Low-Voltage Octal Bus Transceiver with 5-V Tolerant Inputs and Outputs

The TC74LCX245F/FW/FT/FK is a high-performance CMOS octal bus transceiver. Designed for use in $3.3-\mathrm{V}$ systems, it achieves high-speed operation while maintaining the CMOS low power dissipation.

The device is designed for low-voltage (3.3 V) VCC applications, but it could be used to interface to $5-\mathrm{V}$ supply environment for both inputs and outputs.

The direction of data transmission is determined by the level of the DIR input. The enable input ( $\overline{\mathrm{OE}}$ ) can be used to disable the device so that the busses are effectively isolated.

All inputs are equipped with protection circuits against static discharge.

## Features (Note)

- Low-voltage operation: $\mathrm{VCC}=2.0$ to 3.6 V
- High-speed operation: $\mathrm{t}_{\mathrm{pd}}=7.0 \mathrm{~ns}(\max )(\mathrm{VCC}=3.0$ to 3.6 V$)$
- Ouput current: $|\mathrm{IOH}| / \mathrm{IOL}=24 \mathrm{~mA}(\mathrm{~min})(\mathrm{VCC}=3.0 \mathrm{~V})$
- Latch-up performance: $\pm 500 \mathrm{~mA}$
- Available in JEDEC SOP, JEITA SOP and TSSOP
- Bidirectional interface between 5.0 V and 3.3 V signals
- Power-down protection provided on all inputs and outputs
- Pin and function compatible with the 74 series (74AC/VHC/HC/F/ALS/LS etc.) 245 type

Note: Do not apply a signal to any bus pins when it is in the output mode. Damage may result.
All floating (high impedance) bus pins must have their input levels fixed by means of pull-up or pull-down resistors.

Note: $x x x F W$ (JEDEC SOP) is not available in Japan.
