setting for resumption of output coded data:	JOUTRINI bit in JIFECNT
Source address setting:	JIFESA
Line offset setting:	JIFESOFST
Destination address setting:	JIFEDA
Source line count setting:	JIFESLC
Destination count setting:	JIFEDDC
Interrupt settings:	CBTEN, DINLEN, JOUTEN bits in JINTE1

Figure 44.2 Compression Initial Setting Flow

(b) Compression Process

The compression process flows are described below.

- When JPEG compression process has been completed, the INS6 bit in JINTS0 is set to 1. However, the JCU continues processing since the coded data remains to be transferred. The CBTF bit in JINTS1 is set to 1 when the last coded data is transferred. The interrupt source is cleared by writing 0 to the INS6 bit. However, the interrupt request asserted by this interrupt source cannot be cleared by writing 0 to the INS6 bit. Set an interrupt request clear command (by setting the JEND bit in JCCMD to 1) to clear the interrupt request.
- When the JCU has completed compression and all coded data has been transferred, the CBTF flag in JINTS1 is set to 1. When the CBTEN bit in JINTE1 is 1 here, an interrupt is generated. The interrupt source is cleared by writing 0 to the CBTF flag.
- If the count mode for stopping image data lines is on, when the specified number of image data lines set in JIFESLC has been read, the DINLF flag in JINTS1 is set to 1, and reading is stopped. When the DINLEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the DINLEN bit. Setting the DINRCMD bit in JIFECNT to 1 resumes reading.
  When the DINRINI bit in JIFECNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
  When the DINRINI bit is one, the address set in JIFESA is used on resumption.
- If the count mode for stopping the output of coded data is on, when the specified amount of coded data set in JIFEDDC has been written, the JOUTF flag in JINTS1 is set to 1, and writing is stopped. When the JOUTEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the JOUTF bit. Setting the JOUTRCMD bit in JIFECNT to 1 resumes writing.

When the JOUTRINI bit in JIFECNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.
When the JOUTRINI bit is one, the address set in JIFEDA is used on resumption.

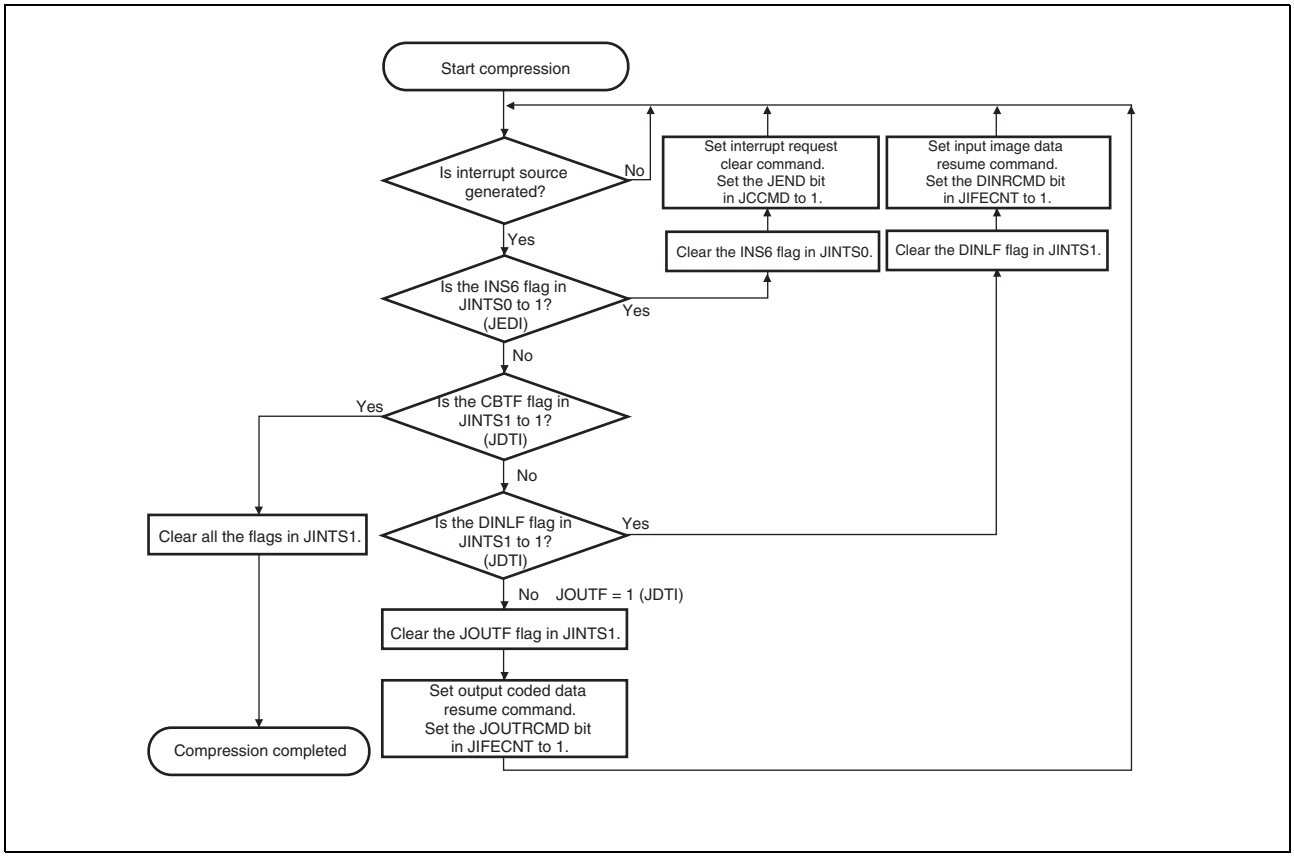


Figure 44.3 Compression Process Flow

(3) JPEG Coded Data Format

Figure 44.4 shows the data output stream in compression. The amount of coded data from SOI to EOI is indicated by JCDTCU, JCDTCM, and JCDTCD. When both JCDRIU and JCDRID are set to H'0000 0000, the following markers are not output.

- DRI marker
- RST marker (in compressed image data)

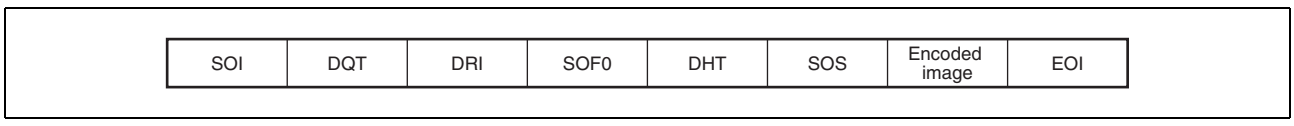

Figure 44.4 JPEG Coded Data Format

DQT: Not output for unused table.
DHT: Output in order DC0, AC0, DC1, and AC1. Not output for unused table.
SOF0: Component identifiers are C1 = first color component, C2 = second color component, and C3 = third color component.
SOS: Scan component selectors are CS1 = first color component, CS2 = second color component, and CS3 = third color component.

Header Volume (Reference):

- SOI: 2 bytes (FFD8)
- DQT: 134 bytes when two quantization tables are used, 199 bytes when three quantization tables are used (±65 bytes/table increase or decrease)
- DRI: 6 bytes
- SOF0: 19 bytes (4:2:2)
- DHT: 420 bytes (two tables are used)
- SOS: 14 bytes (4:2:2)
- EOI: 2 bytes (FFD9)

(4) Table Setting

(a) Quantization Table Specification

The order of addresses shown in 8 × 8 blocks corresponds to that of the register addresses. Do not access this table while the JCU is in processing.

Table 44.2 Quantization Table

00	01	02	03	04	05	06	07
08	09	0A	0B	0C	0D	0E	0F
10	11	12	13	14	15	16	17
18	19	1A	1B	1C	1D	1E	1F
20	21	22	23	24	25	26	27
28	29	2A	2B	2C	2D	2E	2F
30	31	32	33	34	35	36	37
38	39	3A	3B	3C	3D	3E	3F

JCQTBL0 (H'E801 7100) = H'00
JCQTBL0 (H'E801 7101) = H'01
JCQTBL0 (H'E801 7102) = H'02
JCQTBL0 (H'E801 7103) = H'03
:
JCQTBL0 (H'E801 713F) = H'3F

(b) Huffman Table Specification

Examples of the Huffman table specification given in the ITU-T T81 Annex K.3.3 recommended by JPEG are shown below. In compression, the following settings must be specified for all the codes so that Huffman codes can be generated for all the group numbers.

- DC Huffman table: The number of codes for each code length is 12.
  The group numbers in order of frequency of occurrence are 12.
- AC Huffman table: The number of codes for each code length is 162.
  The zero run length/the group numbers in order of frequency of occurrence are 162.

Do not access the following tables while the JCU is in processing. In particular, read access is prohibited.

- able K.3/T81
  JCHTBD0 (H'E801 7200) = H'00
  JCHTBD0 (H'E801 7201) = H'01
  JCHTBD0 (H'E801 7202) = H'05
  JCHTBD0 (H'E801 7203) = H'01
  :
  JCHTBD0 (H'E801 721B) = H'0B

- Table K.4/T81
  JCHTBD1 (H'E801 7300) = H'00
  JCHTBD1 (H'E801 7301) = H'03

  JCHTBD1 (H'E801 7303) = H'01
  :
  JCHTBD1 (H'E801 731B) = H'0B

- Table K.5/T81
  JCHTBA0 (H'E801 7220) = H'00
  JCHTBA0 (H'E801 7221) = H'02
  JCHTBA0 (H'E801 7222) = H'01
  JCHTBA0 (H'E801 7223) = H'03
  :
  JCHTBA0 (H'E801 72D1) = H'FA

- Table K.6/T81
  JCHTBA1 (H'E801 7320) = H'00
  JCHTBA1 (H'E801 7321) = H'02
  JCHTBA1 (H'E801 7322) = H'01
  JCHTBA1 (H'E801 7323) = H'02
  :
  JCHTBA1 (H'E801 73D1) = H'FA

(5) Input Pixel Format

Image data in the YCbCr422 format can be input to this module. Allocation of data in the YCbCr422 format can be changed by the DINSWAP bits in JIFECNT as shown below.

- When the DINSWAP bits = 000

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Y0 8 bits	Cb0 8 bits	Y1 8 bits	Cr0 8 bits	Y2 8 bits	Cb1 8 bits	Y3 8 bits	Cr1 8 bits

- When the DINSWAP bits = 001

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Cb0 8 bits	Y0 8 bits	Cr0 8 bits	Y1 8 bits	Cb1 8 bits	Y2 8 bits	Cr1 8 bits	Y3 8 bits

- When the DINSWAP bits = 010

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Y1 8 bits	Cr0 8 bits	Y0 8 bits	Cb0 8 bits	Y3 8 bits	Cr1 8 bits	Y2 8 bits	Cb1 8 bits

- When the DINSWAP bits = 100

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Y2 8 bits	Cb1 8 bits	Y3 8 bits	Cr1 8 bits	Y0 8 bits	Cb0 8 bits	Y1 8 bits	Cr0 8 bits

- When the DINSWAP bits = 101

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Cb1 8 bits	Y2 8 bits	Cr1 8 bits	Y3 8 bits	Cb0 8 bits	Y0 8 bits	Cr0 8 bits	Y1 8 bits

- When the DINSWAP bits = 110

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Y3 8 bits	Cr1 8 bits	Y2 8 bits	Cb1 8 bits	Y1 8 bits	Cr0 8 bits	Y0 8 bits	Cb0 8 bits

- When the DINSWAP bits = 111

b63 b56	b55 b48	b47 b40	b39 b32	b31 b24	b23 b16	b15 b8	b7 b0
Cr1 8 bits	Y3 8 bits	Cb1 8 bits	Y2 8 bits	Cr0 8 bits	Y1 8 bits	Cb0 8 bits	Y0 8 bits

(6) Output Coded Data

In the case of compression, coded data are output. This module handles the output of coded data in 16-bit units. For this reason, if the coded data have an odd code length (are fractional), the final code for output will be H'D9FF.
The JOUTSWAP bits in JIFECNT can be used to alter the arrangement of coded data in the output.

44.3.2 Decompression

(1) Overview of Processing

The decompression process flows are described below.

1. The JPEG core is activated.
2. Coded data is transferred from the external buffer to the JCU.
   If the count mode for stopping the input of coded data is on, reading is stopped each time the amount of coded data set in JIFDSLC is read. Reading is resumed by setting the JINRCMD bit in JIFDCNT to 1. When the JINRINI bit in JIFDCNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
   When the JINRINI bit is one, the address set in JIFDSA is used on resumption. Reading is stopped when the end of the coded data is detected.
   If the count mode for stopping the input of coded data is off, reading is continued until the end of code is detected. With this module, more coded data may be read than the coded data size since coded data reading is continued until the end of code is detected.
3. Coded data is input to the JPEG core.
   The input data is processed in MCUs at any time in the JPEG core.
4. Image data is transferred in MCUs from the JCU to the external buffer.
   When the count mode for stopping the output of image data lines is on, writing is stopped each time the number of image data lines set in JIFDDLC is written. Writing is resumed by setting the DOUTRCMD bit in JIFECNT to 1. When the DOUTRINI bit in JIFDCNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.
   When the DOUTRINI bit is one, the address set in JIFDDA is used on resumption. Writing is stopped when one frame of image data is completely transferred.
   If the count mode for stopping the output of image data lines is off, writing is continued until one frame of image data is completely transferred.
5. Decompression is completed after one frame of data is processed completely.

(a) Initial Settings

- When the INT3 bit in JINTE0 is set to 0:
  After completing the JPEG core settings and input/output buffer settings and transferring coded data to the external buffer, activate this module by setting the JSRT bit in JCCMD to 1.
- When the INT3 bit in JINTE0 is set to 1:
  After completing the JPEG core settings and input buffer settings and transferring coded data to the external buffer, activate this module by setting the JSRT bit in JCCMD to 1.
  When the image size and pixel format become readable after the coded data has been decompressed, the INS3 bit in JINTS0 is set. At this time, decompression is temporarily stopped.
  After the image size and pixel format have been read, set the output buffer.
  Setting the JRST bit in JCCMD to 1 after interrupt handling resumes decompression.

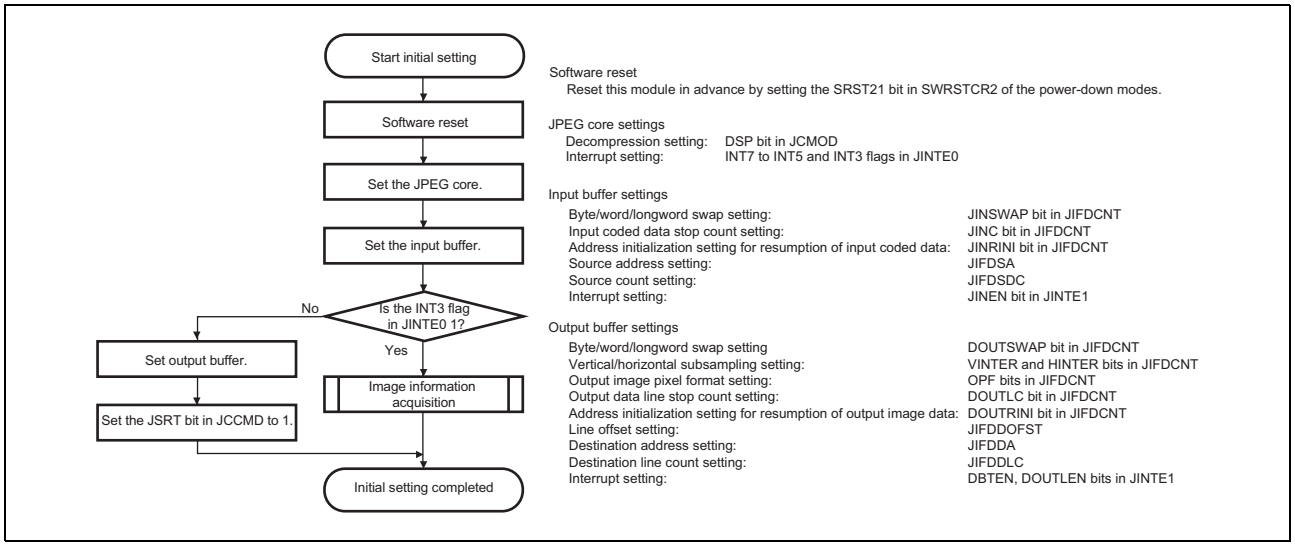

Figure 44.5 Decompression Initial Setting Flow

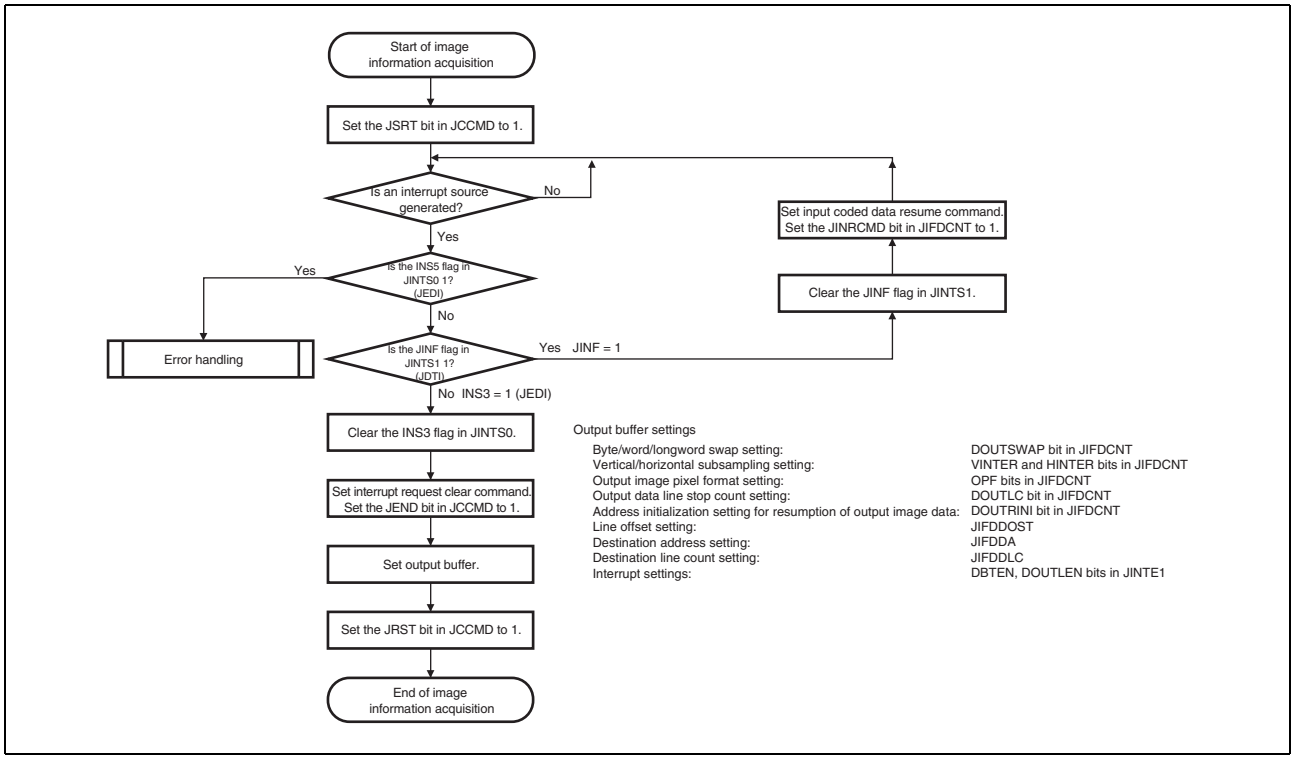

Figure 44.6 Image Information Acquisition Flow

(b) Decompression Process

The decompression process flows are described below.

- When JPEG decompression process has been completed, the INS6 bit in JINTS0 is set to 1. However, the JCU continues processing since the image data remains to be transferred. The DBTF bit in JINTS1 is set to 1 when the last image data is transferred. The interrupt source is cleared by writing 0 to the INS6 bit. However, the interrupt request asserted by this interrupt source cannot be cleared by writing 0 to the INS6 bit. Set an interrupt request clear command (by setting the JEND bit in JCCMD to 1) to clear the interrupt request.
- When the JCU has completed decompression process and all image data has been transferred, the DBTF flag in JINTS1 is set to 1. When the DBTEN bit in JINTE1 is 1 here, an interrupt is generated. The interrupt source is cleared by writing 0 to the DBTF flag.
- If the count mode for stopping input coded data is on, when the specified amount of coded data set in JIFDSDC have been read, the JINF flag in JINTS1 is set to 1, and reading is stopped. When the JINEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the JINF bit. Setting the JINRCMD bit in JIFDCNT to 1 resumes reading.
  When the JINRINI bit in JIFDCNT is zero, the addresses for reading on resumption are continued from the addresses in the previous round of transfer.
  When the JINRINI bit is one, the address set in JIFDSA is used on resumption.
- If the count mode for stopping the output image data is on, when the specified number of image data lines set in JIFDDLC have been written, the DOUTLF flag in JINT1 is set to 1, and writing is stopped. When the DOUTLEN bit in JINTE1 is 1 here, an interrupt is generated. An interrupt source is cleared by writing 0 to the DOUTLF bit. Setting the DOUTRCMD bit in JIFDCNT to 1 resumes writing.
  When the DOUTRINI bit in JIFDCNT is zero, the addresses for writing on resumption are continued from the addresses in the previous round of transfer.
  When the DOUTRINI bit is one, the address set in JIFDDA is used on resumption.

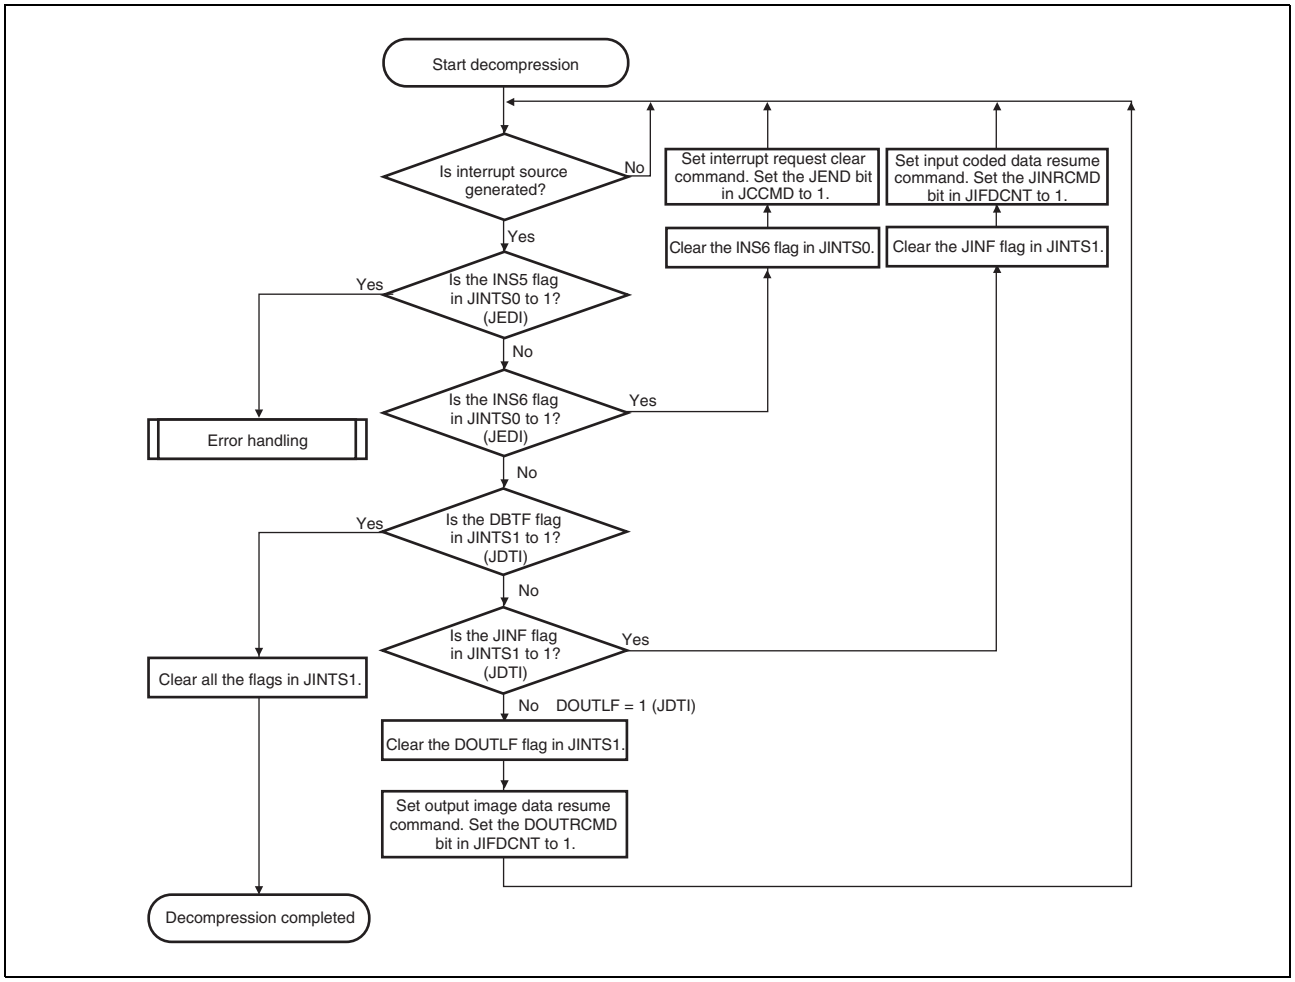

Figure 44.7 Decompression Process Flow

(c) Error Handling

If the INS5 bit in JINTS0 is 1, it indicates that there is an error in the input JPEG coded data and that the decompression process by this module has been ended. Read the ERR bits in JCDERR to determine the cause of the error. The interrupt signal asserted due to the interrupt source indicated by the INS5 bit cannot be negated by clearing the interrupt status through 0-writing. To clear the interrupt request, set the interrupt request clear command (by setting the JEND bit in JCCMD to 1).
If decompression or compression is to proceed after error handling is completed, start by making the initial settings.

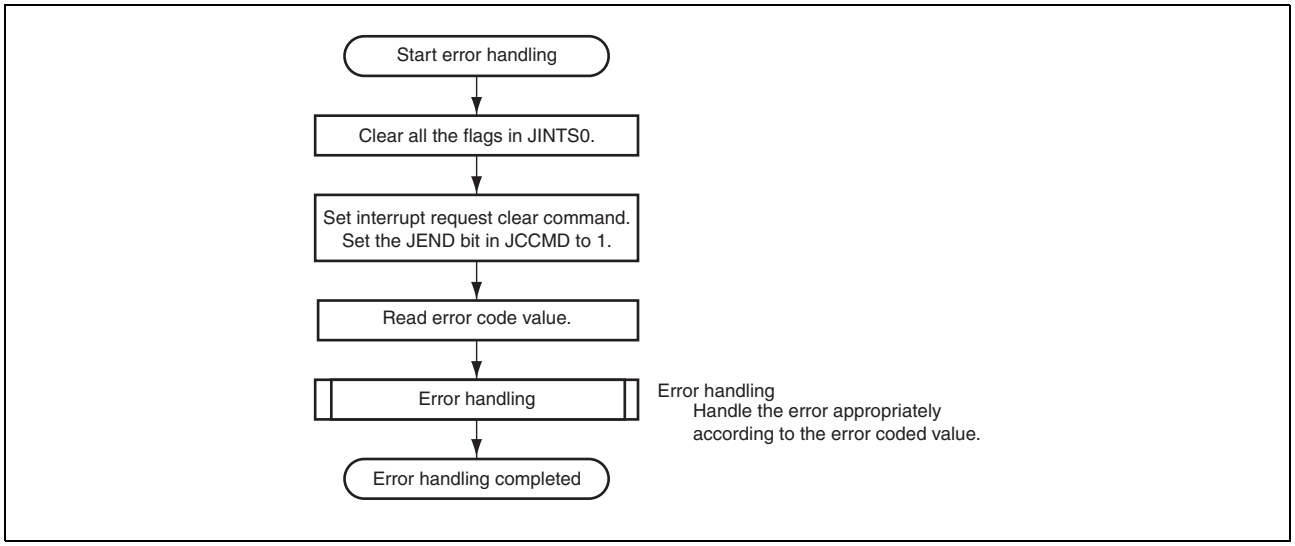

Figure 44.8 Error Handling Flow

(2) Input JPEG Coded Data

Markers to be processed in decompression are SOI, SOF0, SOS, DQT, DHT, DRI, RSTm, and EOI. Other markers except for the error markers shown below are ignored even if they are read.
The JINSWAP bits in JIFDCNT can be used to alter the arrangement for the input of coded data.

(3) JPEG Decompression Errors

(a) Error Marker

If a marker error is found while analyzing compressed data for decompression, the code to identify the error type (shown in Table 44.3) is set to ERR bits in JCDERR. When an error is detected, the JCU generates an interrupt signal and terminates decoding. The stored code value will be set to B'1010 (default value) at the start of processing of the next frame or after a bus reset.

Table 44.3 Decompression Error Codes

Code	Description
B'0000	Normal
B'0001	SOI not detected: SOI not detected until EOI detected
B'0010	SOF1 to SOFF detected
B'0011	Unprovided pixel format detected
B'0100	SOF accuracy error: Other than 8 detected
B'0101	DQT accuracy error: Other than 0 detected
B'0110	Component error 1: The number of SOF0 header components detected is other than 1, 3, or 4
B'0111	Component error 2: The number of components differs between SOF0 header and SOS
B'1000	SOF0, DQT, and DHT not detected when SOS detected
B'1001	SOS not detected: SOS not detected until EOI detected
B'1010	EOI not detected (default)
B'1011	Restart interval data number error detected
B'1100	Image size error detected
B'1101	Last MCU data number error detected
B'1110	Block data number error detected

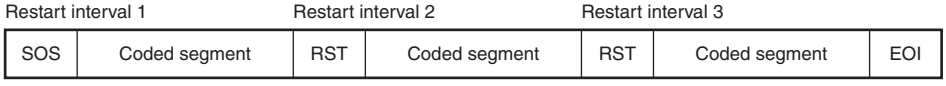
(b) Huffman Coded Segment Error

During the compressed data analysis in decompression operation, if there is an increase or decrease in the decoded data count due to an error resulting from bit reversal or missing data in the Huffman-coded segment, determine the error type, and set the error code in the ERR bit in JCDERR. Table 44.4 lists the segment error codes. The error code is set, interrupt signal is issued, and the process is ended only if the bits INT7 to INT5 in JINTE0 corresponding to the detected error is set to 1. The set code value will turn to the default value (B'1010) at the start of processing of the next frame or after a bus reset.

However, in this error detection, if an error in the Huffman-coded segment does not result in an alteration in the decoded data count, the error will go undetected.

[Example]

The number of data in a Huffman coded segment with pixel format setting YCbCr422, DRI = 2, X = 80 pixels, and Y = 8 pixels



- Number of data in the last MCU: Pixel format setting is YCbCr422, the number of data to be decoded in each MCU is 256.
- Number of data in the restart interval: In restart intervals 1 and 2, there are data of two MCUs; the number of data to be decoded is 512.
- Image size: The total number of data to be decoded is 1280.

Figure 44.9 Huffman Coded Segment

Table 44.4 Segment Error Codes

Code	Description
B'0000	Normal
B'1011	Restart interval data number error: The number of data in each interval is compared with the number of data specified by the DRI marker. If an interval has more or less data that is specified by the DRI marker, the decompression error code (1011) is set. The last interval which is shorter than the restart interval is not compared. If the DRI marker segment is not placed or the specified number is 00, an error is not detected even if the RSTm marker is placed. Also an m which indicates the order of RSTm marker modulo 8 (m = 0 to 7) is exempt from the error detection analysis. When the INT7 bit in JINTE0 is set to 0, this error is not detected.
B'1100	Image size error: The data number of an image which is calculated from the number of lines specified by the frame parameter and the number of samples per line is compared with the total number of data from SOS to EOI (in pixel units). If the numbers of data do not match, the decompression error code (1100) is set. When the INT6 bit in JINTE0 is set to 0, this error is not detected. The data number of an image is shown in MCU units. Thus the number of lines and the number of samples per line for calculation need to be shown in MCU units.
B'1101	Last MCU data number error: Whether the number of data in the MCUs at the EOI detection is shown in MCU units is checked and fractions are detected. If error (1100) occurs simultaneously, error (1100) has priority. When the INT5 bit in JINTE0 is set to 0, this error is not detected.
B'1110	Block data number error: Whether a block is an 8 × 8 array is checked; the check is performed for fractions. When bits INT7 to INT5 in JINTE0 are all set to 0, this error is not detected.

44.3.3 Output Pixel Format in Decompression

This module is capable of decompressing JPEG encoded data created in the YCbCr444, YCbCr422, YCbCr411 and YCbCr420 formats. The pixel format of the output image will be YCbCr422, ARGB8888, or RGB565. The flow of conversion of decompressed data to the given output pixel format is shown below.

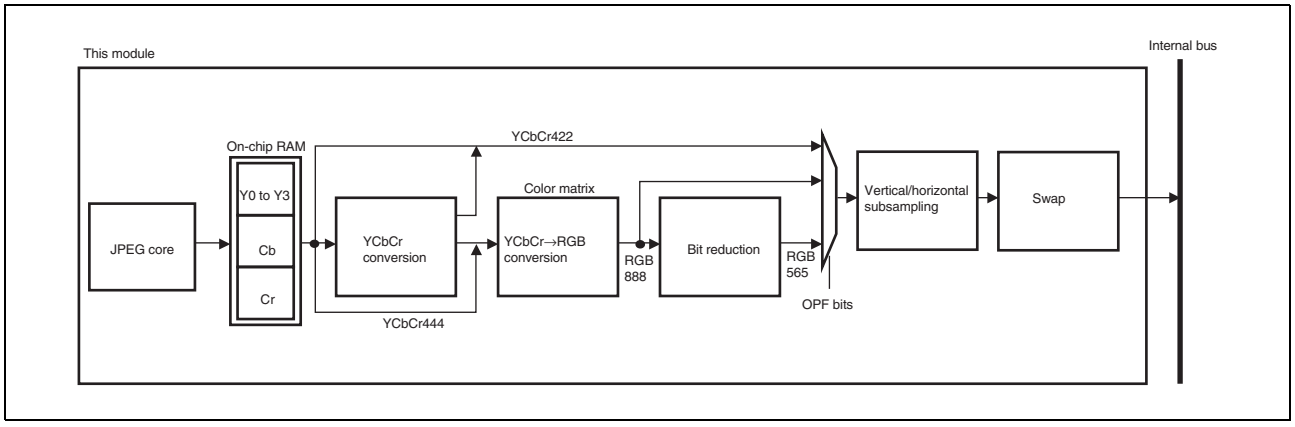


Figure 44.10 Block Diagram of Output Pixel Format Conversion in Decompression

(1) On-chip RAM

Data decoded by the JPEG core are stored in MCUs on RAM in this module.

(2) YCbCr Conversion

When data are to be output in the ARGB8888 or RGB565 format, data in the YCbCr422, YCbCr411 or YCbCr420 format are first converted to the YCbCr444 format.

When data are to be output in the YCbCr422 format, data in the YCbCr444, YCbCr411 or YCbCr420 format are converted to the YCbCr422 format.

Conversion is performed using simple interpolation.

(3) YCbCr → RGB Conversion

Data in the YCbCr444 format are converted to the RGB888 format. The following formulae are used.

R = 1.000Y + 1.402Cr

G = 1.000Y - 0.344Cb - 0.714Cr

B = 1.000Y + 1.772Cb

(4) Bit Reduction

RGB888 data is reduced to RGB565 data. The lower three bits of red and blue, and lower two bits of green are removed.

(5) Output Pixel Format Selection

The pixel format to be output is selected by the OPF bit in JIFDCNT.

Allocation of data (while the DOUTSWAP bits in JIFDCNT = 000) in the pixel format is shown below.

- YCbCr422 (32 bits/pixel)

b31 – b24	b23 – b16	b15 – b8	b7 – b0
Y0 8 bits	Cb 8 bits	Y1 8 bits	Cr 8 bits

- ARGB8888 (32 bits/pixel)

b31 – b24	b23 – b16	b15 – b8	b7 – b0
*	Red 8 bits	Green 8 bits	Blue 8 bits

Note: * This value is determined by the ALPHA[7:0] bits in JIFDADT.

- RGB565 (16 bits/pixel)

b15 – b11	b10 – b5	b4 – b0
Red 5 bits	Green 6 bits	Blue 5 bits

(6) Vertical/Horizontal Subsampling

The output data can be horizontally and vertically subsampled according to the VINTER and HINTER bit setting in JIFDCNT.

Figure 44.11 to Figure 44.13 show line subsampling modes.

For the output formats ARGB8888 and RGB565, one cell represents one pixel in the figures.

For the output format YCbCr422, one cell represents one set of Y0Cb0Y1Cr0 in the figures.

As subsampling is carried out by minimum coded units (MCU), the numbers of the horizontal and vertical block units will vary according to the decompressed pixel format.

Table 44.5 and Table 44.6 show the values of n and m in the figures.

Horizontal:

Table 44.5 Number of Horizontal Blocks

Compression Format	Output Format	n
YCbCr444	YCbCr422	1/2
YCbCr444	ARGB8888, RGB565	1
YCbCr422	YCbCr422	1
YCbCr422	ARGB8888, RGB565	2
YCbCr411	YCbCr422	2
YCbCr411	ARGB8888, RGB565	4
YCbCr420	YCbCr422	1
YCbCr420	ARGB8888, RGB565	2

Vertical:

Table 44.6 Number of Vertical Blocks

Compression Format	Output Format	m
YCbCr444	YCbCr422	1
YCbCr444	ARGB8888, RGB565	1
YCbCr422	YCbCr422	1
YCbCr422	ARGB8888, RGB565	1
YCbCr411	YCbCr422	1
YCbCr411	ARGB8888, RGB565	1
YCbCr420	YCbCr422	2
YCbCr420	ARGB8888, RGB565	2

- Subsampling into 1/2
  Even lines are skipped by subsampling.

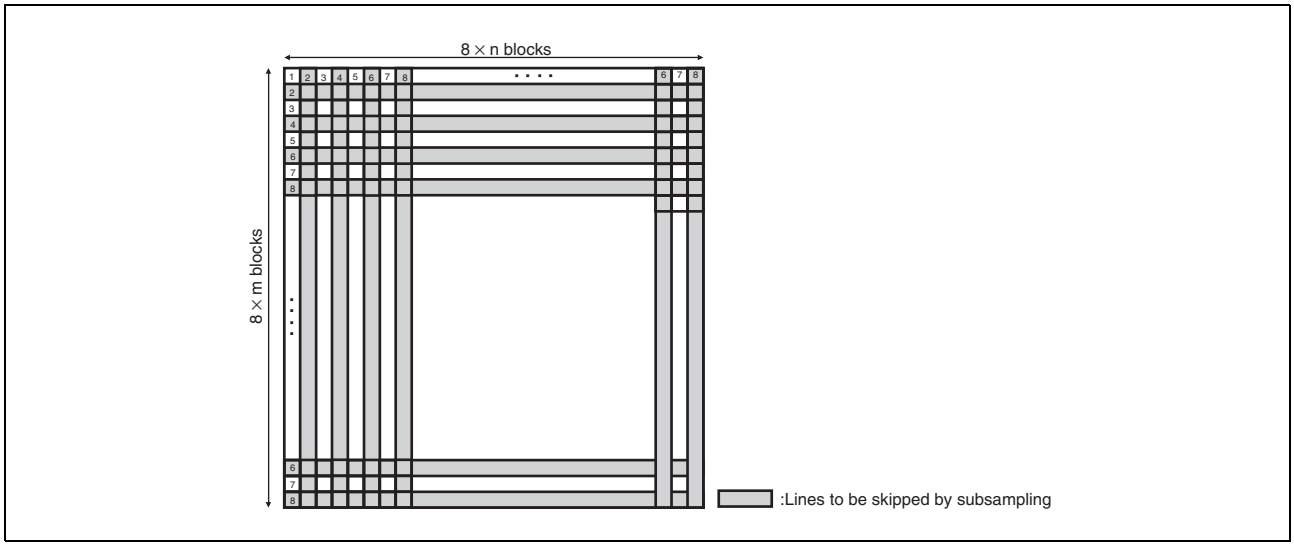

Figure 44.11 MCU when subsampling into 1/2 is selected

- Subsampling into 1/4
  The second, third, and fourth lines are skipped by subsampling.

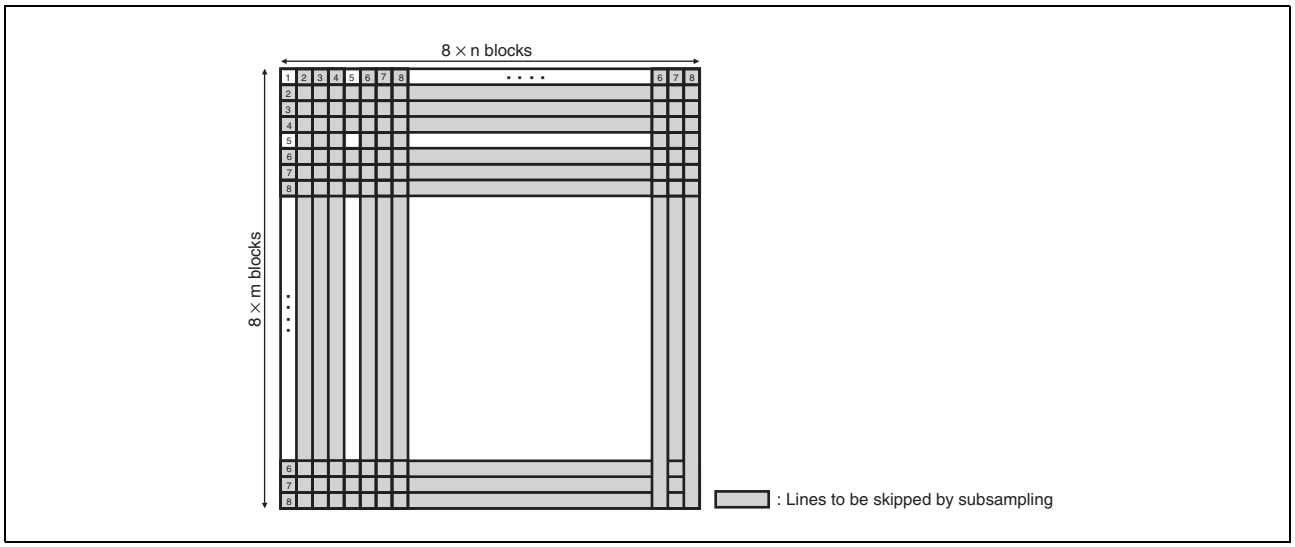

Figure 44.12 MCU when subsampling into 1/4 is selected

- Subsampling into 1/8
  The second, third, fourth, fifth, sixth, seventh, and eighth lines are skipped by subsampling.

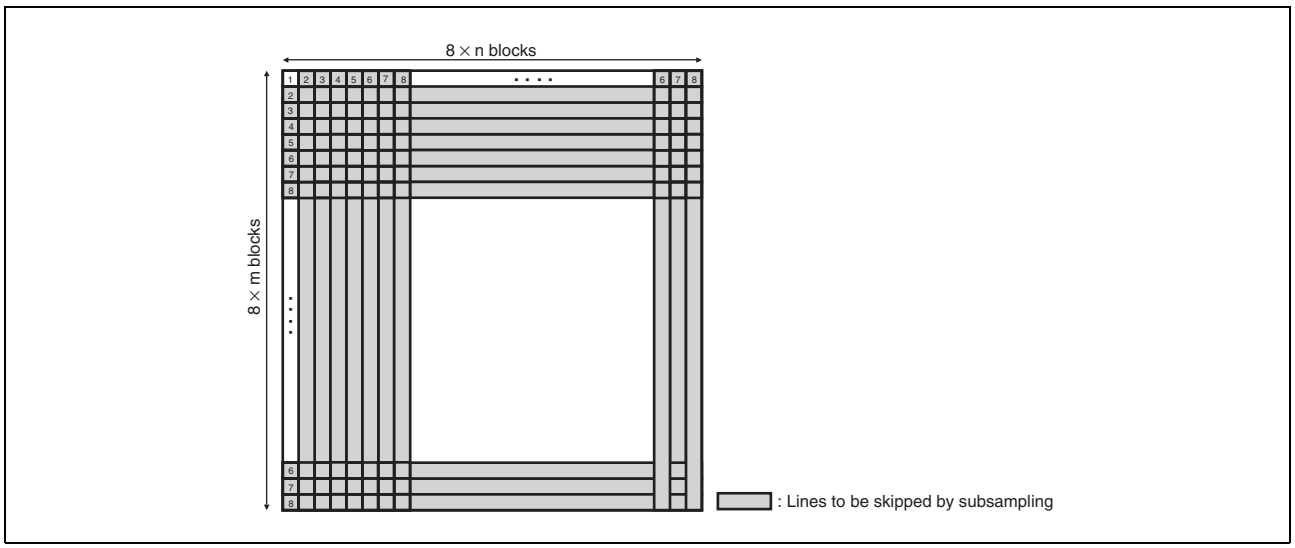

Figure 44.13 MCU when subsampling into 1/8 is selected

(7) Swap

Allocation of data can be changed by the DOUTSWAP bits in JIFECNT.

44.3.4 Storing Image Data

Figure 44.14 shows the buffer area for storing the image data.

- Start address
  Compression: JIFESA
  Decompression: JIFDDA
- Horizontal size
  Compression, decompression: JCHSZU, JCHSZD
- Vertical size
  Compression, decompression: JCVSAU, JCVSZD
- Offset
  Compression: JIFESOFST
  Decompression: JIFDDOFST

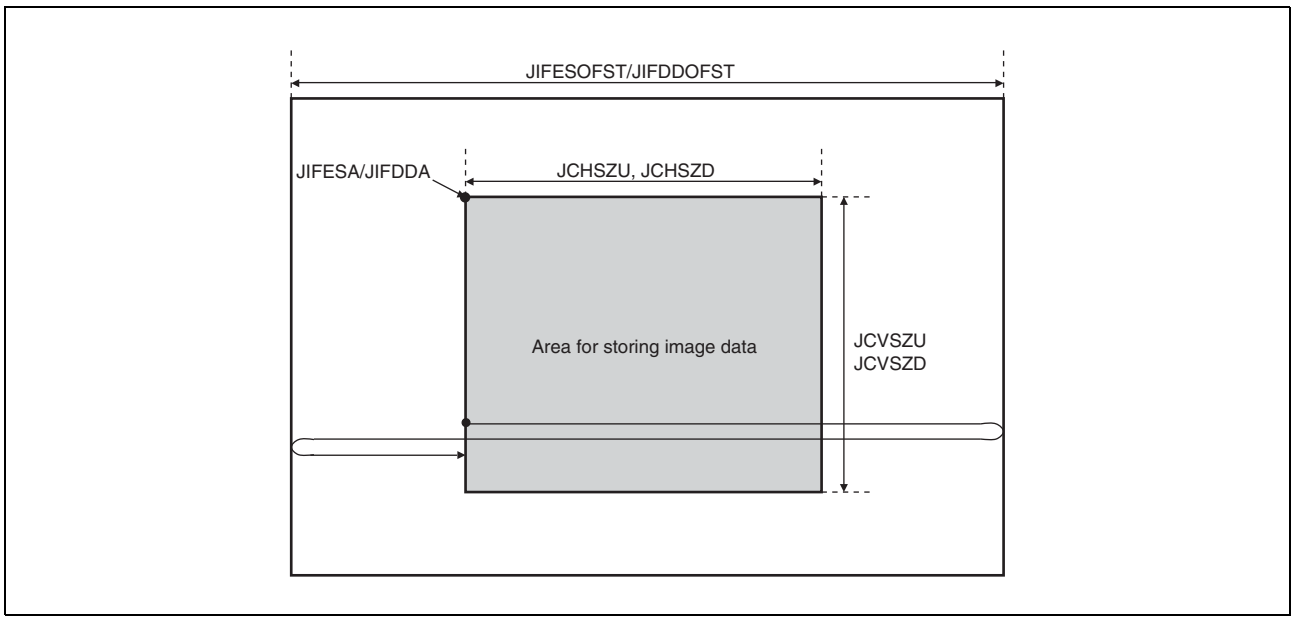

Figure 44.14 Image of Storing Image Data

44.4 Interrupts

Two types of interrupt requests, namely compression/decompression process interrupt request (JEDI) and data transfer interrupt request (JDTI), are available in this module. The two types of interrupt requests are each related to multiple sources. The interrupt request cancellation methods differ depending on the source of the interrupt request.

44.4.1 Compression/Decompression Process Interrupt Request (JEDI)

The flags in JINTS0 indicate compression/decompression-related sources. The interrupt requests asserted by these interrupt sources cannot be negated by clearing the corresponding interrupt status bits to 0. Issue an interrupt request clear command (by setting the JEND bit in JCCMD to 1) to clear the interrupt request. When a flag in JINTS0 is set to 1, a compression/decompression process interrupt request is sent to the interrupt controller.

(1) Compression

- JPEG compression process end
  When the INS6 bit in JINTS0 is 1, the JPEG compression process has been successfully completed. After all of the coded data is transferred, the JCU completes compression.

(2) Decompression

- JPEG decompression process end
  When the INS6 bit in JINTS0 is 1, the JPEG decompression process has been successfully completed. After all of the image data is transferred, JCU completes decompression.
- JPEG decompression error occurrence
  When the INS5 bit in JINTS0 is 1, the input JPEG coded data has an error and the JCU has stopped the decompression process. Read the error code (ERR bits in JCDERR) and identify the error source. This interrupt occurs when any of the INT7 to INT5 bits in JINTE0 is 1.
- Request for reading the image size and pixel format
  When the INS3 bit in JINTS0 is 1, JPEG coded data has been input and information regarding the image size and pixel format can be read. Since the JPEG decompression process is suspended, resume the JPEG decompression process by setting the process stop clear command after accessing the necessary registers. This interrupt occurs when the INT3 bit in JINTE0 is 1.

44.4.2 Data Transfer Interrupt Request (JDTI)

The flags in JINTS1 are the interrupt sources for transferring the image data and coded data. The interrupt requests asserted by these interrupt sources can be negated by clearing the corresponding interrupt status bits to 0.

(1) Compression

- Interrupt request generated after the specified number of input image data lines has been read
  When the DINLF bit in JINTS1 is 1, the number of image data lines specified by JIFESLC has been transferred; transfer the rest of the image data to the external buffer and resume transferring the data from the external buffer. A data transfer interrupt request is sent when the DINLEN bit in JINTE1 is 1.
- Interrupt request generated after the specified amount of output coded data have been written to
  When the JOUTF bit in JINTS1 is 1, the amount of coded data specified by JIFEDDC has been transferred. Secure a space for the next coded data in the external buffer, and resume transfer process. The data transfer interrupt request is sent when the JOUTEN bit in JINTE1 is 1.
- Interrupt request generated after all processes are completed
  When the CBTF bit in JINTS1 is 1, the JCU has completed compression and transferred all of the coded data. The data transfer interrupt request is sent when the CBTEN bit in JINTE1 is set to 1.

(2) Decompression

- Interrupt request generated after the specified number of output image data lines has been written to
  When the DOUTLF bit in the JINTS1 is 1, the number of image data lines specified by JIFDDLC has been transferred. Secure a space for the next coded data in the external buffer, and resume transfer process. A data transfer interrupt request is sent when the DOUTLEN bit in JINTE1 is 1.
- Interrupt request generated after the specified amount of input coded data has been read
  The JINF bit in JINTS1 becomes 1 when the amount of coded data specified by JIFDSDC has been transferred. Secure the next coded data in the external buffer, and resume transfer process. A data transfer interrupt is also sent at this time if the JINEN bit in JINTE1 is 1.
- Interrupt request generated after all processes are completed
  The DBTF bit in JINTS1 becomes 1 when the JCU has completed decompression and transferred all of the coded data. A data transfer interrupt request is also sent at this time if the DBTEN bit in JINTE1 is set to 1.

44.5 Bus Reset Processing

Issuing the bus reset command (setting the BRST bit in JCCMD to 1) causes a bus reset.
When the JCU is in operation, the bus reset command should not be issued. Registers below are initialized by a bus reset.

- JPEG code data count upper register (JCDTCU)
- JPEG code data count middle register (JCDTCM)
- JPEG code data count lower register (JCDTCD)
- JPEG interrupt status register 0 (JINTS0)
- JPEG code decode error register (JCDERR)
- JPEG code reset register (JCRST)

45. EthernetAVB

This module is only incorporated in the RZ/A1LU.

45.1 Overview

The EthernetAVB incorporates an Ethernet controller (E-MAC) that conforms to the definition of the MAC (Media Access Control) layer for Ethernet in the IEEE 802.3 standard.

When connected with a physical-layer LSI chip (PHY-LSI) that complies with the standard, the E-MAC is able to transmit and receive Ethernet (IEEE 802.3) frames. The E-MAC has a single MAC layer interface.

The EthernetAVB has a dedicated direct memory access controller (AVB-DMAC) for transferring transmitted Ethernet frames to and received Ethernet frames from respective storage areas in the on-chip RAM at high speed.

The AVB-DMAC is compliant with the following three standards formulated for IEEE 802.1BA: the IEEE 802.1AS timing and synchronization protocol, the IEEE 802.1Qav real-time transfer, and the IEEE 802.1Qat stream reservation protocol.

For the on-chip RAM, see section 40, On-Chip RAM.

45.1.1 Specifications (Functions)

Table 45.1 lists the specifications of the EthernetAVB module.

Table 45.1 Specifications (Functions)

Item	Description
Protocol	Flow control conforming with the IEEE 802.3x standard
Data transmission and reception	Transmission and reception of Ethernet (IEEE 802.3) frames
Transfer speed	Supports transfer at 10 and 100 Mbps
Mode	Full-duplex mode
Interface	Supports the IEEE 802.3 standard MII (Media Independent Interface)
Summary of the EthernetAVB function	An intelligent frame separation DMAC (AVB-DMAC) conforming with the following standards stipulated for IEEE 802.1BA: • IEEE 802.1AS (time synchronization protocol) • IEEE 802.1Qav (real-time transfer) • IEEE 1722 (AVTP presentation timestamp) IEEE 802.1Qat is supported by software. • Descriptor management system • Identification and sorting of frame data, and extraction and gathering of valid video data • Controllable interrupt frequency (reducing the load on the CPU)

45.1.2 Block Diagram

Figure 45.1 is a block diagram of the EthernetAVB.

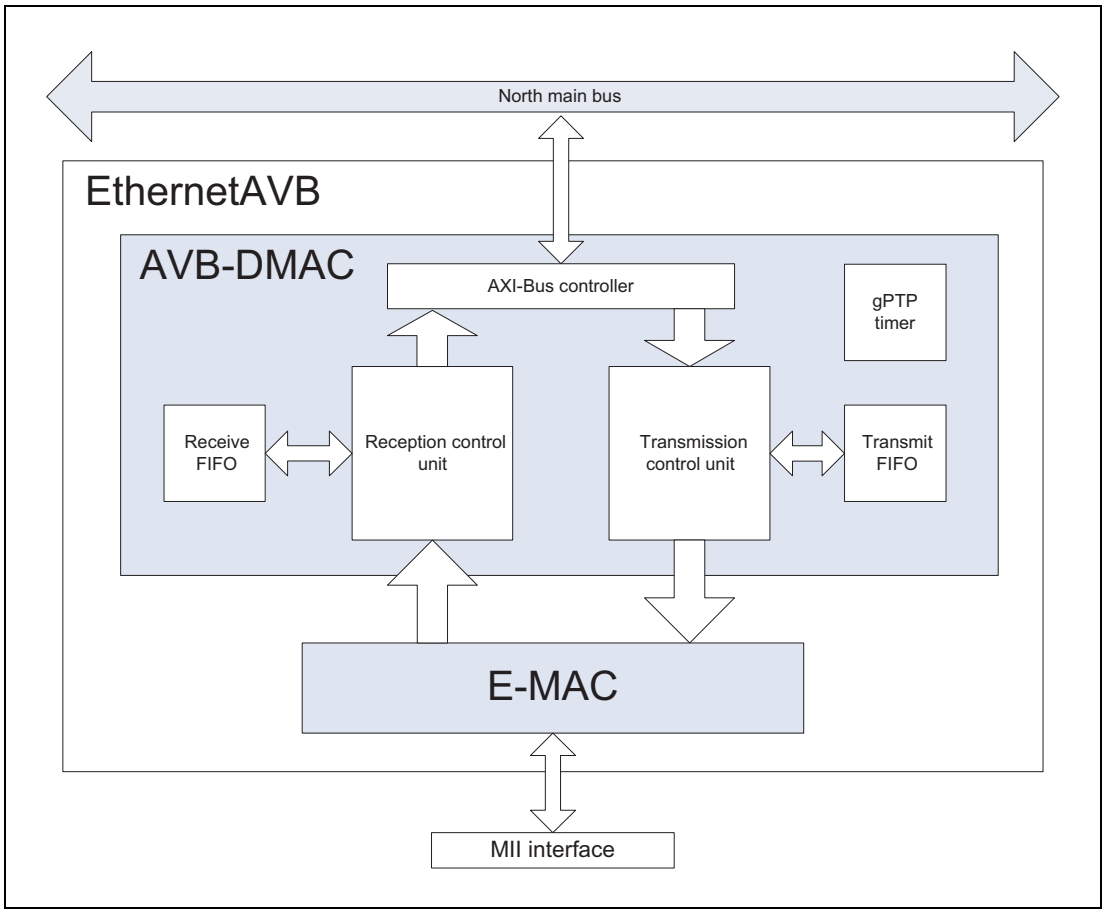

Figure 45.1 Block Diagram of EthernetAVB

45.1.3 I/O Pins

Table 45.2 lists the pins for use by EthernetAVB.

Table 45.2 Pin Configuration

Pin Name	I/O	Function
ET_TXD[3:0]	O	Transmit data signal
ET_TXEN	O	Transmit data enable signal
ET_RXD[3:0]	I	Receive data signal
ET_RXDV	I	Receive data enable signal
ET_TXCLK	I	Transmit clock signal
ET_RXCLK	I	Receive clock signal
ET_TXER	O	Transmit error signal
ET_RXER	I	Reception error signal
ET_MDC	O	Management information transfer clock signal
ET_MDIO	I/O	Management information transmit/receive data
ET_CRS	I	Carrier detection signal
ET_COL	I	Collision detection signal
AVB_CAPTURE	I	Signal for capturing AVTP presentation times
AVB_GPTP_EXTERN	I	External clock signal for gPTP timer

45.2 Register Descriptions

Table 45.3 and Table 45.4 list the EthernetAVB related registers and their configurations.

Table 45.3 Configuration of AVB-DMAC-related Registers (1/2)

Register Name	Symbol	Address	Access size
AVB-DMAC mode register	CCC	H'E821 5000	32

Table 45.5 CCC register contents

Bit Position	Bit Name	Function
b31 to b26	—	Reserved These bits are read as 0. The write value should be 0.
b25	FCE	Flow Control Enable 0: Normal operation 1: Flow control is enabled.
b24	LBME	Loopback Mode Enable 0: Normal operation 1: Loopback mode is enabled.
b23 to b21	—	Reserved These bits are read as 0. The write value should be 0.
b20	BOC	First Byte Specification 0: The first byte is the 8 lower-order bits (on-chip RAM[7:0]) 1: The first byte is the 8 higher-order bits (on-chip RAM[31:24])
b19, b18	—	Reserved These bits are read as 0. The write value should be 0.
b17, b16	CSEL[1:0]	gPTP Clock Select B'00: gPTP is not in use. B'01: Internal bus clock (Bϕ) B'10: Ethernet transmission clock (ET_TXCLK) B'11: External clock (AVB_GPTP_EXTERN)
b15 to b9	—	Reserved These bits are read as 0. The write value should be 0.
b8	DTSR	Data Transfer Suspend Request 0: Normal operation 1: Requests suspension.
b7 to b2	—	Reserved These bits are read as 0. The write value should be 0.
b1, b0	OPC[1:0]	Operating Mode Configuration B'00: Reset mode B'01: Configuration mode B'10: Operation mode B'11: Standby mode

FCE (Flow Control Enable) Bit

This bit enables flow control by the E-MAC.

Writing to this bit is only possible when the current operating mode is configuration mode.

LBME (Loopback Mode Enable) Bit

This bit enables loopback mode.

In loopback mode, the transmission lines are internally connected to the reception lines. When loopback mode is to be used, the Ethernet transmission clock must be supplied to the MII interface. A received clock signal is not required. Writing to this bit is only possible when the current operating mode is configuration mode.

CAUTION

Data for transmission are still output normally. To eliminate effects on external modules, pin control should be applied to block the output of data. For pin control, see section 41., Ports.

BOC (First Byte Specification) Bit

Specifies the allocation of the first byte from a received Ethernet frame to the on-chip RAM.

This configuration setting does not affect the format and filter parameters of the descriptor in the on-chip RAM.

Writing to this bit is only possible when the current operating mode is configuration mode.

Figure 45.2 to Figure 45.4 show how data from frames received via the Ethernet connection are stored in the on-chip RAM.

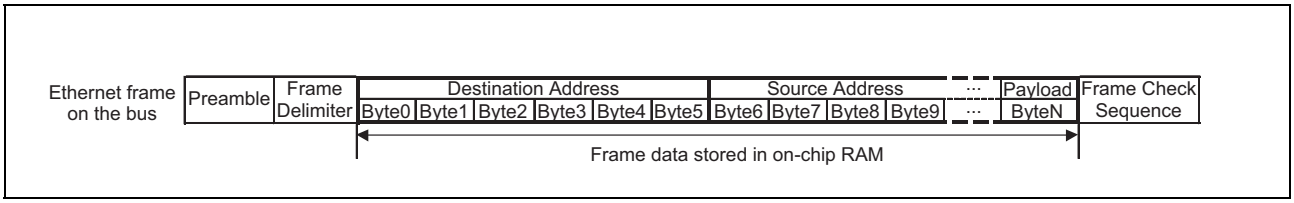

Figure 45.2 Data for Reception in an Ethernet Frame

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Figure 45.4 When CCC.BOC = 1

CSEL[1:0] (gPTP Clock Select) Bits

These bits select the clock source for the gPTP timer.

Writing to these bits is only possible when the current operating mode is configuration mode.

DTSR (Data Transfer Suspend Request) Bit

This bit can suspend access to the on-chip RAM.

The access is suspended on completion of the transfer of the frame currently being transferred.

This function disables access to the on-chip RAM without affecting normal operation of the AVB-DMAC. Use this bit when exclusive control over the contents of the on-chip RAM is necessary, for example, in checking its integrity.

Note that the transmission and reception queues are not processed while access is suspended.

Change neither the AVB-DMAC settings nor the mode from when this bit is set to 1 to complete suspension until when the data transfer suspend status bit (CSR.DTS) is set to 1.

OPC[1:0] (Operating Mode Configuration) Bits

These bits specify the operating mode.

For the operating modes, see section 45.3.1.1, Operating Modes.

Writing to this bit is possible in any of the operating modes, but should not be done after the standby request has been issued to the EthernetAVB. For issuance of the standby request to the EthernetAVB, see section 42., Power-Down Modes.

45.2.2 Descriptor Base Address Table Register (DBAT)

The DBAT register is used to set the base address of the descriptor table.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.6 DBAT register contents

Bit Position	Bit Name	Function
b31 to b0	TA[31:0]	Table Address Base address of the descriptor table in the on-chip RAM

CAUTION

The setting of this bit must be a multiple of four (i.e. b0 and b1 must be set to 0).

TAL3[1:0] (Table Address) Bits

These bits specify the base address of the descriptor table in the on-chip RAM.

For the structure of this table, see section 45.3.3, Descriptors.

Writing to this bit is only possible when the current operating mode is configuration mode.

45.2.3 Descriptor Base Address Load Request Register (DLR)

The DLR register is used to issue a request to load the values from the current descriptor address register q (CDARq) for each queue to the descriptor base address table register (DBAT).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.7 DLR register contents (1/2)

Bit Position	Bit Name	Function
b31 to 22	—	Reserved These bits are read as 0. The write value should be 0.
b21	LBA21	Base Address Load Request (Rx17: Stream 15) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b20	LBA20	Base Address Load Request (Rx16: Stream 14) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b19	LBA19	Base Address Load Request (Rx15: Stream 13) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b18	LBA18	Base Address Load Request (Rx14: Stream 12) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b17	LBA17	Base Address Load Request (Rx13: Stream 11) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b16	LBA16	Base Address Load Request (Rx12: Stream 10) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b15	LBA15	Base Address Load Request (Rx11: Stream 9) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b14	LBA14	Base Address Load Request (Rx10: Stream 8) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b13	LBA13	Base Address Load Request (Rx9: Stream 7) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.

Table 45.7 DLR register contents (2/2)

Bit Position	Bit Name	Function
b12	LBA12	Base Address Load Request (Rx8: Stream 6) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b11	LBA11	Base Address Load Request (Rx7: Stream 5) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b10	LBA10	Base Address Load Request (Rx6: Stream 4) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b9	LBA9	Base Address Load Request (Rx5: Stream 3) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b8	LBA8	Base Address Load Request (Rx4: Stream 2) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b7	LBA7	Base Address Load Request (Rx3: Stream 1) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b6	LBA6	Base Address Load Request (Rx2: Stream 0) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b5	LBA5	Base Address Load Request (Rx1: Network Control) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b4	LBA4	Base Address Load Request (Rx0: Best Effort) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b3	LBA3	Base Address Load Request (Tx3: Stream Class A) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b2	LBA2	Base Address Load Request (Tx2: Stream Class B) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b1	LBA1	Base Address Load Request (Tx1: Network Control) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.
b0	LBA0	Base Address Load Request (Tx0: Best Effort) 0(R): No load request is issued. 1(W): A request for loading the corresponding base address is issued. 1(R): The given base address is being loaded.

LBAq (Base Address Load Request) Bits

Each bit is used to issue requests to load base addresses and to indicate that a base address is currently being loaded.

Setting a bit to 1 issues a request for loading the descriptor base address for the queue q (q = 0 to 21), to change the current descriptor address bit (CDARq.CDA) to DBAT.TA + 8*q.

If transfer is currently in progress, loading is executed on completion of transfer for the current frame.

Completion of loading leads to automatic setting of the corresponding bit to 0.

For the transmission queues, base address load requests are executed even while fetching is in progress (the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is 1). Therefore, be sure to check that fetching is not in progress before issuing a request.

Writing to a bit of this register is only possible when the current operating mode is configuration mode.

Only 1 can be written to this bit.

45.2.4 AVB-DMAC Status Register (CSR)

The CSR register is used to indicate the operating mode in which the AVB-DMAC is running and the individual communications states.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

	—	—	—	—	—	—	—	DTS	—	—	—	—	OPS[3:0]			
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.8 CSR register contents

Bit Position	Bit Name	Function
b31 to b21	—	Reserved These bits are read as 0. The write value should be 0.
b20	RPO	Receive Process Status 0: Reception completed. 1: Reception is in progress.
b19	TPO3	Transmit Process Status 3 (Stream Class A) 0: Transmission completed. 1: Transmission is in progress.
b18	TPO2	Transmit Process Status 2 (Stream Class B) 0: Transmission completed. 1: Transmission is in progress.
b17	TPO1	Transmit Process Status 1 (Network Control) 0: Transmission completed. 1: Transmission is in progress.
b16	TPO0	Transmit Process Status 0 (Best Effort) 0: Transmission completed. 1: Transmission is in progress.
b16 to b9	—	Reserved These bits are read as 0. The write value should be 0.
b8	DTS	Data Transfer Suspend Status 0: Normal operation 1: Transmission is suspended.
b7 to b4	—	Reserved These bits are read as 0. The write value should be 0.
b3 to b0	OPS[3:0]	Operating Mode Status B'0001: Reset mode B'0010: Configuration mode B'0100: Operation mode B'1000: Standby mode Other settings are reserved.

RPO (Receive Process Status) Bit

This bit indicates whether a reception queue contains an unread received frame.

This bit being set to 1 indicates that a received frame is yet to be stored in the on-chip RAM.

- [Clearing conditions]
  The current operating mode is not operation mode.
  Received frames in the reception FIFO all being stored in the on-chip RAM.
- [Setting condition]
  A received frame being stored in the reception FIFO (but not yet in the on-chip RAM)

TPO3 (Transmit Process Status 3) Bit

This bit indicates whether a class A stream is being transmitted.

This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the on-chip RAM, or the E-MAC is transmitting data.

- [Clearing conditions]
  The current operating mode is not operation mode.
  Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (TCCR.TSRQ3) is 0)
- [Setting condition]
  Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ3))

TPO2 (Transmit Process Status 2) Bit

This bit indicates whether a class B stream is being transmitted.

This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the on-chip RAM, or the E-MAC is transmitting data.

- [Clearing conditions]
  The current operating mode is not operation mode.
  Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (TCCR.TSRQ2) is 0)
- [Setting condition]
  Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ2))

TPO1 (Transmit Process Status 1) Bit

This bit indicates whether a network control is being transmitted.

This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the on-chip RAM, or the E-MAC is transmitting data.

- [Clearing conditions]
  The current operating mode is not operation mode.
  Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (TCCR.TSRQ1) is 0)
- [Setting condition]
  Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ1))

TPO0 (Transmit Process Status 0) Bit

This bit indicates whether a best effort is being transmitted.

This bit being set to 1 indicates that the AVB-DMAC is fetching data for transmission from the on-chip RAM, or the E-MAC is transmitting data.

- [Clearing conditions]
  The current operating mode is not operation mode.
  Completion of transfer of all frames for transmission from the transmission FIFO (the transmit start request bit in the transmit configuration control register (TCCR.TSRQ0) is 0)
- [Setting condition]
  Transmission being started (by writing 1 to the transmit start request bit in the transmit configuration control register (TCCR.TSRQ0))

DTS (Data Transfer Suspend Status) Bit

This bit indicates whether access to the on-chip RAM is enabled.

- [Clearing condition]
  The current operating mode is not operation mode.
  The data transfer suspend request bit in the AVB-DMAC mode register (CCC.DTSR) being 0.
- [Setting condition]
  Access to the on-chip RAM not proceeding while the data transfer suspend request bit (CCC.DTSR) in the AVB-DMAC mode register (CCC) is 1 (if the on-chip RAM is being accessed, this bit is set to 1 on completion of access).

OPS[3:0] (Operating Mode Status) Bits

These bits indicate the current operating mode.

For the operating modes, see section 45.3.1.1, Operating Modes.

45.2.5 Current Descriptor Address Register q (CDARq) (q = 0 to 21)

The CDARq register indicates the current descriptor address.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	CDA[31:16]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	CDA[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.9 CDARq (q = 0 to 21) register contents

Bit Position	Bit Name	Function
b31 to b0	CDA[31:0]	Current Descriptor Address The address of the current descriptors for the transmission queues

CDA[31:0] (Current Descriptor Address) Bits

CDAR0 to CDAR3 indicate the addresses of the current descriptors for the corresponding transmission queues while CDAR4 to CDAR21 indicate the addresses of the current descriptors for the corresponding reception queues.

If the operating mode is changed to operation mode, the contents of the register for the queue to be used are set in the descriptor base address table register (DBAT).

Also, when the descriptor base address load request register (DLR) issues a load request, the contents of the corresponding register are set in the descriptor base address table register (DBAT).

Conditions for updating:

These bits are set to 0 when the operating mode is not operation mode.

This register is updated in response to processing of the descriptor for a queue.

45.2.6 Error Status Register (ESR)

The ESR register indicates the error status in the AVB-DMAC.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	EIL	ET[3:0]				—	—	—	EQN[4:0]				
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.10 ESR register contents

Bit Position	Bit Name	Function
b31 to b13	—	Reserved These bits are read as 0. The write value should be 0.
b12	EIL	Error Information Lost 0: No error information lost. 1: Error information lost.
b11 to b8	ET[3:0]	Error Type B'0000: Descriptor reading error from the on-chip RAM B'0001: Descriptor writing error to the on-chip RAM B'0010: Illegal descriptor reading error B'0100: Data/time stamp reading error from the on-chip RAM B'0101: Data/time stamp writing error to the on-chip RAM B'1001: Transmission frame size error B'1010: Transmission FIFO overflow error
b7 to b5	—	Reserved These bits are read as 0. The write value should be 0.
b4 to b0	EQN[4:0]	Error Queue Number Error queue number.

EIL (Error Information Lost) Bit

This bit indicates that error information has been lost because a new error was detected when the previous error remained unprocessed.

Conditions for updating:

This bit is set to 0 when the operating mode is not operation mode.
This bit is also set to 0 when 0 is written to the queue error interrupt status bit in the error interrupt status register (EIS.QEF).

This bit is set to 1 when the condition for setting the queue error interrupt status bit in the error interrupt status register (EIS.QEF) to 1 is satisfied when the queue error interrupt status bit in the error interrupt status register (EIS.QEF) is 1.

ET[3:0] (Error Type) Bits

These bits indicate the detail of the error detected.
When the detected error is related to descriptor reading (ESR.ET = B'0000 or B'0010), the current descriptor address bits in the current descriptor address register q (CDARq.CDA) are not updated thus the same descriptor is processed again. To handle this, correct the descriptor.

When the detected error is related to descriptor writing (ESR.ET = B'0001), the current descriptor address bits in the current descriptor address register q (CDARq.CDA) and the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) are updated as in the normal case thus the descriptor chain processing is not affected.
The other errors are temporary and might be eliminated by transfer continuation. For details, refer to section 45.3.2.3, Checking Integrity.

This bit should be referred to only when the queue error interrupt status bit in the error interrupt status register (EIS.QEF) is 1.

Conditions for updating:

These bits are updated when the condition for setting the queue error interrupt status bit in the error interrupt status register (EIS.QEF) to 1 is satisfied when the queue error interrupt status bit in the error interrupt status register (EIS.QEF) is 0.

EQN (Error Queue Number) Bits

These bits indicate the queue number in which the error has been detected.
When ESR.EQN is 0 to 3, it means that the related queue is a transmission queue and the EQN value is the transmission queue number. When ESR.EQN is 4 or larger, it means that the related queue is a reception queue and the "ESR.EQN – 4" is the reception queue number r.
Refer to these bits only when the queue error interrupt status bit in the error interrupt status register (EIS.QEF) is 1.

Conditions for updating:

These bits are updated when the condition for setting the queue error interrupt status bit in the error interrupt status register (EIS.QEF) to 1 is satisfied when the EIS.QEF bit is 0.

45.2.7 Receive Configuration Register (RCR)

The RCR register is used to make settings related to reception for the AVB-DMAC.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.11 RCR register contents

Bit Position	Bit Name	Function
b31 to b29	—	Reserved These bits are read as 0. The write value should be 0.
b28 to b16	RFCL[12:0]	Receive FIFO Caution Level
b15 to b6	—	Reserved These bits are read as 0. The write value should be 0.
b5	ETS2	Time Stamp Enable (Stream) 0: Time stamping is disabled. 1: Time stamping is enabled.
b4	ETS0	Time Stamp Enable (Best Effort) 0: Time stamping is disabled. 1: Time stamping is enabled.
b3, b2	ESF[1:0]	Stream Filtering Select Settings for reception queues 2 to 17 B'00: Filtering is disabled. Frames are processed in queue 0 (best effort). B'01: The filter for separating AVB stream frames from non-AVB stream frames is enabled; non-matching frames from the stream are processed in queue 0 (best effort). B'10: The filter for separating AVB stream frames from non-AVB stream frames is enabled; non-matching frames are discarded. B'11: The filter for separating AVB stream frames from non-AVB stream frames is enabled; non-matching frames from a stream are processed in queue 0 (best effort).
b1	ENCF	Network Control Filtering Enable Setting for reception queue 1 (network control) 0: Network control is disabled. 1: Network control is enabled.
b0	EFFS	Error Frame Enable 0: Error frames are disabled. 1: Error frames are enabled.

RFCL[12:0] (Receive FIFO Caution Level) Bits

These bits set the caution level for the reception FIFO and are used to maintain the priority order of the storage of received data and the fetching of data for transmission.

If the reception FIFO contains less data than this level, processing of both transmission and reception queues becomes pending.

If the reception FIFO contains more data than this level, only data in the reception queue are transferred, and processing of the transmission queue becomes pending.

Writing to this bit is only possible when the current operating mode is configuration mode.

CAUTION

- In the case of this LSI chip, set these bits to H'1800.

ETS2 (Time Stamp Enable (Stream)) Bit

Enables the inclusion of time-stamp information in reception queues 2 to 17.

The descriptor structure differs depending on whether time-stamp information is included or not. The reception queue in which time-stamp information is enabled uses the extended descriptor.

Writing to this bit is only possible when the current operating mode is configuration mode.

ETS0 (Time Stamp Enable (Best Effort)) Bit

Enables the inclusion of time-stamp information in reception queue 0.

The descriptor structure differs depending on whether time-stamp information is included or not. The reception queue 0 in which time-stamp information is enabled uses the extended descriptor.

Writing to this bit is only possible when the current operating mode is configuration mode.

ESF[1:0] (Stream Filtering Select) Bits

These bits select separation filtering for reception queues 2 to 17.

The queue-dependent separation filter can be used in combination with the identification of AVB stream frames.

When the value is B'00, filtering is disabled and frames from streams are processed in reception queue 0 (best effort).

When the value is B'01, the separation filter is enabled for both AVB stream frames and non-AVB stream frames; frames from non-matching streams are processed in reception queue 0 (best effort).

When the value is B'10, the separation filter is enabled for AVB stream frames; frames from non-matching streams are discarded.

When the value is B'11, the separation filter is enabled for AVB stream frames; frames from non-matching streams are processed in reception queue 0 (best effort).

For separation filtering, see 45.3.4.1 (1) Separation Filtering.

Writing to this bit is only possible when the current operating mode is configuration mode.

ENCF (Enable Network Control Filtering) Bit

Enables the AVB network control frame for reception queue 1.

When reception queue 1 is disabled, a received frame is stored in reception queue 0 (best effort).

Writing to this bit is only possible when the current operating mode is configuration mode.

EFFS (Enable Error Frame) Bit

Enables or disables the reception of frames that have been classified as error frames by the E-MAC.

Received error frames are stored in reception queue 0 (best effort).

An indicator of error detection by the E-MAC during reception is stored in the descriptor (DESCR.MS).

Writing to this bit is only possible when the current operating mode is configuration mode.

45.2.8 Receive Queue Configuration Register i (RQCi) (i = 0 to 4)

The RQC0 register is used to set up reception queues 0 to 3.

The RQC1 register is used to set up reception queues 4 to 7.

The RQC2 register is used to set up reception queues 8 to 11.

The RQC3 register is used to set up reception queues 12 to 15.

The RQC4 register is used to set up reception queues 16 to 17.

Bit Position	Bit Name	Function
b3, b2	—	Reserved These bits are read as 0. The write value should be 0.
b1, b0	RSM0[1:0]	Receive Synchronous Mode (Receive Queue 0+i*4) B'00: Mode with write-back Other than B'00: Setting prohibited

UFCCr[1:0] (r = 0 to 17) Unread Frame Counter Configuration Bits

These bits set the unread frame counter for reception queue r.

With the AVB-DMAC, four patterns of settings are available for the unread frame counter. Use the unread frame counter stop level configuration register (UFCS) to set the stop level of the unread frame counter.

When these bits are set to B'00, the stop function is disabled.

Writing to the bits is only possible when the current operating mode is configuration mode.

RSMr[1:0] (r = 0 to 17) Receive Synchronous Mode Bits

These bits set receive synchronous mode.

Set B'00 in this bit.

Writing to the bits is only possible when the current operating mode is configuration mode.

45.2.9 Receive Padding Configuration Register (RPC)

The RPC register is used to set padding for received frames.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.13 RPC register contents

Bit Position	Bit Name	Function
b31 to b24	—	Reserved These bits are read as 0. The write value should be 0.
b23 to b16	DCNT[7:0]	Stored Data Counter These bits specify the amount of data to be stored with the descriptor. The setting is in words. I.e. 1 in the counter indicates 1 word (4 bytes).
b15 to b11	—	Reserved These bits are read as 0. The write value should be 0.
b10 to b8	PCNT[2:0]	Stored Padding Counter These bits indicate the amount of padding to be stored in data areas for descriptors. The setting is in words. I.e. 1 in the counter indicates 1 word (4 bytes).
b7 to b0	—	Reserved These bits are read as 0. The write value should be 0.

CAUTION

Padding can be used to extend frame lengths, but frame lengths should not exceed 4 Kbytes.

DCNT[7:0] Stored Data Counter Bits

These bits specify the amount of the frame data (1 to 255) to be stored following the padding. Counting by one indicates one word (4 bytes). For example, when these bits are set to 47, the amount of data is 47 words (= 188 bytes).

When these bits are 0, all received data have been stored following the initial padding.

Writing to the bits is only possible when the current operating mode is configuration mode.

For details on padding, see section 45.3.4.3 (c) Padding.

PCNT[2:0] Stored Padding Counter Bits

These bits specify the amount of padding to be appended to the on-chip RAM. Counting by one indicates one word (4 bytes). For example, when these bits are set to 1, the amount of padding is one word (= 4 bytes).

Writing to the bits is only possible when the current operating mode is configuration mode.

For details on padding, see section 45.3.4.3 (c) Padding.

45.2.10 Unread Frame Counter Stop Level Configuration Register (UFCS)

The UFCS register sets the stop levels for unread frames.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

	—	—	SL1[5:0]						—	—	SL0[5:0]					
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Table 45.14 UFCS register contents

Bit Position	Bit Name	Function
b31, b30	—	Reserved These bits are read as 0. The write value should be 0.
b29 to b24	SL3[5:0]	Stop Level 3 Unread frame count stop level 3
b23, b22	—	Reserved These bits are read as 0. The write value should be 0.
b21 to b16	SL2[5:0]	Stop Level 2 Unread frame count stop level 2
b15, b14	—	Reserved These bits are read as 0. The write value should be 0.
b13 to b8	SL1[5:0]	Stop Level 1 Unread frame count stop level 1
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5 to b0	SL0[5:0]	Stop Level 0 Unread frame count stop level 0 These bits are read as 0. The write value should be 0.

SL0 to SL3[5:0] Stop Level 0 to 3 Bits

These bits set the stop levels for unread frames.

One of the four stop levels from 0 to 3 can be set for each reception queue. When these bits are set to 0, the stop function is disabled. The level to be used is specified by the receive queue configuration register i (RQCi) (i = 0 to 4).

Writing to the bits is only possible when the current operating mode is configuration mode.

45.2.11 Unread Frame Counter Register i (UFCVi) (i = 0 to 4)

The UFCV0 register indicates the number of unread frames in reception queues 0 to 3.

The UFCV1 register indicates the number of unread frames in reception queues 4 to 7.

The UFCV2 register indicates the number of unread frames in reception queues 8 to 11.

The UFCV3 register indicates the number of unread frames in reception queues 12 to 15.

The UFCV4 register indicates the number of unread frames in reception queues 16 and 17.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.15 UFCS0 register contents

Bit Position	Bit Name	Function
b31, b30	—	Reserved These bits are read as 0. The write value should be 0.
b29 to b24	CV3[5:0]	Unread Frame Count 3+4*i Number of unread frames in reception queue 3+4*i
b23, b22	—	Reserved These bits are read as 0. The write value should be 0.
b21 to b16	CV2[5:0]	Unread Frame Count 2+4*i Number of unread frames in reception queue 2+4*i
b15, b14	—	Reserved These bits are read as 0. The write value should be 0.
b13 to b8	CV1[5:0]	Unread Frame Count 1+4*i Number of unread frames in reception queue 1+4*i
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5 to b0	CV0[5:0]	Unread Frame Count 0+4*i Number of unread frames in reception queue 0+4*i

CVr[5:0] Unread Frame Count r (r = 0 to 17) Bits

These bits indicate the number of unread frames in reception queue r.

The number of unread frames is decremented by the value that is written to the unread frame counter decrement register i (UFCDi).

For a description of how to use unread frames, refer to section 45.3.4.4, Unread Frame Counters.

Conditions for updating:

The bits are set to 0 when the operating mode is not operation mode and when the descriptor base address load request register (DLR) issues a base address load request.

The value of these bits is incremented when a frame is stored in reception queue r normally and a write transaction to the corresponding descriptor is issued. (The maximum setting is H’3F. If the value exceeds H’3F, incrementation will not proceed.) Note that the value is incremented without waiting for response to the write transaction. Therefore confirm that the descriptor type (DESCR.DT) of the corresponding descriptor has been updated before processing the received data.

The value is decremented by the value written to the unread frame counter decrement register i

(UFCDi). Confirm that the descriptor types (DESCR.DT) of all the target descriptors for decrementing have been updated before decrementing.

45.2.12 Unread Frame Counter Decrement Register i (UFCDi) (i = 0 to 4)

The UFCD0 register is used to decrement unread counters in reception queues 0 to 3.

The UFCD1 register is used to decrement unread counters in reception queues 4 to 7.

The UFCD2 register is used to decrement unread counters in reception queues 8 to 11.

The UFCD3 register is used to decrement unread counters in reception queues 12 to 15.

The UFCD4 register is used to decrement unread counters in reception queues 16 and 17.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.16 UFCDi register contents

Bit Position	Bit Name	Function
b31, b30	—	Reserved These bits are read as 0. The write value should be 0.
b29 to b24	DV3[5:0]	Unread Frame Decrement Value 3+4*i Unread frame decrement value for reception queue 3+4*i
b23, b22	—	Reserved These bits are read as 0. The write value should be 0.
b21 to b16	DV2[5:0]	Unread Frame Decrement Value 2+4*i Unread frame decrement value for reception queue 2+4*i
b15, b14	—	Reserved These bits are read as 0. The write value should be 0.
b13 to b8	DV1[5:0]	Unread Frame Decrement Value 1+4*i Unread frame decrement value for reception queue 1+4*i
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5 to b0	DV0[5:0]	Unread Frame Decrement Value 0+4*i Unread frame decrement value for reception queue 0+4*i

DVr[5:0] Unread Frame Decrement Value r (r = 0 to 17) Bits

These bits set the decrement value for unread frames in reception queue r. The value of an unread frame counter register i (UFCVi) (i = 0 to 4) is decremented by the value set in the corresponding bits of this register.

Write H'3F to these bits to reset the unread counters in reception queue r.

These bits are always read as 0.

45.2.13 Separation Filter Offset Register (SFO)

The SFO register sets an offset into frames for use by the separation filter.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.17 SFO register contents

Bit Position	Bit Name	Function
b31 to b6	—	Reserved These bits are read as 0. The write value should be 0.
b5 to b0	FBP[5:0]	First Byte Position Position in Ethernet frames of the first byte of the bytes to be used by the separation filter

FBP[5:0] First Byte Position Bits

These bits set the position in Ethernet frames of the first byte of the bytes to be used by the separation filter.

When these bits are 0, the separation filter starts from the start of each Ethernet frame (first byte of the destination address). For bytes in Ethernet frames, see Figure 45.2, in section 45.2.1, AVB-DMAC Mode Register (CCC).

Writing to the bits is only possible when the current operating mode is configuration mode.

For separation filtering, see section 45.3.4.1 (1) Separation Filtering.

CAUTION

Received frames having fewer bytes than the setting of these bits + 8 bytes are judged to be non-matching by the separation filter. In this case, the data will either be sorted into a reception queue or discarded in accord with the setting of the separation filtering select bits in the receive configuration register (RCR.ESF).

45.2.14 Separation Filter Pattern Register i (SFPi) (i = 0 to 31)

Pairs of SFPi registers set the pattern for the separation filters to be used by the corresponding reception queues 2 to 17.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 45.18 SFPi register contents

Bit Position	Bit Name	Function
b31 to b0	FPs[31+32*(i%2):0+32*(i%2)]	Separation Filter Pattern These bits set the pattern of the separation filter. The 64-bit filter pattern is set for each queue.

FPs[63:0](s = i/2) Separation Filter Pattern Bits

These bits set the pattern for a separation filter to be used with reception queues 2 to 17 (for streams 0 to 15).

Each queue has a 64-bit setting; reception queue 2 (for stream 0) uses SFP0 and SFP1, reception queue 17 (for stream 15) uses SFP30 and SFP31, and so on.

SFPi.FPs[7:0] (where i is an even number) are used for the byte of Ethernet frame data specified by the separation filter offset register, while SFPi.FPs[63:56] (where i is the corresponding odd number) are used for the byte at the address specified by the separation filter offset register (SFO) + 7.

Data from received frames passes the separation filter when the following formula is satisfied.

(Data from received frames & SFMi.CFM) == SFPi.FPs

Eight bytes from the position specified by the start byte position bits (SFO.FBP) of data in the received frames are used by the separation filter.

Writing to the bits is only possible when the current operating mode is configuration mode.

For separation filtering, see section 45.3.4.1 (1) Separation Filtering.

45.2.15 Separation Filter Mask Register i (SFMi) (i = 0 or 1)

A pair of SFMi registers sets the mask value for the separation filter used by the corresponding reception queue 2 to 17.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	CFM[31:16]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 45.19 SFMi register contents

Bit Position	Bit Name	Function
b31 to b0	CFM[31:0]	Separation Filter Mask These bits set the mask value for the separation filter.

CFM[63:0] Separation Filter Mask Bits

These bits set the mask value for the separation filter for use with the corresponding reception queue 2 to 17 (stream 0 to 15).

SFM0.CFM[7:0] are used for bytes of Ethernet frame data specified by the separation filter offset register, while SFM1.CFM[63:56] are used for the separation filter offset register (SFO) + 7.

Writing to the bits is only possible when the current operating mode is configuration mode.

For separation filtering, see section 45.3.4.1 (1) Separation Filtering.

45.2.16 Transmit Configuration Register (TGC)

The TGC register is used to make settings related to transmission for the AVB-DMAC.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.20 TGC register contents (1/2)

Bit Position	Bit Name	Function
b31 to b22	—	Reserved These bits are read as 0. The write value should be 0.
b21, b20	TBD3[1:0]	Transmit FIFO Size (Stream Class A) Number of frames to be fetched from transmission queue 3 (for stream class A) **CAUTION** Write 2 to these bits.
b19, b18	—	Reserved These bits are read as 0. The write value should be 0.
b17, b16	TBD2[1:0]	Transmit FIFO Size (Stream Class B) Number of frames to be fetched from transmission queue 2 (for stream class B) **CAUTION** Write 2 to these bits.
b15, b14	—	Reserved These bits are read as 0. The write value should be 0.
b13, b12	TBD1[1:0]	Transmit FIFO Size (Network Control) Number of frames to be fetched from transmission queue 1 (for network control) **CAUTION** Write 2 to these bits.
b11, b10	—	Reserved These bits are read as 0. The write value should be 0.
b9, b8	TBD0[1:0]	Transmit FIFO Size (Best Effort) Number of frames to be fetched from transmission queue 0 (for best effort) **CAUTION** Write 2 to these bits.
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5, b4	TQP[1:0]	Transmit Queue Priority 00: Non-ABV mode 01: AVB mode 1 10: Setting prohibited 11: AVB mode 2

Table 45.20 TGC register contents (2/2)

Bit Position	Bit Name	Function
b3	TSM3	Transmit Synchronous Mode (Stream Class A) 0: With write-back 1: Setting prohibited
b2	TSM2	Transmit Synchronous Mode (Stream Class B) 0: With write-back 1: Setting prohibited
b1	TSM1	Transmit Synchronous Mode (Network Control) 0: With write-back 1: Setting prohibited
b0	TSM0	Transmit Synchronous Mode (Best Effort) 0: With write-back 1: Setting prohibited

TBD0 to TBD3[1:0] Transmit FIFO Size (Stream Class A/ Stream Class B/Network Control/ Best Effort) Bits

These bits set the sizes of the transmission FIFO buffers for use with each of the transmission queues.

Writing to these bits is only possible when the current operating mode is configuration mode.

Set these bits to 2.

TQP[1:0] Transmit Queue Priority Bits

These bits set the priority of the transmission queues.

B’00: Non-AVB mode: Q3→Q2→Q1→Q0

B’01: AVB mode 1: Q3 (CBS)→Q2 (CBS)→Q1→Q0

B’10: Setting prohibited

B’11: AVB mode 2: Q1→Q3 (CBS)→Q2 (CBS)→Q0

For the credit-based shaping (CBS) algorithm, see section 45.3.6, CBS (Credit-Based Shaping).

The CBS algorithm is not applied in non-AVB mode (i.e. when the value is B’00).

Writing to the bits is only possible when the current operating mode is configuration mode.

TSM0 to TSM3 Transmit Synchronous Bits

Set these bits to 0.

45.2.17 Transmit Configuration Control Register (TCCR)

The TCCR register controls transmission by the AVB-DMAC and is used to make related settings.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 45.21 TCCR register contents

Bit Position	Bit Name	Function
b31 to b10	—	Reserved These bits are read as 0. The write value should be 0.
b9	TFR	Time Stamp FIFO Release 0(W): No request to the time-stamp FIFO. 1(W): Releases the oldest entry in the time-stamp FIFO.
b8	TFEN	Time Stamp FIFO Enable 0: Recording of transmission time stamps in the time-stamp FIFO is disabled. 1: Recording of transmission time stamps in the time-stamp FIFO is enabled.
b7 to b4	—	Reserved These bits are read as 0. The write value should be 0.
b3	TSRQ3	Transmit Start Request (Queue 3 (Stream Class A)) 0(R): Transmission queue is empty or stopped. 1(W): A transmission start request is issued. 1(R): Fetching of data for transmission is pending.
b2	TSRQ2	Transmit Start Request (Queue 2 (Stream Class B)) 0(R): Transmission queue is empty or stopped. 1(W): A transmission start request is issued. 1(R): Fetching of data for transmission is pending.
b1	TSRQ1	Transmit Start Request (Queue 1 (Network Control)) 0(R): Transmission queue is empty or stopped. 1(W): A transmission start request is issued. 1(R): Fetching of data for transmission is pending.
b0	TSRQ0	Transmit Start Request (Queue 0 (Best Effort)) 0(R): Transmission queue is empty or stopped. 1(W): A transmission start request is issued. 1(R): Fetching of data for transmission is pending.

TFR Time Stamp FIFO Release Bit

This bit releases the oldest entry in the time-stamp FIFO.

When 1 is written to this bit, the TFAi register is updated by the oldest entry in the time-stamp FIFO.

For a description of how to use the time-stamp FIFO, see section 45.3.5.4, Time Stamping in Transmission.

This bit is always read as 0.

When the time stamp FIFO count bits (TSR.TFFL) are set to B’000, 1 should not be written to this bit.

TFEN Time Stamp FIFO Enable Bit

This bit enables storage in the time-stamp FIFO.

When it is set, time-stamp information is stored for descriptors with DESCR.TSR set to 1 (for DESCR.TSR, see section 45.3.5.2 (2) Configuration of Transmission Frame Data Descriptors.

When 0 is set in this bit, no entries are made in the time-stamp FIFO.

For a description of how to use the time-stamp FIFO, see section 45.3.5.4, Time Stamping in Transmission.

TSRQt Transmit Start Request (Queue t) (t = 0 to 3) Bit

This bit issues a request to start transmission for transmission queue t.

When read, this bit being set to 1 indicates that transmission queue t has a frame that has not yet been fetched to the transmission FIFO.

Frame transmission by the E-MAC is processed independently from fetching to the transmission FIFO. The timing of transmission from a queue depends on the priority order of transmission.

For the scheduling of transmission queues, see section 45.3.5.1, Transmission Modes.

Writing to this bit is only possible when the current operating mode is configuration mode.

Only 1 can be written to the bit. Writing 0 to the bit has no effect.

Conditions for updating:

The bit is set to 0 when the operating mode is not operation mode, when a descriptor of type EEMPTY, FEMPTY, or LEMPTY (no usable data) is processed, when an EOS descriptor is processed, and when a descriptor with defective data is processed.

45.2.18 Transmit Status Register (TSR)

The TSR register indicates the state of transmission by the AVB-DMAC.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TFFL[2:0]			—	—	—	—	CCS1[1:0]		CCS0[1:0]	
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.22 TSR register contents

Bit Position	Bit Name	Function
b31 to b11	—	Reserved These bits are read as 0. The write value should be 0.
b10 to b8	TFFL[2:0]	Time Stamp FIFO Count Number of time-stamp FIFOs
b7 to b4	—	Reserved These bits are read as 0. The write value should be 0.
b3, b2	CCS1[1:0]	CBS Counter Status 1 (Class A) B'00: The current credit value is within the limit. B'01: The current credit value is less than or equal to the lower limit. B'10: The current credit value is greater than or equal to the upper limit. B'11: (Reserved)
b1, b0	CCS0[1:0]	CBS Counter Status 0 (Class B) B'00: The current credit value is within the limit. B'01: The current credit value is less than or equal to the lower limit. B'10: The current credit value is greater than or equal to the upper limit. B'11: (Reserved)

TFFL[3:0] Time Stamp FIFO Count Bits

These bits indicate the number of time stamps in the time-stamp FIFO.

The values 0 and 2 indicate that the time-stamp FIFO is empty and full, respectively (values 3 to 7 are reserved).

Conditions for updating:

The bits are set to 0 when the operating mode is not operation mode and when the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) = 0.

When the time stamp FIFO enable bit (TCCR.TFEN) is 1 and these bits are not 2, the value of these bits is incremented after a frame with DESCR.TSR set has been transmitted by the E-MAC (for DESCR.TSR, see section 45.3.5.2 (2) Configuration of Transmission Frame Data Descriptors.

The value of these bits is decremented if it is not 0 when 1 is written to the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR).

CCS0 and CCS1[1:0] CBS Counter Status 0 and 1 Bits

These bits indicate the CBS (credit-based shaping) state of stream data transmission queues 0 and 1. If the calculated credit value is outside the range specified by CBS upper limit register c (CULc) and CBS lower limit register c (CLLc), it falls outside the range for CBS.

Conditions for updating:

The bits are set to B’00 when the operating mode is not operation mode.

The bits are set to B’00 when the credit value calculated by the CBS is within the range specified by the CBS upper limit register c (CULc) (c = 0, 1) and the CBS lower limit register c (CLLc) (c = 0, 1).

The bits are set to B’01 if the credit value calculated by the CBS is lower than the value in CBS lower limit register c (CLLc).

The bits are set to B’10 if the credit value calculated by the CBS is higher than the value in CBS upper limit register c (CULc).

45.2.19 Time Stamp FIFO Access Register 0 (TFA0)

TFA0 indicates the time stamp value.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TSV[31:16]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TSV[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.23 TFA0 register contents

Bit Position	Bit Name	Function
b31 to b0	TSV[31:0]	Time Stamp Value Time stamp value

TSV[79:0] Time Stamp Value Bits

These 80 bits consist of TFA0.TSV[31:0], TFA1.TSV[63:32], and TFA2.TSV[79:64], which together indicate the oldest time stamp value stored in the time-stamp FIFO.

Once the time-stamp FIFO is full, no further time-stamp values are stored.

Conditions for updating:

The bits are set to H'0000 0000 when the operating mode is not operation mode.

The register is updated whenever a value is stored in the time-stamp FIFO (when the time-stamp FIFO count bit in the transmit status register (TSR.TFFL) changes from 0 to 1).

The register is updated when the oldest entry is released (when the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR) is set to 1).

45.2.20 Time Stamp FIFO Access Register 1 (TFA1)

The TFA1 register indicates the time-stamp value.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TSV[63:48]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TSV[47:32]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.24 TFA1 register contents

Bit Position	Bit Name	Function
b31 to b0	TSV[63:32]	Time Stamp Value Time-stamp value

TSV[63:32] Time Stamp Value Bits

For details, see section 45.2.19, Time Stamp FIFO Access Register 0 (TFA0).

45.2.21 Time Stamp FIFO Access Register 2 (TFA2)

The TFA2 register indicates the time-stamp tag and part of the time-stamp value.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	TST[9:0]									
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TSV[79:64]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 45.25 TFA2 register contents

Bit Position	Bit Name	Function
b31 to b26	—	Reserved These bits are read as 0.
b25 to b16	TST[9:0]	Time Stamp Tag Time-stamp tag
b15 to b0	TSV[79:64]	Time Stamp Value Time-stamp value

TST[9:0] Time Stamp Tag Bits

These bits indicate the contents of the DESCR.TAG bit within the descriptor for frame transmission. These values are used to check the correlation between frames within the transmission queue and the time-stamp values (accessible through time stamp FIFO access register i (TFAi.TSV, i = 0 to 2)) which can be placed in the FIFO.

For the tagging of frames in transmission, see section 45.3.5.4, Time Stamping in Transmission.

When the time stamp FIFO count bits (TSR.TFFL) are 0, do not refer to these bits.

Conditions for updating:

The bits are set to H'000 when the operating mode is not operation mode.

Updated when a value is stored in the time-stamp FIFO (when the value of the time stamp FIFO count bit in the transmit status register (TSR.TFFL) changes from 0 to 1).

Updated when the oldest entry has been released (1 is set in the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR)).

TSV[73:64] Time Stamp Value Bits

For details, see section 45.2.19, Time Stamp FIFO Access Register 0 (TFA0).

45.2.22 CBS Increment Value Register c (CIVRc) (c = 0 or 1)

The CIVR0 register sets the increment in the CBS algorithm for transmission queue 2 (for stream class B).

The CIVR1 register sets the increment in the CBS algorithm for transmission queue 3 (for stream class A).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.26 CIVRc register contents

Bit Position	Bit Name	Function
b31 to b0	CIV[31:0]	CBS Increment Value Setting value: 1 to 65535 (H'00000001 to H'0000FFFF)

CIV[31:0] CBS Increment Value Bits

These bits set the increment for the CBS algorithm.

Set a value in the range from 1 to 65535 (H'0000 0001 to H'0000 FFFF).

The value to be written to these bits depends on the Ethernet bit rate and Bϕ (internal bus clock). For details, see section 45.3.6, CBS (Credit-Based Shaping).

45.2.23 CBS Decrement Value Register c (CDVRc) (c = 0 or 1)

The CDVR0 register sets the decrement in the CBS algorithm for transmission queue 2 (for stream class B).

The CDVR1 register sets the decrement in the CBS algorithm for transmission queue 3 (for stream class A).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.27 CDVR0 and CDVR1 register contents

Bit Position	Bit Name	Function
b31 to b0	CDV[31:0]	CBS Decrement Value Setting value: -1 to -65536 (H'FFFF FFFF to H'FFFF 0000)

CDV[31:0] CBS Decrement Value Bits

These bits set the decrement for the CBS algorithm.

Set a negative value from -1 to -65536 (H'FFFF FFFF to H'FFFF 0000).

The value to be written to these bits depends on the Ethernet bit rate and Bϕ (internal bus clock). For details, see section 45.3.6, CBS (Credit-Based Shaping).

45.2.24 CBS Upper Limit Register c (CULc) (c = 0 or 1)

The CUL0 register sets the upper limit for credit values calculated by using the CSB algorithm for transmission queue 2 (for stream class B).

The CUL1 register sets the upper limit for credit values calculated by using the CSB algorithm for transmission queue 3 (for stream class A).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.28 CUL0 and CUL1 register contents

Bit Position	Bit Name	Function
b31?b0	ULV[31:0]	CBS Upper Limit Upper limit on CBS values

ULV[31:0] CBS Upper Limit Bits

These bits set the upper limit for credit values calculated by using the CBS algorithm.

The setting is a limiting value for error detection and does not normally affect operation of the algorithm.

Write a positive value to these bits.

For details, see section 45.3.6, CBS (Credit-Based Shaping).

45.2.25 CBS Lower Limit Register c (CLLc) (c = 0 or 1)

The CUL0 register sets the lower limit for credit values calculated by using the CSB algorithm for transmission queue 2 (for stream class B).

The CUL1 register sets the lower limit for credit values calculated by using the CSB algorithm for transmission queue 3 (for stream class A).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.29 CULc register contents

Bit Position	Bit Name	Function
b31 to b0	LLV[31:0]	CBS Lower Limit Lower limit on CBS values

LLV[31:0] CBS Lower Limit Bits

These bits set the lower limit for credit values calculated by using the CBS algorithm.

The setting is a limiting value for error detection and does not normally affect operation of the algorithm.

Write a negative value to these bits.

For details, see section 45.3.6, CBS (Credit-Based Shaping).

45.2.26 Descriptor Interrupt Control Register (DIC)

The DIC register is used to control descriptor interrupts 1 to 15.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b0	—	Reserved This bit is read as 0. The write value should be 0.

RPE1 to RPE15 Descriptor Interrupt Enable Bits 1 to 15

When an interrupt source flag is set (a bit from among the DPF1 to DPF15 bits in the descriptor interrupt status register (DIS) = 1) while the interrupt is enabled, the interrupt is issued.

45.2.27 Descriptor Interrupt Status Register (DIS)

The DIS register indicates the state of descriptor interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b2	DPF2	Descriptor Interrupt Status2 0: The interrupt is not pending. 1: The interrupt is pending.
b1	DPF1	Descriptor Interrupt Status1 0: The interrupt is not pending. 1: The interrupt is pending.
b0	—	Reserved This bit is read as 0. The write value should be 0.

DPF1 to DPF15 Descriptor Interrupt Status Bits

The corresponding bit indicates completion of the processing of a descriptor with DESCR.DIE set to the corresponding number from 1 to 15 within the reception or transmission queue.

When DESCR.DIE is 0, the descriptor interrupt is not generated.

Only 0 can be written to these bits.

[Conditions for Changing]

A bit is set to 0 when the operating mode is not operation mode.

A bit is set to 1 when a descriptor with DESCR.DIE set to the corresponding number from 1 to 15 is processed and a write transaction to the corresponding descriptor is issued. Note that the bit is set to 1 without waiting for response to the write transaction. Therefore confirm that the descriptor type (DESCR.DT) of the corresponding descriptor has been updated before post-processing the processed descriptor.

45.2.28 Error Interrupt Control Register (EIC)

The EIC register controls the AVB-DMAC-related error interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b4	CLLE0	CBS Lower Limit Error Interrupt Enable (Class B) 0: Disabled 1: Enabled
b3	SEE	Separation Filter Error Interrupt Enable 0: Disabled 1: Enabled
b2	QEE	Queue Error Interrupt Enable 0: Disabled 1: Enabled
b1, b0	—	Reserved These bits are read as 0. The write value should be 0.

TFFE Time Stamp FIFO Full-Error Interrupt Enable Bits

When the time stamp FIFO is full (TFFF in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued.

CULE1 CBS Upper Limit Error Interrupt Enable Bit (Class A)

When the Class A CBS reaches its upper limit (CULF1 in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued.

CULE0 CBS Upper Limit Error Interrupt Enable Bit (Class B)

When the Class B CBS reaches its upper limit (CULF0 in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued.

CLLE1 CBS Lower Limit Error Interrupt Enable Bit (Class A)

When the Class A CBS reaches its lower limit (CLLF1 in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued.

CLLE0 CBS Lower Limit Error Interrupt Enable Bit (Class B)

When the Class B CBS reaches its lower limit (CLLF0 in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued.

SEE Separation Filter Error Interrupt Enable Bit

When the separation filter error is detected (SEF in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued.

QEE Queue Error Interrupt Enable Bit

When the queue error is detected (QEF in the error interrupt status register (EIS) = 1) and the interrupt is enabled, the interrupt is issued.

45.2.29 Error Interrupt Status Register (EIS)

The EIS register indicates the states of AVB-DMAC-related error interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.33 EIS register contents

Bit Position	Bit Name	Function
b31 to b17	—	Reserved These bits are read as 0. The write value should be 0.
b16	QFS	Queue Full Error Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b15 to b9	—	Reserved These bits are read as 0. The write value should be 0.
b8	TFFF	Time Stamp FIFO Full Error Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b7	CULF1	CBS Upper Limit Error Interrupt Status (Class A) 0: The interrupt is not pending. 1: The interrupt is pending.
b6	CULF0	CBS Upper Limit Error Interrupt Status (Class B) 0: The interrupt is not pending. 1: The interrupt is pending.
b5	CLLF1	CBS Lower Limit Error Interrupt Status (Class A) 0: The interrupt is not pending. 1: The interrupt is pending.
b4	CLLF0	CBS Lower Limit Error Interrupt Status (Class B) 0: The interrupt is not pending. 1: The interrupt is pending.
b3	SEF	Separation Filter Error Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b2	QEF	Queue Error Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b1, b0	—	Reserved These bits are read as 0. The write value should be 0.

QFS Queue Full Error Status Bit

With the interrupts enabled, this bit indicates that a queue is full (the receive queue r full interrupt status bit (QFFr) or the receive FIFO full interrupt status bit (RFFF) in receive interrupt status register 2 (RIS2) = 1).

[Conditions for Changing]

If the receive queue r full interrupt status bit (RIS2.QFFr) and the receive queue r full interrupt enable bit in the receive interrupt control register 2 (RIC2.QFEr) are updated, this bit is also updated.

If the receive FIFO full interrupt status bit (RIS2.RFFF) and the receive FIFO full interrupt enable bit (RIC2.RFFE) are updated, this bit is also updated.

TFFF Time Stamp FIFO Full-Error Interrupt Status Bit

This bit indicates that a new transmission time stamp has been discarded due to the time-stamp FIFO being full (i.e. has reached the overflow state).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when a frame with DESCR.TSR set is transmitted while the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) is set to 1 and the time stamp FIFO count bit in the transmit status register (TSR.TFFL) is set to 2.

CULF1 CBS Upper Limit Error Interrupt Status Bit (Class A)

This bit indicates that CBS counter 1 has exceeded the set upper limit (CUL1.ULV in the CBS upper limit register c (CULc)).

Only 0 can be written to the bit.

[Conditions for Changing]

This bit is set to 0 when the operating mode is not operation mode.

This bit is set to 1 when the value of the CBS counter status 1 (Class A) bits in the transmit status register (TSR.CCS1) change from 00 (indicating a value within the range between the limits) to 10 (indicating a value over the upper limit).

CULF0 CBS Upper Limit Error Interrupt Status Bit (Class B)

This bit indicates that CBS counter 0 has exceeded the set upper limit (CUL0.ULV in the CBS upper limit register c (CULc)).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the value of the CBS counter status 0 (Class B) bit in the transmit status register changes from 00 (indicating a value within the range between the limits) to 10 (indicating a value over the upper limit).

CULF1 CBS Lower Limit Error Interrupt Status Bit (Class A)

This bit indicates that CBS counter 1 has fallen below the set lower limit (CLL1.LLV in CBS lower limit register c (CLLc)).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the value of the CBS counter status 1 (Class A) bit in the transmit status register (TSR.CCS1) changes from 00 (indicating a value within the range between the limits) to 01 (indicating a value less than the lower limit).

CLLF0 CBS Lower Limit Error Interrupt Status Bit (Class B)

This bit indicates that CBS counter 0 has fallen below the set lower limit (CLL0.LLV in the CBS lower limit register c (CLLc)).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the value of the CBS counter status 0 (Class B) bit in the transmit status register (TSR.CCS0) changes from 00 (indicating a value within the range between the limits) to 01 (indicating a value less than the lower limit).

SEF Separation Filter Error Interrupt Status Bit

This bit indicates that a received frame has been discarded due to non-matching of the defined separation filter.

Only 0 can be written to this bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

If the stream filtering select bits in the receive configuration register (RCR.ESF) are B'10, this bit is set to 1 when the received frame is discarded because the received AVB stream data frame has not match any of the separation filters.

QEF Queue Error Interrupt Status Bit

This bit indicates that an error is detected when the transmission and reception queues are processed. For details, see section 45.3.2.3, Checking Integrity.

Only 0 can be written to this bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

If an error in the transmission and reception queues is detected, this bit is set to 1.

45.2.30 Receive Interrupt Control Register 0 (RIC0)

The RIC0 register controls the AVB-DMAC receive interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b0	FRF0	Receive Frame Interrupt Status 0 (Best Effort) 0: The interrupt is not pending. 1: The interrupt is pending.

FRF0 to FRF17 Receive Frame Interrupt Status Bits 0 to 17

Each bit indicates that a corresponding frame has been stored normally in reception queues 0 to 17 and that data are ready for CPU processing.

Only 0 can be written to the bit.

[Conditions for Changing]

A bit is set to 0 when the operating mode is not operation mode.

A bit is set to 0 when a value is written to the unread frame counter decrement register i (UFCDi) (i = 0 to 4), and this decrements the value of unread frame counter register i (UFCVi) (i = 0 to 4) to 0.

When a frame is stored in reception queue normally and a write transaction to the corresponding descriptor is issued, the corresponding bit is set to 1. Note that the bit is set to 1 without waiting for response to the write transaction. Therefore confirm that the descriptor type (DESCR.DT) of the corresponding descriptor has been updated before processing the received data.

45.2.32 Receive Interrupt Control Register 1 (RIC1)

The RIC1 register controls the AVB-DMAC receive interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.37 RIS1 register contents

Bit Position	Bit Name	Function
b31	RFWF	Receive FIFO Warning Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b30 to b0	—	Reserved These bits are read as 0. The write value should be 0.

RFWF Receive FIFO Warning Interrupt Status Bit

This bit indicates that the reception FIFO has reached the set caution level (the value set in the receive FIFO caution level bits in the receive configuration register (RCR.RFCL)).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the reception FIFO exceeds the set caution level (the value set in the receive FIFO caution level bits in the receive configuration register (RCR.RFCL)).

45.2.34 Receive Interrupt Control Register 2 (RIC2)

The RIC2 register controls the AVB-DMAC receive interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b0	QFE0	Receive Queue 0 (Best Effort) Full Interrupt Enable 0: Disabled 1: Enabled

RFFE Receive FIFO Full Interrupt Enable Bit

When the reception FIFO is full and the interrupt is enabled, the interrupt is issued.

QFE0 to 17 Receive Queue 0 to 17 Full Interrupt Enable Bits

When a reception queue is full and the interrupt is enabled, the interrupt is issued.

45.2.35 Receive Interrupt Status Register 2 (RIS2)

The RIS2 register indicates the states of the AVB-DMAC receive interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.39 RIS2 register contents (1/2)

Bit Position	Bit Name	Function
b31	RFFF	Receive FIFO Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending
b30 to b18	—	Reserved These bits are read as 0. The write value should be 0.
b17	QFF17	Receive Queue 17 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b16	QFF16	Receive Queue 16 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b15	QFF15	Receive Queue 15 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b14	QFF14	Receive Queue 14 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b13	QFF13	Receive Queue 13 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b12	QFF12	Receive Queue 12 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b11	QFF11	Receive Queue 11 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b10	QFF10	Receive Queue 10 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b9	QFF9	Receive Queue 9 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b8	QFF8	Receive Queue 8 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b7	QFF7	Receive Queue 7 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.

Table 45.39 RIS2 register contents (2/2)

Bit Position	Bit Name	Function
b6	QFF6	Receive Queue 6 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b5	QFF5	Receive Queue 5 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b4	QFF4	Receive Queue 4 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b3	QFF3	Receive Queue 3 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b2	QFF2	Receive Queue 2 (Stream) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b1	QFF1	Receive Queue 7 (Network Control) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.
b0	QFF0	Receive Queue 0 (Best Effort) Full Interrupt Status 0: The interrupt is not pending. 1: The interrupt is pending.

RFFF Receive FIFO Full Interrupt Status Bit

This bit indicates that a frame was received but storing it was not possible due to the reception FIFO being full.

When receiving a frame is not possible, the frame will be discarded.

Other information regarding discarded frames is not retained. Even if the frame is not discarded, this bit may also be set to 1 if the E-MAC determines that the frame is an error frame

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the reception FIFO cannot hold received data.

QFF0 to 17 Receive 0 to 17 Full Interrupt Status Bits

These bits indicate that reception queue r did not have space for storing a received frame.

A reception queue is treated as full when it has no descriptors (descriptor type (DESCR.DT) = FEMPTY, FEMPTY_IS, FEMPTY_IC, or FEMPTY_ND) available or reaches the set level for stopping.

CAUTION

If no FEMPTY descriptors or no empty space for descriptors remains in the queue during storing of a divided frame (see section 45.3.4.3 (b) Divided Frames), an error frame is stored in the queue. Such error frames are treated as descriptor sequence errors.

[Conditions for Changing]

A bit is set to 0 when the operating mode is not operation mode.

A bit is set to 1 when reception queue r has no space available for storage.

A bit is set to 1 when the unread frame counter (unread frame counter register i (UFCVi) (i = 0 to 4)) reaches the set level for stopping.

A bit is set to 1 when the unread frame counter reaches the level for stopping before the subsequent received frame is discarded.

45.2.36 Transmit Interrupt Control Register (TIC)

The TIC register controls the AVB-DMAC transmit interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Table 45.40 TIC register contents

Bit Position	Bit Name	Function
b31 to b10	—	Reserved These bits are read as 0. The write value should be 0.
b9	TFWE	Time Stamp FIFO Warning Interrupt Enable 0: Disabled 1: Enabled
b8	TFUE	Time Stamp FIFO Update Interrupt Enable 0: Disabled 1: Enabled
b7 to b0	—	Reserved These bits are read as 0. The write value should be 0.

TFWE Time Stamp FIFO Warning Interrupt Enable Bit

When the time-stamp FIFO reaches the warning level while the interrupt is enabled, the interrupt is issued.

TFUE Time Stamp FIFO Update Interrupt Enable Bit

When the time-stamp FIFO is updated while the interrupt is enabled, the interrupt is issued.

45.2.37 Transmit Interrupt Status Register (TIS)

The TIS register indicates the states of the AVB-DMAC transmit interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	TFWF	TFUF	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R

Table 45.41 TIS register contents

Bit Position	Bit Name	Function
b31 to b10	—	Reserved These bits are read as 0. The write value should be 0.
b9	TFWF	Time Stamp FIFO Warning Interrupt Status 0: The interrupt is not pending. 1: The time-stamp FIFO has reached the warning level.
b8	TFUF	Time Stamp FIFO Update Interrupt Status 0: The interrupt is not pending. 1: The time-stamp FIFO has been updated.
b7 to b0	—	Reserved These bits are read as 0. The write value should be 0.

TFWF Time Stamp FIFO Warning Interrupt Status Bit

This bit indicates that the transmission time-stamp FIFO has reached the warning level.

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode and when the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) is 0.

The bit is set to 1 after a frame including DESCR.TSR set has been transmitted and one entry has already been stored in the time-stamp FIFO.

TFUF Time Stamp FIFO Update Interrupt Status Bit

This bit indicates that the transmission time-stamp FIFO has been updated.

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode, when the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) is 0, and when 1 is written to the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR).

The bit is set to 1 when the time stamp FIFO enable bit (TCCR.TFEN) is 1 after a frame including DESCR.TSR set has been transmitted.

45.2.38 Interrupt Summary Status Register (ISS)

The ISS register gives a summary of the states of AVB-DMAC-related interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b21	DPS5	Descriptor Interrupt 5 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b20	DPS4	Descriptor Interrupt 4 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b19	DPS3	Descriptor Interrupt 3 Summary 0: The interrupt is not pending. 1: The interrupt is pending.

Table 45.42 ISS register contents (2/2)

Bit Position	Bit Name	Function
b18	DPS2	Descriptor Interrupt 2 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b17	DPS1	Descriptor Interrupt 1 Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b16 to b14	—	Reserved These bits are read as 0. The write value should be 0.
b13	CGIS	gPTP Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b12	RFWS	Receive FIFO Warning Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b11 to b10	—	Reserved These bits are read as 0. The write value should be 0.
b9	TFWS	Time Stamp FIFO Warning Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b8	TFUS	Time Stamp FIFO Update Interrupt 0: The interrupt is not pending. 1: The interrupt is pending.
b7	MS	E-MAC Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b6	ES	Error Interrupt Summary 0: The interrupt is not pending. 1: The interrupt is pending.
b5 to b0	—	Reserved These bits are read as 0. The write value should be 0.

DPS1 to DPS15 Descriptor Interrupt 1 to 15 Summary Bits

These bits are set to 1 when the given descriptor interrupt enable bit (DIC.DPE1 to DPE15) and descriptor interrupt status flag (DIS.DPF1 to DPF15) are both 1.

CGIS gPTP Interrupt Summary Bit

This bit is set to 1 when either interrupt-related bit in the two gPTP-related interrupt registers (GIC and GIS) is 1.

RFWS Receive FIFO Warning Interrupt Summary Bit

This bit is set to 1 when the receive FIFO warning interrupt enable bit (RIC1.RFWE) and receive FIFO warning interrupt status flag (RIS1.RFWF) are both 1.

TFWS Time Stamp FIFO Warning Interrupt Summary Bit

This bit is set to 1 when the time stamp FIFO warning interrupt enable bit (TIC.TFWE) and time stamp FIFO warning interrupt status flag (TIS.TFWF) are both 1.

TFUS Time Stamp FIFO Update Interrupt Summary Bit

This bit is set to 1 when the time stamp FIFO update interrupt enable bit (TIC.TFUE) and time stamp FIFO update interrupt status flag (TIS.TFUF) are both 1.

MS E-MAC Interrupt Summary Bit

This bit is set to 1 when an E-MAC interrupt is issued.

ES Error Interrupt Summary Bit

This bit is set to 1 when any of the valid flags in the error interrupt status register (EIS) is 1 or the queue full error interrupt status bit (EIS.QFS) in the error interrupt status register (EIS) is 1.

45.2.39 gPTP Configuration Control Register (GCCR)

The GCCR register is used to set and control the gPTP (generalized precision time protocol).

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.43 GCCR register contents

Bit Position	Bit Name	Function
b31 to b10	—	Reserved These bits are read as 0. The write value should be 0.
b9, b8	TCSS[1:0]	Timer Capture Source Select 00: gPTP timer value 01: Adjusted gPTP timer value 10: AVTP presentation time 11: Setting prohibited
b7, b6	—	Reserved These bits are read as 0. The write value should be 0.
b5	LMTT	Maximum Transit Time Configuration Request 0: Setting completed 1(W): Issue a configuration request. 1(R): Completion of settings is pending.
b4	LPTC	Presentation Time Compare Value Configuration Request 0: Setting completed 1(W): Issue a configuration request. 1(R): Completion of settings is pending.
b3	LTI	Timer Increment Value Configuration Request 0: Setting completed 1(W): Issue a configuration request. 1(R): Completion of settings is pending.
b2	LTO	Timer Offset Value Configuration Request 0: Setting completed 1(W): Issue a configuration request. 1(R): Completion of settings is pending.
b1, b0	TCR[1:0]	Timer Control Request 00: Timer control is not requested. 01: gPTP/AVPT presentation time reset 10: Setting prohibited 11: Captures the value set in the TCSS bit.

TCSS[1:0] Timer Capture Source Select Bits

These bits select the source used for updating the captured timer register (gPTP timer capture register (GCTi.CTV)).

These bits should still be controlled when timer control is not being requested (GCCR.TCR = B'00).

LMTT Maximum Transit Time Configuration Request Bit

This bit issues requests for configuring the gPTP maximum transit time configuration register (GMTT).

Only 1 can be written to the bit.

[Conditions for Changing]

The bit is set to 1 when the operating mode is not operation mode.

The bit is set to 0 when the value of the gPTP maximum transit time configuration register (GMTT) is reflected in the gPTP timer.

LPTC Presentation Time Compare Value Configuration Request Bit

This bit issues requests for configuring the gPTP presentation time comparison register (GPTC).

Only 1 can be written to the bit.

[Conditions for Changing]

The bit is set to 1 when the operating mode is not operation mode.

The bit is set to 0 when the value of the gPTP presentation time comparison register (GPTC) is reflected in the gPTP timer.

LTI Timer Increment Value Configuration Request Bit

This bit issues requests for configuring the gPTP timer increment configuration register (GTI).

Only 1 can be written to the bit.

[Conditions for Changing]

The bit is set to 1 when the operating mode is not operation mode.

The bit is set to 0 when the value of the gPTP timer increment configuration register (GTI) is reflected in the gPTP timer.

LTO Timer Offset Value Configuration Request Bit

This bit issues requests for configuring gPTP timer offset configuration register i (GTOi).

Only 1 can be written to the bit.

[Conditions for Changing]

The bit is set to 1 when the operating mode is not operation mode.

The bit is set to 0 when the value of gPTP timer offset configuration register i (GTOi) is reflected in the gPTP timer.

TCR[1:0] Timer Control Request Bits

These bits issue requests for controlling the gPTP timer.

Writing to the bits is only possible when the current operating mode is operation mode and the bits are B’00.

Do not write to the bit when the gPTP timer clock select bit in the AVB-DMAC mode register is B’00.

[Conditions for Changing]

The bits are set to B’00 when the operating mode is not operation mode and on completion of the requested processing.

45.2.40 gPTP Maximum Transit Time Configuration Register (GMTT)

The GMTT register sets the maximum time for transitions of the gPTP timer.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Table 45.44 GMTT register contents

Bit Position	Bit Name	Function
b31 to b0	MTTV[31:0]	Maximum Transit Time The maximum transition time for addition to the presentation time

MTTV[31:0] Maximum Transit Time Bits

These bits set the maximum transition time for use in calculating AVTP presentation times.

Write the desired setting to the bits, then issue the configuration request by setting the maximum transit time configuration request bit in the gPTP configuration control register (GCCR.LMTT) to 1.

CAUTION

Do not write a value to these bits when the operating mode is operation mode and the maximum transit time configuration request bit (GCCR.LMTT) is 1.

45.2.41 gPTP Presentation Time Comparison Register (GPTC)

The GPTC register sets a value for comparison with presentation times in the gPTP timer.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	PTCV[31:16]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PTCV[15:0]

Table 45.45 GPTC register contents

Bit Position	Bit Name	Function
b31 to b0	PTCV[31:0]	Presentation Time Comparison Value Value for comparison with the gPTP presentation times

PTCV[31:0] Presentation Time Comparison Value Bits

These bits set a value for comparison with AVTP timer values to which a maximum transit time is not appended.

Write the desired setting to the bits, then issue the configuration request by setting the presentation time comparison value configuration request bit in the gPTP configuration control register (GCCR.LPTC) to 1.

CAUTION

Do not write a value to these bits when the operating mode is operation mode and the presentation time comparison value configuration request bit (GCCR.LPTC) is 1.

Do not set these bits to a value in the range from x-1 to x+1 (x is the setting value of the gPTP timer increment value bits (GTI.TIV)).

45.2.42 gPTP Timer Increment Configuration Register (GTI)

The GTI register sets the increment for the gPTP timer.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	TIV[27:16]											
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TIV[15:0]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 45.46 GTI register contents

Bit Position	Bit Name	Function
b31 to b28	—	Reserved These bits are read as 0. The write value should be 0.
b27 to b0	TIV[27:0]	gPTP Timer Increment Value Increment for the gPTP timer

TIV[27:0] Bits (gPTP Timer Increment Value)

When the gPTP clock select bits in the AVB-DMAV mode register (CCC.CSEL) are selecting a clock signal, these bits set the value by which the timer is incremented each time a cycle of that clock signal elapses.

Write the desired setting to the bits, then issue the configuration request by setting the timer increment value configuration request bit in the gPTP configuration control register (GCCR.LTI) to 1.

CAUTION

Do not write a value to these bits when the operating mode is operation mode and the timer increment value configuration request bit (GCCR.LTI) is 1.

Do not write 0 to the bits.

45.2.43 gPTP Timer Offset Configuration Register i (GTOi) (i = 0 to 2)

The GTOi register sets an offset value for the gPTP timer.

The offset value is added to the combination of bits 0 to 31 in GTO0, 32 to 63 in GTO1, and 64 to 79 in GTO2, which together make up the gPTP timer.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	TOV[31+32*i:16+32*i]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	TOV[15+32*i:32*i]															
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 45.47 GTOi register contents

Bit Position	Bit Name	Function
b31 to b0	TOV[31+32*i:32*i]	Timer Offset Value Offset value for the gPTP timer

TOV[79:0] Timer Offset Value Bits

This is an 80-bit value consisting of the settings in GTO0.TOV[31:0], GTO1.TOV[63:32], and GTO2.TOV[79:64], and is used to set an offset for adding to the value of the gPTP timer.

Write the desired setting to the bits, then issue the configuration request by setting the timer offset value configuration request bit in the gPTP configuration control register (GCCR.LTO) to 1.

CAUTION

Do not write a value to these bits when the operating mode is operation mode and the timer offset value configuration request bit (GCCR.LTO) is 1.

Write H'0000 to GTO2.TOV[95:80].

Set a value in the range from 0 to 10^9-1 (H'0000 0000 to H'3B9A C9FF) in GTO0.TOV[31:0].

45.2.44 gPTP Interrupt Control Register (GIC)

The GCI register is used to control gPTP-related interrupts.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	PTME	PTOE	PTCE
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 45.48 GIC register contents

Bit Position	Bit Name	Function
b31 to b3	—	Reserved These bits are read as 0. The write value should be 0.
b2	PTME	Presentation Time Match Interrupt Enable 0: Disabled 1: Enabled
b1	PTOE	Presentation Time Overrun Interrupt Enable 0: Disabled 1: Enabled
b0	PTCE	Presentation Time Capture Interrupt Enable 0: Disabled 1: Enabled

PTME Presentation Time Match Interrupt Enable Bit

When this bit is 1, setting of the presentation time match interrupt flag in the gPTP interrupt status register (GIS.PTMF) to 1 leads to generation of that interrupt.

PTOE Presentation Time Overrun Interrupt Enable Bit

When this bit is 1, setting of the presentation time overrun interrupt flag in the gPTP interrupt status register (GIS.PTOF) to 1 leads to generation of that interrupt.

PTCE Presentation Time Capture Interrupt Enable Bit

When this bit is 1, setting of the presentation time capture interrupt flag in the gPTP interrupt status register (GIS.PTCF) to 1 leads to generation of that interrupt.

45.2.45 gPTP Interrupt Status Register (GIS)

The GIC register indicates the state of the gPTP-related interrupt.

Bit	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	PTMF	PTOF	PTCF
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 45.49 GIS register contents

Bit Position	Bit Name	Function
b31 to b3	—	Reserved These bits are read as 0. The write value should be 0.
b2	PTMF	Presentation Time Match Interrupt Flag 0: The interrupt is not pending. 1: The interrupt is pending.
b1	PTOF	Presentation Time Overrun Interrupt Flag 0: The interrupt is not pending. 1: The interrupt is pending.
b0	PTCF	Presentation Time Capture Interrupt Flag 0: The interrupt is not pending. 1: The interrupt is pending.

PTMF Presentation Time Match Interrupt Flag Bit

This bit indicates that the value of the AVTP timer exceeds the value of the gPTP presentation time comparison register (GPTC).

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when the AVTP timer value is greater than or equal to the value of the gPTP presentation time comparison register (GPTC).

PTOF Presentation Time Overrun Interrupt Flag Bit

This bit indicates that a capture event is generated before completion of the previous capture process.

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 0 when the presentation time capture interrupt flag bit (GIS.PTCF) is set to 0. The bit is set to 1 when a capture event is generated while the value of the presentation time capture interrupt flag bit (GIS.PTCF) is 1.

PTCF Presentation Time Capture Interrupt Flag Bit

This bit indicates that a capture event is generated.

Only 0 can be written to the bit.

[Conditions for Changing]

The bit is set to 0 when the operating mode is not operation mode.

The bit is set to 1 when a capture event is generated.
