Precision shafts

SKF precision shafts (**fig. 8**) can be supplied either as solid or hollow shafts.
The solid shafts are available in all dimensions required to fit SKF linear ball bearings; the hollow shafts have a minimum outside diameter of 16 mm.

They are induction hardened and ground (**see table on next page**). SKF shafts have exceptionally high dimensional stability and long service life.

Yet at the end of shafts of normal production length, deviations of hardness and dimensional stability can occur.

For special applications, solid shafts of stainless steel or hard chromium plated shafts having a chromium layer approximately 10 µm thick can be supplied. When using stainless steel shafts, please note that the surface is not as hard as that of shafts made of high-grade steel. The case depth may also be greater than indicated in **table 5** and this may have an influence on the machinability of the shafts.

Because of the benefits they offer, SKF precision shafts are not only used in combination with SKF linear ball bearings for linear guides, but also for other purposes, for instance axles or column sleeves.

Tolerances

SKF precision steel shafts are available as standard with a diameter machined to tolerance h6 or h7. Other tolerances are available on request. Shafts cut to special lengths have a length tolerance to DIN 7168 "medium". The relevant values are given in **table 4**.

Shafts with radial holes

For linear guides requiring support, shafts with threaded radial holes are needed. These can be supplied by SKF. The radial holes can be positioned either in a way that they accommodate SKF shaft supports or as specified in the customer drawing.

Publication nr. 4182 EN

Composite shafts

Composite shafts can be supplied to customer drawings, either with screwed joints or with "plug and socket" joints, depending on the application.

Accurately centred trunnions and sockets guarantee smooth transitions at the butt joint. To ensure correct assembly, the relative positions of the shaft sections and of the shaft ends are marked. Composite shafts should be fastened to a support at the butt joints, particularly when these are of the "plug and socket" type. The radial holes should be positioned as closely to the joint as possible and the shaft length selected in a way that bending of the shaft will not result in a gap forming at the joint.

Materials

SKF precision steel shafts are available as shown in **tables 6** and **7**.

SKF precision shafts are made from the non-alloyed high-grade steels Cf53 (Material No.1.1213), Ck53 (Material No.1.1210), Ck60 (Material No.1.1221) and 100Cr6 (Material No.12067).

The surface hardness is between approximately 60 and 64 HRC. The solid shafts of stainless steel are made from the steel X90CrMoV18 (Material No.1.4112) or X46Cr13 (Material No.1.4034). In this case the surface hardness lies between approximately 52 and 56 HRC.

Shafts made from other materials can be supplied to special order.

Table 6

Designation	Type
LJM	Precision shaft, steel Ck53/Cf53, 60-64HRC, h6
LJMH	Hard chromium plated precision shaft, steel Ck53/Cf53, min. 60HRC, h7
LJMR	Precision shaft, corrosion resistant, X90CrMoV18, 52-56HRC, h6/h7
LJMS	Precision shaft, corrosion resistant, X46Cr13, 52-56HRC, h6/h7
LJT	Hollow shaft, high-grade steel, Ck60 or 100Cr6, 60-66HRC, h6/h7

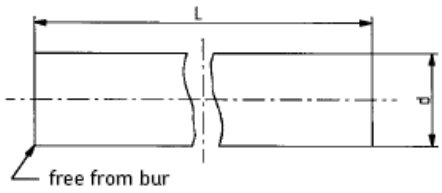
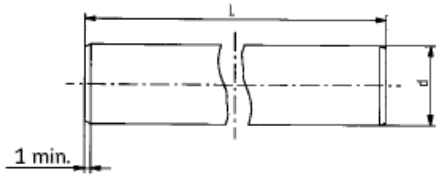
ESSC 1

Cut, without chamfer, only deburred
Length tolerance according to ISO 2768 medium class



ESSC 2

Cut, with chamfer
Length tolerance as ESSC 1



ESSC 3

Cut, 25° machined chamfer, end faces cut at right angles for limited length tolerance or chamfered according to customer specification
Length tolerance +/– 0,1 mm to a total length of 3 000 mm

ESSC 4

Cut, 25° machined chamfer, end faces cut at right angles, one front-side (axial) hole
Length tolerance as ESSC 3
(**table 8**)

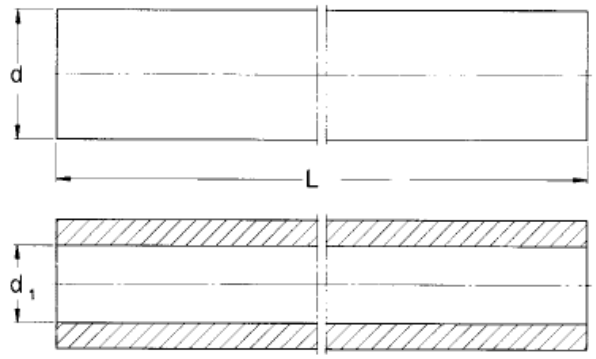
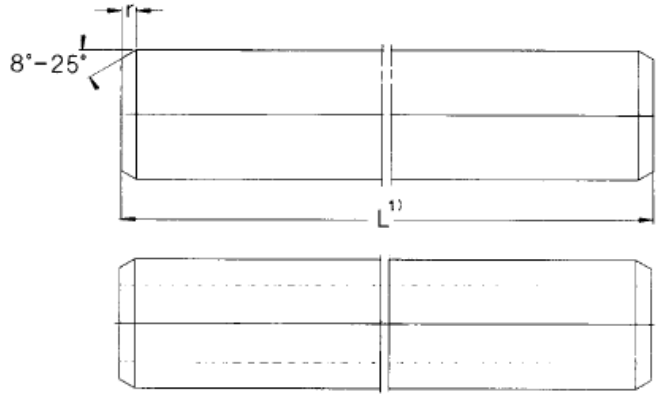
Standard designs for fixed length without chamfer



Standard designs for fixed length with chamfer



[1] Shafts cut to special length with chamfered ends. The length tolerance of these shafts corresponds to LJM 20×1 500 ESSC2 medium class.
The designation for a shaft with 20 mm diameter cut to a length of 1,5 m is, for example, LJM 20×1 500 ESSC2.
