## Safety Information

## Important Information

Read these instructions carefully, and look at the equipment to become familiar with the device before trying to install, operate, service, or maintain it. The following special messages may appear throughout this documentation or on the equipment to warn of potential hazards or to call attention to information that clarifies or simplifies a procedure.

The addition of this symbol to a "Danger" or "Warning" safety label indicates that an electrical hazard exists which will result in personal injury if the instructions are not followed.

This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

## DANGER

DANGER indicates a hazardous situation which, if not avoided, will result in death or serious injury.

## A WARNING

WARNING indicates a hazardous situation which, if not avoided, could result in death or serious injury.

| A CAUTION |
| :--- |
| CAUTITN indicates a hazardous situation which, if not avoided, could result in minor or <br> moderate injury. |

## NOTICE

NOTICE is used to address practices not related to physical injury.

## Please Note

Electrical equipment should be installed, operated, serviced, and maintained only by qualified personnel. No responsibility is assumed by Schneider Electric for any consequences arising out of the use of this material.

A qualified person is one who has skills and knowledge related to the construction and operation of electrical equipment and its installation, and has received safety training to recognize and avoid the hazards involved.

## QUALIFICATION OF PERSONNEL

Only appropriately trained persons who are familiar with and understand the contents of this manual and all other pertinent product documentation are authorized to work on and with this product. These persons must have sufficient technical training, knowledge and experience and be able to foresee and detect potential hazards that may be caused by using the product, by modifying the settings and by the mechanical, electrical and electronic equipment of the entire system in which the product is used.

All persons working on and with the product must be fully familiar with all applicable standards, directives, and accident prevention regulations when performing such work.

## INTENDED USE

The products described or affected by this document are, along with software, accessories and options, servo drive systems for servo motors and intended for industrial use according to the instructions, directions, examples and safety information contained in the present document and other supporting documentation.

The products may only be used in compliance with all applicable safety regulations and directives, the specified requirements and the technical data.

Prior to using the products, you must perform a risk assessment in view of the planned application. Based on the results, the appropriate safety-related measures must be implemented.

Since the products are used as components in an entire system, you must ensure the safety of persons by means of the design of this entire system.

Operate the products only with the specified cables and accessories. Use only genuine accessories and spare parts.

Any use other than the use explicitly permitted is prohibited and can result in hazards.

## About the Book

This document describes the functions of the Servo Drive LXM28A and the BCH2 motor.

## Validity Note

This document has been updated with the firmware release of the Lexium 28A V1.78.

The technical characteristics of the devices described in the present document also appear online. To access the information online, go to the Schneider Electric home page www.se.com/ww/en/download/.

The characteristics that are described in the present document should be the same as those characteristics that appear online. In line with our policy of constant improvement, we may revise content over time to improve clarity and accuracy. If you see a difference between the document and online information, use the online information as your reference.

For product compliance and environmental information (RoHS, REACH, PEP, EOLI, etc.), go to www.se.com/ww/en/work/support/green-premium/.

## Related Documents

Use your tablet or your PC to quickly access detailed and comprehensive information on all our products on www.se.com.

The internet site provides the information you need for products and solutions:

- The whole catalog for detailed characteristics and selection guides,
- The CAD files to help design your installation,
- All software and firmware to maintain your installation up to date,
- And finally all the User Guides related to your drive, listed below:

## Product Related Information

The use and application of the information contained herein require expertise in the design and programming of automated control systems.

Only you, the user, machine builder or integrator, can be aware of all the conditions and factors present during installation and setup, operation, repair and maintenance of the machine or process.

You must also consider any applicable standards and/or regulations with respect to grounding of all equipment. Verify compliance with any safety information, different electrical requirements, and normative standards that apply to your machine or process in the use of this equipment.

Many components of the equipment, including the printed circuit board, operate with mains voltage, or present transformed high currents, and/or high voltages.

The motor itself generates voltage when the motor shaft is rotated.

## AADANGER

## ELECTRIC SHOCK, EXPLOSION, OR ARC FLASH

- Disconnect all power from all equipment including connected devices prior to removing any covers or doors, or installing or removing any accessories, hardware, cables, or wires.
- Place a "Do Not Turn On" or equivalent hazard label on all power switches and lock them in the non-energized position.
- Wait 15 minutes to allow the residual energy of the DC bus capacitors to discharge.
- Measure the voltage on the DC bus with a properly rated voltage sensing device and verify that the voltage is less than 42.4 Vdc .
- Do not assume that the DC bus is voltage-free when the DC bus LED is off.
- Block the motor shaft to prevent rotation prior to performing any type of work on the drive system.
- Do not create a short-circuit across the DC bus terminals or the DC bus capacitors.
- Replace and secure all covers, accessories, hardware, cables, and wires and confirm that a proper ground connection exists before applying power to the unit.
- Use only the specified voltage when operating this equipment and any associated products.
Failure to follow these instructions will result in death or serious injury.

This equipment has been designed to operate outside of any hazardous location. Only install this equipment in zones known to be free of a hazardous atmosphere.

## ADANGER

## POTENTIAL FOR EXPLOSION

Install and use this equipment in non-hazardous locations only.
Failure to follow these instructions will result in death or serious injury.

If the power stage is disabled unintentionally, for example as a result of power outage, errors or functions, the motor is no longer decelerated in a controlled way. Overload, errors or incorrect use may cause the holding brake to no longer operate properly and may result in premature wear.

## A WARNING

## UNINTENDED EQUIPMENT OPERATION

- Verify that movements without braking effect cannot cause injuries or equipment damage.
- Verify the function of the holding brake at regular intervals.
- Do not use the holding brake as a service brake.
- Do not use the holding brake for safety-related purposes.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

Drive systems may perform unanticipated movements because of incorrect wiring, incorrect settings, incorrect data or other errors.

## AWARNING

## UNINTENDED MOVEMENT OR MACHINE OPERATION

- Carefully install the wiring in accordance with the EMC requirements.
- Do not operate the product with undetermined settings and data.
- Perform comprehensive commissioning tests that include verification of configuration settings and data that determine position and movement.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

## AWARNING

## LOSS OF CONTROL

- The designer of any control scheme must consider the potential failure modes of control paths and, for certain critical control functions, provide a means to achieve a safe state during and after a path failure. Examples of critical control functions are emergency stop and overtravel stop, power outage and restart.
- Separate or redundant control paths must be provided for critical control functions.
- System control paths may include communication links. Consideration must be given to the implications of unanticipated transmission delays or failures of the link.
- Observe all accident prevention regulations and local safety guidelines. ${ }^{1}$
- Each implementation of this equipment must be individually and thoroughly tested for proper operation before being placed into service.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

1 For additional information, refer to NEMA ICS 1.1 (latest edition), "Safety Guidelines for the Application, Installation, and Maintenance of Solid State Control" and to NEMA ICS 7.1 (latest edition), "Safety Standards for Construction and Guide for Selection, Installation and Operation of Adjustable-Speed Drive Systems" or their equivalent governing your particular location.

## DC Bus Voltage Measurement

The DC bus voltage can exceed 400 Vdc . The DC bus LED is not an indicator of the absence of DC bus voltage.

## AADANGER

ELECTRIC SHOCK, EXPLOSION OR ARC FLASH

- Disconnect the voltage supply to all connections.
- Wait 15 minutes to allow the DC bus capacitors to discharge.
- Use a properly rated voltage-sensing device for measuring (greater than 400 Vdc).
- Measure the DC bus voltage between the DC bus terminals (PA/+ and PC/-) to verify that the voltage is less than 42 Vdc
- Contact your local Schneider Electric representative if the DC bus capacitors do not discharge to less than 42 Vdc within a period of 15 minutes.
- Do not operate the product if the DC bus capacitors do not discharge properly.
- Do not attempt any repairs involving opening the drive case.
- Do not attempt to replace cables, connectors or the drive itself if the DC bus capacitors are not discharged to a voltage level less than 42 Vdc .
- Do not assume that the DC bus is voltage-free when the DC bus LED is off.

Failure to follow these instructions will result in death or serious injury.

## Terminology Derived from Standards

The technical terms, terminology, symbols and the corresponding descriptions in this manual, or that appear in or on the products themselves, are generally derived from the terms or definitions of international standards.

In the area of functional safety systems, drives and general automation, this may include, but is not limited to, terms such as safety, safety function, safe state, fault, fault reset, malfunction, failure, error, error message, dangerous, etc.

Among others, these standards include:

| Standard | Description |
| :--- | :--- |
| IEC 61131-2:2007 | Programmable controllers, part 2: Equipment requirements and tests. |
| ISO 13849-1:2015 | Safety of machinery: Safety related parts of control systems. <br> General principles for design. |
| EN 61496-1:2013 | Safety of machinery: Electro-sensitive protective equipment. <br> Part 1: General requirements and tests. |
| ISO 12100:2010 | Safety of machinery - General principles for design - Risk assessment <br> and risk reduction |
| EN 60204-1:2006 | Safety of machinery - Electrical equipment of machines - Part 1: General <br> requirements |
| ISO 14119:2013 | Safety of machinery - Interlocking devices associated with guards - <br> Principles for design and selection |
| ISO 13850:2015 | Safety of machinery - Emergency stop - Principles for design |
| IEC 62061:2015 | Safety of machinery - Functional safety of safety-related electrical, <br> electronic, and electronic programmable control systems |
| IEC 61508-1:2010 | Functional safety of electrical/electronic/programmable electronic safety- <br> related systems: General requirements. |
| IEC 61508-2:2010 | Functional safety of electrical/electronic/programmable electronic safety- <br> related systems: Requirements for electrical/electronic/programmable <br> electronic safety-related systems. |
| IEC 61508-3:2010 61784-3:2016 | Functional safety of electrical/electronic/programmable electronic safety- <br> related systems: Software requirements. |
|  | Industrial communication networks - Profiles - Part 3: Functional safety <br> fieldbuses - General rules and profile definitions. |

| Standard | Description |
| :--- | :--- |
| 2006/42/EC | Machinery Directive |
| $2014 / 30 / E U$ | Electromagnetic Compatibility Directive |
| $2014 / 35 / E U$ | Low Voltage Directive |

In addition, terms used in the present document may tangentially be used as they are derived from other standards such as:

| Standard | Description |
| :--- | :--- |
| IEC 60034 series | Rotating electrical machines |
| IEC 61800 series | Adjustable speed electrical power drive systems |
| IEC 61158 series | Digital data communications for measurement and control - Fieldbus for <br> use in industrial control systems |

Finally, the term zone of operation may be used in conjunction with the description of specific hazards, and is defined as it is for a hazard zone or danger zone in the Machinery Directive (2006/42/EC) and ISO 12100:2010.

NOTE: The aforementioned standards may or may not apply to the specific products cited in the present documentation. For more information concerning the individual standards applicable to the products described herein, see the characteristics tables for those product references.

## Drive / Motor References

## Introduction

The present user guide provides information about the following Drives and Motors reference tables.

The Lexium 28A range is defined by AC-servo drives Lexium 28A for combination with AC-servo motors BCH2.

- The combinations of servo motors with servo drives are based on the power class: both servo motor and servo drive must have the same power class.
- The bundle of a servo drive with its related servo motor is designed to cover a nominal power from:
- 0.05 kW up to 4.5 kW ( 0.067 up to 6.03 hp ) with $200 . . .240 \mathrm{~V}$ mains supply voltage.
- 0.05 kW up to 0.75 kW ( 0.067 up to 1.005 hp ) with $100 . . .120 \mathrm{~V}$ mains supply voltage.

Compatibility between Drive and Motor is defined in the Drive / Motor combinations table, page 21.

## Lexium 28A Drive References List

| Drive references | Nominal power | Supply mains |
| :--- | :--- | :--- |
| LXM28AUA5M1X | 50 W | single phase, 110 Vac |
| LXM28AU01M1X | 100 W | single phase, 110 Vac |
| LXM28AU02M1X | 200 W | single phase, 110 Vac |
| LXM28AU04M1X | 400 W | single phase, 110 Vac |
| LXM28AU07M1X | 750 W | single phase, 110 Vac |
| LXM28AUA5M3X | 50 W | single phase or 3-phase, 230 Vac |
| LXM28AU01M3X | 100 W | single phase or 3-phase, 230 Vac |
| LXM28AU02M3X | 200 W | single phase or 3-phase, 230 Vac |
| LXM28AU04M3X | 400 W | single phase or 3-phase, 230 Vac |
| LXM28AU07M3X | 750 W | single phase or 3-phase, 230 Vac |
| LXM28AU10M3X | 1000 W | single phase or 3-phase, 230 Vac |
| LXM28AU15M3X | 1500 W | single phase or 3-phase, 230 Vac |
| LXM28AU20M3X | 2000 W | 3-phase, 230 Vac |
| LXM28AU30M3X | 3000 W | 3-phase, 230 Vac |
| LXM28AU45M3X | 4500 W | 3-phase, 230 Vac |

For further information, refer to the servo drive general overview, page 29.

## BCH2 Motor References List

| Motor references | Nominal power |
| :---: | :---: |
| BCH2MBA53•••5C | 50 W |

## Conditions for UL 508C

## Introduction

The UL certification status can be downloaded on the Schneider Electric website.
If the product is used to comply with UL 508C, the following conditions must also be met.

## Wiring

Use at least $75^{\circ} \mathrm{C}\left(167^{\circ} \mathrm{F}\right)$ copper conductors.

## Fuses

Use fuses as per UL 248 or circuit breaker as per UL 489.

| LXM28A | UA5, U01, <br> U02, U04, <br> U07, U10, U15 | U20, U30, U45 |
| :--- | :--- | :--- |
| Maximum fuse rating of fuse to be connected upstream | 25 A | 32 A |
| Class if fuses are used | J | J |
| Class if circuit breakers are used | D | D |

## Overvoltage Category

Use only in overvoltage category III or where the maximum available Rated Impulse Withstand Voltage Peak is equal or less than 4000 Volts, or equivalent as defined in UL 840 and its equivalent defined in IEC 60664-1.

## Conditions for CSA

The CSA certificate can be downloaded on the Schneider Electric website.
If the product is used to comply with CSA, the following conditions must also be met.

Integral solid-state short circuit protection in these drives does not provide branch circuit protection.

## ADANGER

## ELECTRIC SHOCK, EXPLOSION OR ARC FLASH

Provide branch circuit protection in accordance with the manual instructions, National Electrical Code and any additional local codes of the type and size specified in the present document.

Failure to follow these instructions will result in death or serious injury.

For reference groups 1, 2, 3, and 4 (see Fuse Types table), this product is suitable for use on a circuit capable of delivering not more than 200 kA RMS symmetrical amperes and 230 Vac (LXM28A $\cdots \cdot \mathrm{M} 3 \mathrm{X}$ ) or 120 Vac (LXM28A $\cdots \cdot \mathrm{M} 1 \mathrm{X}$ ) maximum, when protected by Listed Class J, CC or RK5 fuses as indicated in this instruction manual and the Fuse Types table. Instead of fuses, protection may be provided by circuit breakers of type C60 by Schneider Electric with the maximum current ratings specified in the Fuse Types table.

For reference group 1 only, this product is suitable for motor group installation on a circuit capable of delivering not more than 5 kA RMS symmetrical amperes and $230 \mathrm{Vac}(L X M 28 A \cdot \cdots \mathrm{M} 3 \mathrm{X})$ or $120 \mathrm{Vac}(L X M 28 \mathrm{~A} \cdot \bullet \cdot \mathrm{M} 1 \mathrm{X})$ maximum, when protected by Listed Class J or CC fuses as indicated in the instruction manual and the Fuse Types table. Instead of fuses, protection may be provided by circuit breakers of type C60 by Schneider Electric with the maximum current ratings specified in the Fuse Types table.

The opening of the branch-circuit protective device may be an indication that an electrical interruption has been detected.

## AADANGER

## ELECTRIC SHOCK, EXPLOSION OR ARC FLASH

- Examine all current carrying parts and other components of the drive controller for damage and replace if necessary before replacing fuses or engaging circuit breakers.
- Completely replace overload relays if burnout of the current element occurs. Failure to follow these instructions will result in death or serious injury.

Capacitive voltages above 42.4 V may remain for up to 15 minutes after power is removed from the drive.

## AADANGER

## ELECTRIC SHOCK, EXPLOSION, OR ARC FLASH

- Disconnect all power from all equipment including connected devices prior to removing any covers or doors, or installing or removing any accessories, hardware, cables, or wires.
- Place a "Do Not Turn On" or equivalent hazard label on all power switches and lock them in the non-energized position.
- Wait 15 minutes to allow the residual energy of the DC bus capacitors to discharge.
- Measure the voltage on the DC bus with a properly rated voltage sensing device and verify that the voltage is less than 42.4 Vdc .
- Do not assume that the DC bus is voltage-free when the DC bus LED is off.
- Block the motor shaft to prevent rotation prior to performing any type of work on the drive system.
- Do not create a short-circuit across the DC bus terminals or the DC bus capacitors.
- Replace and secure all covers, accessories, hardware, cables, and wires and confirm that a proper ground connection exists before applying power to the unit.
- Use only the specified voltage when operating this equipment and any associated products.

Failure to follow these instructions will result in death or serious injury.

These drives are provided with load and speed adjustable motor overload and short circuit protection. Adjust the parameter P1-78 'User-Defined maximal current' in the drive which protects the motor by limiting the maximum current according to the required degree of protection of the motors as indicated on the name plate.

## Other Characteristics

Maximum surrounding Air Temperature: $40 . . .55^{\circ} \mathrm{C}\left(104 \ldots 131^{\circ} \mathrm{F}\right)$ with current derating of $1 \%$ per ${ }^{\circ} \mathrm{C}$ (per $1.8^{\circ} \mathrm{F}$ ).

Tightening torque for the connectors labelled CN5, CN7 and CN8 for drive reference group:

- 3 and 4: 0.7 .. 0.8 Nm (6.2 ... $7 \mathrm{lb} . \mathrm{in}$ )

## Fuse Types

| Reference Group | Reference | Class | Maximum Current |

## Integrated Fieldbus

The Lexium 28A Servo Drive embeds a dual port CANopen adapter that can be used in a CANopen industrial fieldbus.

Servo drive parameters, page 187 may be accessed using:

- The integrated HMI
- The Device Type Manager (DTM)
- Directly using the fieldbus address of the device to read and write to parameters using the object dictionary

## Object Dictionary

The CANopen objects may be accessed through the fieldbus, using their address.
The objects Drive Parameters are identified by their name in the Parameter column in the object dictionary table.

Three groups of objects are available in the object dictionary.

- 1000h $-1 F F F_{h}$ : Standard communication Object Group, page 398
- 4000 $\mathrm{h}-4 \mathrm{FFF}_{\mathrm{h}}$ : Vendor-specific Object Group, page 409
- 6000h - 6FFF ${ }_{h}$ : Device profile Object Group, page 450

## Servo Drive Nameplate

## Presentation

The nameplate contains the following data:

| Item | Description |
| :--- | :--- |
| 1 | Drive reference, page 31 |
| 2 | Logic supply |
| 3 | Cable specifications |
| 4 | Certifications |

## Drive Technical Data

## Environmental Conditions

## Ambient Conditions During Operation

The maximum permissible ambient temperature during operation depends on the mounting distances between the devices and on the required power. Observe the instructions in the chapter Installation, page 104.

| Description | Unit | Value |
| :--- | :--- | :--- |
| Ambient temperature without current derating (no icing, non- <br> condensing | ${ }^{\circ} \mathrm{C}\left({ }^{\circ} \mathrm{F}\right)$ | $0 \ldots 40(32 \ldots 104)$ |
| Ambient temperature with current derating of $1 \%$ per $1^{\circ} \mathrm{C}\left(1.8^{\circ} \mathrm{F}\right)$ | ${ }^{\circ} \mathrm{C}\left({ }^{\circ} \mathrm{F}\right)$ | $40 \ldots 55(104 \ldots 131)$ |

The following relative humidity is permissible during operation:

| Description | Unit | Value |
| :--- | :--- | :--- |
| Relative humidity (non-condensing) | $\%$ | $<95$ |

| Description | Unit | Value |
| :--- | :--- | :--- |
| Installation altitude above mean sea level without current derating | $\mathrm{m}(\mathrm{ft})$ | $<2000(<6561)$ |

## Ambient Conditions During Transportation and Storage

The environment during transportation and storage must be dry and free from dust.

| Description | Unit | Value |
| :--- | :--- | :--- |
| Temperature | ${ }^{\circ} \mathrm{C}\left({ }^{\circ} \mathrm{F}\right)$ | $-25 \ldots 65(-4 \ldots 149)$ |

The following relative humidity is permissible during transportation and storage:

| Description | Unit | Value |
| :--- | :--- | :--- |
| Relative humidity (non-condensing) | $\%$ | $<95$ |

## Installation Site and Connection

For operation, the device must be mounted in a closed control cabinet with a degree of protection of at least IP 54. The device may only be operated with a permanently installed connection.

## A! DANGER

ELECTRIC SHOCK, EXPLOSION, OR ARC FLASH
Install the drive in a control cabinet or housing with a minimum IP 54 rating.
Failure to follow these instructions will result in death or serious injury.

## Pollution Degree and Degree of Protection

| Description | Value |
| :--- | :--- |
| Pollution degree | 2 |
| Degree of protection | IP20 |

## Degree of Protection When the Safety Function Is Used

You must ensure that conductive substances cannot get into the product (pollution degree 2). Conductive substances may cause the safety function to become inoperative.

| AWNARNING |
| :--- |
| INOPERABLE SAFETY FUNCTION |
| Ensure that conductive substances (water, contaminated or impregnated oils, <br> metal shavings, etc.) cannot get into the drive. |
| Failure to follow these instructions can result in death, serious injury, or <br> equipment damage. |

## Vibration and Shock During Operation

| Description | Value |
| :--- | :--- |
| Class as per IEC 60721-3-3 | 3 M 43 mm from $9 \ldots 200 \mathrm{~Hz}$ |
| Maximum shock | $98.1 \mathrm{~m} / \mathrm{s}^{2}(10 \mathrm{~g})$ Type I |

## Vibration and Shock During Transportation and Storage

| Description | Value |
| :--- | :--- |
| Class as per IEC 60721-3-2 | 2 M 2 |
|  | $3.5 \mathrm{~mm}(2 \ldots .9 \mathrm{~Hz})$ |
|  | $9.81 \mathrm{~m} / \mathrm{s}^{2}(1 \mathrm{~g})$ from $9 \ldots 200 \mathrm{~Hz}$ |
|  | $14.715 \mathrm{~m} / \mathrm{s}^{2}(1.5 \mathrm{~g})$ from $200 \ldots .500 \mathrm{~Hz}$ |
|  | $34.335 \mathrm{~m} / \mathrm{s}^{2}(3.5 \mathrm{~g})$ from $2 \ldots 9 \mathrm{~Hz}$ |
| Maximum shock | $294.3 \mathrm{~m} / \mathrm{s}^{2}(30 \mathrm{~g})$ Type II |

LXM28A...M3X

| Description | Unit | Value |
| :--- | :--- | :--- |
| 220 Vac single-phase/three-phase (LXM28A $\cdots \mathrm{M} 3 \mathrm{X})$ | Vac | $200-15 \% \ldots 230+10 \%$ |
| Frequency | Hz | $50-5 \% \ldots 60+5 \%$ |
| Transient overvoltages | - | Overvoltage category III(1) |
| Rated voltage to ground | Vac | 230 |
|  |  |  |
| $(1)$ | Depends on installation altitude, see Environmental Conditions, page 31 |  |

## Type of Grounding

| Description | Value |
| :--- | :--- |
| TT grounding system, TN grounding system | Approved |
| IT mains | Not approved |
| Mains with grounded line conductor | Not approved |

## Leakage Current

| Description | Unit | Value |
| :--- | :--- | :--- |
| Leakage current (as per IEC 60990, figure 3) | mA | $<30(1)$ |
| $(1)$ | Measured on mains with grounded neutral point and without external <br> mains filter. Take into account that a 30 mA RCD can already trigger at <br> 15 mA . In addition, there is a high-frequency leakage current which is <br> not considered in the measurement. The response to this depends on <br> the type of residual current device. |  |

## Monitoring of the Continuous Output Power

The continuous output power is monitored by the device. If the continuous output power is exceeded, the device reduces the output current.

## PWM Frequency Power Stage

PWM frequency power stage The PWM frequency of the power stage is set to a fixed value.

| LXM28A | UA5, U01, U02, U04, <br> U07, U10, U15 | U20, U30, U45 |
| :--- | :--- | :--- |
| PWM frequency power stage | 16 kHz | 8 kHz |

Type of Cooling

| LXM28A | UA5, U01, U02 | U04, U07, U10, U15, <br> U20, U30, U45 |
| :--- | :--- | :--- |
| Type of cooling | Convection | Fan |

## Permissible Drive / Motor Combinations

The BCH 2 motors can be connected to the Lexium 28A drive range.
Compatibility between Drive and Motor is defined in the Drive / Motor combinations table, page 21.

## Single-Phase Connection

Electrical Data for LXM28A…M1X Drive Connected Via a Single-Phase 110 Vac

| LXM28A…M1X |  | Unit | UA5 | U01 | U02 | U04 | U07 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Inputs / Outputs Characteristics

## Logic Type

The outputs are short-circuit protected. The inputs and outputs are galvanically isolated.

The digital inputs and outputs of this product can be wired for positive or negative logic.

| Logic type | Active state |
| :--- | :--- |
| Positive logic | Output supplies current (source output) <br> Current flows to the input (sink input) |
| Negative logic | Output draws current (sink output) <br> Current flows from the input (source input) |

## Digital Input Signals 24 V

When wired as positive logic, the levels of the opto-isolated inputs DI1...DI5 and DI8 comply with IEC 61131-2, type 1. The electrical characteristics are also valid when wired as negative logic.

| Description | Unit | Value |  |
| :--- | :--- | :--- | :---: |
| " $0 "$ " signal voltage | Vdc | $\leq 5$ |  |
| "1" signal voltage | Vdc | $\geq 11$ |  |
| Input current (typical) | mA | 6 |  |
| Debounce time(1) | mA | $0 \ldots 20$ |  |
|  |  |  |  |
| $(1)$ | Adjustable via parameter P2-09 in increments of 1 ms. |  |  |

## Digital Output Signals 24 V

The levels of the digital 24 V output signals DO• comply with IEC 61131-2.

| Description | Unit | Value |
| :--- | :--- | :--- |
| Switching voltage | Vdc | 24 |
| Maximum switching current | mA | 100 |
| Voltage drop at 100 mA load | Vdc | $<3$ |

## Analog Input Signals

| Description | Unit | Value |
| :--- | :--- | :--- |
| Voltage range | Vdc | $-10 \ldots 10$ |
| Input resistance, typical | $\mathrm{k} \Omega$ | 10 |
| Resolution | Bit | 12 |
| Sampling period | $\mu \mathrm{s}$ | 32.25 |

## Analog Output Signals

| Description | Unit | Value |
| :--- | :--- | :--- |
| Voltage range | Vdc | $-8 \ldots 8$ |
| Output current | mA | 10 |
| Minimum load resistance (voltage source)! | $\mathrm{k} \Omega$ | 1 |
| Resolution | Bit | 12 |
| Sampling period | ms | 1 |
| Time constant | $\mu \mathrm{s}$ | 10 |

## Touch Probe Input Signals 24 V

When wired as positive logic, the levels of the opto-isolated inputs DI6 and DI7 comply with IEC 61131-2, type 1. The electrical characteristics are also valid when wired as negative logic.

| Description | Unit | Value |  |
| :--- | :--- | :--- | :---: |
| "0" signal voltage | Vdc | $\leq 5$ |  |
| "1" signal voltage | Vdc | $\geq 11$ |  |
| Input current (typical) | mA | 7 |  |
| Debounce time(1) | $\mu \mathrm{s}$ | $0 \ldots 20000$ |  |
| Jitter Capture | $\mu \mathrm{s}$ | 1 |  |
|  |  |  |  |
| $(1)$ | Adjustable via parameter P2-24 in increments of $1 \mu \mathrm{~s}$. |  |  |

## Safety Function STO

The signal inputs $\overline{\mathbf{S T O} \mathbf{0 V}}$ and $\overline{\mathbf{S T O} \mathbf{2 4 V}}$ (CN9) are protected against reverse polarity.

| Description | Unit | Value |
| :--- | :--- | :--- |
| Nominal voltage | Vdc | 24 |
| PELV power supply unit | - | Required |
| "0" signal voltage (1) | Vdc | $<5$ |
| "1" signal voltage (1) | Vdc | $15 \ldots 30$ |
| Input current (typical) <br> LXM28AUA5M3X, U01M3X, U02M3X, U04M3X, U07M3X <br> LXM28AUA5M1X, U01M1X, U02M1X, U04M1X, U07M1X <br> LXM28AU10M3X, U15M3X <br> LXM28AU20 <br> LXM28AU30, U45 | mA | 190 |
| Maximum peak current | 190 |  |
| Maximum frequency for OSSD (Output Signal Switching <br> Device) test pulses | Hz | 190 |
| Debounce time | m | 190 |
| Response time of safety function STO | ms | 18 |

(1)

Voltage level according to IEC 61131-2 type 2 with the exception of the operation with 15 Vdc instead of 11 Vdc . The condition between 5 Vdc and 15 Vdc is undefined and not permissible.

For further information, refer to data for maintenance plan and the calculation for the safety function, page 85.

## 24 Vdc Power Supply (Pin 17):

24 Vdc power supply (pin 17):

| Description | Unit | Value |
| :--- | :--- | :--- |
| Output voltage | Vdc | 24 |
| Maximum output current | mA | 200 |

## CAN Bus Signals:

The CAN bus signals comply with the CAN standard and are short-circuit protected.

## ESIM Output Signals

The ESIM output signals comply with the RS422 interface specification.

| Description | Unit | Value |
| :--- | :--- | :--- |
| Logic level | - | As per RS422(1) |
| Output frequency per signal | kHz | 800 |
| Maximum output frequency (quadruple <br> evaluation) | kHz | 3200 |
|  |  |  |
| $(1)$ | Due to the input current of the optocoupler in the input circuit, a parallel <br> connection of a driver output to several devices is not permitted. |  |

## Function A/B Signals

External A/B signals can be supplied via the PTI input as reference values in operating mode Pulse Train (Pt).

| Signal | Function |
| :--- | :--- |
| Signal SIGN before signal PULSE | Movement in positive direction |
| Signal PULSE before signal SIGN | Movement in negative direction |

Time chart with A/B signal, counting forwards and backwards

The signal shape shown relates to the factory setting (P1-00 C=0). The direction of movement shown relates to the factory setting ( $\mathrm{P} 1-01 \mathrm{C}=0$ ).

| Intervals (minimum) | HPULSE / HSIGN <br> with RS422 | PULSE / SIGN with <br> RS422 | PULSE / SIGN with <br> Open Collector |
| :--- | :--- | :--- | :--- |
| 1 | 4 MHz | 500 kHz | 200 kHz |
| 2 | $0.125 \mu \mathrm{~s}$ | $0.1 \mu \mathrm{~s}$ | $2.5 \mu \mathrm{~s}$ |
| 3 | $0.0625 \mu \mathrm{~s}$ | $0.5 \mu \mathrm{~s}$ | $1.25 \mu \mathrm{~s}$ |

## Function CW/CCW

External CW/CCW signals can be supplied via the PTI input as reference values.

| Signal | Function |
| :--- | :--- |
| Signal PULSE (CCW) | Movement in positive direction |
| Signal SIGN (CW) | Movement in negative direction |

Time chart with "CW/CCW"

The signal shape shown relates to the factory setting (P1-00 C=0). The direction of movement shown relates to the factory setting ( $\mathrm{P} 1-01 \mathrm{C}=0$ ).

| Intervals (minimum) | HPULSE / HSIGN <br> with RS422 | PULSE / SIGN with <br> RS422 | PULSE / SIGN with <br> Open Collector |
| :--- | :--- | :--- | :--- |
| 1 | 4 MHz | 500 kHz | 200 kHz |
| 2 | $0.125 \mu \mathrm{~s}$ | $0.1 \mu \mathrm{~s}$ | $2.5 \mu \mathrm{~s}$ |
| 3 | $0.0625 \mu \mathrm{~s}$ | $0.5 \mu \mathrm{~s}$ | $1.25 \mu \mathrm{~s}$ |

## Function P/D

External P/D signals can be supplied via the PTI input as reference values.

| Signal | Function |
| :--- | :--- |
| Signal PULSE | Motor movement |
| Signal SIGN | Direction of movement |

Time chart with pulse/direction signal

The signal shape shown relates to the factory setting ( $\mathrm{P} 1-00 \mathrm{C}=0$ ). The direction of movement shown relates to the factory setting ( $\mathrm{P} 1-01 \mathrm{C}=0$ ).

| Intervals (minimum) | HPULSE / HSIGN <br> with RS422 | PULSE / SIGN with <br> RS422 | PULSE / SIGN with <br> Open Collector |
| :--- | :--- | :--- | :--- |
| 1 | 4 MHz | 500 kHz | 200 kHz |
| 2 | $0.125 \mu \mathrm{~s}$ | $0.1 \mu \mathrm{~s}$ | $2.5 \mu \mathrm{~s}$ |
| 3 | $0.0625 \mu \mathrm{~s}$ | $0.5 \mu \mathrm{~s}$ | $1.25 \mu \mathrm{~s}$ |
| 4 | $0.0625 \mu \mathrm{~s}$ | $0.5 \mu \mathrm{~s}$ | $1.25 \mu \mathrm{~s}$ |

## General Overview

## Components and Interfaces

## Presentation

BCH 2 servo motors, with a 3-phase stator and rotor with rare earth-based permanent magnets, consist of:

| Item | Description |
| :--- | :--- |
| 1 | Connector of the motor cable, page 73 |
| 2 | Connector of the encoder cable, page 74 |
| 3 | Housing |
| 4 | Smooth or keyed shaft end, depending on the motor reference |
| 5 | 4-point axial mounting flange |

## Servo Motor Nameplate

The nameplate contains the following data:

| Item | Description | Item | Description |
| :---: | :---: | :---: | :---: |
| 1 | Motor reference, page 47 | 13 | Country of manufacture |
| 2 | Nominal voltage | 14 | Nominal voltage of the holding brake (optional) |
| 3 | Continuous stall current | 15 | Nominal power of the holding brake (optional) |
| 4 | Continuous stall torque | 16 | Nominal torque of the holding brake (optional) |
| 5 | Maximum current | 17 | Mass |
| 6 | Barcode | 18 | Date of manufacture DOM |
| 7 | Serial number | 19 | Number of motor phases, temperature class, degree of protection |
| 8 | QR code | 20 | Certifications |
| 9 | Nominal power | 21 | Applied standard |
| 10 | Nominal current | 22 | Peak torque |
| 11 | Nominal torque | 23 | Maximum permissible speed of rotation |
| 12 | Nominal speed of rotation | 24 | Hardware version |

## BCH2•D, BCH2•F, BCH2•H, BCH2•M, and BCH2•R

The nameplate contains the following data:

| Item | Description | Item | Description |
| :--- | :--- | :--- | :--- |
| 1 | Motor reference, page 47 | 13 | Nominal speed of rotation |
| 2 | Nominal voltage | 14 | Mass |
| 3 | Continuous stall current | 15 | Nominal voltage of the holding brake <br> (optional) |
| 4 | Continuous stall torque | 16 | Nominal power of the holding brake <br> (optional) |
| 5 | Peak torque | 17 | Nominal torque of the holding brake <br> (optional) |
| 6 | Maximum permissible speed of <br> rotation | 19 | Certifications |

| (2) Only available with single-turn encoder, up to 4.5 kW. |

## Motor Technical Data

## Environmental Conditions

## Ambient Conditions During Operation

The maximum permissible ambient temperature during operation depends on the mounting distances between the devices and on the required power. Observe the instructions in the chapter Installation, page 139.

| Description |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| Ambient temperature ${ }^{(1)}$ for motors without holding brake (no icing, non-condensing). |  | ${ }^{\circ} \mathrm{C}\left({ }^{\circ} \mathrm{F}\right)$ | -20...40 (-4...104) |
| Ambient temperature for motors with holding brake (no icing, non-condensing). |  | ${ }^{\circ} \mathrm{C}\left({ }^{\circ} \mathrm{F}\right)$ | 0... 40 (32...104) |
| Ambient temperature with current derating of $1 \%$ per ${ }^{\circ}$ $\mathrm{C}\left(\right.$ per $\left.1.8^{\circ} \mathrm{F}\right)$ |  | ${ }^{\circ} \mathrm{C}\left({ }^{\circ} \mathrm{F}\right)$ | 40... 60 (104...140) |
| Relative humidity (non-condensing) |  | \% | 5... 85 |
| Class as per IEC 60721-3-3 |  | - | $\begin{aligned} & 3 \mathrm{~K} 3,3 \mathrm{Z} 12,3 \mathrm{Z} 2,3 \mathrm{~B} 2,3 \mathrm{C} 1, \\ & 3 \mathrm{M} 6^{(2)} \end{aligned}$ |
| Installation altitude above mean sea level without current derating |  | $\mathrm{m}(\mathrm{ft})$ | <1000 (<3281) |
| Installation altitude above mean sea level with current derating of $1 \%$ per 100 m at altitudes higher than 1000 m |  | $\mathrm{m}(\mathrm{ft})$ | 1000... 3000 (3281...9843) |
| (1) | Limit values with flanged motor, see Flange Sizes for Limit Values, page 49 |  |  |
| (2) | Tested as per IEC 60068-2-6 and IEC 60068-2-27 |  |  |

## Ambient Conditions During Transportation and Storage

The environment during transportation and storage must be dry and free from dust.

| Description | Unit | Value |
| :--- | :--- | :--- |
| Temperature | ${ }^{\circ} \mathrm{C}\left({ }^{\circ} \mathrm{F}\right)$ | $-40 \ldots 70(-40 \ldots 158)$ |
| Relative humidity (non-condensing) | $\%$ | $\leq 75$ |
| Set of class combinations as per IEC 60721-3-2 | - | IE 21 |

## Flange Sizes for Limit Values

Limit values referring to this table relate to flanged motors with the following flange sizes:

| Motor | Flange <br> material | Flange size in [mm (in)] |
| :--- | :--- | :--- |
| BCH2MB | Aluminum | $185 \times 185 \times 8(7.28 \times 7.28 \times 0.31)$ |
| BCH2LD | Aluminum | $250 \times 250 \times 12(9.84 \times 9.84 \times 0.47)$ |
| BCH2 $\cdot \mathrm{F}$ | Aluminum | $250 \times 250 \times 12(9.84 \times 9.84 \times 0.47)$ |
| BCH2LH | Steel | $300 \times 300 \times 20(11.8 \times 11.8 \times 0.79)$ |
| BCH2•M | Steel | $400 \times 400 \times 20(15.7 \times 15.7 \times 0.79)$ |
| BCH2•R | Steel | $550 \times 550 \times 20(21.7 \times 21.7 \times 0.79)$ |

## Compatibility with Foreign Substances

The motor has been tested for compatibility with many known substances and with the latest available knowledge at the moment of the design. Nonetheless, you must perform a compatibility test before using a foreign substance.

## Tightening Torque and Property Class of Screws

| Housing screws | Unit | Tightening torque |
| :--- | :--- | :--- |
| $M 3 \times 0.50$ | Nm (lb.in) | $1(8.85)$ |
| $M 4 \times 0.70$ | Nm (lb.in) | $2.9(25.67)$ |
| $M 5 \times 0.80$ | Nm (lb.in) | $5.9(52.22)$ |
| $M 6 \times 1.00$ | Nm (lb.in) | $9.9(87.62)$ |
| $M 7 \times 1.25$ | Nm (lb.in) | $24(212.40)$ |
| M8 $\times 1.50$ | Nm (lb.in) | $49(433.65)$ |
| Property class of the screws | H | 8.8 |

## Overload Characteristics Curves

In order to make old MFOLD and new MFOLD be compatible, add new $P$ parameter P2-71 to active new fold back algorithm. If you want to increase the
overload capacity, you can set MFOLD level by new parameter P2-73 (1~4), default value is 1 . The corresponding MFOLDT value is displayed in $P 2-72$ (see New Motor Fold Back Characteristics and Parameter Setting, page 376).

## Encoder Technical Data

## Overview

The drive can access the electronic nameplate via the electronic interface of the encoder for easy commissioning.

The signals meet the PELV requirements.
Depending on the motor reference, the motor are delivered with a single-turn encoder or a multi-turn encoder.

## Single-Turn Encoder

Technical data

| Description | Value |
| :--- | :--- |
| Measuring range absolute | 1 revolution |
| Resolution in increments | Depending on evaluation |
| Accuracy of position | $\pm 0.044^{\circ}$ |
| Supply voltage | $4.1 \ldots .5 .25 \mathrm{Vdc}$ |
| Maximum supply current | 100 mA |
| Maximum permissible speed of rotation | 6000 rpm |
| Maximum angular acceleration | $100,000 \mathrm{rad} / \mathrm{s}^{2}$ |

## Multi-Turn Encoder

Technical data

| Description | Value |
| :--- | :--- |
| Measuring range absolute | 1 revolution |
| Resolution in increments | Depending on evaluation |
| Accuracy of position | $\pm 0.044^{\circ}$ |
| Supply voltage | $4.1 \ldots .5 .25 \mathrm{Vdc}$ |
| Maximum supply current | $40 \mu \mathrm{~A}$ |
| Maximum permissible speed of rotation | 6000 rpm |
| Maximum angular acceleration | 100,000 rad/s ${ }^{2}$ |
| Battery nominal voltage | 3.6 Vdc |
| Battery nominal current consumption while the encoder is not <br> powered by the drive | $20 \mu \mathrm{~A}$ at standstill |
| Battery life time (at $25^{\circ} \mathrm{C}$ ) | 30 A with rotating shaft |

The multi-turn counting is preserved through power down by an external battery

- For further information on the battery compartment connection, refer to the motor encoder connection, page 121.
- For further information on the battery replacement, refer to the maintenance of the motor, page 382.

## BCH2MB Motor

BCH2MB Dimensions

| BCH2MB | Unit | A5 | $\mathbf{0 1}$ |
| :--- | :--- | :--- | :--- |

## Commissioning Tools

| Description | Reference |
| :--- | :--- |
| Commissioning software LXM28 DTM Library, can be downloaded at: www.se.com | - |
| PC connection kit, serial connection between drive and PC, USB-A to RJ45 | TCSMCNAM3M002P |
| Multi-Loader, device for copying the parameter settings to a PC or to another drive | VW3A8121 |
| Connection cable for Multi-Loader | VW3A8126 |
| Modbus cable, 1 m (3.28 ft), $2 \times$ RJ45 | VW3A8306R10 |

## Connectors and Adapters

| Description | Reference |
| :--- | :--- |
| Connector kit for controller supply and power stage supply (CN5), braking resistor (CN7) and motor (CN8); <br> suitable for LXM28•UA5, U01, U02, U04, U07, U10 and U15 | VW3M4C21 |
| Connector kit for controller supply and power stage supply (CN5), braking resistor (CN7) and motor (CN8); <br> suitable for LXM28•U2219U20, U30 and U45 | VW3M4C22 |
| Interface connector for CN1, 50-pin, 3 pieces | VW3M1C12 |
| Interface adapter for CN1, connector with 0.5 m (1.64 ft) cable and connection module with screw terminals <br> for DIN rail mounting | VW3M1C13 |
| Connector kit for motor; motor end plastic connector without holding brake | VW3M5D1A |
| Connector kit for motor; motor end plastic connector with holding brake | VW3M5D1F |
| Connector kit for motor; motor end MIL connector with holding brake, size 100 ... 130 | VW3M5D2A |
| Connector kit for motor; motor end MIL connector with holding brake, size 180 | VW3M5D2B |
| Connector kit for encoder; motor end flying leads; device end IEEE1394 connector | VW3M8D1A |
| Connector kit for encoder; motor end MIL connector; device end IEEE1394 connector | VW3M8D2A |

## External Mains Filters

| Description | Reference |  |
| :--- | :--- | :--- |
| Mains filter single-phase;115/230 Vac | 9 A | VW3A4420 |
|  | 16 A | VW3A4421 |
|  | 23 A | VW3A4426 |
| Mains filter three-phase; 208/400/480 Vac | 15 A | VW3A4422 |
|  | 25 A | VW3A4423 |
|  | 47 A | VW3A4424 |

## DC Bus Accessories

| Description |  | Reference |
| :--- | :--- | :--- |
| $2 \times 6 \mathrm{~mm}^{2}(2 \times$ AWG 10 $)$ | Pre-assembled, $0.1 \mathrm{~m}(0.33 \mathrm{ft}), 5$ pieces | VW3M7101R01 |
|  | Twisted Pair, shielded, $15 \mathrm{~m}(49.2 \mathrm{ft})$ | VW3M7102R150 |
| DC bus connector kit, connector housing, and crimp contacts for $3 \ldots 6 \mathrm{~mm}^{2}$ (AWG $\left.12 \ldots 10\right), 10$ pieces | VW3M2207 |  |

A crimping tool is required for the crimp contacts of the connector kit.
Manufacturer: Tyco Electronics, Heavy Head Hand Tool, Tool Pt. No 180250

## Application Nameplate

| Description | Reference |
| :--- | :--- |
| Application nameplate to be clipped onto the top of the drive, size $38.5 \mathrm{~mm}(1.52 \mathrm{in}) \times 13 \mathrm{~mm}(0.51 \mathrm{in}), 50$ <br> pieces | VW3M2501 |

## CANopen Connectors, Distributors, Terminating Resistors

| Description |  |  | Reference |
| :---: | :---: | :---: | :---: |
| CANopen terminating resistor, 120 Ohm, integrated in RJ45 connector |  |  | TCSCAR013M120 |
| CANopen cable | $2 \times \mathrm{RJ} 45$ | 0.3 m (0.98 ft) | VW3CANCARR03 |
|  |  | 1 m (3.28 ft) | VW3CANCARR1 |
|  | D9-SUB (female) with integrated terminating resistor to RJ45 | 1 m (3.28 ft) | VW3M3805R010 |
|  |  | 3 m (9.84 ft) | VW3M3805R030 |

## CANopen Cables with Open Cable Ends

Cables with open cable ends are suitable for connection of D-SUB connectors. Observe the cable cross section and the connection cross section of the required connector.

| Description |  |  | Reference |
| :---: | :---: | :---: | :---: |
| CANopen cable, [( 2 x AWG 22) + ( $2 \times$ AWG 24)], both cable ends open | LSZH standard cable (low-smoke, zero halogen, flameretardant, tested as per IEC 60332-1) | 50 m (164 ft) | TSXCANCA50 |
|  |  | 100 m (328 ft) | TSXCANCA100 |
|  |  | 300 m (984 ft) | TSXCANCA300 |
|  | flame-retardant, tested as per IEC 60332-2, UL certification | 50 m (164 ft) | TSXCANCB50 |
|  |  | 100 m (328 ft) | TSXCANCB100 |
|  |  | 300 m (984 ft) | TSXCANCB300 |
|  | flexible LSZH HD standard cable (low-smoke, zero halogen, flame-retardant, tested as per IEC 60332-1), for heavy-duty or flexible installation, oil-resistant | 50 m (164 ft) | TSXCANCD50 |
|  |  | 100 m (328 ft) | TSXCANCD100 |
|  |  | 300 m (984 ft) | TSXCANCD300 |

## Motor Cables

| Description | Reference |
| :---: | :---: |
| Motor cable without holding brake $1.5 \mathrm{~m}(4.92 \mathrm{ft}), 4 \times 0.82 \mathrm{~mm} 2$ (AWG 18) shielded; motor end plastic connector, other cable end flying leads | VW3M5D1AR15 |
| Motor cable without holding brake $3 \mathrm{~m}(9.84 \mathrm{ft}), 4 \times 0.82 \mathrm{~mm} 2$ (AWG 18) shielded; motor end plastic connector, other cable end flying leads | VW3M5D1AR30 |
| Motor cable without holding brake $5 \mathrm{~m}(16.4 \mathrm{ft}), 4 \times 0.82 \mathrm{~mm} 2$ (AWG 18) shielded; motor end plastic connector, other cable end flying leads | VW3M5D1AR50 |
| Motor cable with holding brake $3 \mathrm{~m}(9.84 \mathrm{ft}$ ), $6 \times 0.82 \mathrm{~mm} 2$ (AWG 18) shielded; motor end plastic connector, other cable end flying leads | VW3M5D1FR30 |
| Motor cable with holding brake $5 \mathrm{~m}(16.4 \mathrm{ft}), 6 \times 0.82 \mathrm{~mm} 2$ (AWG 18) shielded; motor end plastic connector, other cable end flying leads | VW3M5D1FR50 |
| Motor cable without holding brake $3 \mathrm{~m}(9.84 \mathrm{ft}), 4 \times 1.3 \mathrm{~mm} 2$ (AWG 16) shielded; motor end MIL connector, other cable end flying leads | VW3M5D2AR30 |
| Motor cable without holding brake $5 \mathrm{~m}(16.4 \mathrm{ft}), 4 \times 1.3 \mathrm{~mm} 2$ (AWG 16) shielded; motor end MIL connector, other cable end flying leads | VW3M5D2AR50 |
| Motor cable with holding brake $3 \mathrm{~m}(9.84 \mathrm{ft}), 6 \times 1.3 \mathrm{~mm} 2$ (AWG 16) shielded; motor end MIL connector, other cable end flying leads | VW3M5D2FR30 |
| Motor cable with holding brake $5 \mathrm{~m}(16.4 \mathrm{ft}), 6 \times 1.3 \mathrm{~mm} 2$ (AWG 16) shielded; motor end MIL connector, other cable end flying leads | VW3M5D2FR50 |
| Motor cable without holding brake $3 \mathrm{~m}(9.84 \mathrm{ft}), 4 \times 3.3 \mathrm{~mm} 2$ (AWG 12) shielded; motor end MIL connector, other cable end flying leads | VW3M5D4AR30 |
| Motor cable without holding brake $5 \mathrm{~m}(16.4 \mathrm{ft}), 4 \times 3.3 \mathrm{~mm} 2$ (AWG 12) shielded; motor end MIL connector, other cable end flying leads | VW3M5D4AR50 |
| Motor cable with holding brake $3 \mathrm{~m}(9.84 \mathrm{ft}), 6 \times 3.3 \mathrm{~mm} 2$ (AWG 12) shielded; motor end MIL connector, other cable end flying leads | VW3M5D4FR30 |
| Motor cable with holding brake 5 m ( 16.4 ft ), $6 \times 3.3 \mathrm{~mm} 2$ (AWG 12) shielded; motor end MIL connector, other cable end flying leads | VW3M5D4FR50 |
| Motor cable without holding brake $3 \mathrm{~m}(9.84 \mathrm{ft}), 4 \times 6 \mathrm{~mm} 2$ (AWG 10) shielded; motor end MIL connector, other cable end flying leads | VW3M5D6AR30 |
| Motor cable without holding brake $5 \mathrm{~m}(16.4 \mathrm{ft}), 4 \times 6 \mathrm{~mm} 2$ (AWG 10) shielded; motor end MIL connector, other cable end flying leads | VW3M5D6AR50 |
| Motor cable with holding brake 3 m ( 9.84 ft ), $6 \times 6 \mathrm{~mm} 2$ (AWG 10) shielded; motor end MIL connector, other cable end flying leads | VW3M5D6FR30 |
| Motor cable with holding brake $5 \mathrm{~m}(16.4 \mathrm{ft}), 6 \times 6 \mathrm{~mm} 2$ (AWG 10) shielded; motor end MIL connector, other cable end flying leads | VW3M5D6FR50 |

## Encoder Cables and Accessories

| Description |  |  | Reference |
| :---: | :---: | :---: | :---: |
| Encoder cable, $10 \times 0.13 \mathrm{~mm}^{2}$ (AWG 26) shielded | Motor end and device end plastic connector | 1.5 m (4.92 ft) | VW3M8D1AR15 |
|  |  | 3 m (9.84 ft) | VW3M8D1AR30 |
|  |  | 5 m (16.4 ft) | VW3M8D1AR50 |
|  | Motor end MIL connector, other cable end plastic connector | 3 m (9.84 ft) | VW3M8D2AR30 |
|  |  | $5 \mathrm{~m}(16.4 \mathrm{ft})$ | VW3M8D2AR50 |
| Battery compartment for multi-turn encoder, cable 0.45 m (1.47 ft) |  |  | VW3M8BATC |
| Battery 3.6 Vdc for multi-turn encoder |  |  | VW3M9BATT |

NOTE: The battery compartment and the battery are not provided with motor equipped with a multi-turn encoder and must be ordered separately.

## Signal Cables

| Description | Reference |  |
| :--- | :--- | :--- |
| Signal cable for signal interface CN1, device end 50-pin connector, other cable end flying <br> leads | $1 \mathrm{~m} \mathrm{(3.28} \mathrm{ft)}$ | VW3M1C10R10 |
|  | $2 \mathrm{~m} \mathrm{(6.56} \mathrm{ft)}$ | VW3M1C10R20 |
|  | $3 \mathrm{~m}(9.84 \mathrm{ft})$ | VW3M1C10R30 |

## Signal Cable for Safety Function STO

| Description | Reference |  |
| :--- | :--- | :--- |
| Signal cable for safety function STO CN9 | $1 \mathrm{~m}(3.28 \mathrm{ft})$ | VW3M1C20R10 |
|  | $2 \mathrm{~m}(6.56 \mathrm{ft})$ | VW3M1C20R20 |
| $(9.84 \mathrm{ft})$ | VW3M1C20R30 |  |

## External Braking Resistors and Holding Brake Controller

| Description |  |  |  | Reference |
| :---: | :---: | :---: | :---: | :---: |
| Holding brake controller HBC with automatic voltage reduction; $24 \mathrm{~V}-1.6 \mathrm{~A}$ |  |  |  | VW3M3103 |
| Braking resistor IP 65 <br> connection cable $2.1 \mathrm{~mm}^{2}$ (AWG 14) | $10 \Omega$ | Maximum continuous power 400 W | 0.75 m (2.46 ft) | VW3A7601R07 |
|  |  |  | 2 m (6.56 ft) | VW3A7601R20 |
|  |  |  | 3 m (9.84 ft) | VW3A7601R30 |
| Braking resistor IP 65, UL <br> connection cable $2.1 \mathrm{~mm}^{2}$ (AWG 14) | $27 \Omega$ | Maximum continuous power 100 W | 0.75 m (2.46 ft) | VW3A7602R07 |
|  |  |  | 2 m (6.56 ft) | VW3A7602R20 |
|  |  |  | 3 m (9.84 ft) | VW3A7602R30 |
|  |  | Maximum continuous power 200 W | 0.75 m (2.46 ft) | VW3A7603R07 |
|  |  |  | 2 m (6.56 ft) | VW3A7603R20 |
|  |  |  | 3 m (9.84 ft) | VW3A7603R30 |

| Description |  |  |  | Reference |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Maximum continuous power 400 W | $0.75 \mathrm{~m}(2.46 \mathrm{ft})$ | VW3A7604R07 |
|  |  |  | 2 m (6.56 ft) | VW3A7604R20 |
|  |  |  | 3 m (9.84 ft) | VW3A7604R30 |
|  | $72 \Omega$ | Maximum continuous power 200 W | $0.75 \mathrm{~m}(2.46 \mathrm{ft})$ | VW3A7606R07 |
|  |  |  | 2 m (6.56 ft) | VW3A7606R20 |
|  |  |  | 3 m (9.84 ft) | VW3A7606R30 |
|  |  | Maximum continuous power 400 W | $0.75 \mathrm{~m}(2.46 \mathrm{ft})$ | VW3A7607R07 |
|  |  |  | 2 m (6.56 ft) | VW3A7607R20 |
|  |  |  | 3 m (9.84 ft) | VW3A7607R30 |
| Braking resistor IP20, UL screw terminals M6 | $16 \Omega$ | Maximum continuous power 956 W | - | VW3A7733 |
|  | $10 \Omega$ |  |  | VW3A7734 |

## Circuit Breakers

| Description | Reference |
| :--- | :--- |
| Circuit breaker - thermal magnetic $-4 \ldots 6.3 \mathrm{~A}$ - screw terminals | GV2P10 |
| Circuit breaker - thermal magnetic $-6 \ldots 10 \mathrm{~A}$ - screw terminals | GV2P14 |
| Circuit breaker - thermal magnetic $-9 \ldots 14 \mathrm{~A}$ - screw terminals | GV2P16 |
| Circuit breaker - thermal magnetic $-13 \ldots 18 \mathrm{~A}$ - screw terminals | GV2P20 |
| Circuit breaker - thermal magnetic $-17 \ldots 23 \mathrm{~A}$ - screw terminals | GV2P21 |
| Circuit breaker - thermal magnetic $-20 \ldots 25 \mathrm{~A}$ - screw terminals | GV2P22 |
| Circuit breaker - thermal magnetic $-24 \ldots 32 \mathrm{~A}$ - screw terminals | GV2P32 |

## Motor Protection Switches and Power Contactors

| Drive | Nominal power | Order no. motor <br> protection switch | Rated continuous current <br> motor protection switch | Order no. power <br> contactor |

This chapter contains information on the application of the Servo Drive system for the engineering phase.

## Electromagnetic Compatibility (EMC)

## Electromagnetic Compatibility (EMC)

Signal interference can cause unexpected responses of the drive and of other equipment in the vicinity of the drive.

| A WARNING |
| :--- |
| SIGNAL AND EQUIPMENT INTERFERENCE |
| - Only operate the drive with the specified external mains filter. |
| - Install the wiring in accordance with the EMC requirements described in the |
| present document. |
| - Verify compliance with the EMC requirements described in the present |
| document. |
| - Verify compliance with all EMC regulations and requirements applicable in |
| the country in which the product is to be operated and with all EMC |
| regulations and requirements applicable at the installation site. |
| Failure to follow these instructions can result in death, serious injury, or |
| equipment damage. |

## Limit Values

This product meets the EMC requirements according to the standard IEC 61800-3 if the measures described in this manual, and in particular the installation of the mains filters, are implemented during installation.

## AWARNING

## ELECTROMAGNETIC DISTURBANCES OF SIGNALS AND DEVICES

Use proper EMC shielding techniques to help prevent unintended device operation in accordance with the standard IEC 61800-3.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

These types of devices are not intended to be used on a low-voltage public network which supplies domestic premises. Radio frequency interference is expected if used in such a network.

| AWARNING |
| :--- | :--- |
| RADIO INTERFERENCE |
| Do not use these products in domestic electrical networks. |
| Failure to follow these instructions can result in death, serious injury, or <br> equipment damage. |

As a system provider, you may have to include this information in the documentation to your customer.

## Equipotential Bonding Conductors

Potential differences can result in excessive currents on the cable shields. Use equipotential bonding conductors to reduce currents on the cable shields.

| AWARNING |
| :--- |
| UNINTENDED EQUIPMENT OPERATION |
| - Ground cable shields for all fast I/O, analog I/O, and communication signals |
| at a single point. 1) |
| - Route communications and I/O cables separately from power cables. |
| Failure to follow these instructions can result in death, serious injury, or <br> equipment damage. |

1) Multipoint grounding is permissible if connections are made to an equipotential ground plane dimensioned to help avoid cable shield damage in the event of power system short-circuit currents.

The equipotential bonding conductors must be rated for the maximum current. The following conductors cross sections can be used:

- $16 \mathrm{~mm}^{2}$ (AWG 4) for equipotential bonding conductors up to a length of 200 m (656 ft)
- $20 \mathrm{~mm}^{2}$ (AWG 4) for equipotential bonding conductors with a length of more than 200 m ( 656 ft )

## EMC Requirements for the Control Cabinet

| EMC measures | Objective |
| :--- | :--- |
| Use mounting plates with good electrical <br> conductivity, connect large surface areas of <br> metal parts, remove paint from contact areas. | Good conductivity due to large surface contact. |
| Ground the control cabinet, the control cabinet <br> door, and the mounting plate with ground straps <br> or ground wires. The conductor cross section <br> must be at least 10 mm² (AWG 6). | Reduces emissions. |
| Install switching devices such as power <br> contactors, relays, or solenoid valves with <br> interference suppression units or arc <br> suppressors (for example, diodes, varistors, RC <br> circuits). | Reduces mutual interference |
| Do not install power components and control <br> components adjacent to one another. | Reduces mutual interference |

## Additional Measures for EMC Improvement

Depending on the application, the following measures can improve the EMCdependent values:

| EMC measures | Objective |
| :--- | :--- |
| Use mains reactors. | Reduces mains harmonics, prolongs product <br> service life. |
| Mount in a closed control cabinet with shielded <br> attenuation of radiated interference | Improves the EMC limit values. |

## External Mains Filters

## Filter/Drive Combinations

You can obtain EMC conformance by following the wiring standards and practices in the present document and installing, for each drive, the following filter/drive combination:

For further information, refer to Electromagnetic compatibility (EMC), page 77.

| LXM28A | Mains filter for single-phase <br> connection | Mains filter for three-phase <br> connection |
| :--- | :--- | :--- |
| UA5 $=0.05 \mathrm{~kW}$ | VW3A4420 | VW3A4422 |
| U01 $=0.1 \mathrm{~kW}$ |  |  |
| U04 $=0.2 \mathrm{~kW}$ |  |  |
| U07 $=0.4 \mathrm{~kW}$ |  |  |
| U10 $=1 \mathrm{~kW}$ |  | VW3A4422 |
| U15 $=1.5 \mathrm{~kW}$ | VW3A4421 | VW3A4422 |
| U20 $=2 \mathrm{~kW}$ | - | VW3A4422 |
| U30 $=3 \mathrm{~kW}$ | - | VW3A4423 |
| U45 $=4.5 \mathrm{~kW}$ | - |  |

If you use mains filters of other manufacturers, these mains filters must have the same technical data as specified mains filters.

## Emission

The specified limit values are complied with if the external mains filters available as accessories are used.

The following limit values for emission are complied with if the installation is EMCcompliant and if the cables offered as accessories are used.

| Lexium 28A | Category |
| :--- | :--- |
| Conducted interference | C3 |
| Radiated emission | C3 |

## Cables

## Cables

## Suitability of the Cables

Cables must not be twisted, stretched, crushed, or bent. Use only cables that comply with the cable specification. Consider the following in determining suitability of the cables:

- Suitable for drag chain applications
- Temperature range
- Chemical resistance
- Outdoor installation
- Underground installation

## Equipotential Bonding Conductors

Potential differences can result in excessive currents on the cable shields. Use equipotential bonding conductors to reduce currents on the cable shields

| AWARN/NG |
| :--- |
| UNINTENDED EQUIPMENT OPERATION |
| - Ground cable shields for all fast I/O, analog I/O, and communication signals |
| at a single point. 1) |
| - Route communications and I/O cables separately from power cables. |
| Failure to follow these instructions can result in death, serious injury, or |
| equipment damage. |

1) Multipoint grounding is permissible if connections are made to an equipotential ground plane dimensioned to help avoid cable shield damage in the event of power system short-circuit currents.

The equipotential bonding conductor must be rated for the maximum current. The following conductor cross sections can be used:

- $16 \mathrm{~mm}^{2}$ (AWG 4) for equipotential bonding conductors up to a length of 200 m ( 656 ft )
- $20 \mathrm{~mm}^{2}$ (AWG 4) for equipotential bonding conductors with a length of more than 200 m ( 656 ft )

## Conductor Cross Sections According to Method of Installation

The following sections describe the conductor cross sections for two methods of installation:

- Method of installation B2:

Cables in conduits or cable trunking systems

- Method of installation E:

Cables on open cable trays

| Cross section in $\mathbf{m m}^{\mathbf{2}}$ (AWG) | Current-carrying capacity <br> with method of installation <br> B2 in A(2) | Current carrying capacity <br> with method of installation E <br> in $\mathbf{A}^{(2)}$ |
| :--- | :--- | :--- |
| $0.75(18)$ | 8.5 | 10.4 |
| $1(16)$ | 10.1 | 12.4 |

| $(1)$ | See chapter "Accessories and spare parts", page 71 for available <br> cables. |  |
| $(2)$ | Values as per IEC 60204-1 for continuous operation, copper <br> conductors, and ambient air temperature $40^{\circ} \mathrm{C}\left(104{ }^{\circ} \mathrm{F}\right) ;$ see IEC <br> $60204-1$ for additional information. |  |

Note the derating factors for grouping of cables and correction factors for other ambient conditions (IEC 60204-1).

The conductors must have a sufficiently large cross section so that the upstream fuse can trip.

In the case of longer cables, it may be necessary to use a greater conductor cross section to reduce the energy losses.

For conformance to UL requirements, use $75^{\circ} \mathrm{C}\left(167^{\circ} \mathrm{F}\right)$ copper conductors.

## Residual Current Device

## Residual Current Device

Direct current can be introduced in the protective ground conductor of this drive. If a residual current device (RCD / GFCI) or a residual current monitor (RCM) is used for protection against direct or indirect contact, the following specific types must be used:

## A WARNING

## DIRECT CURRENT CAN BE INTRODUCED INTO THE PROTECTIVE GROUND CONDUCTOR

- Use a Type A Residual Current Device (RCD / GFCI) or a Residual Current Monitor (RCM) for single-phase drives connected to a phase and to the neutral conductor.
- Use a Type B Residual Current Device (RCD / GFCI) or a Residual Current Monitor (RCM) that has approval for use with frequency inverters and is sensitive to all types of current for three-phase drives and for single-phase drives not connected to a phase and the neutral conductor.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

## Conditions for Use of Residual Current Device

- The drive has an increased leakage current at the moment power is applied. Use residual current devices with a response delay.
- High-frequency currents must be filtered.

## Common DC Bus

## Common DC Bus

## Function Principle

The DC buses of several devices can be connected so that energy can be used efficiently. If on device decelerates, a different device connected to the common DC bus can use the generated braking energy. Without a common DC bus, the braking energy would be converted to heat by the braking resistor while the other device would have to be supplied with energy from mains.

Another advantage of having a common DC bus is that several devices can share one external braking resistor. The number of the individual external braking resistors can be reduced to a single braking resistor if the braking resistor is properly rated.

This and other important information can be found in the Common DC bus Application Note for the drive. If you wish to take advantage of DC bus sharing, you must first consult the Common DC bus Application Note for important safetyrelated information.

The requirements and limit values for parallel connection of multiple devices via the DC bus are described in the Common DC bus Application Note for the drive that can be found on www.se.com. If there are any issues or questions related to obtaining the Common DC bus Application Note, consult your local SchneiderElectric representative.

## Safety Function STO ("Safe Torque Off")

For information on using the IEC 61508 standard, refer to Functional Safety, page 84.

## Process Minimizing Risks Associated with the Machine

## General

The goal of designing machines safely is to protect people. The risk associated with machines with electrically controlled drives comes chiefly from moving machine parts and electricity itself.

Only you, the user, machine builder, or system integrator can be aware of all the conditions and factors realized in the design of your application for the machine. Therefore, only you can determine the automation equipment and the related safeties and interlocks which can be properly used, and validate such usage.

## Hazard and Risk Analysis

Based on the system configuration and utilization, a hazard and risk analysis must be carried out for the system (for example, according to ISO 12100 or ISO 138491). The results of this analysis must be considered when designing the machine, and subsequently applying safety-related equipment and safety-related functions. The results of your analysis may deviate from any application examples contained in the present or related documentation. For example, additional safety components may be required. In principle, the results from the hazard and risk analysis have priority.

## A WARNING

## NON-CONFORMANCE TO SAFETY FUNCTION REQUIREMENTS

- Specify the requirements and/or measures to be implemented in the risk analysis you perform.
- Verify that your safety-related application complies to applicable safety regulations and standards.
- Make certain that appropriate procedures and measures (according to applicable sector standards) have been established to help avoid hazardous situations when operating the machine.
- Use appropriate safety interlocks where personnel and/or equipment hazards exist.
- Validate the overall safety-related function and thoroughly test the application.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

The ISO 13849-1 Safety of machinery - Safety-related parts of control systems Part 1: General principle for design describes an iterative process for the selection and design of safety-related parts of controllers to reduce the risk to the machine to a reasonable degree:

To perform risk assessment and risk minimization according to ISO 12100, proceed as follows:

1. Defining the boundary of the machine.
2. Identifying risks associated with the machine.
3. Assessing risks.
4. Evaluating risks.
5. Minimizing risks by:

- Intrinsically safe design
- Protective devices
- User information (see ISO 12100)

6. Designing safety-related controller parts (SRP/CS, Safety-Related Parts of the Control System) in an interactive process.
To design the safety-related controller parts in an interactive process, proceed as follows:

| Step | Action |
| :--- | :--- |
| 1 | Identify necessary safety functions that are executed via SRP/CS (Safety-Related Parts <br> of the Control System). |
| 2 | Determine required properties for each safety function. |
| 3 | Determine the required performance level PLr. |
| 4 | Identify safety-related parts executing the safety function. |
| 5 | Determine the performance level PL of the afore-mentioned safety-related parts. |

| Step | Action |
| :--- | :--- |
| 6 | Verify the performance level PL for the safety function $\left(P L \geq P L_{r}\right)$. |
| 7 | Verify if all requirements have been met (validation). |

Additional information is available on www.se.com.

## Functional Safety

## Overview

Automation and safety engineering are closely related. Engineering, installation, and operation of complex automation solutions are greatly simplified by integrated safety-related functions and modules.

Usually, the safety-related engineering requirements depend on the application. The level of the requirements results from, among other things, the risk, and the hazard potential arising from the specific application and from the applicable standards and regulations.

## IEC 61508 and IEC 61800-5-2

The standard IEC 61508 "Functional safety of electrical/electronic/programmable electronic safety-related systems" defines the safety-related aspects of systems. Instead of a single functional unit of a safety-related system, the standard treats all elements of a function chain as a unit. These elements must meet the requirements of the specific safety integrity level as a whole.

The standard IEC 61800-5-2 "Adjustable speed electrical power drive systems Safety requirements - Functional" is a product standard that defines the safetyrelated requirements regarding drives. Among other things, this standard defines the safety functions for drives.

## Safety Integrity Level (SIL)

The standard IEC 61508 defines 4 safety integrity levels (Safety Integrity Level (SIL)). Safety integrity level SIL1 is the lowest level, safety integrity level SIL4 is the highest level. The safety integrity level required for a given application is determined on the basis of the hazard potential resulting from the hazard and risk analysis. This is used to decide whether the relevant function chain is to be considered as a safety-related function chain and which hazard potential it must cover.

## Average Frequency of a Dangerous Failure Per Hour (PFH)

To maintain the function of the safety-related system, the IEC 61508 standard requires various levels of measures for avoiding and controlling faults, depending on the required safety integrity level (Safety Integrity Level (SIL)). All components must be subjected to a probability assessment to evaluate the effectiveness of the measures implemented for controlling faults. This assessment determines the probability of a dangerous failure per hour PFH (Average Frequency of a Dangerous Failure per Hour (PFH)) for a safety-related system. This is the frequency per hour with which a safety-related system fails in a hazardous manner so that it can no longer perform its function correctly. Depending on the SIL, the average frequency of a dangerous failure per hour must not exceed certain values for the entire safety-related system. The individual PFH values of a function chain are added. The result must not exceed the maximum value specified in the standard.

| SIL | PFH at high demand or continuous demand |
| :--- | :--- |
| 4 | $\geq 10^{-9} \ldots<10^{-8}$ |
| 3 | $\geq 10^{-8} \ldots<10^{-7}$ |
| 2 | $\geq 10^{-7} \ldots<10^{-6}$ |
| 1 | $\geq 10^{-6} \ldots<10^{-5}$ |

## Hardware Fault Tolerance (HFT) and Safe Failure Fraction (SFF)

Depending on the safety integrity level (Safety Integrity Level (SIL)) for the safetyrelated system, the IEC 61508 standard requires a specific hardware fault tolerance (Hardware Fault Tolerance (HFT)) in connection with a specific safe failure fraction (Safe Failure Fraction (SFF)). The hardware fault tolerance is the ability of a safety-related system to execute the required function even if one or more hardware faults are present. The safe failure fraction of a safety-related system is defined as the ratio of the rate of safe failures to the total failure rate of the safety-related system. As per IEC 61508, the maximum achievable safety integrity level of a safety-related system is partly determined by the hardware fault tolerance and the safe failure fraction of the safety-related system.

IEC 61800-5-2 distinguishes two types of subsystems (type A subsystem, type B subsystem). These types are specified on the basis of criteria which the standard defines for the safety-related components.

| SFF | HFT type A subsystem |  | HFT type B subsystem |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | $\mathbf{0}$ | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{0}$ | $\mathbf{1}$ | $\mathbf{2}$ |
| $<60 \%$ | SIL1 | SIL2 | SIL3 | - | SIL1 | SIL2 |
| $60 \ldots<90 \%$ | SIL2 | SIL3 | SIL4 | SIL1 | SIL2 | SIL3 |
| $90 \ldots<99 \%$ | SIL3 | SIL4 | SIL4 | SIL2 | SIL3 | SIL4 |
| $\geq 99 \%$ | SIL3 | SIL4 | SIL4 | SIL3 | SIL4 | SIL4 |

## Fault Avoidance Measures

Systematic errors in the specifications, in the hardware and the software, incorrect usage and maintenance of the safety-related system must be avoided to the maximum degree possible. To meet these requirements, IEC 61508 specifies a number of measures for fault avoidance that must be implemented depending on the required safety integrity level (Safety Integrity Level (SIL)). These measures for fault avoidance must cover the entire life cycle of the safety-related system, i.e. from design to decommissioning of the system.

## Data for Maintenance Plan and the Calculations for the Safety Function

The safety function must be tested at regular intervals. The interval depends on the hazard and risk analysis of the total system. The minimum interval is 1 year (high demand mode as per IEC 61508).

Use the following data of the safety function STO for your maintenance plan and the calculations for the safety function:

| Description | Unit | Value |
| :--- | :--- | :--- |
| Lifetime of the safety function STO (IEC 61508)(1) | Years | 20 |
| SFF (IEC 61508) <br> Safe Failure Fraction | $\%$ | 98.9 |
| Safety integrity level | - | SIL CL 2 |

| Description |  | Unit | Value |
| :---: | :---: | :---: | :---: |
| IEC 61508 <br> IEC 62061 <br> IEC 61800-5-2 |  |  |  |
| PFH (IEC 61508) <br> Probability of Dangerous Hardware Failure per Hour |  | 1/h | $\begin{aligned} & \text { STO_A(2): } 1.7 \times 10^{-9} \\ & \text { STO_B }{ }^{(3): ~} 1.5 \times 10^{-9} \end{aligned}$ |
| PFD ${ }_{\text {avg }}$ (IEC 61508) <br> Probability of Failure on Demand, calculated as one demand per year |  | - | $\begin{aligned} & \text { STO_A }^{(2)}: 1.5 \times 10^{-4} \\ & \text { STO_B }^{(3)}: 1.3 \times 10^{-4} \end{aligned}$ |
| PL (ISO 13849-1) <br> Performance Level |  | - | d (category 3) |
| MTTF $_{\text {d }}$ (ISO 13849-1) <br> Mean Time to Dangerous Failure |  | Years | $\begin{aligned} & \text { STO_A(2): } 66757 \\ & \text { STO_B }{ }^{(3): ~} 78457 \end{aligned}$ |
| DCavg (ISO 13849-1) <br> Diagnostic Coverage |  | \% | $\geq 90$ |
| (1) | See chapter Lifetime Safety Function STO, page 380 |  |  |
| (2) | STO_A: LXM28AUA5,LXM28AU01, LXM28AU02, LXM28AU04, LXM28AU07, LXM28AU10, LXM2̄8AU15, LXM28AU20 |  |  |
| (3) | STO_B: LXM28AU30, LXM28AU45 |  |  |

If two non-adjacent IGBTs have a short circuit, a movement of a maximum of 120 degrees (electrical) can occur even if the safety function STO is active. Include in your risk analysis the probability of IGBT short circuits, and make a determination whether it is acceptable as it relates to your application.

| AWARNING |
| :--- |
| UNINTENTIONAL MOVEMENT DURING STO FUNCTION |
| Use appropriate safety interlocks (such as a service brake) where personnel |
| and/or equipment hazards exist. |
| Failure to follow these instructions can result in death, serious injury, or <br> equipment damage. |

The probability of such a condition is $1.5 \times 10^{-15}$ per hour (without common cause error). Include this in your calculations for the safety function.

Contact your local sales office for additional data, if required.

## Definitions

## Integrated Safety-Related Function "Safe Torque Off" STO

The integrated safety-related function STO (IEC 61800-5-2) allows for a category 0 stop as per IEC 60204-1 without external power contactors. It is not necessary to interrupt the supply voltage for a category 0 stop. This reduces the system costs and the response times.

## Category 0 Stop (IEC 60204-1)

In stop category 0 (Safe Torque Off, STO), the drive coasts to a stop (provided there are no external forces operating to the contrary). The safety-related function

STO is intended to help prevent an unintended start-up, not stop a motor, and therefore corresponds to an unassisted stop in accordance with IEC 60204-1.

In circumstances where external influences are present, the coast down time depends on physical properties of the components used (such as weight, torque, friction, etc.), and additional measures such as external safety-related brakes may be necessary to help prevent any hazard from materializing. That is to say, if this means a hazard to your personnel or equipment, you must take appropriate measures.

## A WARNING

## UNINTENDED EQUIPMENT OPERATION

- Make certain that no hazards can arise for persons or material during the coast down period of the axis/machine.
- Do not enter the zone of operation during the coast down period.
- Ensure that no other persons can access the zone of operation during the coast down period.
- Use appropriate safety interlocks where personnel and/or equipment hazards exist.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

## Category 1 Stop (IEC 60204-1)

For stops of category 1 (Safe Stop 1, SS1), you can initiate a controlled stop via the control system, or through the use of specific functional safety-related devices. A Category 1 Stop is a controlled stop with power available to the machine actuators to achieve the stop.

The controlled stop by the control/safety-related system is not safety-relevant, nor monitored, and does not perform as defined in the case of a power outage or if an error is detected. This has to be implemented by means of an external safetyrelated switching device with safety-related delay.

## Function

The safety function STO integrated into the product can be used to implement an "EMERGENCY STOP" (IEC 60204-1) for category 0 stops. With an additional, approved EMERGENCY STOP safety relay module, it is also possible to implement category 1 stops.

The safety function STO switches the supply voltage of the IGBT drivers so that PWM signals cannot switch the IGBTs. The following diagram illustrates the concept:

## Requirements for Using the Safety Function

The safety function STO (Safe Torque Off) does not remove power from the DC bus. The safety function STO only removes power to the motor. The DC bus voltage and the mains voltage to the drive are still present.

## AADANGER

## ELECTRIC SHOCK

- Do not use the safety function STO for any other purposes than its intended function.
- Use an appropriate switch, that is not part of the circuit of the safety function STO, to disconnect the drive from the mains power.

Failure to follow these instructions will result in death or serious injury.

After the safety function STO is triggered, the motor can no longer generate torque and coasts down without braking in the case of motors without a holding brake. In the case of motors with holding brake, the holding brake is not a safetyrelated function, and may not be sufficient to hold the axis at a standstill.

#### Abstract

\section*{A WARNING}

\section*{UNINTENDED EQUIPMENT OPERATION}

Install a dedicated service brake if coasting does not meet the deceleration requirements of your application.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

The safety function STO is factory-deactivated by means of the jumper for CN9. If you want to use the safety function STO, you must remove the jumper for CN9. You may only use the safety function STO with an external PELV 24 Vdc power supply unit.

## AWARNING <br> UNINTENDED EQUIPMENT OPERATION

- Remove the jumpers connected to the STO power connector (CN9) only if you intend to use the STO safety-related function for your application.
- Use only an external PELV 24 Vdc power supply unit when applying the safety-related STO function.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

For additional information on deactivating the safety function STO, refer to Connection STO (CN9), page 136.

## Holding Brake and Safety Function STO

When the safety function STO is triggered, the power stage is immediately disabled. In the case of vertical axes or external forces acting on the load, you may have to take additional measures to bring the load to a standstill and to keep it at a standstill when the safety function STO is used, for example, by using a service brake.

## AWARNING

## FALLING LOAD

Ensure that all loads come to a secure standstill when the safety function STO is used.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

If the suspension of hanging / pulling loads is a safety objective for the machine, then you can only achieve this objective by using an appropriate external brake as a safety-related measure.

## AWARNING

## UNINTENDED AXIS MOVEMENT

- Do not use the internal holding brake as a safety-related measure.
- Only use certified external brakes as safety-related measures.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

NOTE: The drive does not provide its own safety-related output to connect an external brake to use as a safety-related measure.

To help avoid unintended restart of the motor after restoration of power (for example, after power outage), the parameter $\mathrm{P} 2-68$ must be set to " $X=0$ ". A controlled restart must be managed externally from the drive, note that the external management itself must not trigger an unintended restart.

## A WARNING <br> UNINTENDED EQUIPMENT OPERATION <br> Set parameter P2-68 setting $X$ to 0 (zero) if the automatic enabling of the power stage presents hazards in your application. <br> Failure to follow these instructions can result in death, serious injury, or equipment damage.

## Degree of Protection When the Safety Function Is Used

You must ensure that conductive substances cannot get into the product (pollution degree 2). Conductive substances may cause the safety function to become inoperative.

| AWARNING |
| :--- |
| INOPERABLE SAFETY FUNCTION |
| Ensure that conductive substances (water, contaminated or impregnated oils, |
| metal shavings, etc.) cannot get into the drive. |
| Failure to follow these instructions can result in death, serious injury, or |
| equipment damage. |

## Protected Cable Installation

If short circuits or other wiring errors such as a cross fault between STO inputs can be expected in connection with safety-related signals, and if these short circuits or other wiring errors are not detected by upstream devices, protected cable installation as per ISO 13849-2 is required.

ISO 13849-2 describes protected cable installation for cables for safety-related signals. The cables for the safety function STO must be protected against external voltage. A shield with ground connection helps to keep external voltage away from the cables for the signals of the safety function STO.

- Use shielded cables for the signals of the safety function STO.
- Do not use the cable for the signals of the safety function STO for other signals.
- Connect one end of the shield.
- When daisychaining the signals of the safety function STO, connect the shield to the equipotential grounding plane associated to the drives.

## Hazard and Risk Analysis

You must conduct, or ensure that your OEM, system integrator, or anyone responsible for the development of the application containing the equipment indicated in the present document conducts a hazard and risk analysis of the entire system. The results of the analysis must be taken into account in the application of the safety function.

The type of circuit resulting from the analysis may differ from any application examples provided in the present document or any supplementary documents
concerning this equipment. Additional safety components may be required. The results of the hazard and risk analysis have priority over any other design considerations. Pay particular attention in conforming to any safety information, different electrical requirements, and normative standards that would apply to your system.

## AWARNING

## UNINTENDED EQUIPMENT OPERATION

- Perform a hazard and risk analysis to determine the appropriate safety integrity level, and any other safety requirements, for your specific application based on all the applicable standards.
- Ensure that the hazard and risk analysis is conducted and respected according to EN/ISO 12100 during the design of your machine.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

## Application Examples STO

## Example of Category 0 Stop

Use without EMERGENCY STOP safety relay module, category 0 stop.

1 If the maximum output current of the 24 V power supply exceeds 4 A , a 4 A slow-blow fuse is required.

2 Grounded shielded cable for wiring out of the control cabinet.
For further information on STO wiring, refer to Connection of STO (CN9), page 136

NOTE: The internal DC power supply of the drive is only to be used to deactivate the safety function STO via the jumper supplied with the drive.

## A WARNING <br> UNINTENDED EQUIPMENT OPERATION <br> - Remove the jumpers connected to the STO power connector (CN9) only if you intend to use the STO safety-related function for your application. <br> - Use only an external PELV 24 Vdc power supply unit when applying the safety-related STO function. <br> Failure to follow these instructions can result in death, serious injury, or equipment damage.

In this example, when an EMERGENCY STOP is activated, it leads to a category 0 stop:

The power stage is immediately disabled via the inputs STO_24V and STO_0V of the safety function STO. Power can no longer be supplied to the motor. If the motor is not already at a standstill when the STO is triggered, it decelerates under the salient physical forces (gravity, friction, etc.) active at the time until presumably coasting to a standstill.

## AWARNING <br> UNINTENDED EQUIPMENT OPERATION <br> Install a dedicated service brake if coasting does not meet the deceleration requirements of your application. <br> Failure to follow these instructions can result in death, serious injury, or equipment damage.

If the coasting of the motor and its potential load is unsatisfactory as determined by your risk and hazard analysis, an external service brake may also be required. Refer to Holding Brake and Safety Function STO, page 89.

## Example of Category 1 Stop

Use with EMERGENCY STOP safety relay module, category 1 stop. Example of category 1 stop with external Preventa XPS-AV EMERGENCY STOP safety relay module.

1 If the maximum output current of the 24 V power supply exceeds 4 A , a 4 A slow-blow fuse is required.
For more information on STO wiring, see chapter Connection of STO (CN9), page 136

In this example, when an EMERGENCY STOP is activated, it leads to a category 1 stop:

- The safety relay module requests an immediate stop (undelayed) of the drive via the logic controller (Halt). The logic controller takes the configured or programmed action to instruct the drive to make a decelerated stop.
- The power stage is disabled via the inputs STO_24V and STO_OV of the safety function STO after the delay time set in the EMERGENCY STOP safety relay module has elapsed. Power can no longer be supplied to the motor. If the motor is not already at a standstill when safety function STO is triggered when the delay time has elapsed, it decelerates under the salient physical forces (gravity, friction, etc.) active at the time until presumably coasting to a standstill.
If the coasting of the motor and its potential load is unsatisfactory as determined by your risk and hazard analysis, an external service brake may also be required. Refer to Holding Brake and Safety Function STO, page 89.

## A WARNING

## UNINTENDED EQUIPMENT OPERATION

Install a dedicated service brake if coasting does not meet the deceleration requirements of your application.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

NOTE: The specified minimum current and the permissible maximum current of the relay outputs of the EMERGENCY STOP safety relay module must be respected.

## Rating the Braking Resistor

## Rating the Braking Resistor

Braking resistors are required for dynamic applications. During deceleration, the kinetic energy is transformed into electrical energy in the motor. The electrical energy increases the DC bus voltage. The braking resistor is activated when the defined threshold value is exceeded. The braking resistor transforms electrical energy into heat. If highly dynamic deceleration is required, the braking resistor must be well adapted to the system. External driving forces acting on the motor can cause high currents to be regenerated and supplied back to the drive.

## ADANGER

FIRE DUE TO EXTERNAL DRIVING FORCES ACTING ON MOTOR
Verify that no external forces can act on the motor that will exceeded the capacity of the braking resistor.
Failure to follow these instructions will result in death or serious injury.

An insufficiently rated braking resistor can cause overvoltage on the DC bus. Overvoltage on the DC bus causes the power stage to be disabled. The motor is no longer actively decelerated.

## AWARNING <br> UNINTENDED EQUIPMENT OPERATION <br> - Verify that the braking resistor has a sufficient rating by performing a test run under maximum load conditions. <br> - Verify that the parameter settings for the braking resistor are correct. <br> Failure to follow these instructions can result in death, serious injury, or equipment damage.

If multiple drives are connected via a common DC bus, this affects all motors. For further information, refer to Common DC bus, page 82.

An external braking resistor, page 74 is required for applications in which the motor must be decelerated quickly and the internal braking resistor cannot absorb the excess braking energy.

## Internal Braking Resistor

## Introduction

The drive has an internal braking resistor. If the internal braking resistor is insufficient for the dynamics of the application, one or more external braking resistors must be used.

The resistance values for external braking resistors must not be below the specified minimum resistance. If an external braking resistor is activated by using the appropriate parameter, the internal braking resistor is deactivated.

## External Braking Resistors

## Introduction

An external braking resistor is required for applications in which the motor must be decelerated quickly and the internal braking resistor cannot absorb the excess braking energy. The temperature of the braking resistor may exceed $250^{\circ} \mathrm{C}\left(482^{\circ}\right.$ F) during operation

## A WARNING <br> HOT SURFACES <br> - Ensure that it is not possible to make any contact with a hot braking resistor. <br> - Do not allow flammable or heat-sensitive parts in the immediate vicinity of the braking resistor. <br> - Verify that the heat dissipation is sufficient by performing a test run under maximum load conditions. <br> Failure to follow these instructions can result in death, serious injury, or equipment damage.

## Monitoring Functions

## Monitoring Functions

## Overview

The monitoring functions of the drive can be used to monitor movements and to monitor internal signals. These monitoring functions are not safety-related functions.

The following monitoring functions are available:

| Monitoring function | Task |
| :--- | :--- |
| Data connection | Monitors data connection for interruption |
| Limit switch signals | Monitors for permissible movement range |

| Monitoring function | Task |
| :--- | :--- |
| Position deviation | Monitors for difference between actual position <br> and reference position |
| Motor overload | Monitors for excessively high current in the <br> motor phases |
| Overvoltage and undervoltage | Monitors for overvoltage and undervoltage of <br> the power stage supply and the DC bus |
| Overtemperature | Monitors the drive for overtemperature |
| Encoder overtemperature | Monitors the encoder for overtemperature |
| Overvoltage and undervoltage | Monitors the logic supply and power stage <br> supply for permissible voltage range |
| Overvoltage at digital inputs | Monitors the digital inputs for overvoltage |
| Wire break HPULSE inputs | Monitors the HPULSE inputs for wire break |
| Power supply encoder | Monitors the encoder supply for short circuit and <br> permissible voltage range |
| Current limitation (Foldback) | Power limitation in the case of overloads for the <br> motor, the output current, the output power, and <br> the braking resistor. |

## Configurable Inputs and Outputs

## Configurable Inputs and Outputs

## Presentation

This drive has digital inputs and outputs that can be configured. The inputs and outputs have a defined default assignment depending on the operating mode. This assignment can be adapted to the requirements of the customer's installation.

For further details, refer to chapter Operation, page 269.

## Wiring

## General Wiring

## I/O Wiring Example With Modicon M221 Logic Controller

## Positive Logic

> Wiring example with Modicon M221 Logic Controller (positive logic).

## Negative Logic

Wiring example with Modicon M221 Logic Controller (negative logic).

## Installation

## What's in This Part

Before Mounting ..... 103
Drive Installation ..... 104
Motor Installation ..... 139
Verifying Installation ..... 148

An engineering phase is mandatory prior to mechanical and electrical installation. For basic information, refer to Engineering, page 77.

## AADANGER

## INSUFFICIENT GROUNDING

- Use a protective ground conductor with at least 10 mm 2 (AWG 6) or two protective ground conductors with the cross section of the conductors supplying the power terminals.
- Verify compliance with all local and national electrical code requirements as well as all other applicable regulations with respect to grounding of the entire drive system.
- Ground the drive system before applying voltage.
- Do not use conduits as protective ground conductors; use a protective ground conductor inside the conduit.
- Do not use cable shields as protective ground conductors.
- Keep foreign objects from getting into the product.
- Verify the correct seating of seals and cable entries in order to avoid contamination such as deposits and humidity.
Failure to follow these instructions will result in death or serious injury.

In the case of a ground error, the maximum permissible current in the motor phases may be exceeded.

## ADANGER

## FIRE CAUSED BY INCORRECT INSTALLATION

Use upstream, external ground error detection equipment (Residual Current Device / Ground Fault Circuit Interrupter).

Failure to follow these instructions will result in death or serious injury.

## AWARNING <br> LOSS OF CONTROL <br> - The designer of any control scheme must consider the potential failure modes of control paths and, for certain critical control functions, provide a means to achieve a safe state during and after a path failure. Examples of critical control functions are emergency stop and overtravel stop, power outage and restart. <br> - Separate or redundant control paths must be provided for critical control functions. <br> - System control paths may include communication links. Consideration must be given to the implications of unanticipated transmission delays or failures of the link. <br> - Observe all accident prevention regulations and local safety guidelines. ${ }^{1}$ <br> - Each implementation of this equipment must be individually and thoroughly tested for proper operation before being placed into service. <br> Failure to follow these instructions can result in death, serious injury, or equipment damage.

${ }^{1}$ For additional information, refer to NEMA ICS 1.1 (latest edition), "Safety Guidelines for the Application, Installation, and Maintenance of Solid State Control" and to NEMA ICS 7.1 (latest edition), "Safety Standards for Construction and Guide for Selection, Installation and Operation of Adjustable-Speed Drive Systems" or their equivalent governing your particular location.

Conductive foreign objects, dust or liquids may cause safety functions to become inoperative.

## AWARNING

## LOSS OF SAFETY FUNCTION CAUSED BY FOREIGN OBJECTS

Protect the system against contamination by conductive substances.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

The metal surfaces of the product may exceed $65^{\circ} \mathrm{C}\left(149{ }^{\circ} \mathrm{F}\right)$ (for bare metal) during operation.

## AWARNING

## HOT SURFACES

- Avoid unprotected contact with hot surfaces.
- Do not allow flammable or heat-sensitive parts in the immediate vicinity of hot surfaces.
- Verify that the heat dissipation is sufficient by performing a test run under maximum load conditions.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

## ACAUTION

## INOPERABLE EQUIPMENT DUE TO INCORRECT MAINS VOLTAGE

 CONNECTION- Verify that you use the correct mains voltage; install a transformer, if necessary.
- Do not connect mains voltage to the output terminals (U, V, W).

Failure to follow these instructions can result in injury or equipment damage.

## Before Mounting

What's in This Chapter
Inspecting the Product ..... 103
Scope of Supply ..... 103

## Inspecting the Product

## Inspecting the Product

- Verify the product version by means of the type code on the nameplate. Refer to chapter Nameplate, page 30 and chapter Type Code, page 31.
- Prior to mounting, inspect the product for visible damage.

Damaged products may cause electric shock or unintended equipment operation.

## A ADANGER

ELECTRIC SHOCK OR UNINTENDED EQUIPMENT OPERATION

- Do not use damaged products.
- Keep foreign objects (such as chips, screws or wire clippings) from getting into the product.

Failure to follow these instructions will result in death or serious injury.

Contact your local Schneider Electric representative if you detect any damage whatsoever to the products.

## Scope of Supply

## Drive

- Drive Lexium 28A
- Connector kit with 3 connectors for:
- Power stage supply and logic supply
- Braking resistor Including jumper between $\mathbf{P B i}$ and $\mathbf{P B e}$
- Motor
- Plastic tool for opening the spring terminals (available for devices from 50 W to 1.5 kW )
- 4-pin connector for deactivating the safety function STO (CN9)
- Adhesive hazard labels in 5 languages (German, French, Italian, Spanish, Chinese)
- Instruction sheet for the product

## Motor

- BCH2 servo motor
- BCH2•R: 2 eyebolts
- Information sheet for the product

## Mechanical Installation Drive

## A A DANGER

ELECTRIC SHOCK OR UNINTENDED EQUIPMENT OPERATION

- Keep foreign objects from getting into the product.
- Verify the correct seating of seals and cable entries in order to avoid contamination such as deposits and humidity.
Failure to follow these instructions will result in death or serious injury.

Conductive foreign objects, dust or liquids may cause safety functions to become inoperative.

| $\quad 1 \mathrm{NARN}$ NG |
| :--- |
| LOSS OF SAFETY FUNCTION CAUSED BY FOREIGN OBJECTS |
| Protect the system against contamination by conductive substances. |
| Failure to follow these instructions can result in death, serious injury, or |
| equipment damage. |

The metal surfaces of the product may exceed $70^{\circ} \mathrm{C}\left(158{ }^{\circ} \mathrm{F}\right)$ during operation.

| HOT SURFACES |
| :--- |
| - Avoid unprotected contact with hot surfaces. |
| - Do not allow flammable or heat-sensitive parts in the immediate vicinity of |
| hot surfaces. |
| - Verify that the heat dissipation is sufficient by performing a test run under |
| maximum load conditions. |
| Failure to follow these instructions can result in death, serious injury, or |
| equipment damage. |

## Attaching a Hazard Label with Safety Instructions

Included in the packaging of the drive are adhesive hazard labels in German, French, Italian, Spanish, and Chinese languages. The English version is affixed to
the drive by the factory. If the country to which your final machine or process is to be delivered is other than English speaking:

- Select the hazard label suitable for the target country.

Respect the safety regulations in the target country

- Attach the hazard label to the front of the device so that it is clearly visible.

## Control Cabinet

The control cabinet (enclosure) must have a sufficient size so that all devices and components can be permanently installed and wired in compliance with the EMC requirements.

The ventilation of the control cabinet must be sufficient to comply with the specified ambient conditions for the devices and components operated in the control cabinet.

Install and operate this equipment in a control cabinet rated for its intended environment and secured by a keyed or tooled locking mechanism.

## Mounting Distances, Ventilation

When selecting the position of the device in the control cabinet, note the following:

- Mount the device in a vertical position $\left( \pm 10^{\circ}\right)$. This is required for cooling the device.
- Adhere to the minimum installation distances for required cooling. Avoid heat accumulations.
- Do not mount the device close to heat sources
- Do not mount the device on or near flammable materials.
- The heated airflow from other devices and components must not heat up the air used for cooling the device.
The connection cables of the devices are routed to the top and to the bottom. The minimum distances must be adhered to for air circulation and cable installation.

Mounting distances and air circulation

LXM28AUA5, U01, U02, U04, U07, U10, U15, U20, U30, U45

| Distance | Unit | Value |
| :---: | :---: | :---: |
| Free space a above the device | mm <br> (in) | $\begin{aligned} & \geq 50 \\ & (\geq 1.97) \end{aligned}$ |
| Free space b below the device | mm <br> (in) | $\begin{aligned} & \geq 50 \\ & (\geq 1.97) \end{aligned}$ |
| Free space c <br> in front of the device ${ }^{(1)}$ | mm <br> (in) | $\begin{aligned} & \geq 60 \\ & (\geq 2.36) \end{aligned}$ |
| Free space d between devices | mm <br> (in) | $\begin{aligned} & \geq 15 \\ & (\geq 0.59) \end{aligned}$ |
| (1) | The free space is strictly for observing proper ventilation and may not be sufficient for your wiring requirements. |  |

## Mounting the Drive

For further information on the dimensions of the mounting holes, refer to chapter Dimensions, page 33.
Painted surfaces may create electrical resistance or isolation. Before mounting the device to a painted mounting plate, remove all paint across a large area of the mounting points.

- Respect the ambient conditions in chapter Environmental Conditions, page 31.
- Mount the device in a vertical position $\left( \pm 10^{\circ}\right)$.

## Electrical Installation Drive

## Introduction

## A! DANGER

## INSUFFICIENT GROUNDING

- Use a protective ground conductor with at least 10 mm 2 (AWG 6) or two protective ground conductors with the cross section of the conductors supplying the power terminals.
- Verify compliance with all local and national electrical code requirements as well as all other applicable regulations with respect to grounding of the entire drive system.
- Ground the drive system before applying voltage.
- Do not use conduits as protective ground conductors; use a protective ground conductor inside the conduit.
- Do not use cable shields as protective ground conductors.
- Keep foreign objects from getting into the product.
- Verify the correct seating of seals and cable entries in order to avoid contamination such as deposits and humidity.
Failure to follow these instructions will result in death or serious injury.

Direct current can be introduced in the protective ground conductor of this drive. If a residual current device (RCD / GFCI) or a residual current monitor (RCM) is used for protection against direct or indirect contact, the following specific types must be used:

## A WARNING

## DIRECT CURRENT CAN BE INTRODUCED INTO THE PROTECTIVE

 GROUND CONDUCTOR- Use a Type A Residual Current Device (RCD / GFCI) or a Residual Current Monitor (RCM) for single-phase drives connected to a phase and to the neutral conductor.
- Use a Type B Residual Current Device (RCD / GFCI) or a Residual Current Monitor (RCM) that has approval for use with frequency inverters and is sensitive to all types of current for three-phase drives and for single-phase drives not connected to a phase and the neutral conductor.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

The entire installation procedure must be performed without voltage present.

## Connection Grounding Screw

This product has a leakage (touch) current greater than 3.5 mA . If the protective ground connection is interrupted, a hazardous leakage (touch) current may flow if the housing is touched.

## AADANGER

## INSUFFICIENT GROUNDING

- Use a protective ground conductor with at least 10 mm 2 (AWG 6) or two protective ground conductors with the cross section of the conductors supplying the power terminals.
- Verify compliance with all local and national electrical code requirements as well as all other applicable regulations with respect to grounding of the entire drive system.
- Ground the drive system before applying voltage.
- Do not use conduits as protective ground conductors; use a protective ground conductor inside the conduit.
- Do not use cable shields as protective ground conductors.
- Keep foreign objects from getting into the product.
- Verify the correct seating of seals and cable entries in order to avoid contamination such as deposits and humidity.

Failure to follow these instructions will result in death or serious injury.

The central grounding screws of the product are located at the front side.

LXM28AU20

LXM28AU30, U45

- Use ring-type cable lugs or fork-type cable lugs.
- Connect the ground connection of the device to the equipotential ground plane of your system.

Example of analog output:

## Pulse Input (Open Collector, Negative Logic)

## AWARNING

## UNINTENDED EQUIPMENT OPERATION

Do not connect an external, 24 Vdc power supply to the VDD connection of the I/O interface (CN1) connector.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

Example of pulse input (open collector) with internal power supply (negative logic).

Example of pulse input (open collector) with external power supply (negative logic).

## Pulse Input (Open Collector, Positive Logic)

## A WARNING

UNINTENDED EQUIPMENT OPERATION
Do not connect an external, 24 Vdc power supply to the VDD connection of the I/O interface (CN1) connector.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

Example of pulse input (open collector) with internal power supply (positive logic).

Example of pulse input (open collector) with external power supply (positive logic).

## Pulse Input (Line Driver)

Example of pulse input (line driver).

## High-Speed Pulses

Example of high-speed pulse input (line driver).

Connect the cable shield to the equipotential ground of your controller/drive electrical system.

## Wiring of the Digital Outputs (Negative Logic)

Example of digital outputs DO1 ... DO5 with internal power supply (negative logic):

Example of digital outputs DO1 ... DO5 with external power supply (negative logic):

Example of digital output DO6 (OCZ) with internal power supply (negative logic):

Example of digital output DO6 (OCZ) with external power supply (negative logic):

Inductive loads using DC voltages may damage the signal outputs. A protection circuit is required to protect the signal outputs against inductive loads.

## ACAUTION

OUTPUT CIRCUIT DAMAGE DUE TO INDUCTIVE LOADS
Use an appropriate external protective circuit or device to reduce the inductive direct current load damage.

Failure to follow these instructions can result in injury or equipment damage.

A diode can be used to protect the signal outputs against inductive loads.
Use a diode with the following ratings:

- Reverse withstand voltage: voltage of signal output times 10
- Forward current: greater than the load current

## Wiring of the Digital Outputs (Positive Logic)

Example of digital outputs DO1 ... DO5 with internal power supply (positive logic):

Example of digital outputs DO1 ... DO5 with external power supply (positive logic):

Inductive loads using DC voltages may damage the signal outputs. A protection circuit is required to protect the signal outputs against inductive loads.

## ACAUTION

OUTPUT CIRCUIT DAMAGE DUE TO INDUCTIVE LOADS
Use an appropriate external protective circuit or device to reduce the inductive direct current load damage.

Failure to follow these instructions can result in injury or equipment damage.

A diode can be used to protect the signal outputs against inductive loads. Use a diode with the following ratings:

Reverse withstand voltage: voltage of signal output times 10
Forward current: greater than the load current

## Wiring of the Digital Inputs (Negative Logic)

## A WARNING

## UNINTENDED EQUIPMENT OPERATION

Do not connect an external, 24 Vdc power supply to the VDD connection of the I/O interface (CN1) connector.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

Use a relay or an open collector output (NPN transistor) for the input signal.
Example of digital input (negative logic) with internal power supply:

Example of digital input (negative logic) with external power supply:

## Wiring of the Digital Inputs (Positive Logic)

## AWARNING

## UNINTENDED EQUIPMENT OPERATION

Do not connect an external, 24 Vdc power supply to the VDD connection of the I/O interface (CN1) connector.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

Use a relay or an open collector output (PNP transistor) for the input signal.

## Encoder Output Signal

Example of encoder output signal Line Driver.

Example of encoder output signal, high-speed optocoupler.

## Connecting the Motor Encoder (CN2)

## Function and Encoder Type

The motor encoder is an integrated, high-resolution absolute encoder. It provides the device with information on the motor position (analog and digital).

Compatibility between Drive and Motor is defined in the Drive / Motor combinations table, page 21.

## Cable Specifications

For further information, refer to chapter Cables, page 80.

| Shield: | Required, both ends grounded |
| :--- | :--- |
| Twisted Pair: | Required |
| PELV: | Required |
| Cable composition: | $10 \times 0.13 \mathrm{~mm}^{2}$ <br> $(10 \times$ AWG 24$)$ |
| Maximum cable length: | $20 \mathrm{~m}(65.6 \mathrm{ft})$ |
| Special characteristics: | Fieldbus cables are not suitable for connecting <br> encoders. |

NOTE: Use pre-assembled cables to reduce the risk of wiring errors.

## Wiring Diagram

Connection assignment motor encoder (CN2)

The motor encoder interface (CN2) is a 6-pin connector. The following table describes the contacts of the connector:

| Pin | Signal | Color ${ }^{(1)}$ | Meaning | Motor military connector | Motor plastic connector | 1/0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 5 | T+ | Blue (BU) | Serial communication | A | 1 | I/O |
| 6 | T- | Blue/Black (BU/BK) |  | B | 4 |  |
| 1 | $+5 \mathrm{~V}$ | Red, red/white (RD, RD/ WH) | 5 V encoder supply | S | 7 | 1 |
| 2 | GND | Black, black/white (BK, BK/WH) | Reference potential for encoder supply | R | 8 | 0 |
| 3,4 | N.C. | Reserved | - | - | - | - |

## A WARNING <br> UNINTENDED EQUIPMENT OPERATION <br> Do not connect any wiring to reserved, unused connections, or to connections designated as No Connection (N.C.). <br> Failure to follow these instructions can result in death, serious injury, or equipment damage.

## Connecting the Motor Encoder

- Verify that wiring, cables, and connected interface meet the PELV requirements.
- Note the information on EMC, see chapter Electromagnetic Compatibility (EMC), page 77. Use equipotential bonding conductors for equipotential bonding.
- Connect the connector to
- CN2 Encoder if using a motor equipped with a single-turn encoder.
- the battery compartment if using a motor equipped with a multi-turn encoder.
- Verify that the connector locks snap in properly at the housing.

Route the cables from the motor and the encoder to the device (starting from the motor). Due to the pre-assembled connectors, this direction is often faster and easier.

## Connecting the Battery Compartment When Using a Motor Equipped With a Multi-Turn Encoder

The battery compartment is connected to CN2 Encoder, between the drive and the motor encoder cable.

NOTE: The multi-turn counting is preserved through power down by the external battery located into the battery compartment.

For further information on the battery replacement, refer to the maintenance of the motor, page 382.

For LXM28A‥UA5 ...U45, the battery compartment should be installed on a baseplate near the drive

## Connection PC (CN3)

## Function

The commissioning interface (CN3) is an RS-485 connection, supported on an RJ45 connector. If the PC used to connect to the commissioning interface has an RS-485 port, typically supported on a DB9 connector, you can connect it to this connector (RJ45 / DB9 cable). Otherwise, you can use the USB port of the PC with a USB to RS-485 converter.

The commissioning interface may only be used for a point-to-point connection, but not for a point-to-multipoint connection (RS-485 network).

If the commissioning interface at the product is directly connected to an Ethernet interface at the PC, the PC interface may be damaged and rendered inoperable.

| NOT/CE |
| :--- |
| INOPERABLE EQUIPMENT |
| Do not directly connect an Ethernet interface to the commissioning interface of |
| this product. |
| Failure to follow these instructions can result in equipment damage. |

## Connecting a PC

A PC with the commissioning software LXM28 DTM Library can be connected for commissioning. The PC is connected via a bidirectional USB/RS485 converter, refer to Accessories and Spare Parts, page 71.

## Cable Specifications

For further information, refer to chapter Cables, page 80.

| Shield: | Required, both ends grounded |
| :--- | :--- |
| Twisted Pair: | Required |
| PELV: | Required |
| Cable composition: | $8 \times 0.25 \mathrm{~mm}^{2}(8 \times$ AWG 22) |
| Maximum cable length: | $100 \mathrm{~m} \mathrm{(328} \mathrm{ft)}$ |
| Special characteristics: | - |

## Wiring Diagram

Wiring diagram PC with commissioning software

The commissioning interface (CN3) is an RJ45 connector. The following table describes the contacts of the connector:

| Pin | Signal | Meaning | I/O |
| :--- | :--- | :--- | :--- |
| $1 \ldots 3$ | - | Reserved | - |
| 4 | MOD_D1(1) | Bidirectional transmit/receive signal | RS-485 level |
| 5 | - | Bidirectional transmit/receive signal, inverted |  |
| $6 \ldots 7$ | SHLD | Functional ground $/$ shield - internally connected to ground potential of <br> the drive | - |
| 8 and <br> honnector |  | No polarization. |  |

#### Abstract

A WARNING UNINTENDED EQUIPMENT OPERATION Do not connect any wiring to reserved, unused connections, or to connections designated as No Connection (N.C.).

Failure to follow these instructions can result in death, serious injury, or equipment damage.

NOTE: Verify that the connector locks snap in properly at the housing.

## Connection CAN (CN4)

## Function

The device is suitable for connection to CANopen and CANmotion.
A CAN bus connects multiple devices via a bus cable. Each network device can transmit and receive messages. Data between network devices is transmitted serially.

Each network device must be configured before it can be operated on the network. The device is assigned a unique 7 -bit node address (node ID) between 1 $\left(01_{h}\right)$ and $127\left(7 \mathrm{~F}_{\mathrm{h}}\right)$. The address is set during commissioning.

The baud rate must be the same for all devices in the fieldbus.

## Cable Specifications

For further information, refer to chapter Cables, page 80.

| Shield: | Required, both ends grounded |
| :--- | :--- |
| Twisted Pair: | Required |
| PELV: | Required |
| Cable composition for cables with RJ45 <br> connectors(1): | $8 \times 0.14 \mathrm{~mm}^{2}$ (AWG 24) |
| Cable composition with D-SUB connectors: | $2 \times 0.25 \mathrm{~mm}^{2}, 2 \times 0.20 \mathrm{~mm}^{2}(2 \times$ AWG 22, $2 \times$ AWG <br> $24)$ <br> Cross section $0.20 \mathrm{~mm}^{2}$ (AWG 24) for CAN level, <br> cross section $0.25 \mathrm{~mm}^{2}$ (AWG 22) for reference <br> potential. |
| $(1)$ | Cables with RJ45 connectors may only be used inside of control <br> cabinets. |

- Use equipotential bonding conductors.
- Use pre-assembled cables to reduce the risk of wiring errors.

## Connectors D-SUB and RJ45

Usually, a cable with D-Sub connectors is used for CAN fieldbus connection in the field. Inside control cabinets, connections with RJ45 cables have the benefit of easier and faster wiring. In the case of CAN cables with RJ45 connectors, the maximum permissible bus length is reduced by $50 \%$.

Multiple-port taps can be used to connect an RJ45 system inside the control cabinet to a D-Sub system in the field, see the figure below. The trunk line is connected to the multiple-port tap by means of screw terminals; the devices are connected by means of pre-assembled cables. See chapter CANopen Connectors, Distributors, Terminating Resistors, page 72.

Connection of RJ45 CAN in the control cabinet to the field

| Item | Description |
| :--- | :--- |
| 1 | Devices with RJ45 CAN connection in the control cabinet |
| 2 | CANopen cables with RJ45 connectors |
| 3 | Connection cables between device and tap, for example TCSCCN4F3M3T for tap <br> TSXCANTDM4 |
| 4 | Tap in the control cabinet, for example TSXCANTDM4 as D-SUB four-port tap or <br> VW3CANTAP2 as RJ45 tap |
| 5 | Fieldbus cable (trunk line) to the bus devices outside of the control cabinet, connected to <br> the tap by means of screw terminals. Cross section 0.20 mm² (AWG 24) for CAN level, <br> cross section 0.25 mm ${ }^{2}$ (AWG 22) for reference potential |
| 6 | Terminating resistor $120 \Omega$ RJ45 (TCSCAR013M120) |

## Maximum Bus Length CAN

The maximum bus length depends on the selected baud rate. The following table shows the maximum overall length of the CAN bus in the case of cables with DSUB connectors.

| Baud rate | Maximum bus length |
| :---: | :---: |
| 125 kbit/s | 500 m (1640 ft) |
| 250 kbit/s | 250 m (820 ft) |
| $500 \mathrm{kbit} / \mathrm{s}$ | 100 m (328 ft) |
| $1000 \mathrm{kbit} / \mathrm{s}$ | $20 \mathrm{~m}(65.6 \mathrm{ft})^{(1)}$ |
| (1) | According to the CANopen specification, the maximum bus length is 40 m . However, in practice, limiting the length to 20 m reduces communication errors caused by external interference. |

At a baud rate of $1 \mathrm{Mbit} / \mathrm{s}$, the drop lines are limited to $0.3 \mathrm{~m}(0.98 \mathrm{ft})$.

## Terminating Resistors

Both ends of a CAN bus line must be terminated. A $120 \Omega$ terminating resistor between CAN_L and CAN_H is used for this purpose.

Connectors with integrated terminating resistors are available as accessories, refer to chapter CANopen Connectors, Distributors, Terminating Resistors, page 72

## Wiring Diagram

Wiring diagram CN4 CANopen

CN4 CAN

The CAN interface (CN4) consists of 2 RJ45 connectors. The following table describes the contacts of the connectors

| Pin | Signal | Meaning | I/O |
| :--- | :--- | :--- | :--- |
| 1 | CAN_H | CAN interface | CAN level |
| 2 | CAN_L | Reference potential CAN | - |
| 3 | CAN_OV | Reserved | - |
| $4 \ldots 5$ | - | Functional ground / shield - internally connected to ground potential of <br> the drive | - |
| 6 and connector <br> housing | SHLD | Reference potential CAN | - |
| 7 | CAN_OV | Reserved | - |
| 8 | - |  |  |

## A WARNING <br> UNINTENDED EQUIPMENT OPERATION

Do not connect any wiring to reserved, unused connections, or to connections designated as No Connection (N.C.)

Failure to follow these instructions can result in death, serious injury, or equipment damage.

## Connecting CANopen

- Connect the CANopen cable to CN4 (pins 1, 2, and 3) with an RJ45 connector. Note the information on using cables with RJ45 connectors.
- Verify that the connector locks snap in properly at the housing.

## Equipotential Bonding Conductors

Potential differences can result in excessive currents on the cable shields. Use equipotential bonding conductors to reduce currents on the cable shields.

## A WARNING <br> UNINTENDED EQUIPMENT OPERATION <br> - Ground cable shields for all fast I/O, analog I/O, and communication signals at a single point. ${ }^{1)}$ <br> - Route communications and I/O cables separately from power cables. <br> Failure to follow these instructions can result in death, serious injury, or equipment damage.

${ }^{1)}$ Multipoint grounding is permissible if connections are made to an equipotential ground plane dimensioned to help avoid cable shield damage in the event of power system short-circuit currents.

## Terminating Resistors

Both ends of a CAN bus line must be terminated. A $120 \Omega$ terminating resistor between CAN_L and CAN_H is used for this purpose.

## Connection Logic Supply and Power Stage Supply (CN5)

This product has a leakage (touch) current greater than 3.5 mA . If the protective ground connection is interrupted, a hazardous leakage (touch) current may flow if the housing is touched.

## AADANGER

## INSUFFICIENT GROUNDING

- Use a protective ground conductor with at least 10 mm 2 (AWG 6) or two protective ground conductors with the cross section of the conductors supplying the power terminals.
- Verify compliance with all local and national electrical code requirements as well as all other applicable regulations with respect to grounding of the entire drive system.
- Ground the drive system before applying voltage.
- Do not use conduits as protective ground conductors; use a protective ground conductor inside the conduit.
- Do not use cable shields as protective ground conductors.
- Keep foreign objects from getting into the product.
- Verify the correct seating of seals and cable entries in order to avoid contamination such as deposits and humidity.
Failure to follow these instructions will result in death or serious injury.

## AWARNING

## INSUFFICIENT PROTECTION AGAINST OVERCURRENT

- Use the external fuses specified in chapter "Technical Data".
- Do not connect the product to a supply mains whose short-circuit current rating (SCCR) exceeds the value specified in the chapter "Technical Data".

Failure to follow these instructions can result in death, serious injury, or equipment damage.

| AWARN/NG |
| :--- |
| INCORRECT MAINS VOLTAGE |
| Verify that the product is approved for the mains voltage before applying power |
| and configuring the product. |

Failure to follow these instructions can result in death, serious injury, or equipment damage.

The equipment, drives and motors, are intended for industrial use and may only be operated with a permanently installed connection.

Prior to connecting the equipment, verify the approved mains types, see chapter Electrical Data Drive, page 34.

## Cable Specifications

Respect the required cable properties in chapter Cables, page 80 and in chapter Electromagnetic Compatibility (EMC), page 77.

| Shield: | - |
| :--- | :--- |
| Twisted Pair: | - |
| PELV: | - |
| Cable composition: | The conductors must have a sufficiently large cross section so <br> that the fuse at the mains connection can trip if required. |
| Maximum cable length: | $3 \mathrm{~m} \mathrm{(9.84} \mathrm{ft)}$ |
| Special characteristics: | - |

## Properties of the Terminals

The terminals are approved for stranded conductors and solid conductors. Use cable ends (ferrules), if possible.

| LXM28A | Unit | UA5, U01, U02, U04, <br> U07, U10, U15 | U20, U30, U45 |
| :--- | :--- | :--- | :--- |
| Connection cross section | $\mathrm{mm}^{2}$ | $0.75 \ldots 2.5$ <br> $($ AWG $)$ | $0.75 \ldots 6$ <br> $(20 \ldots 14)$ |
| Stripping length | mm | $8 \ldots 9$ |  |
|  | (in) | $(0.31 \ldots 0.35)$ | 15 |

## Prerequisites for Connecting the Logic Supply

Note the following information:

- Use upstream mains fuses. For further information about fuse types and fuse ratings, refer to chapter Electrical Data Drive, page 34.
- Note the EMC requirements. Where required, use surge arresters and mains reactors.
- If the length of the mains cable between the external mains filter and the drive exceeds 200 mm ( 7.87 in ), it must be shielded and grounded at both ends.
- For a UL-compliant design, refer to chapter Conditions for UL 508C, page 25.

## Connection Logic Supply

Wiring diagram logic supply LXM28A•••M1X
UA5, U01, U02, U04, U07, U10, U15
~110V

Wiring diagram logic supply LXM28A•••M3X

U45
~220V

| Connection | Meaning |
| :--- | :--- |
| R, S, (T) | Power stage supply |
| L1, L2 | Logic supply |

- Verify the type of mains. For the approved types of mains, refer to chapter Electrical Data Drive, page 34.
- Connect the mains cable.
- Verify that the connector locks snap in properly at the housing.

## Wiring Diagram for Devices That Can Be Connected Via a SinglePhase or Three Phases

Drives with a continuous power from 50 W to 1500 W can be connected via a single-phase or via three phases. Drives with a continuous power of more than 1500 W must be connected via three phases.

Wiring diagram for devices that can be connected via a single-phase or three-phases

## Connection DC Bus (CN6)

Incorrect use of the DC bus may permanently damage the drives either immediately or over time.

| AWARNING |
| :--- |
| INOPERABLE SYSTEM COMPONENTS AND LOSS OF CONTROL |
| Verify that all requirements for using the DC bus are met. |
| Failure to follow these instructions can result in death, serious injury, or <br> equipment damage. |

This and other important information can be found in the "LXM28-Common DC bus - Application note", page 11. If you wish to take advantage of DC bus sharing, you must first consult the LXM28 - Common DC bus - Application note for important safety-related information.

## Requirements for Use

The requirements and limit values for parallel connection of multiple devices via the DC bus can be found on www.se.com in the form of an application note (refer to chapter Related Documents, page 11).

## Connection Braking Resistor (CN7)

An insufficiently rated braking resistor can cause overvoltage on the DC bus. Overvoltage on the DC bus causes the power stage to be disabled. The motor is no longer actively decelerated.

## AWARNING <br> UNINTENDED EQUIPMENT OPERATION <br> - Verify that the braking resistor has a sufficient rating by performing a test run under maximum load conditions. <br> - Verify that the parameter settings for the braking resistor are correct. <br> Failure to follow these instructions can result in death, serious injury, or equipment damage.

## Internal Braking Resistor

A braking resistor is integrated in the device to absorb braking energy. The drive is shipped with the internal braking resistor active.

## External Braking Resistor

An external braking resistor is required for applications in which the motor must be decelerated quickly and the internal braking resistor cannot absorb the excess braking energy.

Selection and rating of the external braking resistor are described in chapter Rating the Braking Resistor, page 94. For suitable braking resistors, refer to chapter Accessories and Spare Parts, page 74.

## Cable Specifications

For further information, refer to chapter Cables, page 80.

| Shield: | Required, both ends grounded |
| :--- | :--- |
| Twisted Pair: | - |
| PELV: | - |
| Cable composition: | Minimum conductor cross section: Same cross section as logic <br> supply. <br> The conductors must have a sufficiently large cross section so <br> that the fuse at the mains connection can trip if required. |
| Maximum cable length: | 3 m (9.84 ft) |
| Special characteristics: | Temperature resistance |

The braking resistors listed in chapter Accessories and Spare Parts, page 74 have a 3-wire, temperature-resistant cable with a length of $0.75 \mathrm{~m}(2.46 \mathrm{ft})$ to 3 m ( 9.84 ft ).

## Properties of the Terminals (CN7) LXM28AUA5, U01, U02, U04, U07, U10, U15, U20, U30, U45

The terminals are approved for stranded conductors and solid conductors. Use cable ends (ferrules), if possible.

| LXM28A | Unit | UA5, U01, U02, U04, <br> U07, U10, U15 | U20, U30, U45 |
| :--- | :--- | :--- | :--- |
| Connection cross section | $\mathrm{mm}^{2}$ | $0.75 \ldots 2.5$ | $0.75 \ldots 6$ |
|  | (AWG) | $(20 \ldots 14)$ | $(20 \ldots 10)$ |
| Stripping length | mm | $8 \ldots 9$ | 15 |
|  | (in) | $(0.31 \ldots 0.35)$ | $(0.59)$ |

The removable terminals are approved for fine-stranded conductors and solid conductors. Respect the maximum permissible connection cross section. Take into account the fact that cable ends (ferrules) increase the conductor cross section.

NOTE: If you use cable ends (ferrules), use only cable ends (ferrules) with collars for these terminals.

## Wiring Diagram

Wiring diagram internal braking resistor activated

## LXM28AUA5...U45

Wiring diagram external braking resistor

## LXM28AUA5...U45

## Connecting the External Braking Resistor

- Remove power from all supply voltages. Respect the safety instructions concerning electrical installation.
- Verify that no voltages are present.
- Ground the ground connection (PE) of the braking resistor.
- Connect the external braking resistor to the device.
- Connect a large surface area of the cable shield to the central grounding point of your system.

## AADANGER

## ELECTRIC SHOCK, EXPLOSION, OR ARC FLASH

- Disconnect all power from all equipment including connected devices prior to removing any covers or doors, or installing or removing any accessories, hardware, cables, or wires.
- Place a "Do Not Turn On" or equivalent hazard label on all power switches and lock them in the non-energized position.
- Wait 15 minutes to allow the residual energy of the DC bus capacitors to discharge.
- Measure the voltage on the DC bus with a properly rated voltage sensing device and verify that the voltage is less than 42.4 Vdc .
- Do not assume that the DC bus is voltage-free when the DC bus LED is off.
- Block the motor shaft to prevent rotation prior to performing any type of work on the drive system.
- Do not create a short-circuit across the DC bus terminals or the DC bus capacitors.
- Replace and secure all covers, accessories, hardware, cables, and wires and confirm that a proper ground connection exists before applying power to the unit.
- Use only the specified voltage when operating this equipment and any associated products.
Failure to follow these instructions will result in death or serious injury.

## Connecting the Motor Phases (CN8)

High voltages may be present at the motor connection. The motor itself generates voltage when the motor shaft is rotated. AC voltage can couple voltage to unused conductors in the motor cable.

## AADANGER

## ELECTRIC SHOCK

- Verify that no voltage is present prior to performing any type of work on the drive system.
- Block the motor shaft to prevent rotation prior to performing any type of work on the drive system.
- Insulate both ends of unused conductors of the motor cable.
- Supplement the motor cable grounding conductor with an additional protective ground conductor to the motor housing.
- Verify compliance with all local and national electrical code requirements as well as all other applicable regulations with respect to grounding of all equipment.
Failure to follow these instructions will result in death or serious injury.

Incorrect wiring of the motor connection may cause live wires to be exposed outside of the motor connector below the HMI.

## A A DANGER

## ELECTRIC SHOCK CAUSED BY INCORRECT WIRING

- Verify that the protective ground connection (PE) of the device is connected to ground.
- Do not remove the cable end (ferrule) from the protective ground terminal (PE) of the motor connector until you are prepared to wire the protective ground conductor of the motor to the protective ground terminal (PE) of the motor connector.
- Verify that no bare metal of the wires is exposed outside of the motor connector housing when wiring the motor connector.
- Regularly, as part of a maintenance plan, assure that the motor wires are secured in the terminals of the motor connector due to vibration or other influences.

Failure to follow these instructions will result in death or serious injury.

Drive systems may perform unintended movements if unapproved combinations of drive and motor are used. Even if motors are similar, different adjustment of the encoder system may be a source of hazards. Even if the connectors for motor connection and encoder connection match mechanically, this does not imply that the motor is approved for use.

## A WARNING

## UNINTENDED MOVEMENT

Only use approved combinations of drive and motor.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

Compatibility between Drive and Motor is defined in the Drive / Motor combinations table, page 21.

Route the cables from the motor and the encoder to the device (starting from the motor). Due to the pre-assembled connectors, this direction is often faster and easier.

## Cable Specifications

For further information, refer to chapter Cables, page 80.

| Shield: | Required, both ends grounded |
| :--- | :--- |
| Twisted Pair: | - |
| PELV: | The wires for the holding brake must be PELV-compliant. |
| Cable composition: | wires for motor phases <br> The conductors must have a sufficiently large cross section so <br> that the fuse at the mains connection can trip if required. |
| Maximum cable length: | Depends on the required limit values for conducted <br> interference. <br> Category C3: 20 m (65.6 ft) |
| Special characteristics: | Contains wires for the temperature sensor |

Note the following information:

- You may only connect the original motor cable.
- If you do not connect the wires at the motor end, you must isolate each wire individually (inductive voltages).
- Use pre-assembled cables to reduce the risk of wiring errors.

## Properties of the Terminals (CN8)

The terminals are approved for stranded conductors and solid conductors. Use cable ends (ferrules), if possible.

| LXM28A | Unit | UA5, U01, U02, U04, <br> U07, U10, U15 | U20, U30, U45 |
| :--- | :--- | :--- | :--- |
| Connection cross section | $\mathrm{mm}^{2}$ | $0.75 \ldots 2.5$ <br> $(20 \ldots 14)$ | $0.75 \ldots 6$ <br> $(20 \ldots 10)$ |
| Stripping length | mm | $8 \ldots 9$ |  |
|  | (in) | $(0.31 \ldots 0.35)$ | 15 |
| $(0)$ | $(0.59)$ |  |  |

## Monitoring

The drive monitors the motor phases for:

- Short circuit between the motor phases
- Short circuit between the motor phases and ground (Not applicable for LXM28AUA5 ... U07 M3X.)
Short circuits between the motor phases and the DC bus, the braking resistor, or the holding brake wires are not detected.

When a short-circuit is detected, power is removed by disabling the power stage. The firmware reports error AL001. Once you have resolved the issue of the overcurrent, you can re-enable the power stage of the drive.

NOTE: After three successive unsuccessful retries of resetting the power stage, the reset will be blocked for a minimum of one minute.

## Wiring Diagram Motor

LXM28AUA5...U45

| Connection | Meaning | Color(1) <br> (IEC 757) |
| :---: | :---: | :---: |
| U | Motor phase | Red (RD) |
| V |  | White (WH) |
| W |  | Black (BK) |
| PE | Protective ground conductor | Green/Yellow (GN/YE) |
| (1) | Color information relates to the cables available as accessories. |  |

## Connecting the Motor Cable

- Note the information on EMC, refer to chapter Electromagnetic Compatibility (EMC), page 77.
- Connect the motor phases and protective ground conductor to CN8. Verify that the connections $\mathrm{U}, \mathrm{V}, \mathrm{W}$, and PE (ground) match at the motor and the device.
- If the product is equipped with removable connectors, Verify that the connector locks snap in properly at the housing.

## Holding Brake Connection

The holding brake in the motor has the task of holding the motor position when the power stage is disabled. The holding brake is not a safety function and not a service brake.

A motor with a holding brake requires a suitable holding brake controller which releases the brake when the power stage is enabled and locks the motor shaft when the power stage is disabled.

The holding brake is connected to one of the digital outputs DO1...DO5. The signal output function BRKR must be assigned to the digital output to which the holding brake is connected. The signal output function BRKR releases the holding brake when the power stage is enabled. When the power stage is disabled, the holding brake is reapplied.

The factory settings for the signal outputs depend on the operating mode, see chapter Setting the Digital Signal Outputs, page 276. Depending on the operating mode, the signal output function is either assigned to the digital output DO4 or not assigned at all. When you reset the drive to the factory settings with P2-08 = 10, the assignments of the signal output functions are also reset to the factory settings.

When you switch the operating mode using the parameter P1-01 or the signal input functions V-Px and V-T, the signal output functions may also be reset to the factory settings for the new operating mode. If you use the setting $D=0$ of parameter P1-01, the assignment of the signal output functions remains the same in the new operating mode.

Resetting the drive to the factory settings or switching the operating mode can modify the assignment of the signal output functions in such a way that the holding brake is released unintentionally.

## AWARNING

## UNINTENDED EQUIPMENT OPERATION

- Verify that the digital output to which you have assigned the signal output function BRKR has been properly wired and configured.
- Before switching to a different operating mode, verify that the signal output function BRKR for the holding brake will not be assigned to an incorrect digital output in the new operating mode.
- Before resetting the drive to the factory settings, verify that the signal output function BRKR for the holding brake will be assigned to the correct digita output or reassign the signal output function BRKR after the factory reset according to the requirements of your application prior to starting the system.
- In all cases, take all necessary measures to prevent unintended movements of the load caused by a release of the holding brake.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

## Example (negative logic) of wiring the holding brake

| Item | Description |
| :--- | :--- |
| 1 | Triggering an EMERGENCY STOP should apply the holding brake |
| 2 | Flyback diode |

## Connection STO (CN9)

For important safety information, refer to the chapter Safety Function STO (Safe Torque Off), page 82 for the requirements for using the safety function STO.

## Cable Specifications - Cables Outside of Control Cabinet

| Shield: | Yes |
| :--- | :--- |
| Twisted Pair: | Yes |
| PELV: | Required |
| Minimum conductor cross section: | $2 \times 0.34 \mathrm{~mm}^{2}$ (AWG 22) |
| Maximum cable length: | $30 \mathrm{~m} \mathrm{(98.4} \mathrm{ft)}$ |
| Fuse: | 4 A |

## Cable Specifications - Cables Inside Control Cabinet

| Shield: | No |
| :--- | :--- |
| Twisted Pair: | No |
| PELV: | Required |
| Minimum conductor cross section: | $2 \times 0.25 \mathrm{~mm}^{2}$ (AWG 24) |
| Maximum cable length: | $3 \mathrm{~m}(9.84 \mathrm{ft})$ |
| Fuse: | 4 A |

## Properties of the Connection

| Connectors housing <br> Connectors crimp contact |  | Molex 436450400(1) <br> Molex 430300001(1) |  |
| :--- | :--- | :--- | :---: |
| Connection cross section | $\mathrm{mm}^{2}$ <br> (AWG) | $0.25 \ldots 0.34$ <br> $(24 \ldots 22)$ |  |
| $(1)$ | Or corresponding equivalent. |  |  |

## Wiring Diagram

Wiring diagram safety function STO

The STO interface (CN9) is a 4-pin female connector. The following table describes the contacts of the connector:

| Pin | Signal | Meaning |
| :--- | :--- | :--- |
| 1 | JMPC_1 | Jumper connector 1 to be connected to STO_24V if the safety function STO is not used <br> in your application |
| 2 | JMPC_2 | Jumper connector 2 to be connected to STO_0V if the safety function STO is not used in <br> your application |
| 3 | STO_0V | Safety function STO 0 Vdc input(1) |
| 4 | STO_24V | Safety function STO 24 Vdc input(1) |
| $(1)$ | PELV power supply is required. |  |

## Connecting the Safety Function STO

- Verify that wiring, cables, and connected interfaces meet the PELV requirements.
- Connect the safety function STO in accordance with the specifications in chapter Safety Function STO (Safe Torque Off), page 82.

## Deactivating the Safety Function STO

If the safety function STO is not to be used, it must be deactivated. Plug in the jumper for CN9 to bridge pin 1 and pin 4 as well as pin 2 and pin 3 to deactivate the safety function STO. The jumper for CN9 is factory-fitted.

## Deactivating the safety function STO

## AWARNING

UNINTENDED EQUIPMENT OPERATION

- Remove the jumpers connected to the STO power connector (CN9) only if you intend to use the STO safety-related function for your application.
- Use only an external PELV 24 Vdc power supply unit when applying the safety-related STO function.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

## Motor Installation

What's in This Chapter
Mechanical Installation Motor ..... 139
Connections and Pin Assignments ..... 142
Connection of Motor and Encoder. ..... 144
Holding Brake Connection ..... 146

## Mechanical Installation Motor

Motors are very heavy relative to their size. The mass of the motor can cause injuries and damage.

## A WARNING

## HEAVY AND/OR FALLING PARTS

- Use a suitable crane or other suitable lifting gear for mounting the motor if this is required by the weight of the motor.
- Use the necessary personal protective equipment (for example, protective shoes, protective glasses and protective gloves)
- Mount the motor so that it cannot come loose (use of securing screws with appropriate tightening torque), especially in cases of fast acceleration or continuous vibration.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

Motors can generate strong local electrical and magnetic fields. This can cause interference in sensitive devices.

## A WARNING

## ELECTROMAGNETIC FIELDS

- Keep persons with electronic medical implants, such as pacemakers, away from the motor.
- Do not place electromagnetically sensitive devices in the vicinity of the motor.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

The metal surfaces of the product may exceed $70^{\circ} \mathrm{C}\left(158{ }^{\circ} \mathrm{F}\right)$ during operation.

## A WARNING

## HOT SURFACES

- Avoid unprotected contact with hot surfaces.
- Do not allow flammable or heat-sensitive parts in the immediate vicinity of hot surfaces.
- Verify that the heat dissipation is sufficient by performing a test run under maximum load conditions.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

| A CAUTION |
| :--- |
| IMPROPER APPLICATION OF FORCES |
| - Do not use the motor as a step to climb into or onto the machine. |
| - Do not use the motor as a load-bearing part. |
| - Use hazard labels and guards on your machine to help prevent the improper |
| application of forces on the motor. |
| Failure to follow these instructions can result in injury or equipment <br> damage. |

## Mounting Position

The following mounting positions are defined and permissible as per IEC 60034-7:

IM B5

IM V1

IM V3

## Mounting

When the motor is mounted to the mounting surface, it must be accurately aligned axially and radially and make even contact with the mounting surface. All mounting screws must be tightened with the specified tightening torque. No uneven mechanical load may be applied while the mounting screws are tightened. For data, dimensions, and degrees of protection (IP), refer to chapter Motor, page 45.

## Mounting Situation

## NOTICE

FORCES APPLIED TO THE REAR SIDE OF THE MOTOR

- Do not place the motor on the rear side.
- Protect the rear side of the motor from impact.
- Do not lift motors via the rear side.
- Only lift motors equipped with eyebolts via the eyebolts.

Failure to follow these instructions can result in equipment damage.

## Special Characteristics BCH2•H, BCH2•M, BCH2•R

## Rear side of motor

| Item | Description |
| :--- | :--- |
| 1 | Protect the rear side of the motor from application of forces. |

## Eyebolts BCH2•R

Consider the mass of the product when mounting the motor. It may be necessary to use suitable lifting gear.

## Connections and Pin Assignments

Connection overview

| Item | Description |
| :--- | :--- |
| 1 | Encoder connection |
| 2 | Motor connection |

## Pin Assignment Motor Connection

Pin assignments of motor phases and holding brake
Motor connection plastic connector (type A and type B), drive side:

Motor connection MIL connector (type C and type D), motor side:

| Pin <br> Type A | Pin <br> Type B | Pin <br> Type C and D | Signal | Meaning | Color(1) <br> (IEC 757) |  |

| - | - | C | - | Reserved | - | - |
| (1) Color information relates to the cables available as accessories. |  |  |  |  |  |  |

## A WARNING

## UNINTENDED EQUIPMENT OPERATION

Do not connect any wiring to reserved, unused connections, or to connections designated as No Connection (N.C.).

Failure to follow these instructions can result in death, serious injury, or equipment damage.

## Pin Assignment Encoder Connection

Pin assignment of the encoder.
Encoder connection plastic connector (Type A), drive side:

Encoder connection MIL connector (Type B), motor side:

| Pin | Pin | Signal | Meaning | Color(1) <br> (IEC 757) |
| :--- | :--- | :--- | :--- | :--- |

| - | J | - | Reserved | - |
| - | K | - | Reserved | - |
| - | M | - | Reserved | - |
| - | N | - | Reserved | - |
| - | P | - | Reserved | - |
| - | T | - | Reserved | - |

| AMARNING |
| :--- |
| UNINTENDED EQUIPMENT OPERATION |
| Do not connect any wiring to reserved, unused connections, or to connections |
| designated as No Connection (N.C.). |
| Failure to follow these instructions can result in death, serious injury, or |
| equipment damage. |

## Mating Connector

For suitable mating connectors, refer to chapter Connectors and Adapters, page 71.

## Connection of Motor and Encoder

The motor is designed for operation via a drive. Connecting the motor directly to line voltage will damage the motor and can cause fires.

## ADANGER

FIRE HAZARD DUE TO INCORRECT CONNECTION
Only connect the motor to a matching, approved drive.
Failure to follow these instructions will result in death or serious injury.

Compatibility between Drive and Motor is defined in the Drive / Motor combinations table, page 21.

High voltages may be present at the motor connection. The motor itself generates voltage when the motor shaft is rotated. AC voltage can couple voltage to unused conductors in the motor cable.

## AADANGER

## ELECTRIC SHOCK

- Verify that no voltage is present prior to performing any type of work on the drive system.
- Block the motor shaft to prevent rotation prior to performing any type of work on the drive system.
- Insulate both ends of unused conductors of the motor cable.
- Supplement the motor cable grounding conductor with an additional protective ground conductor to the motor housing.
- Verify compliance with all local and national electrical code requirements as well as all other applicable regulations with respect to grounding of all equipment.
Failure to follow these instructions will result in death or serious injury.

Drive systems may perform unintended movements if unapproved combinations of drive and motor are used. Even if motors are similar, different adjustment of the encoder system may be a source of hazards. Even if the connectors for motor connection and encoder connection match mechanically, this does not imply that the motor is approved for use.

| AWARNING |
| :--- |
| UNINTENDED MOVEMENT |
| Only use approved combinations of drive and motor. |
| Failure to follow these instructions can result in death, serious injury, or <br> equipment damage. |

Compatibility between Drive and Motor is defined in the Drive / Motor combinations table, page 21.

## Protective Ground Conductor Connection

- Ground the motor via a grounding screw if grounding via the flange and the protective ground conductor of the motor cable is not sufficient.
- Use parts with suitable corrosion protection.

## Connecting the Cables

Incorrect installation of the cable may destroy the insulation. Broken conductors in the cable or improperly connected connectors may be melted by arcs.

## A A DANGER

## ELECTRIC SHOCK, ARC FLASH AND FIRE CAUSED BY INCORRECT INSTALLATION OF THE CABLE

- Disconnect all power before plugging in or unplugging the connectors.
- Verify correct pin assignment of the connectors according to the specifications in this chapter before connecting the cables.
- Verify that the connectors are properly inserted and locked before applying power.
- Avoid forces or movements of the cable at the cable entries.

Failure to follow these instructions will result in death or serious injury.

- Connect the motor cable and the encoder cable to the drive according to the wiring diagram of the drive.
- If your motor is equipped with a holding brake, follow the instructions in chapter Holding Brake Connection, page 146.

## Holding Brake Connection

The holding brake in the motor has the task of holding the motor position when the power stage is disabled. The holding brake is not a safety function and not a service brake.

A motor with a holding brake requires a suitable holding brake controller which releases the brake when the power stage is enabled and locks the motor shaft when the power stage is disabled.

See chapter Holding Brake Connection, page 135 for additional information.
As a result of damage to the insulation of the motor cable, mains voltage may get to the wires for the holding brake.

## AADANGER

## ELECTRIC SHOCK CAUSED BY DAMAGE TO THE MOTOR CABLE

- Use a PELV power supply for the holding brake.
- Insulate both ends of unused conductors of the motor cable.

Failure to follow these instructions will result in death or serious injury.
When the product is operated for the first time, there is a risk of unanticipated movements caused by, for example, incorrect wiring or unsuitable parameter settings. Releasing the holding brake can cause an unintended movement, for example, lowering of the load in the case of vertical axes.

## AWARNING

## UNINTENDED MOVEMENT

- Verify that there are no persons or obstacles in the zone of operation when performing a test of the holding brake.
- Take appropriate measures to avoid damage caused by falling or lowering loads or other unintended movements.
- Run initial tests without coupled loads.
- Verify that a functioning emergency stop push-button is within reach of all persons involved in running tests.
- Anticipate movements in unintended directions or oscillations of the motor.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

## Cable Specifications

For further information on cable specifications, refer to chapter Cables, page 80.

## Verifying Installation

## What's in This Chapter

Verifying Installation

## Verifying Installation

Verify the mechanical installation of the entire drive system:

- Does the installation meet the specified distance requirements?
- Did you tighten all fastening screws with the specified tightening torque?

Verify the electrical connections and the wiring:

- Did you connect all protective ground conductors?
- Do all fuses have the correct rating; are the fuses of the specified type?
- Did you connect all wires of the cables or insulate them?
- Did you properly connect and install all cables and connectors?
- Are the mechanical locks of the connectors correct and effective?
- Did you properly connect the signal wires?
- Are the required shield connections EMC-compliant?
- Did you take all measures for EMC compliance?
- Does the drive installation conform to all local, regional, and national electrical safety codes for the eventual placement of the equipment?
Verify that all covers and seals of the control cabinet are properly installed to meet the required degree of protection.

## Commissioning

What's in This Part
Overview ..... 150
Integrated HMI ..... 153
Commissioning Procedure ..... 158
Tuning the Control Loops ..... 165

## Overview

What's in This Chapter
General ..... 150
Commissioning Tools ..... 152

## General

You must recommission an already configured device if you want to use it under different operating conditions.

The safety function STO (Safe Torque Off) does not remove power from the DC bus. The safety function STO only removes power to the motor. The DC bus voltage and the mains voltage to the drive are still present.

## AADANGER

## ELECTRIC SHOCK

- Do not use the safety function STO for any other purposes than its intended function.
- Use an appropriate switch, that is not part of the circuit of the safety function STO, to disconnect the drive from the mains power.

Failure to follow these instructions will result in death or serious injury.

Unsuitable settings or unsuitable data may trigger unintended movements, trigger signals, damage parts and disable monitoring functions. Some parameters and other operational data do not become active until after a restart.

## AWARNING <br> UNINTENDED EQUIPMENT OPERATION

- Only start the system if there are no persons or obstructions in the zone of operation.
- Do not operate the drive system with undetermined parameter values.
- Never modify a parameter value unless you fully understand the parameter and all effects of the modification.
- Restart the drive and verify the saved operational data and/or parameter values after modification.
- Carefully run tests for all operating states and potential error situations when commissioning, upgrading or otherwise modifying the operation of the drive.
- Verify the functions after replacing the product and also after making modifications to the parameter values and/or other operational data.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

If the power stage is disabled unintentionally, for example as a result of a power outage, errors or functions, the motor is no longer decelerated in a controlled way.

| AWARNING |
| :--- |
| UNINTENDED EQUIPMENT OPERATION |
| Verify that movements without braking effect cannot cause injuries or equipment |
| damage. |
| Failure to follow these instructions can result in death, serious injury, or |
| equipment damage. |

Applying the holding brake while the motor is running will cause excessive wear and loss of the braking force.

## A WARNING

## LOSS OF BRAKING FORCE DUE TO WEAR OR HIGH TEMPERATURE

- Do not use the holding brake as a service brake.
- Do not exceed the maximum number of brake applications and the kinetic energy during braking of moving loads.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

The metal surfaces of the product may exceed $70^{\circ} \mathrm{C}\left(158{ }^{\circ} \mathrm{F}\right)$ during operation.

## AWARNING

## HOT SURFACES

- Avoid unprotected contact with hot surfaces.
- Do not allow flammable or heat-sensitive parts in the immediate vicinity of hot surfaces.
- Verify that the heat dissipation is sufficient by performing a test run under maximum load conditions.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

Rotating parts may cause injuries and may catch clothing or hair. Loose parts or parts that are out of balance may be ejected.

## AWARNING <br> MOVING, UNGUARDED EQUIPMENT <br> Verify that rotating parts cannot cause injuries or equipment damage. <br> Failure to follow these instructions can result in death, serious injury, or equipment damage.

When the product is operated for the first time, there is a risk of unanticipated movements caused by, for example, incorrect wiring or unsuitable parameter settings. Releasing the holding brake can cause an unintended movement, for example, lowering of the load in the case of vertical axes.

## AWARNING

## UNINTENDED MOVEMENT

- Verify that there are no persons or obstacles in the zone of operation when performing a test of the holding brake.
- Take appropriate measures to avoid damage caused by falling or lowering loads or other unintended movements.
- Run initial tests without coupled loads.
- Verify that a functioning emergency stop push-button is within reach of all persons involved in running tests.
- Anticipate movements in unintended directions or oscillations of the motor.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

The product can be accessed via different types of access channels.
Simultaneous access via multiple access channels or the use of exclusive access may cause unintended equipment operation.

## A WARNING

## UNINTENDED EQUIPMENT OPERATION

- Verify that simultaneous access via multiple access channels cannot cause unintended triggering or blocking of commands.
- Verify that the use of exclusive access cannot cause unintended triggering or blocking of commands.
- Verify that the required access channels are available.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

## Commissioning Tools

## Overview

The following tools, page 71 can be used for commissioning, parameterization, and diagnostics:

| Item | Description |
| :--- | :--- |
| 1 | Integrated HMI |
| 2 | PC with commissioning software LXM28 DTM Library |
| 3 | Fieldbus |

Device settings can be duplicated. Stored device settings can be transferred to a device of the same type. Duplicating the device settings can be used if multiple devices are to have the same settings, for example, when devices are replaced.

## Integrated HMI

What's in This Chapter
Overview ..... 153
Integrated HMI Structure ..... 154
7-Segment Display ..... 154
Status Information Via the HMI ..... 156

The integrated HMI allows you to edit parameters, start the operating mode Jog or perform autotuning via the integrated Human-Machine Interface (HMI).
Diagnostics information (such as parameter values or error codes) can also be displayed. The individual sections on commissioning and operation include information on whether a function can be carried out via the integrated HMI or whether the commissioning software must be used.

| Item | Description |
| :--- | :--- |
| 1 | 5-digit 7-segment display |
| 2 | OK key |
| 3 | Arrow keys |
| 4 | M key |
| 5 | S key |

Incorrect wiring of the motor connection may cause live wires to be exposed outside of the motor connector below the HMI.

## AADANGER

## ELECTRIC SHOCK CAUSED BY INCORRECT WIRING

- Verify that the protective ground connection (PE) of the device is connected to ground.
- Do not remove the cable end (ferrule) from the protective ground terminal (PE) of the motor connector until you are prepared to wire the protective ground conductor of the motor to the protective ground terminal (PE) of the motor connector.
- Verify that no bare metal of the wires is exposed outside of the motor connector housing when wiring the motor connector.
- Regularly, as part of a maintenance plan, assure that the motor wires are secured in the terminals of the motor connector due to vibration or other influences.
Failure to follow these instructions will result in death or serious injury.

## Integrated HMI Structure

When the drive is powered on, the display shows the name of the selected status information function for approximately one second; after that, it displays the corresponding actual value or status value.

| Element | Function |
| :--- | :--- |
| HMI display | The 5-digit 7-segment display shows actual values, parameter settings, status <br> information, and error codes. |
| $\mathbf{M}$ key | The M key lets you switch between the type of information displayed: status <br> information/actual values, error codes, and parameters. <br> If an error is detected, the display shows the error code. If you press the $\mathbf{M}$ while the <br> error is active, you can display other information; however, after approximately 20 <br> seconds without interaction, the error code is displayed again. |
| $\mathbf{S}$ key | The $\mathbf{S}$ lets you scroll through the parameter groups. <br> After you have selected a parameter and its value is displayed, you can use the $\mathbf{S}$ <br> key to move the cursor to the left. The digit at the current cursor position flashes. The <br> arrow keys let you change the value at the current cursor position. |
| Arrow keys | The arrow keys let you scroll through the actual values/status information and the <br> parameters within a parameter group. Use the arrow keys to increase or decrease <br> values. |
| OK key | After you have selected a parameter, press the OK key to display the current <br> parameter value. The arrow keys let you change the displayed value. Pressing the <br> OK key again saves the value. |

## 7-Segment Display

## Saving Settings

If you set a new parameter value and press the OK key, a message is displayed for approximately one second to provide feedback.

| 7-segment <br> display | Description |
| :--- | :--- |
| $5 R \_E d$ | The new parameter value was successfully saved. |
| $r-a L Y$ | The parameter value is a read-only value and cannot be saved (Read-Only). |
| $P r a t$ | Changing a parameter value requires exclusive access. See chapter Access <br> Channels, page 269. |
| $a \sim E-r$ | The new parameter value is outside the permissible value range (Out of range). |

| 7-segment <br> display | Description |
| :--- | :--- |
| $5 r$ arn | The new parameter value can only be saved when the power stage is disabled <br> (Servo On). |
| Pa-Dn | The new parameter value becomes active the next time the product is powered <br> on (Power On). |
| Errar | Displayed whenever a value you have entered for a parameter is, for various <br> reasons, rejected by the drive. |

## Representation of Numerical Values on the 7-Segment Display

The illustration below shows the decimal representation of a 16-bit value and a 32bit value as a positive value and as a negative value each.

Example of representation of decimal values

1285:

S

-1285 :

S

Negative Sign

2147483647:

-2147483648:

Example of representation of hexadecimal values

## Changing the Sign Via the 7－Segment Display

| 7－segment display | Description |
| :---: | :---: |
|  | You can change the sign of a value by holding down the $\mathbf{S}$ key for a period of more than 2 seconds． <br> Negative decimal values are represented with a dot between the second and the third position．Negative hexadecimal values are represented as a two＇s complement． |

## Alert Messages and Error Messages on the 7－Segment Display

| 7－segment display | Description |
| :---: | :---: |
| Wחnח\％ | If an alert condition is detected，Wnnnn is displayed．Win identifies the code as an alert．The subsequent 3 digit nnn represent the number of the alert．For a list of alert codes，refer to Alert Codes and Error Codes，page 370. |
| ALnno | If an error is detected ALnnn is displayed．AL identifies the code as a detected error．The subsequent 3 digit nnn represent the error number．For a list of error codes，refer to Alert Codes and Error Codes，page 370. |
| Star | The display shows STOP if exclusive access is enableds while the power stage is still enabled．For further information on access channels，refer to Access Channels，page 269. |
| －－－－ | The display shows－－－－if the drive boot was unsuccessful．It may be caused by corrupted or missing firmware，or because the hardware is inoperable．Contact your local Schneider Electric service representative． |

## Status Information Via the HMI

After you have powered on the drive，status information is displayed via the HMI． Use the parameter $P 0-02$ to select the type of status information to be displayed． For example，if you set the parameter $P 0-02$ to the value 7 ，the speed of rotation of the motor after is displayed after you have powered on the drive．

| Setting P0－ <br> $\mathbf{0 2}$ | Description |
| :--- | :--- |
| 0 | Actual position（with gear ratio applied）in the unit PUU |
| 1 | Target position（with gear ratio applied）in the unit PUU |
| 2 | Deviation between actual position and target position（with gear ratio applied）in the <br> unit PUU |
| 3 | Actual position in motor increments（1280000 pulses／revolution） |
| 4 | Darget position in motor increments（1280000 pulses／revolution） <br> pulses／revolution） |
| 5 | Reference value in kilopulses per second（kpps） |
| 6 | Actual velocity in rpm |
| 7 | Voltage for target velocity in V |
| 8 | Target velocity in rpm |
| 9 | Voltage for target torque in V |
| 10 | Target torque in percent of continuous motor current |
| 11 | Average load of the motor in percent of continuous motor current（The sampling <br> window duration is specified via parameter P4－29） |
| 12 |  |

| Setting PO- <br> 02 | Description |
| :---: | :---: |
| 13 | Peak load of the motor since the last power cycle of the drive in percent of continuous motor current (maximum value of occurring in setting 12 since last power cycle) |
| 14 | Mains voltage in V |
| 15 | Ratio of load inertia and motor inertia (divided by 10) |
| 16 | Power stage temperature in degrees Celsius ( ${ }^{\circ} \mathrm{C}$ ) |
| 17 | Resonance frequency in Hz |
| 18 | Absolute pulse number relative to encoder |
| 19 | Mapping parameter 1: Content of parameter $P 0-25$ (mapping target is specified via parameter P0-35) |

www.se.com
```

## Setting the Device Address, Baud Rate and Connection Settings

> Each device is identified by a unique address. Each device must have its own unique node address, which may only be assigned once in the network. The transmission rate (baud rate) must be the same for all devices in the network.
> Use the parameter P3-00 to set the Modbus device address.
> Use the parameter P3-05 to set the CANopen device address.
> Use the parameter P3-01 to set the baud rate.
> Use the parameter P3-02 to set the connection settings.

Setting the baud rate:

Modbus Connection Settings

## A WARNING

## UNINTENDED EQUIPMENT OPERATION

- Verify that there is only one master controller configured on the network or remote link.
- Verify that all devices have unique addresses.
- Confirm that the device address is unique before placing the system into service.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |

## Verifying the Direction of Movement

## Direction of Movement

## AWARNING <br> UNINTENDED MOVEMENT CAUSED BY INTERCHANGED MOTOR PHASES <br> Do not interchange the motor phases. <br> Failure to follow these instructions can result in death, serious injury, or equipment damage.

If your application requires an inversion of the direction of movement, you may parameterize the direction of movement.

Movements are made in positive or in negative directions.
Definition of the direction of movement: Positive direction of movement is when the motor shaft rotates counterclockwise as you look at the end of the protruding motor shaft.

Direction of movement with factory settings

## Verifying the Direction of Movement

- Start the operating mode Jog. (HMI: Рч-ロ5)

The HMI displays the velocity in the unit rpm for the operating mode JOG.

- Set a velocity suitable for your application and conform with the OK key.

The HMI displays $J \square \square$.
Movement in positive direction:

- Press the Up Arrow key.

A movement is made in positive direction.
Movement in negative direction:

- Press the Down Arrow key.

A movement is made in negative direction.
Press the M key to terminate the operating mode Jog.

## Changing the Direction of Movement

If the expected direction of movement and the actual direction of movement are not identical, you can invert the direction of movement.

- Inversion of direction of movement is not activated:

Movements are made in positive direction with positive target values.

- Inversion of direction of movement is activated:

Movements are made in positive direction with negative target values.
The parameter P1-01 C = 1 allows you to invert the direction of movement.
Changing the direction of movement

## P1-01 <br> 

## Test Operation in Operating Mode Velocity (V)

- Select the operating mode Velocity $(\mathrm{V})$ via the parameter $P 1-01$ : $=2$. Refer to Setting the Operating Mode, page 286.
- Set the parameter $P 1-01$ to $D=1$. This assigns defaults to the signal input functions for the operating mode Velocity (V), DI6...DI8 presets must be modified for this test.

New settings for the parameter P1-01 do not become active until the drive is powered on the next time.

- Restart the drive.
- Select the following signal input functions via the parameters P2-10 to P2-17:

| Digital input | Parameter | Setting | Signal | Function | Pin at CN1 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| DI1 | $P 2-10$ | $0101_{h}$ | SON | Enable power stage | 9 |
| DI2 | $P 2-11$ | $0109_{h}$ | TRQLM | Activate Torque Limitation | 10 |
| DI3 | $P 2-12$ | $0114_{h}$ | SPD0 | Velocity Reference Value Bit 0 | 34 |
| DI4 | $P 2-13$ | $0115_{h}$ | SPD1 | Velocity Reference Value Bit 1 | 8 |
| DI5 | $P 2-14$ | $0102_{h}$ | FAULT_RESET | Fault Reset | 33 |
| DI6 | $P 2-15$ | $0_{h}$ | - | - | 32 |
| DI7 | $P 2-16$ | $0_{h}$ | - | - | 31 |
| DI8 | $P 2-17$ | $0_{h}$ | - | - | 30 |

For further information on the settings, refer to Setting the Digital Signal Inputs, page 271.

## Error Messages HMI

If the default presets of the signal inputs OPST, CWL(NL), and CCWL(PL/LIMP) are still present, the following error codes can be displayed:

- AL013: Parameter P2-17 not set to 0 (deactivated).
- AL014: Parameter P2-15 not set to 0 (deactivated).
- AL015: Parameter P2-16 not set to 0 (deactivated).

For further information on error messages, refer to Diagnostics and Troubleshooting, page 370.

## Target Velocity

The target velocity is selected via the signal input functions SPD0 (least significant bit) and SPD (most significant bit):

| - | Signal state of the digital signal inputs |  | Target velocity via: |  | Range |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | SPD1 | SPD0 |  |  |  |
| S1 | 0 | 0 | External analog signal | Voltage between V_REF (pin 42) and GND (pin 44) | $-10 . .10 \mathrm{Vdc}$ |
| S2 | 0 | 1 | Internal parameters | P1-09 | -60000 ... $60000 \times 0.1 \mathrm{rpm}$ |
| S3 | 1 | 0 |  | P1-10 |  |
| S4 | 1 | 1 |  | P1-11 |  |

- Enable the power stage via DI1 (SON).

If DI3 (SPD0) and DI4 (SPD1) are deactivated, the target velocity is supplied via the analog input V_REF.

- Activate DI3 (SPD0).

The target velocity is supplied via the parameter P1-09. The factory setting for the target velocity is 1000 rpm .

## Verifying the Safety Function STO

The safety function STO must be tested at least once per year.
Procedure:

- Operate the system with the nominal voltage at the STO inputs as described in the chapter Inputs / Outputs Characteristics, page 39.
- Enable the power stage (operating state 6 Operation Enabled).
- Trigger the safety function STO by switching off the voltage (for example, via an emergency stop push-button).

The power stage is disabled and the error message AL501 is displayed.

- Verify that drive is in the operating state Fault.
- Check whether the drive can be set to the operating state 6 Operation Enabled.

The drive remains in the operating state Fault.

- Restore the STO voltage at the signal inputs of the safety function STO and trigger a Fault Reset.
- Verify that the drive can be set to the operating state 6 Operation Enabled. The drive is set to the operating state 6 Operation Enabled. Movements are possible again.

## Tuning the Control Loops

What's in This Chapter
Tuning the Control Loops ..... 165
Easy Tuning ..... 165
Comfort Tuning ..... 166
Manual Tuning ..... 172

## Tuning the Control Loops

Autotuning and manual tuning move the motor in order to tune the control loops. Incorrect parameters may cause unintended movements or the loss of monitoring functions.

## AWARNING

## UNINTENDED MOVEMENT

- Only start the system if there are no persons or obstructions in the zone of operation.
- Verify that the values for the parameters $P 9-26$ and $P 9-27$ do not exceed the available movement range.
- Verify that the parameterized movement ranges are available.
- In determining the available movement range, consider the additional distance for the deceleration ramp in the case of an EMERGENCY STOP.
- Verify that the parameter settings for a Quick Stop are correct
- Verify correct operation of the limit switches.
- Verify that a functioning emergency stop push-button is within reach of all persons involved in the operation.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

Autotuning adapts the control performance of the drive to the mechanical system used and optimizes the control loop settings appropriately. External factors such as a load at the motor are considered. The control loop settings can also be optimized by using manual tuning.

Two autotuning methods and manual tuning are provided for control loop optimization:

- Easy Tuning: This type of autotuning is performed without user intervention. For most applications, Easy Tuning yields good, highly dynamic results.
- Comfort Tuning: This type of autotuning is performed with user intervention. You can select optimization criteria and set parameters for movement, direction, and velocity.
- Manual Tuning: This type of tuning allows you to perform test movements and optimize the control loop settings using the Scope function.

## Easy Tuning

Easy Tuning is started via the HMI or the commissioning software LXM28 DTM Library.

Easy Tuning requires an available movement range of 5 revolutions. During Easy Tuning, movements of 2.5 revolutions are performed in positive direction of movement and 2.5 revolutions in negative direction of movement. If this movement range is not available, you must use Comfort Tuning.

Easy Tuning can be used for a ratio of motor inertia to load inertia of up to 1:50.

## Performing Easy Tuning

Set the parameter P2-32 to 1 to perform Easy Tuning.

After you have started Easy Tuning via P2-32, the display of the HMI shows the progress as a percentage from tn000 to tn100.

Press the $\mathbf{M}$ button of the HMI to cancel autotuning.
If autotuning completes successfully, the display of the HMI shows the message done.

Press the OK key of the HMI to save the control loop parameters. The display of the HMI briefly shows the message saved.

Press the $\mathbf{M}$ key of the HMI to discard the autotuning results.
If autotuning does not complete successfully, the display of the HMI shows the message ERROR. The cause can be read with the parameter P9-30.

The parameter P9-37 provides additional information on the last event that occurred during autotuning.

## Comfort Tuning

Comfort Tuning allows you to select optimization criteria and set values for the movement.

## Optimization Criteria for Comfort Tuning

Comfort Tuning allows you to select an optimization criterion for autotuning. The following optimization criteria are available:

- Optimization of the control loop parameters for minimum settling time with vibration suppression
- Optimization of the control loop parameters for minimum overshoot with vibration suppression
- Optimization of the control loop parameters for minimum settling time without vibration suppression
- Optimization of the control loop parameters for minimum overshoot without vibration suppression
The illustration below shows optimization for minimum overshoot and optimization for minimum settling time.

| Item | Description |
| :--- | :--- |
| 1 | Optimization for minimum overshoot |
| 2 | Optimization for minimum settling time |

Vibration suppression compensates resonance frequencies of the mechanical system. The option Vibration Suppression is available for both optimization criteria.

## Parameters for the Movement for Comfort Tuning

The following settings must be made for Comfort Tuning:

- Direction of movement
- Velocity
- Acceleration and deceleration
- Movement range
- Smoothing

These values must be as close as possible to the values used in the actual application. If you enter implausible values, Comfort Tuning is canceled.

## Setting the Direction of Movement

Set the direction of movement via the parameter P9-20.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| P9-20 <br> LTNCYCLE | Autotuning - Direction of Movement <br> Applicable operating mode: PT, PS, V <br> This parameter sets the direction of movement for autotuning. <br> Value 0: Both directions of movement <br> Value 2: One direction of movement | 0 <br> 0 <br> 3 <br> Decimal | s16 <br> RW | Modbus A28h <br> CANopen 4914h |

## Setting the Velocity

Set the velocity via the parameter P9-29.
The velocity must be between $10 \ldots 100 \%$ of the nominal velocity $n_{N}$.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| P9-29 <br> LTNVCRUISE | Autotuning - Velocity <br> Applicable operating mode: PT, PS, V <br> Bits $0 \ldots 15$ : Velocity for positive direction of movement <br> Bits $16 \ldots 31$ : Velocity for negative direction of movement | $0.1 \mathrm{rpm} \mid 0.1 \mathrm{rpm}$ <br> Decimal | u32 <br> RW | Modbus $\mathrm{A}_{3} \mathrm{~A}_{\mathrm{h}}$ <br>  |

## Setting Acceleration and Deceleration

Set the acceleration and the deceleration with the P9-31 parameter.
The value for the acceleration and the value for the deceleration must be between $t_{\text {min }}$ and $t_{\text {max }}$ :

$$
t_{\min }=\frac{100}{90} 20 \pi \frac{J_{M}+J_{\text {load }}}{M_{\max }} \quad t_{\max }=\frac{100}{33} 20 \pi \frac{J_{M}+J_{\text {load }}}{M_{N}}
$$

$\mathrm{J}_{\mathrm{M}}=$ Moment of inertia of the motor in $\mathrm{kg} \mathrm{cm}^{2}$
$J_{\text {load }}=$ Moment of inertia of the load in $\mathrm{kg} \mathrm{cm}^{2}$
$M_{\text {max }}=$ Peak torque in Nm
$\mathrm{M}_{\mathrm{N}}=$ Nominal torque in Nm

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |

## Setting the Movement Range

Set the movement range via parameters P9-26 and P9-27.
The movement range must be sufficiently large to allow for a constant movement at the set speed in addition to the acceleration phase and the deceleration phase.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |

## Setting Smoothing

Comfort Tuning uses S-curve smoothing by default. The value for smoothing via the S-curve is optimized during Comfort Tunings.

The parameter P9-23 allows you to change from automatic smoothing to manual smoothing.

The following options are available for manual smoothing:

- No smoothing
- Smoothing via low-pass filter with a fixed value
- Smoothing via S-curve with a fixed value

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| P9-23 <br> LTNSTIFF | Defines which values are used for the position command filters. <br> Applicable operating mode: PT, PS, V <br> Value 0: Automatic smoothing via S-curve optimization of the value <br> Value 1: Manual smoothing | 0 <br> 0 <br> 1 <br> Decimal | u16 <br> RW | Modbus A2E ${ }_{h}$ <br> CANopen 4917h |
| P8-34 <br> MOVESMOOTHMODE | Smoothing Filter for Operating modes PT and PS Type <br> Applicable operating mode: PT, PS <br> Value 0: No smoothing <br> Value 1: LPF smoothing <br> Value 2: S-curve smoothing <br> Setting can only be modified if power stage is disabled. | 0 <br> 2 <br> 2 <br> Decimal | u16 <br> RW <br> per. | Modbus 944h CANopen 4822h |

The illustration below shows the movement during Comfort Tuning if smoothing via the low-pass filter is used:
Comfort Tuning with smoothing via low-pass filter

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| P8-33 <br> MOVESMOOTHLPFHZ | Low Pass Filter Setting <br> Applicable operating mode: PT, PS | Hz <br> 1 <br> 5000 <br> 500000 <br> Decimal | u32 <br> RW <br> per. | Modbus 942h <br> CANopen 4821h |

The illustration below shows the movement during Comfort Tuning if smoothing via an S-curve is used:

Comfort Tuning with smoothing via S-curve

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| $P 8-32$ <br> MOVESMOOTHAVG | S-Curve Setting <br> Applicable operating mode: PT, PS <br> Setting can only be modified if power stage is disabled. <br> The maximum value is reduced to 12800 if $P 8$ - 35 CONTROLMODE (high byte) is set to 5 . | 0.01 ms <br> 25 <br> 400 <br> 25600 <br> Decimal | u32 <br> RW <br> per. | Modbus 940h <br> CANopen 4820 h |

## Performing Comfort Tuning

Start Comfort Tuning by selecting the required method via the parameter P2-32.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address <br> via fieldbus |
| :--- | :--- | :--- | :--- | :--- |
| ATMODE | Autotuning <br> Applicable operating mode: PT, PS, V <br> This parameter is used to start autotuning with the <br> selected autotuning method. <br> Value 0: Stop Autotuning <br> Value 1: Easy Tuning <br> Value 2: Comfort Tuning [minimum settling time, <br> vibration suppression] <br> Value 3: Comfort Tuning [minimum overshoot, <br> vibration suppression] <br> Value 52: Comfort Tuning [minimum settling time, <br> no vibration suppression] <br> Value 53: Comfort Tuning [minimum overshoot, no <br> vibration suppression] | - <br> 56 | RW | Re |

If you want Comfort Tuning in both directions, set parameter P9-20 to 0. Then set the parameters P9-26 and P9-27 to the same values, but with different signs (for example, P9-26 $=-20000$ and P9-27 $=+20000$ ). The value determines the movement range in both directions.

If you want Comfort Tuning in a single direction, set parameter P9-20 to 2. Then set the parameters P9-26 and P9-27 to the same values. The sign of the value determines the direction for Comfort Tuning. For example, if you set P9-26 = -20000 and P9-27 = -20000, Comfort Tuning is performed in negative direction of movement with a movement range of 20000 PUU.

NOTE: If you do not enter consistent values for parameters P9-26 and P9-27, the autotuning is unsuccessful. Parameter P9-30 contains the information on the unsuccessful autotuning attempt.

After you have started the required Comfort Tuning method via P2-32, the display

Press the $\mathbf{M}$ button of the HMI to cancel autotuning.
If autotuning completes successfully, the display of the HMI shows the message danE.

Press the OK key of the HMI to save the control loop parameters. The display of the HMI briefly shows the message 5 RVEd.

Press the $\mathbf{M}$ key of the HMI to discard the autotuning results.
If autotuning does not complete successfully, the display of the HMI shows the message $E r r a r$. The cause can be read with the parameter P9-30.

The parameter P9-37 provides additional information on the last event that occurred during autotuning.

## Manual Tuning

Manual tuning is performed in the operating mode Internal Profile. Manual tuning allows you to perform test movements and optimize the control loop settings using the Scope function.

NOTE: Manual tuning should only be attempted by trained persons who are familiar with and understand the contents of this manual and all other pertinent product documentation. These persons must have sufficient technical training, knowledge, and experience and be able to foresee and detect potential hazards and issues that may be caused by manual tuning, by changing the settings and by the mechanical, electrical, and electronic equipment of the entire system in which the product is used. No responsibility is assumed by Schneider Electric for any consequences arising out of the use of manual tuning.

In addition to the low-pass filter, electronic gear filter function can be used in the following cases:

- Pulse and direction command has a low resolution
- Low rigidity of the coupling between motor and load
- Movement is too short
- Motor is noisy after tuning
- Current is unstable during tuning
- Motor temperature is unusually high

## Procedure for Manual Tuning

The control loop parameters are tuned in the following sequence:

| Step | Item | Parameters |
| :---: | :--- | :--- |
| 1 | Derivative gain, page 173 | $P 8-00$ (LTND) |
| 2 | Low-pass filter, page 175 | $P 8-14$ (NLFILTDAMPING) |
|  |  | $P 8-15$ (NLFILTT1) |

| Step | Item | Parameters |
| :---: | :--- | :--- |
| 3 | Retuning of the derivative gain, page 177 | $P 8-00$ (LTND) |
| 4 | Proportional gain, page 177 | $P 8-03$ (LTNP) |
| 5 | Derivative-integral gain, page 180 | $P 8-02$ (LTNIV) |
| 6 | Integral gain, page 182 | $P 8-01$ (LTNI) |
| 7 | Compensation of the flexibility of the mechanical <br> system, page 183 | P8-05 (NLAFFLPFHZ) <br> $88-20$ (NLPEAFF) |

Depending on the requirements concerning the control performance, steps 2 and 3 can be omitted. Perform a movement in both directions after each of the steps below to check the recorded parameter values on the Scope tab of the commissioning software LXM28 DTM Library.

## Step 1: Setting the Derivative Gain

The objective of tuning the derivative gain is to achieve a current ripple that is as low as possible. The optimum value primarily depends on the load.

Criteria for a well-tuned derivative gain include:

- For loads less than twice the rotor inertia: $5 \%$ of the nominal current may be acceptable
- For greater loads: $10 \%$ of the nominal current may be acceptable

The derivative gain is set via parameter $\mathrm{P} 8-00$ (LTND).
Procedure:

- Set the value of parameter P8-03 (LTNP) to 150 (corresponds to 15 Hz ).
- Set the value of parameter P8-01 (LTNI) to 0 .
- Set the value of parameter P8-02 (LTNIV) to 0 .
- Progressively increase the value of parameter P8-00 (LTND) until the oscilloscope shows oscillation of the reference current, P11-11 (TCMD).

Example P8-00 (LTND) set to 1340 ( 134 Hz )

Example P8-00 (LTND) set too high at $2000(200 \mathrm{~Hz})$

Example P8-00 (LTND) OK at $1500(150 \mathrm{~Hz})$

Example P8-00 (LTND) set too low at $100(10 \mathrm{~Hz})$

NOTE: The process of tuning requires trials of successive approximations. Values that are too high or too low relative to the other relevant values might cause instability. If it is necessary to have a low or high value of the parameter in the preceding example, you may need to adjust the values of the other relevant parameters to compensate and achieve a stable system.

## Step 2: Setting the Low-Pass Filter

Setting the low-pass filter is an optional step in manual tuning of the control loop parameters. The low-pass filter parameters are optimized after you have tuned the derivative gain. The objective of tuning the low-pass filter parameters is to suppress high-frequency resonance and reduce the response time of the control loops to a minimum.

The low-pass filter is set via parameters $\operatorname{P8-14}$ (NLFILTDAMPING) and $P 8-15$ (NLFILTT1).
The parameter P8-14 (NLFILTDAMPING) maintains the bandwidth of the lowpass filter up to the cutoff frequency. The parameter value is expressed as a percentage. The parameter $P 8-15$ (NLFILTT1) sets the inverse frequency of the cutoff frequency. The parameter P8-14 (NLFILTDAMPING) can also be used independently to allow for a certain degree of compensation of system-related bandwidth limits.

Criteria for a well-tuned low-pass filter include:

- The value of parameter P8-14 (NLFILTDAMPING) is as high as possible.
- The value of parameter $P 8-15$ (NLFILTT1) is as low as possible.

When P8-35 (CONTROLMODE) (high byte) is set to 5 , the following table presents the values for 10 \% overshoot. Set the filter parameter values $P 8-14$ (NLFILTDAMPING) and P8-15 (NLFILTT1) accordingly:

| Frequency (Hz) | $\boldsymbol{P 8} \mathbf{- 1 4}$ (NLFILTDAMPING) (\%) | $\boldsymbol{P 8}-15$ (NLFILTT1) (ms) |
| :--- | :--- | :--- |
| 100 | 98.27 | 122.86 |
| 200 | 29.3 | 96.5 |
| 300 | 14.3 | 95 |
| 400 | 7.9 | 93.32 |
| 500 | 5.05 | 91.677 |
| 600 | 3.5 | 90.03 |
| 700 | 2.566 | 88.4 |
| 800 | 2 | 86.934 |
| 900 | 1.6056 | 85.457 |
| 1000 | 1.31 | 83.98 |
| 1100 | 1.09 | 82.45 |
| 1200 | 0.928694 | 81.1 |
| 1300 | 0.815 | 79.9 |
| 1400 | 0.7 | 78.4 |
| 1500 | 0.62 | 77 |
| 1600 | 0.555 | 75.97 |
| 1700 | 0.496 | 74.6 |
| 1800 | 0.439 | 73 |
| 1900 | 0.406 | 72.19 |
| 2000 |  | 70.5 |
|  |  |  |

Electronic gear filter example 1:

Increasing P8-27 (GEARFILTT1) smooths the input command, but adds a delay.
Electronic gear filter example 2:

Increasing P8-28 (GEARFILTT2) and P8-29 (GEARFILTVELFF) compensate the delay, but adds overshoots.

If P8-29 (GEARFILTVELFF) has the same value as P8-28 (GEARFILTT2), there is no delay.
Usual values:

- P8-27 (GEARFILTT1) is usually around 2 times the input step width
- P8-28 (GEARFILTT2) is usually 2 times P8-27 (GEARFILTT1)

NOTE: When a system has multiple axes, gear filter values must be the same for all axes.
Procedure:

- Progressively increase the value of parameter P8-14 (NLFILTDAMPING) until the oscilloscope shows noise and/or oscillation of the reference current, P1111 (TCMD).
- Progressively decrease the value of parameter P8-15 (NLFILTT1) until the oscilloscope shows noise and/or oscillation of the reference current P11-11 (TCMD).
- Increase the value of parameter P8-15 (NLFILTT1) by $20 \%$, however, by at least 0.05 ms .
Example P8-14 (NLFILTDAMPING) OK (75 \%)

Example P8-15 (NLFILTT1) too low ( 0.5 ms )

Example P8-15 (NLFILTT1) OK (1.2 ms)

## Step 3: Re-Tuning of the Derivative Gain

If you have modified the low-pass filter values in parameters $P 8$-14 (NLFILTDAMPING) and P8-15 (NLFILTT1), the derivative gain can be set to a greater value via parameter P8-00 (LTND). Follow the procedure described in step 1.

The objective of tuning the proportional gain is to get a constant and low position deviation in the acceleration phase, the constant velocity phase, and the deceleration phase and to have no oscillations during the transitions between these phases. In the oscilloscope, this is indicated by a shape that is as square and as flat as possible.

Criteria for a well-tuned proportional gain include:

- No or minimum overshoot of position deviation
- No or minimum current ripple
- No or minimum oscillations at standstill

## Step 4: Setting the Proportional Gain

The proportional gain is set via parameter P8-03 (LTNP).

## Procedure:

- Progressively increase the value of parameter P8-03 (LTNP) to find the optimum value. The figures below show examples of the plot as the value approaches the optimum value.

Example P8-03 (LTNP) starting value ( 13 Hz )

Example P8-03 (LTNP) position deviation decreased ( 25 Hz )

Example P8-03 (LTNP) position deviation further decreased (35 Hz)

Example P8-03 (LTNP) position deviation further decreased ( 45 Hz )

Example P8-03 (LTNP) value too high - oscillation at standstill ( 65 Hz )

Example P8-03 (LTNP) value too high - oscillation at standstill ( 75 Hz )

Example P8-03 (LTNP) value too high - oscillation at standstill, overshoot of position deviation $(100 \mathrm{~Hz})$

Example P8-03 (LTNP) OK (65 Hz)

## Step 5: Setting the Derivative-Integral Gain

The objective of tuning the derivative-integral gain is to reduce the position deviation. As a general rule, the value for the derivative-integral gain (P802LTNIV) is within the following range:

P8-03 (LTNP) / $2<$ P8-02 (LTNIV) < $2 \times$ P8-03 (LTNP)
Progressively increasing the value of the derivative-integral gain progressively decreases the position deviation during the acceleration phase, the constant velocity phase, and the deceleration phase.

Criteria for a well-tuned derivative-integral gain include:

- Position deviation decreases rapidly after each transition of the movement phases (jerk)
- No or minimum overshoot of position deviation
- No or minimum oscillations during transitions between the movement phases
- Oscillations at standstill as low as possible (+/- 1 encoder increment)

The derivative-integral gain is set via parameter P8-02 (LTNIV).
Procedure:

- Progressively increase the value of parameter P8-02 (LTNIV) to find the optimum value. The figures below show examples of the plot as the value approaches the optimum value.

Example P8-02 (LTNIV) starting value ( 30 Hz )

Example P8-02 (LTNIV) position deviation decreased ( 60 Hz )

Example P8-02 (LTNIV) position deviation decreases rapidly when target velocity is reached $(90 \mathrm{~Hz})$

Example P8-02 (LTNIV) value too high - oscillation at standstill, overshoot of position deviation ( 120 Hz )

Example P8-02 (LTNIV) OK (90 Hz)

## Step 6: Setting the Integral Gain

The objective of tuning the integral gain is to reduce the position deviation during movements and at standstill.

Criteria for a well-tuned integral gain include:

- Position deviation further reduced
- No or minimum overshoot of position deviation at the end of the deceleration phase
- Oscillations at standstill as low as possible (+/- 1 encoder increment)

The integral gain is set via parameter P8-01 (LTNI).
Procedure:

- Progressively increase the value of parameter P8-01 (LTNI) until the oscilloscope shows overshoot or oscillations. The figures below show examples of the plot as the value approaches the optimum value.

Example P8-01 (LTNI) value too high - oscillation at standstill, overshoot of position deviation ( 50 Hz )

Example P8-01 (LTNI) OK ( 25 Hz )

## Step 7: Compensation of the Flexibility of the Mechanical System

The parameters for compensation of the system flexibility reduce the vibrations caused by abrupt changes in the acceleration (jerk). The parameters can also be used to further minimize overshoot or settling time.

The value of parameter $P 8-20$ (NLPEAFF) reflects the oscillation frequency of the mechanical system, i.e. the coupling between the motor and the load. The coupling can be very rigid (for example, a direct drive or a low-backlash coupling) and less rigid (for example, a belt drive or an elastic coupling). Systems with a high rigidity require a high value. Systems with high load inertia and less rigid couplings require lower values. The less rigid the coupling, the lower this frequency. Depending on the application, the typical value range is $400 \ldots 30 \mathrm{~Hz}$.

The parameter P8-05 (NLAFFLPFHZ) sets a low-pass filter for the acceleration profile. If the target value has a relatively low resolution as, for example, in the case of a pulse train input, the calculated acceleration may be subject to noise. The low-pass filter set via this parameter can be used to smooth the acceleration profile. The parameter can be used if the flexibility compensation set via parameter P8-20 (NLPEAFF) results in noise.

The compensation of the flexibility of the mechanical system is set via parameters P8-05 (NLAFFLPFHZ) and P8-20 (NLPEAFF).

Procedure:

- Set the value of parameter P8-05 (NLAFFLPFHZ) to a value three times as high as that of parameter P8-20 (NLPEAFF). With this value, the bandwidth of this low-pass filter is sufficiently higher than the response time of the system.
- Progressively decrease the value of parameter P8-20 (NLPEAFF) to find the optimum value. The optimum value depends on your optimization criterion: either short settling time or low position deviation.

Start with a high frequency of 400 Hz . Decrease the value and compare the amplitudes for the position deviation and the settling time. Select the most suitable value according to your optimization criterion. The figures below show examples of the plot as the value approaches the optimum value.
Example P8-20 (NLPEAFF) without compensation of the flexibility $(5000 \mathrm{~Hz})$

Example P8-20 (NLPEAFF) maximum position deviation decreased ( 300 Hz )

Example P8-20 (NLPEAFF) maximum position deviation further decreased (220 Hz)

Example $P 8$-20 (NLPEAFF) minimum position deviation, short settling time, oscillation at standstill ( 120 Hz )

Example P8-20 (NLPEAFF) negative position deviation during acceleration phase ( 100 Hz )

## Manual turning steps within cascade mode

| Step | Action |
| :--- | :--- |
| 1 | Increase the speed loop gain P8-57 to decrease the speed deviation. After increasing <br> the gain value each time, the motor moves in a positive and negative direction at high <br> and low speed respectively. If the motor does not vibrate or scream, the gain can be <br> increased continuously. <br> If the motor vibrates or screams, reduce the current value by $20 \%$. |
| 2 | Increase the gain of position loop P8-53 decrease the position deviation. After <br> increasing the gain value each time, the motor moves in a positive and negative <br> direction at high and low speed respectively. If the motor does not vibrate or scream, <br> the gain can be increased continuously. <br> Slow to reach target position, increase the gain. Shaking near the target position, <br> reduce the gain. If the motor vibrates or screams, reduce the current value by $20 \%$ |
| 3 | To further reduce the steady-state error, increase the speed integral $P 8-58$. |
| 4 | To further reduce the dynamic position error, feed-forward $P 8-54$ is used. |
| 5 | Set the S-curve smoothing time constant $P 8-32$ appropriately. |
| 6 | Use low-pass filtering and notch filter $P 8-60, P 8-61, P 8-62$ as appropriate. |

## Representation of the Parameters

This chapter provides an overview of the parameters which can be used for operating the product.

Unsuitable settings or unsuitable data may trigger unintended movements, trigger signals, damage parts and disable monitoring functions. Some parameters and other operational data do not become active until after a restart.

## AWARNING

## UNINTENDED EQUIPMENT OPERATION

- Only start the system if there are no persons or obstructions in the zone of operation.
- Do not operate the drive system with undetermined parameter values.
- Never modify a parameter value unless you fully understand the parameter and all effects of the modification.
- Restart the drive and verify the saved operational data and/or parameter values after modification.
- Carefully run tests for all operating states and potential error situations when commissioning, upgrading or otherwise modifying the operation of the drive.
- Verify the functions after replacing the product and also after making modifications to the parameter values and/or other operational data.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

NOTE: Possible values of a parameter that are not described are considered as reserved and must not be used.

## Parameter Name

The parameter name uniquely identifies a parameter.

## Unit

The unit of the value.

## P0 - Status Parameters

| P1-30 <br> COMMERRMAXCNT | Commutation Monitoring - Maximum Counter Value <br> Applicable operating mode: PT, PS, V, T | ms <br> 0 <br> 0 <br> 0 <br> Decimal | u16 <br> RW | Modbus 23Ch CANopen $411 \mathrm{E}_{\mathrm{h}}$ |
| $\begin{aligned} & \text { P1-32 } \\ & \text { LSTP } \end{aligned}$ | Stop Method <br> Applicable operating mode: PT, PS, V <br> This parameter specifies how the motor is stopped if the power stage is to be disabled (includes signal input function OPST) or if an error is detected. <br> Value $0_{h}$ : Deceleration ramp <br> Value 10h: Coast to stop <br> Value $20_{\mathrm{h}}$ : Deceleration ramp to velocity P1-38, then coast to stop (actual velocity must be less than the value of P1-38 for 50 ms before coasting to stop starts) <br> In the operating mode Torque ( T ), the deceleration ramp is not used. Instead, the current is set to zero. <br> Depending on the event that triggered the stop, the following deceleration ramps are used: <br> - Signal input function STOP: P5-20 <br> - Transmission error detected: P5-21 <br> - Position overflow: P5-22 <br> - Triggering of negative software limit switch: P523 <br> - Triggering of positive software limit switch: P5-24 <br> - Triggering of negative hardware limit switch: P525 <br> - Triggering of positive hardware limit switch: P526 <br> - Any other event: P1-68 <br> The delay time between standstill of the motor and disabling the power stage is set via P1-19. | $0_{n}$ <br> $0_{h}$ <br> 20h <br> Hexadecimal | u16 <br> RW <br> per. | Modbus 240h CANopen 4120 h |
| $\begin{aligned} & \text { P1-34 } \\ & \text { TACC } \end{aligned}$ | Acceleration Period <br> Applicable operating mode: PT, V <br> The acceleration period is the time in milliseconds required to accelerate from motor standstill to 6000 rpm. <br> For operating mode V , this parameter specifies the acceleration. <br> For operating mode PT, this parameter specifies an acceleration limitation for the pulses at the PTI interface. | ms <br> 6 <br> 30 <br> 65500 <br> Decimal | u16 <br> RW <br> per. | Modbus 244h CANopen 4122h |
| $\begin{aligned} & \text { P1-35 } \\ & \text { TDEC } \end{aligned}$ | Deceleration Period <br> Applicable operating mode: PT, V | $\begin{aligned} & \mathrm{ms} \\ & 6 \end{aligned}$ | $\begin{aligned} & \text { u16 } \\ & \text { RW } \end{aligned}$ | Modbus 246h CANopen 4123 h |

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
|  | The deceleration period is the time in milliseconds required to decelerate from 6000 rpm to motor standstill. <br> For operating mode V , this parameter specifies the deceleration. <br> For operating mode PT , this parameter specifies a deceleration limitation for the pulses at the PTI interface. | $30$ $65500$ <br> Decimal | per. |  |
| $P 1-37$ <br> LMJR | Ratio of Load Inertia to Motor Inertia <br> Applicable operating mode: PT, PS, V, T <br> This parameter specifies the ratio of load inertia to motor inertia (J_load / J_motor). <br> J_load: Total moment of inertia of external mechanical load <br> J_motor: Moment of inertia of motor | 0.1 <br> 0 <br> 10 <br> 20000 <br> Decimal | u32 <br> RW per. | Modbus 24Ah CANopen 4125h |
| $\begin{aligned} & \text { P1-38 } \\ & \text { ZSPD } \end{aligned}$ | Signal Output Function ZSPD / Signal Input Function ZCLAMP - Velocity <br> Applicable operating mode: PT, PS, V, T <br> This parameter specifies the velocity for the signal output function ZSPD. The signal output function ZSPD indicates that the velocity of the motor is less than the velocity value set via this parameter. <br> This parameter specifies the velocity for the signal input function ZCLAMP. The signal input function ZCLAMP stops the motor. The velocity of the motor must be below the velocity value set via this parameter. | 0.1 rpm <br> 0 <br> 100 <br> 2000 <br> Decimal | s32 <br> RW per. | Modbus 24Ch <br> CANopen 4126h |
| $\begin{aligned} & \text { P1-39 } \\ & \text { SSPD } \end{aligned}$ | Signal Output Function TSPD - Velocity <br> Applicable operating mode: PT, PS, V, T <br> This parameter specifies the velocity for the signal output function TSPD. The signal output function TSPD indicates that the velocity of the motor is greater than the velocity value set via this parameter. | rpm <br> 0 <br> 3000 <br> 5000 <br> Decimal | u32 <br> RW per. | Modbus 24E <br> CANopen 4127 h |
| P1-40 <br> VCM | Velocity Target Value and Velocity Limitation 10 V <br> Applicable operating mode: PT, PS, V, T <br> In the operating mode V , this parameter specifies the target velocity that corresponds to the maximum input voltage of 10 V . <br> In the operating mode $T$, this parameter specifies the velocity limitation that corresponds to the maximum input voltage of 10 V . <br> Example: If the value of this parameter is 3000 in the operating mode V and if the input voltage is 10 V , the target velocity is 3000 rpm . | rpm <br> 0 <br> 10001 <br> Decimal | s32 <br> RW <br> per. | Modbus 250h <br> CANopen 4128h |
| $P 1-41$ <br> TCM | Torque Target Value and Torque Limitation 10 V <br> Applicable operating mode: PT, PS, V, T <br> In the operating mode T , this parameter specifies the target torque that corresponds to the maximum input voltage of 10 V . <br> In the operating modes PT, PS and V , this parameter specifies the torque limitation that corresponds to the maximum input voltage of 10 V. | \% <br> 0 <br> 100 <br> 1000 <br> Decimal | u16 <br> RW <br> per. | Modbus 252h <br> CANopen 4129h |

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
|  | Example: If the value of this parameter is 100 in the operating mode T and if the input voltage is 10 V , the target torque is $100 \%$ of the nominal torque. <br> Setting can only be modified if power stage is disabled. |  |  |  |
| P1-42 <br> MBT1 | ON Delay Time of Holding Brake <br> Applicable operating mode: PT, PS, V, T <br> This parameter specifies the time between enabling the power stage and starting a movement (opening time for the holding brake). | ms <br> 0 <br> 0 <br> 1000 <br> Decimal | u16 <br> RW <br> per. | Modbus 254h <br> CANopen 412Ah |
| P1-44 <br> GR1 | Electronic Gear Ratio - Numerator 1 <br> Applicable operating mode: PT, PS <br> This parameter is used to set the numerator of the gear ratio. The denominator of the gear ratio is set via P1-45. <br> In the operating mode PS, the value of this parameter can only be modified when the power stage is disabled. | 1 <br> 128 <br> 536870911 <br> Decimal | u32 <br> RW <br> per. | Modbus 258h CANopen 412Ch $_{h}$ |
| P1-45 <br> GR2 | Electronic Gear Ratio - Denominator <br> Applicable operating mode: PT, PS <br> This parameter is used to set the denominator of the gear ratio. The numerator of the gear ratio is set via P1-44. <br> Setting can only be modified if power stage is disabled. | 1 <br> 10 <br> 2147483647 <br> Decimal | u32 <br> RW <br> per. | Modbus 25Ah <br> CANopen 412Dh |
| $P 1-46$ <br> ENCOUTRES | Number of encoder simulation increments (AB signal) per revolution <br> Applicable operating mode: PT, PS, V, T <br> The calculation of the range of this parameter depends on the value of P1-55. <br> Setting can only be modified if power stage is disabled. | LPR $2048$ <br> Decimal | s32 <br> RW per. | Modbus 25Ch CANopen $412 \mathrm{E}_{\mathrm{h}}$ |
| $\begin{aligned} & \text { P1-47 } \\ & \text { SPOK } \end{aligned}$ | Signal Output Function SP_OK - Velocity <br> Applicable operating mode: V <br> This parameter specifies the velocity deviation window for the signal output function SP_OK. The signal output function SP_OK indicates that actual velocity is within the velocity deviation window. | rpm <br> 0 <br> 10 <br> 300 <br> Decimal | u32 <br> RW <br> per. | Modbus $25 \mathrm{E}_{\mathrm{h}}$ <br> CANopen $412 F_{h}$ |
| $\begin{aligned} & P 1-48 \\ & \text { MCOK } \end{aligned}$ | Signal Output Function MC_OK - Settings <br> Applicable operating mode: PS <br> This parameter specifies the behavior of the signal output function MC_OK after it has been activated. The signal output function MC_OK indicates that both the signal output functions CMD_OK and TPOS have been activated. In addition, you can specify whether a detected position deviation is to trigger a detected error. | $0_{h}$ <br> $0_{h}$ $21_{n}$ <br> Hexadecimal | u16 <br> RW <br> per. | Modbus 260h <br> CANopen 4130h |

|  | - Bit 2: The device temperature is too low. <br> - Bit 3: The device is not calibrated or the calibration data is corrupted. The device is not able to decode the position. <br> - Bit 4: The device supply voltage has dropped under operational value. <br> - Bit 5: The multi-turn encoder battery voltage has dropped under 3 Vdc . <br> - Bit 6: The multi-turn encoder requires an explicit configuration command. <br> - Bit 7: Internal position synchronization error detected between the multi-turn and the single-turn modules. <br> - Bit 8:Generic error code of the multi-turn module is detected. <br> - Bit 16...23: Internal Error detected. <br> - Bit 24: The encoder firmware cannot operate on the provided hardware. <br> - Bit 25...31: Reserved. | Hexadecimal |  |  |
| P8-49 <br> SRVSNS_WRNS | Encoder alerts <br> Applicable operating mode: PT, PS, V, T <br> - Bit 0: The device temperature is too high. <br> - Bit 1: The device temperature is too low. <br> - Bit 2: Over speed. <br> - Bit 3: Over acceleration. <br> - Bit 4: Invalid checksum value detected on non-volatile memory initialization. <br> - Bit 5: non-volatile memory is empty. <br> - Bit 6: Internal Parameters area detected as invalid, default values are used. <br> - Bit 7: Invalid decoding sequence detected. <br> - Bit 8: Encoder internal flash error detected. <br> - Bit 9: The device has detected unusual high shaft displacement. Position error might be greater than usual. <br> - Bit 10: The multi-turn encoder battery voltage is in the range $3000 \ldots 3150 \mathrm{mVdc}$. <br> - Bit 11: Reserved. <br> - Bit 12: The multi-turn encoder counter exceeded the range of signed 16 bit value (-32767 ... 32768). The alert remains active until MT_COMMANDS (P8-44) is set to 2. The multi-turn encoder counter continues to count in the range $0 \ldots 65535$. <br> - Bit 13...31: Reserved. | 4294967295 <br> Hexadecimal | $\begin{aligned} & \text { u32 } \\ & \text { RO } \end{aligned}$ | Modbus 962h CANopen 4831h |
| P8-51 <br> SPDOBSRVRMODE | Speed Observer Mode <br> Applicable operating mode: PT, PS, V, T <br> Value 0 : Speed feedback value is computed by the drive. <br> Value 3:Speed feedback value is measured by the encoder. | 0 <br> 0 <br> 3 <br> Decimal | u16 <br> RW <br> per. | Modbus 966h CANopen 4833h |
| P8-52 <br> GEARFILTDEPTH | Electronic Gear Filter - Depth <br> Applicable operating mode: PT <br> This parameter sets the value of the depth for the enhanced electronic gear filter (P8-26 set to the value 2 ). | 0.01 ms <br> 75 <br> 200 <br> 3200 | u32 <br> RW <br> per. | Modbus 968h CANopen 4834h |

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Decimal |  |  |
| $P 8-53$ <br> KPP | Position Linear Controller Proportional Gain <br> Applicable operating mode: PT, PS <br> This parameter sets the value of the proportional gain for the linear position controller. <br> NOTE: After motor connection, the drive automatically sets the optimized value, page 260. | $0.1 \mathrm{rps} / \mathrm{rev}$ <br> 0 <br> 300 <br> 12000 <br> Decimal | u16 <br> RW <br> per. | Modbus $96 A_{h}$ <br> CANopen $4835_{h}$ |
| P8-54 <br> KPVFR | Position Velocity Feedforward <br> This parameter sets the value of the position velocity feedforward to velocity command gain for the linear position controller. This is used to reduce the position following error at constant speed. <br> NOTE: Value of 1000 is the nominal design for zero position following error. | $\begin{aligned} & 0.001 \\ & -2000 \\ & 500 \\ & 2000 \\ & \text { Decimal } \end{aligned}$ | s32 <br> RW <br> per. | Modbus 96Ch <br> CANopen 4836h |
| $P 8-55$ <br> KPAFVRV | Position Acceleration Feedforward <br> This parameter sets the value of the position acceleration feedforward to velocity command gain for the linear position controller. This is used to reduce the position following error at constant acceleration. <br> NOTE: Value of 1000 is the nominal design for zero position following error. | 0.001 <br> -20000 <br> 0 <br> 20000 <br> Decimal | s32 <br> RW <br> per. | Modbus $96 \mathrm{E}_{\mathrm{h}}$ <br> CANopen $4837_{h}$ |
| $P 8-56$ <br> KPAFRC | Position Acceleration Feedforward to Current Loop <br> This parameter sets the value of the position acceleration feedforward to current command gain for the linear position controller. This is used to reduce the position following error at constant acceleration. <br> NOTE: Value of 100 is the nominal design for zero position following error. P1-37 value must be correctly set. | 0.001 <br> -20000 <br> 0 <br> 20000 <br> Decimal | s32 <br> RW <br> per. | Modbus 970h <br> CANopen $4838_{h}$ |
| $P 8-57$ <br> KVP | Velocity Proportional Gain <br> This parameter sets the value of the proportional gain for the linear velocity controller. <br> NOTE: After motor connection, the drive automatically sets the optimized value, page 260. | $\begin{aligned} & 0.001 \\ & 0 \\ & 100 \\ & 1000000000 \end{aligned}$ <br> Decimal | u32 <br> RW <br> per. | Modbus 972h <br> CANopen 4839h |
| $P 8-58$ <br> KVI | Velocity Integral Gain <br> This parameter sets the value of the integral gain for the linear velocity controller. <br> NOTE: After motor connection, the drive automatically sets the optimized value, page 260. | $0.001$ <br> 0 30000 200000000 <br> Decimal | u32 <br> RW <br> per. | Modbus 974h <br> CANopen $483 \mathrm{~A}_{h}$ |
| $P 8-59$ <br> KVFR | Velocity Feedforward Ratio <br> This parameter sets the value of the feedforward ratio for the linear velocity controller. <br> NOTE: Value of 1000 makes the control close to a PI control. Higher values reduces the following error but introduces an overshoot. | $\begin{aligned} & 0.001 \\ & 0 \\ & 900 \\ & 1000 \\ & \text { Decimal } \end{aligned}$ | u16 <br> RW <br> per. | Modbus 976h <br> CANopen 483Bh |
| P8-60 | Velocity Loop Output Filter Mode | - | u16 | Modbus 978h |

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| FILTMODE | This parameter sets the value of the velocity loop output filter for the linear velocity controller. <br> Value 0 : No filtering. <br> Value 1: First order low pass filter; sets P8-61 as corner frequency. <br> Value 2: Double first order low pass filter (sets P861 and P8-62 as corner frequencies). <br> Value 3: Notch filter (sets P8-62 as notch center frequency and P8-61 as notch frequency width). <br> NOTE: After motor connection, the drive automatically sets the optimized value, page 260. | 0 <br> 2 <br> 3 <br> Decimal | RW <br> per. | CANopen 483Ch |
| P8-61 <br> FILTHZ1 | Velocity Loop Output Filter Parameter 1 <br> The function of this parameter depends on the velocity loop output filter mode (see P8-60). <br> NOTE: After motor connection, the drive automatically sets the optimized value, page 260. | 1 <br> 500 <br> 10000 <br> Decimal | u16 <br> RW <br> per. | Modbus 97Ah CANopen 483D $h$ |
| $P 8-62$ <br> FILTHZ2 | Velocity Loop Output Filter Parameter 2 <br> The function of this parameter depends on the velocity loop output filter mode (see P8-60). <br> NOTE: After motor connection, the drive automatically sets the optimized value, page 260. | 1 <br> 500 <br> 10000 <br> Decimal | u16 <br> RW <br> per. | Modbus 97Ch <br> CANopen $483 \mathrm{E}_{\mathrm{h}}$ |
| P8-63 <br> VELFILTMODE | Velocity Filter Mode <br> This parameter sets the value of the type of filter that is used for extraction of a velocity signal from the position feedback. <br> Value 0: No filtering. Use derivative of feedback position. <br> Value 1: First order low pass filter; sets P8-64 as corner frequency. <br> Value 2: Use of the velocity feedback provided by the encoder. <br> Setting can only be modified if power stage is disabled. | 0 <br> 1 <br> 2 <br> Decimal | u32 <br> RW <br> per. | Modbus $97 \mathrm{E}_{\mathrm{h}}$ CANopen $483 \mathrm{~F}_{\mathrm{h}}$ |
| P8-64 <br> VELFILTFRQ | Velocity Filter Pole Frequency <br> This parameter sets the value of the first order filter, which is applied to the velocity feedback signal before applying the velocity controller. <br> NOTE: This parameter value is used only if P8-63 is set to 1. <br> Setting can only be modified if power stage is disabled. | 20 <br> 440 <br> 2000 <br> Decimal | u16 <br> RW <br> per. | Modbus 980h CANopen 4840h |
| $P 8-65$ <br> IFFLPFHZ | Current Feedforward Low Pass Filter <br> Applicable operating mode: PT, PS <br> This parameter sets the value of the first order filter of the linear controller which is applied to the current feedforward before it is added to current command. | 10 <br> 1000 <br> 1000 <br> Decimal | u16 <br> RW <br> per. | Modbus 982h <br> CANopen 4841 $h$ |
| P8-66 | LTN Torque Filter Mode | - | u16 | Modbus 984h |

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| NLTFDESIGNMODE | Applicable operating mode: PT, PS, V <br> This parameter sets the value of the torque filter mode used in the LTN control loop. <br> Value 0: Manual set of P8-15 and P8-14 values. <br> Value 1: P8-15 and P8-14 values are computed based on P8-67 value. | 0 <br> 0 <br> 1 <br> Decimal | RW per. | CANopen 4842h |
| P8-67 <br> NLTFBW | LTN Torque Filter Bandwidth <br> Applicable operating mode: PT, PS, V <br> This parameter sets the value of the filter bandwidth used in LTN control loop to define P815 and P8-14 values with $10 \%$ overshoot. | Hz <br> 50 <br> 1000 <br> 2000 <br> Decimal | u16 <br> RW <br> per. | Modbus 986h CANopen $4843_{h}$ |
| P8-68 <br> NLNOTCHMODE | Current Filter - Notch Filter Mode <br> Applicable operating mode: PT, PS, V <br> This parameter sets the value of the notch filter mode used in the LTN control loop. <br> Value 0: Original notch filter. <br> Value 1: Advanced notch filter. | 0 <br> 0 <br> 1 <br> Decimal | u16 <br> RW <br> per. | Modbus 988h <br> CANopen 4844h |
| P8-69 <br> STANDSTILLMODE | Standstill Mode <br> Applicable operating mode: PT, PS, V <br> This parameter sets the value of the standstill mode used for variable gain. <br> The drive latches the variable gain when the motor is at standstill. <br> Value 0: The drive revert to the original gain when the motor is not at standstill. <br> Value 1: The drive revert to the original gain when a new motion command is applied. <br> NOTE: The motor is at standstill when: <br> - the velocity command is less than the velocity value set via the parameter P138 <br> - and the position deviation is within the tolerance sets via the parameter P1-54. | 0 <br> 0 <br> 1 <br> Decimal | u16 <br> RW <br> per. | Modbus 98Ah <br> CANopen 4845h |
| $P 8-70$ <br> STANDSTILLGAIN | Standstill Gain <br> Applicable operating mode: PT, PS, V <br> This parameter sets the value of the variable gain used for the linear position controller. <br> When the motor is at standstill, the velocity proportional gain (P8-57 KVP) and the position proportional gain (P8-53 KPP) are multiplied by (P8-70/1024).When the motor is not at standstill, the velocity proportional gain and the position proportional gain revert to their original values. | 128 <br> 1024 <br> 1024 <br> Decimal | u16 <br> RW <br> per. | Modbus $98 \mathrm{C}_{\mathrm{h}}$ <br> CANopen 4846h |
| $P 8-71$ <br> SFILTMODE | Encoder Filter Mode <br> Applicable operating mode: PT, PS, V <br> This parameter activates/deactivates the encoder filter. <br> Value 0: Deactivate the encoder filter. | 0 <br> 0 <br> 1 <br> Decimal | s16 <br> RW <br> per. | Modbus 98E <br> CANopen 4847h |

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
|  | Value 1: Activate the encoder filter. <br> The encoder filter helps to reduce the feedback jitter. |  |  |  |
| P8-72 <br> HWTEMPTHRESH | HW Temperature failure threshold. <br> If HWTEMPTHRESH $=0$, AL561 will be disabled. | 0 <br> 2000 <br> 32767 <br> Decimal | u16 <br> RW <br> per. | Modbus 990h <br> CANopen 4848h |
| P8-99 <br> LTNUSERVCMDGAIN | Adaptive Velocity Reference Value Gain Applicable operating mode: PT, PS | $\begin{array}{\|l\|} \hline 0.001 \\ 0 \\ 1000 \\ 3000 \\ \text { Decimal } \end{array}$ | u32 <br> RW <br> per. | Modbus 9C6h <br> CANopen 4863h |

## Linear Default Gains Values

The following table displays the optimized values set according to the connected motor:

| Motor references | $\begin{aligned} & \text { P8-53 } \\ & \text { KPP } \end{aligned}$ | P8-57 <br> KVP | $\begin{aligned} & \text { P8-58 } \\ & \text { KVI } \end{aligned}$ | P8-60 <br> FILTMODE | P8-61 <br> FILTHZ1 | P8-62 <br> FILTHZ2 |

## Operation

## What's in This Part

Operation ....................................................................................................................................................................................................Operating Modes286

## Operation

What's in This Chapter
Access Channels ..... 269
Operating States ..... 270
Setting the Digital Signal Inputs ..... 271
Setting the Digital Signal Outputs ..... 276
Functions for Target Value Processing ..... 279
Setting a Signal Output Via Parameter ..... 280
Forcing the Digital Signal Inputs and Signal Outputs ..... 281
Position Capture via DS402 Profile ..... 284

## Access Channels

The product can be accessed via different types of access channels.
Simultaneous access via multiple access channels or the use of exclusive access may cause unintended equipment operation.

| AWNARNING |
| :--- |
| UNINTENDED EQUIPMENT OPERATION |
| - Verify that simultaneous access via multiple access channels cannot cause |
| unintended triggering or blocking of commands. |
| - Verify that the use of exclusive access cannot cause unintended triggering or |
| blocking of commands. |
| - Verify that the required access channels are available. |
| Failure to follow these instructions can result in death, serious injury, or |
| equipment damage. |

The product can be addressed via different access channels.
Access channels are:

- Integrated HMI
- Digital and analog input signals
- Fieldbus
- Commissioning software LXM28 DTM Library

The product allows you to work with exclusive access which limits access to the product via a single access channel.

Only one access channel can have exclusive access to the product.
Exclusive access can be provided via different access channels:

- Via the integrated HMI:

The operating mode Jog or Autotuning can be started via the HMI.

- Via a fieldbus:

Exclusive access is provided to a fieldbus by blocking the other access channels with the parameter AccessLock.

- Via the commissioning software LXM28 DTM Library:

The commissioning software receives exclusive access via the switch Exclusive access in position On.
When the product is powered on, there is no exclusive access via an access channel.

The reference values are effective at the analog inputs and at the pulse inputs when the product is powered on. If exclusive access has been assigned to an access channel, signal at the pulse inputs are ignored.

The signal inputs of the safety function STO and the signal input functions HALT, FAULT_RESET, SON (falling edge), CWL(NL) and CCWL(PL) are always effective during exclusive access.

## Operating States

## State Diagram

When the product is powered on and when an operating mode is started, page 286 , the product goes through a number of operating states.

The state diagram (state machine) shows the relationships between the operating states and the state transitions.

The operating states are internally monitored and influenced by monitoring functions.

## Operating States

| Operating state | Description |
| :--- | :--- |
| $\mathbf{1}$ Start | Electronics are initialized |
| $\mathbf{2}$ Not Ready To Switch On | The power stage is not ready to switch on |
| $\mathbf{3}$ Switch On Disabled | Impossible to enable the power stage |
| $\mathbf{4}$ Ready To Switch On | The power stage is ready to switch on. |
| $\mathbf{5}$ Switched On | Power stage is switched on |
| $\mathbf{6}$ Operation Enabled | Selected operating mode is active |
| $\mathbf{7}$ Quick Stop Active | Quick Stop is being executed |

| Operating state | Description |
| :--- | :--- |
| $\mathbf{8}$ Fault Reaction Active | Error response is active |
| $\mathbf{9}$ Fault | Error response terminated <br> Power stage is disabled |

## Resetting an Error Message

After you have removed the cause of the error, you can reset the error message in one of the following ways:

- With a rising edge of the signal input function FAULT_RESET
- With a rising edge of the signal input function SON
- By using the Fault Reset button in the SoMove commissioning software.

## Setting the Digital Signal Inputs

Various signal functions can be assigned to the digital signal inputs.
The functions of the inputs and outputs depend on the selected operating mode and the settings of the corresponding parameters.

## A WARNING

## UNINTENDED EQUIPMENT OPERATION

- Only start the system if there are no persons or obstructions in the zone of operation.
- Verify that the wiring is appropriate for the settings.
- Carefully run tests for all operating states and potential error situations when commissioning, upgrading or otherwise modifying the operation of the drive.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

## Default Presets of the Signal Inputs

The following table shows the default presets of the digital signal inputs depending on the selected operating mode:

| Setting A for P2-10 ... P217 | Short name | Name | PT | PS | v | T | Vz | Tz | $\begin{aligned} & \text { PT } \\ & \text { V } \end{aligned}$ | $\begin{aligned} & \text { PT } \\ & \text { T } \end{aligned}$ | $\begin{aligned} & \text { PS } \\ & \text { v } \end{aligned}$ | $\begin{aligned} & \text { PS } \\ & \text { T } \end{aligned}$ | $\mathrm{v}$ | O |

## Parameterization of the Signal Input Functions

The signal input functions for the inputs DI1 ... DI8 are configured via the parameters P2-10 ... P2-17.

A signal input function can only be assigned to one of the signal inputs.

The operating modes Torque (T) and Torque (Tz) and the dual operating modes with Torque ( T ) and Torque ( Tz ) do not provide deceleration functionality in response to a power stage disable request. In these operating modes, the motor coasts down to a standstill in response to a power stage disable request. You must install additional equipment such as a dedicated service brake if your application requires faster deceleration of the load.

## AWARNING

## UNINTENDED EQUIPMENT OPERATION

- During commissioning, trigger all signals and simulate all conditions that cause a power stage disable request in order to verify that all loads come to a secure standstill when the power stage is disabled under maximum load conditions.
- Install a dedicated service brake if removal of power to the motor does not meet the requirements of your application.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

The following table provides an overview of the possible signal input functions:

| Setting A <br> for P2-10 ... P2-17 | Short name | Name | Description | Signal inputs |
| :---: | :---: | :---: | :---: | :---: |
| 01 ${ }_{\text {h }}$ | SON | Servo ON | The signal input function SON enables the power stage (operating state Operation Enabled). The signal input function SON is only available if no detected errors are present. | DI1 ... DI8 |
| 02h | FAULT RESET | Fault Reset | The signal input function FAULT_RESET performs a Fault Reset. The cause of the error must have been removed before a Fault Reset is performed. | DI1 ... DI8 |
| 03h | GAINUP | Increase Gain | The signal input function GAINUP increases the control gain according to the values and conditions set via parameter P2-27. | DI1 ... DI8 |
| 04h | CLRPOSDEV | Clear Position Deviation | The signal input function CLRPOSDEV resets the position deviation to zero as set via parameter P2-50. <br> This function is only supported in linear control mode (P8-35=4001h) | DI1 ... DI8 |
| 05h | ZCLAMP | Zero Clamp | In the operating mode V, the signal input function ZCLAMP can be used to stop the motor if the velocity of the motor is below the velocity value set via the parameter P1-38. The behavior of the signal input function ZCLAMP is set via the parameter P2-65, bit 10. | DI1 ... DI8 |

| Setting A for P2-10 ... P2-17 | Short name | Name | Description | Signal inputs |
| :---: | :---: | :---: | :---: | :---: |
| 06h | INVDIRROT | Inverse Direction Of Rotation | The signal input function INVDIRROT inverts the direction of rotation of the motor. The signal input function INVDIRROT is available in the operating modes Velocity (V) and Torque ( T ). | DI1 ... DI8 |
| 07 h | HALT | Halt | The signal input function HALT interrupts the movement with the deceleration ramp set via the parameter P1-68. The movement is resumed when the signal input function is no longer active. | DI1 ... DI8 |
| 08h | CTRG | Start Data Set | The signal input function CTRG starts the selected data set in the operating mode Position Sequence (PS). For further information, refer to Operating Mode Position Sequence (PS), page 294. | DI1 ... DI8 |
| $09_{\text {h }}$ | TRQLM | Activate Torque Limit | The signal input function TRQLM activates the torque limitations set via parameters P1-12 ... P1-14. You can also use the parameter P1-02 to activate the torque limitations set via parameters P1-12 ... P1-14. | DI1 ... DI8 |
| $10_{\text {h }}$ | SPDLM | Activate Speed Limit | The signal input function SPDLM activates the velocity limitations set via parameters P1-09 ... P1-11. You can also use the parameter P1-02 to activate the velocity limitations set via parameters P1-09 ... P1-11. | DI1 ... DI8 |
| $11_{\text {h }}$ | POS0 | Data Set Bit 0 | The signal input functions POSO ... POS4 represent bits 0 ... 4 required to select one of the 32 data sets available in the operating mode Position Sequence (PS). For further information, refer to Operating Mode Position Sequence (PS), page 294. | DI1 ... DI8 |
| 12h | POS1 | Data Set Bit 1 | The signal input functions POSO ... POS4 represent bits 0 ... 4 required to select one of the 32 data sets available in the operating mode Position Sequence (PS). For further information, refer to Operating Mode Position Sequence (PS), page 294. | DI1 ... DI8 |
| 13h | POS2 | Data Set Bit 2 | The signal input functions POSO ... POS4 represent bits 0 ... 4 required to select one of the 32 data sets available in the operating mode Position Sequence (PS). For further information, refer to Operating Mode Position Sequence (PS), page 294. | DI1 ... DI8 |
| 14 h | SPD0 | Speed Reference Value Bit 0 | The signal input functions SPD0 and SPD1 represent bits 0 and 1 to select one of the three velocity reference values available in the operating mode Velocity ( V ). For further information, refer to Operating Modes Velocity (V) and Velocity Zero (Vz), page 330. | DI1 ... DI8 |
| 15 h | SPD1 | Speed Reference Value Bit 1 | The signal input functions SPD0 and SPD1 represent bits 0 and 1 to select one of the three velocity reference values available in the operating mode Velocity ( V ). For further information, refer to Operating Modes Velocity (V) and Velocity Zero (Vz), page 330. | DI1 ... DI8 |
| $16_{\text {h }}$ | TCM0 | Torque <br> Reference Value Bit 0 | The signal input functions TCM0 and TCM1 represent bits 0 and 1 to select one of the three torque reference values available in the operating mode Torque (T). For further information, refer to Operating Modes Torque ( T ) and Torque Zero (Tz), page 333. | DI1 ... DI8 |
| $17_{\text {h }}$ | TCM1 | Torque Reference Value Bit 1 | The signal input functions TCM0 and TCM1 represent bits 0 and 1 to select one of the three torque reference values available in the operating mode Torque (T). For further information, refer to Operating Modes Torque ( T ) and Torque Zero (Tz), page 333. | DI1 ... DI8 |
| 18 h | V-Px | Velocity - Position | Operating mode switching between Velocity (V) and Pulse Train (PT) or between Velocity ( V ) and Position Sequence (PS). For further information, refer to Setting the Operating Mode, page 286. <br> (OFF: Velocity (V), ON: Pulse Train (PT) or Position Sequence (PS), depending on P1-01) | DI1 ... DI8 |
| $19_{\text {h }}$ | V-T | Velocity - Torque | Operating mode switching between Velocity (V) and Torque (T). For further information, refer to Setting the Operating Mode, page 286. <br> (OFF: Velocity (V), ON: Pulse Torque (T)) | DI1 ... DI8 |
| $1 \mathrm{~A}_{\mathrm{h}}$ | POS3 | Data Set Bit 3 | The signal input functions POSO ... POS4 represent bits $0 \ldots 4$ required to select one of the 32 data sets available in the operating mode Position Sequence (PS). For further information, refer to Operating Mode Position Sequence (PS), page 294. | DI1 ... DI8 |
| $1 B_{h}$ | POS4 | Data Set Bit 4 | The signal input functions POSO ... POS4 represent bits 0 ... 4 required to select one of the 32 data sets available in the operating mode Position Sequence (PS). For further information, refer to Operating Mode Position Sequence (PS), page 294. | DI1 ... DI8 |
| $1 C_{h}$ | TPROB1 | Touch Probe 1 | The signal input function TPROB1 is used to trigger the Position Capture function. See the sections on the parameters P5-37 ... P5-39 for additional information. | DI7 |

| Setting A for P2-10 ... P2-17 | Short name | Name | Description | Signal inputs |
| :---: | :---: | :---: | :---: | :---: |
| $1 \mathrm{D}_{\mathrm{h}}$ | TPROB2 | Touch Probe 2 | The signal input function TPROB2 is used to trigger the Position Capture function. See the sections on the parameters P5-57 ... P5-59 for additional information. | DI6 |
| $20^{\text {h }}$ | T-Px | Torque - Position | Operating mode switching between Torque (T) and Pulse Train (PT) or between Torque ( T ) and Position Sequence (PS). For further information, refer to Setting the Operating Mode, page 286. <br> (OFF: Torque (T), ON: Pulse Train (PT) or Position Sequence (PS), depending on $\mathrm{P} 1-01$ ) | DI1 ... DI8 |
| 21 h | OPST | Stop and Disable Power Stage | The signal input function OPST stops the motor with the deceleration ramp set via the parameter P1-68 and then disables the power stage. | DI1 ... DI8 |
| 22 h | CWL(NL) | Negative Limit Switch (NL/LIMN) | Negative limit switch (NL/LIMN). When the signal input is activated, an alert is triggered. The deceleration ramp is specified via parameter P525. | DI1 ... DI8 |
| $23_{\text {h }}$ | CCWL(PL) | Positive Limit Switch (PL/LIMP) | Positive limit switch (PL/LIMP). When the signal input is activated, an alert is triggered. The deceleration ramp is specified via parameter $P 5$ 26. | DI1 ... DI8 |
| 24 h | ORGP | Reference Switch | The signal input function ORGP is used for the reference switch. For further information, refer to Operating Mode Position Sequence (PS), page 294. | DI1 ... DI8 |
| 27 h | GOTOHOME | Move To Home Position | The signal input function GOTOHOME triggers a movement to the Home position set via the parameter P5-04. | DI1 ... DI8 |
| $2 \mathrm{C}_{\mathrm{h}}$ | PTCMS | Type of pulses for operating mode Pulse Train (PT) (OFF: Low-speed pulses, ON: HighSpeed pulses) | The signal input function PTCMS selects the type of pulses for the operating mode Pulse Train PT (OFF: Low-speed pulses, ON: Highspeed pulses). You can also use the parameter P1-00 to select the type of pulses. | DI1 ... DI8 |
| $37_{\text {h }}$ | JOGP | Jog Positive | The signal input function JOGP triggers a Jog movement in positive direction if the value determining the direction of movement in the parameter P1-01 is set to the default value. | DI1 ... DI8 |
| 38 h | JOGN | Jog Negative | The signal input function JOGN triggers a Jog movement in negative direction if the value determining the direction of movement in the parameter P1-01 is set to the default value. | DI1 ... DI8 |
| $39_{\text {h }}$ | STEPU | Next Data Set | The signal input function STEPU starts the next data set in the operating mode Position Sequence (PS). | DI1 ... DI8 |
| $40_{\text {h }}$ | STEPD | Previous Data Set | The signal input function STEPD starts the previous data set in the operating mode Position Sequence (PS). | DI1 ... DI8 |
| $41_{\text {h }}$ | STEPB | First Data Set | The signal input function STEPB starts the first data set in the operating mode Position Sequence (PS). | DI1 ... DI8 |
| $42^{\text {h }}$ | AUTOR | Automatic Position Sequence: Start with first data set, repeat sequence | The signal input function AUTOR starts a sequence of data sets from the first data set in the operating mode Position Sequence (PS). The sequence is repeated as long as the signal input function AUTOR is active. | DI1 ... DI8 |
| 43 h | GNUM0 | Numerator Bit 0 Electronic Gear Ratio | The signal input functions GNUM0 and GNUM1 represent bits 0 and 1 to select one of the four numerators set via the parameters P1-44, P2$60 \ldots P 2-62$. The denominator is set via the parameter $P 1-45$. The ratios are used as gear factors in the operating mode Pulse Train (PT) and as scaling factors. For further information, refer to Gear Ratio, page 292 and Scaling, page 301. | DI1 ... DI8 |
| 44h | GNUM1 | Numerator Bit 1 Electronic Gear Ratio | The signal input functions GNUM0 and GNUM1 represent bits 0 and 1 to select one of the four numerators set via the parameters $P 1-44, P 2-$ $60 \ldots P 2-62$. The denominator is set via the parameter $P 1-45$. The ratios are used as gear factors in the operating mode Pulse Train (PT) and as scaling factors. For further information, refer to Gear Ratio, page 292 and Scaling, page 301. | DI1 ... DI8 |
| $45_{\text {h }}$ | INHP | Pulse Inhibit | The signal input function INHP is used in the operating mode Pulse Train (PT) to block pulses received as reference signals. If the signal input function is active, the pulses are no longer evaluated and the motor coasts down. | DI1 ... DI8 |
| 46 h | STOP | Stop Motor (operating mode PS only) | The signal input function STOP stops the motor with the deceleration ramp set via the parameter $P 5-20$. The power stage remains enabled. The signal input function STOP is available in the operating mode Position Sequence (PS). | DI1 ... DI8 |

## Setting the Digital Signal Outputs

Various signal functions can be assigned to the digital signal outputs.
The functions of the inputs and outputs depend on the selected operating mode and the settings of the corresponding parameters.

## AWARNING

UNINTENDED EQUIPMENT OPERATION

- Only start the system if there are no persons or obstructions in the zone of operation.
- Verify that the wiring is appropriate for the settings.
- Carefully run tests for all operating states and potential error situations when commissioning, upgrading or otherwise modifying the operation of the drive.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

## Default Presets of the Signal Outputs

The following table shows the default presets of the digital signal outputs depending on the selected operating mode:

| Setting A for P2-18 ... P222 | Short name | Name | PT | PS | V | T | Vz | Tz | $\begin{aligned} & \text { PT } \\ & \text { v } \end{aligned}$ | $\begin{aligned} & \text { PT } \\ & \text { T } \end{aligned}$ | $\begin{aligned} & \text { PS } \\ & \text { v } \end{aligned}$ | PS <br> T | V T | O |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 01h | SRDY | Servo Ready | DO1 |  |  |  |  |  |  |  |  |  |  |  |
| 02h | SON | Servo On | - |  |  |  |  |  |  |  |  |  |  |  |

| 17h | MC_OK | Motion control completed output | - |  |  |  |  |  |  |  |  |  |  |  |
| 18h | - | - | - |  |  |  |  |  |  |  |  |  |  |  |
| 19 h | SP_OK | Speed reached output | - |  |  |  |  |  |  |  |  |  |  |  |
| $1 \mathrm{~A}_{\mathrm{h}} \ldots 2 \mathrm{~F}_{\mathrm{h}}$ | - | - | - |  |  |  |  |  |  |  |  |  |  |  |
| $30^{\text {h }}$ | SDO_0 | Output the status of bit 0 of P4-06. | - |  |  |  |  |  |  |  |  |  |  |  |
| $31^{\text {h }}$ | SDO_1 | Output the status of bit 1 of P4-06. | - |  |  |  |  |  |  |  |  |  |  |  |
| 32 h | SDO_2 | Output the status of bit 2 of P4-06. | - |  |  |  |  |  |  |  |  |  |  |  |
| $33_{\text {h }}$ | SDO_3 | Output the status of bit 3 of P4-06. | - |  |  |  |  |  |  |  |  |  |  |  |
| 34h | SDO_4 | Output the status of bit 4 of P4-06. | - |  |  |  |  |  |  |  |  |  |  |  |
| 35 h | SDO_5 | Output the status of bit 5 of P4-06. | - |  |  |  |  |  |  |  |  |  |  |  |
| 36 h | SDO_6 | Output the status of bit 6 of P4-06. | - |  |  |  |  |  |  |  |  |  |  |  |
| 37h | SDO_7 | Output the status of bit 7 of P4-06. | - |  |  |  |  |  |  |  |  |  |  |  |
| $38{ }_{h} \ldots 3 \mathrm{~F}_{\mathrm{h}}$ | - | - | - |  |  |  |  |  |  |  |  |  |  |  |

## Parameterization of the Signal Output Functions

The signal output functions for the outputs DO1 ... DO5 are configured via the parameters P2-18 ... P2-22.

The following table provides an overview of the possible signal output functions:

| Setting A for P218 ... P2-22 | Short name | Name | Description |
| :---: | :---: | :---: | :---: |
| 01 ${ }_{\text {h }}$ | SRDY | Servo Ready | The signal output function SRDY indicates that no errors are detected, i.e., the drive is not in the operating state Fault. |
| 02h | SON | Servo On | The signal output function SON indicates that the drive is in the operating state Operation Enabled . |
| 03h | ZSPD | Zero Speed | The signal output function ZSPD indicates that the velocity of the motor is less than the velocity value set via parameter P1-38. |
| 04h | TSPD | Speed Reached | The signal output function TSPD indicates that the velocity of the motor is greater than the velocity value set via parameter P1-39. |
| 05h | TPOS | Movement Completed | Operating mode Pulse Train (PT): The signal output function TPOS indicates that the position deviation is within the tolerance set via the parameter P1-54 and the motor has come to a standstill. <br> Operating mode Position Sequence (PS): The signal output function TPOS indicates that the position deviation at the target position is within the tolerance set via the parameter P1-54 and the reference velocity is below the value set via the parameter P1-38. |
| 06h | TQL | Torque Limit Reached | The signal output function TQL indicates that the torque of the motor has reached the value set via parameters P1-12 ... P1-14 or an analog input. |
| 07h | ERROR | Error Detected | The signal output function ERROR indicates that an error has been detected and that the drive has switched to the operating state Fault. For further information, refer to Diagnostics and Troubleshooting, page 365. |
| 08h | BRKR | Holding Brake Control | The signal output function BRKR is used to control the holding brake with the settings made via parameters P1-42 and P1-19. The holding brake must be connected to the output to which the signal output function BRKR is assigned. For further information, refer to Holding Brake Connection, page 135. |
| 09h | HOMED_OK | Homing Completed | The signal output function HOMED_OK indicates that the homing procedure has been successfully completed. The settings for Homing are specified via parameters P5-04 ... P5-06. For further information, refer to Operating Mode Position Sequence (PS), page 294. |
| $10^{\text {h }}$ | OLW | Motor Overload Alert | The signal output function OLW indicates a motor overload condition. A threshold for the signal output function OLW can be set via parameter P1-28. |
| $11_{\text {h }}$ | WARN | Alert Signal activated | The signal output function indicates that one of the following conditions has been detected: Hardware limit switch triggered, undervoltage, Nodeguard alert, Operational Stop (OPST). For further information, refer to Diagnostics and Troubleshooting, page 365. |
| 12h | - | - | Reserved |
| $13_{h}$ | SCWL(SNL) | Negative Software Limit Switch Reached | The signal output function SCWL(SNL) indicates that the negative software limit switch set via parameter P5-09 has been reached. When the software limit switch is reached, an alert is triggered. The deceleration ramp is specified via parameter P5-23. |
| 14h | $\begin{aligned} & \text { SCCWL } \\ & \text { (SPL) } \end{aligned}$ | Positive Software Limit Switch Reached | The signal output function SCCWL(SPL) indicates that the positive software limit switch set via parameter P5-08 has been reached. When the software limit switch is reached, an alert is triggered. The deceleration ramp is specified via parameter P5-24. |
| $15_{h}$ | CMD_OK | Data set completed | The signal output function CMD_OK indicates that the data set including the waiting time has been successfully completed. |
| 16 h | CAP1_OK | Capture 1 completed | The signal output function CAP1_OK indicates that a position capture (Touch Probe) has been successfully completed. The settings for position capture (Touch Probe) are specified via parameters P5-37 ... P5-39. |
| 17 h | MC_OK | Motion control completed output | The signal output function MC_OK indicates that both the signal output functions CMD_OK and TPOS have been activated. |
| 18h | - | - | Reserved |
| 19 h | SP_OK | Speed reached output | The signal output function SP_OK indicates that the target velocity has been reached. The velocity range for activating this signal output function is set via parameter P1-47. |
| $1 A_{h} \ldots 2 F_{h}$ | - | - | Reserved |
| 30h | SDO_0 | Output the status of bit 0 of P4-06. | The signal output functions SDO_0 ... SDO_7 provide the bit pattern (bits 0 ... 7 ) required to determine the setting of the parameter P4-06. |

| Setting A for P218 ... P2-22 | Short name | Name | Description |
| :---: | :---: | :---: | :---: |
| 31 h | SDO_1 | Output the status of bit 1 of P4-06. | The signal output functions SDO_0 ... SDO_7 provide the bit pattern (bits 0 ... 7 ) required to determine the setting of the parameter P4-06. |
| 32 h | SDO_2 | Output the status of bit 2 of P4-06. | The signal output functions SDO_0 ... SDO_7 provide the bit pattern (bits $0 \ldots 7$ ) required to determine the setting of the parameter P4-06. |
| $33_{h}$ | SDO_3 | Output the status of bit 3 of P4-06. | The signal output functions SDO_0 ... SDO_7 provide the bit pattern (bits $0 \ldots 7$ ) required to determine the setting of the parameter P4-06. |
| 34 h | SDO_4 | Output the status of bit 4 of P4-06. | The signal output functions SDO_0 ... SDO_7 provide the bit pattern (bits 0 ... 7) required to determine the setting of the parameter P4-06. |
| 35 h | SDO_5 | Output the status of bit 5 of P4-06. | The signal output functions SDO_0 ... SDO_7 provide the bit pattern (bits 0 ... 7) required to determine the setting of the parameter P4-06. |
| 36 h | SDO_6 | Output the status of bit 6 of P4-06. | The signal output functions SDO_0 ... SDO_7 provide the bit pattern (bits $0 \ldots 7$ ) required to determine the setting of the parameter P4-06. |
| 37 h | SDO_7 | Output the status of bit 7 of P4-06. | The signal output functions SDO_0 ... SDO_7 provide the bit pattern (bits 0 ... 7 ) required to determine the setting of the parameter P4-06. |
| $38_{h} \ldots 3 F_{h}$ | - | - | Reserved |

## Functions for Target Value Processing

## Interrupting a Movement with HALT

The HALT signal input function is available in the operating mode PT only.
With the signal input function HALT, the ongoing movement is interrupted. When the signal input function HALT is no longer active, the movement is resumed from the point where it was interrupted.

The movement is interrupted via a deceleration ramp. The deceleration ramp is specified via parameter P1-68.

In order to interrupt a movement via a signal input, you must first parameterize the signal input function HALT, refer to Setting the Digital Signal Inputs, page 271.

NOTE: The pulses received while the HALT function is active are ignored. When the HALT is no longer active, the drive accepts any on-going pulse stream and start movement according to that stream.

## A WARNING

## UNINTENDED EQUIPMENT OPERATION

- Do not deactivate the HALT function prior to the deceleration of the motor.
- If the deactivation of the HALT function prior to the deceleration of the motor is unavoidable, be sure to include these circumstances in your hazard and risk analysis of your application.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

If there is uncertainty of the effect of the movement generated by an ongoing pulse stream at the time of HALT deactivation, you must rehome the application.

## Stopping a Movement with OPST

With the signal input function OPST (Operational Stop), the ongoing movement is stopped.

In order to stop a movement via a signal input, you must first parameterize the signal input function OPST, refer to Setting the Digital Signal Inputs, page 271.

The movement is interrupted via a deceleration ramp to the point of the defined standstill. After that, the power stage is disabled once the drive has determined that the motor is at standstill, and if so configured, the holding brake is applied.

## AWARNING

## UNINTENDED EQUIPMENT OPERATION

- During commissioning, trigger all signals and simulate all conditions that cause a power stage disable request in order to verify that all loads come to a secure standstill when the power stage is disabled under maximum load conditions.
- Install a dedicated service brake if removal of power to the motor does not meet the requirements of your application.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

An error, AL013, is detected and presented.
The deceleration ramp is specified via parameter $P 1-68$.
After the OPST function is enabled, you must disable it and re-enable the power stage for continued operation.

## Setting a Signal Output Via Parameter

The digital signal outputs can be set via a parameter.
In order to set a digital signal output via the parameter, you must first parameterize the signal output functions SDO_0 ... SDO_7, refer to Setting the Digital Signal Outputs, page 276.

The parameter P4-06 lets you set the digital signal outputs.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & P 4-06 \\ & \text { FOT } \end{aligned}$ | Setting a signal output via parameter <br> Applicable operating mode: PT, PS, V, T <br> This parameter lets you set those signal outputs whose signal output functions have been defined by SDO_0 ... ## Forcing the Digital Signal Inputs and Signal Outputs

Forcing of signals means that the digital inputs and outputs are set manually. Forcing input and output values can have serious consequences on the operation of a machine or process.

## AWARNING

## UNINTENDED EQUIPMENT OPERATION CAUSED BY FORCING

- Only force I/O if there are no persons or obstructions in the zone of operation.
- Only force I/O if you are fully familiar with the effects of the signals.
- Only force I/O for test purposes, maintenance or other short-term tasks.
- Do not use forcing for regular, long-term or in-service operation.
- Always remove forcing when the task (testing, maintenance or other shortterm operation) is completed.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

## Forcing the Digital Inputs

Forcing of the digital inputs is set via the parameters P3-06 and P4-07.

The parameter P3-06 lets you specify which digital signal inputs are allowed to be forced.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| P3-06 <br> SDI | Digital Inputs - Forcing Settings <br> Applicable operating mode: PT, PS, V, T <br> This parameter determines whether a digital input can be forced. <br> Bits $0 \ldots$ : Digital input DI1 ... Digital input DI8 <br> Bit settings: <br> Value 0: Digital input cannot be forced <br> Value 1: Digital input can be forced <br> To start forcing, you must write P4-07. <br> See P2-10 ... P2-17 for the assignment of signal input functions to the digital inputs. | Oh <br> Oh $7 \mathrm{FF}_{\mathrm{h}}$ <br> Hexadecimal | u16 <br> RW | Modbus 40Ch <br> CANopen 4306h |

Use parameter P4-07 to activate forcing of the digital signal inputs.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |

P2-17 for the assignment of signal input functions to the digital inputs. | Oh <br> Oh <br> $\mathrm{FF}_{\mathrm{h}}$ <br> Hexadecimal | u16 <br> RW | Modbus 50E <br> CANopen 4407 h |

## Forcing the Digital Outputs

Forcing of the digital outputs is set via the parameters $\mathrm{P} 4-27$ and $\mathrm{P} 4-28$.

The parameter P4-27 lets you specify which digital signal outputs are allowed to be forced.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| P4-27 <br> DO_FORCE_MASK | Digital Outputs - Forcing Settings <br> Applicable operating mode: PT, PS, V, T <br> This parameter determines whether a digital output can be forced. <br> Bits $0 \ldots$ : Digital output DO1 ... Digital output DO5 <br> Bit settings: <br> Value 0: Digital output cannot be forced <br> Value 1: Digital output can be forced <br> To start forcing, you must write P4-28. <br> See P2-18 ... P2-22 for the assignment of signal output functions to the digital outputs. | Oh <br> $0_{h}$ <br> 1Fh <br> Hexadecimal | u16 <br> RW | Modbus 536h CANopen 441Bh |

Use parameter P4-28 to activate forcing of the digital signal outputs.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |

## Setting the Operating Mode

## Setting the Operating Mode

Unsuitable settings or unsuitable data may trigger unintended movements, trigger signals, damage parts and disable monitoring functions. Some parameters and other operational data do not become active until after a restart.

## A WARNING

UNINTENDED EQUIPMENT OPERATION

- Only start the system if there are no persons or obstructions in the zone of operation.
- Do not operate the drive system with undetermined parameter values.
- Never modify a parameter value unless you fully understand the parameter and all effects of the modification.
- Restart the drive and verify the saved operational data and/or parameter values after modification.
- Carefully run tests for all operating states and potential error situations when commissioning, upgrading or otherwise modifying the operation of the drive.
- Verify the functions after replacing the product and also after making modifications to the parameter values and/or other operational data.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

The drive has the following types of operating modes:

- Single Mode operating modes
- The drive operates in a single operating mode.
- Dual Mode operating modes
- The drive operates using 2 operating modes alternately. The signal input functions are used to switch between the operating modes.
- CANopen Mode operating mode
- The drive operates in the operating mode CANopen.

The operating modes Torque ( T ) and Torque ( Tz ) and the dual operating modes with Torque ( T ) and Torque ( Tz ) do not provide deceleration functionality in response to a power stage disable request. In these operating modes, the motor coasts down to a standstill in response to a power stage disable request. You must install additional equipment such as a dedicated service brake if your application requires faster deceleration of the load.

## A WARNING

## UNINTENDED EQUIPMENT OPERATION

- During commissioning, trigger all signals and simulate all conditions that cause a power stage disable request in order to verify that all loads come to a secure standstill when the power stage is disabled under maximum load conditions.
- Install a dedicated service brake if removal of power to the motor does not meet the requirements of your application.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

## Object units

## Overview

Two objects are used to set the gear ratio and the feed constant conversion factors, each of which has two subindex.

These objects have four equivalent variables:

| Item | Object |  | Description |
| :--- | :--- | :--- | :--- |
| Feed constant | $6092: 1_{\mathrm{h}}$ | Feed |  |
|  | $6092: 2_{\mathrm{h}}$ | Shit conversion numerator revolutions <br> Unit conversion denominator | Conversion factors of the user-defined position unit. <br> Used to multiply the motor revolution (rotary motors) or the <br> motor pitch (linear motors), according to the configured motor <br> type. |
|  | $6091: 1_{\mathrm{h}}$ | Motor revolutions <br> Motor shaft scaling for the fieldbus <br> gear ratio | Conversion factor of the motor shaft revolution. |
|  | $6091: 2_{\mathrm{h}}$ | Shaft revolutions <br> Drive shaft scaling for the fieldbus <br> gear ratio | Conversion factor of the drive shaft revolution. |

It is possible to modify the subindex of both objects, but it is usually sufficient to modify only the feed constant value, as shown in the following example:

Resolution $=\left(6092: 1_{h} / 6092: 2_{h}\right) \times\left(6091: 1_{h} / 6091: 2_{h}\right)$
Example by unit dimensions:

| Unit dimension | Examples |
| :---: | :---: |
| Position units | Assuming: <br> - 6092:1 $1_{\mathrm{h}}=360000$ <br> - 6092:2h $=1$ <br> - 6091:1 $\mathrm{h}_{\mathrm{h}}=1$ <br> - 6091:2h $=1$ <br> - The actual position reading $=720000$ <br> Then: $720000 /[(360000 / 1) \times(1 / 1)]=2 \text { revolutions }$ |
| Velocity units | Assuming: <br> - $6092: 1_{\mathrm{h}}=360000$ <br> - 6092:2h $=1$ <br> - 6091:1 $1_{\mathrm{h}}=1$ <br> - 6091:2h $=1$ <br> - The actual velocity reading $=720000$ <br> Then: <br> $720000 /[(360000 / 1) \times(1 / 1)]=2$ revolutions per second |
| Acceleration units | Assuming: <br> - $6092: 1_{\mathrm{h}}=360000$ <br> - 6092:2h $=1$ <br> - $6091: 1_{h}=1$ <br> - 6091:2h $=1$ <br> - The actual acceleration reading $=720000$ <br> Then: <br> $720000 /[(360000 / 1) \times(1 / 1)]=2$ revolutions per second ${ }^{2}$ |
| Current units | The units are derived from object 6075 (Motor Rated Current) <br> The value of this object is user-defined, in mA. <br> After setting a value for 6075 h, all other current objects must receive values defined in $1 / 1000$ (one-thousandth) of $6075_{h}$. <br> For example: <br> Assuming 6075 has a value of 20000 mA , then to set a value of 15000 mA for 6073 h (Maximum Current), write 750 for 6073 h . <br> The calculation is: $(750 / 1000) \times 20000=15000 \mathrm{~mA}$ |

## Examples of Rotary Motor with Gear or Rotary to Linear Motion Translation Device

When using a gear or rotary-to-linear motion translation device, set values for the translation ratio of the gear in order to define the unit variables.

| Using a ball screw that converts | Object values to set |
| :--- | :--- |
| 1 motor revolution to 155 mm | $6092: 1_{\mathrm{h}}=1550$ |
|  | $6092: 2_{\mathrm{h}}=1$ |
|  | $6091: 1_{\mathrm{h}}=1$ |
|  | $6091: 2_{\mathrm{h}}=1$ |

This units will be as follows:

- Position in 0.1 mm
- Velocity in $0.1 \mathrm{~mm} / \mathrm{sec}$
- Acceleration in $0.1 \mathrm{~mm} . \mathrm{sec}^{2}$

## Jog Operation

## Jog Operation

## Description

In the Jog operation, a movement is made from the actual motor position in the specified direction.

The parameter $P 4-05$ is used to set the velocity for the movement in the unit rpm.
The movement can be performed via the arrow keys at the HMI or via the signal input functions JOGP and JOGN.

For further information on the parameterizable signal input functions, refer to Setting the Digital Signal Inputs, page 271.

## Jog Via HMI

If the HMI is used, the movements are performed via the arrow keys. The operating mode is terminated via the $\mathbf{M}$ key.

If the HMI is used, the movements are performed via the arrow keys. The operating mode is terminated via the $\mathbf{M}$ key.

## Operating Mode Pulse Train (PT)

## Operating mode Pulse Train (PT)

## Description

In the operating mode Pulse Train (PT), movements are carried out according to externally supplied reference value signals. A position reference value is calculated on the basis of these external reference values plus an adjustable gear
ratio. The reference value signals can be $A / B$ signals, $P / D$ signals or $C W / C C W$ signals.

## Method

A movement can be made using one of 3 methods:

- Position synchronization without compensation movement

In the case of position synchronization without compensation movement, the movement is made synchronously (position synchronicity) with the supplied reference value signals. Reference value signals supplied during an interruption are not taken into account.

- Position synchronization with compensation movement

In the case of position synchronization with compensation movement, the movement is made synchronously (position synchronicity) with the supplied reference value signals. Reference value signals supplied during an interruption are taken into account and compensated for.

- Velocity synchronization

In the case of velocity synchronization, the movement is made synchronously (velocity synchronicity) with the supplied reference value signals.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| P8-31 <br> GEARING_MODE | Method for Operating Mode Pulse Train (PT) <br> Applicable operating mode: PT <br> Value 0: Synchronization deactivated <br> Value 1: Position synchronization without compensation movement <br> Value 2: Position synchronization with compensation movement <br> Value 3: Velocity synchronization <br> The parameters for acceleration (P1-34), deceleration (P1-35) and velocity (P1-55) act as limitations for the synchronization. | 0 <br> 1 <br> 3 <br> Decimal | u16 <br> RW <br> per. | Modbus 93E CANopen $481 \mathrm{~F}_{\mathrm{h}}$ |

## Pulse Settings

The parameter P1-00 lets you specify the type of reference value signals, the input polarity, the maximum signal frequency and the source of the pulses.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { P1-00 } \\ & \text { PTT } \end{aligned}$ | Reference Value Signal - Pulse Settings <br> Applicable operating mode: PT <br> This parameter is used to configure the reference value signals for the operating mode PT. <br> A: Type of reference value signals <br> B: Signal frequency <br> C: Input polarity <br> D: Source of reference value signals <br> Setting can only be modified if power stage is disabled. | $0_{h}$ <br> 2h $1132_{h}$ <br> Hexadecimal | u16 <br> RW <br> per. | Modbus 200h <br> CANopen $4100_{h}$ |

## Settings A and C

Type of reference value signals and input polarity

| - | $C=0$ <br> Positive input polarity | $C=1$ <br> Negative input polarity |
| :---: | :---: | :---: |
|  | Positive direction <br> of movement$\quad$Negative <br> direction of <br> movement | Positive direction <br> of movement Negative <br> direction of <br> movement |
| $A=0$ <br> A/B signals |  |  |
| $A=1$ <br> CW/CCW signals |  |  |
| $A=2$ <br> P/D signals | PULSE $\square$ $\square$ $\square$ <br> SIGN |  |

## Setting B

Maximum signal frequency:

| - | Low-speed pulses <br> PULSE, SIGN | High-speed pulses <br> HPULSE, HSIGN |
| :--- | :--- | :--- |
| $\mathbf{B = 0}$ | $500 \mathrm{Kpps}{ }^{(1)}$ | 4 Mpps |
| $\mathbf{B = 1}$ | 200 Kpps | 2 Mpps |
| $\mathbf{B = 2}$ | 100 Kpps | 1 Mpps |
| $\mathbf{B = 3}$ | 50 Kpps | 500 Kpps |
|  |  |  |
| $(1)$ | Only possible with RS422. |  |

Parameter $P 2-65$ bit 6 allows you to set an error response for frequencies exceeding the maximum signal frequency by more than $10 \%$.

## Setting D

Source of the pulses:

| $\mathbf{D}=\mathbf{0}$ | Low-speed pulses | CN1 Terminal: PULSE, SIGN |
| :--- | :--- | :--- |
| $\mathbf{D}=\mathbf{1}$ | High-speed pulses | CN1 Terminal: HPULSE, HSIGN |

The source of the pulses can also be set via the signal input function PTCMS. The settings of the signal input function take priority over the settings of the parameter P1-00.

## Gear Ratio

The gear ratio is the ratio of the number of motor increments and the number of reference increments.

The reference increments are supplied as reference value signals via the signal inputs.
Gear factor $=\frac{\text { Motor increments }}{\text { Reference increments }}=\frac{\text { Gear factor numerator }}{\text { Gear factor denominator }}$

With the factory setting for the gear ratio, 100000 reference increments correspond to one revolution.

There are 1280000 motor increments per revolution.

## Parameterization

You can set up 4 gear ratios. It is possible to switch between these gear ratios via the signal inputs.

The gear ratios are set via parameters P1-44, P1-45, P2-60, P2-61, and P2-62.
You can switch between the gear ratios with the signal input functions GNUM0 and GNUM1.

| GNUM1 | GNUM0 | $=$ |
| :---: | :---: | :---: |
| 0 | 0 | $\frac{\mathrm{P} 1-44}{\mathrm{P} 1-45}$ |
| 0 | 1 | $\frac{\mathrm{P} 2-60}{\mathrm{P} 1-45}$ |
| 1 | 0 | $\frac{\mathrm{P} 2-61}{\mathrm{P} 1-45}$ |
| 1 | 1 | $\frac{\mathrm{P} 2-62}{\mathrm{P} 1-45}$ |

In order to switch between the gear ratios via the signal inputs, you must first parameterize the signal input functions GNUM0 and GNUM1, refer to Setting the Digital Signal Inputs, page 271.

## Example 1

Calculation of number of motor revolutions corresponding to 30000 PUU:

$$
\begin{equation*}
30000 \text { PUU } \times \frac{\mathrm{P} 1-44=128}{\mathrm{P} 1-45=10}=384000 \rightarrow \frac{384000}{1280000}=0,3 \tag{M}
\end{equation*}
$$

## Example 2

Calculation of gear ratio if 10000 PUU are to effect 500 revolutions of the motor shaft:

## Example 3

A machine encoder with 1024 lines per revolution is to effect one revolution of the motor shaft with one revolution.

## Acceleration and Deceleration Limitation

The parameters P1-34 and P1-35 allow you to set a limitation for the acceleration and deceleration.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| $P 1-34$ <br> TACC | Acceleration Period <br> Applicable operating mode: PT, V <br> The acceleration period is the time in milliseconds required to accelerate from motor standstill to 6000 rpm . <br> For operating mode V , this parameter specifies the acceleration. <br> For operating mode PT, this parameter specifies an acceleration limitation for the pulses at the PTI interface. | ms <br> 6 <br> 30 <br> 65500 <br> Decimal | u16 <br> RW <br> per. | Modbus 244h <br> CANopen 4122h |
| $\begin{aligned} & \text { P1-35 } \\ & \text { TDEC } \end{aligned}$ | Deceleration Period <br> Applicable operating mode: PT, V <br> The deceleration period is the time in milliseconds required to decelerate from 6000 rpm to motor standstill. <br> For operating mode V , this parameter specifies the deceleration. <br> For operating mode PT, this parameter specifies a deceleration limitation for the pulses at the PTI interface. | ms <br> 6 <br> 30 <br> 65500 <br> Decimal | u16 <br> RW <br> per. | Modbus 246h <br> CANopen 4123h |

## Operating Mode Position Sequence (PS)

## Operating mode Position Sequence (PS)

## Description

The operating mode Position Sequence (PS) allows you to set and execute 32 motion profiles in any sequence. The motion profiles are defined via 32 data sets.

The following values can be set for each data set:

- Target position
- Type of movement: Absolute or relative
- Type of transition between data sets
- Acceleration
- Target velocity
- Deceleration
- Waiting time after completion of the data set

In addition, a Homing data set is provided. This Homing data set is used to set a reference point for absolute movements.

## Configuration

The data sets are configured by means of the commissioning software LXM28 DTM Library.

## Structure of a Data Set

Target Position
The target position is set in the user-defined unit. With the factory scaling, the resolution is 100000 user-defined units per revolution.

For further information on scaling, refer to chapter Scaling, page 301.

## Type of Movement

In the case of a relative movement, the movement is relative with reference to the previous target position or the current motor position.

In the case of an absolute movement, the movement is absolute with reference to the zero point.

Homing or position setting is required before the first absolute movement can be performed.

## Transition Between Data Sets

There are two types of transitions:

- The subsequent data set is only started after the preceding data set has been completed.
- The subsequent data set is started as soon as it is triggered via the signal input function CTRG or the parameter P5-07.

The acceleration period is the time in milliseconds required to accelerate from motor standstill to 6000 rpm . It is used to set the acceleration ramp.

## Target Velocity

The target velocity is reached after the time required for acceleration has passed.

## Deceleration Period

The deceleration period is the time in milliseconds required to decelerate from 6000 rpm to motor standstill. It is used to set the deceleration ramp.

## Waiting Time

The waiting time is the period of time that must pass after the target position has been reached for the data set to be considered completed.

## Parameters for the Data Sets

The data set are configured via parameters P6-02 ... P6-65 and P7-02 ... P7-65. The following table provides an overview:

| Data set | Target position | Type / transition | Acceleration / deceleration | Waiting time / target velocity |
| :---: | :---: | :---: | :---: | :---: |
| 1 | P6-02 | P6-03 | P7-02 | P7-03 |
| 2 | P6-04 | P6-05 | P7-04 | P7-05 |
| 3 | P6-06 | P6-07 | P7-06 | P7-07 |
| 4 | P6-08 | P6-09 | P7-08 | P7-09 |
| 5 | P6-10 | P6-11 | P7-10 | P7-11 |
| 6 | P6-12 | P6-13 | P7-12 | P7-13 |
| 7 | P6-14 | P6-15 | P7-14 | P7-15 |
| 8 | P6-16 | P6-17 | P7-16 | P7-17 |
| 9 | P6-18 | P6-19 | P7-18 | P7-19 |
| 10 | P6-20 | P6-21 | P7-20 | P7-21 |

## Running Data Sets

## Running Individual Data Sets

Individual data sets are selected via the signal input functions POS0 ... POS4.
The following table shows the bit pattern used to select the data sets.

| Data set | POS4 | POS3 | POS2 | POS1 | POS0 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 0 | 0 | 0 | 0 | 0 |
| 2 | 0 | 0 | 0 | 0 | 1 |
| 3 | 0 | 0 | 0 | 1 | 0 |
| 4 | 0 | 0 | 0 | 1 | 1 |
| 5 | 0 | 0 | 1 | 0 | 0 |
| $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ |
| 31 | 1 | 1 | 1 | 1 | 0 |
| 32 | 1 | 1 | 1 | 1 | 1 |

The selected data set is executed and the movement started via the signal input function CTRG, rising edge, or via the parameter P5-07.

For further information on parameterizing the signal input functions, refer to Setting the Digital Signal Inputs, page 271.

## Example of Running Individual Data Sets

The illustration below shows how the data sets are started and terminated via the signal input functions and the signal output functions CMD_OK, TPOS and MC_ OK:

Operating mode Position Sequence (PS)

For further information, refer to Setting the Digital Signal Inputs, page 271.

## Running Sequences of Data Sets via the Signal Input Functions AUTOR and STEPB

The signal input function AUTOR allows you to automatically execute a sequence of the 32 available data sets. When this signal input function is activated, data sets 1 to 32 are executed one after the other with the values set via the appropriate parameters for each data set (P6-02 ...P6-65 and P7-02 ...P7-65).

After the last data is completed, the sequence restarts with the first data set. This loop continues as long as the signal input function AUTOR is active.

If any of the 32 data sets contains an absolute movement, successful homing is required before the signal input function AUTOR can be used.

The signal input function AUTOR is level-triggered.
If the execution of a data set is interrupted and AUTOR is active again, the data set is resumed where it was interrupted.

If the signal input function AUTOR is deactivated, the currently active data set is completed. You can use the signal input function STEPB to return to the first of the 32 data sets.

The parameter P2-44 can be used to provide information on the running sequence of data sets via the digital outputs. For further information, refer to Status of Data Set Sequences - Parameter P2-44, page 299.

For further information on assigning signal input functions to the digital inputs, refer to Setting the Digital Signal Inputs, page 271.

## Running Sequences of Data Sets via the Signal Input Functions STEPU, STEPD, and STEPB

The signal input functions STEPU and STEPD allow you to run data sets in ascending or descending order.

Successful homing is required before the signal input function STEPU and STEPD can be used.

When the signal input function STEPU is activated via a rising edge at the digital input to which the signal input function STEPU is assigned, the first of the 32 data sets is executed with the values set via the parameters ( $P 6-02 \ldots P 6-03$ and $P 7-$ $02 \ldots$... $7-03$ ).

Each subsequent rising edge at the digital input to which the signal input function STEPU is assigned starts the next data set in the sequence. A falling edge at the digital input has no effect. If a rising edge is detected at the digital input, the next data set is started immediately if the target position has been reached, even if the waiting time set for the data set currently being executed has not yet elapsed.

When the last data set (data set 32) is reached with the signal input function STEPU, a further rising edge at the corresponding input has no effect. Use the signal input functions STEPB to return to the first data set (data set 1).

The signal input function STEPD works like the signal input function STEPU, but instead of the next data set, it starts the preceding data set.

You can use the signal input function STEPB to return to the first of the 32 data sets.

The parameter P2-44 can be used to provide information on the running sequence of data sets via the digital outputs. For further information, refer to Status of Data Set Sequences - Parameter P2-44, page 299.

For further information on assigning signal input functions to the digital inputs, refer to Setting the Digital Signal Inputs, page 271.

## Status of Data Set Sequences

Parameter P2-44 allows you to output information on the status of the sequence of data sets processed with the signal input functions AUTOR, STEPB, STEPU, and STEPD.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| $P 2-44$ <br> AUTOR_DOMS | Status of Data Set Sequences in Operating Mode PS <br> Applicable operating mode: PS <br> This parameter provides information on the status of the sequence of data sets. <br> Value 0: The functions assigned to the digital outputs DO1 ... DO6 via the parameters P2-18 ... P2-23 are active. <br> Value 1: The digital outputs provide information on the status of the sequence of data sets. <br> When this parameter is reset to 0 , the previous assignments and configurations of the digital outputs as set via the parameters P2-18 ... P2-23 are restored. | Oh <br> Oh <br> 1h <br> Hexadecimal | u16 <br> RW <br> per. | Modbus 358h CANopen 422Ch |

The following table shows the meanings of the bit patterns available via the digital outputs when the parameter $P 2-44$ is set to 1 :

| Item | DO6 | DO5 | DO4 | DO3 | DO2 | DO1 | Meaning |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 31 | 0 | 1 | 1 | 1 | 1 | 0 | Data set 26 target position reached |
| 32 | 0 | 1 | 1 | 1 | 1 | 1 | Data set 27 target position reached |
| 33 | 1 | 0 | 0 | 0 | 0 | 0 | Data set 28 target position reached |
| 34 | 1 | 0 | 0 | 0 | 0 | 1 | Data set 29 target position reached |
| 35 | 1 | 0 | 0 | 0 | 1 | 0 | Data set 30 target position reached |
| 36 | 1 | 0 | 0 | 0 | 1 | 1 | Data set 31 target position reached |
| 37 | 1 | 0 | 0 | 1 | 0 | 0 | Data set 32 target position reached |

## Scaling

Scaling is the ratio of the number of user-defined units and the number of internal units.

The user-defined units are supplied as parameter values in the unit PUU.
Scaling factor $=\frac{\text { Internal units }}{\text { User-defined units }}=\frac{\text { Gear factor numerator }}{\text { Gear factor denominator }}$

With the factory setting for the scaling factor, 100000 user-defined units correspond to one revolution.

The internal units are 1280000 increments per revolution.

## Parameterization

The scaling factor is set using the parameters $\mathrm{P} 1-44$ and $\mathrm{P} 1-45$.

$$
\frac{\mathrm{P} 1-44}{\mathrm{P} 1-45}
$$

## Example 1

Calculation of number of motor revolutions corresponding to 30000 PUU:

$$
\begin{equation*}
30000 \text { PUU } \times \frac{P 1-44=128}{P 1-45=10}=384000 \rightarrow \frac{384000}{1280000}=0,3 \tag{M}
\end{equation*}
$$

## Example 2

Calculation of the scaling factor if 10000 PUU are to effect 500 revolutions of the motor shaft:

$$
\begin{aligned}
10000 \text { PUU }= & 500(M) \frac{\mathrm{P} 1-44=?}{\mathrm{P} 1-45=?} \\
\frac{1280000}{1(M)} \longrightarrow & \frac{1280000 \times 500}{1(M) \times 10000}=\frac{128 \times 500}{(M \times 1} \\
& \longrightarrow \frac{\mathrm{P} 1-44=128 \times 500}{\mathrm{P} 1-45=1}
\end{aligned}
$$

## Homing Data Set for Absolute Movements

The Homing data set is used to establish a reference between a mechanical position and the actual position of the motor.

A reference between a mechanical position and the actual position of the motor is generated by means of a reference movement or by means of position setting.

A successful reference movement, or position setting, homes the motor. Homing establishes the zero point for absolute movements.

## Methods

The following methods are available:

- Reference movement to a limit switch

In the case of a reference movement to a limit switch, a movement to the negative limit switch or the positive limit switch is performed.
When the limit switch is reached, the motor is stopped and a movement is made back to the switching point of the limit switch.
From the switching point of the limit switch, an additional movement can be made to the next index pulse of the motor.
The switching point of the limit switch or the position of the index pulse point is the reference point.

- Reference movement to the reference switch

In the case of a reference movement to the reference switch, a movement to the reference switch is performed.

When the reference switch is reached, the motor is stopped and a movement is made back to the switching point of the reference switch.
From the switching point of the reference switch, an additional movement can be made to the next index pulse of the motor.
The switching point of the reference switch or the position of the index pulse point is the reference point.

- Reference movement to the index pulse

In the case of a reference movement to the index pulse, a movement is made from the actual position to the next index pulse. The position of the index pulse is the reference point.

- Position setting

In the case of position setting, the current motor position is set to a desired position value.

A reference movement must be terminated without interruption for the new zero point to be valid. If the reference movement is interrupted, it must be started again.

## Starting the Homing Data Set

The Homing data set can be started in the following ways:

- Automatic start when the power stage is enabled for the first time The automatic start can be set with the parameter P6-01.
- Start via the signal input function GOTOHOME

The signal input function must have been parameterized, refer to Setting the Digital Signal Inputs, page 271.

## Setting Automatic Start and the Subsequent Data Set

The parameter P6-01 is used to set the automatic start and select a data set to be executed after completion of the Homing data set.

The parameter P7-01 is used to set a waiting time for the subsequent data set. The subsequent data set is started after the waiting time has elapsed.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & P 6-01 \\ & \text { ODEF } \end{aligned}$ | Subsequent Data Set and Auto-start of Homing Data Set <br> Applicable operating mode: PS <br> Bit 0: <br> $0=$ Do not start Homing after first power stage enable <br> 1 = Start Homing after first power stage enable <br> Bits $1 \ldots 7$ : Reserved <br> Bits $8 \ldots$ 15: Subsequent data set | $0_{h}$ <br> $0_{h}$ $2001_{h}$ <br> Hexadecimal | u32 <br> RW <br> per. | Modbus 702h <br> CANopen 4601h |
| $P 7-01$ <br> HOME_DLY | Waiting Time of Homing Data Set <br> Applicable operating mode: PS <br> Bits 0 ... 15: Waiting time until next dataset is started <br> Bits 16 ... 31: Reserved | ms <br> 0 <br> 0 <br> 32767 <br> Decimal | u32 <br> RW <br> per. | Modbus 802h <br> CANopen 4701h |

## Setting Acceleration and Deceleration

The acceleration and deceleration for the Homing data set are set via the parameter P7-00.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value | Data type <br> R/W <br> Persistent <br> via fieldbus |
| :--- | :--- | :--- | :--- | :--- |
| H7-00 |  | HMI Format |  |

## Setting Velocities

The parameters P5-05 and P5-06 are used to set the velocities for searching the switch and for moving away from the switch.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| P5-05 <br> HOMESPEED1 | Homing - Fast Velocity for Reference Movement Applicable operating mode: PS | $\begin{aligned} & 0.1 \mathrm{rpm} \\ & 10 \\ & 1000 \\ & 60000 \\ & \text { Decimal } \end{aligned}$ | u32 <br> RW <br> per. | Modbus 60Ah <br> CANopen $4505_{h}$ |
| P5-06 <br> HOMESPEED2 | Homing - Slow Velocity for Reference Movement Applicable operating mode: PS | 0.1 rpm <br> 10 <br> 200 <br> 60000 <br> Decimal | u32 <br> RW <br> per. | Modbus 60Ch <br> CANopen 4506h |

## Defining the Zero Point

The parameter P6-00 is used to specify a position value, which is set at the reference point after a successful reference movement or after position setting. This position value defines the zero point.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| P6-00 ODAT | Position of Homing Data Set <br> Applicable operating mode: PS <br> After a successful reference movement, this position is automatically set at the reference point. <br> Bits $0 \ldots 31$ : Position | PUU $-2147483647$ <br> 0 <br> 2147483647 <br> Decimal | s32 <br> RW <br> per. | Modbus 700h CANopen $4600_{h}$ |

## Selecting the Homing Method

The parameter P5-04 is used to set the Homing method.

$\rightarrow$ Reserved

| Setting Z - limit switch | Setting Y - index pulse | Settings X - Homing method |  |
| :---: | :---: | :---: | :---: |
| - | $\mathrm{Y}=0$ : Movement back to the last index pulse <br> $\mathrm{Y}=2$ : No movement to the index pulse | 0 | Movement in positive direction to the positive limit switch |
| - |  | 1 | Movement in negative direction to the negative limit switch |
| $Z=0$ : Stop after limit switch is reached and trigger alert AL014 or AL015 <br> $Z=1$ : Move in opposite direction after having reached the limit switch, no alert | $\mathrm{Y}=0$ : Movement back to the last index pulse <br> $Y=1$ : Movement to the next index pulse <br> $Y=2$ : No movement to the index pulse | 2 | Movement in positive direction to the rising edge of the reference switch |
|  |  | 3 | Movement in negative direction to the rising edge of the reference switch |
|  | - | 4 | Movement in positive direction to the next index pulse |
|  | - | 5 | Movement in negative direction to the next index pulse |
|  | $Y=0$ : Movement back to the last index pulse | 6 | Movement in positive direction to the falling edge of the reference switch |
|  | $Y=1$ : Movement to the next index pulse <br> $Y=2$ : No movement to the index pulse | 7 | Movement in negative direction to the falling edge of the reference switch |
| - | - | 8 | Position setting |

The illustrations below show the Homing methods.

## Reference Movement to the Positive Limit Switch

The following illustrations show reference movements to the positive limit switch from different starting positions.

Reference movement (ZYX = -00)

| Item | Description |
| :--- | :--- |
| 1 | Movement to rising edge at velocity P5-05 |
| 2 | Movement to falling edge at velocity P5-05 |
| 3 | Movement to the index pulse at velocity P5-06 |

Reference movement (ZYX = -20)

| Item | Description |
| :--- | :--- |
| 1 | Movement to rising edge at velocity P5-05 |
| 2 | Movement to falling edge at velocity P5-06 |

## Reference Movement to the Negative Limit Switch

The following illustrations show reference movements to the negative limit switch from different starting positions.
Reference movement (ZYX = -01)

| Item | Description |
| :--- | :--- |
| 1 | Movement to rising edge at velocity P5-05 |
| 2 | Movement to falling edge at velocity P5-05 |
| 3 | Movement to the index pulse at velocity P5-06 |

Reference movement (ZYX = -21)

| Item | Description |
| :--- | :--- |
| 1 | Movement to rising edge at velocity P5-05 |
| 2 | Movement to falling edge at velocity P5-06 |

## Reference Movement in Positive Direction to the Rising Edge of the Reference Switch

The following illustrations show reference movements to the rising edge of the reference switch in positive direction from different starting positions.

Reference movement $(Z Y X=002)$

| Item | Description |
| :--- | :--- |
| 1 | Movement to rising edge at velocity P5-05 |
| 2 | Movement to falling edge at velocity P5-05 |
| 3 | Movement to the index pulse at velocity P5-06 |
| 4 | Movement to the limit switch at velocity P5-05 |

Reference movement (ZYX = 012)

| Item | Description |
| :--- | :--- |
| 1 | Movement to rising edge at velocity P5-05 |
| 2 | Movement to the index pulse at velocity P5-06 |
| 3 | Movement to falling edge at velocity P5-05 |
| 4 | Movement to the limit switch at velocity P5-05 |

Reference movement (ZYX = 022)

| Item | Description |
| :--- | :--- |
| 1 | Movement to rising edge at velocity P5-05 |
| 2 | Movement to falling edge at velocity P5-06 |
| 3 | Movement to the limit switch at velocity P5-05 |

Reference movement (ZYX = 102)

| Item | Description |
| :--- | :--- |
| 1 | Movement to rising edge at velocity P5-05 |
| 2 | Movement to falling edge at velocity P5-05 |
| 3 | Movement to the index pulse at velocity P5-06 |
| 4 | Movement to the limit switch at velocity P5-05 |

Reference movement (ZYX = 112)

| Item | Description |
| :--- | :--- |
| 1 | Movement to rising edge at velocity P5-05 |
| 2 | Movement to the index pulse at velocity P5-06 |
| 3 | Movement to falling edge at velocity P5-05 |
| 4 | Movement to the limit switch at velocity P5-05 |

Reference movement (ZYX = 122)

| Item | Description |
| :--- | :--- |
| 1 | Movement to rising edge at velocity P5-05 |
| 2 | Movement to falling edge at velocity P5-06 |
| 3 | Movement to the limit switch at velocity P5-05 |

Reference Movement in Negative Direction to the Rising Edge of the Reference Switch

The following illustrations show reference movements to the rising edge of the reference switch in negative direction from different starting positions.

Reference movement (ZYX = 003)

| Item | Description |
| :--- | :--- |
| 1 | Movement to rising edge at velocity P5-05 |
| 2 | Movement to falling edge at velocity P5-05 |
| 3 | Movement to the index pulse at velocity P5-06 |
| 4 | Movement to the limit switch at velocity P5-05 |

Reference movement (ZYX = 013)

| Item | Description |
| :--- | :--- |
| 1 | Movement to rising edge at velocity P5-05 |
| 2 | Movement to the index pulse at velocity P5-06 |
| 3 | Movement to falling edge at velocity P5-05 |
| 4 | Movement to the limit switch at velocity P5-05 |

Reference movement (ZYX = 023)

| Item | Description |
| :--- | :--- |
| 1 | Movement to rising edge at velocity P5-05 |
| 2 | Movement to falling edge at velocity P5-06 |
| 3 | Movement to the limit switch at velocity P5-05 |

Reference movement (ZYX = 103)

| Item | Description |
| :--- | :--- |
| 1 | Movement to rising edge at velocity P5-05 |
| 2 | Movement to falling edge at velocity P5-05 |
| 3 | Movement to the index pulse at velocity P5-06 |
| 4 | Movement to the limit switch at velocity P5-05 |

Reference movement (ZYX = 113)

| Item | Description |
| :--- | :--- |
| 1 | Movement to rising edge at velocity P5-05 |
| 2 | Movement to the index pulse at velocity P5-06 |
| 3 | Movement to falling edge at velocity P5-05 |
| 4 | Movement to the limit switch at velocity P5-05 |

Reference movement (ZYX = 123)

| Item | Description |
| :--- | :--- |
| 1 | Movement to rising edge at velocity P5-05 |
| 2 | Movement to falling edge at velocity P5-06 |
| 3 | Movement to the limit switch at velocity P5-05 |

## Reference Movement to the Index Pulse in Positive Direction

The following illustrations show reference movements to the index pulse in positive direction from different starting positions.

Reference movement (ZYX $=0-4$ )

| Item | Description |
| :--- | :--- |
| 1 | Movement to the next index pulse at velocity P5-06 |
| 2 | Movement to the limit switch at velocity P5-06 |

Reference movement (ZYX = 1-4)

| Item | Description |
| :--- | :--- |
| 1 | Movement to the next index pulse at velocity P5-06 |
| 2 | Movement to the limit switch at velocity P5-06 |

## Reference Movement to the Index Pulse in Negative Direction

The following illustrations show reference movements to the index pulse in negative direction from different starting positions.

Reference movement (ZYX = 0-5)

| Item | Description |
| :--- | :--- |
| 1 | Movement to the next index pulse at velocity P5-06 |
| 2 | Movement to the limit switch at velocity P5-06 |

Reference movement (ZYX = 1-5)

| Item | Description |
| :--- | :--- |
| 1 | Movement to the next index pulse at velocity P5-06 |

## Reference Movement in Positive Direction to the Falling Edge of the Reference Switch

The following illustrations show reference movements to the falling edge of the reference switch in positive direction from different starting positions.

Reference movement (ZYX = 006)

$$
\text { ZYX = } 006
$$

| Item | Description |
| :--- | :--- |
| 1 | Movement to falling edge at velocity P5-05 |
| 2 | Movement to rising edge at velocity P5-05 |
| 3 | Movement to the index pulse at velocity P5-06 |
| 4 | Movement to the limit switch at velocity P5-05 |

Reference movement $(Z Y X=016)$

| Item | Description |
| :--- | :--- |
| 1 | Movement to falling edge at velocity P5-05 |
| 2 | Movement to the index pulse at velocity P5-06 |
| 3 | Movement to the limit switch at velocity P5-05 |

Reference movement (ZYX = 026)

| Item | Description |
| :--- | :--- |
| 1 | Movement to rising edge at velocity P5-05 |
| 2 | Movement to falling edge at velocity P5-06 |
| 3 | Movement to the limit switch at velocity P5-05 |

Reference movement (ZYX = 106)

| Item | Description |
| :--- | :--- |
| 1 | Movement to falling edge at velocity P5-05 |
| 2 | Movement to rising edge at velocity P5-05 |
| 3 | Movement to the index pulse at velocity P5-06 |

| 1 | Movement to rising edge at velocity P5-05 |
| 2 | Movement to falling edge at velocity P5-06 |
| 3 | Movement to the limit switch at velocity P5-05 |

## Position Setting

By means of position setting, the current motor position is set to the position value in parameter P6-00. This also defines the zero point.

Position setting is only possible when the motor is at a standstill. Any active position deviation remains active and can still be compensated for by the position controller after position setting.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |

## Operating Modes Velocity (V) and Velocity Zero (Vz)

## Operating Modes Velocity (V) and Velocity Zero (Vz)

## Description

In the operating mode Velocity $(\mathrm{V})$, a movement is made with a specified target velocity.

## Source of Reference Value Signals

In the operating mode Velocity ( V ), the source of the reference value signals is one of the three values set via the parameters P1-09 to P1-11.

In the operating mode Velocity Zero $(\mathrm{Vz})$, the source of the reference value signals is either one of the three values set via the parameters P1-09 to P1-11 or the fixed target velocity 0 .

The values of the parameters P1-09 to P1-11 can be selected via the signal input functions SPD0 and SPD1.

The signal input functions SPD0 and SPD1 take priority over the reference value signal at the analog input $V \_R E F$.

The target velocity is selected via the signal input functions SPDO (LSB) and SPD1 (MSB) (bit-coded):

For additional information on the parameterizable signal input functions, refer to Setting the Digital Signal Inputs, page 271.

| - | Signal state of the digital signal inputs |  | Target velocity via: |  | Range |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | SPD1 | SPD0 |  |  |  |
| S1 | 0 | 0 | Operating mode Velocity (Vz) | Voltage between V_REF (Pin42) and GND ( $\overline{\text { pin 44 }}$ ) | -10V ... 10V |
|  |  |  | Operating mode <br> Velocity Zero (Vz) | 0 rpm | - |
| S2 | 0 | 1 | Internal parameters | P1-09 |  |
| S3 | 1 | 0 |  | P1-10 |  |
| S4 | 1 | 1 |  | P1-11 |  |

## Scaling of the Analog Input V_REF

The parameter P1-40 lets you set the velocity corresponding to 10 V . This results in a linear scaling for the analog input V_REF.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| P1-40 <br> VCM | Velocity Target Value and Velocity Limitation 10 V <br> Applicable operating mode: PT, PS, V, T <br> In the operating mode V , this parameter specifies the target velocity that corresponds to the maximum input voltage of 10 V . <br> In the operating mode T , this parameter specifies the velocity limitation that corresponds to the maximum input voltage of 10 V . <br> Example: If the value of this parameter is 3000 in the operating mode V and if the input voltage is 10 V , the target velocity is 3000 rpm . | rpm <br> 0 <br> 10001 <br> Decimal | s32 <br> RW <br> per. | Modbus 250h <br> CANopen 4128h |

## Example

The illustration below shows how the target velocities are switched by means of the signal input functions SPD0,SPD1 and SON.

Operating modes Velocity (V) and Velocity Zero (Vz)

For further information, refer to Setting the Digital Signal Inputs, page 271.

## Stopping the Movement via Signal Input Function ZCLAMP

The movement can be stopped via the digital signal input function ZCLAMP.
Conditions for stopping the movement:

- The reference velocity must be below the velocity value defined in parameter P1-38.
- The signal input function ZCLAMP must be assigned and the signal input must be triggered.

For assigning the signal input function, refer to Setting the Digital Signal Inputs, page 271.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| $P 1-38$ ZSPD | Signal Output Function ZSPD / Signal Input <br> Function ZCLAMP - Velocity <br> Applicable operating mode: PT, PS, V, T <br> This parameter specifies the velocity for the signal output function ZSPD. The signal output function ZSPD indicates that the velocity of the motor is less than the velocity value set via this parameter. <br> This parameter specifies the velocity for the signal input function ZCLAMP. The signal input function ZCLAMP stops the motor. The velocity of the motor must be below the velocity value set via this | 0.1 rpm <br> 0 <br> 100 <br> 2000 <br> Decimal | s32 <br> RW <br> per. | Modbus $24 C_{h}$ CANopen 4126h |

Additionally the behavior for ZCLAMP can be set via parameter P2-65 bit 10.
Setting of parameter $P 2-65$ bit 10:

- Bit $10=0$ : Immediate stop. Motor is locked at the position where it was when ZCLAMP became active.
- Bit $10=1$ : Motor is decelerated with deceleration ramp setting. Motor is locked at the position where standstill is reached.

## Acceleration and Deceleration

The parameters P1-34 and P1-35 allow you to set the acceleration and deceleration.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { P1-34 } \\ & \text { TACC } \end{aligned}$ | Acceleration Period <br> Applicable operating mode: PT, V <br> The acceleration period is the time in milliseconds required to accelerate from motor standstill to 6000 rpm . <br> For operating mode V , this parameter specifies the acceleration. <br> For operating mode PT, this parameter specifies an acceleration limitation for the pulses at the PTI interface. | ms <br> 6 <br> 30 <br> 65500 <br> Decimal | u16 <br> RW <br> per. | Modbus 244h CANopen 4122h |
| $\begin{aligned} & \text { P1-35 } \\ & \text { TDEC } \end{aligned}$ | Deceleration Period <br> Applicable operating mode: PT, V <br> The deceleration period is the time in milliseconds required to decelerate from 6000 rpm to motor standstill. <br> For operating mode V , this parameter specifies the deceleration. <br> For operating mode PT, this parameter specifies a deceleration limitation for the pulses at the PTI interface. | ms <br> 6 <br> 30 <br> 65500 <br> Decimal | u16 <br> RW <br> per. | Modbus 246h <br> CANopen $4123_{h}$ |

## Operating Modes Torque (T) and Torque Zero (Tz)

## Operating Modes Torque (T) and Torque Zero (Tz)

## Description

In the operating mode Torque (T), a movement is made with a specified target torque. The target torque is specified in percent of the nominal torque of the motor.

The operating modes Torque ( T ) and Torque ( Tz ) and the dual operating modes with Torque (T) and Torque (Tz) do not provide deceleration functionality in response to a power stage disable request. In these operating modes, the motor coasts down to a standstill in response to a power stage disable request. You
must install additional equipment such as a dedicated service brake if your application requires faster deceleration of the load.

## AWARNING

## UNINTENDED EQUIPMENT OPERATION

- During commissioning, trigger all signals and simulate all conditions that cause a power stage disable request in order to verify that all loads come to a secure standstill when the power stage is disabled under maximum load conditions.
- Install a dedicated service brake if removal of power to the motor does not meet the requirements of your application.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

## Source of Reference Value Signals

In the operating mode Torque ( T ), the source of the reference value signals is either the analog input $T_{-} R E F$ or one of the three values set via the parameters P1-12 to P1-14.

In the operating mode Torque Zero (Tz), the source of the reference value signals is either one of the three values set via the parameters P1-12 to P1-14 or the fixed target torque 0 \%.

The values of the parameters $P 1-12$ to $P 1-14$ can be selected via the signal input functions TCM0 and TCM1.

The signal input functions TCM0 and TCM1 take priority over the reference value signal of the analog input $T_{-} R E F$.
The target torque is selected via the signal input functions TCM0 (LSB) and TCM1 (MSB) (bit-coded):

For further information on the parameterizable signal input functions, refer to Setting the Digital Signal Inputs, page 271.

| - | Signal state of the digital signal inputs |  | Target torque is provided via: |  | Range |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | TCM1 | TCM0 |  |  |  |
| T1 | 0 | 0 | Operating mode Torque ( T ) | Voltage between T_REF (pin 18) and GND (pin 19) | -10V ... 10V |
|  |  |  | Operating mode <br> Torque Zero (Tz) | 0 \% | - |
| T2 | 0 | 1 | Internal parameters | P1-12 | -300 ... 300\% |
| T3 | 1 | 0 |  | P1-13 |  |
| T4 | 1 | 1 |  | P1-14 |  |

## Scaling of the Analog Input T_REF

The parameter P1-41 lets you set the torque corresponding to 10 V . This results in a linear scaling for the analog input T_REF.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |

## Example

The illustration below shows how the target torque is switched by means of the signal input functions TCM0,TCM1 and SON.

Operating modes Torque ( T ) and Torque Zero (Tz)

For further information, refer to Setting the Digital Signal Inputs, page 271.

## Operating Mode CANopen

## Indication of the Operating State

The parameter Statusword 6041h provides information on the operating state of the device and the processing status of the operating mode.

| Index | Name | Object type <br> Data type <br> Access | PDO mapping object | Minimum value <br> Factory settings <br> Maximum value |
| :---: | :---: | :---: | :---: | :---: |
| 6041 h | Statusword <br> Bit assignments: <br> - Bits $0 \ldots 3$ : Status bits <br> - Bit 4: Voltage Enabled <br> - Bits 5 ... 6: Status bits <br> - Bit 7: Error detected <br> - Bit 8: Halt request active <br> - Bit 9: Remote <br> - Bit 10: Target Reached <br> - Bit 11: Internal Limit Active <br> - Bit 12: Operating mode-specific <br> - Bit 13: x_err <br> - Bit 14: x_end <br> - Bit 15: ref_ok | VAR <br> UINT16 <br> ro | Yes | $0$ $65535$ |

## Bits 0, 1, 2, 3, 5 and 6

Bits $0,1,2,3,5$ and 6 of the parameter Statusword $6041_{\mathrm{h}}$ provide information on the operating state.

| Operating state | Bit 6 <br> Switch On <br> Disabled | Bit 5 <br> Quick Stop | Bit 3 <br> Fault | Bit 2 <br> Operation <br> Enabled | Bit 1 <br> Switch On | Bit 0 <br> Ready To <br> Switch On <br> 2 Not Ready To Switch On 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| X Switch On Disabled | 1 | X | 0 | 0 | 0 | 0 |

| Operating state | Bit 6 <br> Switch On <br> Disabled | Bit 5 <br> Quick Stop | Bit 3 <br> Fault | Bit 2 <br> Operation Enabled | Bit 1 <br> Switch On | Bit 0 <br> Ready To <br> Switch On |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 4 Ready To Switch On | 0 | 1 | 0 | 0 | 0 | 1 |
| 5 Switched On | 0 | 1 | 0 | 0 | 1 | 1 |
| 6 Operation Enabled | 0 | 1 | 0 | 1 | 1 | 1 |
| 7 Quick Stop Active | 0 | 0 | 0 | 1 | 1 | 1 |
| 8 Fault Reaction Active | 0 | X | 1 | 1 | 1 | 1 |
| 9 Fault | 0 | X | 1 | 0 | 0 | 0 |

## Bit 4

Bit 4=1 indicates whether the DC bus voltage is correct. If the voltage is missing or is too low, the device does not transition from operating state 3 to operating state 4.

## Bit 7

Bit $7=1$ indicates that an error has been detected.

## Bit 8

Bit 8=1 indicates that a "Halt" is active.

Bit 9

If bit 9 is set, the device carries out commands via the fieldbus. If Bit 9 is reset, the device is controlled via a different interface. In such a case, it is still possible to read or write parameters via the fieldbus.

## Bit 10

Bit 10 is used for monitoring the current operating mode. Details can be found in the chapters on the individual operating modes.

## Bit 11

The assignment of bit 11 can be set via the parameter P3-30.

Bit 12

Bit 12 is used for monitoring the current operating mode. Details can be found in the chapters on the individual operating modes.

## Bit 13

Bit 13 only becomes " 1 " in the case of an error which needs to be remedied prior to further processing.

Bit 14 changes to " 0 " if an operating mode is started. When processing is terminated or interrupted, for example by a "Halt", bit 14 toggles back to "1" once the motor has come to a standstill. The signal change of bit 14 to " 1 " is suppressed if one process is followed immediately by a new process in a different operating mode.

## Bit 15

Bit 15 is "1" if the motor has a valid zero point, for example as a result of a reference movement. A valid zero point remains valid even if the power stage is disabled.

## Changing the Operating State

The parameter Controlword 6040h can be used to switch between the operating states.

| Index | Name | Object type <br> Data type <br> Access | PDO mapping object | Minimum value <br> Factory settings <br> Maximum value |
| :---: | :---: | :---: | :---: | :---: |
| 6040h | Controlword <br> Bit assignments: <br> - Bit 0: Switch On <br> - Bit 1: Enable Voltage <br> - Bit 2: Quick Stop <br> - Bit 3: Enable Operation <br> - Bits $4 \ldots 6$ : Operating mode-specific <br> - Bit 7: Fault Reset <br> - Bit 8: Halt <br> - Bit 9: Operating mode-specific <br> - Bits $10 \ldots 15$ : Reserved | VAR <br> UINT16 <br> rww | Yes | $0$ $65535$ |

## Bits 0 ... 3 and 7

Bits $0 \ldots 3$ and bit 7 of the parameter Controlword $6040_{h}$ allow you to switch between the operating states.

| Fieldbus <br> command | State <br> transitions | State transition to | Bit 7 <br> Fault <br> Reset | Bit 3 <br> Enable <br> Operation | Bit 2 <br> Quick <br> Stop | Bit 1 <br> Enable <br> Voltage |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Shutdown | T2, T6, T8 |  |  |  |  |  |

Bits 4 ... 6 and 9
Bits 4 to 6 and bit 9 are used for the operating mode-specific settings. Details can be found in the descriptions of the individual operating modes in this chapter.

## Bit 8

A "Halt" can be triggered with bit 8=1.
Bits 10 ... 15
Reserved.

## Starting and Changing a CANopen Operating Mode

## Overview of the CANopen Operating Modes

The following CANopen operating modes are available:

- CANopen operating modes as per CiA 402
- Profile Position
- Profile Velocity
- Profile Torque
- Homing
- Interpolated Position
- Cyclic Synchronous Position
- Cyclic Synchronous Velocity
- Cyclic Synchronous Torque
- CANopen vendor-specific operating modes
- Jog
- Electronic Gear
- Analog Velocity
- Analog Torque

## Starting and Changing an Operating Mode

The parameter Modes of Operation 6060h is used to set the operating mode.
The parameter Modes of Operation Display 6061h can be used to read the current operating mode.

| Index | Name | Object type <br> Data type <br> PDO mapping <br> object | Minimum value <br> Factory settings <br> ( |  |
| :--- | :--- | :--- | :--- | :--- |
| $6060_{\mathrm{h}}$ | Modes of Operation | VAR | Maximum value |  |

Values for the parameters Modes of Operation 6060h and Modes of Operation Display (6061h):

- Value 1: Profile Position
- Value 3: Profile Velocity
- Value 4: Profile Torque
- Value 6: Homing
- Value 7: Interpolated Position
- Value 8: Cyclic Synchronous Position
- Value 9: Cyclic Synchronous Velocity
- Value 10: Cyclic Synchronous Torque
- Value-1: Jog
- Value -2: Electronic Gear
- Value -3: Analog Velocity
- Value -4: Analog Torque

## CANopen Operating Mode Profile Position

## Description

In the operating mode Profile Position, a movement to a specified target position is performed.

A movement can be made using one of 2 methods:

- Relative movement
- Absolute movement

In the case of a relative movement, the movement is relative with reference to the previous target position or the current motor position.

In the case of an absolute movement, the movement is absolute with reference to the zero point.

## Starting the Operating Mode

The operating mode must be set in the parameter Modes of Operation 6060h. Writing the parameter value causes the operating mode to start.

The target position is set via the parameter Controlword 607A $A_{h}$ and the target velocity is set via the parameter Controlword 6081h.

| Index | Name | Object type <br> Data type <br> Access | PDO mapping <br> object | Minimum value <br> Factory settings <br> Maximum value |
| :--- | :--- | :--- | :--- | :--- |
| 607A | Target Position | VAR | INT32 | Yes |

The acceleration is set via the parameter Profile Acceleration 6083h and the deceleration is set via the parameter Profile Deceleration 6084h.

| Index | Name | Object type <br> Data type <br> Access | PDO mapping <br> object | Minimum value <br> Factory settings <br> Maximum value |
| :--- | :--- | :--- | :--- | :--- |
| $6083_{\mathrm{h}}$ | Profile Acceleration | Unit: User-defined position unit/s ${ }^{2}$ | VAR <br> UINT32 <br> rww | Yes |
| $6084_{h}$ | Profile Deceleration | VAR | 4 |  |
|  | Unit: User-defined position unit/s ${ }^{2}$ | UINT32 | Yes | 4266666667 |
|  |  | rww |  | 4294967295 |

The movement is started via the parameter Controlword $6040_{h}$.

## Controlword

| Bit 9 | Bit 5 |
| :--- | :--- | :--- | :--- |
| Change on |  |
| setpoint |  |$\quad$| Change |
| :--- |
| setpoint |
| immediately |$\quad$| Nit 4 |
| :--- |
| 0 |

| Controlword | Meaning |
| :--- | :--- |
| Bit 2: Quick Stop | Triggers a Quick Stop |
| Bit 6: Absolute / relative | 0 : Absolute movement |

| Controlword | Meaning |
| :--- | :--- |
|  | 1: Relative movement |
| Bit 7: Fault Reset | Triggers a Fault Reset |
| Bit 8: Halt | Triggers a Halt |

## Statusword

| Statusword | Meaning |
| :--- | :--- |
| Bit 8: Halt request active | 0: No Halt request <br> $1:$ A Halt request is active |
| Bit 10: Target Reached | 0: Target position not reached <br> $1:$ Target position reached |
| Bit 12: Target value acknowledge | 0: New position possible <br> $1:$ New target position accepted |
| Bit 13: x_err | 0: No error detected <br> $1:$ An error has been detected |
| Bit 14: x_end | 0: Operating mode started <br> $1:$ Operating mode terminated |
| Bit 15: ref_ok | 0: Zero point is not valid <br> $1:$ Zero point is valid |

## Terminating the Operating Mode

The operating mode is terminated when the motor is at a standstill and one of the following conditions is met:

- Target position reached
- Stop caused by "Halt" or "Quick Stop"
- Stop caused by a detected error

## Parameterization

The maximum velocity can be adjusted via the parameter Max profile velocity $607 \mathrm{~F}_{\mathrm{h}}$.

| Index | Name | Object type <br> Data type <br> Access | PDO mapping <br> object | Minimum value <br> Factory settings <br> Maximum value |
| :--- | :--- | :--- | :--- | :--- |
| $607 \mathrm{~F}_{\mathrm{h}}$ | Max Profile Velocity |  |  |  |
|  | Unit: User-defined position unit/s | VAR | NINT32 | 1 |
|  |  | rw | - |  |

The reference for a relative movement can be set via the parameter Position option code 60F2h.

| Index | Name | Object type <br> Data type <br> PDO mapping <br> object | Minimum value <br> Factory settings <br> Maximum value |  |
| :--- | :--- | :--- | :--- | :--- |
| 60 F 2 h | Position option code <br> Value 0: Relative with reference to the previous <br> target position <br> Value 2: Relative with reference to the actual <br> position of the motor | VINT16 | No | 0 |

## CANopen Operating Mode Profile Velocity

## Description

In the operating mode Profile Velocity, a movement is made with a specified target velocity.

## Starting the Operating Mode

The operating mode must be set in the parameter Modes of Operation 6060h. Writing the parameter value causes the operating mode to start.

The parameter Target velocity 60FF ${ }_{\mathrm{h}}$ starts the movement.

| Index | Name | Object type <br> Data type <br> Access | PDO mapping <br> object | Minimum value <br> Factory settings |
| :--- | :--- | :--- | :--- | :--- |
| 60FFh | Target Velocity | Maximum value |  |  |
|  | Unit: User-defined position unit/s | INT32 | Yes | -2147483648 |

The acceleration is set via the parameter Profile Acceleration 6083h and the deceleration is set via the parameter Profile Deceleration 6084h.

| Index | Name | Object type <br> Data type <br> Access | PDO mapping <br> object | Minimum value <br> Factory settings |
| :--- | :--- | :--- | :--- | :--- |
| 6083h | Profile Acceleration | Maximum value |  |  |

## Controlword

| Controlword | Meaning |
| :--- | :--- |
| Bit 2: Quick Stop | Triggers a Quick Stop |
| Bits 4 ... 6: Operating mode-specific | Not relevant for this operating mode |
| Bit 7: Fault Reset | Triggers a Fault Reset |

| Controlword | Meaning |
| :--- | :--- |
| Bit 8: Halt | Triggers a Halt |
| Bit 9: Operating mode-specific | Not relevant for this operating mode |

## Statusword

| Statusword | Meaning |
| :--- | :--- |
| Bit 8: Halt request active | 0: No Halt request <br> 1: A Halt request is active |
| Bit 10: Target Reached | 0: Target velocity not reached <br> $1:$ Target velocity reached |
| Bit 12: Operating mode-specific | 0: Velocity $=>0$ <br> $1:$ Velocity $=0$ |
| Bit 13: x_err | 0: No error detected <br> $1:$ An error has been detected |

## CANopen Operating Mode Profile Torque

## Description

In the operating mode Profile Torque, a movement is made with a specified target torque.

## Starting the Operating Mode

The operating mode must be set in the parameter Modes of Operation 6060h. Writing the parameter value causes the operating mode to start.

The parameter Target torque 6071h starts the movement.

| Index | Name | Object type <br> Data type <br> PDO mapping <br> object | Minimum value <br> Factory settings <br> Maximum value |  |
| :--- | :--- | :--- | :--- | :--- |
| $6071_{\mathrm{h}}$ | Target Torque | Access | MAR | Yes |

## Controlword

| Controlword | Meaning |
| :--- | :--- |

## CANopen Operating Mode Homing

## Description

In the operating mode Homing, a reference is generated between a mechanical position and the actual position of the motor.

A reference between a mechanical position and the actual position of the motor is generated by means of a reference movement or by means of position setting.

A successful reference movement or position setting homes the motor and the zero point becomes valid.

The zero point is the point of reference for absolute movements in the CANopen operating mode Profile Position.

A movement can be made using different methods:

- Reference movement to a limit switch

In the case of a reference movement to a limit switch, a movement to the negative limit switch or the positive limit switch is performed. When the limit switch is reached, the motor is stopped and a movement is made back to the switching point of the limit switch. From the switching point of the limit switch, a movement is made to the next index pulse of the motor or to a parameterizable distance from the switching point. The position of the index pulse or the position of the parameterizable distance from the switching point is the reference point.

- Reference movement to the reference switch

In the case of a reference movement to the reference switch, a movement to the reference switch is performed. When the reference switch is reached, the motor is stopped and a movement is made back to the switching point of the reference switch. From the switching point of the reference switch, a movement is made to the next index pulse of the motor or to a parameterizable distance from the switching point. The position of the index pulse or the position of the parameterizable distance from the switching point is the reference point.

- Reference movement to the index pulse

In the case of a reference movement to the index pulse, a movement is made from the actual position to the next index pulse. The position of the index pulse is the reference point.

- Position setting

In the case of position setting, the actual position of the motor is set to a specified position value.

A reference movement must be terminated without interruption for the new zero point to be valid. If the reference movement is interrupted, it must be started again.

## Procedure

- Set Mode of operation $6060_{\mathrm{h}}$ to operating mode Homing (6).
- Set Home offset 607Ch.
- Set Home method 6098h, the value range is 1 to 35 and specifies the different homing methods.
- Set Home speeds 6099:1h to the value for velocity to search for the limit switches (unit = puu).
- Set Home speeds 6099:2h to the value for velocity to search for the index pulse (unit = puu).
- Set Home acceleration $609 A_{\mathrm{h}}$ to the value for the acceleration ramp (unit = ms from 0 to 3000 rpm).

## Supported Homing Methods

## Method 1: Homing on the negative limit switch and index pulse

The initial movement is in the negative direction if the negative limit switch is inactive.

The initial movement is in the positive direction if the negative limit switch is active.
The home position is at the first index pulse in the positive direction where the negative limit switch becomes inactive.

## Method 2: Homing on the positive limit switch and index pulse

The initial movement is in the positive direction if the positive limit switch is inactive.

The initial movement is in the negative direction if the positive limit switch is active.
The home position is at the first index pulse in the negative direction where the positive limit switch becomes inactive.

Methods 3 and 4: Homing on the positive reference switch and index pulse
The initial movement is in the negative direction if the positive reference switch is active.

The initial movement is in the positive direction if the positive reference switch is inactive.

- Method 3: The home position is at the first index pulse in the negative direction where the reference switch becomes inactive.
- Method 4: The home position is at the first index pulse in the positive direction where the reference switch becomes active.

## Methods 5 and 6: Homing on the negative reference switch and index pulse

The initial movement is in the positive direction if the negative reference switch is active.

The initial movement is in the negative direction if the negative reference switch is inactive.

- Method 5: The home position is at the first index pulse in the positive direction where the reference switch becomes inactive.
- Method 6: The home position is at the first index pulse in the negative direction where the reference switch becomes active.
Methods 7 to 10: Homing on the reference switch and index pulse (Positive)
These methods use a reference switch which is active over only a portion of the travel.

The initial movement is in the positive direction if the reference switch is inactive.

The initial movement is in the negative direction if the reference switch is active.
If the initial movement leads away from the reference switch, the drive reverses on encountering the positive limit switch.

- Method 7: The home position is at the first index pulse in the negative direction where the reference switch becomes inactive.
- Method 8: The home position is at the first index pulse in the positive direction where the reference switch becomes active.
- Method 9: The home position is at the first index pulse in the negative direction where the reference switch becomes active.
- Method 10: The home position is at the first index pulse in the positive direction where the reference switch becomes inactive.

## Methods 11 to 14: Homing on the reference switch and index pulse (Negative)

The initial movement is in the negative direction if the reference switch is inactive.
The initial movement is in the positive direction if the reference switch is active.
If the initial movement leads away from the reference switch, the drive reverses on encountering the negative limit switch.

- Method 11: The home position is at the first index pulse in the positive direction where the reference switch becomes inactive.
- Method 12: The home position is at the first index pulse in the negative direction where the reference switch becomes active.
- Method 13: The home position is at the first index pulse in the positive direction where the reference switch becomes active.
- Method 14: The home position is at the first index pulse in the negative direction where the reference switch becomes inactive.

## Methods 15 and 16: Reserved

## Method 17: Homing on the negative limit switch

The initial movement is in the negative direction if the negative limit switch is inactive.

The initial movement is in the positive direction if the negative limit switch is active.
The home position is in the positive direction where the negative limit switch becomes inactive.

## Method 18: Homing on the positive limit switch

The initial movement is in the positive direction if the positive limit switch is inactive.

The initial movement is in the negative direction if the positive limit switch is active.
The home position is in the negative direction where the positive limit switch becomes inactive.

## Methods 19 and 20: Homing on the positive reference switch

The initial movement is in the negative direction if the positive reference switch is active.

The initial movement is in the positive direction if the positive reference switch is inactive.

- Method 19: The home position is in the negative direction where the reference switch becomes inactive.
- Method 20: The home position is in the positive direction where the reference switch becomes active.

## Methods 21 and 22: Homing on the negative reference switch

The initial movement is in the positive direction if the negative reference switch is active.

The initial movement is in the negative direction if the negative reference switch is inactive.

- Method 21: The home position is in the positive direction where the reference switch becomes inactive.
- Method 22: The home position is in the negative direction where the reference switch becomes active.

## Methods 23 to 26: Homing on the reference switch (Positive)

These methods use a reference switch which is active over only a portion of the travel.

The initial movement is in the positive direction if the reference switch is inactive.
The initial movement is in the negative direction if the reference switch is active.
If the initial movement leads away from the reference switch, the drive reverses on encountering the positive limit switch.

- Method 23: The home position is in the negative direction where the reference switch becomes inactive.
- Method 24: The home position is in the positive direction where the reference switch becomes active.
- Method 25: The home position is in the negative direction where the reference switch becomes active.
- Method 26: The home position is in the positive direction where the reference switch becomes inactive.

## Methods 27 to 30: Homing on the reference switch (Negative)

These methods use a reference switch which is active over only a portion of the travel.

The initial movement is in the negative direction if the reference switch is inactive.
The initial movement is in the positive direction if the reference switch is active.
If the initial movement leads away from the reference switch, the drive reverses on encountering the negative limit switch.

- Method 27: The home position is in the positive direction where the reference switch becomes inactive.
- Method 28: The home position is in the negative direction where the reference switch becomes active.
- Method 29: The home position is in the positive direction where the reference switch becomes active.
- Method 30: The home position is in the negative direction where the reference switch becomes inactive.

## Methods 31 and 32: Reserved

## Methods 33 and 34: Homing on the index pulse

- Method 33: The home position is at the first index pulse in the negative direction.
- Method 34: The home position is at the first index pulse in the positive direction.

## Methods 35: Homing on the current position

The current position is considered as the home position.

## Starting the Operating Mode

The operating mode must be set in the parameter Modes of Operation 6060h. Writing the parameter value causes the operating mode to start.

The movement is started via the Controlword 6040h.

## Controlword

Bit 4 in the parameter Controlword 6040h starts a movement, bit 8 terminates the movement.

| Controlword | Meaning |
| :--- | :--- |
| Bit 4: Homing operation start | Start homing |
| Bits 5 ... 6: Operating mode-specific | Not relevant for this operating mode |
| Bit 8: Halt | Triggers a Halt |
| Bit 9: Operating mode-specific | Not relevant for this operating mode |

## Statusword

| Statusword | Meaning |
| :--- | :--- |
| Bit 10: Target Reached | 0: Homing not completed <br> 1: Homing completed |
| Bit 12: Homing attained | Homing successfully completed |
| Bit 13: x_err | $0:$ No error detected <br> $1:$ An error has been detected |
| Bit 14: Operating mode-specific | Not relevant for this operating mode |
| Bit 15: Operating mode-specific | Not relevant for this operating mode |

## Terminating the Operating Mode

The operating mode is terminated when the motor is at a standstill and one of the following conditions is met:

- Homing successful
- Stop caused by "Halt" or "Quick Stop"
- Stop caused by a detected error

## CANopen Operating Mode Interpolated Position

## Description

In the operating mode Interpolated Position, the drive follows the position values transmitted on a cyclic basis. The transmitted values are linearly interpolated within the drive.

This mode uses a buffer of position commands. The buffer size is always 1 , thus it is not possible to give a list of target position commands in advance

The monitoring functions Heartbeat and Node Guarding cannot be used in this operating mode.

Check cyclical reception of PDOs at the PLC in order to detect an interruption of the connection.

The reference positions are transmitted synchronously with each cycle. The cycle time of a cycle can be set from $1 \ldots 20 \mathrm{~ms}$.

The movement to the reference positions starts with the SYNC signal.
The drive performs an internal fine interpolation with a raster of $250 \mu \mathrm{~s}$.
The operating mode is selected by writing 7 in the object Mode of operation 6060h.

## Starting and Terminating the Operating Mode

The movement is started via the Controlword 6040h.
The operating mode is terminated when the motor is at standstill and if one of the following conditions is met:

- Target position reached
- Stop caused by Halt or Quick Stop
- Stop caused by a detected error
- Switch to another operating mode

## Source of Reference Value Signals

The object Target position 60C1 ${ }_{\mathrm{h}}$ provides the target position value.
The target position minimum and maximum values depends on

- Scaling factor
- Software limit switches if they are activated

The object Target velocity 6081h provides the target velocity value.
The object Profile acceleration 6083h provides the acceleration value.
The object Profile deceleration 6084h provides the deceleration value.
The target velocity is limited to the setting in Max Profile Velocity $607 F_{h}$.
The object Interpolation time period 60C2h consist of:

- Interpolation time units 60C2:01 h which specifies the interpolation time.
- Interpolation time index 60C2:02h which specifies the time basis. The value of -3 corresponds to a time basis in milliseconds.
The object Interpolation sub mode select $60 C 0_{\mathrm{h}}$ allows to select the interpolation mode:
- 0: Linear interpolation.
- 1: Cubic interpolation with position only. This forces the interpolated path to pass via the original position commands sent by the controller.

NOTE: This may cause an abrupt velocity profile when velocity changes.
The value of this object cannot be modified when NMT operating state is Operationnal.

Modified settings become active immediately.

## Control Word

In the operating mode, the bit 4 and the bit 8 in the Controlword $6040_{\text {h }}$ start a movement.

| Bit | Name | Meaning |
| :--- | :--- | :--- |
| Bit 4 | Enable IP mode | 0: Interpolated position mode not active <br> 1: Interpolated position mode active |
| Bit 8 | Halt | 0: No Halt command <br> 1: Stop movement with Halt |

## Status Word

Information on the current movement is available via bits 10 and $12 \ldots 15$ in the Statusword 6041h.

| Bit | Name | Meaning |
| :--- | :--- | :--- |
| Bit 10 | Target reached | 0: Target position not reached <br> 1: Target position reached |
| Bit 12 | - | 0: New position possible <br> 1: New target position accepted |
| Bit 13 | x_err | 0: No error detected <br> 1: A following error has been detected |
| Bit 14 | 0: Operating mode started |  |
| Bit 15 | ref_ok | 1: Drive has valid reference point |

## CANopen Operating Mode Cyclic Synchronous Position

## Description

In the operating mode Cyclic Synchronous Position (CSP), the drive synchronously follows the position values transmitted on a cyclic basis. The transmitted values are linearly interpolated within the drive.

The motion profile is generated by the master controller.
The possible applications for this operating mode are described in the manual of the master controller.

The operating mode is selected by writing 8 in the object Mode of operation $6060_{\mathrm{h}}$.

## Starting and Terminating the Operating Mode

A transition to the operating state 6 Operation Enabled starts the set operating mode.

The operating mode is terminated when a different operating mode is selected or when the operating state 6 Operation Enabled is exited.

## Source of Reference Value Signals

The object Target Position $607 A_{\mathrm{h}}$ provides the target value.
Target values are in pulses.
The object Interpolation time period 60C2h consist of:

- Interpolation time units 60C2:01 h which specifies the interpolation time.
- Interpolation time index 60C2:02h which specifies the time basis. The value of -3 corresponds to a time basis in milliseconds.

Modified settings become active immediately.

## Control Word

In the operating mode, the operating mode-specific bits in the Controlword 6040h have no significance.

## Status Word

Information on the current movement is available via bits 10 and $12 \ldots 15$ in the Statusword 6041h.

| Bit | Name | Meaning |
| :--- | :--- | :--- |
| Bit 10 | Reserved | Not relevant for this operating mode |
| Bit 12 | - | 0: Target position ignored <br> 1: Target position used as input to position control loop |
| Bit 13 | Reserved | Not relevant for this operating mode |
| Bit 14 | ref_ok | 0: Operating mode started <br> 1: Operating mode terminated |
| Bit 15 |  | 1: Drive has valid reference point |

## CANopen Operating Mode Cyclic Synchronous Torque

## Operating Mode Cyclic Synchronous Torque

## Description

In the operating mode Cyclic Synchronous Torque (CST), the drive synchronously follows the torque values transmitted on a cyclic basis. The transmitted values are linearly interpolated within the drive.

The motion profile is generated by the master controller. The possible applications for this operating mode are described in the manual of the master controller.

The operating mode is selected by writing 10 in the object Mode of operation 6060h.

## Starting and Terminating the Operating Mode

A transition to the operating state 6 Operation Enabled starts the set operating mode.

The operating mode is terminated when a different operating mode is selected or when the operating state 6 Operation Enabled is exited.

## Source of Reference Value Signals

The object Target torque 6071h provides the target value.
$100.0 \%$ correspond to the continuous stall torque.
Target values are in increments of $0.1 \%$.
Modified settings become active immediately.

## Control Word

In the operating mode, the operating mode-specific bits in the Controlword 6040h have no significance.

Information on the current movement is available via bits 10 and $12 \ldots 15$ in the Statusword 6041h.

| Bit | Name | Meaning |
| :--- | :--- | :--- |
| Bit 10 | Reserved | Not relevant for this operating mode |
| Bit 12 | - | 0: Target torque ignored <br> 1: Target torque shall be used as input to <br> torque control loop |
| Bit 13 | Reserved | Not relevant for this operating mode |
| Bit 14 | x_end | 0: Operating mode started <br> 1: Operating mode terminated |
| Bit 15 | ref_ok | 1: Drive has valid reference point |

This function block is part of the library SM3_Basic. It can be used to create a torque, if the drive is in controller mode "torque".

Function block SMC_SetTorque:

| Name | Type | Initialization | Description |
| :--- | :--- | :--- | :--- |
| VAR_IN_OUT | - | - | - |
| Axis | AXIS_ <br> REF | - | - |
| VAR_INPUT | - | - | - |
| bEnable | BOOL | FALSE | Have to be set to TRUE to enable execution of <br> function block. |
| fTorque | LREAL | - | Torque in Nm. |
| VAR_OUTPUT | - | - | - |
| bBusy | BOOL | FALSE | TRUE, if execution of function block is not finished. |
| bError | BOOL | FALSE | Signal, that an error has occurred within the function <br> block. |
| nErrorID | SMC <br> ERROR | - | Error identification |

## CANopen Operating Mode Cyclic Synchronous Velocity

## Operating Mode Cyclic Synchronous Velocity

## Description

In the operating mode Cyclic Synchronous Velocity (CSV), the drive synchronously follows the velocity values transmitted on a cyclic basis. The transmitted values are linearly interpolated within the drive.

The motion profile is generated by the master controller. The possible applications for this operating mode are described in the manual of the master controller.

The operating mode is selected by writing 9 in the object Mode of operation 6060h.

## Starting and Terminating the Operating Mode

A transition to the operating state 6 Operation Enabled starts the set operating mode.

The operating mode is terminated when a different operating mode is selected or when the operating state 6 Operation Enabled is exited.

## Source of Reference Value Signals

The object Target velocity 60FFh provides the target value.
The target velocity is limited to the setting in Max Profile Velocity 607Fh.
Modified settings become active immediately.

## Control Word

In the operating mode, the operating mode-specific bits in the Controlword 6040h have no significance.

## Status Word

Information on the current movement is available via bits 10 and $12 \ldots 15$ in the Statusword 6041h.

| Bit | Name | Meaning |
| :--- | :--- | :--- |
| Bit 10 | Reserved | Not relevant for this operating mode |
| Bit 12 | - | 0: Target velocity ignored <br> 1: Target velocity shall be used as input to <br> torque control loop |
| Bit 13 | Reserved | Not relevant for this operating mode |
| Bit 14 | x_end | 0: Operating mode started <br> 1: Operating mode terminated |
| Bit 15 | ref_ok | 1: Drive has valid reference point |

## CANopen Operating Mode Jog

## Description

In the operating mode Jog, the drive performs a movement with the transmitted jog target value.

The motion profile is generated by the drive, taking into account the target values received from the master controller.

The operating mode is selected by writing -1 in the object Mode of operation 6060 h .

## Starting and Terminating the Operating Mode

The movement is started via the Controlword $6040_{\mathrm{h}}$.
The operating mode is terminated when the motor is at standstill and if one of the following conditions is met:

- Stop caused by Halt or Quick Stop
- Stop caused by a detected error
- Switch to another operating mode

## Source of Reference Value Signals

The jog method is set with the object Jog Method 4453h.

- 0: jog operation at constant speed
- 1: Move a distance during a time, and start a jog operation at constant speed The fast speed is set with the object Jog Speed Fast 4450h.

The slow speed is set with the object Jog Speed Slow 4454h.
The distance is set with the object Jog Step 4452h.
The time is set with the object Jog Time 4451h.
The target velocity is limited to the setting in Max Profile Velocity 607Fh.
The object Profile acceleration 6083h provides the acceleration value.
The object Profile deceleration 6084h provides the deceleration value.
Modified settings become active immediately.

## Control Word

In the operating mode, the bits $4 \ldots 6$ in the Controlword $6040_{\mathrm{h}}$ start a movement

| Bit | Name | Meaning |
| :--- | :--- | :--- |
| Bit 4 | Forward | Movement in positive direction |
| Bit 5 | Reverse | Movement in negative direction |
| Bit 6 | Speed | 0: Slow speed <br> 1: Fast speed |

NOTE: If bit 4 and bit 5 are both at active state, it stops the movement.

## Status Word

Information on the current movement is available via bits 10 and $12 \ldots 15$ in the Statusword 6041h.

| Bit | Name | Meaning |
| :--- | :--- | :--- |
| Bit 10 | Reserved | Not relevant for this operating mode |
| Bit 12 | - | Not relevant for this operating mode |
| Bit 13 | x_err | 0: No error detected <br> 1: An error has been detected |
| Bit 14 | x_end | 0: Operating mode started <br> 1: Operating mode terminated |
| Bit 15 | ref_ok | 1: Drive has valid reference point |

## CANopen Operating Mode Electronic Gear

## Description

In the operating mode Electronic Gear, movements are carried out according to externally supplied reference value signals. A position reference value is calculated on the basis of these external reference values plus an adjustable gear ratio. The reference value signals can be A/B signals, P/D signals or CW/CCW signals.

## Method

A movement can be made using one of 3 methods:

- Position synchronization without compensation movement In the case of position synchronization without compensation movement, the movement is made synchronously (position synchronicity) with the supplied reference value signals. Reference value signals supplied during an interruption caused by Halt or by a detected error which cancelled the movement with a Quick Stop are not taken into account.
- Position synchronization with compensation movement

In the case of position synchronization with compensation movement, the movement is made synchronously (position synchronicity) with the supplied reference value signals. Reference value signals supplied during an interruption caused by Halt or by a detected error which cancelled the movement with a Quick Stop are taken into account and compensated for.

- Velocity synchronization

In the case of velocity synchronization, the movement is made synchronously (velocity synchronicity) with the supplied reference value signals.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| P8-31 <br> GEARING_MODE | Method for Operating Mode Pulse Train (PT) <br> Applicable operating mode: PT <br> Value 0: Synchronization deactivated <br> Value 1: Position synchronization without compensation movement <br> Value 2: Position synchronization with compensation movement <br> Value 3: Velocity synchronization <br> The parameters for acceleration (P1-34), deceleration (P1-35) and velocity (P1-55) act as limitations for the synchronization. | 0 <br> 1 <br> 3 <br> Decimal | u16 <br> RW <br> per. | Modbus 93E <br> CANopen $481 \mathrm{~F}_{\mathrm{h}}$ |

## Starting the Operating Mode

The operating mode must be set in the parameter Modes of Operation 6060h. Writing the parameter value causes the operating mode to start.

## Controlword

| Controlword | Meaning |
| :--- | :--- |
| Bit 2: Quick Stop | Triggers a Quick Stop |
| Bits 4 ... 6: Operating mode-specific | Not relevant for this operating mode |
| Bit 7: Fault Reset | Triggers a Fault Reset |
| Bit 8: Halt | Triggers a Halt |
| Bit 9: Operating mode-specific | Not relevant for this operating mode |

## Statusword

| Statusword | Meaning |
| :--- | :--- |
| Bit 8: Halt request active | 0: No Halt request <br> 1: A Halt request is active |
| Bit 12: Operating mode-specific | Not relevant for this operating mode |
| Bit 13: x_err | 0: No error detected <br> $1:$ An error has been detected |
| Bit 14: x_end | 0: Operating mode started <br> $1:$ Operating mode terminated |
| Bit 15: ref_ok | 0: Zero point is not valid <br> 1: Zero point is valid |

## Terminating the Operating Mode

The operating mode is terminated when the motor is at a standstill and one of the following conditions is met:

- Stop caused by "Halt" or "Quick Stop"
- Stop caused by a detected error

## Pulse Settings

The parameter P1-00 lets you specify the type of reference value signals, the input polarity, the maximum signal frequency and the source of the pulses.

For further information on the settings of the reference value signal, refer to chapter Pulse Setting, page 290.

## Gear Ratio

The gear ratio is the ratio of the number of motor increments and the number of reference increments.

The reference increments are supplied as reference value signals via the signal inputs.
Gear factor $=\frac{\text { Motor increments }}{\text { Reference increments }}=\frac{\text { Gear factor numerator }}{\text { Gear factor denominator }}$

With the factory setting for the gear ratio, 100000 reference increments correspond to one revolution.

There are 1280000 motor increments per revolution.
The gear ratio can be adjusted via the objects 4FA5:1 h and 4FA5:2h.

| Index | Name | Object type <br> Data type <br> Access | PDO mapping <br> object | Minimum value <br> Factory settings <br> Maximum value |
| :--- | :--- | :--- | :--- | :--- |
| 4FA5:1h | Electronic Gear Ratio (Numerator) | VAR <br> INT32 | Yes | 1 |
|  |  | rww |  | 128 |
| 4FA5:2h | Electronic Gear Ratio (Denominator) | VAR | Yes | 1 |
|  |  | INT32 <br> rww |  | 10 |

The velocity window in gearing mode can be adjusted via the objects $4328_{h}$ and $606 \mathrm{E}_{\mathrm{h}}$.

## CANopen Operating Mode Analog Velocity

## Description

In the operating mode Analog Velocity, a movement is made with a specified target velocity. The source of the reference value signals is the analog input $V_{-}$ $R E F$.

## Starting the Operating Mode

The operating mode must be set in the parameter Modes of Operation 6060h. Writing the parameter value causes the operating mode to start.

## Controlword

| Controlword | Meaning |
| :--- | :--- |
| Bit 2: Quick Stop | Triggers a Quick Stop |
| Bits 4 ... 6: Operating mode-specific | Not relevant for this operating mode |
| Bit 7: Fault Reset | Triggers a Fault Reset |
| Bit 8: Halt | Triggers a Halt |
| Bit 9: Operating mode-specific | Not relevant for this operating mode |

## Statusword

| Statusword | Meaning |
| :--- | :--- |
| Bit 8: Halt request active | 0: No Halt request <br> 1: A Halt request is active |
| Bit 10: Target Reached | 0: Target velocity not reached <br> $1:$ Target velocity reached |
| Bit 12: Operating mode-specific | Not relevant for this operating mode |
| Bit 13: x_err | 0: No error detected <br> $1:$ An error has been detected |
| Bit 14: x_end | 0: Operating mode started <br> $1:$ Operating mode terminated |
| Bit 15: ref_ok | 0: Zero point is not valid <br> $1:$ Zero point is valid |

## Terminating the Operating Mode

The operating mode is terminated when the motor is at a standstill and one of the following conditions is met:

- Stop caused by "Halt" or "Quick Stop"
- Stop caused by a detected error

## Scaling of the Analog Input V_REF

The parameter P1-40 lets you set the velocity corresponding to 10 V . This results in a linear scaling for the analog input V_REF.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { P1-40 } \\ & \text { VCM } \end{aligned}$ | Velocity Target Value and Velocity Limitation 10 V <br> Applicable operating mode: PT, PS, V, T <br> In the operating mode $V$, this parameter specifies the target velocity that corresponds to the maximum input voltage of 10 V . <br> In the operating mode T , this parameter specifies the velocity limitation that corresponds to the maximum input voltage of 10 V . <br> Example: If the value of this parameter is 3000 in the operating mode V and if the input voltage is 10 V , the target velocity is 3000 rpm . | rpm <br> 0 <br> 10001 <br> Decimal | s32 <br> RW <br> per. | Modbus 250h CANopen 4128h |

## CANopen Operating Mode Analog Torque

## Description

In the operating mode Analog Torque, a movement is made with a specified target torque. The target torque is specified in percent of the nominal torque of the motor. The source of the reference value signals is the analog input $T_{-} R E F$.

## Starting the Operating Mode

The operating mode must be set in the parameter Modes of Operation 6060h. Writing the parameter value causes the operating mode to start.

## Controlword

| Controlword | Meaning |
| :--- | :--- |
| Bit 2: Quick Stop | Triggers a Quick Stop |
| Bits 4 ... 6: Operating mode-specific | Not relevant for this operating mode |
| Bit 7: Fault Reset | Triggers a Fault Reset |
| Bit 8: Halt | Triggers a Halt |
| Bit 9: Operating mode-specific | Not relevant for this operating mode |

## Statusword

| Statusword | Meaning |
| :--- | :--- |
| Bit 8: Halt request active | 0: No Halt request <br> 1: A Halt request is active |
| Bit 10: Target Reached | 0: Target torque not reached <br> 1: Target torque reached |
| Bit 12: Operating mode-specific | Not relevant for this operating mode |
| Bit 13: x_err | 0: No error detected <br> $1:$ An error has been detected |

| Statusword | Meaning |
| :--- | :--- |
| Bit 14: x_end | 0: Operating mode started |
|  | 1: Operating mode terminated |
| Bit 15: ref_ok | 0: Zero point is not valid |
|  | 1: Zero point is valid |

## Terminating the Operating Mode

The operating mode is terminated when the motor is at a standstill and one of the following conditions is met:

- Stop caused by "Halt" or "Quick Stop"
- Stop caused by a detected error

## Scaling of the Analog Input T_REF

The parameter P1-41 lets you set the torque corresponding to 10 V . This results in a linear scaling for the analog input T_REF.

| Parameter name | Description | Unit <br> Minimum value <br> Factory setting <br> Maximum value <br> HMI Format | Data type <br> R/W <br> Persistent | Parameter address via fieldbus |
| :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { P1-41 } \\ & \text { TCM } \end{aligned}$ | Torque Target Value and Torque Limitation 10 V <br> Applicable operating mode: PT, PS, V, T <br> In the operating mode T , this parameter specifies the target torque that corresponds to the maximum input voltage of 10 V . <br> In the operating modes PT, PS and V, this parameter specifies the torque limitation that corresponds to the maximum input voltage of 10 V. <br> Example: If the value of this parameter is 100 in the operating mode T and if the input voltage is 10 V , the target torque is $100 \%$ of the nominal torque. <br> Setting can only be modified if power stage is disabled. | \% <br> 0 <br> 100 <br> 1000 <br> Decimal | u16 <br> RW <br> per. | Modbus 252h <br> CANopen 4129h |

## Diagnostics Via the Fieldbus Status LEDs

The fieldbus status LEDs visualize the status of the fieldbus.

The illustration below shows the signals of the CAN bus status LEDs (Run=GN; Err=RD).

| Item | Description |
| :--- | :--- |
| 1 | NMT state PRE-OPERATIONAL |
| 2 | NMT state STOPPED |
| 3 | NMT state OPERATIONAL |
| 4 | Incorrect settings, for example, invalid node address |
| 5 | Alert limit reached, for example after 16 incorrect transmission attempts |
| 6 | Node Guarding |
| 7 | CAN is BUS-OFF, for example after 32 incorrect transmission attempts. |
| 8 | Fieldbus communication without error message |

## Diagnostics Via the Integrated HMI

## Modbus Activity

The left most decimal point in the integrated HMI indicates Modbus activity by flashing.

## Error Memory

Parameters P4-00 to P4-04 allow you to read the error memory.
The error memory also contains a history of the last 5 detected errors.

| Parameter | Description |
| :--- | :--- |
| P4-00 | Error number of the most recently detected error |
| $\ldots$ | $\ldots$ |
| P4-04 | Error number of the oldest detected error |

The parameter P0-47 allows you to read the last detected alert.

## Diagnostics Via the Signal Outputs

The signal outputs allow you to indicate, among other things, operating states and detected errors. The following list is an excerpt of the parameterizable signal output functions. For additional signal output functions, refer to Setting the Digital Signal Outputs, page 276.

| Setting A for P2- <br> $\mathbf{1 8} \ldots$ P2-22 | Short name | Name of the <br> output function | Description |
| :--- | :--- | :--- | :--- |
| 1 | SRDY | Servo Ready | The signal output function SRDY indicates that no errors are presently detected, <br> i.e. the drive is not in the operating state Fault. |
| 2 | SON | Servo On | The signal output function SON indicates that the drive is in the operating state <br> Operation Enabled. |

| Setting A for P2- <br> $\mathbf{1 8} \ldots \mathbf{P 2 - 2 2}$ | Short name | Name of the <br> output function | Description |
| :--- | :--- | :--- | :--- |
| 7 | ERROR | Error Detected | The signal output function ERROR indicates that an error has been detected <br> and that the drive has switched to the operating state Fault. For further <br> information, refer to Diagnostics and Troubleshooting, page 365. |
| 11 | WARN | Advisory or Alert <br> Signal activated | The signal output function indicates that one of the following conditions has been <br> detected: Hardware limit switch triggered, undervoltage, Nodeguard alert, <br> Operational Stop (OPST). |

## Diagnostics Via the Commissioning Software

See the information provided with the commissioning software for details on how to display the device state via the commissioning software LXM28 DTM Library.

## Diagnostics Via the Fieldbus

## Reading Error Numbers

The object $603 \mathrm{~F}_{\mathrm{h}}$ contains the most recently detected error.

| Index | Name | Object type <br> Data type <br> Access | PDO mapping <br> object | Minimum value <br> Factory settings <br> Maximum value |
| :--- | :--- | :--- | :--- | :--- |
| $603 \mathrm{~F}_{\mathrm{h}}$ | Error Code | VAR <br> UINT16 <br> ro | Yes | 0 |

The following table is sorted by CANopen error numbers and shows the corresponding Error Code, page 372 (ALnnn).

| Value (hex) | Value (dec) | Error Code |
| :---: | :---: | :---: |
| 2214h | 8724 | AL001 |
| 2310h | 8976 | AL006 |

## SDO Abort Codes

| SDO Abort Code | Meaning |
| :---: | :---: |
| 05040001h | Client/server command specifier not valid or undetermined |
| 06010002h | Attempt to write a read-only object |
| 06020000h | Object does not exist in the object dictionary |
| 06040041 ${ }_{\text {h }}$ | Object cannot be mapped to the PDO |
| 06040042h | The number and length of the objects to be mapped would exceed PDO length |
| 06060000h | Access impossible due to a hardware error (store or restore error) |
| 06070010h | Data type does not match, length of service parameter does not match |
| 06090011 h | Subindex does not exist |
| 06090030h | Value range of parameter exceeded (only for write access) |
| 08000000h | General error |
| 080000a1 ${ }_{\text {h }}$ | Object error reading from non-volatile memory |
| 080000a2h | Object error writing to non-volatile memory |
| 080000a3h | Invalid Range accessing non-volatile memory |
| 080000a4h | Checksum error accessing non-volatile memory |
| 080000a5h | Password error writing encryption zone |
| 08000020h | Data cannot be transferred to or stored in the application (store or restore signature error) |
| 08000021 ${ }_{\text {h }}$ | Data cannot be transferred to or stored in the application because of the local control (incorrect state) |

## Connection for Fieldbus Mode

## Description

If the product cannot be addressed via the fieldbus, check the following connections:

- Power connections to the device.
- Network cable and network wiring.
- Network connection to the device.

## Alert Codes and Error Codes

## Meaning of an Alert

An alert indicates a potential issue that was detected by a monitoring function. An alert does not trigger a transition of the operating state.

| Number | Description | Cause | Remedy |
| :---: | :---: | :---: | :---: |
| AL014 | Negative hardware limit switch triggered | - | - |
| AL015 | Positive hardware limit switch triggered | - | - |
| AL283 | Positive software limit switch triggered | - | - |
| AL285 | Negative software limit switch triggered | - | - |
| Wn023 | Alert threshold reached: Motor overload (foldback) | The foldback current of the motor has dropped below the alert threshold specified via the parameter P1-28. | Verify correct settings of the parameter P128 for the foldback current of the motor. |
| Wn124 | Data in PDO out of range | - | Verify that the minimum and maximum limit values are not exceeded. |
| Wn127 | R_PDO data cannot be written while the power stage is enabled | - | - |
| Wn185 | CANopen: A communication error was detected. | - | - |
| Wn380 | Position deviation via signal output function MC_OK | After a movement has been successfully completed, MC_OK was active. Then TPOS became inactive which caused MC OK to become inactive as well. | If you want this condition to cause a detected error instead of an alert, set the parameter P1-48 accordingly. |
| Wn700 | Safety function Safe Torque Off (STO) triggered while the power stage was disabled | The safety function STO has been triggered or the signal for the safety function STO is not properly connected. If this condition is detected while the power stage is enabled, the drive detects an error. If this condition is detected while the power stage is disabled, the drive detects an alert. | Check whether the safety function STO was triggered intentionally. If not, verify correct connection of the signal of the safety function STO. |
| Wn701 | Alert threshold reached: Drive overload (foldback) | The foldback current of the drive has dropped below the alert threshold specified via the parameter P1-24. | Verify correct settings of the parameter P124 for the foldback current of the drive. |
| Wn702 | The DC bus voltage has dropped below the alert threshold. | Power supply loss, poor power supply. | Verify correct mains supply. Verify that the undervoltage limit is set correctly via the parameter P4-24. |
| Wn703 | Alert threshold reached: Power stage overtemperature | Ambient temperature is too high, fan is inoperative, dust. | Verify correct operation of the fan. Improve the heat dissipation in the control cabinet. Remove pollution and verify that dust cannot get into the control cabinet or into the drive. |
| Wn704 | Alert threshold reached: Motor overtemperature | The motor temperature is excessively high. | Verify correct settings of the parameters for temperature monitoring. Verify proper ventilation and heat dissipation of the motor. Clean off pollutants such as dust. Verify that the motor is evenly mounted to the flange plate. Increase the size of the flange plate to which the motor is mounted to improve heat dissipation. Verify that the motor is properly sized for the application. |
| Wn707 | Alert threshold reached: Drive overtemperature (controller) | Ambient temperature is too high, fan is inoperative, dust. | Verify correct operation of the fan. Improve the heat dissipation in the control cabinet. Remove pollution and verify that dust cannot get into the control cabinet or into the drive. |
| Wn709 | PLL not synchronized | - | - |
| Wn713 | Positive hardware limit switch and negative hardware limit triggered | - | - |

| Number | Description | Cause | Remedy |
| :---: | :---: | :---: | :---: |
| Wn716 | Positive software limit switch and negative software limit triggered | - | - |
| Wn728 | Alert: Missing mains supply, undervoltage mains supply | At least one mains phase is missing. Mains voltage is out of range. Mains frequency is out of range. | Verify correct connection of mains supply. Verify that the values of the mains power supply network comply with the technical data. |
| Wn729 | Modbus: Node Guarding error detected | Incorrect Modbus connection, incorrect data from Modbus master. | Verify correct Modbus connection. Verify correct operation of Modbus master. |
| Wn730 | Alert threshold reached: Braking resistor overload | The permissible braking resistor power has been exceeded. | Verify correct rating of the braking resistor used. Verify your application. |
| Wn731 | Encoder error detected | Refer to parameter P8-49 for details. | - |
| Wn732 | Alert threshold reached: Processing time too long | - | - |
| Wn734 | Alert threshold reached: Drive overtemperature (IPM) | Ambient temperature is too high, fan is inoperative, dust. | Verify correct operation of the fan. Improve the heat dissipation in the control cabinet. Remove pollution and verify that dust cannot get into the control cabinet or into the drive. |
| Wn736 | PDO packet too long | - | Verify correct PDO mapping. |
| Wn737 | Parameters have been reset to the factory settings, but are not yet saved to the non-volatile memory. | - | Use parameter P2-08 = 11 to save parameters reset to the factory settings to the non-volatile memory and restart the drive. |
| Wn738 | No target values received via the fieldbus | No target values have been received via the fieldbus three times in succession. | Verify that target values are transmitted via the fieldbus. Verify that the fieldbus has exclusive access. |
| Wn739 | Temperature value for monitoring function not available | - | - |
| Wn740 | Target value will cause movement to positive software limit switch | - | Verify correct target positions. |
| Wn741 | Target value will cause movement to negative software limit switch | - | Verify correct target positions. |
| Wn742 | Motor type has changed | The type of motor connected is different from the previously connected type of motor. | Reset the drive to the factory settings. |
| Wn743 | Fan circuit alert | The fan circuit is either overloaded or disconnected. | Check for fan short circuit or disconnection. |
| Wn744 | Excessive electronic noise | - | Check proper grounding and shielding. Use line filter. |
| Wn745 | Configured feedbacktype and actual connected encoder mismatch | The connected encoder does not correspond to configured feedback type. | Check that configured feedback type and connected encoder match. |
| Wn746 | Encoder overtemperature | - | - |
| Wn747 | Encoder internal flash memory error detected | - | - |
| Wn748 | Encoderfeedback error detected | The device has detected unusually high shaft displacement. The device can still operate correctly; but position error might be higher than usual. | - |
| Wn749 | The multi-turn battery voltage is within the following range: $3 \mathrm{~V}<$ VBAT $<3.15 \mathrm{~V}$. <br> Battery voltage has started to drop; but the multi-turn information is still reliable. | - | Replace encoder battery. |
| Wn750 | The multi-turn counter exceeded the range of 16 bit signed value. <br> Multi-turn Counter < - 32768 <br> Or multi-turn Counter > 32767 | - | Execute multi-turn Config/Reset (Set Reference Point) by command P8-44=3/2. <br> For some applications which will rotate motor in one direction, the alert Wn 750 for checking turns number within -32768... 32767 can be turned off by parameter P5-80=1. |

| Number | Description | Cause | Remedy |
| :--- | :--- | :--- | :--- |
| Wn751 | The last save operation was <br> interrupted. | The last save operation was interrupted by <br> power cycle. The former set of parameters <br> are active. | Set the new parameter configuration and <br> perform save command. |
| Wn752 | Stop filter command cannot be set | SensAR Encoder Filter Mode is not <br> supported on the connected Motor. | Set P8-71 to 0 ignore the alert. <br> Or Upgrade Motor Hardware version. |
| Wn753 | Reference position reset | AL576 or homing procedure error or the <br> multi-turn roll over will cause this alert. | Execute multi-turn Config/Reset (Set <br> Reference Point) by command P8-44=2 <br> Or Execute a homing procedure. |

## Meaning of an Error

An error is a discrepancy between a computed, measured, or signaled value or condition and the specified or theoretically correct value or condition detected by a monitoring function. An error triggers a transition of the operating state.

| Number | Short description | Cause | Remedy |
| :---: | :---: | :---: | :---: |
| AL001 | Power stage overcurrent | An overcurrent has been detected at the power stage which may be caused by a short circuit or by incorrect settings of the current loop parameters. This condition may occur up to three times in succession. After the third time, a time delay of one minute must pass before the power stage can be enabled again. | Verify correct connection of the motor. Verify correct settings of the parameters for the current loop. |
| AL002 | DC bus overvoltage | The DC bus voltage exceeded the maximum value. | Verify your application. Reduce the external load, the motor velocity, or the deceleration. Use an appropriately rated braking resistor, if necessary. |
| AL003 | DC bus undervoltage | Power supply loss, poor power supply. | Verify correct mains supply. Verify that the undervoltage limitation is set correctly via the parameter P4-24. |
| AL005 | Braking resistor overload | The braking resistor has been on for such a long period of time that its overload capability has been exceeded. | Verify your application. Reduce the external load, the motor velocity, or the deceleration. Use a braking resistor with a greater rating, if necessary. |
| AL006 | Motor overload (foldback) | The foldback current of the motor has dropped below the value specified via the parameter P1-27. | Verify correct settings for the parameter P1-27. |
| AL007 | Actual motor velocity too high. | The actual motor velocity exceeded the velocity limitation by more than 20\% (P155). The analog input signal is not stable. | Verify that the velocity limitation set via the parameter P1-55 matches the requirements of the application. Verify that the values for the tuning parameters are suitable. Verify that the frequency of the analog input signal is stable using a signal detector. Use a filter function. |
| AL008 | Frequency of reference value signal is too high | The frequency of the pulse signal (A/B, Pulse/Direction, CW/CCW) exceeds the specified range. Received pulses may be lost. | Adapt the output pulse frequency of the external source to fit the input specification of the drive. Adapt the gear ratios to the application requirements (parameters P144, P1-45, P2-60, P2-61 and P2-62). |
| AL009 | Position deviation too high (following error) | The position deviation has exceeded the maximum permissible position deviation specified via the parameter P2-35 and the drive has detected a following error. | Verify your application. Reduce the external load. Increase the permissible position deviation via the parameter P2-35. Reduce the motor velocity via the parameters P1-09 ... P1-11 or the analog input V_REF. Increase the torque limitation via the parameters P1-12 ... P1-14 or the analog input T_REF. |
| AL013 | The input to which the signal input function OPST is assigned has been activated. | - | Identify the cause which has triggered the signal input function OPST. Remove the cause. If your application does not require the signal input function OPST, disable this signal input function. |

| Number | Short description | Cause | Remedy |
| :---: | :---: | :---: | :---: |
| AL016 | Power stage overtemperature | Ambient temperature is too high, fan is inoperative, dust. | Verify correct operation of the fan. Improve the heat dissipation in the control cabinet. Remove pollution and verify that dust cannot get into the control cabinet or into the drive. |
| AL017 | Error detected in non-volatile memory | The drive was reset to the factory settings via parameter P2-08. | Use parameter P2-08 = 11 to save parameters reset to the factory settings to the non-volatile memory and restart the drive. <br> Contact technical support. |
| AL018 | Encoder simulation frequency exceeded 4 MHz | The computed equivalent encoder output frequency exceeds the maximum limit of 4 MHz for this signal. | Reduce the resolution of the encoder simulation via the parameter P1-46 or reduce the maximum velocity. |
| AL020 | Modbus: Node Guarding error detected | Incorrect Modbus connection, incorrect data from Modbus master. | Verify correct Modbus connection. Verify correct operation of Modbus master. |
| AL022 | Missing mains supply, undervoltage mains supply | At least one mains phase is missing. Mains voltage is out of range. Mains frequency is out of range. | Verify correct connection of mains supply. Verify that the values of the mains power supply network comply with the technical data. |
| AL025 | Not possible to read data of electronic motor nameplate | Incorrect or missing motor data. Motor without electronic motor nameplate has been connected. | Verify that the drive and the connected motor are a permissible product combination. Verify correct connection of the encoder. Contact Technical Support or replace the motor. |
| AL026 | Error detected in communication with motor encoder | Communication with the encoder was not initialized correctly. | Verify correct connection of the encoder. Contact Technical Support or replace the motor. |
| AL030 | Motor torque too high for an excessive period of time | The motor torque has exceeded the value specified via the parameter P1-57 for a period of time exceeding the value specified via the parameter P1-58. | Verify your application. Verify that no movements are made up to a mechanical stop (for example, use limit switches). Verify that the values for the parameters P1-57 and P1-58 are suitable. |
| AL180 | CANopen: Heartbeat error detected | The bus cycle time of the CANopen master is greater than the programmed heartbeat or node guard time. The connection between the CANopen master and the drive is lost. | Verify correct CANopen connection. Check the CANopen master. Verify correct CANopen configuration, increase the Heartbeat or Node Guarding time. |
| AL3E1 | Drive is not synchronous with master cycle | Operating mode has been activated but drive is not synchronized to external synchronization signal. | Verify correct CANopen connection. After having started the synchronization mechanism, wait for 120 cycles before activating the operating mode. |
| AL401 | Fieldbus: Communication error detected | While the power stage was enabled, a command was received requesting a different communication state. | Verify that the master does not try to change the communication state while the power stage of the drive is enabled. |
| AL501 | Safety function Safe Torque Off (STO) triggered | The safety function STO has been triggered or the signal for the safety function STO is not properly connected. If this condition is detected while the power stage is enabled, the drive detects an error. If this condition is detected while the power stage is disabled, the drive detects an alert. | Check whether the safety function STO was triggered intentionally. If not, verify correct connection of the signal of the safety function STO. |
| AL502 | System error detected (FPGA) | - | Contact technical support. |
| AL503 | System error detected (nonvolatile memory) | - | Contact technical support. |
| AL504 | System error detected (nonvolatile memory) | - | Contact technical support. |
| AL505 | DC bus voltage measurement | An error was detected in the circuit that measures the DC bus voltage. | Perform a Fault Reset. Restart the drive. If the error persists, contact Technical Support. |
| AL507 | System error detected (NV access) | - | Contact technical support. |
| AL508 | Drive overload (foldback) | The foldback current of the drive has dropped below the value specified via the parameter P1-23. | Verify correct settings for the parameter P1-23. |

| Number | Short description | Cause | Remedy |
| :---: | :---: | :---: | :---: |
| AL514 | Motor overtemperature | The motor temperature is excessively high. | Verify correct settings of the parameters P1-62 and P1-63 for temperature monitoring. Verify proper ventilation and heat dissipation of the motor. Clean off pollutants such as dust. Verify that the motor is evenly mounted to the flange plate. Increase the size of the flange plate to which the motor is mounted to improve heat dissipation. Verify that the motor is properly sized for the application. |
| AL517 | Encoder overvoltage or overcurrent | The current supplied by the drive for the 5 V encoder supply has exceeded the limit. This condition may occur up to three times in succession. After the third time, a time delay of one second must pass before the power stage can be enabled again. | Verify correct connection of the encoder (short circuits). Verify the current consumption of the encoder. |
| AL520 | Target position rejected | A target position was rejected because it would have caused the motor to exceed the maximum velocity. | Verify that target positions do not lead to excessive motor velocities. |
| AL522 | System error detected (CAN power supply) | The internal supply voltage for the CAN bus is not correct. | Contact technical support. |
| AL523 | System error detected (self-test) | The self-test has detected an error. | Contact technical support. |
| AL525 | Reserved | - | - |
| AL526 | Reserved | - | - |
| AL527 | System error detected (Watchdog) | The Watchdog function has detected a system error. | Restart the drive. If the error persists, contact Technical Support. |
| AL528 | Drive overtemperature (IPM) | Ambient temperature is too high, fan is inoperative, dust. | Verify correct operation of the fan. Improve the heat dissipation in the control cabinet. Remove pollution and verify that dust cannot get into the control cabinet or into the drive. |
| AL529 | Drive overtemperature (controller) | Ambient temperature is too high, fan is inoperative, dust. | Verify correct operation of the fan. Improve the heat dissipation in the control cabinet. Remove pollution and verify that dust cannot get into the control cabinet or into the drive. |
| AL532 | Calculated offsets for current sensors out of range | The calculated offsets for the current sensors are out of range. | Perform a Fault Reset. Restart the drive. If the error persists, contact Technical Support. |
| AL533 | Reserved | - | - |
| AL534 | Pulse signal missing | One of the pulse signals is not connected. | Verify correct connection of the pulse inputs. |
| AL535 | System error detected (FPGA does not match firmware) | The firmware version is not suitable for the drive. | Update the firmware of the drive. Contact technical support. |
| AL539 | Motor phase missing | One of the motor phases is not connected. | Verify correct connection of the motor phases. Contact technical support. |
| AL547 | Motor blocked | The motor was blocked mechanically, for example, by a mechanical stop or by the load. | Remove condition causing the mechanical blocking. Verify your application. |
| AL553 | No connection between master and drive | - | Connect master and drive. |
| AL554 | Target position rejected | A target position was rejected because it would have caused the motor to exceed the maximum acceleration/deceleration. | Verify that target positions do not lead to excessive acceleration/deceleration. |
| AL555 | Velocity deviation too high | The deviation between actual velocity and reference velocity has exceeded the maximum velocity deviation specified via the parameter P2-34. | Verify your application. Verify that the values for the tuning parameters are suitable. Increase the value for the maximum velocity deviation in the parameter P2-34. |
| AL557 | No target values received via the fieldbus | No target values have been received via the fieldbus three times in succession. | Perform a Fault Reset. Verify that target values are transmitted via the fieldbus. |
| AL558 | System error detected | - | Contact technical support. |
| AL560 | Power stage supply off | - | Power on the power stage supply. |

| Number | Short description | Cause | Remedy |
| :---: | :---: | :---: | :---: |
| AL561 | Temperature sensor inoperative | - | Restart the drive. If the error persists, contact Technical Support. |
| AL563 | Commutation error detected | Motor phases have been interchanged. | Verify correct connection of the motor phases. |
| AL564 | Position deviation via signal output function MC_OK | After a movement has been successfully completed, MC_OK was active. Then TPOS became inactive which caused MC_ OK to become inactive as well. | Use the signal input function FAULT RESET to perform a Fault Reset and set the parameter P0-01 to 0 . If you want this condition to cause an alert instead of a detected error, set the parameter P1-48 accordingly. |
| AL567 | System error detected (encoder) | Refer to parameter P8-48 for details. | Contact technical support. |
| AL568 | Braking resistor overload | The permissible braking resistor power has been exceeded. | Verify correct rating of the braking resistor used. Verify your application. |
| AL569 | Configuration not correctly transferred via Modbus | - | Verify correct connection. Verify that configuration file and drive are compatible. |
| AL570 | Overcurrent detected at one of the digital outputs | - | Verify correct wiring of the digital outputs. Verify that there are no short circuits. |
| AL571 | Reference position operation rejected. | If you directly perform Homing, or P8-44 = 2, after modifying P1-01 C (byte 2) without power-cycling the drive, then error AL571 is reported. | Power-cycle the drive and then perform Homing or set P8-44 to 2. |
| AL572 | Position deviation too high (following error) | The position deviation has exceeded the maximum permissible position deviation specified via the parameter P2-35 and the drive has detected a following error. | Verify your application. Reduce the external load. Increase the permissible position deviation via the parameter P2-35. Reduce the motor velocity via the parameters P1-09 ... P1-11 or the analog input V_REF. Increase the torque limitation via the parameters P1-12 ... P1-14 or the analog input T_REF. |
| AL573 | The returned position values are no longer considered valid | Usually caused by inoperable encoder hardware or incorrect encoder assembly, for example: damaged hall sensors, damaged encoder rotor, displacement between motor shaft and encoder is too great, corrupted encoder FLASH memory corrupts calibration tables. | Replace new motor. |
| AL574 | The encoder temperature is too high | Caused when temperature on encoder is too high relative to what was configured. | Reduce temperature applied on encoder replace new motor. |
| AL575 | The encoder supply voltage has dropped under operational value | The device supply voltage has dropped under operational value. | Make sure power supplied to encoder is according to specifications. <br> Replace new driver. |
| AL576 | The multi-turn encoder battery voltage has dropped under 3 Vdc | The multi-turn encoder battery voltage has dropped under 3 Vdc ; battery box cable disconnect from motor encoder side. | Check battery box cable. <br> Check battery voltage. <br> Replace encoder battery. <br> Clear AL576 by command P8-44=1. |
| AL577 | The multi-turn encoder requires an explicit configuration command | - | Execute multi-turn Config/Reset (Set Reference Point) by command P8-44=3/2. |
| AL578 | Internal position synchronization error detected between the multiturn and the single-turn modules | Possible likely reasons: incorrect multi-turn calibration, corrupted multi-turn calibration data on FLASH, internal multi-turn chip error, or incorrect multi-turn chip magnetic screw. | Replace by a new motor. |
| AL579 | Generic error code of the multiturn module is detected | Encoder is damaged or that a magnetic screw is missing or multi-turn calibration is either missing or corrupt or battery disconnect form encoder for a long time or the FW version of encoder is below 13020023. | Reconnect battery to encoder and Execute multi-turn Config /Reset (Set Reference Point) by command P8-44=3/2, then power cycle the drive. If this error happens again, contact your local Schneider Electric service representative. |
| AL580 | The encoder firmware cannot operate on the provided hardware | - | - |
| AL581 | The drive firmware cannot operate with the provided encoder version | - | - |

| Number | Short description | Cause | Remedy |
| :--- | :--- | :--- | :--- |
| AL582 | Unsupported HW (110V/Multi- <br> Turn Encoder/Size 5 power stage) | - | - |
| AL585 | CANopen device in state bus-off | Too many error frames have been <br> detected. CANopen devices have different <br> baud rates. | Verify correct baud rates. Verify CANopen <br> bus installation. |
| AL588 | RT Overload error | Real time execution time is more than <br> $31.25 u s$. | Too much load on the real time loop - such <br> as: too many PDO (rx/tx) are mapped/ <br> sync-position/record/ touch probe are <br> tasks with large impact to the CPU. |
| AL595 | Impermissible combination of <br> drive and motor | - | Use an approved drive/motor combination. |
| AL596 | Unstable current loop | Excessive overshoot in current loop. | Verify correct settings of the parameters <br> for the current loop. |
| AL597 | R_PDO is too short | Invalid Quick Stop active state | A Quick Stop has been triggered via the <br> fieldbus or by releasing access right. The <br> Quick Stop option code (P3-31) has been <br> set to -1 or -2 which causes the drive to <br> transition to the operating state 9 Fault <br> instead of the operating state 7 Quick Stop <br> Active. |
| AL598 | Verify correct PDO settings for drive and <br> master. |  |  |
| AL5 |  |  |  |
| AL5A1 | Drive is not configured | Hardware issue causing problems <br> accessing nonvolatile memory. | Return drive to factory check HW. |

## Service, Maintenance and Disposal

What's in This Part<br>Service, Maintenance, and Disposal ............................................................. 379

## Service, Maintenance, and Disposal

What's in This Chapter
General ..... 379
Service Address ..... 380
Maintenance of the Drive ..... 380
Replacement of Drive ..... 381
Maintenance of the Motor ..... 381
Lexium 26/28 Multi-Turn Encoder ..... 383
Changing the Motor ..... 389
Shipping, Storage, Disposal ..... 390

## General

There are no user-serviceable parts within the product. If you perceive difficulties with the operation of the product, contact your local Schneider Electric service representative.

The use and application of the information contained herein require expertise in the design and programming of automated control systems.

Only you, the user, machine builder or integrator, can be aware of all the conditions and factors present during installation and setup, operation, repair and maintenance of the machine or process.

You must also consider any applicable standards and/or regulations with respect to grounding of all equipment. Verify compliance with any safety information, different electrical requirements, and normative standards that apply to your machine or process in the use of this equipment.

Many components of the equipment, including the printed circuit board, operate with mains voltage, or present transformed high currents, and/or high voltages.

The motor itself generates voltage when the motor shaft is rotated.

## AADANGER

## ELECTRIC SHOCK, EXPLOSION, OR ARC FLASH

- Disconnect all power from all equipment including connected devices prior to removing any covers or doors, or installing or removing any accessories, hardware, cables, or wires.
- Place a "Do Not Turn On" or equivalent hazard label on all power switches and lock them in the non-energized position.
- Wait 15 minutes to allow the residual energy of the DC bus capacitors to discharge.
- Measure the voltage on the DC bus with a properly rated voltage sensing device and verify that the voltage is less than 42.4 Vdc .
- Do not assume that the DC bus is voltage-free when the DC bus LED is off.
- Block the motor shaft to prevent rotation prior to performing any type of work on the drive system.
- Do not create a short-circuit across the DC bus terminals or the DC bus capacitors.
- Replace and secure all covers, accessories, hardware, cables, and wires and confirm that a proper ground connection exists before applying power to the unit.
- Use only the specified voltage when operating this equipment and any associated products.
Failure to follow these instructions will result in death or serious injury.

## Service Address

If you cannot resolve an error yourself, contact your sales office.
Have the following data available:

- Nameplate (type, identification number, serial number, DOM, ...)
- Type of error (with LED flash code or error code)
- Previous and concomitant circumstances
- Your own assumptions concerning the cause of the error

Also include this information if you return the product for inspection or repair.
If you have any questions, contact your sales office. Your sales office staff will provide you the name of a customer service office in your area.
www.se.com

## Maintenance of the Drive

Prior to any type of work on the drive system, consult the chapters on Installation and Commissioning for information to be observed.

Repairs cannot be made with the device installed.
Include the following points in the maintenance plan of your machine.

## Connections and Fastening

- Check all connection cables and connectors regularly for damage. Replace damaged cables immediately.
- Tighten all mechanical and electrical threaded connections to the specified torque.

## Cleaning

Clean dust and dirt off the product at regular intervals. Insufficient heat dissipation to the ambient air may excessively increase the temperature.

## Lifetime of the Safety Function STO

The STO safety function is designed for a lifetime of 20 years. After this period, the data of the safety function are no longer valid. The expiry date is determined by adding 20 years to the DOM shown on the nameplate of the product.

- This date must be included in the maintenance plan of the system.
- Do not use the safety function after this date.

Example:
The DOM on the nameplate of the product is shown in the format DD.MM.YY, for example 31.12.08. (31 December 2008). This means: Do not use the safety function after December 31, 2028.

## Replacement of Drive

Unsuitable settings or unsuitable data may trigger unintended movements, trigger signals, damage parts and disable monitoring functions. Some parameters and other operational data do not become active until after a restart.

## AWARNING

## UNINTENDED EQUIPMENT OPERATION

- Only start the system if there are no persons or obstructions in the zone of operation.
- Do not operate the drive system with undetermined parameter values.
- Never modify a parameter value unless you fully understand the parameter and all effects of the modification.
- Restart the drive and verify the saved operational data and/or parameter values after modification.
- Carefully run tests for all operating states and potential error situations when commissioning, upgrading or otherwise modifying the operation of the drive.
- Verify the functions after replacing the product and also after making modifications to the parameter values and/or other operational data.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

Prepare a list with the parameters required for the functions used.
Observe the following procedure when replacing devices:

| Step | Action |
| :---: | :--- |
| 1 | Save all parameter settings. Save the data to your PC using the commissioning <br> software, refer to chapter Commissioning Software, page 158. |
| 2 | Power off all supply voltages. Verify that no voltages are present. |
| 3 | Label all connections and remove all connection cables (unlock connector locks). |
| 4 | Uninstall the product. |
| 5 | Note the identification number and the serial number shown on the product nameplate <br> for later identification. |
| 6 | Install the new product as per chapter Installation, page 104. |
| 7 | If the product to be installed has previously been used in a different system or <br> application, you must restore the factory settings before commissioning the product. |
| 8 | Commission the product as per chapter Commissioning, page 149. |

## Maintenance of the Motor

Prior to any type of work on the drive system, consult the chapters on Installation and Commissioning for information to be observed.

Repairs cannot be made with the device installed.
Include the following points in the maintenance plan of your machine.

## Connections and Fastening

- Inspect all connection cables and connectors regularly for damage. Replace damaged cables immediately.
- Verify that all output elements are firmly seated.
- Tighten all mechanical and electrical threaded connections to the specified torque.

## Lubricating the Shaft Sealing Ring

In the case of motors with shaft sealing ring, lubricant must be applied to the space between the sealing lip of the shaft sealing ring and the shaft with a suitable non-metallic tool. If the shaft sealing rings are allowed to run dry, the service life of the shaft sealing rings will be significantly reduced.

## Cleaning

If the permissible ambient conditions are not respected, external substances from the environment may penetrate the product and cause unintended movement or equipment damage.

| AWARNING |
| :--- |
| UNINTENDED MOVEMENT |
| - Verify that the ambient conditions are respected. |
| - Do not allow seals to run dry. |
| - Keep liquids from getting to the shaft bushing (for example, in mounting |
| position IM V3). |
| - Do not expose the shaft sealing rings and cable entries of the motor to the |
| direct spray of a pressure washer. |
| Failure to follow these instructions can result in death, serious injury, or |
| equipment damage. |

Clean dust and dirt off the product at regular intervals. Insufficient heat dissipation to the ambient air may excessively increase the temperature.

Motors are not suitable for cleaning with a pressure washer. The high pressure may force water into the motor.

When using solvents or cleaning agents, verify that the cables, cable entry seals, O-rings, and motor paint are not damaged.

## Replacing the Rolling Bearing

When the rolling bearing is replaced, the motor is partially demagnetized and loses power.

| NOT/CE |
| :--- |
| INOPERABLE EQUIPMENT |
| Do not replace the rolling bearing. |
| Failure to follow these instructions can result in equipment damage. |

## Replacing the Battery for the Multi-Turn Encoder

The multi-turn counting is preserved through power down by the external battery located into the battery compartment.

- Do not disconnect the encoder cable from the battery compartment or the multi-turn information is discarded.
- Replace the battery while the encoder is powered by the drive or the multiturn information is discarded.
The battery has its manufacturing date printing on it in MMYY format. The expiration date for the battery is 3 years after the manufacturing date.

On the following example, the manufacturing date of the battery is June 2016 (0616). The expiration date is June 2019.

The battery voltage is monitored by the encoder at each power on of the drive.

- An alert Wn749 related to P8-49 Bit 10 is triggered when the measured voltage is in the range $3 \ldots 3.15 \mathrm{Vdc}$.
- An error AL576 related to P8-48 Bit 5 is triggered when the measured voltage is under 3 Vdc .

NOTE: After replacing the battery, the detected error is cleared the next time the drive is powered on (next battery voltage measurement), or when an explicit command is sent to the encoder by setting P8-44 to the value 1.

## Lexium 26/28 Multi-Turn Encoder

The purpose of this part is to help you understand the interface between the multiturn encoder and Lexium 26/28 servo drives in order to be able to operate the system with multi-turn encoder.

## Introduction

## Overview

An absolute system is used in an application which must preserve the motor position even when the power to the servo system is interrupted.

Lexium 26/28 absolute system includes a Lexium 26/28 series servo drive, an absolute type BCH 2 series servo motor, a battery compartment VW3M8BATC, and a battery VW3M9BATT. An absolute encoder in an BCH2 series servo motor will constantly record the actual positions at all times.

When power is removed from the system, the encoder will keep operating because the power will be supplied from battery. Therefore, when the motor shaft is rotated during main power off, the system can still calculate its position to its data memory inside encoder.

Lexium 26/28 multi-turn encoder is a digital, single-turn or multi-turn absolute feedback device. Its major output is the absolute position of the motor shaft in a turn, represented digitally as a 22-bit word, and number of total revolutions in a 16bit word, for the multi-turn one.

## Single-Turn versus Multi-Turn

A single-turn absolute encoder is capable of encoding a shaft position of the motor within one revolution (or turn). After each power up of the servo system with a single-turn encoder, the absolute position of the shaft in a turn can be obtained.

During run-time, both the drive and the single-turn encoder are capable of counting the number of motor revolutions (the multi-turn counter). However, after power cycle, the revolutions counter is reset for a single-turn system. For example, the multi-turn counter is volatile in a single-turn system.

Single-turn systems are used in machines that do not have a requirement for maintaining position data after a power cycle. In terms of application, it means that homing of the machine after power cycle is acceptable or the system is not required to be homed during operation.

Contrary to single-turn, the multi-turn system has full absolute position information, including the revolutions counter, even if the power is removed. This is used in machines where positioning of the load in a multi-dimensional space is required. In those systems, the homing (or motion calibration) is only acceptable during initial machine calibration and not acceptable after each power cycle. For such systems, the multi-turn encoder is typically used.

In conclusion, the advantage of the multi-turn over a single-turn system is the absence of the need for homing procedure after each system power cycle. The multi-turn system has the absolute position information including the number of revolutions at any time, even after power cycle.

There are two major types of multi-turn encoders: battery backed up and batteryless.

Lexium 26/28 multi-turn encoder is battery backed, meaning the battery is used to maintain the non-volatility of the revolutions counter. As long as the battery is connected and has enough voltage (> 3 V ), the multi-turn counter and revolutions counter will remain during the absence of mains power.

## Architecture Single-Turn

Motor with a single-turn encoder is connected to the drive according to the following diagram:

Single-turn encoder is connected to the servo drive over a motor feedback cable. The power to the encoder is supplied over the 5 V output of the servo drive. As long as the servo drive is powered, the encoder is powered too, responding with an absolute position in a single revolution.

The servo drive can move the motor and count the number of revolutions. However, right after the 5 V output is removed, the multi-turn information is reset. After the power is back again, the encoder will return the information inside one revolution, but the multi-turn counter will be zero.

## Architecture Multi-Turn with Battery

Motor with a multi-turn encoder is connected to the drive according to the following diagram:

The multi-turn encoder is connected to the servo drive over a battery compartment, which is responsible to supply battery to the multi-turn subsystem in the encoder while power $(5 \mathrm{~V})$ is off. The battery compartment contains circuitry which controls the switching between the power ( 5 V ) and the battery supply automatically.
Since both the battery and the power supply are connected to the same wires in the cable, Lexium 26/28 multi-turn encoder can measure the battery only during power up.

The battery backup is designed to work for at least 3 years. After this period, the battery voltage is expected to drop exponentially. The drop period might take less than a month or maybe more, depending on how much of battery charge has been consumed.

The battery is consumed only when the power supply of 5 V is removed, meaning when the servo system mains power is removed. If the motor is at standstill, the power consumption off the battery is relatively low. It grows, however, with rotation velocity. Typically, the motor is not rotated when the servo system is without power. However, the multi-turn system is capable to count the revolutions when powered by battery, while consuming more charge from the battery.

## Operation

## Functionalities

## Reference Position Set

The Reference Position Set command is performed in multi-turn motor, only while in the multi-turn mode.

This command can be performed in both (enable and disable) drive states by command (P8-44=2).

The Reference Position Set command configures multi-turn encoder and sets new reference position according to the value of P5-78 parameter.

If you implement $P 8-44=2$, then the position equals the reference position as determined by P5-78.

If you implement Homing, then the position equals the home-offset as determined by HOMEOFFSET- (P-0-4020.0.7, usually equals 0 ).

While a drive is in enable state, this command is performed for all operational modes, excluding CYCLIC SYNCHRONOUS POSITION mode.
During the execution of this command, the encoder serial number is read. This serial number is used to check the replacement of the motor or encoder, when a power cycle is performed.

Such as P8-47 ServoSense firmware and hardware versions, P8-45 encoder Feedback type.

When the Reference Position Set command is successful, the alert - reference position not established (WN753) is cleared, and bit 5 of S-0-0135 in the Statusword is set to 1 .

## Multi-Turn Battery Acknowledge

The battery error (AL576) is set in the drive, when battery disconnection from the multi-turn encoder is detected after power cycle.

This error automatically produces the reference position not established (WN753) alert.

Multi-turn battery Acknowledge command is used to clear battery voltage is below allowed threshold error in the multi-turn encoder after battery replacement, and to reset battery error (AL576) in the drive.

This command can be performed by command P8-44=1.

## Ignore Multi-Turn Encoder Errors

This feature allows multi-turn encoder work in multi-turn or single-turn mode.
When P5-79 is set to 0 , encoder works as multi-turn, when the parameter is set to 1 - as single-turn.

This feature performs the following procedure:

- Get multi-turn encoder error mask by reading special error mask address from the encoder.
- Set new error mask according to the entered value and send command to write updated mask into error mask address in the encoder.
When encoder is set to the single-turn mode, multi-turn errors and alerts are cleared.

## Ignore Multi-Turn Encoder Alerts

When encoder is in multi-turn mode, this feature allows to enable or disable multiturn encoder alerts. Parameter P5-80=1 disables multi-turn encoder alerts.

The alert MT Encoder rollover (WN750) is disabled even if the encoder exceeds the counting range. Multi-turn Counter $\leq-32768$ or multi-turn Counter $\geq 32767$.

This feature performs the following procedure:

- Get multi-turn encoder alert mask by reading special alert mask address from encoder.
- Set new alert mask according to the parameter value and send command to write updated mask into alert mask address in encoder.

## Ignore Homing and Reference Position

This feature allows absolute moving with or without homing for both single-turn and multi-turn encoder and without Reference Position Set command for multiturn encoder. Parameter P5-81=1 blocks the multi-turn encoder alerts and sets the

Bit 15 Statusword to 1, when the reference position is not set. The 'isHomed' signal automatic set to on if parameter P5-81=1

## Multi-Turn Encoder Position Counter

This feature is used to indicate multi-turn encoder current revolutions.
Special command is sent in the init feedback communication procedure to get encoder's position. An encoder revolutions value can be received by reading the P5-82.

When the encoder is single-turn or is in single-turn mode, the value of position counter always is 0 .

## Homing Procedure For Multi-Turn Encoder

To set position, drive with multi-turn encoder can independently perform ether homing or reference position set command.

Two main differences for multi-turn encoder:

- Write position to the multi-turn encoder.
- Save homing parameters in NVRAM to reproduce after power cycle.

The homing procedure for multi-turn encoder needs more execution time than for single-turn encoder.

## Commands and Parameters

Multi-turn encoder has several commands, which allows managing the errors, multi-turn functionality and battery issues. These commands are encapsulated on the drive side as Parameters. The following table gives a short description of the commands:

| Name | Parameters | Description | Use Cases |
| :---: | :---: | :---: | :---: |
| Battery Acknowledge | P8-44-> 1 | Acknowledges the battery event: <br> - Battery Down error - AL576. <br> - Low Battery alert - Wn749. | This command is used to clear the following events: <br> - Battery Down error - AL576 <br> - Low Battery alert - Wn749 |
| MT Set Reference Point | P8-44 -> 2 | This command performs the following: <br> - Set reference point. | This command can be performed in both (enable and disable) drive states, excluding CSP mode When alert Wn753 is indicated. |
| MT Config /Reset | P8-44-> 3 | This command performs the following: <br> - Initialize the multi-turn system. <br> - Reset multi-turn revolution counter to 0 . | This command only can be performed in disable drive states. <br> When the multi-turn Config/ Reset required error AL577 or Wn750 is indicated. |
| MULTI_TURN_REF_ POSITION | P5-78 | Multi-turn reference position in PUU. | After a successful reference set (P8-44=2), this P5-78 position is automatically set at the reference point. |
| IGNORE_BATTERY_ FAULTS | P5-79 | Defines whether the drive is to ignore the multi-turn error AL576: <br> - Value 0: The masking of the multi-turn error AL576 is inactive. <br> - Value 1: The masking of the multi-turn error AL576 is active. | When set P5-79=1, multi-turn encoder can be used as singleturn (even with single-turn cable). |
| IGNORE_ENCODER_ WARNINGS | P5-80 | Defines whether the drive is to ignore the multi-turn alert Wn750. <br> Multi-turn counter exceeded the range of 16 -bit signed value: | For some applications which will rotate motor in one direction, the alert Wn750 for checking turns number within -32768 ... 32767 |

| Name | Parameters | Description | Use Cases |
| :--- | :--- | :--- | :--- |
|  |  | - Multi-turn Counter $\leq-32768$ or; <br> - Multi-turn Counter $\geq 32767$ <br> - Value 0: The masking of Wn750 is inactive. <br> - Value 1: The masking of Wn750 is active. | can be turned off by parameter <br> P5-80 |
| IGNORE_HOMING_ <br> REF_POS | P5-81 | Ignore homing and reference position set. <br> Defines whether absolute positioning is allowed without <br> homing/Reference Position Set. <br> - Value 0: Not allowed. <br> - Value 1: Allowed. | When set P5-81=1, absolute <br> positioning illowed without <br> homing/ set Reference Point. |
| MT_ENCODER_ <br> POSITION | P5-82 | Current position in revolutions. |  |

## Errors and Alerts

| Error Codes | Description | Remedy |
| :--- | :--- | :--- |
| AL571 | Reference position operation rejected. | Power-cycle the drive and then perform Homing/ <br> P8-44 = 2. |
| AL576 | The multi-turn encoder battery voltage has dropped under 3 <br> Vdc. | Replace encoder battery. <br> Clear AL576 by command P8-44=1. |
| AL577 | The multi-turn encoder requires an Config/Reset command. | Execute multi-turn Config /Reset (Set Reference <br> Point) by command P8-44=3/2. |
| AL578 | Internal position synchronization error detected between the <br> multi-turn and the single-turn modules. | Restart Drive. |
| AL579 | Encoder is damaged or that a magnetic screw is missing. | Implement factory restore if error happen again <br> replace motor. |
| Wn749 | The multi-turn battery voltage is within the following range: 3 3 <br> V < VBAT < 3.15V. Battery voltage has started to drop; but <br> the multitiurn information is still reliable. | Replace encoder battery. <br> Clear Wn749 by command P8-44=1. |
| Wn750 | The multi-turn counter exceeded the range of 16bit signed <br> value. Multi-turn Counter <-32768 Or multi-turn Counter > <br> 32767. | Execute multi-turn Config /Reset (Set Reference <br> Point) by command P8-44=3/2. <br> For some applications which will rotate motor in one <br> direction, the alert Wn750 for checking turns <br> number within -32768 ... 32767 can be turned off by <br> parameter P5-80=1. |
| Wn753 | Reference position reset. | Execute multi-turn Config/Reset (Set Reference <br> Point) by command P8-44=2 <br> Or Execute a homing procedure. |

## Initialization Procedure

At the very first time to operate absolute system, there will be an error code AL576 and an alert code Wn753 shown when power on because the initialization procedure has not been done yet. The error and alert will be kept until the initialization procedure is finished. Besides, the AL576 and Wn753 will be displayed when the power from the servo and battery cell box is discontinued that will lead to the coordinate system being reset.

## Parameter Settings for first operation:

1. $P 8-44=1$, the AL576 will be cleared.
2. $P 8-44=3$, initialize the multi-turn system.
3. P8-44=2, or execute a homing procedure, the Wn 753 will be cleared.

## Multi-Turn Methods

LXM28A + Multi-Turn

LXM28A with multi-turn encoder motor lose position while motor rollover (multiturn counter <-32767 or multi-turn counter > 32768) after power cycle if the gear ratio cannot be divided into an integer by 2 .

Follow the workaround:

1. Set P1-44 and P1-45 to values which result to wanted ratio in PT or PS mode (P1-01 set to 0 or 1).
For example, for values to convert to ratio of 13072: P1-44 = 10000, and P1$45=1024$. The gear ration must be divided into an integer by 2.
2. Change drive work mode back to CAN mode (P1-01 set to $B$ ).
3. Set $16 \# 6092$ to 131072 in program SDO configuration.
4. Set to 131072 in canmotion incremental configuration.
5. Add SMC3_PersistPositionSingleturn function block in the PLC program. usiNumberOfAbsoluteBits pin is set to 32, bEnable pin is set to 1 .
6. Put the variable stPerdat into a persistent variable.
7. Add MC_SetPosition function block when do reference point operation.

## Homing35 Limitation

If motor is always running toward the same direction, the Homing 35 mode does not reset the position to 0 when the rollover value $+/-2147483647$ (PUU) is reached.

Follow the workaround:

1. Set P8-44 = $3 / \mathrm{CAN} 0 \times 482 \mathrm{C}=3$ (initial multi-turn encoder while servo disable).
2. Set P8-44 = $2 /$ CAN $0 \times 482 \mathrm{C}=2$ (set encoder position to 0 ).
3. Execute MC_SetPosition function block.

## Changing the Motor

Drive systems may perform unintended movements if unapproved combinations of drive and motor are used. Even if motors are similar, different adjustment of the encoder system may be a source of hazards. Even if the connectors for motor connection and encoder connection match mechanically, this does not imply that the motor is approved for use.

## A WARNING

## UNINTENDED MOVEMENT

Only use approved combinations of drive and motor.
Failure to follow these instructions can result in death, serious injury, or equipment damage.

Compatibility between Drive and Motor is defined in the Drive / Motor combinations table, page 21.

Observe the following procedure when changing motors:

| Step | Action |
| :---: | :--- |
| 1 | Switch off all supply voltages. Verify that no voltages are present. |
| 2 | Label all connections and uninstall the product. |

| Step | Action |
| :---: | :--- |
| 3 | Note the identification number and the serial number shown on the product nameplate <br> for later identification. |
| 4 | Install the new product as per chapter Installation, page 139. |
| 5 | Commission the product as per chapter Commissioning, page 149. |

If the connected motor is replaced by another approved motor, the new motor is automatically recognized by the drive.

## Shipping, Storage, Disposal

## Shipping

The product must be protected against shocks during transportation. If possible, use the original packaging for shipping.

## Storage

The product may only be stored in spaces where the specified permissible ambient conditions are met.

Protect the product from dust and dirt.

## Disposal

The product consists of various materials that can be recycled. Dispose of the product in accordance with local regulations.

Visit www.se.com/green-premium for information and documents on environmental protection as per ISO 14025 such as:

- EoLi (Product End-of-Life Instructions)
- PEP (Product Environmental Profile)

What's in This PartCANopen Basics392CANopen Object Dictionary ..... 395

## CANopen Basics

What's in This ChapterCommunication Objects392
Service Data Communication ..... 392
Process Data Communication ..... 392

## Communication Objects

## Overview

CANopen manages communication between the network devices with object dictionaries and objects. A network device can use process data objects (PDO) and service data objects (SDO) to request the object data from the object dictionary of another device and, if permissible, write back modified values.

- PDOs (process data objects) for real-time transmission of process data.
- SDOs (service data object) for read and write access to the object dictionary.
- Objects for controlling CAN messages:
- SYNC object (synchronization object) for synchronization of network devices.
- EMCY object (emergency object), for signaling detected errors of a device or its peripherals.
- Network management services:
- NMT services for initialization and network control (NMT: network management).
- NMT node guarding for monitoring the network devices.
- NMT heartbeat for monitoring the network devices.

## Service Data Communication

## SDO Description

Service Data Objects (SDO) can be used to access the entries of an object dictionary using index and subindex. The values of the objects can be read and, if permissible, also written.

Every network device has at least one SDO server to be able to respond to read and write requests from a different device.

The TxSDO of a SDO client is used to send the request for data exchange; the RxSDO is used to receive.

## Process Data Communication

## PDO Mapping

Up to 8 bytes of data from different areas of the object dictionary can be transmitted with a PDO message. Mapping of data to a PDO message is referred to as PDO mapping.

Objects that can be used in PDO mapping are identified in the PDO mapping object column in the object dictionary table.

The groups of objects that are involved in PDO mapping are:

- Vendor-specific Object Group 4000h, page 409
- Device Profile Object Group 6000h, page 450

The picture below shows the data exchange between PDOs and object dictionary based on two examples of objects in TxPDO4 and RxPDO4 of the PDOs.

## Dynamic PDO Mapping

The device uses dynamic PDO mapping. Dynamic PDO mapping means that objects can be mapped to the corresponding PDO using adjustable settings.

The settings for PDO mapping are defined in an assigned communication object for each PDO.

| Object | PDO mapping for | Type |
| :--- | :--- | :--- |
| 1st receive PDO mapping $\left(1600_{h}\right)$ | RxPDO1 | Dynamic |
| 2nd receive PDO mapping $\left(1601_{h}\right)$ | RxPDO2 | Dynamic |
| 3rd receive PDO mapping $\left(1602_{h}\right)$ | RxPDO3 | Dynamic |
| 4th receive PDO mapping $\left(1603_{h}\right)$ | RxPDO4 | Dynamic |
| 1st transmit PDO mapping $\left(1 \mathrm{~A} 00_{\mathrm{h}}\right)$ | TxPDO1 | Dynamic |
| 2nd transmit PDO mapping $\left(1 \mathrm{~A} 01_{\mathrm{h}}\right)$ | TxPDO2 | Dynamic |
| 3rd transmit PDO mapping $\left(1 \mathrm{A0} 2_{\mathrm{h}}\right)$ | TxPDO3 | Dynamic |
| 4th transmit PDO mapping $\left(1 \mathrm{~A} 03_{\mathrm{h}}\right)$ | TxPDO4 | Dynamic |

## Structure of the Entries

Up to 8 bytes of 8 different objects can be mapped in a PDO. Each communication object for setting the PDO mapping provides four subindex entries. A subindex
entry contains three pieces of information on the object: the index, the subindex, and the number of bits that the object uses in the PDO.

Subindex $00_{\mathrm{h}}$ of the communication object contains the number of valid subindex entries.

| Object length | Bit value |
| :--- | :--- |
| $08_{\mathrm{h}}$ | 8 bits |
| $10_{\mathrm{h}}$ | 16 bits |
| $20_{\mathrm{h}}$ | 32 bits |

## Overview

## Specifications for the Objects

## Overview

The object dictionary table contains the following information:

| Index | Name | Object type <br> Data type <br> Access | PDO <br> mapping <br> object | Minimum value <br> Factory setting |
| :--- | :--- | :--- | :--- | :--- |

The symbol (-) means that the value is not significant.

## Index

The index specifies the position of the object in the object dictionary. The index value is specified as a hexadecimal value. The subindex is also available in this cell if it is relevant

## Name

Name of the object.
Object Type
The object type specifies the data structure of the object:

| Object type | Description | DS306 <br> Coding |
| :--- | :--- | :--- |
| VAR | A simple value, for example of the type Integer8, Unsigned32 or <br> Visible String8. | $7_{\mathrm{h}}$ |
| ARRAY | A data field in which the entries have the same data type. | $8_{\mathrm{h}}$ |
| RECORD | A data field that contains entries that are a combination of simple <br> data types. | $9_{\mathrm{h}}$ |

## Data Type

The data type specifies the type of the object:

| Data type | Description | Value range | Data <br> length | DS301 <br> coding |
| :--- | :--- | :--- | :--- | :--- |
| BOOL | Boolean | $0=$ false, $1=$ true | 1 byte | $0001_{\mathrm{h}}$ |
| INT8 | Integer 8 bits | $-128 \ldots+127$ | 1 byte | $0002_{\mathrm{h}}$ |
| INT16 | Integer 16 bits | $-32768 \ldots+32767$ | 2 bytes | $0003_{\mathrm{h}}$ |
| INT32 | Integer 32 bits | $-2147483648 \ldots 2147483647$ | 4 bytes | $0004_{\mathrm{h}}$ |
| UINT8 | Unsigned Integer <br> 8 bits | $0 \ldots 255$ | 1 byte | $0005_{\mathrm{h}}$ |
| UINT16 | Unsigned Integer <br> 16 bits | $0 \ldots 65535$ | 2 bytes | $0006_{\mathrm{h}}$ |
| UINT32 | Unsigned Integer <br> 32 bits | $0 \ldots 4294967295$ | 4 bytes | $0007_{\mathrm{h}}$ |
| VISIBLE <br> STRING | Visible String 8 <br> bytes | ASCII characters | 8 bytes | $0009_{\mathrm{h}}$ |

## Access

Indicates the access type for the object:

| Access type | Description |
| :--- | :--- |
| ro | Read only |
| rw | Read and write |
| rww | Read and write on process output |
| const | Constant value |

## PDO Mapping Object

Indicates if the object can be mapped in a PDO:

| PDO mapping object | Description |
| :--- | :--- |
| No | The object cannot be mapped in a PDO |
| Yes | The object can be mapped in a PDO |

## Minimum Value

The minimum value which can be set.

## Factory Setting

The value of the object when the product is shipped from the factory.

## Maximum Value

The maximum value which can be set.

## Object Dictionary Overview

## Description

Each CANopen device manages an object dictionary which contains the objects for communication.

Index and Subindex

The objects are addressed in the object dictionary via a 16 bits index.
One or more 8 bits subindex entries for each object specify individual data fields in the object. Index and subindex are shown in hexadecimal notation.

## Description Object Dictionary

The description object dictionary is made of several object groups:

| Index (hex) | Object |
| :--- | :--- |
| 0000 | Unused |
| $0001 \ldots 001 F$ | Static data types |
| $0020 \ldots 003 F$ | Complex data types |
| $0040 \ldots 005 \mathrm{~F}$ | Unused (Manufacturer-specific complex data types) |
| $0060 \ldots 007 \mathrm{~F}$ | Device profile-specific static data types |
| $0080 \ldots 009 F$ | Device profile-specific complex data types |
| $00 A 0 \ldots 0$ FFF | Reserved |
| $1000 \ldots 1$ FFF | Communication profile area |
| $2000 \ldots 5$ FFF | Vendor-specific profile area |
| $6000 \ldots 9 F F F$ | Standardized device profile area |
| A000...FFFF | Reserved |

## Object Groups Implemented

Three groups of objects are available in the object dictionary.

- 1000h -1 FFF ${ }_{h}$ : Standard communication Object Group, page 398
- 4000h $-4 F F F_{h}$ : Vendor-specific Object Group, page 409
- 6000h - 6FFF h : Device profile Object Group, page 450

## 1000h...1FFFh Standard Communication Object Group

## A <br> absolute movement:

A movement to a position defined from a reference point.

## analog input:

Converts received voltage or current levels into numerical values. You can store and process these values within the logic controller.

## analog output:

Converts numerical values within the logic controller and sends out proportional voltage or current levels.

## ASCII:

(American standard code for Information Interchange) A protocol for representing alphanumeric characters (letters, numbers, certain graphics, and control characters).

AWG:
(American wire gauge) The standard that specifies wire section sizes in North America.

## B

BOOL:
(boolean) A basic data type in computing. A BOOL variable can have one of these values: 0 (FALSE), 1 (TRUE). A bit that is extracted from a word is of type BOOL; for example, \%MW10.4 is a fifth bit of memory word number 10.

## byte:

A type that is encoded in an 8-bit format, ranging from 00 hex to FF hex.

## C

CAN:
(controller area network) A protocol (ISO 11898) for serial bus networks, designed for the interconnection of smart devices (from multiple manufacturers) in smart systems and for real-time industrial applications. Originally developed for use in automobiles, CAN is now used in a variety of industrial automation control environments.

## CANmotion:

A CANopen-based motion bus with an additional mechanism that provides synchronization between the motion controller and the drives.

## CANopen:

An open industry-standard communication protocol and device profile specification (EN 50325-4).

## ccw:

## Counter ClockWise

## CiA :

(CAN in automation) A non-profit group of manufacturers and users dedicated to developing and supporting CAN-based higher layer protocols.

## COB ID:

Each COB is uniquely identified in a CAN network by a number called the $C O B$ Identifier (COB-ID).

## COB:

(communications object) CANopen refers to a CAN frame as a communications object. Within the CAN frame is the COB-ID, which is normally an 11-bit identifier and defines the designated device (node) for the frame and a function code.

## CSA:

(Canadian standards association) The Canadian standard for industrial electronic equipment in hazardous environments.

## CW:

ClockWise

## D

## Degree of Protection:

The degree of protection is a standardized specification for electrical equipment that describes the protection against the ingress of foreign objects and water (for example: IP 20).

## DIN:

(Deutsches Institut für Normung) A German institution that sets engineering and dimensional standards.

## DOM:

Date of manufacturing: The nameplate of the product shows the date of manufacture in the format DD.MM.YY or in the format DD.MM.YYYY. For example: 31.12.11 corresponds to December 31, 2011; 31.12.2011 corresponds to December 31, 2011

## DTM:

(device type manager) Classified into 2 categories:

- Device DTMs connect to the field device configuration components.
- CommDTMs connect to the software communication components.

The DTM provides a unified structure for accessing device parameters and configuring, operating, and diagnosing the devices. DTMs can range from a simple graphical user interface for setting device parameters to a highly sophisticated application capable of performing complex real-time calculations for diagnosis and maintenance purposes.

## E

## Electronic Gear:

Calculation of a new output velocity for the motor movement based on the input velocity and the values of an adjustable gear ratio; calculated by the drive system.

## EMC:

Electromagnetic compatibility
EMCY:
(emergency) The object that enables devices to indicate internal errors detected in and by the device. When the devices receive this signal, other network participants can evaluate the received information and start appropriate manufacturer-specific counter actions.

## Encoder :

Sensor that converts a measured distance or angle into an electrical signal. This signal is evaluated by the drive to determine the actual position of a shaft (rotor) or a driving unit.

## Error:

Discrepancy between a detected (computed, measured or signaled) value or condition and the specified or theoretically correct value or condition.

## F

## Factory Settings:

Settings when the product is shipped.

## Fault :

Fault is an operating state. If the monitoring functions detect an error, a transition to this operating state is triggered, depending on the error class. A "Fault Reset" or a power cycle are required to exit this operating state. Prior to this, the cause of the detected error must be removed. Further information can be found in the pertinent standards such as IEC 61800-7, ODVA Common Industrial Protocol (CIP).

## Fault Reset:

Function used to exit the operating state Fault. Before the function is used, the cause of the detected error must be removed.

## firmware:

Represents the BIOS, data parameters, and programming instructions that constitute the operating system on a controller. The firmware is stored in nonvolatile memory within the controller.

## flash memory:

A non-volatile memory that can be overwritten. It is stored on a special EEPROM that can be erased and reprogrammed.

## H <br> hex: <br> (hexadecimal)

## HMI:

(human machine interface) An operator interface (usually graphical) for human control over industrial equipment.

## homing:

The method used to establish the reference point for absolute movement.

I
I/O:
(input/output)

## IEC:

(international electrotechnical commission) A non-profit and non-governmental international standards organization that prepares and publishes international standards for electrical, electronic, and related technologies.

## Internal Units:

Resolution of the power stage at which the motor can be positioned. Internal units are specified in increments.

## IT Mains:

Mains in which all active components are isolated from ground or are grounded by a high impedance. IT: isolé terre (French), isolated ground. Opposite:
Grounded mains, see TT/TN mains

L
LED:
(light emitting diode) An indicator that illuminates under a low-level electrical charge.

## Limit Switch:

Switches that signal overtravel of the permissible range of travel.

## LSB:

(least significant bit/byte) The part of a number, address, or field that is written as the right-most single value in conventional hexadecimal or binary notation.

## M

## Modbus:

The protocol that allows communications between many devices connected to the same network.

## Monitoring Function:

Monitoring functions acquire a value continuously or cyclically (for example, by measuring) in order to check whether it is within permissible limits. Monitoring functions are used for error detection.

## MSB:

(most significant bit/byte The part of a number, address, or field that is written as the left-most single value in conventional hexadecimal or binary notation.
ms:
(millisecond)

## N

network:
A system of interconnected devices that share a common data path and protocol for communications.

## NMT state machine:

(network management state machine) The communication behavior of any CANopen device. The CANopen NMT state machine consists of an initialization state, a pre-operational state, an operational state, and a stopped state. After power-on or reset, the device enters the initialization state. After the device initialization is finished, the device automatically enters the pre-operational state and announces the state transition by sending the boot-up message. In this manner, the device indicates that it is ready to work. A device that stays in preoperational state may start to transmit SYNC-, Time Stamp-, or Heartbeat message. In this state, the device cannot communicate through a PDO; it communicates with an SDO. In the operational state, the device can use supported communication objects.

## node:

An addressable device on a communication network.

## non-volatile memory:

A memory that can be overwritten. It is stored on a special EEPROM that can be erased and reprogrammed.

## P

## Parameter:

Device data and values that can be read and set (to a certain extent) by the user.

## PDO:

(process data object) An unconfirmed broadcast message or sent from a producer device to a consumer device in a CAN-based network. The transmit PDO from the producer device has a specific identifier that corresponds to the receive PDO of the consumer devices.

## PELV:

Protective Extra Low Voltage, low voltage with isolation. For more information: IEC 60364-4-41

## PE:

(Protective Earth) A common grounding connection to help avoid the hazard of electric shock by keeping any exposed conductive surface of a device at earth potential. To avoid possible voltage drop, no current is allowed to flow in this conductor (also referred to as protective ground in North America or as an equipment grounding conductor in the US national electrical code).

## PLC:

(programmable logic controller) An industrial computer used to automate manufacturing, industrial, and other electromechanical processes. PLCs are different from common computers in that they are designed to have multiple input and output arrays and adhere to more robust specifications for shock, vibration, temperature, and electrical interference among other things.

## Position Deviation:

The position deviation is the difference between reference position and actual position. The current position deviation consists of the load-dependent position deviation and the dynamic position deviation.

## Power Stage :

The power stage controls the motor. The power stage generates current for controlling the motor on the basis of the motion signals from the controller.

## PWM:

(pulse width modulation) A fast output that oscillates between off and on in an adjustable duty cycle, producing a rectangular wave form (though you can adjust it to produce a square wave). The PTO is well adapted to simulate or approximate an analog output in that it regulates the voltage of the output over its period making it useful in light dimming or speed control applications, among others.

## Q

## Quick Stop:

The quick Stop function can be used for fast deceleration of a movement as a response to a detected error or via a command.

## R

## relative movement:

Movement by a specified distance from the current position.

## RJ45:

A standard type of 8-pin connector for network cables defined for Ethernet.

## rms:

"Root Mean Square" value of a voltage (Vrms) or a current (Arms)

## RPM:

(revolutions per minute)

## RSDO:

(receive service data object) A message received from a producer device to a consumer device in a CAN-based network.

## s

## Safety Function:

Safety functions are defined in the standard IEC 61800-5-2 (for example, Safe Torque Off (STO), Safe Operating Stop (SOS) or Safe Stop 1 (SS1)). If the safety functions are wired properly, they meet the requirements specified in IEC 61800-5-2.

## SDO:

(service data object) A message used by the field bus master to access (read/ write) the object directories of network nodes in a CAN-based. SDO types include service SDOs (SSDOs) and client SDOs (CSDOs).

## STO:

(Safe Torque Off) The Safety Function STO (IEC 61800-5-2) ("Safe Torque Off") removes power to the motor thereby relieving the torque applied by the motor. There is no monitoring for standstill..

## SYNC:

Synchronization Object

## T

## TN Mains

Grounded mains, differ in terms of the ground connection (PE conductor connection). Opposite: Ungrounded mains, see IT mains.

## touchprobe input:

Touchprobe inputs are advanced digital inputs. These inputs are used for measuring functions, which accurately detect positions relative to a measure input. Once a touchprobe function has been activated, it runs independently in the system, independent of the IEC program. The IEC program can use parameters to detect the state of the measuring function. This function is supported by hardware and software.

## TP:

(touch probe) A position capture that is triggered by a fast input signal (quick sensor). On the rising edge of the touch probe input, the position of an encoder is captured.

For example, this is used for packaging machines to capture the position of a printmark on a film to cut on the same position.

## TSDO:

(transmit service data object) A message sent from a producer device to a consumer device in a CAN-based network.

## TT Mains:

Grounded mains, differ in terms of the ground connection (PE conductor connection). Opposite: Ungrounded mains, see IT mains.

## U

UL:
(underwriters laboratories) A US organization for product testing and safety certification.
