

## **Cold weather and Devcon products**

Some of the Devcon products are affected by low temperatures.

In light of recent conditions the issues associated with low temperatures have been more prevalent.

To guard against problems with products it is recommended that all Devcon products are stored at a minimum of 10°C and preferably 21-23°C whenever possible.

Where storage at the lower end of this scale is unavoidable then products must be gently brought back up to ~23°C prior to use. This can take a while depending on pack size and initial temperature. It is preferable to warm gradually over several hours and not expose any products to very high temperature to try and speed this process up.
