1 IEC applications

1.1 General Notes

Protection for safety must be provided in accordance with

- IEC 60364 standard series
- Any additional local standards and regulations for electrical installations.

The tables below provide information for each converter type and article number on the following items:

- Suitable protective devices: The specification includes the type or article number of the overcurrent protective devices (OCPD). In many cases, two values of rated current are shown for the same converter. The higher one represents the maximum permissible nominal current of the OCPD that provides protection, the lower one is a typical nominal current that better fits to the converter. Current ratings between these two values are suitable as well.
- Maximum ICC (conditional short circuit current): This is the maximum RMS value of a prospective short circuit current, available from a supply source.
- Minimum enclosure volume: In the end application, the converter shall be installed in an outer enclosure or control cabinet which shall meet the minimum enclosure volume requirement.
- Minimum $I_{cp,mr}$ (prospective short-circuit current): RMS value of a minimum prospective short-circuit current, which shall be available from the source to ensure operation of the specific type of short-circuit protective device.

Notes on the selection of protective devices

- Protective devices of the same type as specified in the tables with a lower ampere rating may be used, if suitable for the application.
- Protective devices of the same type as specified in the tables with a lower interrupting rating may be used, if suitable for the application. In such case, this lower interrupting current rating of a protective device shall be specified as the ICC of a converter and protective device combination.
- The voltage rating of the protective device must be at least the voltage rating of the supply circuit.

The converter provides:

- Integral Motor Overload Protection which reduces the output current flow under overload conditions. Refer to manual for adjustments.
- Integral Output Short-Circuit Protection.

1.2 IEC standard fuses

1.2.1 IEC standard fuses 3AC 380...480V

¹⁾ # stands for type of release and can be replaced by: D (fixed thermal fixed magnetic trip unit), E (adjustable thermal fixed magnetic trip Unit) or F (adjustable thermal adjustable magnetic Trip unit)

²⁾ ## stands for type of release and can be replaced by: HL (line protection LI), HM (line protection LIG), HK (line protection ELISA LI), HN (Line and generator protection LSI), JP (Line and generator protection LSI, with display), JQ (Line and generator protection LSIG, with display), KP (Line and generator protection LSI, with display, with measurement function), KQ (Line and generator protection LSIG, with display, with measurement function)

2 **UL/CSA applications**

2.1 **General Notes**

Branch circuit protection must be provided in accordance with

- the National Electrical Code (NEC) for USA
- the Canadian Electrical Code (CEC) Part I for Canada
- any additional local codes and regulations.

The tables below provide information for each converter type and article number on the following items:

- Suitable protective devices: The specification includes the type or article number of the overcurrent protective devices (OCPD). In many cases, two values of rated current are shown for the same converter. The higher one represents the maximum permissible nominal current of the OCPD that provides Protection, the lower one is a typical nominal current that better fits to the converter. Current ratings between these two values are suitable as well.
- Maximum SCCR (Short-Circuit Current Rating): This is the maximum prospective symmetrical fault current at the specified voltage to which the converter system can be connected without sustaining damage exceeding defined acceptance criteria. The specified SCCR applies to the complete converter including built-in EMI filters and pluggable terminals (where applicable).
- Minimum enclosure volume: In the end application, the converter shall be installed in an outer enclosure or control cabinet which shall meet the minimum enclosure volume requirement.

Notes on the selection of protective devices (in accordance with NEC and CEC)

- Suitable Protective devices of the same type as specified in the tables with a lower ampere rating may be used, if suitable for the application.
- Protective devices of the same type as specified in the tables with a lower interrupting rating than the specified SCCR may be used, if suitable for the application. In such case, this lower interrupting current rating of a protective device shall be specified as the SCCR of a converter and protective device combination.
- The voltage rating of the protective device must be at least the voltage rating of the supply circuit. Protective devices with a straight voltage rating, such as 480V, are permitted on any supply circuits. The specified SCCR is valid for corner grounded delta and solidly grounded wye systems. Protective devices with a slash voltage rating, such as 480Y/277V, are permitted only on solidly grounded wye circuits where the nominal voltage of any conductor to ground does not exceed the lower of the two values.

The converter modules provide:

- Integral Motor Overload Protection which reduces the output current flow under overload conditions. Refer to manual for adjustments.
- Integral Output Short-Circuit Protection. Components on the load side of the converter module are not required to have a short-circuit current rating (UL 508A).

UL File-Number

1) ## stands for type of release and can be replaced by: HL (line protection LI), HM (line protection LIG), HN (Line and generator protection LSI), JP (Line and generator protection LSI, with display), JQ (Line and generator protection LSIG, with display), KP (Line and generator protection LSI, with display, with measurement function), KQ (Line and generator protection LSIG, with display, with measurement function)

2) # stands for type of release and can be replaced by: C (fixed thermal adjustable magnetic trip unit), D (fixed thermal fixed magnetic trip unit) or F (adjustable thermal adjustable magnetic trip unit)

3) Protective devices of the same type with lower current ratings in accordance with and as permitted by the existing applicable local electrical code (e.g. NEC or CEC) and regulations may be used, if suitable for the application.

4) For details and more article numbers, please refer to the catalog links in section 3.
