Platinum Chip Temperature Sensors with Connection Wires to EN 60 751

- **Temperature range from -70 ... +600°C**
- **Standardized nominal values and tolerances**
- **Resistance values from 20 ... 5000Ω**
- **Characteristic curve linearity**
- **Quick response behavior**
- **Vibration proof design**
- **Low price level**

Introduction

The platinum chip temperature sensors are part of the category of temperature sensors manufactured in thin film technology. They are produced by JUMO under clean room conditions meeting the latest state-of-the-art. The platinum layer acting as the active layer is applied to a ceramic body in a sputter process and subsequently given a meander-structure in a lithographic process. Precise adjustment is then carried out in a laser trimming process. To protect the sensor against external influences and for insulation purposes, the platinum meander is coated with a special glass layer once the adjustment is completed. The electrical connection is made by connection wires welded onto the contact surfaces. Depending on the version, the connection wires can be of different materials and their length as well as their diameter can vary to a certain extent. An additional glass layer applied to the contact surface fixes the connection wires and also serves as a tension relief.
Platinum chip temperature sensors of the PCA design are available from stock in various versions as Pt 100-, Pt 500- or Pt 1000 temperature sensors. Special rated values can be manufactured on request. Platinum chip temperature sensors are also available in small sizes with high ohmic load. Their low deadweight allow very low response times. When installed as fixed units, they also provide excellent vibration resistance. The application temperature depends on the respective version and, in normal cases, ranges between -70 ... +600°C. When accepting certain rated value offsets and/or hysteresis effects occurring within specific limits, these platinum chip temperature sensors can also be used for temperatures well below -70°C.
For most temperature applications required in the market, platinum chip temperature sensors are used as an active component for temperature recording. Typical application fields are as follows: heating engineering, air conditioning technology, ventilation technology, medical and laboratory engineering, white goods, automobiles and commercial vehicles as well as mechanical and industrial engineering.

Platinum Chip Temperature Sensors with Connection Wires to EN 60 751

Brief description

The platinum chip temperature sensors are based on a temperature-depending resistor, the course and admissible tolerance of which are defined in the international standard EN 60 751. They combine the favorable properties of a platinum temperature sensor with the advantages of large-scale production. They are characterized by standardization and universal interchangeability as well as high measuring accuracy, excellent long-term stability and good reproducibility of the electric properties. Large quantities required led to a notable price reduction over the last few years. For this reason, platinum chip temperature sensors are also a real alternative to the thermistors based on the semi-conductor technique.
Platinum chip temperature sensors, version "L", are preferably used for the assembly of various sensors and connection cables. They are particularly suitable for soft-soldering connection. The connection wires are of pure silver and optimal for this type of connection.
For this reason, the application temperature range is designed for -70 ... +250 °C. The maximum temperature, however, is +350 °C to allow further applications.

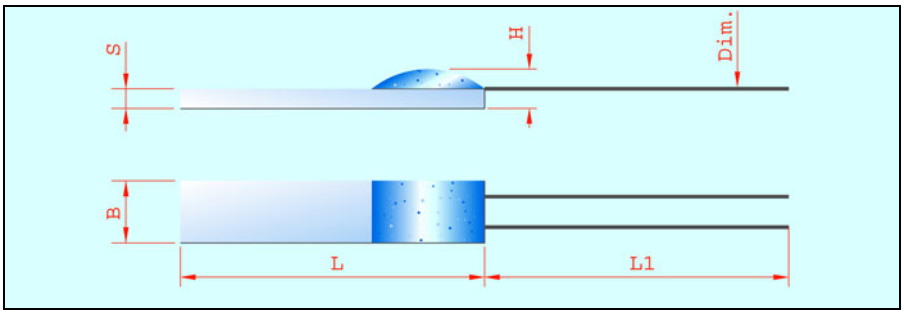
Dimensional drawing



Technical data

Standard	IEC 60 751/EN 60 751
Temperature coefficient	α = 3.850 x 10^{-3} °C^{-1} (between 0 and 100 °C)
Temperature range	-70 ... +250 °C (+350 °C)
Tolerance	Temperature validity range, class 1/3 DIN B: -50 ... +200 °C Temperature validity range, class A: -70 ... +300 °C Temperature validity range, class B: -70 ... +350 °C The sensors also comply with the "new“ classification F0.1, F0.15 and F0.3
Measured current/maximum current	Pt 100 recommended 1.0 mA maximum 7 mA Pt 500 recommended 0.7 mA maximum 3 mA Pt 1000 recommended 0.1 mA maximum 1 mA Pt 5000 recommended 0.1 mA maximum 1 mA
Application conditions	Platinum chip temperature sensors must be protected when used in a humid environment or in aggressive atmospheres. Direct immersion into fluids is also not permitted. The user should check the conditions, prior to using the sensors. **Please also refer to the installation instructions B 90.6121.4 "Information about the application of platinum chip temperature sensors.“**
Connecting wires	These temperature sensors are equipped with connection wires made of pure silver. The connection wires are particularly suitable for soft-soldering connections. For further assembly, avoid lateral pressure load acting on the connections. Ensure that the horizontal pull on individual wires does not exceed 5 N. Avoid unnecessary bending of the connection wires because this will weaken the material and lead to cable breakage. Please also refer to point 3 "Connection techniques“ in our installation instructions. Longer connection wires up to a length of 300 mm (in one piece) can be optionally fitted. On request, as an alternative, extensions in any lengths or insulated strands can also be retrofitted.
Measuring point	The specified rated value is related to the standard connection wire length L1. The measured value is taken 2 mm in front of the open wire end. Wire length extensions could lead to resistance changes as a result of which the tolerance class can no longer be met.
Long-term stability	max. R_0 drift 0.05 %/Year (for definition, see data sheet 90.6000)
Low-temperature application	Taking an occurring rated value drift and hysteresis effect within certain limits into account, temperature measurements are also possible up to -200 °C. Further details are available on request.
Insulating resistance	>10 MΩ at room temperature
Vibration proof design	see EN 60 751, section 4.4.2
Self-heating	$\Delta t = I^2 \times R \times E$ (for the definition, see data sheet 90.6000)
Packaging	Blister belt/bag
Storage	In their (standard) belt packaging, JUMO temperature sensors of the PCA/L design can be stored for at least 12 months under normal ambient conditions. Storage in an aggressive atmosphere or in corroding media as well as under high air humidity is not permitted. Due to the fact that the connection wires of this version are made of pure silver, the shelf life can be considerably extended when stored in an air-tight packaging and in a dark environment. Otherwise, silver tends to oxidize making soldering more difficult.
RoHS conforming	Yes
REACH conforming	Yes

Platinum Chip Temperature Sensors with Connection Wires to EN 60 751

Brief description

The platinum chip temperature sensors are based on a temperature-depending resistor, the course and admissible tolerance of which are defined in the international standard EN 60 751. They combine the favorable properties of a platinum temperature sensor with the advantages of large-scale production. They are characterized by standardization and universal interchangeability as well as high measuring accuracy, excellent long-term stability and good reproducibility of the electric properties. Large quantities required led to a notable price reduction over the last few years. For this reason, platinum chip temperature sensors are also a real alternative to the thermistors based on the semi-conductor technique.
Platinum chip temperature sensors, version "S", are preferably used for application temperatures exceeding 180°C. They are particularly suitable for welded, crimp or brazing connections. The connection wires are made of solid platinum wrapped wire and feature high stability. The application temperature range is between -70 ... +400°C.

Platinum Chip Temperature Sensors with Connection Wires to EN 60 751

Brief description

The platinum chip temperature sensors are based on a temperature-depending resistor, the course and admissible tolerance of which are defined in the international standard EN 60 751. They combine the favorable properties of a platinum temperature sensor with the advantages of large-scale production. They are characterized by standardization and universal interchangeability as well as high measuring accuracy, excellent long-term stability and good reproducibility of the electric properties. Large quantities required led to a notable price reduction over the last few years. For this reason, platinum chip temperature sensors are also a real alternative to the thermistors based on the semi-conductor technique.
Platinum chip temperature sensors, version "M", offer ultimate application possibilities. The temperature sensors feature a particularly wide temperature measurement range from -70 to +550°C. A wide range of different versions is already available on stock. Available miniature versions can also facilitate the assembly where only little space is available. A special coating method used for this version and allowing the unprotected application in humid ambient air is advantageous. Typical application examples include the air conditioning technology and the industrial humidity measuring technology.

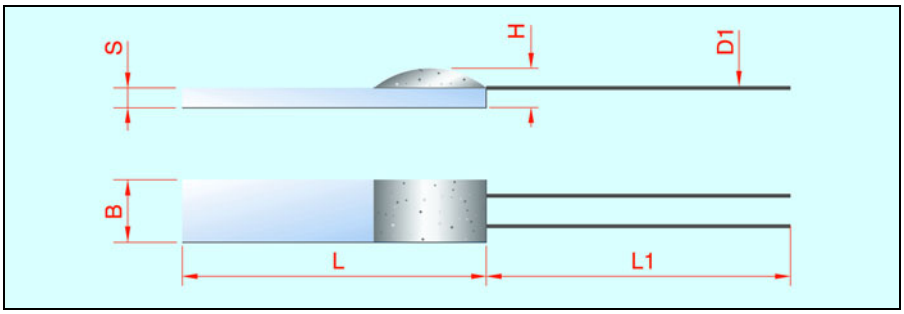
Dimensional drawing



Technical data

Standard	IEC 60 751/EN 60 751
Temperature coefficient	α = 3.850 x 10^{-3} °C^{-1} (between 0 and 100 °C)
Temperature range	-70 ... +550 °C
Tolerance	Temperature validity range, class 1/3 DIN B: -50 ... +200 °C Temperature validity range, class A: -70 ... +300 °C Temperature validity range, class B: -70 ... +550 °C The sensors also comply with the "new“ classification F0.1, F0.15 and F0.3
Measured current/maximum current	Pt 100 recommended 1.0 mA maximum 7 mA Pt 500 recommended 0.7 mA maximum 3 mA Pt 1000 recommended 0.1 mA maximum 1 mA
Application conditions	Platinum chip temperature sensors in this version must be protected when used in aggressive atmospheres. Direct immersion into fluids is also not permitted. The user should check the conditions, prior to using the sensors. **Please also refer to the installation instructions B 90.6121.4 "Information for the application of platinum chip temperature sensors.“**
Connecting wires	These temperature sensors are equipped with connection wires made of a platinum wrapped wire with a nickel core. The connection wires are suitable for crimp, welded and brazing connections. For further assembly, avoid lateral pressure load acting on the connections. Ensure that the horizontal pull on individual wires does not exceed 10 N. Avoid unnecessary bending of the connection wires because this will weaken the material and lead to cable breakage. Please also refer to point 3 "Connection techniques“ in our installation instructions. Longer connection wires up to a length of 300 mm (in one piece) can be optionally fitted. Extension wires made of silver or insulated strands in any lengths can also be retrofitted as an alternative. In this case, however, take into account that this may result in restrictions concerning the application temperature.
Measuring point	The specified rated value is related to the standard connection wire length L1. The measured value is taken 2 mm in front of the open wire end. Wire length extensions could lead to resistance changes as a result of which the tolerance class can no longer be met.
Long-term stability	max. R_0 drift 0.05 %/Year (for definition, see data sheet 90.6000)
Low-temperature application	Taking an occurring rated value drift and hysteresis effect within certain limits into account, temperature measurements are also possible up to -200 °C. Further details are available on request.
Insulating resistance	>10 MΩ at room temperature
Vibration proof design	see EN 60 751, section 4.4.2
Self-heating	$\Delta t = I^2$ x R x E (for the definition, see data sheet 90.6000)
Packaging	Blister belt/bag
Storage	In their (standard) belt packaging, JUMO temperature sensors of the PCA/M design can be stored for at least 12 months under normal ambient conditions. Storage in an aggressive atmosphere or in corroding media as well as under high air humidity is not permitted.
RoHS conforming	Yes
REACH conforming	Yes

Platinum Chip Temperature Sensors with Connection Wires to EN 60 751

Brief description

The platinum chip temperature sensors are based on a temperature-depending resistor, the course and admissible tolerance of which are defined in the international standard EN 60 751. They combine the favorable properties of a platinum temperature sensor with the advantages of large-scale production. They are characterized by standardization and universal interchangeability as well as high measuring accuracy, excellent long-term stability and good reproducibility of the electric properties. Large quantities required led to a notable price reduction over the last few years. For this reason, platinum chip temperature sensors are also a real alternative to the thermistors based on the semi-conductor technique.
Platinum chip temperature sensors, version "H", are preferably used for particularly high and permanently higher application temperatures. They are particularly suitable for electrical connections in melting or laser welding method as well as brazing connections. The connection wires are made of pure palladium. The application temperature range is designed from -70° to +600°C.

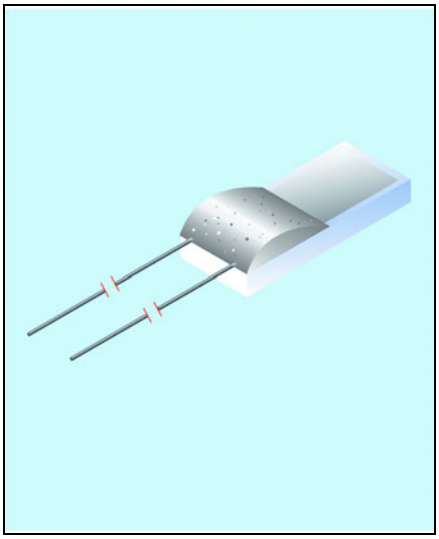
Platinum Chip Temperature Sensors with Nickel Connection Wires to EN 60 751

PCA/E design



Brief description

The platinum chip temperature sensors are based on a temperature-depending resistor, the course and admissible tolerance of which are defined in the international standard EN 60 751. They combine the favorable properties of a platinum temperature sensor with the advantages of large-scale production. They are characterized by standardization and universal interchangeability as well as high measuring accuracy, excellent long-term stability and good reproducibility of the electric properties. Large quantities required led to a notable price reduction over the last few years. For this reason, platinum chip temperature sensors are also a real alternative to the thermistors based on the semi-conductor technique.
Platinum chip temperature sensors, version "E", can be used universally and are suitable for a wide range of applications in low and higher temperature ranges up to 500°C. Short-time use of the sensor at 550°C is admissible. The metallic, bare connection wires are particularly suitable for welded, crimp or brazing connections. Soft-soldering connections are possible under certain circumstances. The application temperature range is -70 ... +500°C.

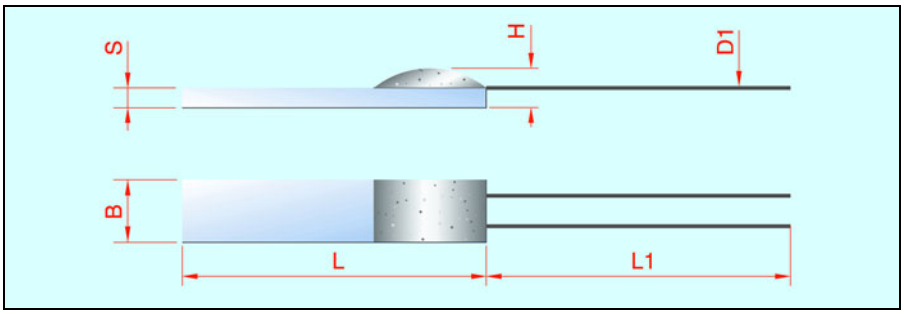
Dimensional drawing



Technical data

Standard	IEC 60 751/EN 60 751
Temperature coefficient	α = 3.850 x 10^{-3} °C^{-1} (between 0 and 100 °C)
Temperature range	-70 ... +500 °C (short-time 550 °C)
Tolerance	Temperature validity range, class 1/3 DIN B: -50 ... +200 °C Temperature validity range, class A: -70 ... +300 °C Temperature validity range, class B: -70 ... +500 °C The temperature sensors also comply with the "new“ classification F0.1, F0.15 and F0.3
Measured current/maximum current	Pt 100 recommended 1.0 mA maximum 7 mA Pt 500 recommended 0.7 mA maximum 3 mA Pt 1000 recommended 0.1 mA maximum 1 mA
Application conditions	Platinum chip temperature sensors must be protected when used in aggressive atmospheres. Direct immersion into fluids is also not permitted. The user should check the conditions, prior to using the sensors. **Please also refer to the installation instructions B 90.6121.4 "Information for the application of platinum chip temperature sensors.“**
Connecting wires	These temperature sensors are equipped with connection wires made of pure nickel. The connection wires are suitable for crimp, welded and soft-soldering/brazing connections. For further assembly, avoid lateral pressure load of the connections. Ensure that the horizontal pull on individual wires does not exceed 6 N. Avoid unnecessary bending of the connection wires because this will weaken the material and lead to cable breakage. Please also refer to point 3 "Connection techniques“ in our installation instructions. Longer connection wires up to a length of 300 mm (in one piece) can be optionally fitted. Extensions wires or insulated strands in any lengths can also be fitted later as an alternative. In this case, however, take into account that this may result in restrictions concerning the application temperature.
Measuring point	The specified rated value is related to the standard connection wire length L1. The measured value is taken 2 mm in front of the open wire end. Wire length extensions could lead to resistance changes as a result of which the tolerance class can no longer be met.
Long-term stability	max. R_0 drift 0.05 %/Year (for definition, see data sheet 90.6000)
Low-temperature application	Taking an occurring rated value drift and hysteresis effect within certain limits into account, temperature measurements are also possible up to -200 °C. Further details are available on request.
Insulating resistance	>10 MΩ at room temperature
Vibration proof design	see EN 60 751, section 4.4.2
Self-heating	$\Delta t = I^2 \times R \times E$ (for the definition, see data sheet 90.6000)
Packaging	Blister belt/bag
Storage	In their (standard) belt packaging, JUMO temperature sensors of the PCA/E design can be stored for at least 12 months under normal ambient conditions. Storage in an aggressive atmosphere or in corroding media as well as under high air humidity is not permitted.
RoHS conforming	Yes
REACH conforming	Yes
