

ATMXT228UD 3.0

maXTouch 228-node Touchscreen Controller

maXTouch® Adaptive Sensing Technology

- Up to 14 X (transmit) lines and 24 Y (receive) lines for use by a touchscreen and/or key array (see Section 4.3 "Permitted Configurations")
- A maximum of 228 nodes can be allocated to the touch sensor
- Touchscreen size of 7.11 inches (16:9 aspect ratio), assuming a sensor electrode pitch of 6.5 mm. Other sizes are possible with different electrode pitches and appropriate sensor material
- Multiple touch support with up to 10 concurrent touches tracked in real time

Touch Sensor Technology

- On-cell/touch-on display support including OLED and LCD
- Discrete/out-cell support including glass and PET filmbased sensors
- · Synchronization with display refresh timing capability
- Support for standard (for example, Diamond) and proprietary sensor patterns (review of designs by Microchip or a Microchip-qualified touch sensor module partner is recommended)

Front Panel Material

- Works with PET or glass, including curved profiles (configuration and stack-up to be approved by Microchip or a Microchip-qualified touch sensor module partner)
- 10 mm glass (or 5 mm PMMA) with bare finger (dependent on sensor size, touch size, configuration and stack-up)
- 6 mm glass (or 3 mm PMMA) with multi-finger 5 mm glove (2.7 mm PMMA equivalent) (dependent on sensor size, touch size, configuration and stack-up)

Touch Performance

- Moisture/Water Compensation
 - No false touch with condensation or water drop up to 22 mm diameter
 - One-finger tracking with condensation or water drop up to 22 mm diameter
- Multiple acquisition schemes for robust and sensitive multi-touch sensing, including:
 - Mutual capacitance measurements
 - Self Capacitance measurements
 - P2P Mutual Capacitance measurements

- Noise suppression technology to combat ambient and power-line noise
 - Up to 240 V_{PP} between 1 Hz and 1 kHz sinusoidal waveform (no touches)
 - IEC 61000-4-6, 7 Vrms, Class A (normal touch operation) conducted noise immunity
- · Stylus Support
 - Supports passive stylus with 1.5 mm contact diameter, subject to configuration, stack-up, and sensor design
- Scan Speed
 - Typical report rate for 10 touches ≥90 Hz (subject to configuration)
 - Initial touch latency <18 ms for first touch from idle (subject to configuration)
 - Configurable for power and speed optimization
- · Touch panel failure detection
 - Automatic touch sensor diagnostics during run time to support the implementation of safety critical features
 - Diagnostics reported using dedicated output pin or by standard Object Protocol messages
 - Configurable test limits

Keys

- Up to 16 nodes can be allocated as mutual capacitance sensor keys in addition to the touchscreen, defined as 1 key array (subject to availability of X and Y lines and other configurations)
- Adjacent Key Suppression (AKS) technology is supported for false key touch prevention

Enhanced Algorithms

- · Lens bending algorithms to remove display noise
- Touch suppression algorithms to remove unintentional large touches
- Palm Recovery Algorithm for quick restoration to normal state

Data Store

- 60-byte CRC checksummed data area for use as a run-time Product Data Store Area
- 64-byte data area for user's custom data (not CRC checksummed)

Device Security

• Encrypted configuration parameters and touch coordinate reports (OBP messages) using customer's own security key

Power Saving

- · Programmable timeout for automatic transition from Active to Idle state
- · Pipelined analog sensing detection and digital processing to optimize system power efficiency

Application Interfaces

- I²C client interface for main communication with the device
 - Standard mode (up to 100 kHz)
 - Fast mode (up to 400 kHz)
 - Fast-mode Plus (up to 1 MHz)
- · Interrupt to indicate when a message is available
- Additional SPI Debug Interface to read the raw data for tuning and debugging purposes

Power Supply

- Digital (Vdd) 3.3V nominal
- Digital I/O (VddIO) 3.3V nominal
- Analog (AVdd) 3.3V nominal
- High voltage internal X line drive (XVdd) 6.6V with internal voltage pump

Package

• 56-pin XQFN 6 x 6 x 0.4 mm, 0.35 mm pitch

Operating Temperature

• -40°C to +85°C

Design Services

- · Review of device configuration, stack-up and sensor patterns (contact your Microchip representative)
- Specific design and tuning tools available as maXTouch Studio plug-ins

PIN CONFIGURATION

TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at **docerrors@microchip.com**. We welcome your feedback.

Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

http://www.microchip.com

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (for example, DS30000000A is version A of document DS30000000).

Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; http://www.microchip.com
- Your local Microchip sales office (see last page)

When contacting Microchip, please specify which device, revision of silicon and data sheet (include literature number) you are using.

Customer Notification System

Register on our web site at http://www.microchip.com to receive the most current information on all of our products.

1.0 OVERVIEW OF ATMXT228UD

The Microchip maXTouch family of touch controllers brings industry-leading capacitive touch performance to customer applications. The ATMXT228UD features the latest generation of Microchip adaptive sensing technology that utilizes a hybrid mutual and self capacitive sensing system in order to deliver unparalleled touch features and a robust user experience.

- Patented capacitive sensing method The ATMXT228UD uses a unique charge-transfer acquisition engine to
 implement Microchip's patented capacitive sensing method. Coupled with a state-of-the-art CPU, the entire
 touchscreen sensing solution can measure, classify and track a number of individual finger touches with a high
 degree of accuracy in the shortest response time.
- Capacitive Touch Engine (CTE) The ATMXT228UD features an acquisition engine that uses an optimal measurement approach to ensure almost complete immunity from parasitic capacitance on the receiver input lines. The engine includes sufficient dynamic range to cope with anticipated touchscreen self and mutual capacitances, which allows great flexibility for use with the Microchip proprietary sensor pattern designs. One- and two-layer ITO sensors are possible using glass or PET substrates.
- Touch detection The ATMXT228UD allows for both mutual and self capacitance measurements, with the self capacitance measurements being used to augment the mutual capacitance measurements to produce reliable touch information.

When self capacitance measurements are enabled, touch classification is achieved using both mutual and self capacitance touch data. This has the advantage that both types of measurement systems can work together to detect touches under a wide variety of circumstances.

The system may be configured for different types of default measurements in both idle and active modes. For example, the device may be configured for Mutual Capacitance Touch as the default in active mode and Self Capacitance Touch as the default in idle mode. Note that other types of scans (such as P2P mutual capacitance scans and other types of self capacitance scans) may also be made depending on configuration.

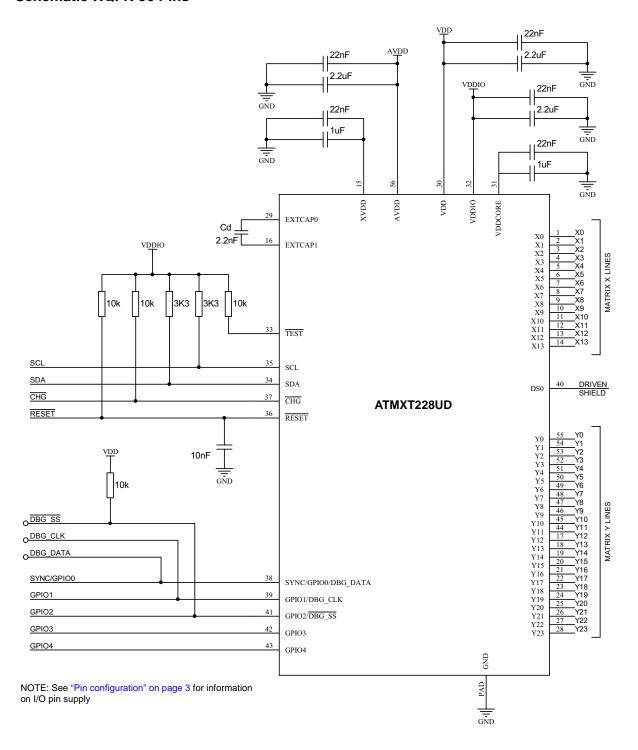

Mutual capacitance touch data is used wherever possible to classify touches as this has a greater resolution than self capacitance measurements and provides positional information on touches. For this reason, multiple touches can only be determined by mutual capacitance touch data. In Self Capacitance Touch Default mode, if the self capacitance touch processing detects multiple touches, touchscreen processing is skipped until mutual capacitance touch data is available.

Self capacitance and P2P mutual capacitance measurements allow for the detection of touches in extreme scenarios, such as thick glove touches, when single-ended mutual capacitance touch detection alone may miss touches.

- **Display Noise Cancellation** A combination of analog circuitry, hardware noise processing, and firmware combats display noise without requiring additional listening channels or synchronization to display timing. This enables the use of shieldless touch sensor stacks, including touch-on-lens.
- Noise filtering Hardware noise processing in the capacitive touch engine provides enhanced autonomous
 filtering and allows a broad range of noise profiles to be handled. The result is good performance in the presence
 of LCD noise.
- Processing power The main CPU has two companion microsequencer coprocessors under its control
 consuming low power. This system allows the signal acquisition, preprocessing and postprocessing to be
 partitioned in an efficient and flexible way.
- Interpreting user intention The Microchip hybrid mutual and self capacitance method provides unambiguous multitouch performance. Algorithms in the ATMXT228UD provide optimized touchscreen position filtering for the smooth tracking of touches, responding to a user's intended touches while preventing false touches triggered by ambient noise, conductive material on the sensor surface, such as moisture, or unintentional touches from the user's resting palm or fingers.

2.0 SCHEMATIC

2.1 Schematic XQFN 56 Pins

See Section 2.2 "Schematic Notes"

2.2 Schematic Notes

2.2.1 NUMBER OF AVAILABLE NODES

Although 14 X lines and 24 Y lines are provided, only a maximum of 228 nodes on the matrix can be used for the touchscreen.

2.2.2 POWER SUPPLY

The sense and I/O pins are supplied by the power rails, as listed in Table 2-1.

TABLE 2-1: POWER SUPPLY FOR SENSE AND I/O PINS

Power Supply	Pins
XVdd	X sense pins
AVdd	Y sense pins
Vdd	GPIO2, GPIO3/DBG_SS, GPIO4
VddIO	RESET, TEST, CHG SCL, SDA, SYNC/GPIO0/DBG_DATA, GPIO1/DBG_CLK

2.2.3 DECOUPLING CAPACITORS

All decoupling capacitors must be X7R or X5R and placed less than 5 mm away from the pins for which they act as bypass capacitors. Pins of the same type can share a capacitor provided no pin is more than 10 mm from the capacitor.

The schematics on the previous pages show the capacitors required. The parallel combination of capacitors is recommended to give high and low frequency filtering, which is beneficial if the voltage regulators are likely to be some distance from the device (for example, if an active tail design is used). Note that this requires that the voltage regulator supplies for AVdd, Vdd and VddIO are clean and noise free. It also assumes that the track length between the capacitors and on-board power supplies is less than 50 mm.

The number of base capacitors can be reduced if the pinout configuration means that sharing a bypass capacitor is possible (subject to the distance between the pins satisfying the conditions above and there being no routing difficulties).

2.2.4 PULL-UP RESISTORS

The pull-up resistors shown in the schematic are suggested typical values and may be modified to meet the requirements of an individual customer design.

This applies, in particular, to the pull-up resistors on the I^2C SDA and SCL lines (shown on the schematic), as the values of these resistors depend on the voltage and the speed of the I^2C interface. See Section 11.9 "Host I2C Specification" for the specification of the I^2C interface on the ATMXT228UD.

Note that if a VddIO supply at the low end of the allowable range is used, the I²C pull-up resistor values may need to be reduced.

2.2.5 VDDCORE

VddCore is internally generated from the Vdd power supply. To guarantee stability of the internal voltage regulator, one or more external decoupling capacitors are required.

2.2.6 XVDD

XVdd power can be supplied either as high voltage (using an internal voltage pump) or as low voltage (connected directly to the AVdd supply). The operating mode should be chosen according to the final application.

The voltage pump requires one external capacitor:

- EXTCAP0 must be connected to EXTCAP1 via a capacitor (Cd).
- The capacitor on XVDD should be rated at least 10 V if the voltage doubler is used.

Capacitor Cd should provide a capacitance of 2.2 nF. The capacitor must be placed as close as possible to the EXTCAPn pins.

If low voltage XVdd is required (that is, the XVdd voltage doubler is not required):

- Capacitor Cd must be omitted and EXTCAP0 and EXTCAP1 left unconnected.
- XVDD must be connected directly to the AVdd supply.

CAUTION!

The device may be permanently damaged if the XVDD supply pin is shorted to Ground or high current is drawn from it.

2.2.7 AVDD

A diode from AVDD to VDD is present in the device. If AVDD and VDD are driven from different supplies, the Vdd supply must be powered up earlier than AVdd.

2.2.8 CHG LINE

The CHG line is an active-low, open-drain output that is used as an interrupt to alert the system host that an OBP message is pending and ready to be read.

See Section 7.8 "CHG Line" for more information.

2.2.9 DRIVEN SHIELD LINE

The driven shield line (DS0) should be used to shield the X/Y sense lines. Specifically, the driven shield line acts as a driven shield in self capacitance operation. See Section 8.4 "Driven Shield Line" for more details.

2.2.10 MULTIPLE FUNCTION PINS

Some pins may have multiple functions. In this case, only one function can be chosen and the circuit should be designed accordingly.

2.2.11 SYNC PIN

The ATMXT228UD has a single SYNC pin that can be used for either frame synchronization (typically connected to VSYNC) or pulse synchronization (typically connected to HSYNC), but not both.

2.2.12 GPIO PINS

ATMXT228UD has 5 GPIO pins. The pins can be set to be either an input or an output, as required, using the GPIO Configuration T19 object.

If a GPIO pin is unused, it should be handled as identified in "Pin configuration" on page 3. The pin should also be given a defined state by the GPIO Configuration T19 object:

- By default, the GPIO pins are set to be inputs so if a pin is not used, and is left configured as an input, it should be connected to GND through a resistor. Alternatively, the internal pull-up resistor should be enabled (in the GPIO Configuration T19 object) to pull up the pin, and the pin left unconnected.
- Alternatively, the GPIO pin can be set as an output low using the GPIO Configuration T19 object and left open. This option avoids any problems should the pin accidentally be configured as output high at a later date.
- If a GPIO pin is shared with a debug line, see Section 2.2.14 "SPI Debug Interface" for advice on how to treat an unused GPIO pin in this case.

If the GPIO Configuration T19 object is not enabled for use, the GPIO pins cannot be used for GPIO purposes, although any alternative function can still be used.

Some GPIO pins have alternative functions or other restrictions. In particular, if an alternative function is used, this takes precedence over the GPIO function and the pin cannot be used as a GPIO pin (see also "Pin configuration" on page 3). Note the following restrictions:

- GPIO0 cannot be used if the SYNC function is in use.
- The SPI Debug Interface functionality is shared with some of the GPIO pins. See Section 2.2.14 "SPI Debug Interface" for more details on the SPI Debug Interface and how to handle these pins if they are totally unused.

2.2.13 HEARTBEAT OUTPUT SIGNAL

One of the GPIO pins can be configured using a GPIO output trigger to act as a regular heartbeat ("keep alive") signal that can be sent to the system host.

Any available GPIO pin can be configured as a heartbeat by the GPIO Configuration T19 object.

2.2.14 SPI DEBUG INTERFACE

The DBG_CLK, DBG_DATA and DBG_SS lines form the SPI Debug Interface. These pins should be routed to test points on all designs, such that they can be connected to external hardware during system development and for debug purposes. See also Section 10.1 "SPI Debug Interface".

The debug lines may share pins with other functionality. If the circuit is designed to use the SPI Debug Interface, then any alternative functionality cannot be used. Specifically:

- The DBG_CLK line shares functionality with GPIO1; therefore GPIO1 cannot be used if the SPI Debug Interface is in use.
- The DBG_DATA line shares functionality with GPIO0; therefore GPIO0 cannot be used if the SPI Debug Interface
 is in use
- The DBG_SS line shares functionality with GPIO2; therefore GPIO2 cannot be used if the DBG_SS line is in use.
- The pull-up resistor for DBG_SS in the schematics is optional and should be present only if the line is used as DBG_SS.

The DBG_CLK, DBG_DATA and DBG_SS lines should not be connected to power or GND. For this reason, where these pins are shared with GPIO pins and they are totally unused (that is, they are not being used as debug or GPIO pins), they should be set as outputs using the GPIO Configuration T19 object.

3.0 TOUCHSCREEN BASICS

3.1 Sensor Construction

A touchscreen is usually constructed from a number of transparent electrodes. These are typically on a glass or plastic substrate. They can also be made using non-transparent electrodes, such as copper or carbon. Electrodes are constructed from Indium Tin Oxide (ITO) or metal mesh. Thicker electrodes yield lower levels of resistance (perhaps tens to hundreds of Ω /square) at the expense of reduced optical clarity. Lower levels of resistance are generally more compatible with capacitive sensing. Thinner electrodes lead to higher levels of resistance (perhaps hundreds of Ω /square) with some of the best optical characteristics.

Interconnecting tracks in ITO can cause problems. The excessive RC time constants formed between the resistance of the track and the capacitance of the electrode to ground can inhibit the capacitive sensing function. In such cases, the tracks should be replaced by screen printed conductive inks (non-transparent) outside the touchscreen viewing area.

3.2 Electrode Configuration

The specific electrode designs used in Microchip touchscreens are the subject of various patents and patent applications. Further information is available on request.

The device supports various configurations of electrodes as summarized in Section 4.0 "Sensor Layout".

3.3 Scanning Sequence

All nodes are scanned in sequence by the device. Where possible, there is a parallelism in the scanning sequence to improve overall response time. The nodes are scanned by measuring capacitive changes at the intersections formed between the first drive (X) line and all the receive (Y) lines. Then the intersections between the next drive line and all the receive lines are scanned, and so on, until all X and Y combinations have been measured.

The device can be configured in various ways. It is possible to disable some nodes so that they are not scanned at all. This can be used to improve overall scanning time.

3.4 Touchscreen Sensitivity

3.4.1 ADJUSTMENT

Sensitivity of touchscreens can vary across the extents of the electrode pattern due to natural differences in the parasitic capacitance of the interconnections, control chip, and so on. An important factor in the uniformity of sensitivity is the electrode design itself. It is a natural consequence of a touchscreen pattern that the edges form a discontinuity and hence tend to have a different sensitivity. The electrodes at the edges do not have a neighboring electrode on one side and this affects the electric field distribution in that region.

A sensitivity adjustment is available for the whole touchscreen. This adjustment is a basic algorithmic threshold that defines when a node is considered to have enough signal change to qualify as being in detect.

3.4.2 MECHANICAL STACKUP

The mechanical stackup refers to the arrangement of material layers that exist above and below a touchscreen. The arrangement of the touchscreen in relation to other parts of the mechanical stackup has an effect on the overall sensitivity of the screen. The maXTouch technology has an excellent ability to operate in the presence of ground planes close to the sensor. The sensitivity of the maXTouch technology is attributed more to the interaction of the electric fields between the transmitting (X) and receiving (Y) electrodes than to the surface area of these electrodes. For this reason, stray capacitance on the X or Y electrodes does not strongly reduce sensitivity.

Front panel dielectric material has a direct bearing on sensitivity. The thicker the front panel, the lower the signal-tonoise ratio of the measured capacitive changes and hence the lower the resolution of the touchscreen. In general, glass front panels are near optimal because they conduct electric fields almost twice as easily as plastic panels.

NOTE Care should be taken using ultra-thin glass panels as retransmission effects can occur, which can significantly degrade performance.

4.0 SENSOR LAYOUT

The specific electrode designs used in Microchip touchscreens may be the subject of various patents and patent applications. Further information is available on request.

4.1 Electrodes

NOTE

The device supports various configurations of touch electrodes as summarized below:

- Touchscreen: 1 touchscreen panel occupies a rectangular matrix of 14 X x 24 Y lines (subject to other configurations).
- Keys: Up to 16 keys in an X/Y grid (Key Array), with each node (X/Y intersection) forming a key within the array.

NOTE

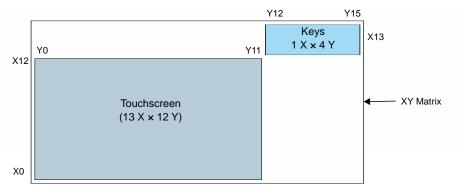

Although there is a total of 38 lines, arranged as a matrix of 14 X by 24 Y, only a maximum of 228 nodes can be used for all the touch objects on this device. The matrix can be made up of any combination of X and Y lines in the design (subject to the limitations described below), provided the X and Y lines are contiguous and subject to the maximum of 228 nodes. For example the matrix could be constructed as a matrix of 14 X by 16 Y lines (giving 224 nodes), as a matrix of 9 X by 24 Y (giving 216 nodes) or as a matrix of any other combination in between. The arrangement chosen depends on the application.

The physical sensor matrix is configured using one or more touch objects. It is not mandatory to have all the allowable touch objects on the device enabled, nor is it mandatory to use all the rows and columns on the matrix, so objects that are not required can be left disabled (default).

4.2 Sensor Matrix Layout

An example layout is shown in Figure 4-1.

FIGURE 4-1: EXAMPLE LAYOUT

When designing the physical layout of the touch panel, the following rules must be obeyed:

· General layout rules:

- Each touch object should be a regular rectangular shape in terms of the lines it uses.
- Although each touch object must use a contiguous block of X or Y lines, there can be gaps between the blocks of X and Y lines used for the different touch objects

- Additional layout rules for Multiple Touch Touchscreen T100:
 - The Multiple Touch Touchscreen T100 object *must* start at (X0, Y0).
 - The Multiple Touch Touchscreen T100 object cannot share an X or Y line with another touch object (for example, a Key Array T15) if self capacitance measurements are enabled. Note that sharing of X or Y lines is allowed for mutual capacitance only designs, but this is not recommended for compatibility reasons.
 - The touchscreen must contain a minimum of 3 X lines. If Dual X Drive is enabled for use in the Noise Suppression T72 object, the minimum is 4 X lines.
 - The touchscreen must contain a minimum of 3 Y lines.
 - Self Capacitance touchscreens must have an even number of Y lines if low frequency compensation is used.

• Additional layout rules for Key Array T15:

- The Key Array must occupy higher X and Y lines than those used by the Multiple Touch Touchscreen T100 object.

4.3 Permitted Configurations

The permitted X/Y configurations are shown in Table 4-1.

TABLE 4-1: PERMITTED TOUCHSCREEN CONFIGURATIONS

												Num	ber c	of Y L	ines

Key: Y Configuration supported for self capacitance and all mutual capacitance measurements; configuration recommended (Y* = optimum 228 nodes)

- P Configuration supported for all mutual capacitance measurement types; self capacitance measurements not supported
- M Configuration supported for non P2P mutual capacitance measurements only; self capacitance measurements not supported
- X Configuration supported for all mutual capacitance measurements types, but only if dual X is *not* used; self capacitance measurements not supported
- Z Configuration supported for non P2P mutual capacitance measurements, but only if dual X is not used; self capacitance measurements not supported
- Configuration not supported

4.4 Touchscreen Size

Table 4-2 lists some typical screen size and electrode pitch combinations to achieve various touchscreen aspect ratios.

TABLE 4-2: TYPICAL SCREEN SIZES

			Screen Diagonal (Inches)						
Aspect Ratio	Matrix Size	Node Count	3.8 mm Pitch ⁽²⁾	4.5 mm Pitch	5.5 mm Pitch	6.5 mm Pitch			
Single Touchscreen (1)									
16:10	X = 14, Y = 23	322	4.0	4.8	5.8	6.9			
16:9	X = 14, Y = 24	336	4.2	4.9	6.0	7.1			
4:3	X = 14, Y = 19	266	3.5	4.2	5.1	6.0			
2:1	X = 12, Y = 24	288	4.0	4.8	5.8	6.9			

Note 1: The figures given in the table are for a Touchscreen and show the largest node count possible to achieve the desired aspect ratio. No provision has been made for a Key Array.

4.5 Driven Shield Line

The driven shield line (DS0) should be used to shield the X/Y sense lines. See Section 8.4 "Driven Shield Line" for more details.

^{2:} Recommended sensor pitch for 1.5 mm passive stylus tip diameter.

5.0 POWER-UP / RESET REQUIREMENTS

5.1 Power Sequencing

The ATMXT228UD has a number of power rails, reflecting the power domains internal to the device. Power sequencing should be straightforward if the following rules are followed.

5.1.1 PREREQUISITES

All input signals to the device must be set to 0V (logic low) whenever the device is powered off to avoid "back-powering" the device through the input protection diodes.

Make sure that any lines connected to the device are below or equal to Vdd during power-up and power-down.

5.1.2 POWER-UP SEQUENCE

The power rails should be powered on in the following order:

- 1. Ideally, VddIO should be powered on first (see Figure 5-1), as the RESET line and CHG line are referenced to this.
- Vdd should be powered on after, or at the same time as, VddIO.
 A diode from AVDD to VDD is present in the device. If AVDD and VDD are driven from different supplies, the Vdd supply must be powered up earlier than AVdd.
- 3. AVdd should be powered on after, or at the same time as, Vdd.

All rails must adhere to the maximum rate-of-rise specification (see Section 11.2.1 "DC Characteristics").

5.1.3 POWER-DOWN SEQUENCE

Powering off the chip is essentially the reverse of power-up. Again, all input signals to the device must be set to 0V (logic low) before power is removed from the device.

5.1.4 SHARED REGULATORS

One or more power rails may be derived from the same LDO, in which case the power rails will power up and down together:

- The Vdd and VddIO rails can be shared.
- Vdd and AVdd can be shared, but for best performance a separate AVdd supply is recommended.

5.1.5 XVDD POWER SUPPLY OPTIONS

The following options are available for the XVdd rail (see Section 2.2.2 "Power Supply"):

• Connected to the internal boosted supply (capacitive pump).

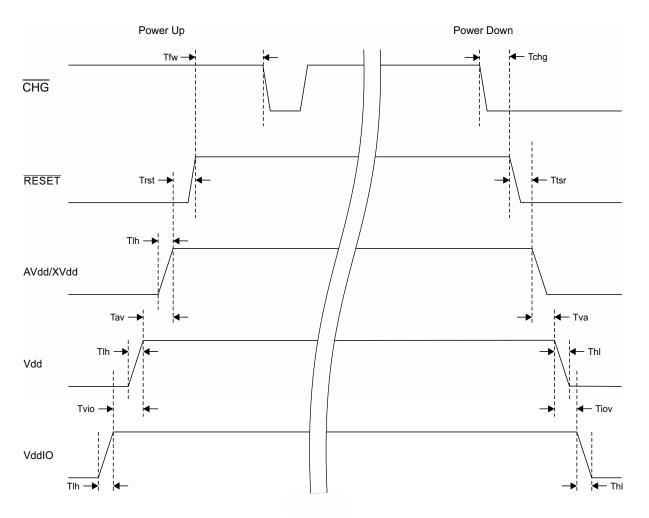

Connected directly to the AVdd supplyFor an internal boosted supply, the device will take care of all necessary timings.

A shared unboosted supply will power up and down at the same time as the shared AVdd power rail.

5.1.6 SUMMARY OF POWER SEQUENCES

Figure 5-1 summarizes the power-on and power-off sequences.

FIGURE 5-1: POWER SEQUENCES

Parameter	Description	Value
Tlh	Supply Rise Rate	See Section 11.2.1 "DC Characteristics"
Tvio	VddIO to Vdd rise delay	0 ns to 10 ms
Tav	Vdd to AVdd rise delay	≥ 0 ns
Trst	Last power rail rise to Reset	≥ 90 ns
Tfw	Reset to CHG line toggled.	Depends on configuration; see Section 11.5.3 "Reset Timings"
Tchg	CHG line to Reset asserted	Controlled by maXTouch device
Ttsr	Reset asserted to first power rail fall	≥ 0 ns
Thl	Supply Fall Rate	See Section 11.2.1 "DC Characteristics"
Tva	AVdd to Vdd fall delay	≥ 0 ns
Tiov	Vdd to VddlO fall delay	≥ 0 ns

5.2 Power-on Reset

5.2.1 INTERNAL RESET

The ATMXT228UD includes a Power-on Reset (POR) function in the device. This will reset the device on the rising edge of the Vdd supply. When using this feature, the following applies:

- VddIO should either share the Vdd supply, or must be powered on before Vdd.
- The RESET pin should be pulled high to VddIO by a resistor.

The POR function will also perform a reset in the event of a power brown-out during operation.

At power-on, the device can be configured to perform self tests (using the Self Test Control T10 object) to check for faults in the device.

5.2.2 EXTERNAL RESET

It is recommended that the ATMXT228UD is controlled by a RESET line from the system host, as this gives the system host full control over the timing and power state of the device. To avoid back-powering problems, the RESET line must be driven low (logic 0) whenever power is not supplied to the device. The RESET line must be held low for at least 90 ns after both the Vdd and VddIO device power supplies have reached their nominal values. Ideally, this applies to all the power supplies, but see Section 5.2.3 "Power-on with late AVdd/XVdd rise".

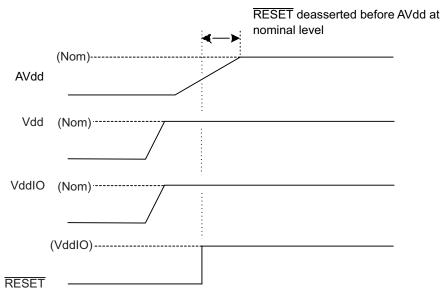

NOTE The voltage level on the RESET pin must never exceed the VddIO supply voltage.

5.2.3 POWER-ON WITH LATE AVDD/XVDD RISE

If the RESET line is released before the AVdd supply has reached its nominal voltage (see Figure 5-2), then some additional operations need to be carried out by the host. There are two possible approaches available to the system host controller:

- Start the device in deep sleep (that is, the stored configuration has Power Configuration T7 ACTVACQINT and IDLEACQINT set to 0). Then write the normal scan frequency values to Power Configuration T7 to allow the device to run. Note that, in this case, the system host must also issue a calibrate command to the device.
- · Send a software Reset command to the chip to reinitialize it.

FIGURE 5-2: POWER SEQUENCING ON THE ATMXT228UD – LATE RISE ON AVDD

5.3 Initialization

After power-up, the device typically takes 45 ms to 67 ms before it is ready to start scanning, depending on the configuration. The device indicates that initialization is complete by asserting the CHG line low (see Section 5.5 "CHG Line Operation").

NOTE

Device initialization will not complete until after all the power supplies are present. If any power supply is not present, internal initialization stalls and the device will not communicate with the host.

5.4 Reset During Operation

5.4.1 HARDWARE RESET

The hardware RESET pin can be used to reset the device during operation whenever the system host considers it necessary. It is recommended to connect the RESET pin to a host controller to allow the host to initiate a full hardware reset without requiring the ATMXT228UD to be powered down.

The RESET pin must be asserted low for a minimum of 90 ns to cause a reset. Following a hardware reset, the device typically takes 47 ms to 70 ms before it restarts scanning, depending on the configuration.

WARNING

The device should be reset only by using the RESET line. If an attempt is made to reset by removing the power from the device without also sending the signal lines low, power will be drawn from the communication and I/O lines and the device will not reset correctly.

NOTE The voltage level on the RESET pin of the device must never exceed VddIO (digital supply voltage).

5.4.2 SOFTWARE RESET

The host can issue a software reset command using the Command Processor T6 object at any time in order to reset the device. The device typically takes 67 ms to 103 ms before it restarts scanning, depending on the configuration.

The reset flag is set in the Command Processor T6 object message data to indicate to the host that it has just completed a reset cycle. This bit can be used by the host to detect any unexpected brownout events. This allows the host to take any necessary corrective actions, such as reconfiguration.

5.4.3 RESET INDICATION

After any reset and reinitialization, a Command Processor T6 message is generated by the device. The RESET bit in the Command Processor T6 STATUS message field is set to 1 to indicate that a reset has been performed.

5.5 CHG Line Operation

The $\overline{\text{CHG}}$ line is briefly set as an input during power-up or reset until the device has finished initializing. It is therefore particularly important that the line should be allowed to be pulled high by the $\overline{\text{CHG}}$ line pull-up resistor during this period: it should never be driven by the host.

Once the device has reset, and has completed its initialization, it pulls the CHG line low. This signals to the system host that the Command Processor T6 reset report message is available.

6.0 DETAILED OPERATION

6.1 Touch Detection

The ATMXT228UD allows for both mutual and self capacitance measurements, with the self capacitance measurements being used to augment the mutual capacitance measurements to produce reliable touch information.

When self capacitance measurements are enabled, touch classification is achieved using both mutual and self capacitance touch data. This has the advantage that both types of measurement systems can work together to detect touches under a wide variety of circumstances.

Mutual capacitance touch data is used wherever possible to classify touches as this has greater granularity than self capacitance measurements and provides positional information on touches.

Self capacitance measurements, on the other hand, allow for the detection of single touches in extreme cases, such as single thick glove touches, when touches can only be detected by self capacitance data and may be missed by mutual capacitance touch detection.

6.2 Operational Modes

The device operates in two modes: **Active** (touch detected) and **Idle** (no touches detected). Both modes operate as a series of burst cycles. Each cycle consists of a short burst (during which measurements are taken) followed by an inactive sleep period. The difference between these modes is the length of the cycles. Those in idle mode typically have longer sleep periods. The cycle length is configured using the IDLEACQINT and ACTVACQINT settings in the Power Configuration T7. In addition, an *Active to Idle Timeout* setting is provided.

6.3 Detection Integrator

The device features a touch detection integration mechanism. This acts to confirm a detection in a robust fashion. A counter is incremented each time a touch has exceeded its threshold and has remained above the threshold for the current acquisition. When this counter reaches a preset limit the sensor is finally declared to be touched. If, on any acquisition, the signal is not seen to exceed the threshold level, the counter is cleared and the process has to start from the beginning.

The detection integrator is configured using the appropriate touch objects (Multiple Touch Touchscreen T100, Key Array T15).

6.4 Sensor Acquisition

The charge time for mutual capacitance measurements is set using the Acquisition Configuration T8 object. The device combines a number of factors together to arrive at the total acquisition time for one drive line (that is, one X line for mutual capacitance acquisitions or one axis for self capacitance acquisitions).

The following constraints apply on the ATMXT228UD:

- The per X line mutual capacitance touch measurement and the per axis self capacitance measurement should not exceed 2 ms. Furthermore, the total acquisition time for the sensor as a whole must not exceed 250 ms. In the event of a timeout, a SIGERR may be reported.
- The high and low pulse periods must not exceed 51.26 µs each. This means that the maximum possible burst period is 102.46 µs (that is, a minimum frequency of 9.76 kHz). In addition, the burst period must not be less than 4 µs (that is, a maximum frequency of 250 kHz).

Unpredictable system behavior might occur if any of the above constraints are not met.

Care should be taken to configure all the objects that can affect the measurement timing (for example, drift and noise measurement interval settings) so that these limits are not exceeded.

6.5 Calibration

Calibration is the process by which a sensor chip assesses the background capacitance on each node. Calibration occurs in a variety of circumstances, for example:

- When determined by the mutual capacitance recalibration process, as controlled by the Acquisition Configuration T8 object
- When determined by the self capacitance recalibration process, as controlled by the Self Capacitance Configuration T111 object
- When the Retransmission Compensation T80 object detects calibrated-in moisture has been removed
- Following a Self Capacitance Global Configuration T109 Tune command
- · When the host issues a recalibrate command
- · When certain configuration settings are changed

6.6 Digital Filtering and Noise Suppression

The ATMXT228UD supports on-chip filtering of the acquisition data received from the sensor. Specifically, the Noise Suppression T72 object provides an algorithm to suppress the effects of noise (for example, from a noisy charger plugged into the user's product). This algorithm can automatically adjust some of the acquisition parameters during operation to filter the Analog-to-Digital Conversions (ADCs) received from the sensor.

Additional noise suppression is provided by the Self Capacitance Noise Suppression T108 object. Similar in both design and configuration to the Noise Suppression T72 object, the Self Capacitance Noise Suppression T108 object is the noise suppression interface for self capacitance touch measurements.

Noise suppression is triggered when a noise source is detected.

- The host driver code can indicate when a noise source is present.
- The noise suppression is also triggered based on the noise levels detected using internal line measurements. The
 Noise Suppression T72 and Self Capacitance Noise Suppression T108 object select the appropriate controls to
 suppress the noise present in the system.

6.7 Shieldless Support and Display Noise Suppression

The ATMXT228UD can support shieldless sensor design even with a noisy LCD.

The Optimal Integration feature is not filtering as such, but enables the user to use a shorter integration window. The integration window optimizes the amount of charge collected against the amount of noise collected, to ensure an optimal SNR. This feature also benefits the system in the presence of an external noise source. This feature is configured using the Shieldless T56 object.

Display noise suppression allows the device to overcome display noise simultaneously with external noise. This feature is based on filtering provided by the Lens Bending T65 object (see Section 6.11 "Lens Bending").

6.8 Retransmission Compensation

The device can limit the undesirable effects on the mutual capacitance touch signals caused by poor device coupling to ground, such as poor sensitivity and touch break-up. This is achieved using the Retransmission Compensation T80 object. This object can be configured to allow the touchscreen to compensate for signal degradation due to these undesirable effects. If self capacitance measurements are also scheduled, the Retransmission Compensation T80 object will use the resultant data to enhance the compensation process.

The Retransmission Compensation T80 object is also capable of compensating for water presence on the sensor if self capacitance measurements are scheduled. In this case, both mutual capacitance and self capacitance measurements are used to detect moisture and then, once moisture is detected, self capacitance measurements are used to detect single touches in the presence of moisture.

6.9 Electromagnetic Interference Reduction

The ATMXT228UD has the following mechanisms to help reduce Electromagnetic Interference (EMI) and other emissions and ensure that the user's product operates within the desired EMC limits:

 Configurable Voltage Reference Mode – Allows for the selection of voltage swing of the self capacitance measurements. This feature is configured by the Self Capacitance Global Configuration T109 object.

- Input Buffer Power Configuration Controls the positive/negative drive strength of the Input Buffer for self capacitance measurements. This feature is configured by the Self Capacitance Global Configuration T109 object.
- Configurable Input Amplifier Bias Controls the Input Amplifier Bias. This feature is configured by the Self Capacitance Global Configuration T109 object.

6.10 Grip Suppression

The device has grip suppression functionality to suppress false detections from a user's grip.

Grip suppression works by specifying a boundary around a touchscreen, within which touches can be suppressed whilst still allowing touches in the center of the touchscreen. This ensures that an accidental hand touch on the edge is suppressed while still allowing a "real" (finger) touch towards the center of the screen. Mutual capacitance grip suppression is configured using the Grip Suppression T40 object.

6.11 Lens Bending

The device supports algorithms to eliminate disturbances from the measured signal.

When the sensor suffers from the screen deformation (lens bending) the signal values acquired by normal procedure are corrupted by the disturbance component (bend). The amount of bend depends on:

- · The mechanical and electrical characteristics of the sensor
- The amount and location of the force applied by the user touch to the sensor
- The Lens Bending T65 object measures the bend component and compensates for any distortion caused by the bend. As the bend component is primarily influenced by the user touch force, it can be used as a secondary source to identify the presence of a touch. The additional benefit of the Lens Bending T65 object is that it will eliminate LCD noise as well.

6.12 Glove Detection

The device has glove detection algorithms that process the measurement data received from the touchscreen classifying touches as potential gloved touches.

The Glove Detection T78 object is used to detect glove touches. In Normal Mode the Glove Detection T78 object applies vigorous glove classification to small signal touches to minimize the effect of unintentional hovering finger reporting. Once a gloved touch is found, the Glove Detection T78 object can enter Glove Confidence Mode. In this mode the device expects the user to be wearing gloves so the classification process is much less stringent.

6.13 Stylus Support

The ATMXT228UD allows for the particular characteristics of passive stylus touches, whilst still allowing conventional finger touches to be detected. The touch sensitivity and threshold controls for stylus touches are configured separately from those for conventional finger touches so that both types of touches can be accommodated.

Stylus support ensures that the small touch area of a stylus registers as a touch, as this would otherwise be considered too small for the touchscreen. Additionally, there are controls to distinguish a stylus touch from an unwanted approaching finger (such as on the hand holding the stylus).

Passive stylus touches are configured by the Passive Stylus T47 object. There is one instance of the Passive Stylus T47 object for each Multiple Touch Touchscreen T100 object present on the device.

6.14 Unintentional Touch Suppression

The Touch Suppression T42 object provides a mechanism to suppress false detections from unintentional touches from a large body area, such as from a palm. The Touch Suppression T42 object also provides Maximum Touch Suppression to suppress all touches if more than a specified number of touches has been detected.

6.15 Adjacent Key Suppression Technology

Adjacent Key Suppression (AKS) technology is a patented method used to detect which touch object (Multiple Touch Touchscreen T100 or Key Array T15) is touched, and to suppress touches on the other touch objects, when touch objects are located close together.

The device has two levels of AKS:

- The first level works between the touch objects (Multiple Touch Touchscreen T100 and Key Array T15). The touch objects are assigned to AKS groups. If a touch occurs within one of the touch objects in a group, then touches within other objects inside that group are suppressed. For example, if a touchscreen and a Key Array are placed in the same AKS group, then a touch in the touchscreen will suppress touches in the Key Array, and vice versa. Objects can be in more than one AKS group.
- The second level of AKS is internal AKS within an individual Key Array object. If internal AKS is enabled, then when one key is touched, touches on all the other keys within the Key Array are suppressed. Note that internal AKS is not present on other types of touch objects.

6.16 Device Encryption

For added security, the ATMXT228UD allows for the encryption of important configuration parameters within the device, and for the encryption of messages sent by the device.

The default state of the ATMXT228UD is to be unencrypted, which allows the host to interact with the device using the standard Object-based Protocol in the same manner as any other unencrypted maXTouch device. However, the host can enable encryption if desired. This uses the AES 128 algorithm (Cipher Block Chaining mode) for the encryption and decryption of data. One or more of the following encryption modes are possible:

- Encrypted configuration read/write
- Encrypted Message Processor T5 messages
- Debug output can be disabled when the device is in an encrypted state

Encryption is requested by downloading the encryption parameters to the Serial Data Command T68 object. Encryption is then activated when the device is next reset. If the device has active encryption, the Variant ID is reported with bit 7 set to 1. This provides a method for the host controller to detect if encryption is in use.

The current encryption status can be read from the device using the Encryption Status T2 object.

NOTE Users are recommended to contact their Microchip representative for additional guidance on using encryption features available on this device.

7.0 I²C COMMUNICATIONS

Communication between the ATMXT228UD and the host controller is achieved using the I²C interface.

The I^2C interface is used in conjunction with the \overline{CHG} line. The \overline{CHG} line going active signifies that a new data packet is available. This provides an interrupt-style interface and allows the device to present data packets when internal changes have occurred. See Section 7.8 "CHG Line" for more information.

7.1 Encrypted Communications

The default state of the ATMXT228UD is to be in an unencrypted state. This allows the host to interact with the device using the standard Object-based Protocol in the same manner as any other unencrypted maXTouch device.

For added security, the host can request that the data communication between the device and the system host is encrypted using mutually agreed keys. This uses the AES 128 algorithm (Cipher Block Chaining mode) for the encryption and decryption of data. One or more of the following encryption modes are possible:

- Encrypted configuration read/write If enabled, all objects with an address above the User Data T38 object require read/write transactions to be encrypted.
- Encrypted Message Processor T5 messages If enabled, all messages are sent from the device in encrypted format.
- All debug output disabled When encryption is enabled, all debug data output can be disabled for additional security.

A customer key is required to encrypt or decrypt configuration settings and messages.

NOTE Users are recommended to contact their Microchip representative for additional guidance on using encryption features available on this device.

7.2 I²C Address

The ATMXT228UD supports one fixed I²C device address: 0x4A.

The I²C address is shifted left to form the SLA+W or SLA+R address when transmitted over the I²C interface, as shown in Table 7-1.

TABLE 7-1: FORMAT OF SLA+W/SLA+R

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
			Address: 0x4A				Read/write

7.3 Writing To the Device

An I²C WRITE cycle consists of the following bytes:

START	1 bit	I ² C START condition
SLA+W	1 byte	I ² C address of the device (see Section 7.2 "I2C Address")
Address (LSByte, MSByte)	2 bytes	Address of the location at which the data writing starts. This address is stored as the address pointer.
Embedded Data Size (only if encryption is active)	2 bytes	If writing to an encrypted object, the size of the embedded data to be written, including the data CRC (if requested), but excluding any padding bytes; that is, these bytes specify the actual data size and not the number of bytes sent. Otherwise these bytes must be set to zero.
		Note that these bytes will have a non-zero value only if writing one or more byes of data to an encrypted object. In all other cases the size should be set to zero (that is, when the object is not encrypted, or encryption is enabled for message reads only, or the data is zero bytes in length).
		These bytes are present only if encryption is active; they are not present if encryption is not active.
Data	0 or more bytes	The actual data to be written. The data is written to the device, starting at the location of the address pointer. The address pointer returns to its starting value when the I ² C STOP condition is detected.

CRC (optional) An optional 8-bit CRC that includes all the bytes that have been sent, 1 byte including the two address bytes and the data size bytes (if encryption is active), but not the SLA+W byte. If the device detects an error in the CRC during a write transfer, a COMSERR fault is reported by the Command Processor T6 object. See Section 7.4 "I2C Writes in Checksum Mode" for more details Padding to 16 bytes Maximum If writing to an encrypted object, and there are one or more bytes of data (only if encrypted 15 bytes (excluding the CRC), the data block (including the CRC, if present) must be writes are enabled) padded to 16 bytes. If the data is zero bytes in size, the padding is not necessary and the data block will consist of the CRC only (if present).

STOP 1 bit I²C STOP condition

Figure 7-1 and Figure 7-1 show examples of writing four bytes of data to contiguous addresses starting at 0x1234.

FIGURE 7-1: EXAMPLE OF A FOUR-BYTE WRITE – ENCRYPTION NOT ACTIVE

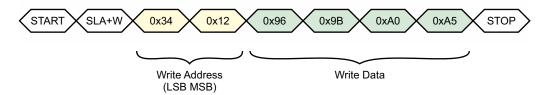

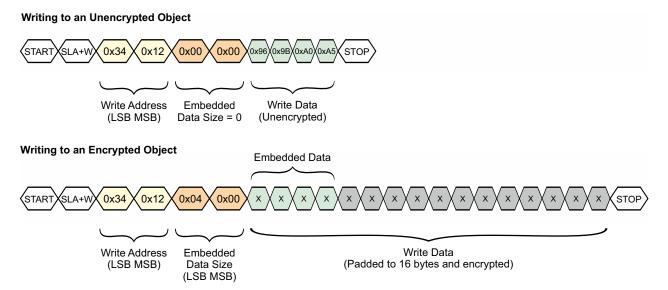

FIGURE 7-2: EXAMPLE OF A FOUR-BYTE WRITE – ENCRYPTION ACTIVE

7.4 I²C Writes in Checksum Mode

In I^2C checksum mode an 8-bit CRC is added to all I^2C writes. The CRC is sent following the last data byte. All the bytes sent are included in the CRC, including the two address bytes and the two data size bytes (if encryption is active). Any command or data sent to the device is processed even if the CRC fails.

To indicate that a checksum is to be sent in the write, the most significant bit of the MSByte of the write address is set to 1. For example, the I²C command shown in Figure 7-3 writes a value of 150 (0x96) to address 0x1234 with a checksum. The address is changed to 0x**9**234 to indicate checksum mode.

FIGURE 7-3: EXAMPLE OF A WRITE TO ADDRESS 0x1234 WITH A CHECKSUM – ENCRYPTION NOT ACTIVE

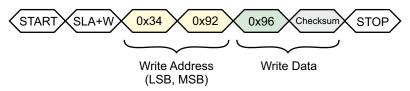

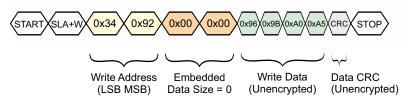

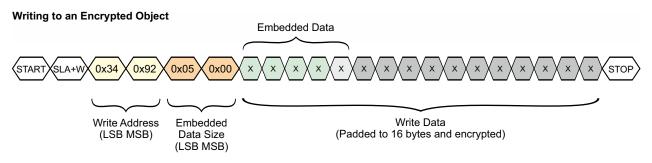

FIGURE 7-4: EXAMPLE OF A WRITE TO ADDRESS 0x1234 WITH A CHECKSUM – ENCRYPTION ACTIVE

Writing to an Unencrypted Object

7.5 Reading From the Device

Two I²C bus activities must take place to read from the device. The first activity is an I²C write to set the address pointer (LSByte then MSByte). The second activity is the actual I²C read to receive the data. The address pointer returns to its starting value when the read cycle NACK or STOP is detected.

It is not necessary to set the address pointer before every read. The address pointer is updated automatically after every read operation. The address pointer will be correct if the reads occur in order. In particular, when reading multiple messages from the Message Processor T5 object, the address pointer is automatically reset to the address of the Message Processor T5 object, in order to allow continuous reads (see Section 7.7.1 "Reading Status Messages with DMA").

NOTE

Encryption functionality on the ATMXT228UD means that if the host read request falls within the Message Processor T5 address space, but not at its start address, the device considers it a valid Message Processor T5 message read. The device therefore sends the entire Message Processor T5 message.

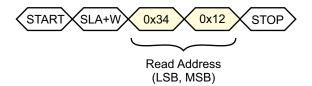

Note that the message may be encrypted or unencrypted, depending on the message encryption setting.

The WRITE and READ cycles consist of a START condition followed by the I²C address of the device (SLA+W or SLA+R respectively).

Figure 7-5 and Figure 7-6 show the I²C commands to read four bytes starting at address 0x1234.

FIGURE 7-5: EXAMPLE OF A FOUR-BYTE READ – ENCRYPTION NOT ACTIVE

Set Address Pointer

Read Data

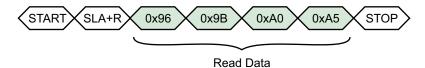

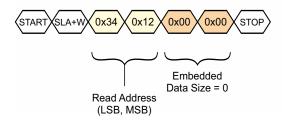

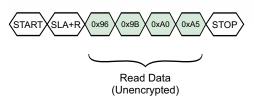

FIGURE 7-6: EXAMPLE OF A FOUR-BYTE READ – ENCRYPTION ACTIVE

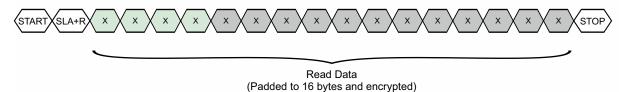

Set Address Pointer

Read Data - Unencrypted Object

Read Data - Encrypted Object

NOTE At least one data byte must be read during an I²C READ transaction; it is illegal to abort the transaction with an I²C STOP condition without reading any data.

7.6 I²C Reads in Checksum Mode

In I^2C checksum mode an 8-bit CRC is added to all I^2C reads. The CRC is sent following the last data byte. The CRC includes the Report Id and the data bytes.

To indicate that a checksum is to be sent in the read response, the most significant bit of the MSByte of the write address is set to 1. For example, to read from address 0x1234 with a checksum, the address is changed to 0x**9**234 to indicate checksum mode.

7.7 Reading a Message from the Message Processor T5 Object

An I²C read of the Message Processor T5 object contains the following bytes:

START	1 bit	I ² C START condition.
SLA+R	1 byte	$\rm I^2C$ address of the device (see Section 7.2 "I2C Address"). If a checksum is requested, the MSBit of the address is set to 1.
Report ID	1 byte	Message report ID.
Data	9 bytes	The message data (that is, the Message Processor T5 MESSAGE field).
CRC (optional)	1 byte	An 8-bit CRC (if requested) for the Message Processor T5 report ID and message data.
		See Section 7.6 "I2C Reads in Checksum Mode" for more details on how to request a checksum.
Padding to 16 bytes (only if encrypted messages enabled)	5 or 6 bytes	If the encryption of Message Processor T5 messages is enabled, the data block (including the CRC, if present) is padded to 16 bytes.
STOP	1 bit	I ² C STOP condition.

Figure 7-7 shows an example read from the Message Processor T5 object with a checksum. To read multiple messages using Direct Memory Access, see Section 7.7.1 "Reading Status Messages with DMA".

FIGURE 7-7: EXAMPLE READ FROM MESSAGE PROCESSOR T5 WITH A CHECKSUM – ENCRYPTION NOT ACTIVE

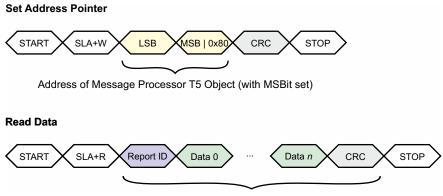

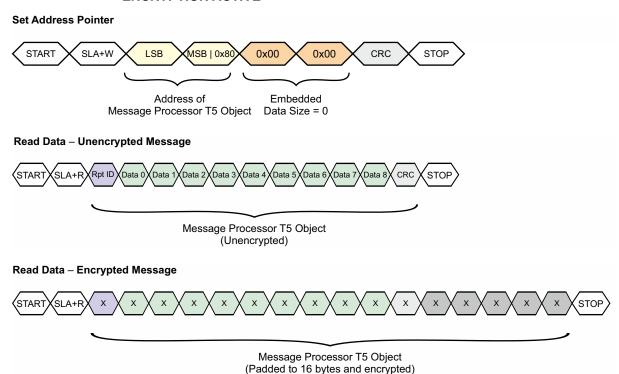

FIGURE 7-8: EXAMPLE READ FROM MESSAGE PROCESSOR T5 WITH A CHECKSUM – ENCRYPTION ACTIVE

7.7.1 READING STATUS MESSAGES WITH DMA

The device facilitates the easy reading of multiple messages using a single continuous read operation. This allows the host hardware to use a Direct Memory Access (DMA) controller for the fast reading of messages, as follows:

- 1. The host uses a write operation to set the address pointer to the start of the Message Count T44 object, if necessary. Note that the STOP condition at the end of the read resets the address pointer to its initial location, so it may already be pointing at the Message Count T44 object following a previous message read. If a checksum is required on each message, the most significant bit of the MSByte of the read address must be set to 1.
- 2. The host starts the read operation of the message by sending a START condition.
- 3. The host reads the Message Count T44 object (one byte) to retrieve a count of the pending messages.
- 4. The host calculates the number of bytes to read, as follows:
 - If encryption is not enabled, by multiplying the message count by the size of the Message Processor T5 object. Note that the host should have already read the size of the Message Processor T5 object in its initialization code.
 - If encryption is enabled, by multiplying the message count by 16. Note that, in order to decrypt the message data, the host will still need to know the size of the Message Processor T5 object.

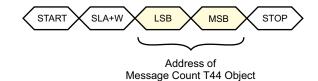

Note that the size of the Message Processor T5 object as recorded in the Object Table includes the checksum. If a checksum has not been requested, one byte should be deducted from the size of the object. That is: number of bytes = count \times (size -1).

- 5. The host reads the calculated number of message bytes. It is important that the host does *not* send a STOP condition during the message reads, as this will terminate the continuous read operation and reset the address pointer. No START and STOP conditions must be sent between the messages.
- The host sends a STOP condition at the end of the read operation after the last message has been read. The NACK condition immediately before the STOP condition resets the address pointer to the start of the Message Count T44 object.

Figure 7-9 shows an example of using a continuous read operation to read three messages from the device without a checksum. Figure 7-10 shows the same example with a checksum.

FIGURE 7-9: CONTINUOUS MESSAGE READ EXAMPLE – NO CHECKSUM

Set Address Pointer

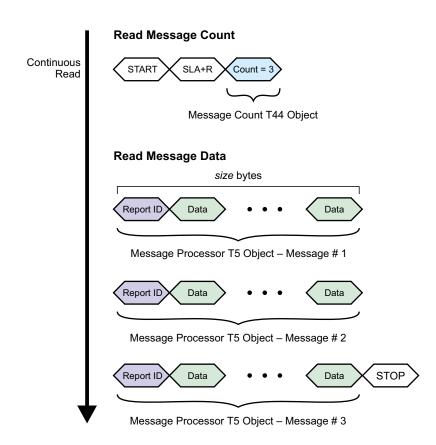

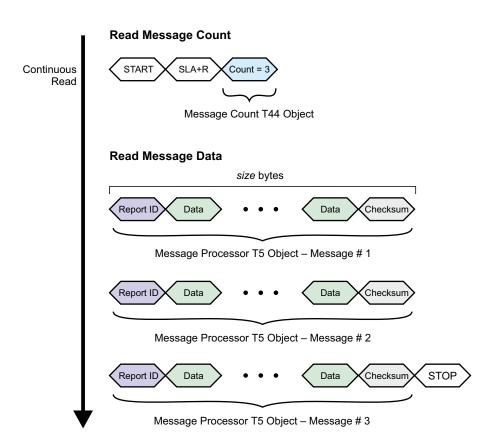

FIGURE 7-10: CONTINUOUS MESSAGE READ EXAMPLE – I²C CHECKSUM MODE

Set Address Pointer

START SLA+W LSB MSB | 0x80 Checksum STOP Address of Message Count T44 Object

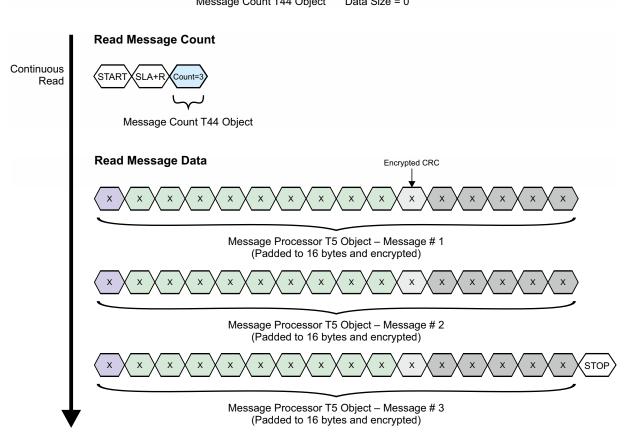

If encryption is enabled for Message Processor T5 message reads, then each message read using DMA will need to be decrypted. An example of this is shown in Figure 7-11. Note that this example also assumes the use of a CRC on the message reads, although this is not necessary.

FIGURE 7-11: EXAMPLE READ FROM MESSAGE PROCESSOR T5 – ENCRYPTION ACTIVE

Set Address Pointer

START SLA+W LSB MSB | 0x80 0x00 0x00 CRC STOP Address of Embedded Data Size = 0

NOTE: Example assumes CRC mode is being used.

7.8 CHG Line

The $\overline{\text{CHG}}$ line is an active-low, open-drain output that is used as an interrupt to alert the host that the client is ready to send a response or that an OBP message is pending and ready to be read by the host. This provides the host with an interrupt-style interface with the potential for fast response times. It reduces the need for wasteful I²C communications.

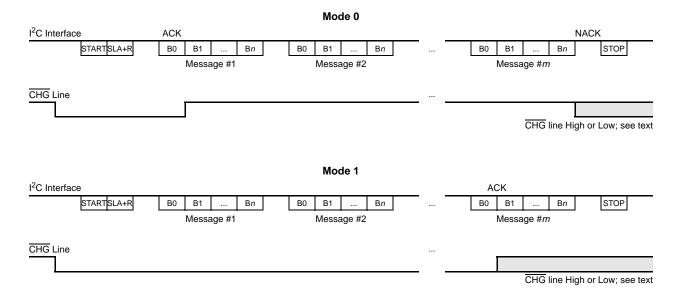

NOTE The host should always use the CHG line as an indication that a message is ready to be read from the Message Processor T5 object; the host should never poll the device for messages.

The CHG line should always be configured as an input on the host during normal usage. This is particularly important after power-up or reset (see Section 5.0 "Power-up / Reset Requirements").

A pull-up resistor is required to VddIO (see Section 2.0 "Schematic").

The $\overline{\text{CHG}}$ line operates in two modes when it is used with I²C communications, as defined by the Communications Configuration T18 object.

FIGURE 7-12: CHG LINE MODES FOR I²C-COMPATIBLE TRANSFERS

In Mode 0 (edge-triggered operation):

- 1. The CHG line goes low to indicate that a message is present.
- 2. The CHG line goes high when the first byte of the first message (that is, its report ID) has been sent and acknowledged (ACK sent) and the next byte has been prepared in the buffer.
- 3. The STOP condition at the end of an I²C transfer causes the CHG line to stay high if there are no more messages. Otherwise the CHG line goes low to indicate a further message.

Note that Mode 0 also allows the host to continually read messages by simply continuing to read bytes back without issuing a STOP condition. Message reading should end when a report ID of 255 ("invalid message") is received. Alternatively the host ends the transfer by sending a NACK after receiving the last byte of a message, followed by a STOP condition. If there is another message present, the $\overline{\text{CHG}}$ line goes low again, as in step 1. In this mode the state of the $\overline{\text{CHG}}$ line does not need to be checked during the I 2 C read.

In Mode 1 (level-triggered operation):

- 1. The CHG line goes low to indicate that a message is present.
- 2. The CHG line remains low while there are further messages to be sent after the current message.
- 3. The CHG line goes high again only once the first byte of the last message (that is, its report ID) has been sent and acknowledged (ACK sent) and the next byte has been prepared in the output buffer.

Mode 1 allows the host to continually read the messages until the CHG line goes high, and the state of the CHG line determines whether or not the host should continue receiving messages from the device.

NOTE The state of the CHG line should be checked only between messages and not between the bytes of a message. The precise point at which the CHG line changes state cannot be predicted and so the state of the CHG line cannot be guaranteed between bytes.

The Communications Configuration T18 object can be used to configure the behavior of the $\overline{\text{CHG}}$ line. In addition to the $\overline{\text{CHG}}$ line operation modes described above, this object allows direct control over the state of the $\overline{\text{CHG}}$ line.

7.9 SDA and SCL

The I^2C bus transmits data and clock with SDA and SCL respectively. These are open-drain. The device can only drive these lines low or leave them open. The termination resistors (Rp) pull the line up to VddIO if no I^2C device is pulling it down.

The termination resistors should be chosen so that the rise times on SDA and SCL meet the I^2C specifications for the interface speed being used, bearing in mind other loads on the bus. For best latency performance, it is recommended that no other devices share the I^2C bus with the ATMXT228UD.

7.10 Clock Stretching

The ATMXT228UD supports clock stretching in accordance with the I^2C specification. It may also instigate a clock stretch if a communications event happens during a period when the ATMXT228UD is busy internally. The maximum clock stretch is 2 ms and typically less than 350 μ s.

8.0 PCB DESIGN CONSIDERATIONS

8.1 Introduction

The following sections give the design considerations that should be adhered to when designing a PCB layout for use with the ATMXT228UD. Of these, power supply and ground tracking considerations are the most critical.

By observing the following design rules, and with careful preparation for the PCB layout exercise, designers will be assured of a far better chance of success and a correctly functioning product.

8.2 Printed Circuit Board

Microchip recommends the use of a four-layer printed circuit board for ATMXT228UD applications. This, together with careful layout, will ensure that the board meets relevant EMC requirements for both noise radiation and susceptibility, as laid down by the various national and international standards agencies.

8.2.1 PCB CLEANLINESS

Modern no-clean-flux is generally compatible with capacitive sensing circuits.

CAUTION

If a PCB is reworked to correct soldering faults relating to any device, or to any associated traces or components, be sure that you fully understand the nature of the flux used during the rework process. Leakage currents from hygroscopic ionic residues can stop capacitive sensors from functioning. If you have any doubts, a thorough cleaning after rework may be the only safe option.

8.3 Power Supply

8.3.1 SUPPLY QUALITY

While the device has good Power Supply Rejection Ratio properties, poorly regulated and/or noisy power supplies can significantly reduce performance.

Particular care should be taken of the AVdd supply, as it supplies the sensitive analog stages in the device.

8.3.2 SUPPLY RAILS AND GROUND TRACKING

Power supply and clock distribution are the most critical parts of any board layout. Because of this, it is advisable that these be completed before any other tracking is undertaken. After these, supply decoupling, and analog and high speed digital signals should be addressed. Track widths for all signals, especially power rails should be kept as wide as possible in order to reduce inductance.

The Power and Ground planes themselves can form a useful capacitor. Flood filling for either or both of these supply rails, therefore, should be used where possible. It is important to ensure that there are no floating copper areas remaining on the board: all such areas should be connected to the ground plane. The flood filling should be done on the outside layers of the board.

8.3.3 POWER SUPPLY DECOUPLING

Decoupling capacitors should be fitted as specified in Section 2.2 "Schematic Notes".

The decoupling capacitors must be placed as close as possible to the pin being decoupled. The traces from these capacitors to the respective device pins should be wide and take a straight route. They should be routed over a ground plane as much as possible. The capacitor ground pins should also be connected directly to a ground plane.

Surface mounting capacitors are preferred over wire-leaded types due to their lower ESR and ESL. It is often possible to fit these decoupling capacitors underneath and on the opposite side of the PCB to the digital ICs. This will provide the shortest tracking, and most effective decoupling possible.

8.3.4 VOLTAGE PUMP

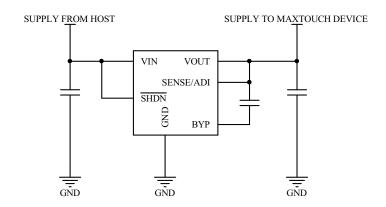

The traces for the voltage pump capacitor between EXTCAP0 and EXTCAP1 (Cd on the schematic in Section 2.0 "Schematic") should be kept as short and as wide as possible for best pump performance. They should also be routed as parallel and as close as possible to each other in order to reduce emissions, and ideally the traces should be the same length.

8.3.5 VOLTAGE REGULATORS

Each supply rail requires a Low Drop-Out (LDO) voltage regulator, although an LDO can be shared where supply rails share the same voltage level.

Figure 8-1 shows an example circuit for an LDO.

FIGURE 8-1: EXAMPLE LDO CIRCUIT

An LDO regulator should be chosen that provides adequate output capability, low noise, no-load stability, good load regulation and step response. The ATMXT228UD has been qualified for use only with the Microchip LDOs listed in Table 8-1. However, some alternative LDOs with similar specifications are listed in Table 8-2. Microchip has not tested this maXTouch controller with any of these alternative LDOs. Microchip cannot guarantee the functionality or performance of this maXTouch controller with these or any other LDO besides those listed in Table 8-1.

NOTE

Microchip recommends that a minimum of a $1.0 \mu F$ ceramic, low ESR capacitor at the input and output of these devices is always used. The datasheet for the device should always be referred to when selecting capacitors and the typical recommended values, types and dielectrics adhered to.

Sufficient output capacitance should be provided such that the output rate of rise is compatible with the ATMXT228UD power rail specifications (see Section 11.2.1 "DC Characteristics"). This can be achieved by a combination of output capacitance on the pins of the LDO and bulk capacitance at the inputs to the ATMXT228UD.

TABLE 8-1: LDO REGULATORS – QUALIFIED FOR USE

Manufacturer	Device	Current Rating (mA)
Microchip Technology Inc.	MCP1824	300

Linear Technology	LT1763CS8-3.3	500
NXP	LD6836	300
Texas Instruments	LP3981	300

8.3.6 SINGLE SUPPLY OPERATION

When designing a PCB for an application using a single LDO, extra care should be taken to ensure short, low inductance traces between the supply and the touch controller supply input pins. Ideally, tracking for the individual supplies should be arranged in a star configuration, with the LDO at the junction of the star. This will ensure that supply current variations or noise in one supply rail will have minimum effect on the other supplies. In applications where a ground plane is not practical, this same star layout should also apply to the power supply ground returns.

Only regulators with a 300 mA or greater rating can be used in a single-supply design.

Refer to the following application note for more information:

• Application Note: MXTAN0208 - Design Guide for PCB Layouts for maXTouch Touch Controllers

8.3.7 MULTIPLE VOLTAGE REGULATOR SUPPLY

The AVdd supply stability is critical for the device because this supply interacts directly with the analog front end. If noise problems exist when using a single LDO regulator, Microchip recommends that AVdd is supplied by a regulator that is separate from the digital supply. This reduces the amount of noise injected into the sensitive, low signal level parts of the design.

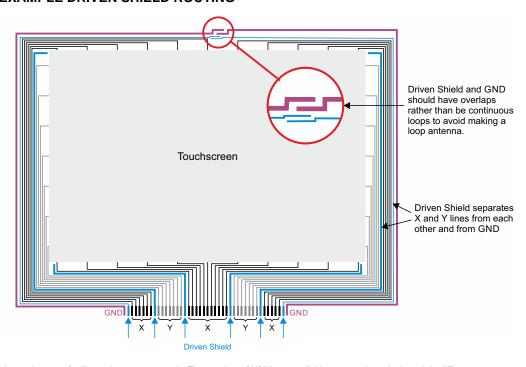

8.4 Driven Shield Line

The driven shield line is used to provide a guard track around the touchscreen panel that serves as Ground in mutual capacitance operation and as a driven shield in self capacitance operation.

The guard track must be routed between the groups of X tracks and the groups of Y tracks, as well as between the combined group of X/Y tracks and Ground. It should be fairly wide to avoid X-to-Y coupling in mutual capacitance operation, as the guard track will act as Ground in this circumstance.

A guard track is also needed between any self capacitance X/Y lines and mutual capacitance only X/Y lines (for example, between Multiple Touch Touchscreen T100 and Key Array T15 lines).

FIGURE 8-2: EXAMPLE DRIVEN SHIELD ROUTING

NOTE: Sample touchscreen for illustrative purposes only. The number of X/Y lines available on any given device might differ from that shown here. Similarly, the routing of the X/Y lines shown should not be taken as indicative of any preferred layout and the user's layout may vary.

8.5 ESD Ground Routing

To avoid damage due to ESD strikes, the outermost track on the sensor should be an ESD ground (see Figure 8-2). Like the driven shield, this should completely surround the sensor but with an overlap at the top rather than forming a complete loop.

To avoid electromagnetic induction of currents into the driven shield trace, a minimum separation of 0.3 mm should be maintained between the ESD GND trace and the Driven Shield.

The ESD ground traces should be connected to a dedicated ground trace in the PCB, and routed such that ESD strike currents do not flow under or close to the touch controller or the connecting wiring between it and the touchscreen array. The ESD ground should be connected in to the main system ground at a star point at the main GND connection to the PCB.

See also:

• MXTAN0208 - Design guide for PCB Layouts for maXTouch Touch Controllers

8.6 Analog I/O

In general, tracking for the analog I/O signals from the device should be kept as short as possible. These normally go to a connector which interfaces directly to the touchscreen.

Ensure that adequate ground-planes are used. An analog ground plane should be used in addition to a digital one. Care should be taken to ensure that both ground planes are kept separate and are connected together only at the point of entry for the power to the PCB. This is usually at the input connector.

8.7 Component Placement and Tracking

It is important to orient all devices so that the tracking for important signals (such as power and clocks) are kept as short as possible.

8.7.1 DIGITAL SIGNALS

In general, when tracking digital signals, it is advisable to avoid sharp directional changes on sensitive signal tracks (such as analog I/O) and any clock or crystal tracking.

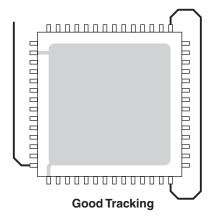

A good ground return path for all signals should be provided, where possible, to ensure that there are no discontinuities.

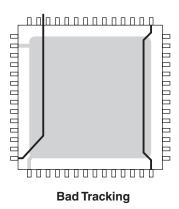

8.7.2 QFN PACKAGE RESTRICTIONS

The central pad on the underside of the QFN device should be connected to ground. Do not run any tracks underneath the body of the device on the top layer of the PCB, only ground. Figure 8-3 shows examples of good and bad tracking.

FIGURE 8-3: EXAMPLES OF GOOD AND BAD TRACKING

Note: The number of pins and their functions is shown for example purposes only and may not reflect the actual number or function on the device.

8.8 EMC and Other Observations

The following recommendations are not mandatory, but may help in situations where particularly difficult EMC or other problems are present:

- Try to keep as many signals as possible on the inside layers of the board. If suitable ground flood fills are used on
 the top and bottom layers, these will provide a good level of screening for noisy signals, both into and out of the
 PCB.
- Ensure that the on-board regulators have sufficient tracking around and underneath the devices to act as a heatsink. This heatsink will normally be connected to the 0 V or ground supply pin. Increasing the width of the copper tracking to any of the device pins will aid in removing heat. There should be no solder mask over the copper track underneath the body of the regulators.
- Ensure that the decoupling capacitors, especially high capacity ceramic type, have the requisite low ESR, ESL and good stability/temperature properties. Refer to the regulator manufacturer's datasheet for more information.

9.0 GETTING STARTED WITH ATMXT228UD

9.1 Establishing Contact

9.1.1 COMMUNICATION WITH THE HOST

The host can use the following interface to communicate with the device:

• I²C interface (see Section 7.0 "I2C Communications")

9.1.2 POWER-UP SEQUENCE

The power-up sequence is as follows:

- 1. After the device has reset, the $\overline{\text{CHG}}$ line goes low to indicate to the host that a message is available. If the $\overline{\text{CHG}}$ line does not go low within a suitable timeout, there is a problem with the device. The timeout should be chosen to be, for example, three times the relevant typical values for the system as defined in Section 11.5.3 "Reset Timings" (for example, 1 second if all POST tests are performed).
- 2. Once the CHG line goes low, the host should attempt to read the first 7 bytes of memory from address 0x0000 (that is, the ID Information portion of the Information Block) to establish that the device is present and running following power-up. This should be done as part of the host's initialization sequence (see Section 9.1.3 "Host Initialization").
- 3. The device performs a checksum on the configuration settings held in the non-volatile memory. If the checksum does not match a stored copy of the last checksum, then this indicates that the settings have become corrupted. The host should write a correct configuration to the device, and issue a Command Processor T6 Backup command, if the read checksum does not match the expected checksum, or if the configuration error bit in the message data from the Command Processor T6 object is set.

9.1.3 HOST INITIALIZATION

Once the device has powered up, the host should perform the following initialization steps so that it can communicate with the device:

1. Immediately after start-up (once the CHG line goes low), the host attempts to read the ID Information portion of the Information Block. The ID Information bytes are the first 7 bytes of memory, located at address 0x0000. This will be used to determine whether the device is encrypted or not, and therefore which communications protocol to use. A successful read will also confirm that the device is present and running following power-up.

The write transfer to set the address pointer to 0x0000 must be sent using the encryption communications protocol, even if the device is currently unencrypted. If the device is expecting an encrypted format write transfer, it will expect, and accept, the entire write transfer. If, however, the device is not currently encrypted it will simply ignore the extra bytes in the write transfer (see Figure 9-1).

FIGURE 9-1: WRITE TRANSFER

The device ignores these bytes if the device is not currently encrypted

- 2. Once the host has read the Information Block, the host should examine the Variant ID and use it to determine if encrypted communications are active. The Variant ID is the second byte in the Information Block (read in Step 1.).
 - If encryption is not active (default), the most significant bit will be set to 0 (that is, the Variant ID is 0x1D).
 - If encryption is active, the most significant bit will be set to 1 (that is, the Variant ID is 0x9D).
- 3. The host can now read the start positions of all the objects in the device from the Object Table and build up a list of the object addresses. Note that the number of Object Table elements was read by the host at start-up as part of the ID Information bytes. If encryption is active:
 - a) Record the start position of the User Data T38 object (found in Step 3.).
 - b) If encrypted configuration read/writes are enabled, use the address of the User Data T38 object to determine which objects will use encryption. These are the objects that are located after the User Data T38 object (that is, they have higher addresses).

- 4. Read the Encryption Status T2 object to determine which mode of encryption is enabled (that is, encrypted configuration read/writes and/or encrypted messages). This will determine the communications protocol to use to read or write configuration parameters and to read messages from the device.
- 5. Use the Object Table to calculate the report IDs so that messages from the device can be correctly interpreted.
- 6. Finally, read any pending messages generated during the start-up process. Note that Step 4. will have determined the communications protocol to use for reading messages.

9.2 Using the Object-based Protocol

The device has an object-based protocol (OBP) that is used to communicate with the device. Typical communication includes configuring the device, sending commands to the device, and receiving messages from the device.

9.2.1 CLASSES OF OBJECTS

The ATMXT228UD contains the following classes of objects:

- Debug objects provide a raw data output method for development and testing.
- General objects required for global configuration, transmitting messages and receiving commands.
- Touch objects operate on measured signals from the touch sensor and report touch data.
- Signal processing objects process data from other objects (typically signal filtering operations).
- Support objects provide additional functionality on the device.

9.2.2 OBJECT INSTANCES

TABLE 9-1: OBJECTS ON THE ATMXT228UD

Object	Description	Number of Instances	Usage
Debug Objects			
Diagnostic Debug T37	nostic Debug T37 Allows access to diagnostic debug data to aid development.		Debug commands only; Read-only object. No configuration or tuning is necessary. Not for use in production. Debug data is not encrypted.
General Objects			•
Encryption Status T2	Provides information on the configuration encryption status.	1	Read-only object; no configuration is necessary. Object is not encrypted.
Message Processor T5	Handles the transmission of messages. This object holds a message in its memory space for the host to read.	1	Read-only object; no configuration is necessary. Messages can be encrypted.
Command Processor T6	Performs a command when written to. Commands include reset, calibrate and backup settings.	1	No configuration is necessary. Object is not encrypted.
Power Configuration T7	Controls the sleep mode of the device. Power consumption can be lowered by controlling the acquisition frequency and the sleep time between acquisitions.	1	Must be configured before use. Configuration read/writes may be encrypted.
Acquisition Configuration T8	Controls how the device takes each capacitive measurement.	1	Must be configured before use. Configuration read/writes may be encrypted.
Touch Objects	•		•
Key Array T15	Defines a rectangular array of keys. A Key Array T15 object reports simple on/off touch information.	1	Enable and configure as required. Configuration read/writes may be encrypted.
Multiple Touch Touchscreen T100	Creates a touchscreen that supports the tracking of more than one touch.	1	Enable and configure as required. Configuration read/writes may be encrypted.

TABLE 9-1: OBJECTS ON THE ATMXT228UD (CONTINUED)

Object	Description	Number of Instances	Usage
Signal Processing Objects			
Grip Suppression T40	Suppresses false detections caused, for example, by the user gripping the edge of a touchscreen.	1	Enable and configure as required. Configuration read/writes may be encrypted.
Touch Suppression T42	Suppresses false detections caused by unintentional large touches by the user.	1	Enable and configure as required. Configuration read/writes may be encrypted.
Passive Stylus T47	Processes passive stylus input.	1	Enable and configure as required. Configuration read/writes may be encrypted.
Shieldless T56	Adjusts the integration window and timing to maximize the signal-to-noise ratio from the sensor.	1	Enable and configure as required. Configuration read/writes may be encrypted.
Lens Bending T65	Compensates for lens deformation (lens bending) by attempting to eliminate the disturbance signal from the reported deltas.	3	Enable and configure as required. Configuration read/writes may be encrypted.
Noise Suppression T72	Performs various noise reduction techniques during sensor signal acquisition.	1	Enable and configure as required. Configuration read/writes may be encrypted.
Glove Detection T78	Allows for the reporting of glove touches.	1	Enable and configure as required. Configuration read/writes may be encrypted.
Retransmission Compensation T80	Limits the negative effects on touch signals caused by poor device coupling to ground or moisture on the sensor.	1	Enable and configure as required. Configuration read/writes may be encrypted.
Self Capacitance Noise Suppression T108	Suppresses the effects of external noise within the context of self capacitance touch measurements.	1	Enable and configure as required. Configuration read/writes may be encrypted.
Support Objects			
Self Test Control T10	Controls the self-test routines to find faults on the touch sensor.	1	Enable and configure as required. Configuration read/writes may be encrypted.
Self Test Pin Faults T11	Specifies the configuration settings for the Pin Fault self tests.	1	Configure as required. Configuration read/writes may be encrypted.
Self Test Signal Limits T12	Specifies the configuration settings for the Signal Limit self tests.	2	Configure as required. Configuration read/writes may be encrypted.
Communications Configuration T18	Configures additional communications behavior for the device.	1	Check and configure as necessary. Configuration read/writes may be encrypted.
GPIO Configuration T19	Allows the host controller to configure and use the general purpose I/O pins on the device.	1	Enable and configure as required. Configuration read/writes may be encrypted.
User Data T38	Provides a data storage area for user data.	1	Configure as required. Object is not encrypted.
Message Count T44	Provides a count of pending messages.	1	Read-only object; no configuration is necessary. Object is not encrypted.
CTE Configuration T46	Controls the capacitive touch engine for the device.	1	Must be configured. Configuration read/writes may be encrypted.
Timer T61	Provides control of a timer.	6	Enable and configure as required. Configuration read/writes may be encrypted.

TABLE 9-1: OBJECTS ON THE ATMXT228UD (CONTINUED)

Object	Description	Number of Instances	Usage
Serial Data Command T68	Serial Data Command T68 Provides an interface for the host driver to deliver various data sets to the device.		Enable and configure as required. Object is not encrypted.
Dynamic Configuration Controller T70	Allows rules to be defined that respond to system events.	20	Enable and configure as required. Configuration read/writes may be encrypted.
Dynamic Configuration Container T71	Allows the storage of user configuration on the device that can be selected at runtime based on rules defined in the Dynamic Configuration Controller T70 object.	1	Configure if Dynamic Configuration Controller T70 is in use. Configuration read/writes may be encrypted.
Auxiliary Touch Configuration T104	Allows the setting of self capacitance gain and thresholds for a particular measurement to generate auxiliary touch data for use by other objects.	1	Enable and configure if using self capacitance measurements. Configuration read/writes may be encrypted.
Self Capacitance Global Configuration T109	,		Check and configure as required (if using self capacitance measurements). Configuration read/writes may be encrypted.
Self Capacitance Tuning Parameters T110	Provides configuration space for a generic set of settings for self capacitance measurements.	4	Use under the guidance of Microchip field engineers only. Configuration read/writes may be encrypted.
Self Capacitance Configuration T111	Provides configuration for self capacitance measurements employed on the device.	2	Check and configure as required (if using self capacitance measurements). Configuration read/writes may be encrypted.
Self Capacitance Measurement Configuration T113	Configures self capacitance measurements to generate data for use by other objects.	1	Enable and configure as required. Configuration read/writes may be encrypted.

9.2.3 CONFIGURING AND TUNING THE DEVICE

The objects are designed such that a default value of zero in their fields is a "safe" value that typically disables functionality. The objects must be configured before use and the settings written to the non-volatile memory using the Command Processor T6 object.

Perform the following actions for each object:

- 1. Enable the object, if the object requires it.
- 2. Configure the fields in the object, as required.
- 3. Enable reporting, if the object supports messages, to receive messages from the object.

9.3 Writing to the Device

The following mechanism can be used to write to the device:

• Using an I²C write operation (see Section 7.3 "Writing To the Device").

Communication with the device is achieved by writing to the appropriate object:

- To send a command to the device, an appropriate command is written to the Command Processor T6 object.
- To configure the device, a configuration parameter is written to the appropriate object. For example, writing to the Power Configuration T7 configures the power consumption for the device and writing to the Multiple Touch Touchscreen T100 object sets up the touchscreen. Some objects are optional and need to be enabled before use.

IMPORTANT!

When the host issues any command within an object that results in a flash write to the device Non-Volatile Memory (NVM), that object should have its CTRL RPTEN bit set to 1, if it has one. This ensures that a message from the object writing to the NVM is generated at the completion of the process and an assertion of the $\overline{\text{CHG}}$ line is executed.

The host must also ensure that the assertion of the \overline{CHG} line refers to the expected object report ID before asserting the \overline{RESET} line to perform a reset. Failure to follow this guidance may result in a corruption of device configuration area and the generation of a CFGERR.

9.3.1 WRITING A CONFIGURATION TO THE DEVICE

During a configuration download, device operation may be based upon only part of that configuration because it is yet to finish downloading. In rare circumstances, the total processing time might exceed the WDT reset time. This is more likely to happen when measurements take a long time to perform due to the partial configuration.

To ensure that the configuration is written safely, follow these steps:

- 1. Use the Command Processor T6 Freeze command (BACKUPNV = 0x22) to suspend device operations.
- 2. Download the configuration.
- 3. Finally, use the Command Processor T6 Unfreeze command (BACKUPNV = 0x11) to resume device operations.

9.4 Reading from the Device

Status information is stored in the Message Processor T5 object. This object can be read to receive any status information from the device.

The following mechanisms can be used to read messages:

- The CHG line is asserted whenever a new message is available in the Message Processor T5 object. The system
 host should read the available message. See the sections for each interface for more information. See Section 7.8
 "CHG Line" for more information.
- Direct Memory Access (DMA) reads can be used to read multiple Message Processor T5 messages using a single continuous read operation. See Section 7.7.1 "Reading Status Messages with DMA" for more information.

NOTE

The host should always wait to be notified of messages; the host should not poll the device for messages, either by polling the Message Processor T5 object or by polling the CHG line.

10.0 DEBUGGING AND TUNING

10.1 SPI Debug Interface

The SPI Debug Interface is used for tuning and debugging when running the system and allows the development engineer to use Microchip maXTouch Studio to read the real-time raw data. This uses the low-level debug port. See Section 2.2.14 "SPI Debug Interface" for more details.

The SPI Debug Interface is enabled by the Command Processor T6 object and by default will be off.

10.2 Object-based Protocol

The device provides a mechanism for obtaining debug data for development and testing purposes by reading data from the Diagnostic Debug T37 object.

NOTE

The Diagnostic Debug T37 object is of most use for simple tuning purposes. When debugging a design, it is preferable to use the SPI Debug Interface, as this will have a much higher bandwidth and can provide real-time data.

10.3 Debug Data and Encryption

It is possible to disable all debug data output from all sources if encryption is active. This is achieved by setting the STATUS DISDBG parameter in the Encryption Status T2 object.

This feature disables debug data from the following sources:

- · The SPI Debug Interface
- The Diagnostic Debug T37 object

10.4 Self Test

The Self Test Control T10, Self Test Pin Faults T11 and Self Test Signal Limits T12 objects run self-test routines in the device to find hardware faults in the device both at power-on/reset and during normal operation. These self-test routines can be configured to check the power supplies of the devices, as well as the signal levels. The tests can also check for pin shorts between sensor X and Y pins, and between the sensor lines and DS0, power or GND pins.

The Self Test Control T10 object can also provide continuous monitoring of the health of the device while it is in operation. A periodic Built-In Self Test (BIST) test can be run at a user-specified interval and reports the global pass and specific fail messages (as determined by the device configuration). Reporting is achieved either by standard Self Test Control T10 object protocol messages or by a configurable hardware GPIO pin, configured using the GPIO Configuration T19 object.

For a list of the self tests available on the ATMXT228UD, see Table 10-1.

TABLE 10-1: SELF TESTS

Run as

11.0 SPECIFICATIONS

11.1 Absolute Maximum Specifications

Vdd	3.6V
VddlO	3.6V
AVdd	3.6V
Maximum continuous combined pin current, all GPIOn pins	40 mA
Voltage forced onto any pin	-0.3 V to (Vdd, VddIO or AVdd) + 0.3 V
Configuration parameters maximum writes	10,000
Maximum junction temperature	125°C

CAUTION!

Stresses beyond those listed under *Absolute Maximum Specifications* may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum specification conditions for extended periods may affect device reliability.

11.2 Recommended Operating Conditions

Operating temperature	-40°C to +85°C
Storage temperature	-60°C to +150°C
Vdd	3.3 V
VddIO	1.8 V to 3.3 V
AVdd	3.3 V
XVdd with internal voltage doubler	2 × AVdd
XVdd low voltage operation (without internal voltage doubler)	Connected to AVdd
Temperature slew rate	10°C/min

11.2.1 DC CHARACTERISTICS

11.2.1.1 Analog Voltage Supply – AVdd

Parameter	Min	Тур	Max	Units	Notes
AVdd					
Operating limits	3.0	3.3	3.47	V	
Supply Rise Rate	-	_	0.036	V/µs	For example, for a 3.3 V rail, the voltage should take a minimum of 92 µs to rise

11.2.1.2 Digital Voltage Supply – VddIO, Vdd

Parameter	Min	Тур	Max	Units	Notes	
VddIO						
Operating limits – Normal Voltage	2.7	3.3	3.47	V		
Operating limits – Low Voltage	1.71	1.8	1.89	V		
Supply Rise Rate	-	-	0.036	V/µs	For example, for a 3.3 V rail, the voltage should take a minimum of 92 µs to rise	
Vdd						
Operating limits	2.7	3.3	3.47	V		
Supply Rise Rate	-	-	0.036	V/µs	For example, for a 3.3 V rail, the voltage should take a minimum of 92 µs to rise	
Supply Fall Rate	-	_	0.05	V/µs	For example, for a 3.3 V rail, the voltage should take a minimum of 66 µs to fall	

11.2.1.3 XVdd Voltage Supply – XVdd

Parameter	Min	Тур	Max	Units	Notes
XVdd					
Operating limits – voltage doubler enabled		2 × AVdd	-	V	
Operating limits – voltage doubler disabled	ı	AVdd	-	V	

11.2.2 POWER SUPPLY RIPPLE AND NOISE

Parameter	Min	Тур	Max	Units	Notes
Vdd, VddlO	-	-	±50	mV	Across frequency range 1 Hz to 1 MHz
AVdd, XVdd	-	-	±40	mV	Across frequency range 1 Hz to 1 MHz, with Noise Suppression enabled

11.3 Test Configuration

The configuration values listed below were used in the reference unit to validate the interfaces and derive the characterization data provided in the following sections. Where the values differ, this is noted.

TABLE 11-1: TEST CONFIGURATION

Object/Parameter or Feature	Description/Setting (Numbers in Decimal)
Power Configuration T7	
CFG2	0 (Power Monitor Enabled)
Acquisition Configuration T8	
CHRGTIME	40
MEASALLOW	11
Self Test Control T10	Object Enabled; Reporting Enabled; BIST Reporting Enabled; POST Reporting Enabled
POSTCFG	All Power, Signal Limits and Pin Fault tests enabled
BISTCFG	All Power, Signal Limits and Pin Fault tests enabled
GPIO Configuration T19	Object Enabled
Touch Suppression T42	Object Enabled
CTE Configuration T46	
IDLESYNCSPERX	8

ACTVSYNCSPERL	32
Self Capacitance Measurement Configuration T113	Object Enabled
Device Encryption	Not active

11.4 Current Consumption – I²C Interface

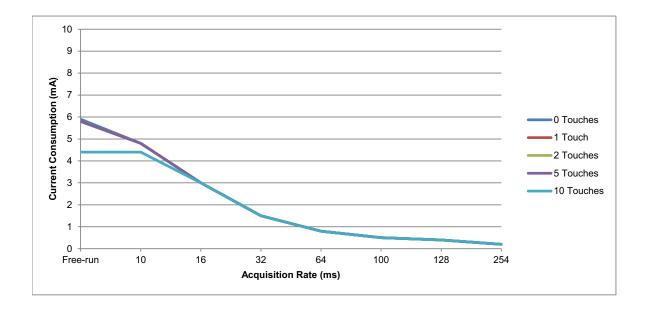

NOTE

The characterization charts show typical values based on the configuration in Table 11-1. Actual power consumption in the user's application will depend on the circumstances of that particular project and will vary from that shown here. Further tuning will be required to achieve an optimal performance.

Note also that the use of encryption has no noticeable effect on power consumption.

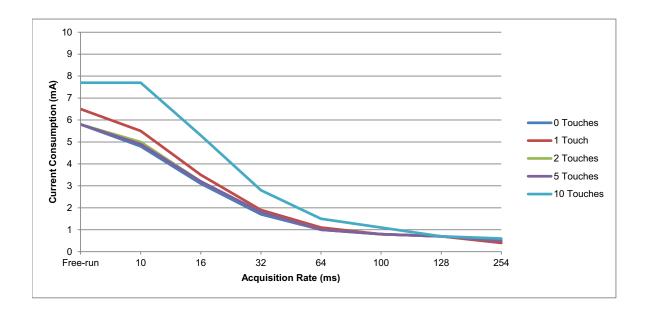

11.4.1 AVDD 3.3V

	Current Consumption (mA)						
Acquisition Rate (ms)	0 Touches	1 Touch	2 Touches	5 Touches	10 Touches		
Free-run	5.9	5.8	5.8	5.8	4.4		
10	4.8	4.8	4.8	4.8	4.4		
16	3	3	3	3	3		
32	1.5	1.5	1.5	1.5	1.5		
64	0.8	0.8	0.8	0.8	0.8		
100	0.5	0.5	0.5	0.5	0.5		
128	0.4	0.4	0.4	0.4	0.4		
254	0.2	0.2	0.2	0.2	0.2		

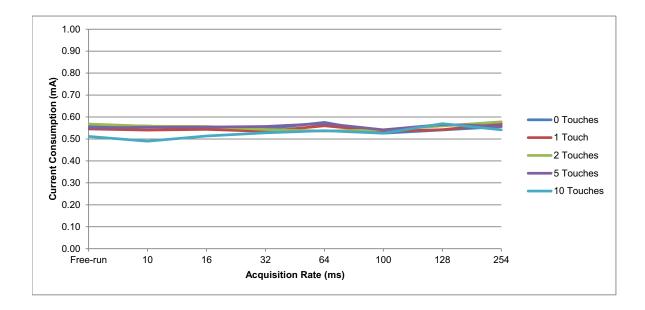

11.4.2 VDD 3.3V

		Current Consumption (mA)							
Acquisition Rate (ms)	0 Touches	1 Touch	2 Touches	5 Touches	10 Touches				
Free-run	5.8	6.5	5.8	5.8	7.7				
10	4.8	5.5	5	4.9	7.7				
16	3.1	3.5	3.2	3.2	5.3				
32	1.7	1.9	1.8	1.8	2.8

64	0.58	0.56	0.54	0.57	0.54			
100	0.53	0.53	0.54	0.54	0.53			
128	0.54	0.54	0.56	0.57	0.57			
254	0.56	0.57	0.58	0.56	0.54			

11.4.4 DEEP SLEEP

T_A = 25°C

Power Monitoring On			Power Monitoring		
Parameter	Sampling Mode	Continuous Mode	Off	Units	Notes
Deep Sleep Current	0.73	1.52	0.59	mA	Vdd = 3.3V, AVdd = 3.3V,
Deep Sleep Power	1.61	3.97	1.14	mW	VddIO = 1.8V

11.5 Timing Specifications

NOTE

The figures below show typical values based on the test configuration. Actual timings in the user's application will depend on the circumstances of that particular project and will vary from those shown below. Further tuning will be required to achieve an optimal performance.

11.5.1 TOUCH LATENCY

Conditions: XSIZE = 14; CHRGTIME = 40; IDLESYNCSPERX = 8; ACTVSYNCSPERX = 8; T = ambient temperature; Finger center of screen; Reporting off (except T100)

Idle Primary = Mutual Capacitance; Active Primary = Mutual Capacitance

	Pipelining Off						
T100 TCHDIDOWN	Min	Тур	Max	Min	Тур	Max	Units
3	28.6	32.1	36.8	31.1	35.4	38.9	ms
2	20.7	24.9	39.4	22.1	26.8	30.7	ms
1	12.7	16.5	20.2	12.4	16.2	20.4	ms

Idle Primary = Self Capacitance; Active Primary = Mutual Capacitance

	Pipelining Off						
T100 TCHDIDOWN	Min	Тур	Max	Min	Тур	Max	Units
3	28.7	31.8	34.9	30.6	33.4	36.9	ms
2	20.4	23.3	26.4	22.7	25.8	28.9	ms
1	12.3	15	17.7	12.6	15.4	23.3	ms

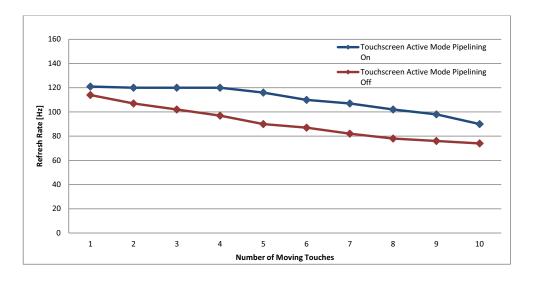

Idle Primary = Self Capacitance; Active Primary = Self Capacitance

	Pipelining Off						
T100 TCHDIDOWN	Min	Тур	Max	Min	Тур	Max	Units
3	26.6	28.2	30.5	27.8	30.5	32.7	ms
2	18.7	21.5	24.4	20.6	23.3	26.6	ms
1	12.3	15.1	18.1	12	15.1	18.2	ms

11.5.2 REPORT RATE

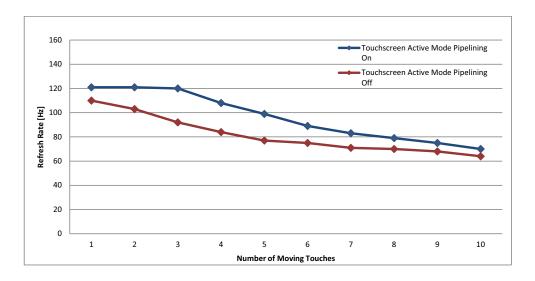

11.5.2.1 Encryption Not Active

Conditions: XSIZE = 14; CHRGTIME = 40; IDLESYNCSPERX = 8; ACTVSYNCSPERX = 8; T = ambient temperature

11.5.2.2 Encryption Active

Conditions: XSIZE = 14; CHRGTIME = 40; IDLESYNCSPERX = 8; ACTVSYNCSPERX = 8; T = ambient temperature

11.5.3 RESET TIMINGS

	Power-on Features (Typ) (2)			
Parameter	Disabled	Enabled	Units	Notes
Power on to CHG line low (1)	45	67	ms	Triggered by Vdd supply at start up
Hardware reset to CHG line low (1)	47	70	ms	Triggered by RESET
Software reset to CHG line low (1)	67	103	ms	Triggered by Command Processor T6 Reset command

Note 1: Any CHG line activity before the power-on or reset period has expired should be ignored by the host. Operation of this signal cannot be guaranteed before the power-on/reset periods have expired.

11.6 Touch Accuracy and Repeatability

Parameter	Min	Тур	Max	Units	Notes
Linearity	-	±0.5	-	mm	Finger diameter 8 mm
Accuracy (across all areas of sensor)	-	0.5	-	mm	Finger diameter 8 mm
Repeatability	-	±0.25	-	%	X axis with 12-bit resolution

11.7 Touch Sensor Characteristics

Parameter	Description	Value
Cm	Mutual capacitance	Typical value is between 0.15 pF and 10 pF on a single node.
Срх	Mutual capacitance load to X	Microchip recommends a maximum load of 300 pF on each X or Y line. (1)
	With Internal Voltage Pump	Maximum recommended load on each X line: (2)
		Cpx + (num_Y × Cm) < 240 pF
	With Internal Voltage Pump and Dual X	Maximum recommended load on each X line: (2)
		Cpx + (2 × num_Y × Cm) < 120 pF
Сру	Mutual capacitance load to Y	Microchip recommends a maximum load of 300 pF on each X or Y line. (1)
Срх	Self capacitance load to X	Microchip recommends a maximum load of 130 pF on each X or
Сру	Self capacitance load to Y	Y line. ⁽¹⁾
ΔСрх	Self capacitance imbalance on X	Nominal value is 14.8 at 100 pF
ΔСру	Self capacitance imbalance on Y	Value increases by 1 pF for every 45 pF reduction in Cpx/Cpy (based on 100 pF load)
Cpds0	Self capacitance load to Driven Shield	Microchip recommends a maximum load of 130 pF on the Driven Shield line. (1)

Note 1: Please contact your Microchip representative for advice if you intend to use higher values.

^{2:} Power-on features include POST self tests and device encryption. Figures show typical values for extreme cases; that is, with all features disabled and with all features enabled.

^{2:} num_Y = Number of active Y lines defined by Multiple Touch Touchscreen T100.

11.8 Input/Output Characteristics

Parameter	Description	Min	Тур	Max	Units	Notes	
Input (All input pins connected to the VddIO power rail)							
Vil	Low input logic level	-0.3	_	0.3 × VddIO	V	VddIO = 1.8 V to Vdd	
Vih	High input logic level	0.7 × VddIO	_	VddIO	V	VddIO = 1.8 V to Vdd	
lil	Input leakage current	_	_	1	μΑ		
RESET	Internal pull-up resistor	9	10	16	kΩ		
GPIOs	Internal pull-up/pull-down resistor	20	40	60	kΩ		
Input (All inp	out pins connected to the Vdd pow	er rail)					
Vil	Low input logic level	-0.3	-	0.3 × Vdd	V		
Vih	High input logic level	$0.7 \times Vdd$	-	Vdd	V		
lil	Input leakage current	ı	ı	1	μA	Pull-up resistors disabled	
GPIOs	Internal pull-up/pull-down resistor	9	10	16	kΩ		
Output (All o	utput pins connected to the VddlC	power rai	1)				
Vol	Low output voltage	0	-	0.2 × VddIO	V	VddIO = 1.8 V to Vdd IoI = max 0.4 mA	
Voh	High output voltage	0.8 × VddIO	-	VddIO	V	VddIO = 1.8 V to Vdd Ioh = 0.4 mA	
Output (All o	Output (All output pins connected to the Vdd power rail)						
Vol	Low output voltage	0	-	0.2 × Vdd	V	Iol = max 0.4 mA	
Voh	High output voltage	0.8 × Vdd	_	Vdd	V	Ioh = 0.4 mA	

11.9 Host I²C Specification

Parameter	Value
Address	0x4A
I ² C specification ⁽¹⁾	Revision 7.0
Maximum bus speed (SCL) (2)	1 MHz
Standard Mode (3)	100 kHz
Fast Mode (3)	400 kHz
Fast Mode Plus (3)	1 MHz

- Note 1: More detailed information on I²C operation is available from UM10204, I²C bus specification and user manual, available from NXP
 - 2: In systems with heavily laden I²C lines, even with minimum pull-up resistor values, bus speed may be limited by capacitive loading to less than the theoretical maximum.
 - 3: The values of pull-up resistors should be chosen to ensure SCL and SDA rise and fall times meet the I²C specification. The value required will depend on the amount of capacitance loading on the lines.

11.10 Thermal Packaging

11.10.1 THERMAL DATA

Parameter	Description	Тур	Unit	Condition	Package
θ _{JA}	Junction to ambient thermal resistance	33.7	°C/W	Still air	56-pin XQFN 6 × 6 × 0.4 mm
θ _{JC}	Junction to case thermal resistance	10.1	°C/W		56-pin XQFN 6 × 6 × 0.4 mm

11.10.2 JUNCTION TEMPERATURE

The maximum junction temperature allowed on this device is 125°C.

The average junction temperature in °C (T_J) for this device can be obtained from the following:

$$T_J = T_A + (P_D \times \theta_{JA})$$

If a cooling device is required, use this equation:

$$T_J = T_A + (P_D \times (\theta_{HEATSINK} + \theta_{JC}))$$

where:

- θ_{JA}= package thermal resistance, Junction to ambient (°C/W) (see Section 11.10.1 "Thermal Data")
- θ_{JC} = package thermal resistance, Junction to case thermal resistance (°C/W) (see Section 11.10.1 "Thermal Data")
- θ_{HEATSINK} = cooling device thermal resistance (°C/W), provided in the cooling device datasheet
- P_D = device power consumption (W)
- T_A is the ambient temperature (°C)

11.11 ESD Information

Parameter	Value	Reference Standard
Human Body Model (HBM)	±2000V	JEDEC JS-001
Charge Device Model (CDM)	±250V	JEDEC JS-001

11.12 Soldering Profile

Profile Feature	Green Package
Average Ramp-up Rate (217°C to Peak)	3°C/s max
Preheat Temperature 175°C ±25°C	150 – 200°C
Time Maintained Above 217°C	60 – 150 s
Time within 5°C of Actual Peak Temperature	30 s
Peak Temperature Range	260°C
Ramp down Rate	6°C/s max
Time 25°C to Peak Temperature	8 minutes max

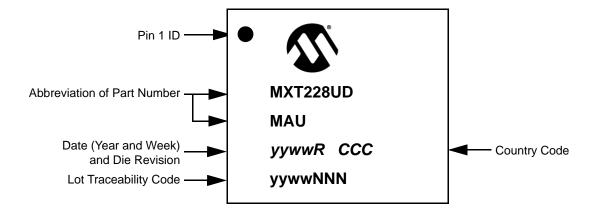

11.13 Moisture Sensitivity Level (MSL)

MSL Rating	Package Type(s)	Peak Body Temperature	Specifications
MSL3	56-pin XQFN	260°C	IPC/JEDEC J-STD-020

12.0 PACKAGING INFORMATION

12.1 Package Marking Information

12.1.1 56-PIN XQFN

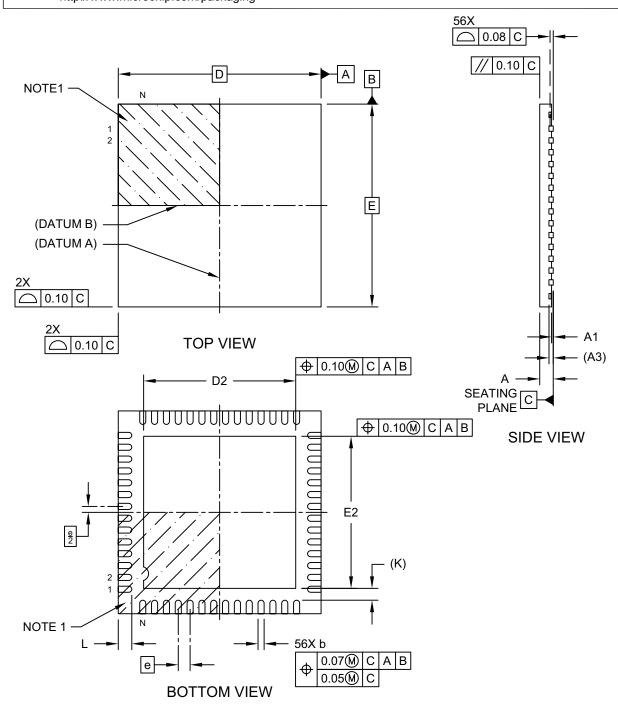

12.1.2 ORDERABLE PART NUMBERS

The product identification system for maXTouch devices is described in "Product Identification System" on page 66. That section also lists example part numbers for the device.

12.2 Package Details

56-Lead Extremely Thin Quad Flatpack No-Lead Package (TWB) - 6x6x0.4 mm Body [XQFN] With 4.5x4.5 mm Exposed Pad; Atmel Legacy Global Package Code ZIX

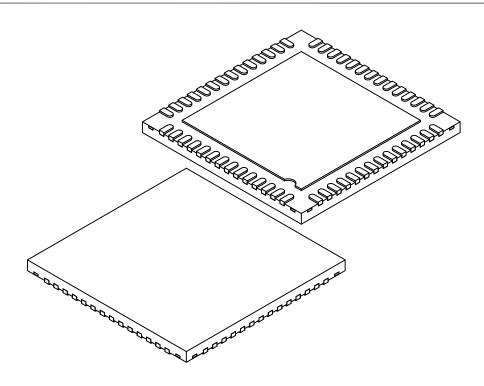

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging

Microchip Technology Drawing C04-21448 Rev A Sheet 1 of 2

56-Lead Extremely Thin Quad Flatpack No-Lead Package (TWB) - 6x6x0.4 mm Body [XQFN] With 4.5x4.5 mm Exposed Pad; Atmel Legacy Global Package Code ZIX

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging

	Units		MILLIMETERS

PRODUCT IDENTIFICATION SYSTEM

The table below gives details on the product identification system for maXTouch devices. See "Orderable Part Numbers" below for example part numbers for the ATMXT228UD.

To order or obtain information, for example on pricing or delivery, refer to the factory or the listed sales office.

Note 1: Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. See "Orderable Part Numbers" below or check with your Microchip Sales Office for package availability with the Tape and Reel option.

Orderable Part Numbers

Orderable Part Number	Firmware Revision	Family ID	Variant ID	Description
ATMXT228UD-MAU003 (Supplied in trays)	3.0.AA	0xA6	()Y11)	56-pin XQFN 6 × 6 × 0.4 mm, RoHS compliant
ATMXT228UD-MAUR003 (Supplied in tape and reel)	3.U.AA			Industrial grade; not suitable for automotive characterization

THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** Datasheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- Business of Microchip Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

For information on the ATMXT228UD, visit https://www.microchip.com/en-us/product/ATMXT228UD.

THE MAXTOUCH WEB SITE

Information on Microchip's maXTouch product line can be accessed via the microchip web site at www.microchip.com, This information is also available for direct access via a short-cut at www.maxtouch.com. The maXTouch web pages contain the following information:

- Product Information Product specifications, brochures, datasheets, protocol guides
- Tools and Software Evaluation kits, maXTouch Studio, software libraries for individual maXTouch touch controllers
- Training and Support Generic application notes and training material for the maXTouch product range

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- · Distributor or Representative
- · Local Sales Office
- Field Application Engineer (FAE)
- · Technical Support

Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: http://microchip.com/support

NOTES:

Note the following details of the code protection feature on Microchip products:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
- Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip
 products is strictly prohibited and may violate the Digital Millennium Copyright Act.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is "unbreakable". Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.

This publication and the information herein may be used only with Microchip products, including to design, test, and integrate Microchip products with your application. Use of this information in any other manner violates these terms. Information regarding device applications is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. Contact your local Microchip sales office for additional support or, obtain additional support at https://www.microchip.com/en-us/support/design-help/client-support-services.

THIS INFORMATION IS PROVIDED BY MICROCHIP "AS IS". MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE, OR WARRANTIES RELATED TO ITS CONDITION, QUALITY, OR PERFORMANCE.

IN NO EVENT WILL MICROCHIP BE LIABLE FOR ANY PUNITIVE, INDIRECT. SPECIAL. INCIDENTAL. CONSEQUENTIAL LOSS, DAMAGE, COST, OR EXPENSE OF ANY KIND WHATSOEVER RELATED TO THE INFORMATION OR ITS USE, HOWEVER CAUSED, EVEN IF MICROCHIP HAS BEEN ADVISED OF THE POSSIBILITY OR THE DAMAGES ARE FORESEEABLE. TO THE FULLEST EXTENT ALLOWED BY LAW, MICROCHIP'S TOTAL LIABILITY ON ALL CLAIMS IN ANY WAY RELATED TO THE INFORMATION OR ITS USE WILL NOT EXCEED THE AMOUNT OF FEES, IF ANY, THAT YOU HAVE PAID DIRECTLY TO MICROCHIP FOR THE INFORMATION. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

For information regarding Microchip's Quality Management Systems, please visit www.microchip.com/quality.

Trademarks

The Microchip name and logo, the Microchip logo, Adaptec, AVR, AVR logo, AVR Freaks, BesTime, BitCloud, CryptoMemory, CryptoRF, dsPIC, flexPWR, HELDO, IGLOO, JukeBlox, KeeLoq, Kleer, LANCheck, LinkMD, maXStylus, maXTouch, MediaLB, megaAVR, Microsemi, Microsemi logo, MOST, MOST logo, MPLAB, OptoLyzer, PIC, picoPower, PICSTART, PIC32 logo, PolarFire, Prochip Designer, QTouch, SAM-BA, SenGenuity, SpyNIC, SST, SST Logo, SuperFlash, Symmetricom, SyncServer, Tachyon, TimeSource, tinyAVR, UNI/O, Vectron, and XMEGA are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

AgileSwitch, ClockWorks, The Embedded Control Solutions Company, EtherSynch, Flashtec, Hyper Speed Control, HyperLight Load, Libero, motorBench, mTouch, Powermite 3, Precision Edge, ProASIC, ProASIC Plus, ProASIC Plus logo, Quiet-Wire, SmartFusion, SyncWorld, TimeCesium, TimeHub, TimePictra, TimeProvider, and ZL are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Adjacent Key Suppression, AKS, Analog-for-the-Digital Age, Any Capacitor, AnyIn, AnyOut, Augmented Switching, BlueSky, BodyCom, Clockstudio, CodeGuard, CryptoAuthentication, CryptoAutomotive, CryptoCompanion, CryptoController, dsPICDEM, dsPICDEM.net, Dynamic Average Matching, DAM, ECAN, Espresso T1S, EtherGREEN, EyeOpen, GridTime, IdealBridge, IGaT, In-Circuit Serial Programming, ICSP, INICnet, Intelligent Paralleling, IntelliMOS, Inter-Chip Connectivity, JitterBlocker, Knob-on-Display, KoD, MarginLink, maxCrypto, maxView, memBrain, Mindi, MiWi, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, mSiC, MultiTRAK, NetDetach, Omniscient Code Generation, PICDEM, PICDEM.net, PICkit, PICtail, Power MOS IV, Power MOS 7, PowerSmart, PureSilicon, QMatrix, REAL ICE, Ripple Blocker, RTAX, RTG4, SAM-ICE, Serial Quad I/O, simpleMAP, SimpliPHY, SmartBuffer, SmartHLS, SMART-I.S., storClad, SQI, SuperSwitcher, SuperSwitcher II, Switchtec, SynchroPHY, Total Endurance, Trusted Time, TSHARC, Turing, USBCheck, VariSense, VectorBlox, VeriPHY, ViewSpan, WiperLock, XpressConnect, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

 $\ensuremath{\mathsf{SQTP}}$ is a service mark of Microchip Technology Incorporated in the U.S.A.
