i-CON TRACE control station 230V

The Ersa IoT soldering station i-CON TRACE is primarily designed for use in a digitally networked environment – key settings are configured via input devices already integrated into the company network (PC, tablet, smartphone) or via an MES. This allows the user simultaneous access to all soldering stations on the network and makes operation extremely convenient.

Furthermore, this ensures detailed process control in hand soldering. Additional differentiating features include:

- Seamless traceability and documentation of the hand soldering process
- High process reliability through pre-setting of all parameters and process data documentation
- Increased productivity and soldering quality through tip-to-tip replacement
- Maximum precision and excellent reliability
- Significant cost savings through separately replaceable soldering tips
