REDS, REDtest

IMQ only for REDs,
cat. no. 18264, 18265, 18266, 18267,
18268, 18269, 18687 and 18689

Country approval pictogram

EN 50557

The REDs and the REDtest, **RE**sidual current **D**evice recloser, is made up of a residual current device and a recloser.

The **REDs** and **REDtest RESidual current Devices** offer the following functions:

- protection of people against direct and indirect contacts
- protection of installations against insulation faults
- disconnection of on-load electric circuits, already protected against overloads and short-circuits
- automatic restart after insulation monitoring of the downstream circuit.

REDtest provides the following additional functions:

- automatic and periodical test of the device, without breaking downstream circuit (REDtest).

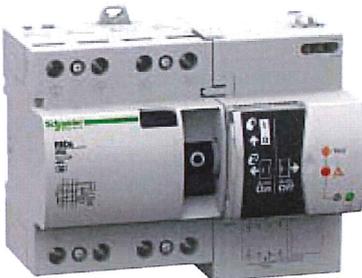

Only used on TT and TN-S earthing grounding systems.

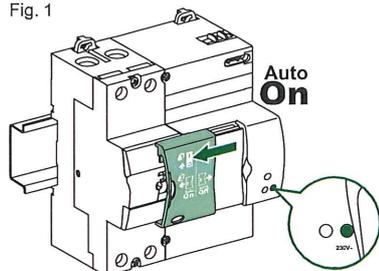

Fig. 2

Operation

REDs

The REDs operates in the residual current device mode, without automatic restart, when the sliding cover is open, i.e. to the right in the Auto Off position (Fig. 1).

The automatic restart mode and the Autotest are activated, when the sliding cover is closed, i.e. to the left in the Auto On position (Fig. 2).

Test

⚠ This is only possible in manual mode, i.e. sliding cover open in the Auto Off position. You can then manually test the device by pressing the Test key. The downstream installation is then temporarily broken. You must then manually reclose the RED by activating the O-I lever to power supply the downstream circuit.

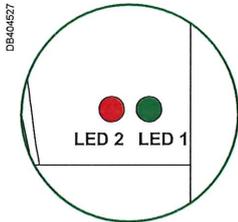

REDtest

■ The REDtest carries out automatic testing of earth leakage protection every months.

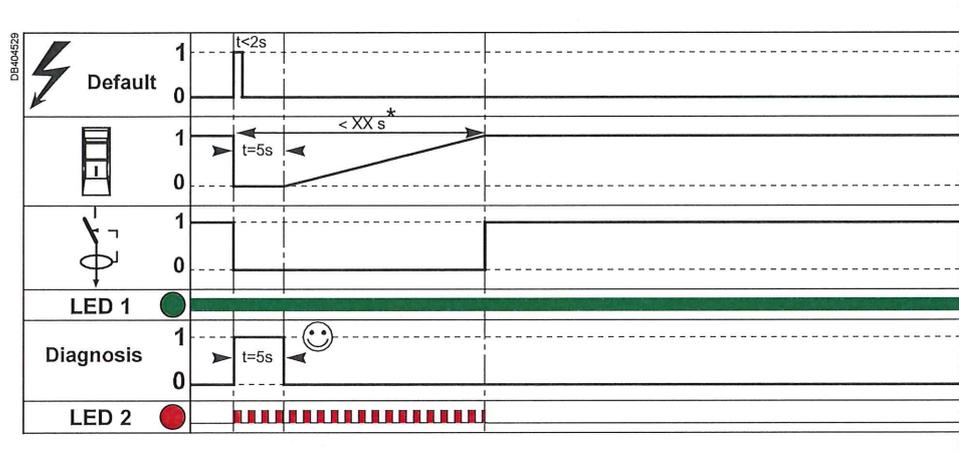

The test consists in opening and reclosing the REDtest, during which time continuity of supply of the downstream installation is guaranteed.

Autotest: after checking installation insulation, the REDtest monitors its residual current device, without breaking the downstream power supply (bypass by bypass contact).

Operation ON mode: temporary network fault REDs, REDtest

(*) Reclosing time:
REDtest 2P: 10 s
REDs 2P: 90 s
REDs 4P: 10 s

The built-in automatic recloser automatically recloses the residual current device after checking insulation of the downstream circuit.

Rd: lower level of insulation resistance, if $R < R_d$ = no reclose
Rdo: higher level of insulation resistance, if $R_d > R_{do}$ = reclose

$I\Delta n$	30 mA	300 mA
Rd	8 k Ω	2.5 k Ω
Rdo	16 k Ω	5 k Ω

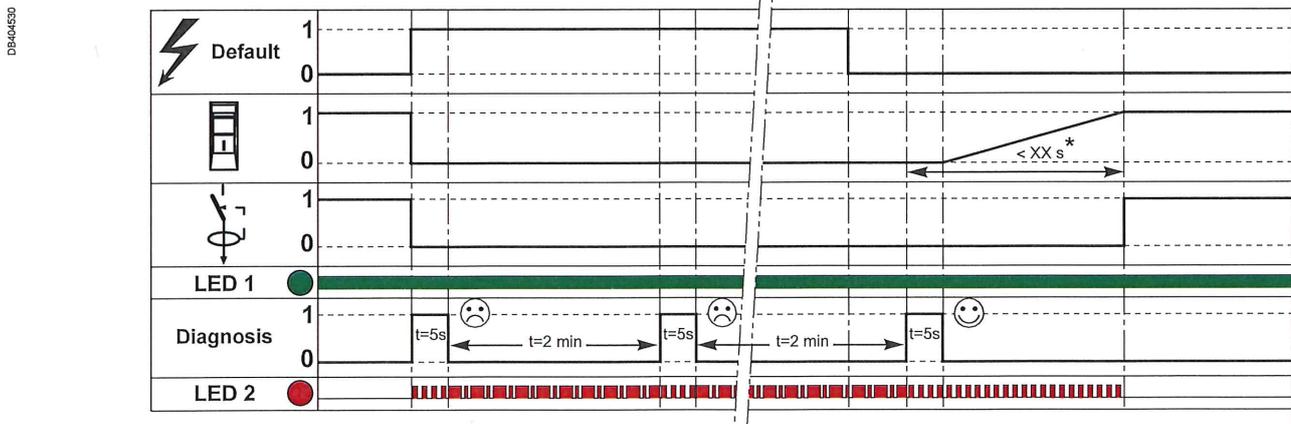

Operation ON mode: long network fault

REDs

If the circuit is faulty, the switch is prohibited from reclosing. After a time delay of 2 minutes, the downstream circuit insulation is rechecked.

There are then two possibilities:

- the installation is still faulty (the resistance to earth is lower than Rd): in this case a new check will be carried out in 2 minutes.
- the fault was temporary and has disappeared (the resistance to earth is higher than Rdo): the recloser automatically recloses the REDs.

(*) Reclosing time:
REDs 2P: 90 s
REDs 4P: 10 s

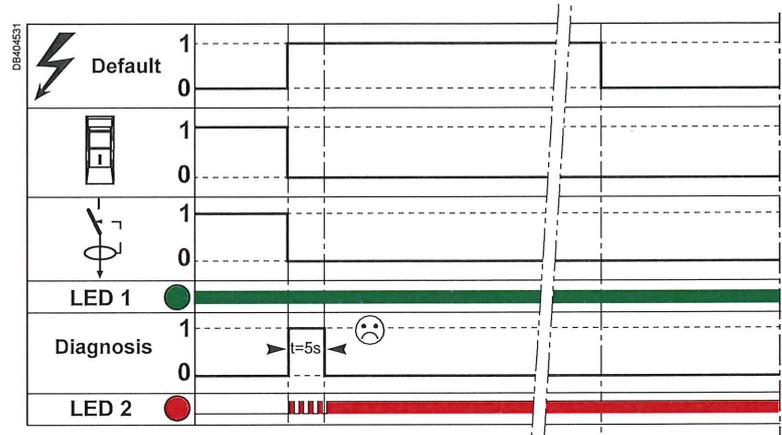

IΔn	30 mA
Rd	20 k Ω
Rdo	70 k Ω

Operation ON mode: long network fault (cont.)

REDtest

If the circuit is faulty for a length of time "greater than 5 seconds", the switch is prohibited from reclosing.

- The installation is faulty: the earth resistance is lower than Rd.
