## Single joints

Ref. 101
Plain molded bores. Attach shafts by cross-pinning

Ref. 103
Headed brass inserts fitted 2 screws per end (size 6, one screw)

Typical

## Double joints

Ref. 109
Plain molded bores.
Attach shafts by cross-pinning

Ref. 111
Headed brass inserts fitted 2 screws per end (size 6, one screw)

## Constant velocity

The velocity ratio of single universal joints is not constant when the working angle is greater than zero. Their geometry gives rise to sinusoidal fluctuations at the output that increase with the working angle and which vary between:
$\omega \cos \beta$ and $\omega \sec \beta$
where $\omega$ = angular velocity

$$
\text { and } \beta=\text { operating angle }
$$

For example, when the operating angle is $5^{\circ}$, the maximum error is $\pm 0.4 \%$; at $7^{\circ}$ it is $\pm 0.8 \%$, and at $10^{\circ}$ it is $\pm 1.5 \%$. A motor shaft turning at a constant 1000 rpm , driving through a single universal joint set at an operating angle of $5^{\circ}$, produces an output that fluctuates between 996 rpm and 1004 rpm twice each revolution.

The fluctuations are cancelled out when using a double joint or two single joints connected back to back.

To maintain constant velocity ratio, ensure that:
a) The orientation of two single joints is correct; the inboard forks should align as in double joints.
b) The working angle of both joints, or both halves of a double joint, is the same.

Materials \& Finishes
Forked body members:
Acetal (black)
Cross pieces \& headed inserts:
Brass CZ121 (C38500 to
ASTM B455 or equivalent)
Chromate \& passivate finish
Fasteners:
Alloy steel, black oiled or Zinc plated, blue dye finish

Diameters for which a bore adaptor is shown can be adapted to smaller shaft sizes. See page 40 for details.

## ADJUSTED TORQUE

Peak torque values apply when the working angle is zero. Adjusted torque takes account of dynamic loading at the joint bearings. To find adjusted torque, determine application speed, torque and operating angle,
Then:
a) multiply speed $x$ working angle
b) subtract the result from 10000
c) divide the answer into 10000
d) apply the result to the application torque.

$$
\begin{array}{ll}
\text { eg. } \text { speed } & =400 \mathrm{rpm} \\
\text { application torque } & =0.9 \mathrm{lb} . \mathrm{in} \\
\text { working angle } & =20^{\circ}
\end{array}
$$

Accordingly:

| a) $400 \mathrm{rpm} \times 20^{\circ}$ | $=8000$ |
| :--- | :--- |
| b) $10000-8000$ | $=2000$ |
| c) $10000 / 2000$ | $=5$ |
| d) $5 \times 0.9 \mathrm{lb}$. in | $=4.5 \mathrm{lb}$. in |

Select a joint where Peak Torque exceeds 4.5 lb .in, ie., size 13 or larger.
Note: To remain within the capacity of the joint, the result of speed x working angle must be less than 10000 .

[^1]
[^0]:    8. Couplers can be specified with 'D' bores. See page 4 for details.
    9. Refs. 101 \& $109+0.0016 " /-0.0004^{\prime \prime}(+0.04 /-0.01 \mathrm{~mm})$

    Refs. 103 \& $111+0.0012^{\prime \prime} /-0^{\prime \prime}(+0.03 /-0 \mathrm{~mm})$
    $\ddagger$ Insert both bore refs. in place of $\ddagger$.
