The diagram shows a Class D amplifier circuit. A square-wave voltage source (1) is connected in series with a resistor R_G to the gate of a MOSFET. The MOSFET's source is grounded. Its drain is connected to the gate of a second MOSFET (the D.U.T.). The D.U.T.'s source is grounded, and its drain is connected to a load inductor (2) in series with a load capacitor (3). The other end of the capacitor is connected to ground. A feedback path (4) branches off from the node between the inductor and capacitor, passes through a resistor, and returns to ground. The D.U.T. is represented by a circle containing a MOSFET symbol with the label 'D.U.T.'.

Circuit Layout Considerations

- Low Stray Inductance
- Ground Plane
- Low Leakage Inductance

Current Transformer

- dv/dt controlled by R_G
- Driver same type as D.U.T.
- I_{SD} controlled by Duty Factor "D"
- D.U.T. - Device Under Test
