1.65 V to 3.6 V, Single-Channel Level Translator in SOT-23 Package

Data Sheet **ADG3231**

FEATURES

- Operates from 1.65 V to 3.6 V supply rails
- Unidirectional signal path
- Up/down level translation
- Ultracompact 6-lead SOT-23 package
- Output short-circuit protection
- LVTTL-/CMOS-compatible inputs

APPLICATIONS

- Level translation in
  - PDAs
  - Handsets
  - MP3 players

GENERAL DESCRIPTION

The ADG3231 is a single-channel level translator designed on a submicron process that is guaranteed to operate over the 1.65 V to 3.6 V supply range. The device can be used in applications requiring communication between digital devices operating from multiple supply voltages. The logic levels on each side of the device are set by the two supply voltages, V_{CC1} for A and V_{CC2} for Y. The signal path is unidirectional, meaning data can flow only from A to Y.

The ADG3231 can operate with any combination of V_{CC1} and V_{CC2} supply voltages within the 1.65 V to 3.6 V range, allowing the part to perform either up ($V_{CC1} < V_{CC2}$) or down ($V_{CC1} > V_{CC2}$) level translation. The output stage is protected against current overload, which can occur when the Y pin is accidentally shorted to the V_{CC2} or GND rails.

The ADG3231 is available in the SOT-23 (2.8 mm × 2.9 mm × 1.3 mm) ultracompact package, making the part ideal for applications where space is critical.

PRODUCT HIGHLIGHTS

1. Up/down level translation.
2. Guaranteed to operate with any supply combination within the 1.65 V to 3.6 V range.
3. Output short-circuit protection.
4. Available in ultracompact SOT-23 package.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Only one absolute maximum rating may be applied at any one time.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

THEORY OF OPERATION

The ADG3231 is a single-channel level translator designed on a submicron process that is guaranteed to operate over the 1.65 V to 3.6 V supply range. The device can be used in applications requiring communication between digital devices operating from multiple supply voltages. The logic levels on each side of the device are set by the two supply voltages, V_{CC1} for A, and V_{CC2} for Y. The signal path is unidirectional, meaning data can flow only from A to Y.

The ADG3231 can operate with any combination of V_{CC1} and V_{CC2} supply voltages within the 1.65 V to 3.6 V range, allowing the part to perform either up ($V_{CC1} < V_{CC2}$) or down ($V_{CC1} > V_{CC2}$) level translation.

By limiting the current delivered into the load, for example, ~1.7 mA with V_{CC2} = 3.6 V, the output stage is protected against current overload, which can occur when the Y pin is accidentally shorted to the V_{CC2} or GND rails.

The short-circuit protection circuitry works by limiting the output current when the output voltage exceeds V_{OL} (A = 0 logic) or is less than V_{OH} (A = 1 logic) threshold values specified for the V_{CC2} supply voltage used.

Figure 18 shows a typical application for the ADG3231 where the device performs level translation from V_{CC1}-compatible levels to V_{CC2}-compatible levels to allow proper communication between the two digital devices, DEVICE 1 and DEVICE 2.
