

TVAC80020A

Wireless video–based intercom

The video intercom consists of a door station including a video camera and a 3.5" monitor, both connected wirelessly with each other. Thanks to simple operation and easy installation (ideal for retrofitting), the system is well suited for over–the–counter sales.

More safety and privacy

This intercom brings together the “intercom” and “video image” functions in a simple, easy–to–retrofit solution. Residents see who is at the door, can speak with the person and can operate the electric door opener if required.

Operation in three easy steps

1. Pressing the doorbell activates the portable monitor (live screen and recording)
2. You can view the video image on the monitor; the intercom can be used
3. You can switch the door opener by pressing a button on the monitor

Easy installation, ideal for retrofitting

The door station is mounted in a protected outdoor area (protection class IP55) and can be connected to existing cables (doorbell, door opener). This makes the door station optimal for retrofitting existing buildings. The monitor operates on batteries and can be used accordingly on a mobile basis.

Complete scope of delivery

In addition to the door station and monitor, the scope of delivery includes everything you need for retrofitting a house or apartment. Including power supply units, cable lug, round socket, screws, wall plugs, and screwdriver.

Note: The product with the English language package is TVAC80020B.
