

**Low-power, 2.5 MHz, RR IO, 36 V BiCMOS operational amplifier**

Datasheet - production data

MiniSO8

DFN8 3x3

**Applications**

- Active filtering
- Audio systems
- Automotive
- Power supplies
- Industrial
- Low/High side current sensing

**Description**

The TSB572 dual operational amplifier offers extended voltage operating range from 4 V to 36 V and rail-to-rail input/output.

The TSB572 offers a very good speed/power consumption ratio with 2.5 MHz gain bandwidth product while consuming only 380  $\mu$ A typically at 36 V supply voltage.

Stability and robustness of the TSB572 make it an ideal solution for a wide voltage range of applications.

**Features**

- Low-power consumption: 380  $\mu$ A typ
- Wide supply voltage: 4 V - 36 V
- Rail-to-rail input and output
- Gain bandwidth product: 2.5 MHz
- Low input bias current: 30 nA max
- No phase reversal
- High tolerance to ESD: 4 kV HBM
- Extended temperature range: -40 °C to 125 °C
- Automotive grade
- Small SMD packages
- 40 V BiCMOS technology
- Enhanced stability vs. capacitive load

# 1 Package pin connections

Figure 1: Pin connections for each package (top view)

- Exposed pad can be left floating or connected to ground

## 2 Absolute maximum ratings and operating conditions

Table 1: Absolute maximum ratings

Symbol	Parameter	Value	Unit	
V <sub>CC</sub>	Supply voltage <sup>(1)</sup>	40	V	
V <sub>id</sub>	Differential input voltage <sup>(2)</sup>	±1		
V <sub>in</sub>	Input voltage <sup>(3)</sup>	(V <sub>CC</sub> <sup>-</sup> ) - 0.2 to (V <sub>CC</sub> <sup>+</sup> ) + 0.2		
I <sub>in</sub>	Input current <sup>(4)</sup>	10	mA	
T <sub>stg</sub>	Storage temperature	-65 to 150	°C	
T <sub>j</sub>	Maximum junction temperature	150		
R <sub>thja</sub>	Thermal resistance junction to ambient <sup>(5/6)</sup>	MiniSO8	190	°C/W
		DFN8 3x3	40	
ESD	Human body model (HBM) <sup>(7)</sup>	4	kV	
	Machine model (MM) <sup>(8)</sup>	100	V	
	CDM: charged device model <sup>(9)</sup>	1.5	kV	
	Latch-up immunity	200	mA	

**Notes:**

- <sup>(1)</sup>All voltage values, except the differential voltage are with respect to network ground terminal.
- <sup>(2)</sup>Differential voltages are the non-inverting input terminal with respect to the inverting input terminal.
- <sup>(3)</sup>V<sub>CC</sub>-V<sub>in</sub> must not exceed 6 V, V<sub>in</sub> must not exceed 6 V.
- <sup>(4)</sup>Input current must be limited by a resistor in-series with the inputs.
- <sup>(5)</sup>R<sub>th</sub> are typical values.
- <sup>(6)</sup>Short-circuits can cause excessive heating and destructive dissipation.
- <sup>(7)</sup>According to JEDEC standard JESD22-A114F.
- <sup>(8)</sup>According to JEDEC standard JESD22-A115A.
- <sup>(9)</sup>According to ANSI/ESD STM5.3.1.

Table 2: Operating conditions

Symbol	Parameter	Value	Unit
V <sub>CC</sub>	Supply voltage	4 to 36	V
V <sub>icm</sub>	Common mode input voltage range	(V <sub>CC</sub> <sup>-</sup> ) - 0.1 to (V <sub>CC</sub> <sup>+</sup> ) + 0.1	
T <sub>oper</sub>	Operating free-air temperature range	-40 to 125	°C

### 3 Electrical characteristics

**Notes:**

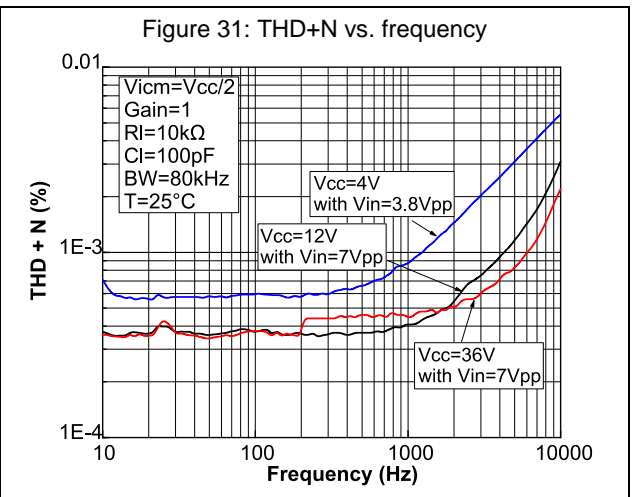

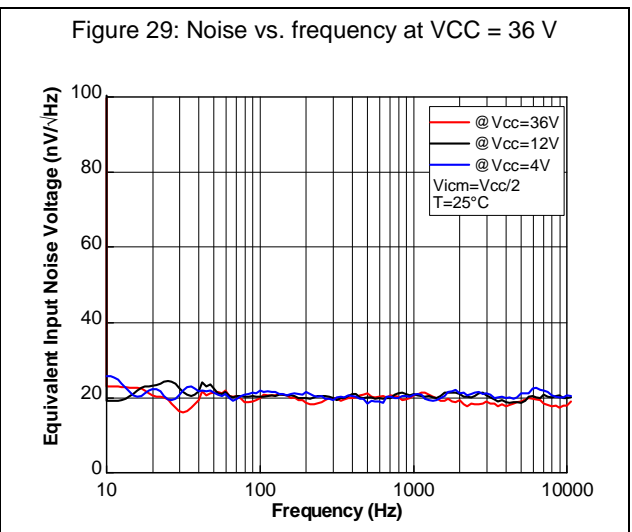

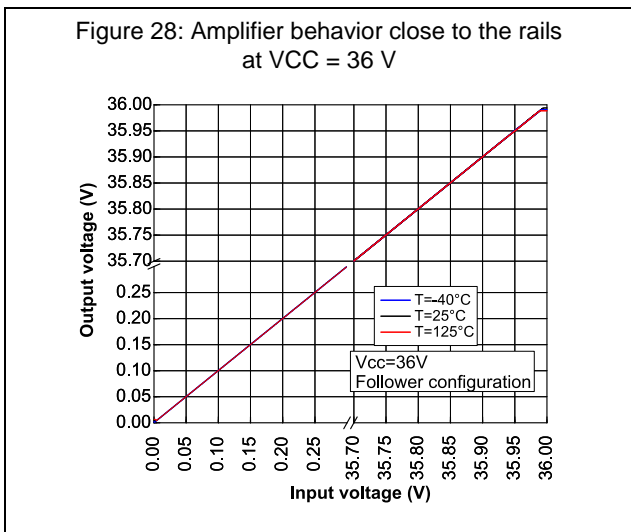

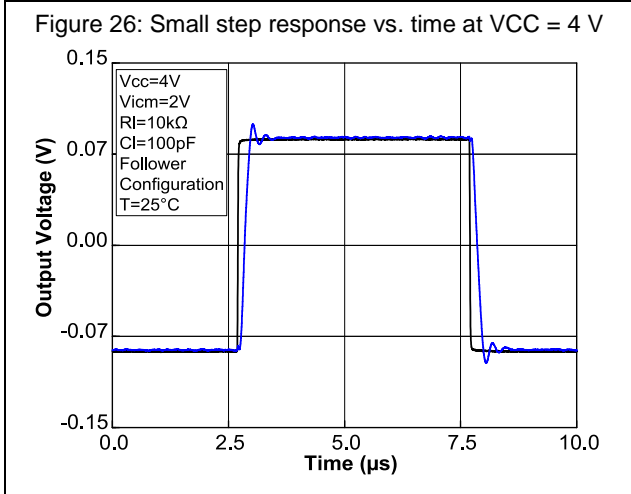

<sup>(1)</sup>Typical value is based on the  $V_{io}$  drift observed after 1000h at 125 °C extrapolated to 25 °C using Arrhenius law and assuming an activation energy of 0.7 eV. The operational amplifier is aged in follower mode configuration (see [Section 4.5](#)).

## 4 Application information

### 4.1 Operating voltages

The TSB572 can operate from 4 V to 36 V. The parameters are fully specified for 4 V, 12 V, and 36 V power supplies. However, the parameters are stable in the full  $V_{CC}$  range. Additionally, the main specifications are guaranteed in extended temperature ranges from -40 to 125 °C.

### 4.2 Input pin voltage ranges

The TSB572 has internal ESD diode protection on the inputs. These diodes are connected between the inputs and each supply rail to protect the input transistors from electrical discharge.

If the input pin voltage exceeds the power supply by 0.2 V, the ESD diodes become conductive and excessive current can flow through them. Without limitation this over current can damage the device.

In this case, it is important to limit the current to 10 mA, by adding resistance on the input pin, as shown in [Figure 35: "Input current limitation"](#).

**Figure 35: Input current limitation**

### 4.3 Rail-to-rail input

The TSB572 has rail-to-rail inputs. The input common mode range is extended from  $(V_{CC-}) - 0.1$  V to  $(V_{CC+}) + 0.1$  V at  $T = 25$  °C.

## 4.4 Input offset voltage drift over temperature

The maximum input voltage drift variation over temperature is defined as the offset variation related to the offset value measured at 25 °C. The operational amplifier is one of the main circuits of the signal conditioning chain, and the amplifier input offset is a major contributor to the chain accuracy. The signal chain accuracy at 25 °C can be compensated during production at application level. The maximum input voltage drift over temperature enables the system designer to anticipate the effect of temperature variations.

The maximum input voltage drift over temperature is computed using [Equation 1](#).

### Equation 1

$$\frac{\Delta V_{io}}{\Delta T} = \max \left| \frac{V_{io}(T) - V_{io}(25\text{ °C})}{T - 25\text{ °C}} \right|$$

where T = -40 °C and 125 °C.

The TSB572 datasheet maximum value is guaranteed by measurements on a representative sample size ensuring a C<sub>pk</sub> (process capability index) greater than 1.3.

## 4.5 Long term input offset voltage drift

To evaluate product reliability, two types of stress acceleration are used:

- Voltage acceleration, by changing the applied voltage
- Temperature acceleration, by changing the die temperature (below the maximum junction temperature allowed by the technology) with the ambient temperature.

The voltage acceleration has been defined based on JEDEC results, and is defined using [Equation 2](#).

### Equation 2

$$A_{FV} = e^{\beta \cdot (V_S - V_U)}$$

Where:

A<sub>FV</sub> is the voltage acceleration factor

β is the voltage acceleration constant in 1/V, constant technology parameter (β = 1)

V<sub>S</sub> is the stress voltage used for the accelerated test

V<sub>U</sub> is the voltage used for the application

The temperature acceleration is driven by the Arrhenius model, and is defined in [Equation 3](#).

### Equation 3

$$A_{FT} = e^{\frac{E_a}{k} \cdot \left( \frac{1}{T_U} - \frac{1}{T_S} \right)}$$

Where:

A<sub>FT</sub> is the temperature acceleration factor

E<sub>a</sub> is the activation energy of the technology based on the failure rate

$k$  is the Boltzmann constant ( $8.6173 \times 10^{-5} \text{ eV.K}^{-1}$ )

$T_U$  is the temperature of the die when  $V_U$  is used (K)

$T_S$  is the temperature of the die under temperature stress (K)

The final acceleration factor,  $A_F$ , is the multiplication of the voltage acceleration factor and the temperature acceleration factor ([Equation 4](#)).

#### Equation 4

$$A_F = A_{FT} \times A_{FV}$$

$A_F$  is calculated using the temperature and voltage defined in the mission profile of the product. The  $A_F$  value can then be used in [Equation 5](#) to calculate the number of months of use equivalent to 1000 hours of reliable stress duration.

#### Equation 5

$$\text{Months} = A_F \times 1000 \text{ h} \times 12 \text{ months} / (24 \text{ h} \times 365.25 \text{ days})$$

To evaluate the op amp reliability, a follower stress condition is used where  $V_{CC}$  is defined as a function of the maximum operating voltage and the absolute maximum rating (as recommended by JEDEC rules).

The  $V_{io}$  drift (in  $\mu\text{V}$ ) of the product after 1000 h of stress is tracked with parameters at different measurement conditions (see [Equation 6](#)).

#### Equation 6

$$V_{CC} = \max V_{op} \text{ with } V_{icm} = V_{CC} / 2$$

The long term drift parameter ( $\Delta V_{io}$ ), estimating the reliability performance of the product, is obtained using the ratio of the  $V_{io}$  (input offset voltage value) drift over the square root of the calculated number of months ([Equation 7](#)).

#### Equation 7

$$\Delta V_{io} = \frac{V_{io} \text{ drift}}{\sqrt{(\text{months})}}$$

Where  $V_{io}$  drift is the measured drift value in the specified test conditions after 1000 h stress duration.

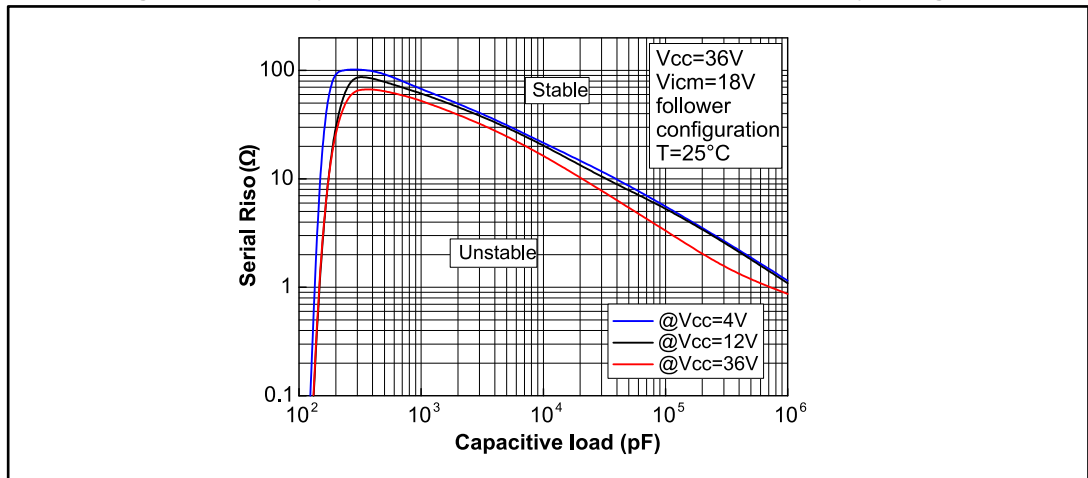

## 4.6 Capacitive load

Driving large capacitive loads can cause stability problems. Increasing the load capacitance produces gain peaking in the frequency response, with overshoot and ringing in the step response. It is usually considered that with a gain peaking higher than 2.3 dB an op amp might become unstable.

Generally, unity gain configuration is the worst situation for stability and the ability to drive large capacitive loads.

*Figure 36: "Stability criteria with a serial resistor at different supply voltages"* shows the serial resistor that must be added to the output, to make a system stable. *Figure 37: "Test configuration for Riso"* shows the test configuration using an isolation resistor, Riso.

**Figure 36: Stability criteria with a serial resistor at different supply voltages**

**Figure 37: Test configuration for Riso**

## 4.7 PCB layout recommendations

Particular attention must be paid to the layout of the PCB tracks connected to the amplifier, load, and power supply. The power and ground traces are critical as they must provide adequate energy and grounding for all circuits. The best practice is to use short and wide PCB traces to minimize voltage drops and parasitic inductance.

In addition, to minimizing parasitic impedance over the entire surface, a multi-via technique that connects the bottom and top layer ground planes together in many locations is often used.

The copper traces that connect the output pins to the load and supply pins should be as wide as possible to minimize trace resistance.

## 4.8 Optimized application recommendation

It is recommended to place a 22 nF capacitor as close as possible to the supply pin. A good decoupling will help to reduce electromagnetic interference impact.

## 5 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK<sup>®</sup> packages, depending on their level of environmental compliance. ECOPACK<sup>®</sup> specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK<sup>®</sup> is an ST trademark.

### 5.1 MiniSO8 package information

Figure 38: MiniSO8 package outline

Table 6: MiniSO8 mechanical data

Ref.	Dimensions					
	Millimeters			Inches		
	Min.	Typ.	Max.	Min.	Typ.	Max.
A			1.1			0.043
A1	0		0.15	0		0.006
A2	0.75	0.85	0.95	0.030	0.033	0.037
b	0.22		0.40	0.009		0.016
c	0.08		0.23	0.003		0.009
D	2.80	3.00	3.20	0.11	0.118	0.126
E	4.65	4.90	5.15	0.183	0.193	0.203

ccc			0.10			0.004

## 5.2 DFN8 3x3 package information

Figure 39: DFN8 3x3 package outline and mechanical data

## 6 Ordering information

Table 7: Order codes

Order code	Temperature range	Package	Packing	Marking
TSB572IQ2T	-40 °C to 125 °C	DFN8 3x3	Tape and reel	K31
TSB572IYQ2T <sup>(1)</sup>				K32
TSB572IST		MiniSO8		K31
TSB572IYST <sup>(1)</sup>				K32

**Notes:**

<sup>(1)</sup>Automotive qualification according to AEC-Q100.

## 7 Revision history

**Table 8: Document revision history**

Date	Version	Changes
12-Oct-2015	1	Initial release
17-Dec-2015	2	<i>Section 2: "Absolute maximum ratings and operating conditions"</i> : updated ESD, MM value. <i>Section 6: "Ordering information"</i> : removed footnote (1) from order code TSB572IQ2T.
