ABUS Flood Detector

The ABUS flood detector is a technical detector, reacting to water and other liquids. If its sensors – to be installed directly at the detector or connected via a cable of up to 150 cm length – get into contact with water, the detector issues an alarm by the integrated sounder (85 dB(A) @ 1 m). The detector can be mounted to the floor in the kitchen, bath or cellar. Damages that are typically caused by bursting of pipes or broken water hoses of washing machines or dish washers can be prevented by discovering them immediately and intervening quickly. Furthermore, the smoke detector can be integrated into alarm systems.
