

## INSTALLATION INSTRUCTION FOR AML75 PANEL SEALS

AML75A - For square .19" high buttons  
AML75B - For rectangular .19" high buttons

When properly installed, panel seals help protect AML pushbutton switches and indicators from contamination by moisture, dust and dirt. No tools are required for installation.

Slip seal base over housing, with the grooved side up. Stop when you feel tension from the mounting clip springs.

After inserting in panel hole, push on the bezel to firmly seat the base against the panel. Then add button.

Install seal by first pressing the corners into the groove. Then press the sides into the groove to complete seating of the seal.

Note: These panel seals are used with pushbutton switches and indicators mounted in individual panel holes. They are not intended for multiple units mounted in a single slot or units mounted in AML61 mounting bracket assemblies.

While we provide application assistance on MICRO SWITCH products, personally and thru our literature, it is up to the customer to determine the suitability of the product in his application.
