

To our customers,

---

## Old Company Name in Catalogs and Other Documents

---

On April 1<sup>st</sup>, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: <http://www.renesas.com>

Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (<http://www.renesas.com>)

Send any inquiries to <http://www.renesas.com/inquiry>.

## Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: “Standard”, “High Quality”, and “Specific”. The recommended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as “Specific” without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as “Specific” or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is “Standard” unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
  - “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
  - “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
  - “Specific”: Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

## MONOLITHIC QUAD H BRIDGE DRIVER CIRCUIT

### DESCRIPTION

The  $\mu$ PD16835 is a monolithic quad H bridge driver IC that employs a CMOS control circuit and a MOS FET output circuit. Because it uses MOS FETs in its output stage, this driver IC consumes less power than conventional driver ICs that use bipolar transistors.

Because the  $\mu$ PD16835 controls a motor by inputting serial data, its package has been shrunk and the number of pins reduced. As a result, the performance of the application set can be improved and the size of the set has been reduced.

The  $\mu$ PD16835 employs a current-controlled 64-step micro step driving method that drives stepper motor with low vibration.

The  $\mu$ PD16835 is housed in a 38-pin plastic shrink SOP to contribute to the miniaturization of the application set.

The  $\mu$ PD16835 can simultaneously drive two stepper motors and is ideal for the mechanisms of camcorders.

### FEATURES

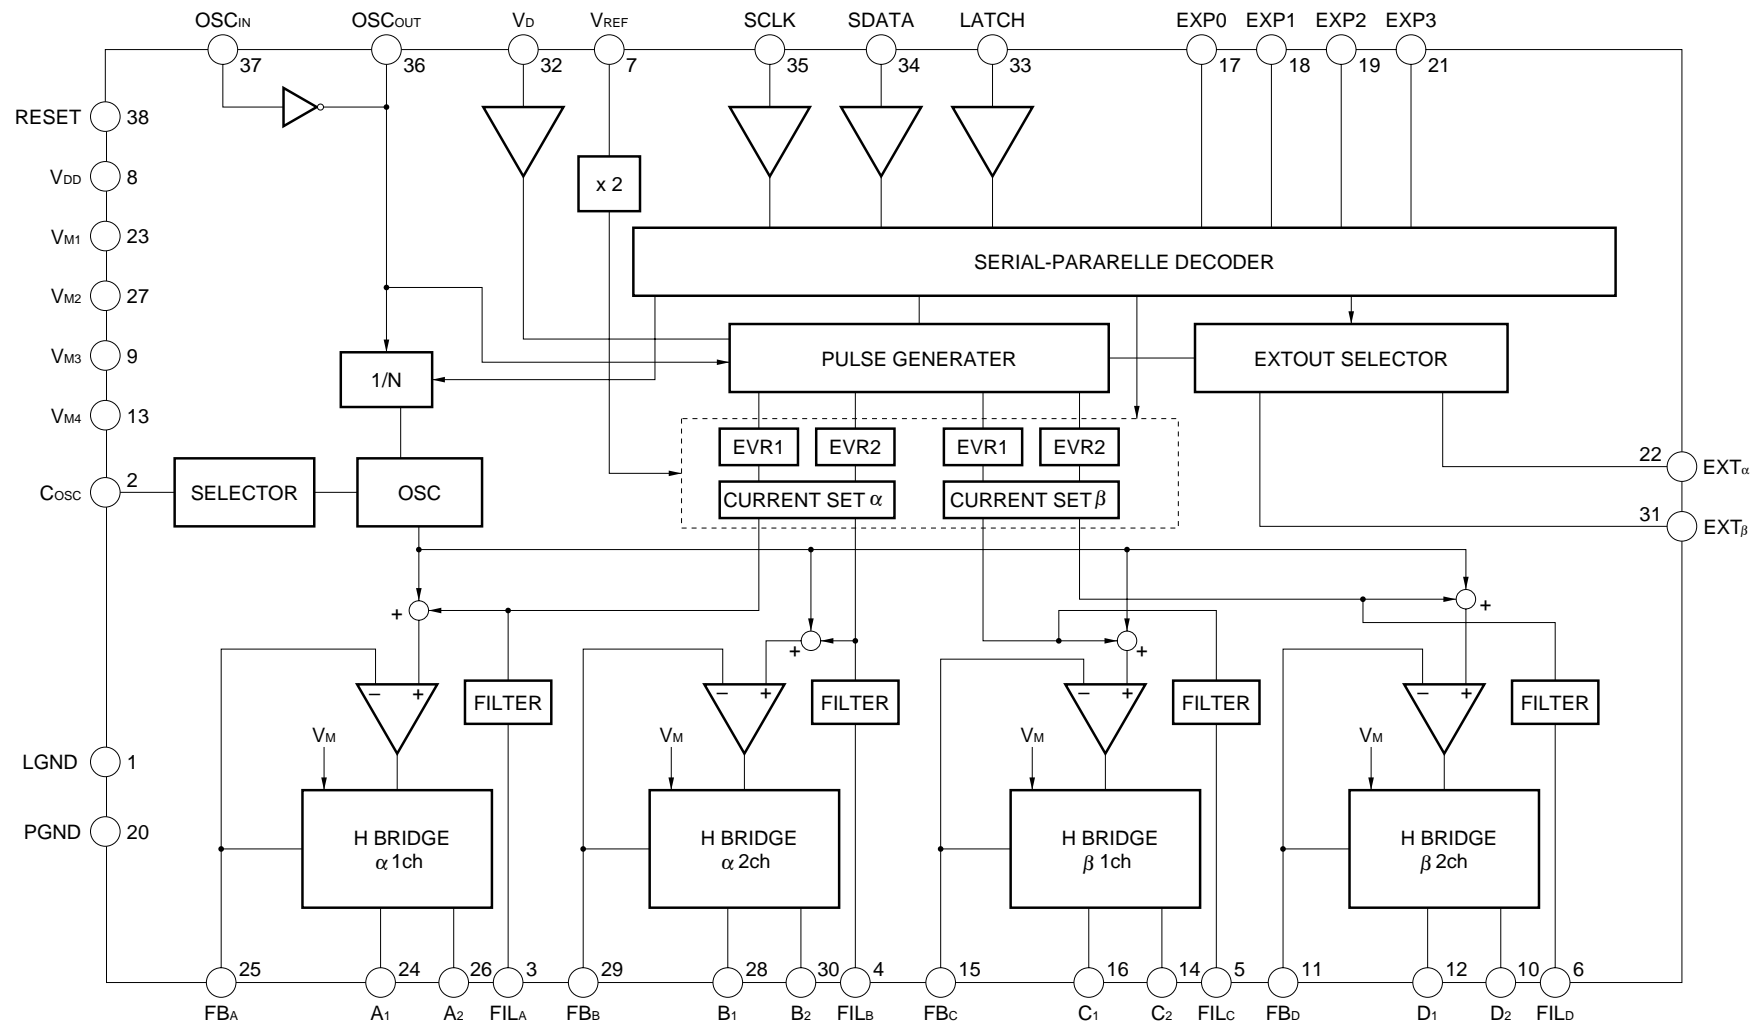

- Four H bridge circuits employing power MOS FETs
- Current-controlled 64-step micro step driving
- Motor control by serial data (8 bytes x 8 bits) (original oscillation: 4-MHz input)  
Data is input with the LSB first.  
EVR reference setting voltage: 100 to 250 mV (@ $V_{REF} = 250$  mV) ... 4-bit data input (10-mV step)  
Chopping frequency: 32 to 124 kHz ... 5-bit data input (4-kHz step)  
Original oscillation division or internal oscillation selectable  
Number of pulses in 1 V<sub>D</sub>: 0 to 252 pulses ... 6 bits + 2-bit data input (4 pulses/step)  
Step cycle: 0.25 to 8191.75  $\mu$ s ... 15-bit data input (0.25-  $\mu$ s step)
- 3-V power supply. Minimum operating voltage: 2.7 V (MIN.)
- Low current consumption I<sub>DD</sub>: 3.0 mA (MAX.), I<sub>DD (RESET)</sub>: 100  $\mu$ A (MAX.), I<sub>MO(RESET)</sub>: 1.0  $\mu$ A (MAX.)
- 38-pin plastic shrink SOP (7.62 mm (300))

### ★ ORDERING INFORMATION

Part number	Package
$\mu$ PD16835G3	38-pin plastic shrink SOP (7.62 mm (300))

The information in this document is subject to change without notice. Before using this document, please confirm that this is the latest version.  
Not all devices/types available in every country. Please check with local NEC representative for availability and additional information.

BLOCK DIAGRAM

PIN CONFIGURATION

38-pin plastic shrink SOP (7.62 mm (300))

1. PIN FUNCTIONS

Pin No.	Symbol	Function
1	LGND	Control circuit GND pin
2	C <sub>OSC</sub>	Chopping capacitor connection pin
3	FIL <sub>A</sub>	α 1-ch filter capacitor connection pin (1000 pF TYP.)
4	FIL <sub>B</sub>	α 2-ch filter capacitor connection pin (1000 pF TYP.)
5	FIL <sub>C</sub>	β 1-ch filter capacitor connection pin (1000 pF TYP.)
6	FIL <sub>D</sub>	β 2-ch filter capacitor connection pin (1000 pF TYP.)
7	V <sub>REF</sub>	Reference voltage input pin (250 mV TYP.)
8	V <sub>DD</sub>	Control circuit supply voltage input pin
9	V <sub>M3</sub>	Output circuit supply voltage input pin
10	D <sub>2</sub>	β 2-ch output pin
11	FB <sub>D</sub>	β 2-ch sense resistor connection pin
12	D <sub>1</sub>	β 2-ch output pin
13	V <sub>M4</sub>	Output circuit supply voltage connection pin
14	C <sub>2</sub>	β 1-ch output pin
15	FB <sub>C</sub>	β 1-ch sense resistor connection pin
16	C <sub>1</sub>	β 1-ch output pin
17	EXP0	Output monitor pin (open drain)
18	EXP1	Output monitor pin (open drain)
19	EXP2	Output monitor pin (open drain)
20	PGND	Power circuit GND pin
21	EXP3	Output monitor pin (open drain)
22	EXT <sub>α</sub>	Logic circuit monitor pin
23	V <sub>M1</sub>	Output circuit supply voltage input pin
24	A <sub>1</sub>	α 1-ch output pin
25	FB <sub>A</sub>	α 1-ch sense resistor connection pin
26	A <sub>2</sub>	α 1-ch output pin
27	V <sub>M2</sub>	Output circuit supply voltage input pin
28	B <sub>1</sub>	α 2-ch output pin
29	FB <sub>B</sub>	α 2-ch sense resistor connection pin
30	B <sub>2</sub>	α 2-ch output pin
31	EXT <sub>β</sub>	Logic circuit monitor pin
32	V <sub>D</sub>	Video sync signal input pin
33	LATCH	Latch signal input pin
34	SDATA	Serial data input pin
35	SCLK	Serial clock input pin
36	OSC <sub>IN</sub>	Original oscillation input pin (4 MHz TYP.)
37	OSC <sub>OUT</sub>	Original oscillation output pin
38	RESET	Reset signal output pin

2. I/O PIN EQUIVALENT CIRCUIT

Pin Name	Equivalent Circuit	Pin Name	Equivalent Circuit
<p>V<sub>DD</sub> LATCH SDATA SCLK</p>	 <p>Pull-down resistor (125 Ω)</p>	<p>OSC<sub>IN</sub> RESET</p>

3. EXAMPLE OF STANDARD CONNECTION

4. STANDARD CHARACTERISTICS CURVES

5. INTERFACE (I/F) CIRCUIT DATA CONFIGURATION (f<sub>CLK</sub> = 4-MHz EXTERNAL CLOCK INPUT)

Input data consists of serial data (8 bytes x 8 bits).

Input serial data with the LSB first, from the 1st byte to 8th byte.

(1) Initial data

<1st byte>

Bit	Data	Function	Setting
D7	1	HEADER DATA2	DATA selection
D6	1	HEADER DATA1	
D5	1	HEADER DATA0	
D4	0	-	-
D3	1 or 0	EXP3	Hi-Z or L
D2	1 or 0	EXP2	Hi-Z or L
D1	1 or 0	EXP1	Hi-Z or L
D0	1 or 0	EXP0	Hi-Z or L

**Remark** Hi-Z : High impedance,  
L : Low level (current sink)

(2) Standard data

<1st byte>

Bit	Data	Function	Setting
D7	0	HEADER DATA2	DATA selection
D6	0	HEADER DATA1	
D5	0	HEADER DATA0	
D4	0	-	-
D3	1 or 0	EXP3	Hi-Z or L
D2	1 or 0	EXP2	Hi-Z or L
D1	1 or 0	EXP1	Hi-Z or L
D0	1 or 0	EXP0	Hi-Z or L

**Remark** Hi-Z : High impedance,  
L : Low level (current sink)

<2nd byte>

Bit	Data	Function	Setting
D7	8-bit data input <sup>Note</sup>	First Point Wait	Start point wait 256 μs to 65.28 ms Setting (1 to 255) Δt = 256 μs
D6			
D5			
D4			
D3			
D2			
D1			
D0			

**Note** Input other than "0".

<2nd byte>

Bit	Data	Function	Setting
D7	1 or 0	α ROTATION	α ch CCW/CW
D6	1 or 0	α ENABLE	α ch ON/OFF
D5	6-bit data input	α Pulse Number	α ch Number of pulses in 1 V <sub>D</sub> Setting (0 to 63) Δn = 4 pulses <sup>Note</sup>
D4			
D3			
D2			
D1			
D0			

**Note** The number of pulses can be varied in 4-pulse steps.

<3rd byte>

Bit	Data	Function	Setting
D7	8-bit data input <sup>Note</sup>	First Point Magnetize Wait	Start point drive wait 256 μs to 65.28 ms Setting (1 to 255) Δt = 256 μs
D6			
D5			
D4			
D3			
D2			
D1			
D0			

**Note** Input other than "0".

<3rd byte>

Bit	Data	Function	Setting
D7	15-bit data	α Pulse Width	α ch pulse cycle 0.25 to 8191.75 μs Setting (1 to 32767) Δt = 0.25 μs
D6			
D5			
D4			
D3			
D2			
D1			
D0			

<4th byte>

Bit	Data	Function	Setting
D7	1 or 0	OSCSEL	Internal/external
D6	0	-	-
D5	0	-	-
D4	5-bit data input	Chopping Frequency	Chopping frequency : 32 to 124 kHz Setting (8 to 31) <sup>Note</sup> $\Delta f = 4$ kHz
D3			
D2			
D1			
D0			

**Note** The frequency is 0 kHz if 0 to 7 is input.

<4th byte>

Bit	Data	Function	Setting
D7	1 or 0	Current Set $\alpha$	set2/set1
D6	15-bit data	$\alpha$ Pulse Width	$\alpha$ ch pulse cycle : 0.25 to 8191.75 $\mu s$ Setting (1 to 32767) $\Delta t = 0.25 \mu s$
D5			
D4			
D3			
D2			
D1			
D0			

<5th byte>

Bit	Data	EXT $\alpha$	EXT $\beta$
D7	0	-	-
D6	<b>Note 5</b>	ENABLE $\alpha$ <sup>Note1</sup>	ENABLE $\beta$ <sup>Note1</sup>
D5	<b>Note 5</b>	ROTATION $\alpha$ <sup>Note2</sup>	ROTATION $\beta$ <sup>Note2</sup>
D4	<b>Note 5</b>	Pulse Out $\alpha$	Pulse Out $\beta$
D3	<b>Note 5</b>	FF7 $\alpha$	FF7 $\beta$
D2	<b>Note 5</b>	FF3 $\alpha$	FF3 $\beta$
D1	<b>Note 5</b>	Checksum <sup>Note3</sup>	FF2 $\beta$
D0	<b>Note 5</b>	Chopping <sup>Note4</sup>	FF1 $\beta$

- Notes**
1. H level : Conducts, L level : Stops
  2. H level : Reverse (CCW),  
L level : Forward (CW)
  3. H level : Normal data input,  
L level : Abnormal data input
  4. Not output in internal oscillation mode.
  5. Select one of D0 to D6 and input "1".  
If two or more of D0 to D6 are selected,  
they are positively ORed for output.

<5th byte>

Bit	Data	Function	Setting
D7	1 or 0	$\beta$ ROTATION	$\beta$ ch CCW/CW
D6	1 or 0	$\beta$ ENABLE	$\beta$ ch ON/OFF
D5	6-bit data input	$\beta$ Pulse Number	$\beta$ ch Number of pulses in 1 V <sub>D</sub> Setting (1 to 63) $\Delta n = 4$ pulses <sup>Note</sup>
D4			
D3			
D2			
D1			
D0			

**Note** The number of pulses can be varied in 4-pulse steps.

<6th byte>

Bit	Data	Function	Setting
D7	4-bit data input	$\alpha$ ch Current Set2	$\alpha$ ch Output current setting 2 EVR : 100 to 250 mV Setting (0 to 15) <sup>Note</sup>
D6			
D5			
D4			
D3	4-bit data input	$\alpha$ ch Current Set1	$\alpha$ ch Output current setting 1 EVR : 100 to 250 mV Setting (0 to 15) <sup>Note</sup>
D2			
D1			
D0			

**Note** A voltage of about double EVR is output to the FIL pin.

<6th byte>

Bit	Data	Function	Setting
D7	15-bit data	$\beta$ Pulse Width	$\beta$ ch pulse cycle: 0.25 to 8191.75 $\mu s$ Setting (1 to 32767) $\Delta t = 0.25 \mu s$
D6			
D5			
D4			
D3			
D2			
D1			
D0			

<7th byte>

Bit	Data	Function	Setting
D7	4-bit data input	β ch Current Set2	β ch Output current setting 2 EVR: 100 to 250 mV Setting (0 to 15) <sup>Note</sup>
D6			
D5			
D4			
D3	4-bit data input	β ch Current Set1	β ch Output current setting 1 EVR: 100 to 250 mV Setting (0 to 15) <sup>Note</sup>
D2			
D1			
D0			

**Note** A voltage of about double EVR is output to the FIL pin.

<7th byte>

Bit	Data	Function	Setting
D7	1 or 0	Current Set β	set2/set1
D6	15-bit data  High-order 7-bit data input	β Pulse Width	β ch pulse cycle: 0.25 to 8191.75 μs Setting (1 to 32767) Δt = 0.25 μs
D5			
D4			
D3			
D2			
D1			
D0			

<8th byte>

Bit	Data	Function	Setting
D7	1 or 0	Checksum	Checksum <sup>Note</sup>
D6	1 or 0		
D5	1 or 0		
D4	1 or 0		
D3	1 or 0		
D2	1 or 0		
D1	1 or 0		
D0	1 or 0		

**Note** Data is input so that the sum of the 1st through the 8th bytes is 00H.

<8th byte>

Bit	Data	Function	Setting
D7	1 or 0	Checksum	Checksum <sup>Note</sup>
D6	1 or 0		
D5	1 or 0		
D4	1 or 0		
D3	1 or 0		
D2	1 or 0		
D1	1 or 0		
D0	1 or 0		

**Note** Data is input so that the sum of the 1st through the 8th bytes is 00H.

**Data Configuration**

Data can be input in either of two ways. Initial data can be input when the power is first applied, or standard data can be input during normal operation. Input serial data with the LSB first, i.e., starting from the D0 bit (LSB) of the 1st byte. Therefore, the D7 bit of the 8th byte is the most significant bit (MSB).

When inputting initial data, set a start point wait time that specifies the delay from power application to pulse output, and the start point drive wait time. At the same time, also set a chopping frequency and a reference voltage (EVR) that determines the output current of each channel. Because the μPD16835 has an EXT pin for monitoring the internal operations, the parameter to be monitored can be selected by initial data.

When inputting standard data, input the rotation direction of each channel, the number of pulses, and the data for the pulse cycle.

Initial data or standard data is selected by using bits D5 to D7 of the 1st byte (see Table 5-1).

**Table 5-1. Data Selection Mode (1st byte)**

D7	D6	D5	Data type
1	1	1	Initial data
0	0	0	Standard data

**Remark** If the high-order three bits are high, the initial data is selected; if they are low, the standard data is selected. Data other than (0, 0, 0) and (1, 1, 1) must not be input.

Input the serial data during start point wait time.

**Details of Data Configuration**

How to input initial data and standard data is described below.

**(1) Initial data input**

<1st byte>

The 1st byte specifies the type of data (initial data or standard data) and determines the presence or absence of the EXP pin output. Bits D5 to D7 of this byte specify the type of data as shown in Table 5-1, while bits D0 to D3 select the EXP output (open drain).

**Table 5-2. 1st Byte Data Configuration**

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Data	1	1	1	0	0 or 1	0 or 1	0 or 1	0 or 1

The EXP pin goes low (current sink) when the input data is “0”, and high (high impedance state) when the input data is “1”. Pull this pin up to V<sub>DD</sub> for use. Input “0” to bit D4.

<2nd byte>

The 2nd byte specifies the delay between data being read and data being output. This delay is called the start up wait time, and the motor can be driven from that point at which the start up wait time is “0”. This time is counted at the rising edge of V<sub>D</sub>. The start up wait time can be set to 65.28 ms (when a 4-MHz clock is input), and can be fine-tuned by means of 8-bit division (256-μs step: with 4-MHz clock). The start up wait time is set to 65.28 ms when all the bits of the 2nd byte are set to “1”.

**Caution** Always input data other than “0” to this byte because the start up wait time is necessary for latching data. If “0” is input to this byte, data cannot be updated. Transfer standard data during the start up wait time.

<3rd byte>

The 3rd byte specifies the delay between the start point wait time being cleared and the output pulse being generated. This time is called the start up drive wait time, and the output pulse is generated from the point at which the start up drive wait time reaches “0”. The start up drive wait time is counted at the falling edge of the start up wait time. The start up drive wait time can be set to 65.28 ms (with 4-MHz clock) and can be fine-tuned by means of 8-bit division (256-μs step: with 4-MHz clock). The start up drive wait time is set to 65.28 ms when all the bits of the 3rd byte are “1”.

**Caution** Always input data other than “0” to this byte because the start up drive wait time is necessary for latching data. If “0” is input to this byte, data cannot be updated.

<4th byte>

The 4th byte selects a chopping frequency by using 5-bit data. It also selects whether the chopping frequency is created by dividing the original oscillation (external clock) or whether the internal oscillator is used. The chopping frequency is selected by bits D0 to D4. Bit D7 specifies the method used to create the chopping frequency. When this bit is “0”, the original oscillation (external clock input to OSC<sub>IN</sub>) is used; when it is “1”, the internal oscillator is used. Bits D5 and D6 are fixed to “0”.

The chopping signal is output after the initial data has been input and the first standard data has been latched (see **Timing Chart**).

**Table 5-3. 4th Byte Data Configuration (Initial data)**

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Data	0 or 1	0	0	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1

The chopping frequency is set to 0 kHz and to a value in the range of 32 to 124 kHz (in 4-kHz steps), as follows. Although the chopping frequency is set by 5 bits of data, it is internally configured using 7-bit data (with the low-order 2 bits fixed to 0).

Bit	D7	D6	D5	D4	D3	D2	D1	D0	fosc = 0 kHz
Data	0 or 1	0	0	0	0	0	0	0	

Bit	D7	D6	D5	D4	D3	D2	D1	D0	fosc = 0 kHz
Data	0 or 1	0	0	0	0	1	1	1	

Bit	D7	D6	D5	D4	D3	D2	D1	D0	fosc = 32 kHz
Data	0 or 1	0	0	0	1	0	0	0	

Bit	D7	D6	D5	D4	D3	D2	D1	D0	fosc = 36 kHz
Data	0 or 1	0	0	0	1	0	0	1	

Bit	D7	D6	D5	D4	D3	D2	D1	D0	fosc = 124 kHz
Data	0 or 1	0	0	1	1	1	1	1	

<5th byte>

The 5th byte selects a parameter to be output to the EXT pin (logic operation monitor pin). Input data to bits D0 to D6 of this byte. Bit D7 is fixed to “0”.

There are two EXT pins. EXT<sub>α</sub> indicates the operating status of α ch, and EXT<sub>β</sub> indicates that of β ch. The relationship between each bit and each EXT pin is as shown in Table 5-4.

**Table 5-4. 5th Byte Data Configuration (Initial data)**

Bit	Data	EXT <sub>α</sub>	EXT <sub>β</sub>
D7	0	Not used	Not used
D6	0 or 1	ENABLE <sub>α</sub>	ENABLE <sub>β</sub>
D5	0 or 1	ROTATION <sub>α</sub>	ROTATION <sub>β</sub>
D4	0 or 1	PULSEOUT <sub>α</sub>	PULSEOUT <sub>β</sub>
D3	0 or 1	FF7 <sub>α</sub>	FF7 <sub>β</sub>
D2	0 or 1	FF3 <sub>α</sub>	FF3 <sub>β</sub>
D1	0 or 1	CHECKSUM	FF2 <sub>β</sub>
D0	0 or 1	CHOPPING	FF1 <sub>β</sub>

The checksum bit is cleared to “0” in the event of an error. Normally, it is “1”.

If two or more signals that output signals to EXT<sub>α</sub> and EXT<sub>β</sub> are selected, they are positively ORed for output.

**Caution** The CHOPPING signal is not output in internal oscillation mode.

**Remark** The meanings of the symbols listed in Table 5-4 are as follows:

- ENABLE : Output setting (H : Conducts, L : Stops)
- ROTATION : Rotation direction (H : Reverse (CCW), L : Forward (CW))
- PULSEOUT : Output pulse signal
- FF7 : Presence/absence of pulse in LATCH cycle (Outputs H level if output pulse information exists in standard data.)
- FF3 : Pulse gate (output while pulse exists)
- FF2 : Outputs H level during start up wait time + start up drive wait time
- FF1 : Outputs H level during start up wait time
- CHECKSUM : Checksum output (H : when normal data is transmitted,  
L : when abnormal data is transmitted)
- CHOPPING : Chopping wave output (in original oscillation mode only)

<6th byte>

The 6th byte sets the peak output current value of  $\alpha$  ch. The output current is determined by the EVR reference voltage.

The 250-mV (TYP.) voltage input from an external source to the  $V_{REF}$  pin is internally doubled and input to a 4-bit D/A converter. By dividing this voltage by 4-bit data, an EVR reference voltage can be set inside the IC within the range of 200 to 500 mV, in units of 20 mV.

The μPD16835 can set two values of the EVR reference voltage in advance. This is done by using bits D0 to D3 or D4 to D7. Which of the two EVR reference voltage values is to be used is specified by the CURRENT SET bit in the standard data.

If all the bits of the 6th byte are “0”, the EVR reference voltage of 200 mV is selected; if they are “1”, the EVR reference voltage of 500 mV is selected.

**Table 5-5. 6th Byte Data Configuration (Initial data)**

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Data	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1

**Remark** Bits D4 to D7 : Reference voltage 2 (EVR  $\alpha_2$ )

Bits D0 to D3 : Reference voltage 1 (EVR  $\alpha_1$ )

<7th byte>

The 7th byte specifies the peak output current value of  $\beta$  ch. The output current is determined by the EVR reference voltage.

The 250-mV (TYP.) voltage input from an external source to the  $V_{REF}$  pin is internally doubled and input to a 4-bit D/A converter. By dividing this voltage by 4-bit data, an EVR reference voltage can be set inside the IC within a range of 200 to 500 mV, in units of 20 mV.

The μPD16835 can set two values of the EVR reference voltage in advance. This is done using bits D0 to D3 or D4 to D7. Which of the two EVR reference voltage values is to be used is specified by the CURRENT SET bit in the standard data.

If all the bits of the 7th byte are “0”, the EVR reference voltage of 200 mV is selected; if they are “1”, the EVR reference voltage of 500 mV is selected.

**Table 5-6. 7th Byte Data Configuration (Initial data)**

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Data	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1

**Remark** Bits D4 to D7 : Reference voltage 2 (EVR  $\beta_2$ )  
 Bits D0 to D3 : Reference voltage 1 (EVR  $\beta_1$ )

<8th byte>

The 8th byte is checksum data. Normally, the sum of the 8-byte data is 00H.

If the sum is not 00H because data transmission is abnormal, the stepping operation is inhibited and the checksum output pin (EXT pin) is kept “L”.

**(2) Standard data input**

<1st byte>

The 1st byte specifies the type of data and whether the EXP pin output is used, such as when the initial data is input.

**Table 5-7. 1st Byte Data Configuration**

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Data	1	1	1	0	0 or 1	0 or 1	0 or 1	0 or 1

The EXP pin goes low (current sink) when the input data is “0”, and high (high impedance state) when the input data is “1”. Input “0” to bit D4.

<2nd byte>

The 2nd byte specifies the rotation direction of the  $\alpha$  channel, enables output of the  $\alpha$  channel, and the number of pulses (252 pulses MAX.) during the  $1V_D$  period (in 1 cycle of FF2) of the  $\alpha$  channel.

Bit D7 is used to specify the rotation direction. The rotation is in the forward direction (CW mode) when this bit is “0”; it is in the reverse direction (CCW mode) when the bit is “1”.

Bit D6 is used to enable the output of the  $\alpha$  channel. The  $\alpha$  channel enters the high impedance state when this bit is “0”; it is in conduction mode when the bit is “1”.

The number of pulses is set by bits D0 to D5. It is set by 6 bits in terms of software. However, the actual circuit uses an 8-bit counter with the low-order two bits fixed to “0”. Therefore, the number of pulses that is actually generated during start up wait time + start up drive wait (FF2) cycle is the number of pulses input x 4. The number of pulses can be set to a value in the range of 0 to 252, in units of 4 pulses.

**Table 5-8. 2nd Byte Data Configuration (Standard data)**

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Data	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1

<3rd and 4th bytes>

The 3rd and 4th bytes select the pulse cycle of the  $\alpha$  channel and which of the two reference voltages, created in the initial mode, is to be used (CURRENT SET $\alpha$ ).

The pulse cycle is specified using 15 bits : bits D0 (least significant bit) to D7 of the 3rd byte, and bits D0 to D6 (most significant bit) of the 4th byte. The pulse cycle can be set to a value in the range of 0.25 to 8191.75  $\mu$ s in units of 0.25  $\mu$ s (with a 4-MHz clock).

CURRENT SET $\alpha$  is specified by bit D7 of the 4th byte. When this bit is “0”, reference voltage 1 (EVR $\alpha$ 1) is selected; when it is “1”, reference voltage 2 (EVR $\alpha$ 2) is selected. For further information, refer to the description of the 6th byte of the initial data.

**Table 5-9. 4th Byte Data Configuration (Standard data)**

**Table 5-10. 3rd Byte Data Configuration (Standard data)**

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Data	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1

D7	D6	D5	D4	D3	D2	D1	D0
0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1

CURRENT SET $\alpha$  Most significant bit

Least significant bit

**(Reference) 6th Byte Data Configuration for Initial Data**

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Data	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1

**Remark** Bits D4 to D7 : Reference voltage 2 (EVR  $\alpha$ 2)

Bits D0 to D3 : Reference voltage 1 (EVR  $\alpha$ 1)

<5th byte>

The 5th byte specifies the rotation direction of the  $\beta$  channel, enables output of the  $\beta$  channel, and the number of pulses (252 pulses MAX.) during the 1V<sub>D</sub> period (in one cycle of FF2) of the  $\beta$  channel.

Bit D7 is used to specify the rotation direction. The rotation is in the forward direction (CW mode) when this bit is “0”; it is in the reverse direction (CCW mode) when the bit is “1”.

Bit D6 is used to enable the output of the  $\beta$  channel. The  $\beta$  channel goes into a high impedance state when this bit is “0”; it is in the conduction mode when the bit is “1”.

The number of pulses is set by bits D0 to D5. It is set by six bits in terms of software. However, the actual circuit uses an 8-bit decoder with the low-order two bits fixed to “0”. Therefore, the number of pulses that is actually generated during start up wait time + start up drive wait (FF2) cycle is the number of pulses input x 4. The number of pulses can be set in a range of 0 to 252 and in units of 4 pulses.

**Table 5-11. 5th Byte Data Configuration (Standard data)**

<6th and 7th bytes>

The 6th and 7th bytes select the pulse cycle of the β channel and which of the two reference voltages, created in the initial mode, is to be used (CURRENT SETβ).

The pulse cycle is specified using 15 bits : bits D0 (least significant bit) to D7 of the 6th byte, and bits D0 to D6 (most significant bit) of the 7th byte. The pulse cycle can be set to a value in the range of 0.25 to 8191.75 μs in units of 0.25 μs (with a 4-MHz clock).

CURRENT SETβ is specified by bit D7 of the 7th byte. When this bit is “0”, reference voltage 1 (EVRβ1) is selected; when it is “1”, reference voltage 2 (EVRβ2) is selected. For further information, refer to the description of the 7th byte of the initial data.

**Table 5-12. 7th Byte Data Configuration (Standard data)**

**Table 5-13. 6th Byte Data Configuration (Standard data)**

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Data	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1

D7	D6	D5	D4	D3	D2	D1	D0
0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1

CURRENT SETβ Most significant bit

Least significant bit

**(Reference) 7th Byte Data Configuration for Initial Data**

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Data	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1	0 or 1

**Remark** Bits D4 to D7 : Reference voltage 2 (EVRβ2)  
 Bits D0 to D3 : Reference voltage 1 (EVRβ1)

<8th byte>

The 8th byte is checksum data. Normally, the sum of the 8-byte data is 00H.

If the sum is not 00H because data transmission is abnormal, the stepping operation is inhibited and the checksum output pin (EXT pin) is held at “L”.

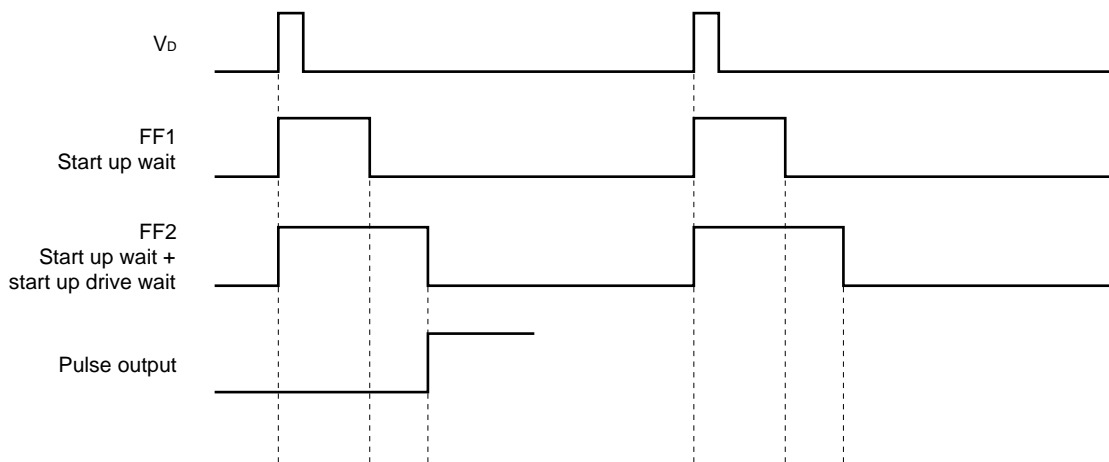

**(Data Update Timing)**

The standard data (pulse width, number of pulses, rotation direction, current setting, and ENABLE) of this product are set and updated at the following latch timing.

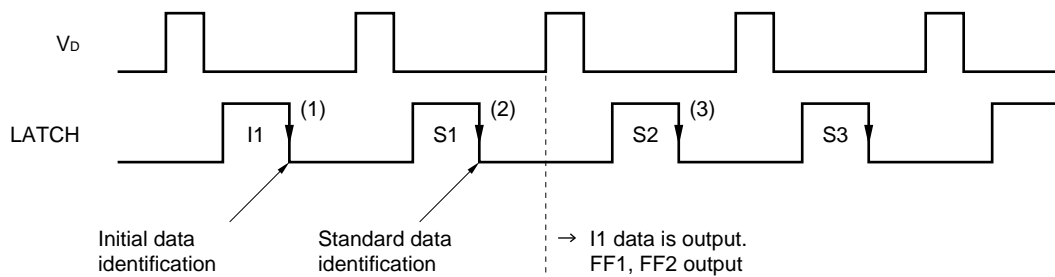

**Table 5-14. Data Update Timing**

ENABLE change	1 → 1	0 → 1	1 → 0	0 → 0
Pulse width	FF2↓	FF2↓	FF2↓	-
Number of pulses	FF2↓	FF2↓	FF2↓	-
Rotation direction	FF2↓	FF2↓	FF2↓	-
Current setting	FF2↓	FF1↓	FF2↓	-
ENABLE	FF2↓	FF1↓	FF2↓	-

The timing at which data is to be updated differs, as shown in Table 5-14, depending on the enabled status. For example, suppose the enable signal is currently “0” (output high impedance) and “1” (output conduction) is input by the next data. In this case, the pulse width, number of pulses, and rotation direction signals are updated at FF2 (upon the completion of start up wait), and the current setting and ENABLE signals are updated at FF1 (upon completion of start up drive wait).

Pulse width, number of pulses, and rotation direction are updated.  
 Current setting and ENABLE are updated (ENABLE change: 0 to 1).

	(1)	(2)	(3)
Pulse width	Internal data retained. Output reset	Not output	Updated to S2 data at FF2
Rotation direction	Internal output retained	Not output	
Number of pulses	Internal data retained. Output reset	Not output	
Current setting	Internal output retained	Not output	Updated to S2 data at either FF1 or FF2
ENABLE	Internal output retained	Not output	by enable data of (2)

The initial mode of this product is as follows.

The IC operation can be initialized as follows:

- (1) Turns ON V<sub>DD</sub>.
- (2) Make RESET input "L".
- (3) Input serial initial data.

In initial mode, the operating status of the IC is as shown in Table 5-15.

**Table 5-15. Operations in Initial Mode**

Item	Specifications
Current consumption	100 μA
OSC	Oscillation stops. Input of external clock is inhibited.
V <sub>D</sub>	Input inhibited.
FF1 to FF7	"L" level
PULSE OUT	"L" level
EXP0 to EXP3	Undefined in the case of (1) above. Previous value is retained in the case of (2) above. Can be updated by serial data in the case of (3) above.
Serial operation	Can be accessed after initialization in the case of (1) above. Can be accessed after RESET has gone "H" in the case of (2) above. Can be accessed in the case of (3) above.

Step pulse output is inhibited and FF7 is made "L" if the following conditions are satisfied.

- (1) If the set number of pulses (2nd/5th: standard data) is 00H.
- (2) If the checksum value is other than 00H.
- (3) If the start up wait time is set to 1 V<sub>D</sub> or longer.
- (4) If the start up wait time + start up drive wait time is set to 1 V<sub>D</sub> or longer.
- (5) If start up wait is completed earlier than LATCH (↓).
- (6) If V<sub>D</sub> is not input.

**Cautions on Correct Use**

- (1) With this product, input the data for start up wait and start up drive wait. Because the standard data are set or updated by these wait times, if the start up wait time and start up drive wait time are not input, the data are not updated.
- (2) The start up wait time must be longer than LATCH.
- (3) If the rising of the start up drive wait time is the same as the falling of the last output pulse, a count error occurs, and the IC may malfunction.
- (4) Input the initial data in a manner that it does not straddle the video sync signal ( $V_D$ ). If it does, the initial data is not latched.
- (5) Transmit the standard data during the start up wait time (FF1). If it is input at any other time, the data may not be transmitted correctly.
- (6) If the LGND potential is undefined, the data may not be input correctly. Keep the LGND potential to the minimum level. It is recommended that LGND and PGND be divided for connection (single ground) to prevent the leakage of noise from the output circuit.

6. ELECTRICAL SPECIFICATIONS

Absolute Maximum Ratings (T<sub>A</sub> = 25°C)

Parameter	Symbol	Condition	Rating	Unit
Supply voltage	V <sub>DD</sub>		-0.5 to +6.0	V
	V <sub>M</sub>		-0.5 to +11.2	V
Input voltage	V <sub>IN</sub>		-0.5 to V <sub>DD</sub> + 0.5	V
Reference voltage	V <sub>REF</sub>		500	mV
H bridge drive current <sup>Note 1</sup>	I <sub>M(DC)</sub>	DC	±150	mA/phase
Instantaneous H bridge drive current <sup>Note 1</sup>	I <sub>M(pulse)</sub>	PW ≤ 10 ms, Duty ≤ 5%	±300	mA/phase
Power consumption <sup>Note 2</sup>	P <sub>T</sub>		1.0	W
Peak junction temperature	T <sub>CH(MAX.)</sub>		150	°C
Storage temperature	T <sub>stg</sub>		-55 to +150	°C

- Notes**
1. Permissible current per phase with the IC mounted on a PCB.
  2. When the IC is mounted on a glass epoxy PCB (10 cm x 10 cm x 1 mm).

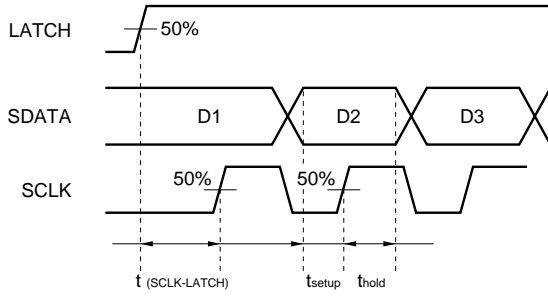

**Caution** If the absolute maximum rating of even one of the above parameters is exceeded even momentarily, the quality of the product may be degraded. Absolute maximum ratings, therefore, specify the values exceeding which the product may be physically damaged. Be sure to use the product within the range of the absolute maximum ratings.

Recommended Operating Range

Parameter	Symbol	MIN.	TYP.	MAX.	Unit
Supply voltage	V <sub>DD</sub>	2.7		5.5	V
	V <sub>M</sub>	4.8		11	V
Input voltage	V <sub>IN</sub>	0		V <sub>DD</sub>	V

**2.** By OSC<sub>IN</sub> and V<sub>D</sub> sync circuit

**3.** FB pin is monitored.

**4.** FIL pin is monitored. A voltage about twice that of the EVR value is output to the FIL pin.

**5.** 10 to 90% of the pulse peak value without filter capacitor (C<sub>FIL</sub>)

TIMING CHART (1)

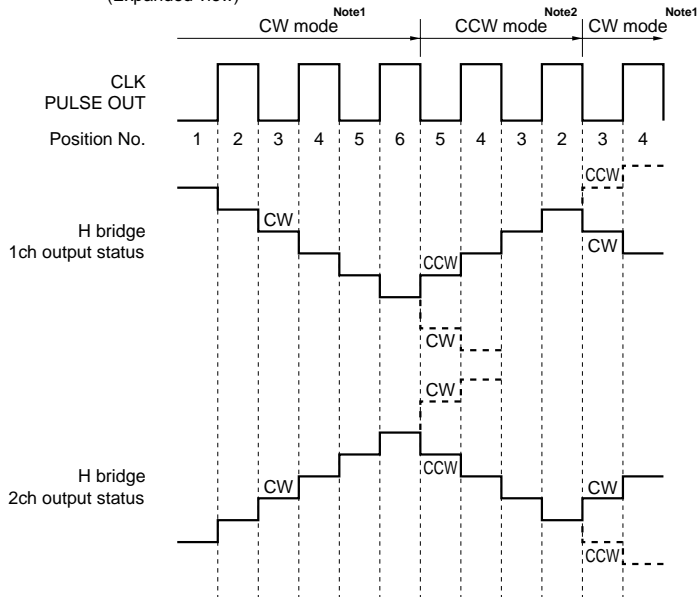

- Notes
1. ENABLE is set at the falling edge of FF1 when the level changes from low to high, and at the falling edge of FF2 when the level changes from high to low.
  2. FF7 is an output signal that is used to check for the presence or absence of a pulse in the standard data, is updated at the falling edge of LATCH and reset once at the rising edge of LATCH. If CHECK SUM is other than "00H", FF7 goes low, inhibiting pulse output, even if a pulse is generated.
  3. CHECK SUM output is updated at the falling edge of LATCH.

TIMING CHART (2)

(Expanded view)

**Notes1.** In CW mode : Position No. is incremented.  
**2.** In CCW mode : Position No. is decremented.

- Remarks 1.** The current value of the actual wave is approximated to the value shown on the next page.  
**2.** The C<sub>1</sub>, C<sub>2</sub>, D<sub>1</sub>, and D<sub>2</sub> pins of β channel correspond to the A<sub>1</sub>, A<sub>2</sub>, B<sub>1</sub>, and B<sub>2</sub> pins of α channel.  
**3.** The CW mode is set if the D<sub>7</sub> bit of the 2nd and 5th bytes of the standard data is "0".  
**4.** The CCW mode is set if the D<sub>7</sub> bit of the 2nd and 5th bytes of the standard data is "1".

**8. RECOMMENDED SOLDERING CONDITIONS**

When soldering this product, it is highly recommended to observe the conditions as shown below. If other soldering processes are used, or if the soldering is performed under different conditions, please make sure to consult with our sales offices.

For more details, refer to our document "**SEMICONDUCTOR DEVICE MOUNTING TECHNOLOGY MANUAL**"(C10535E).

**Type of Surface Mount Device**

**μPD16835G3 : 38-pin plastic shrink SOP (7.62 mm (300))**

Process	Soldering conditions	Symbol
Infrared Ray Reflow	Peak temperature: 235°C or below (Package surface temperature), Reflow time: 30 seconds or less (at 210°C or higher), Maximum number of reflow processes: 3 time or less, Number of days: None <sup>Note</sup> , Flux: Rosin-based flux with low chlorine content (chlorine 0.2 Wt% or below) is recommended.	IR35-00-3
Vapor Phase Soldering	Peak temperature: 215°C or below (Package surface temperature), Reflow time: 40 seconds or less (at 200°C or higher), Maximum number of reflow processes: 3 time or less, Number of days: None <sup>Note</sup> , Flux: Rosin-based flux with low chlorine content (chlorine 0.2 Wt% or below) is recommended.	VP15-00-3
Wave Soldering	Solder temperature: 260°C or below, Flow time: 10 seconds or less, Maximum number of flow processes: 1 time, Pre-heating temperature: 120°C or below (Package surface temperature), Flux: Rosin-based flux with low chlorine content (chlorine 0.2 Wt% or below) is recommended.	WS60-00-1
Partial Heating Method	Pin temperature: 300°C or below, Heat time: 3 seconds or less (Per each side of the device).	—

**Note** Number of days the device can be stored after the dry pack has been opened, at conditions of 25°C, 65%RH.

**Caution** Apply only one kind of soldering condition to a device, except for "partial heating method", or the device will be damaged by heat stress.

[MEMO]

**NOTES FOR CMOS DEVICES****① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS**

Note:

Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

**② HANDLING OF UNUSED INPUT PINS FOR CMOS**

Note:

No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to  $V_{DD}$  or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

**③ STATUS BEFORE INITIALIZATION OF MOS DEVICES**

Note:

Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

- **The information in this document is current as of October, 2000. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC's data sheets or data books, etc., for the most up-to-date specifications of NEC semiconductor products. Not all products and/or types are available in every country. Please check with an NEC sales representative for availability and additional information.**
  - No part of this document may be copied or reproduced in any form or by any means without prior written consent of NEC. NEC assumes no responsibility for any errors that may appear in this document.
  - NEC does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC semiconductor products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC or others.
  - Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of customer's equipment shall be done under the full responsibility of customer. NEC assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.
  - While NEC endeavours to enhance the quality, reliability and safety of NEC semiconductor products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risks of damage to property or injury (including death) to persons arising from defects in NEC semiconductor products, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment, and anti-failure features.
  - NEC semiconductor products are classified into the following three quality grades:
    - "Standard", "Special" and "Specific". The "Specific" quality grade applies only to semiconductor products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of a semiconductor product depend on its quality grade, as indicated below. Customers must check the quality grade of each semiconductor product before using it in a particular application.
    - "Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots
    - "Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)
    - "Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.
- The quality grade of NEC semiconductor products is "Standard" unless otherwise expressly specified in NEC's data sheets or data books, etc. If customers wish to use NEC semiconductor products in applications not intended by NEC, they must contact an NEC sales representative in advance to determine NEC's willingness to support a given application.
- (Note)
- (1) "NEC" as used in this statement means NEC Corporation and also includes its majority-owned subsidiaries.
  - (2) "NEC semiconductor products" means any semiconductor product developed or manufactured by or for NEC (as defined above).
