

# Vacuum Ejector

## Box Style (Built-in Silencer)/Body Ported Style

# Series ZH

Nozzle diameter —  $\varnothing 0.5, \varnothing 0.7, \varnothing 1.0, \varnothing 1.3, \varnothing 1.5, \varnothing 1.8, \varnothing 2.0$   
 Style — **S: Standard**  
**L: Large Flow Capacity**

## Compact and Lightweight

The nozzle and the body, which have been made into a composite resin construction, are compact and lightweight.  
 Nozzle diameter  $\varnothing 0.5 \sim 28g$

## Box style (built-in silencer) and body ported style

Two styles are available in the series: the box style with a silencer exhaust and the body ported style with an individual exhaust.

(Silencer exhaust)

(Centralized exhaust)

## One-touch and screw-in connections can be combined.

To suit the operating conditions, port connections can be combined with a choice of One-touch and screw-in connections.

## Body can be mounted and secured.

The body ported style is also provided with mounting holes for securing the body.

## ⚠ Precautions

Be sure to read before handling. Refer to p.0-20 and 0-21 for Safety Instructions and common precautions on the products mentioned in this catalogue, and refer to p.3.0-2 for precautions on every series.

### ⚠ Caution

#### Installation

Make sure that an excessive amount of load or moment is not applied to the ejector body due to pipe connections or installation.

#### Exhaust piping

On the ZH□□B□ models, keep exhaust ports open on at least one side. Make sure that the back pressure of the exhaust pipe on the ZH□□D□ models is 0.005MPa max. (Reference: Using a tube with the applicable diameter, its length must be 0.5m max.) (Port indication: P: supply port; V: vacuum port; E: exhaust port.)

#### Matching of the ejector to the vacuum circuit:

For precautions associated with the matching of the ejector to the vacuum circuit, refer to the technical data in "Best Pneumatics 3"

## How to Read Graphs

Flow characteristics are expressed in ejector vacuum pressure and suction flow. If suction flow rate changes a change in vacuum pressure will also be expressed. Normally this relationship is expressed in ejector standard use. In graph, Pmax is max. vacuum pressure and Qmax is max. suction flow. The values are specified according to catalogue use. Changes in vacuum pressure are expressed in the below order.

① When ejector suction port is covered and made airtight, suction flow becomes 0 and vacuum pressure is at maximum value (Pmax).

② When suction port is opened gradually, air can flow through, (air leakage), suction flow increases, but vacuum pressure decreases. (condition P1 and Q1)

③ When suction port is opened further, suction flow moves to maximum value (Qmax), but vacuum pressure is near 0. (atmospheric pressure).

When vacuum port (vacuum piping) has no leakage, vacuum pressure becomes maximum, and vacuum pressure decreases as leakage increases when leakage value is the same as max. suction flow, vacuum pressure is near 0. In the case when ventirative or leaky work should be absorbed, please note that vacuum pressure will not be high.

## Application Circuit Example

### Basic Style

### ⚠ Caution

#### Handling of application circuits

- ① **Countermeasures for power outages**  
Select a supply valve for the ejector that is normally open or one that is equipped with a self-holding function.
- ② **Using a small-diameter picking nozzle**  
For picking electronic parts or small precision parts, if the picking nozzle is approximately  $\phi 1$ mm in diameter, the vacuum remains high by being restricted by the nozzle. As a result, it will not be possible to verify it with the vacuum switch. In such a case, it is necessary to use an ejector that is suited to the nozzle and to select a vacuum switch with a favourable hysteresis and precision.

- ③ **Considerable leakage from the suction surface**

If the workpiece is made of porous material or if there is air leakage from the area between the pad and the workpiece, use a nozzle with a large diameter and a large suction flow volume. If the amount of leakage is known based on the effective sectional area of the side with the leakage, the vacuum pressure can be estimated in accordance with the ejector's flow volume characteristics.

- ④ **Suction filter**

To protect the ejectors and valves from dust, the use of a suction filter (ZFA, ZFB series) is recommended.

- ⑤ **Use of a vacuum switch**

It is recommended that verification be made with a vacuum switch as much as possible.

- ⑥ **Vacuum release valve**

To serve as a vacuum release valve, use a 2 port or 3 port valve. As for the performance of the valve, select a valve for a low vacuum. In addition, add a needle valve that can regulate the flow volume of the vacuum releasing air. Use the atmospheric pressure or a positive pressure for the vacuum releasing pressure.

(a) Full system

(b) 3 port valve selection

(c) Switching on the vacuum side

(d) Centralized exhaust style

Diagrams a to d show the combination with peripherals.
