Edition 03/21

SINAMICS S210 1 AC 230 V

Edition 03/21

Danger to life if the safety instructions and installation instructions are not observed. The Quick Installation Guide only contains the most important information for the installation of the converter. If the safety instructions and installation instructions in the associated documentation are not observed, accidents involving severe injuries or death can occur.

- Observe the safety instructions and installation instructions given in the associated operating instructions: www.siemens.com/sinamics-s210
- Also observe the safety instructions for the integrated functional Safety functions. Make sure that these functions are fully operational again after replacing a converter.

Danger to life through electric shock due to residual charge in the DC link capacitors Because of the DC link capacitors, a hazardous voltage is present for up to 5 minutes after the power to the converter has been removed.

- Contact with live parts of the converter can result in death or serious injury.

 Do not open the protective covers or the terminal covers until 5 minutes after the power has been
- Before starting any work, check that the system is in a voltage-free state by measuring all terminals,
- including to ground.

 Ensure that the associated warning labels, in the approropriate languages, are attached.

Mounting the conver	ter				

Mounting the converter

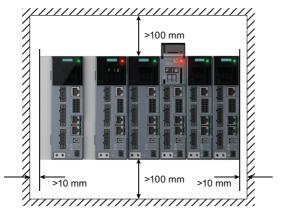

The converter may be operated only in closed housings or in higher-level control cabinets with protective covers that are closed, and when all of the protective devices are used. The installation of the converter in a metal control cabinet or the protection with another equivalent measure must prevent the spread of fire and emissions outside the control cabinet.

Protect the converter, e.g. by installing it in a control cabinet with degree of protection IP54 according to IEC 60529 or NEMA 12. Further measures may be necessary for particularly critical operating conditions.

If condensation or conductive pollution can be excluded at the installation site, a lower degree of control cabinet protection may be permitted.

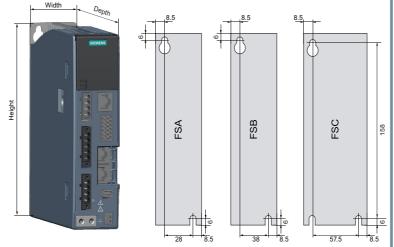

Leave a minimum 100 mm clearance to other devices at the top and bottom. A lateral clearance between multiple SINAMICS S210 converters is not mandatory. Observe a lateral clearance of at least 10 mm to other

7	SPEED-CONNECT extension cable (optional)	14)	Commissioning using PC
		15)	Control example; SIMATIC S7-1500 PLC

Connection the converter

Install the converter so that you comply with local regulations for erecting and installing low voltage systems

Til, when switching over a function from ON to OFF, an LED or other similar display is not lit or not active; this does not indicate that the device is switched-off or in a no-current condition.

Converter is grounded (earthed) correctly
Make sure that the shield of the motor cable is properly grounded (earth). Use the shielding clamp
which comes with the cable to mount the cable to the converter's shielding plate.

Install suitable protective equipment between the line supply and converter.

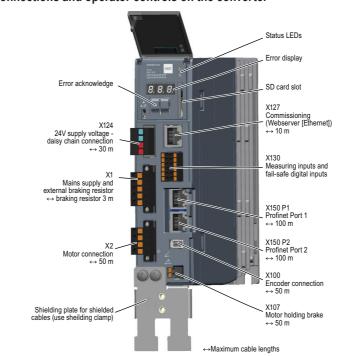

https://support.industry.siemens.com/cs/document/109748999

Protection and monitoring equipment
To provide protection against short-circuit, use the overcurrent devices listed in the Technical data (fuses, circuit breakers etc.).

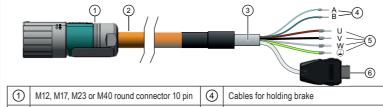

If the apparent impedance of the line supply at the infeed point is not suitable, so that fuses do not rupture in the specified time in the case of insulation failure (ground fault, fault to frame), then you must use additional residual current protective devices RCD (RCCB or MRCD), type B. To prevent an RCD from unnecessarily tripping as a result of operational leakage currents, the following preconditions must be fulfilled:

- · The neutral point of the line supply is grounded.
- Use an RCCB type B with a response limit current of 300 mA. Connect the RCCB in series with the overcurrent protective devices.
- · Use a separate RCD for each converter
- The motor cables are shorter than 50 m (164 ft) shielded.

Connections and operator controls on the converter

Cables and connections

١	1	M12, M17, M23 or M40 round connector 10 pin	4	Cables for holding brake
١	2	MOTION-CONNECT OCC cable	(5)	Power cables
١	3	Shielding	6	SIEMENS IX connector for signal line

System connections

X1: Line connection and connection for external braking resistor

	Pin	Connection for	Explanation
B	L1	Phase L1 line system	_
	N	Neutral conductor	
	DCP		If you are using the internal braking resistor, DCP
	R2	Internal braking resistor	and R2 must be jumpered. If you are using the external braking resistor, remove the jumper between DCP and R2.
	R1	E	Connect the external braking resistor by means of terminals DCP and R1
Waidmullar: R	I F 5 08	HC/05/180E SN BK BY article	number 1012670000

As daisy chain: BLDF 5.08/05/180F SN BK BX, article number 1000970000

The terminals are spring-type terminals.

Permissible conductor cross-sections for single-core connection or for the connection of flexible cables with end sleeves:

• 0.2 mm² ... 2.5 mm² , AWG: 26 ... 12

X2: Power connections for the motor

	Pin	Pin assignment	Colour coding for Siemens OCC cables

	DI 1	High-speed DI, measuring input		+24 V output	+	
		M	Ground		Digital input	DI 4
	Phoenix 1790	140 DFI	MC 1,5/ 6-ST-3,5, Article number 179	9014	.0	

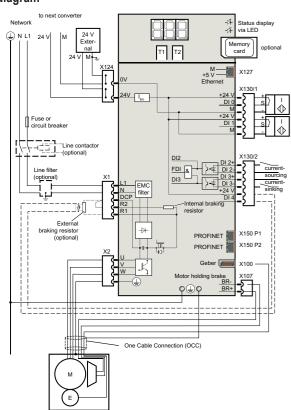

The terminals are spring-type terminals.

Permissible conductor cross-sections:

for single-wire connection: 0.2 mm² ... 1.5 mm², AWG: 24 ... 16
 for flexible cables with end sleeves: 0.25 mm² ... 1.5 mm², AWG: 24 ... 16

for flexible cables with end sleeves with plastic protection: 0.25 mm² ... 0.75 mm², AWG: 24 ... 19

Block diagram

Commissioning

Commissioning with web serverUse the web server integrated in the converter for the commissioning. The Web server integrated in the converter supports the following browsers:

- Microsoft Internet Explorer (Version 11)
- Microsoft Edge (Version 14)
- Mozilla Firefox (Version 62)
- Google Chrome (Version 69)

Preparation for commissioning

- Mount the motor on the mechanical system. Connect the motor to the converter.
- · Connect the converter to your Commissioning-PC via the Ethernet interface (X127). · Switch the converter on
- The converter powers up and reads the motor data.
- Start the Internet-Browser for commissioning
- Enter the IP address of the converter in the input line of your browser. Default-IP-Address: 169.254.11.22 (Subnet-Mask: 255.255.0.0).

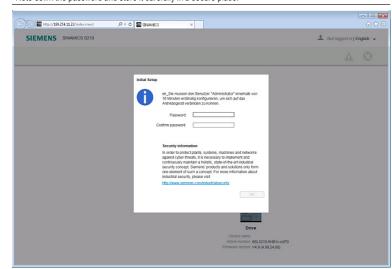

If the RDY LED is blinking fast in yellow after the first power up of the converter, then a power cycle is required after an update of a motor component. Turn the 24V supply of the converter off and back on

Assigning an Administrator password

In order to get full access to the converter, you have to log-in as an Administrator. For access as an Administrator, a password is required. After connecting the Service interface (X127) to the PC, a dialog to assign the Administrator password appears for 10 minutes.

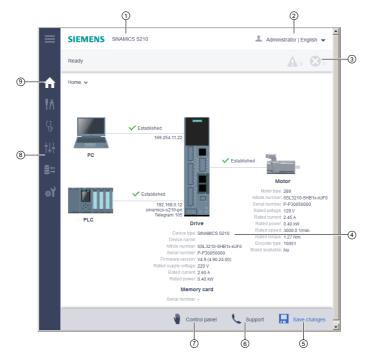

The following mask appears only if the Administrator password has not been assigned and only for a duration of 10 minutes after connecting to the X127 of the converter. If the 10 minutes has expired, disconnect and reconnect the LAN-cable again.
Assign an Administrator password.

Note down the password and store it carefully in a secure place!

After assigning the Administrator password the Log-in page is displayed. Enter the login "Administrator" and the password which you have assigned in the step before. After a successful log-in the Overview page appears.

WARNING

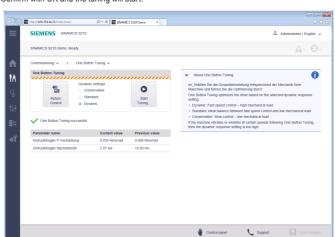

Danger due to moving parts of the machine
During the following steps the motor will rotate. Please make sure that the motor is mounted and connected correctly and that the connected mechanics may be moved without causing a damage or

Perform a One-Button-Tuning

For the optimization of the control parameters, perform the following procedure:

1. Select 'Commissioning'

- Select 'Tuning'
- Click on "Take Control" and confirm the confirmation prompt (Orange/white bar appears). Choose a Dynamic setting according to the mechanical capabilities of your machine. Click on "Start tuning".
- Enter the permissible angle of rotation for the required measurement about which the motor and the connected machine are permitted to turn without causing a damage to the mechanics (the angle
- should at least be 60°, a greater angle leads to better results). Confirm with OK and the tuning will start.

If it is required to move the axis this can be done using the control panel. Click on the button 'Control panel' in the footer, take over the control and enter the desired speed. Now the axis can be moved by holding the 'Rotate Left/Right' buttons.

Additional functions

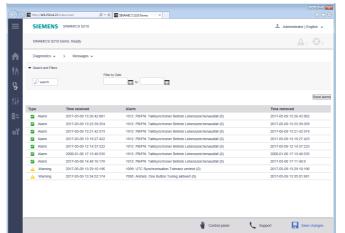

Further adjustments can be made by selecting the menu item 'Parameters'

You can also save the parameter settings and restore them later if required or you can reset the converter to the factory defaults.

For this choose the menu item 'Backup &Restore' In the 'System' menu you can change passwords and enable the access to the web server via the

Saving changesIn order to save the changes permanently click on the floppy disk symbol in the footer.

Messages
In the menu choose 'Diagnostics' and 'Messages' to display the Warnings and Alarms including information concerning cause and remedy. A detailed description of the events is available in the

Diagnostics

Diagnostic of the converter Besides the diagnose with the Webserver troubleshooting can be done directly on the device. The alarms and faults are shown in the display of the converter according to the message classes defined in PROFIdrive.

Display and operational elements

The converter displays the current operating state via two LEDs.

- RDY: Status of the converter
- COM: Status of the communication

 Faults can be acknowledged with the OK button.

When using an SD-Card, push it into the slot (label to the left). When parameters were saved on the card after commissioning, an easy exchange of the converter is possible in case of a defect. Switch the converter off to plug-in or remove the SD card.

Message number	Description
1	Hardware/software error Hardware or software malfunction
2	Network fault A line supply fault has occurred (phase failure, voltage level, etc.)
3	Supply voltage fault Power supply fault (24 V) has been identified
4	DC link overvoltage The DC-link voltage is too high
5	Power electronics fault Failure in power electronics (overcurrent, overtemperature, IGBT failure,)
6	Overtemperature electronic component Temperature of electronics exceeded the highest permissible limit
7	Ground fault / inter-phase short-circuit detected Failure in the power cables or motor windings
8	Motor overload The motor has exceeded its limits
9	Communication error to PLC Interrupted or failed network communications
10	Safety monitoring channel detected an error A safe operation function has detected an error
11	Position actual value/speed value error Encoder signal error detected (track signals, zero marks, absolute values)
12	Internal (DRIVE-CLIQ) communication error Communications between SINAMICS components is faulty or has been interrupted
13	Fault infeed The infeed is faulty or has failed.
14	Braking controller / Braking Module error Braking Module fault or overloaded
15	Line filter fault The line filter exceeded temperature limits or has non-permissible state
16	External value/signal out of the range Digital/Analog inputs error (or temperature)
17	Application / technology fault Application or technology function has exceeded a limit (position, velocity, torque)
18	Error in the configuration/commissioning Error in the commissioning procedure, or the configuration of the device
19	General drive fault Group fault
20	Auxiliary unit fault Auxiliary unit has identified an illegal state.

Safety functions

A detailed description of the Safety commissioning can be found in the S210 operation instructions under www.siemens.com/sinamics-s210

For United States / Canadian installations (UL/cUL): The products are cULus listed under File

Solid State Motor Overload Protection: 300% of motor FLA.

R Fault originating from the gearbox | Adjust/repair gearbox

Suitable for use on a circuit capable of delivering not more than 65 kA rms (symmetrical), 240 V maximum. Branch circuit protection for individual drives shall be provided by Class J fuses stated in Technical Data. Branch circuit protection for group installation shall be provided by Class J fuses with 30 Amps maximum. For further protective devices and SCCRs for individual drives and group installation refer to:

https://support.industry.siemens.com/cs/document/109748999

This equipment is to be installed in an enclosure that provides a pollution degree 2 (controlled) environment. Maximum Surrounding Air Temperature 50°C. Equipment does not provide internal motor overtemperature protection. Overtemperature protection is

provided by evaluation of thermal sensor.

Use 75°C rated copper wires for all power conductors. Cables with a higher rated temperature value may also be used. A reduction of the conductor cross-section is not permitted.

Additional requirements for CSA compliance:

Overvoltage Category OVC III must be ensured for all primary circuit connections of the equipment. This may require Surge Protective Devices (SPD) to be installed on the line side of the equipment.

Security information

In order to protect technical infrastructures, systems machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art IT security concept. Siemens' products and solutions constitute one element of such a concept. For more information about cyber security, please visit:
