Bits 11:9 – PAR[2:0] Parity Type

Value	Name	Description
0	EVEN	Even parity
1	ODD	Odd parity
2	SPACE	Parity forced to 0 (Space)
3	MARK	Parity forced to 1 (Mark)
4	NO	No parity
6	MULTIDROP	Multidrop mode

Bit 8 – SYNC Synchronous Mode Select

Value	Description
0	USART operates in Asynchronous mode (UART).
1	USART operates in Synchronous mode.

Bits 7:6 – CHRL[1:0] Character Length

Value	Name	Description
0	5_BIT	Character length is 5 bits
1	6_BIT	Character length is 6 bits
2	7_BIT	Character length is 7 bits
3	8_BIT	Character length is 8 bits

Bits 5:4 – USCLKS[1:0] Clock Selection

Value	Name	Description
0	MCK	Peripheral clock is selected
–	–	Reserved
2	GCLK	PMC generic clock is selected. If the SCK pin is driven (CLKO = 1), the CD field must be greater than 1.
3	SCK	External pin SCK is selected

Bits 3:0 – USART_MODE[3:0] USART Mode of Operation
Values not listed in the table below should be considered ‘reserved’.

Value	Name	Description
0x0	NORMAL	Normal mode
0x1	RS485	RS485
0x2	HW_HANDSHAKING	Hardware handshaking
0x4	ISO7816_T_0	ISO7816 Protocol: T = 0
0x6	ISO7816_T_1	ISO7816 Protocol: T = 1
0x8	IRDA	IrDA
0xA	LIN_MASTER	LIN Host mode

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
0xB	LIN_SLAVE	LIN Client mode
0xC	DATA16BIT_MASTER	16-bit data host
0xD	DATA16BIT_SLAVE	16-bit data client

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.6. USART Interrupt Enable Register (Default Mode)

Name: FLEX_US_IER (DEFAULT_MODE)
Offset: 0x208
Reset: –
Property: Write-only

For LIN-specific configurations, see USART Interrupt Enable Register (LIN_MODE).

This register can only be written if the WPITEN bit is cleared in the USART Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
								MANE
Access								W
Reset								–

Bit	23	22	21	20	19	18	17	16
		CMP	SECE		CTSIC			
Access		W	W		W			
Reset		–	–		–			

Bit	15	14	13	12	11	10	9	8
			NACK			ITER	TXEMPTY	TIMEOUT
Access			W			W	W	W
Reset			–			–	–	–

Bit	7	6	5	4	3	2	1	0
	PARE	FRAME	OVRE			RXBRK	TXRDY	RXRDY
Access	W	W	W			W	W	W
Reset	–	–	–			–	–	–

Bit 24 – MANE Manchester Error Interrupt Enable

Bit 22 – CMP Comparison Interrupt Enable

Bit 21 – SECE Security/Safety Error Interrupt Enable

Bit 19 – CTSIC Clear to Send Input Change Interrupt Enable

Bit 13 – NACK Non Acknowledge Interrupt Enable

Bit 10 – ITER Max number of Repetitions Reached Interrupt Enable

Bit 9 – TXEMPTY TXEMPTY Interrupt Enable

Bit 8 – TIMEOUT Timeout Interrupt Enable

Bit 7 – PARE Parity Error Interrupt Enable

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 6 – FRAME Framing Error Interrupt Enable

Bit 5 – OVRE Overrun Error Interrupt Enable

Bit 2 – RXBRK Receiver Break Interrupt Enable

Bit 1 – TXRDY TXRDY Interrupt Enable

Bit 0 – RXRDY RXRDY Interrupt Enable

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.7. USART Interrupt Enable Register (LIN_MODE)

Name: FLEX_US_IER (LIN_MODE)
Offset: 0x208
Reset: –
Property: Write-only

This configuration is relevant only if USART_MODE = 0xA or 0xB in the USART Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
	LINHTE	LINSTE	LINSNRE	LINCE	LINIPE	LINISFE	LINBE	
Access	W	W	W	W	W	W	W	
Reset	–	–	–	–	–	–	–

74.10.8. USART Interrupt Disable Register (Default Mode)

Name: FLEX_US_IDR (DEFAULT_MODE)
Offset: 0x20C
Reset: –
Property: Write-only

For LIN-specific configurations, see USART Interrupt Disable Register (LIN_MODE).

This register can only be written if the WPITEN bit is cleared in the USART Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
								MANE
Access								W
Reset								–

Bit	23	22	21	20	19	18	17	16

74.10.12.USART Channel Status Register (Default Mode)

Name: FLEX_US_CSR (DEFAULT_MODE)
Offset: 0x214
Reset: 0x00000000
Property: Read-only

For LIN-specific configurations, see USART Channel Status Register (LIN_MODE).

Bit	31	30	29	28	27	26	25	24
								MANE
Access								R
Reset								–

Bit	23	22	21	20	19	18	17	16
	CTS	CMP	SECE		CTSIC			
Access	R	R	R		R			
Reset	–	–	–		–			

Bit	15	14	13	12	11	10	9	8
			NACK			ITER	TXEMPTY	TIMEOUT
Access			R			R	R	R
Reset			–			–	–	–

Bit	7	6	5	4	3	2	1	0
	PARE	FRAME	OVRE			RXBRK	TXRDY	RXRDY
Access	R	R	R			R	R	R
Reset	–	–	–			–	–	–

Bit 24 – MANE Manchester Error

Value	Description
0	No Manchester error has been detected since the last RSTSTA command was issued.
1	At least one Manchester error has been detected since the last RSTSTA command was issued.

Bit 23 – CTS Image of CTS Input

Value	Description
0	CTS input is driven low.
1	CTS input is driven high.

Bit 22 – CMP Comparison Status

Value	Description
0	No received character matched the comparison criteria programmed in VAL1, VAL2 fields and CMPPAR bit in since the last RSTSTA command was issued.
1	A received character matched the comparison criteria since the last RSTSTA command was issued.

Bit 21 – SECE Security/Safety Error (cleared on read)

Value	Description
0	No error detected on TXD and/or SCK pad output and no access violation of a write-protected register since the last read of FLEX_US_CSR.
1	An error has been detected on TXD and/or SCK pad output (FLEX_US_WPSR.PADERR=1) and/or a violation of a write-protected register (FLEX_US_WPSR.WPVS=1) since the last read of FLEX_US_CSR.

Bit 19 – CTSIC Clear to Send Input Change Flag

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No input change has been detected on the CTS pin since the last read of FLEX_US_CSR.
1	At least one input change has been detected on the CTS pin since the last read of FLEX_US_CSR.

Bit 13 – NACK Non Acknowledge Interrupt

Value	Description
0	Non acknowledge has not been detected since the last RSTNACK.
1	At least one non acknowledge has been detected since the last RSTNACK.

Bit 10 – ITER Max Number of Repetitions Reached

Value	Description
0	Maximum number of repetitions has not been reached since the last RSTIT command was issued.
1	Maximum number of repetitions has been reached since the last RSTIT command was issued.

Bit 9 – TXEMPTY Transmitter Empty (cleared by writing FLEX_US_THR)

Value	Description
0	There are characters in either FLEX_US_THR or the Transmit Shift Register, or the transmitter is disabled.
1	There are no characters in FLEX_US_THR, nor in the Transmit Shift Register.

Bit 8 – TIMEOUT Receiver Timeout

Value	Description
0	There has not been a timeout since the last Start Timeout command (FLEX_US_CR.STTTO) or the Timeout Register is 0.
1	There has been a timeout since the last Start Timeout command (FLEX_US_CR.STTTO).

Bit 7 – PARE Parity Error

Value	Description
0	No parity error has been detected since the last RSTSTA command was issued.
1	At least one parity error has been detected since the last RSTSTA command was issued.

Bit 6 – FRAME Framing Error

Value	Description
0	No stop bit has been detected low since the last RSTSTA command was issued.
1	At least one stop bit has been detected low since the last RSTSTA command was issued.

Bit 5 – OVRE Overrun Error

Value	Description
0	No overrun error has occurred since the last RSTSTA command was issued.
1	At least one overrun error has occurred since the last RSTSTA command was issued.

Bit 2 – RXBRK Break Received/End of Break

Value	Description
0	No break received or end of break detected since the last RSTSTA command was issued.
1	Break received or end of break detected since the last RSTSTA command was issued.

Bit 1 – TXRDY Transmitter Ready (cleared by writing FLEX_US_THR)

When FIFOs are disabled:
0: A character in FLEX_US_THR is waiting to be transferred to the Transmit Shift Register, or an STTBRK command has been requested, or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1.

© 2025 Microchip Technology Inc. and its subsidiaries

1: There is no character in FLEX_US_THR.
When FIFOs are enabled:
0: Transmit FIFO is full and cannot accept more data.
1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.
TXRDY behavior with FIFO enabled is illustrated in TXEMPTY, TXRDY and RXRDY Behavior.

Bit 0 – RXRDY Receiver Ready (cleared by reading FLEX_US_RHR)
When FIFOs are disabled:
0: No complete character has been received since the last read of FLEX_US_RHR or the receiver is disabled. If characters were received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled.
1: At least one complete character has been received and FLEX_US_RHR has not yet been read.
When FIFOs are enabled:
0: Receive FIFO is empty; no data to read
1: At least one unread data is in the Receive FIFO
RXRDY behavior with FIFO enabled is illustrated in TXEMPTY, TXRDY and RXRDY Behavior.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.13.USART Channel Status Register (LIN_MODE)

Name: FLEX_US_CSR (LIN_MODE)
Offset: 0x214
Reset: –
Property: Read-only

This configuration is relevant only if USART_MODE = 0xA or 0xB in the USART Mode Register.

Bit	31	30	29	28	27	26	25	24
	LINHTE	LINSTE	LINSNRE	LINCE	LINIPE	LINISFE	LINBE	
Access	R	R	R	R	R	R	R

Reset	–	–	–				–	–

Bit	7	6	5	4	3	2	1	0
	PARE	FRAME	OVRE				TXRDY	RXRDY
Access	R	R	R				R	R
Reset	–	–	–				–	–

Bit 31 – LINHTE LIN Header Timeout Error

Value	Description
0	No LIN header timeout error has been detected since the last RSTSTA command was issued.
1	A LIN header timeout error has been detected since the last RSTSTA command was issued.

Bit 30 – LINSTE LIN Synch Tolerance Error

Value	Description
0	No LIN synch tolerance error has been detected since the last RSTSTA command was issued.
1	A LIN synch tolerance error has been detected since the last RSTSTA command was issued.

Bit 29 – LINSNRE LIN Client Not Responding Error

Value	Description
0	No LIN client not responding error has been detected since the last RSTSTA command was issued.
1	A LIN client not responding error has been detected since the last RSTSTA command was issued.

Bit 28 – LINCE LIN Checksum Error

Value	Description
0	No LIN checksum error has been detected since the last RSTSTA command was issued.
1	A LIN checksum error has been detected since the last RSTSTA command was issued.

Bit 27 – LINIPE LIN Identifier Parity Error

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No LIN identifier parity error has been detected since the last RSTSTA command was issued.
1	A LIN identifier parity error has been detected since the last RSTSTA command was issued.

Bit 26 – LINISFE LIN Inconsistent Synch Field Error

Value	Description
0	No LIN inconsistent synch field error has been detected since the last RSTSTA
1	The USART is configured as a client node and a LIN Inconsistent synch field error has been detected since the last RSTSTA command was issued.

Bit 25 – LINBE LIN Bit Error

Value	Description
0	No bit error has been detected since the last RSTSTA command was issued.
1	A bit error has been detected since the last RSTSTA command was issued.

Bit 23 – LINBLS LIN Bus Line Status

Value	Description
0	LIN bus line is set to 0.
1	LIN bus line is set to 1.

Bit 21 – SECE Security/Safety Error (cleared on read)

Value	Description
0	No error detected on TXD and/or SCK pad output and no access violation of a write-protected register since the last read of FLEX_US_CSR.
1	An error has been detected on TXD and/or SCK pad output (FLEX_US_WPSR.PADERR=1) and/or a violation of a write-protected register (FLEX_US_WPSR.WPVS=1) since the last read of FLEX_US_CSR.

Bit 15 – LINTC LIN Transfer Completed

Value	Description
0	The USART is idle or a LIN transfer is ongoing.
1	A LIN transfer has been completed since the last RSTSTA command was issued.

Bit 14 – LINID LIN Identifier Sent or LIN Identifier Received

If USART operates in LIN Host mode (USART_MODE = 0xA):
0: No LIN identifier has been sent since the last RSTSTA command was issued.
1: At least one LIN identifier has been sent since the last RSTSTA command was issued.
If USART operates in LIN Client mode (USART_MODE = 0xB):
0: No LIN identifier has been received since the last RSTSTA command was issued.
1: At least one LIN identifier has been received since the last RSTSTA.

Bit 13 – LINBK LIN Break Sent or LIN Break Received

Applicable if USART operates in LIN Host mode (USART_MODE = 0xA):
0: No LIN break has been sent since the last RSTSTA command was issued.
1: At least one LIN break has been sent since the last RSTSTA.
If USART operates in LIN Client mode (USART_MODE = 0xB):
0: No LIN break has been received since the last RSTSTA command was issued.
1: At least one LIN break has been received since the last RSTSTA command was issued.

Bit 9 – TXEMPTY Transmitter Empty (cleared by writing FLEX_US_THR)

Value	Description
0	There are characters in either FLEX_US_THR or the Transmit Shift Register, or the transmitter is disabled.
1	There are no characters in FLEX_US_THR, nor in the Transmit Shift Register.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 8 – TIMEOUT Receiver Timeout

Value	Description
0	There has not been a timeout since the last start timeout command (FLEX_US_CR.STTTO) or the Timeout Register is 0.
1	There has been a timeout since the last start timeout command (FLEX_US_CR.STTTO).

Bit 7 – PARE Parity Error

Value	Description
0	No parity error has been detected since the last RSTSTA command was issued.
1	At least one parity error has been detected since the last RSTSTA command was issued.

Bit 6 – FRAME Framing Error

Value	Description
0	No stop bit has been detected low since the last RSTSTA command was issued.
1	At least one stop bit has been detected low since the last RSTSTA command was issued.

Bit 5 – OVRE Overrun Error

Value	Description
0	No overrun error has occurred since the last RSTSTA command was issued.
1	At least one overrun error has occurred since the last RSTSTA command was issued.

Bit 1 – TXRDY Transmitter Ready (cleared by writing FLEX_US_THR)

Value	Description
0	A character in FLEX_US_THR is waiting to be transferred to the Transmit Shift Register, or the transmitter is disabled. As soon as the transmitter is enabled, TXRDY becomes 1.
1	There is no character in FLEX_US_THR.

Bit 0 – RXRDY Receiver Ready (cleared by reading FLEX_US_RHR)

Value	Description
0	No complete character has been received since the last read of FLEX_US_RHR or the receiver is disabled. If characters were being received when the receiver was disabled, RXRDY changes to 1 when the receiver is enabled.
1	At least one complete character has been received and FLEX_US_RHR has not yet been read.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.14.USART Receive Holding Register (Default Mode)

Name: FLEX_US_RHR (DEFAULT_MODE)
Offset: 0x218
Reset: 0x00000000
Property: Read-only

If FIFO is enabled (FLEX_US_CR.FIFOEN=1), a byte access on FLEX_SPI_TDR reads one byte (FLEX_US_RHR.MODE9=0), see FIFO Single Data Access for details.

Bit	31	30	29	28	27	26	25	24

Reset	0	0	0	0	0	0	0	0

Bit 15 – RXSYNH Received Sync

Value	Description
0	Last character received is a data.
1	Last character received is a command.

Bits 8:0 – RXCHR[8:0] Received Character
Last character received if RXRDY is set.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.15.USART Receive Holding Register (FIFO Multi Data)

Name: FLEX_US_RHR (FIFO_MULTI_DATA)
Offset: 0x218
Reset: 0x00000000
Property: Read-only

To read multi-data in a single access, the FIFO must be enabled (FLEX_US_CR.FIFOEN=1) and FLEX_US_MR.MODE9=0. The access type (byte, halfword or word) determines the number of data written in a single access (1, 2, 4), see FIFO Multiple Data Access for details.

Bit	31	30	29	28	27	26	25	24
	RXCHR3[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	RXCHR2[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	RXCHR1[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	RXCHR0[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 0:7, 8:15, 16:23, 24:31 – RXCHRx Received Character
First unread character in the Receive FIFO if RXRDY is set.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.16.USART Transmit Holding Register (Default Mode)

Name: FLEX_US_THR (DEFAULT_MODE)
Offset: 0x21C
Reset: –
Property: Write-only

If FIFO is enabled (FLEX_US_CR.FIFOEN=1), a byte access on FLEX_SPI_TDR writes one byte (FLEX_US_MR.MODE9=0), see FIFO Single Data Access for details.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	TXSYNH							TXCHR[8]
Access	W							W
Reset	–							–

Bit	7	6	5	4	3	2	1	0
	TXCHR[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit 15 – TXSYNH Sync Field to be Transmitted

Value	Description
0	The next character sent is encoded as a data. Start frame delimiter is DATA SYNC.
1	The next character sent is encoded as a command. Start frame delimiter is COMMAND SYNC.

Bits 8:0 – TXCHR[8:0] Character to be Transmitted
The next character to be transmitted after the current character if TXRDY is not set.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.17.USART Transmit Holding Register (FIFO Multi Data)

Name: FLEX_US_THR (FIFO_MULTI_DATA)
Offset: 0x21C
Reset: –
Property: Write-only

To write multi-data in a single access, the FIFO must be enabled (FLEX_US_CR.FIFOEN=1) and FLEX_US_MR.MODE9=0. The access type (byte, halfword or word) determines the number of data written in a single access (1, 2 or 4), see FIFO Multiple Data Access for details.

Bit	31	30	29	28	27	26	25	24
	TXCHR3[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	23	22	21	20	19	18	17	16
	TXCHR2[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	15	14	13	12	11	10	9	8
	TXCHR1[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	TXCHR0[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bits 0:7, 8:15, 16:23, 24:31 – TXCHRx Character to be Transmitted
Next character to be transmitted.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.18.USART Baud Rate Generator Register

Name: FLEX_US_BRGR
Offset: 0x220
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
						FP[2:0]		
Access						R/W	R/W	R/W
Reset						0	0	0

Bit	15	14	13	12	11	10	9	8
	CD[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	CD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 18:16 – FP[2:0] Fractional Part

WARNING When the value of field FP is greater than 0, the SCK (oversampling clock) generates nonconstant duty cycles. The SCK high duration is increased by "selected clock" period from time to time. The duty cycle depends on the value of the CD field.

Value	Description
0	Fractional divider is disabled.
1–7	Baud rate resolution, defined by FP × 1/8.

Bits 15:0 – CD[15:0] Clock Divider

CD	USART_MODE ≠ ISO7816			USART_MODE = ISO7816
	SYNC = 0		SYNC = 1	
	OVER = 0	OVER = 1		
0	Baud Rate Clock disabled			
1 to 65535	CD = Selected Clock / (16 × Baud Rate)	CD = Selected Clock / (8 × Baud Rate)	CD = Selected Clock / Baud Rate	CD = Selected Clock / (FI_DI_RATIO × Baud Rate)

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.19.USART Receiver Timeout Register

Name: FLEX_US_RTOR
Offset: 0x224
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
								TO[16]
Access								R/W
Reset								0

Bit	15	14	13	12	11	10	9	8
	TO[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	TO[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 16:0 – TO[16:0] Timeout Value
The TO field size is limited to 8 bits if the ISO7816 logic is not implemented on some instances of FLEXCOM. The ISO7816 logic is implemented if it is possible to write FLEX_US_MR.MAX_ITERATIONS=1 (a read operation must be performed after the write operation to check that MAX_ITERATIONS equals 1).

Value	Description
0	The receiver timeout is disabled.
1–131071	The receiver timeout is enabled and the timeout delay is TO × bit period.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.20.USART Transmitter Timeguard Register

Name: FLEX_US_TTGR
Offset: 0x228
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	TG[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 7:0 – TG[7:0] Timeguard Value

Value	Description
0	The transmitter timeguard is disabled.
1–255	The transmitter timeguard is enabled and TG is timeguard delay / bit period.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.21.USART FI DI RATIO Register

Name: FLEX_US_FIDI
Offset: 0x240
Reset: 0x174
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	FI_DI_RATIO[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	1

Bit	7	6	5	4	3	2	1	0
	FI_DI_RATIO[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	1	1	1	0	1	0	0

Bits 15:0 – FI_DI_RATIO[15:0] FI Over DI Ratio Value

Value	Description
0	If ISO7816 mode is selected, the baud rate generator generates no signal.
1–2	Do not use.
3–65535	If ISO7816 mode is selected, the baud rate is the clock provided on SCK divided by FI_DI_RATIO.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.22.USART Number of Errors Register

Name: FLEX_US_NER
Offset: 0x244
Reset: 0x00000000
Property: Read-only

This register is relevant only if USART_MODE = 0x4 or 0x6 in the USART Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	NB_ERRORS[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	–	–	–	–	–	–	–	–

Bits 7:0 – NB_ERRORS[7:0] Number of Errors
Total number of errors that occurred during an ISO7816 transfer. This register automatically clears when read.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.23.USART IrDA FILTER Register

Name: FLEX_US_IF
Offset: 0x24C
Reset: 0x00000000
Property: Read/Write

This register is relevant only if USART_MODE = 0x8 in the USART Mode Register.

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	IRDA_FILTER[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 7:0 – IRDA_FILTER[7:0] IrDA Filter

The IRDA_FILTER value must be defined to meet the following criteria:

$t_{peripheral\ clock} \times (IRDA_FILTER + 3) < 1.41\ \mu s$

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.24.USART Manchester Configuration Register

Name: FLEX_US_MAN
Offset: 0x250
Reset: 0xB0011004
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	RXIDLEV	DRIFT	ONE	RX_MPOL			RX_PP[1:0]	
Access	R/W	R/W	R/W	R/W			R/W	R/W
Reset	1	0	1	1			0	0

Bit	23	22	21	20	19	18	17	16
					RX_PL[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	1

Bit	15	14	13	12	11	10	9	8
				TX_MPOL			TX_PP[1:0]	
Access				R/W			R/W	R/W
Reset				1			0	0

Bit	7	6	5	4	3	2	1	0
					TX_PL[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	1	0	0

Bit 31 – RXIDLEV Receiver Idle Value

Value	Description
0	Receiver line idle value is 0.
1	Receiver line idle value is 1.

Bit 30 – DRIFT Drift Compensation

Value	Description
0	The USART cannot recover from an important clock drift.
1	The USART can recover from clock drift. The 16X Clock mode must be enabled.

Bit 29 – ONE Must Be Set to 1
Bit 29 must always be set to 1 when programming the FLEX_US_MAN register.

Bit 28 – RX_MPOL Receiver Manchester Polarity

Value	Description
0	Logic zero is coded as a zero-to-one transition, Logic one is coded as a one-to-zero transition.
1	Logic zero is coded as a one-to-zero transition, Logic one is coded as a zero-to-one transition.

Bits 25:24 – RX_PP[1:0] Receiver Preamble Pattern detected
The following values assume that RX_MPOL field is not set:

Value	Name	Description
0	ALL_ONE	The preamble is composed of '1's.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
1	ALL_ZERO	The preamble is composed of ‘0’s.
2	ZERO_ONE	The preamble is composed of ‘01’s.
3	ONE_ZERO	The preamble is composed of ‘10’s.

Bits 19:16 – RX_PL[3:0] Receiver Preamble Length

Value	Description
0	The receiver preamble pattern detection is disabled.
1–15	The detected preamble length is RX_PL × Bit Period.

Bit 12 – TX_MPOL Transmitter Manchester Polarity

Value	Description
0	Logic zero is coded as a zero-to-one transition, Logic one is coded as a one-to-zero transition.
1	Logic zero is coded as a one-to-zero transition, Logic one is coded as a zero-to-one transition.

Bits 9:8 – TX_PP[1:0] Transmitter Preamble Pattern
The following values assume that TX_MPOL field is not set:

Value	Name	Description
0	ALL_ONE	The preamble is composed of ‘1’s.
1	ALL_ZERO	The preamble is composed of ‘0’s.
2	ZERO_ONE	The preamble is composed of ‘01’s.
3	ONE_ZERO	The preamble is composed of ‘10’s.

Bits 3:0 – TX_PL[3:0] Transmitter Preamble Length

Value	Description
0	The transmitter preamble pattern generation is disabled.
1–15	The preamble length is TX_PL × Bit Period.

74.10.25.USART LIN Mode Register

Name: FLEX_US_LINMR
Offset: 0x254
Reset: 0x00000000
Property: Read/Write

This register is relevant only if USART_MODE = 0xA or 0xB in the USART Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
							SYNCDIS	PDCM
Access							R/W	R/W
Reset							0	0

Bit	15	14	13	12	11	10	9	8
	DLC[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	WKUPTYP	FSDIS	DLM	CHKTYP	CHKDIS	PARDIS	NACT[1:0]	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 17 – SYNCDIS Synchronization Disable

Value	Description
0	The synchronization procedure is performed in LIN client node configuration.
1	The synchronization procedure is not performed in LIN client node configuration.

Bit 16 – PDCM DMAC Mode

Value	Description
0	The LIN mode register FLEX_US_LINMR is not written by the DMAC.
1	The LIN mode register FLEX_US_LINMR (excepting that flag) is written by the DMAC.

Bits 15:8 – DLC[7:0] Data Length Control

Value	Description
0–255	Defines the response data length if DLM = 0, in that case the response data length is equal to DLC+1 bytes.

Bit 7 – WKUPTYP Wake-up Signal Type

Value	Description
0	Setting the LINWKUP bit in the control register sends a LIN 2.0 wake-up signal.
1	Setting the LINWKUP bit in the control register sends a LIN 1.3 wake-up signal.

Bit 6 – FSDIS Frame Slot Mode Disable

Value	Description
0	The Frame Slot mode is enabled.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
1	The Frame Slot mode is disabled.

Bit 5 – DLM Data Length Mode

Value	Description
0	The response data length is defined by the DLC field of this register.
1	The response data length is defined by the bits 5 and 6 of the identifier (FLEX_US_LINIR.IDCHR).

Bit 4 – CHKTYP Checksum Type

Value	Description
0	LIN 2.0 “enhanced” checksum
1	LIN 1.3 “classic” checksum

Bit 3 – CHKDIS Checksum Disable

Value	Description
0	In host node configuration, the checksum is computed and sent automatically. In client node configuration, the checksum is checked automatically.
1	Whatever the node configuration is, the checksum is not computed/sent and it is not checked.

Bit 2 – PARDIS Parity Disable

Value	Description
0	In host node configuration, the identifier parity is computed and sent automatically. In host node and client node configuration, the parity is checked automatically.
1	Whatever the node configuration is, the Identifier parity is not computed/sent and it is not checked.

Bits 1:0 – NACT[1:0] LIN Node Action
Values which are not listed in the table must be considered as “reserved”.

Value	Name	Description
0	PUBLISH	The USART transmits the response.
1	SUBSCRIBE	The USART receives the response.
2	IGNORE	The USART does not transmit and does not receive the response.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.26.USART LIN Identifier Register

Name: FLEX_US_LINIR
Offset: 0x258
Reset: 0x00000000
Property: Read/Write

Write is possible only in LIN host node configuration.

This register is relevant only if USART_MODE = 0xA or 0xB in USART Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	IDCHR[7:0]							
Access	R/W-R	R/W-R	R/W-R	R/W-R	R/W-R	R/W-R	R/W-R	R/W-R
Reset	0	0	0	0	0	0	0	0

Bits 7:0 – IDCHR[7:0] Identifier Character

If USART_MODE = 0xA (host node configuration):

- IDCHR is Read/Write and its value is the identifier character to be transmitted.

If USART_MODE = 0xB (client node configuration):

- IDCHR is Read-only and its value is the last identifier character that has been received.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.27.USART LIN Baud Rate Register

Name: FLEX_US_LINBRR
Offset: 0x25C
Reset: 0x00000000
Property: Read-only

This register is relevant only if USART_MODE = 0xA or 0xB in USART Mode Register.

Returns the baud rate value after the synchronization process completion.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
						LINFP[2:0]		
Access						R	R	R
Reset						0	0	0

Bit	15	14	13	12	11	10	9	8
	LINCD[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	LINCD[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 18:16 – LINFP[2:0] Fractional Part after Synchronization

Bits 15:0 – LINCD[15:0] Clock Divider after Synchronization

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.28.USART Comparison Register

Name: FLEX_US_CMPR
Offset: 0x290
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the USART Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
								VAL2[8]
Access								R/W
Reset								0

Bit	23	22	21	20	19	18	17	16
	VAL2[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
		CMPPAR	CMPMODE[1:0]					VAL1[8]
Access		R/W	R/W	R/W				R/W
Reset		0	0	0				0

Bit	7	6	5	4	3	2	1	0
	VAL1[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 24:16 – VAL2[8:0] Second Comparison Value for Received Character

Value	Description
0–511	The received character must be lower than or equal to the value of VAL2 and higher than or equal to VAL1 to set the FLEX_US_CSR.CMP flag. If asynchronous partial wakeup is enabled in PMC_SLPWK_ER, the UART requests a system wakeup if condition is met.

Bit 14 – CMPPAR Compare Parity

Value	Description
0	The parity is not checked and a bad parity cannot prevent from waking up the system.
1	The parity is checked and a matching condition on data can be cancelled by an error on parity bit, so no wakeup is performed.

Bits 13:12 – CMPMODE[1:0] Comparison Mode

Value	Name	Description
0	FLAG_ONLY	Any character is received and comparison function drives CMP flag.
1	START_CONDITION	Comparison condition must be met to start reception.
2	FILTER	Comparison must be met to receive the current data only

Bits 8:0 – VAL1[8:0] First Comparison Value for Received Character

Value	Description
0–511	The received character must be higher than or equal to the value of VAL1 and lower than or equal to VAL2 to set the FLEX_US_CSR.CMP flag. If asynchronous partial wakeup is enabled in PMC_SLPWK_ER, the UART requests a system wakeup if the condition is met.

	FRTSC		RXRDYM[1:0]				TXRDYM[1:0]	
Access	R/W		R/W	R/W			R/W	R/W
Reset	0		0	0			0	0

Bits 29:24 – RXFTHRES2[5:0] Receive FIFO Threshold 2

Value	Description
0–32	Defines the Receive FIFO threshold 2 value (number of bytes). The FLEX_US_FESR.RXFTHF2 flag will be set when Receive FIFO goes from "above" threshold state to "equal to or below" threshold state.

Bits 21:16 – RXFTHRES[5:0] Receive FIFO Threshold

Value	Description
0–32	Defines the Receive FIFO threshold value (number of bytes). The FLEX_US_FESR.RXFTHF flag will be set when Receive FIFO goes from "below" threshold state to "equal to or above" threshold state.

Bits 13:8 – TXFTHRES[5:0] Transmit FIFO Threshold

Value	Description
0–32	Defines the Transmit FIFO threshold value (number of bytes). The FLEX_US_FESR.TXFTHF flag will be set when Transmit FIFO goes from "above" threshold state to "equal to or below" threshold state.

Bit 7 – FRTSC FIFO RTS Pin Control enable (Hardware Handshaking mode only)
See Hardware Handshaking for details.

Value	Description
0	RTS pin is not controlled by Receive FIFO thresholds.
1	RTS pin is controlled by Receive FIFO thresholds.

Bits 5:4 – RXRDYM[1:0] Receiver Ready Mode
If FIFOs are enabled, the FLEX_US_CSR.RXRDY flag behaves as follows.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
0	ONE_DATA	RXRDY will be at level '1' when at least one unread data is in the receive FIFO. When DMA is enabled to transfer data and FLEX_US_MR.MODE9=0 (up to 8 bits to transfer on the line), the chunk of 1 byte must be configured in the DMA. If the transfer is performed by software, the access type must be defined as a byte.
1	TWO_DATA	RXRDY will be at level '1' when at least two unread data are in the receive FIFO. To minimize system bus load, when DMA is enabled to transfer data and FLEX_US_MR.MODE9=0 (up to 8 bits to transfer on the line), the chunk of 1 halfword (1 halfword carries 2 bytes) must be configured in the DMA (chunk size=1 and halfword access). If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 2 accesses) or halfword (2 bytes per access, 1 single access).
2	FOUR_DATA	RXRDY will be at level '1' when at least four unread data are in the receive FIFO. To minimize system bus load, when DMA is enabled to transfer data and FLEX_US_MR.MODE9=0 (up to 8 bits to transfer on the line), the chunk of 1 word (1 word carries 4 bytes) must be configured in the DMA. If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 4 accesses), halfword (2 bytes per access, 2 accesses) or word (4 bytes per access, 1 single access).
3	EIGHT_DATA	RXRDY will be at level '1' when at least eight unread data are in the receive FIFO. To minimize system bus load, when DMA is enabled to transfer data and FLEX_US_MR.MODE9=0 (up to 8 bits transferred on the line), the chunk of 2 words (1 word carries 4 bytes) must be configured in the DMA (chunk size=2 and word access). If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 8 accesses), halfword (2 bytes per access, 4 accesses) or word (4 bytes per access, 2 accesses).

Bits 1:0 – TXRDYM[1:0] Transmitter Ready Mode
If FIFOs are enabled, the FLEX_US_CSR.TXRDY flag behaves as follows.

Value	Name	Description
0	ONE_DATA	TXRDY will be at level '1' when at least one data can be written in the transmit FIFO. When DMA is enabled to transfer data and FLEX_US_MR.MODE9=0 (up to 8 bits to transfer on the line), the chunk of 1 byte must be configured in the DMA. If the transfer is performed by software, the access type must be defined as a byte.
1	TWO_DATA	TXRDY will be at level '1' when at least two data can be written in the transmit FIFO. To minimize system bus load, when DMA is enabled to transfer data and FLEX_US_MR.MODE9=0 (up to 8 bits to transfer on the line), the chunk of 1 halfword (1 halfword carries 2 bytes) must be configured in the DMA. If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 2 accesses) or halfword (2 bytes per access, 1 single access).
2	FOUR_DATA	TXRDY will be at level '1' when at least four data can be written in the transmit FIFO. To minimize system bus load, when DMA is enabled to transfer data and FLEX_US_MR.MODE9=0 (up to 8 bits to transfer on the line), the chunk of 1 word (1 word carries 4 bytes) must be configured in the DMA (chunk size=1 and word access). If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 4 accesses), halfword (2 bytes per access, 2 accesses) or word (4 bytes per access, 1 single access).
3	EIGHT_DATA	TXRDY will be at level '1' when at least eight data can be written in the Transmit FIFO. To minimize system bus load, when DMA is enabled to transfer data and FLEX_US_MR.MODE9=0 (up to 8 bits transferred on the line), the chunk of 2 words (1 word carries 4 bytes) must be configured in the DMA (chunk size=2 and word access). If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 8 accesses), halfword (2 bytes per access, 4 accesses) or word (4 bytes per access, 2 accesses).

			TXFL[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bits 21:16 – RXFL[5:0] Receive FIFO Level

Value	Description
0	There is no unread data in the Receive FIFO.
1–32	Indicates the number of unread data in the Receive FIFO.

Bits 5:0 – TXFL[5:0] Transmit FIFO Level

Value	Description
0	There is no data in the Transmit FIFO.
1–32	Indicates the number of data in the Transmit FIFO.

Bit	15	14	13	12	11	10	9	8
							RXFTHF2	TXFLOCK
Access							R	R
Reset							0	0

Bit	7	6	5	4	3	2	1	0
	RXFPTEF	TXFPTEF	RXFTHF	RXFFF	RXFEF	TXFTHF	TXFFF	TXFEF
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit 9 – RXFTHF2 Receive FIFO Threshold Flag 2 (cleared by writing the FLEX_US_CR.RSTSTA bit)

Value	Description
0	Number of unread data in Receive FIFO is above RXFTHRES threshold.
1	Number of unread data in Receive FIFO has reached RXFTHRES2 threshold since the last RSTSTA command was issued.

Bit 8 – TXFLOCK Transmit FIFO Lock

Value	Description
0	The Transmit FIFO is not locked.
1	The Transmit FIFO is locked.

Bit 7 – RXFPTEF Receive FIFO Underflow Error Flag
See FIFO Overflow/Underflow Error for details.

Value	Description
0	No Receive FIFO underflow occurred.
1	Receive FIFO underflow error occurred due to an incorrect software access (read data exceeding available data in FIFO). Receiver must be reset by writing FLEX_SPI_CR.SWRST=1.

Bit 6 – TXFPTEF Transmit FIFO Overflow Error Flag
See FIFO Overflow/Underflow Error for details.

Value	Description
0	No Transmit FIFO overflow occurred.
1	Transmit FIFO overflow error occurred due to an incorrect software access (written data exceeding available space). Transceiver must be reset by writing FLEX_SPI_CR.SWRST=1.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 5 – RXFTHF Receive FIFO Threshold Flag (cleared by writing the FLEX_US_CR.RSTSTA bit)

Value	Description
0	Number of unread data in Receive FIFO is below RXFTHRES threshold.
1	Number of unread data in Receive FIFO has reached RXFTHRES threshold since the last RSTSTA command was issued.

Bit 4 – RXFFF Receive FIFO Full Flag (cleared by writing the FLEX_US_CR.RSTSTA bit)

Value	Description
0	Receive FIFO is not empty.
1	Receive FIFO has been filled since the last RSTSTA command was issued.

Bit 3 – RXFEF Receive FIFO Empty Flag (cleared by writing the FLEX_US_CR.RSTSTA bit)

Value	Description
0	Receive FIFO is not empty.
1	Receive FIFO has been emptied since the last RSTSTA command was issued.

Bit 2 – TXFTHF Transmit FIFO Threshold Flag (cleared by writing the FLEX_US_CR.RSTSTA bit)

Value	Description
0	Number of data in Transmit FIFO is above TXFTHRES threshold.
1	Number of data in Transmit FIFO has reached TXFTHRES threshold since the last RSTSTA command was issued.

Bit 1 – TXFFF Transmit FIFO Full Flag (cleared by writing the FLEX_US_CR.RSTSTA bit)

Value	Description
0	Transmit FIFO is not full.
1	Transmit FIFO has been filled since the last RSTSTA command was issued.

Bit 0 – TXFEF Transmit FIFO Empty Flag (cleared by writing the FLEX_US_CR.RSTSTA bit)

Value	Description
0	Transmit FIFO is not empty.
1	Transmit FIFO has been emptied since the last RSTSTA command was issued.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.35.USART Write Protection Mode Register

Name: FLEX_US_WPMR
Offset: 0x2E4
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
						WPCREN	WPITEN	WPEN
Access						R/W	R/W	R/W
Reset						0	0	0

Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x555341	PASSWD	Writing any other value in this field aborts the write operation of bits WPEN, WPITEN and WPCREN. Always reads as 0.

Bit 2 – WPCREN Write Protection Control Enable
See USART Register Write Protection for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to 0x555341 (“USA” in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x555341 (“USA” in ASCII).

Bit 1 – WPITEN Write Protection Interrupt Enable
See USART Register Write Protection for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x555341 (“USA” in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x555341 (“USA” in ASCII).

Bit 0 – WPEN Write Protection Enable
See USART Register Write Protection for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection on configuration registers if WPKEY corresponds to 0x555341 (“USA” in ASCII).
1	Enables the write protection on configuration registers if WPKEY corresponds to 0x555341 (“USA” in ASCII).

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.36.USART Write Protection Status Register

Name: FLEX_US_WPSR
Offset: 0x2E8
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	WPVSRC[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	WPVSRC[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
							PADERR	WPVS
Access							R	R
Reset							0	0

Bits 23:8 – WPVSRC[15:0] Write Protection Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

Bit 1 – PADERR Output Pad Error (cleared on read)

Value	Description
0	No error detected during a character transfer.
1	Two successive bit periods with a difference between the data read at the output of the TXD pad buffer and the input driven by USART or abnormal number of SCK edges (or no clock edge) at the output of SCK pad buffer in synchronous mode. This may be due to erroneous IO multiplexing configuration, external short circuits, etc.

Bit 0 – WPVS Write Protection Violation Status

Value	Description
0	No write protection violation has occurred since the last read of FLEX_US_WPSR.
1	A write protection violation has occurred since the last read of FLEX_US_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.37.SPI Control Register

Name: FLEX_SPI_CR
Offset: 0x400
Reset: –
Property: Write-only

This register can only be written if the WPCREN bit is cleared in the SPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	FIFODIS	FIFOEN						LASTXFER
Access	W	W						W
Reset	–	–						–

Bit	23	22	21	20	19	18	17	16
							RXFCLR	TXFCLR
Access							W	W
Reset							–	–

Bit	15	14	13	12	11	10	9	8
				REQCLR				
Access				W				
Reset				–				

Bit	7	6	5	4	3	2	1	0
	SWRST						SPIDIS	SPIEN
Access	W						W	W
Reset	–						–	–

Bit 31 – FIFODIS FIFO Disable

Value	Description
0	No effect.
1	Disables the Transmit and Receive FIFOs

Bit 30 – FIFOEN FIFO Enable

Value	Description
0	No effect.
1	Enables the Transmit and Receive FIFOs

Bit 24 – LASTXFER Last Transfer
See Peripheral Selection for more details.

Value	Description
0	No effect.
1	The current NPCS will be de-asserted after the character written in TD has been transferred. When CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed.

Bit 17 – RXFCLR Receive FIFO Clear

Value	Description
0	No effect.
1	Empties the Receive FIFO.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 16 – TXFCLR Transmit FIFO Clear

Value	Description
0	No effect.
1	Empties the Transmit FIFO.

Bit 12 – REQCLR Request to Clear the Comparison Trigger

Asynchronous partial wakeup enabled:
0: No effect.
1: Clears the potential clock request currently issued by SPI, thus the potential system wakeup is cancelled.
Asynchronous partial wakeup disabled:
0: No effect.
1: Restarts the comparison trigger to enable FLEX_SPI_RDR loading.

Bit 7 – SWRST SPI Software Reset

The SPI is in Client mode after software reset.

Value	Description
0	No effect.
1	Resets the SPI. A software-triggered hardware reset of the SPI interface is performed.

Bit 1 – SPIDIS SPI Disable

If a transfer is in progress when SPIDIS is set, the SPI completes the transmission of the shifter register and does not start any new transfer, even if the FLEX_US_THR is loaded.
All pins are set to Input mode after completion of the transmission in progress, if any.

Value	Description
0	No effect.
1	Disables the SPI.

Bit 0 – SPIEN SPI Enable

Value	Description
0	No effect.
1	Enables the SPI to transfer and receive data.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.38.SPI Mode Register

Name: FLEX_SPI_MR
Offset: 0x404
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the SPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	DLYBCS[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
					PCS[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit	15	14	13	12	11	10	9	8
				CMPMODE		MLCE		LSBHALF
Access				R/W		R/W		R/W
Reset				0		0		0

Bit	7	6	5	4	3	2	1	0
	LLB		WDRBT	MODFDIS	BRSRCCLK	PCSDEC	PS	MSTR
Access	R/W		R/W	R/W	R/W	R/W	R/W	R/W
Reset	0		0	0	0	0	0	0

Bits 31:24 – DLYBCS[7:0] Delay Between Chip Selects
This field defines the delay between the inactivation and the activation of NPCS. The DLYBCS time ensures chip selects do not overlap and solves bus contentions in case of peripherals having long data float times.
If DLYBCS is ≤ 6, six peripheral clock periods are inserted by default.
Otherwise, the following equations determine the delay:
If FLEX_SPI_MR.BRSRCCLK = 0: DLYBCS = Delay Between Chip Selects × $f_{peripheral\ clock}$
If FLEX_SPI_MR.BRSRCCLK = 1: DLYBCS = Delay Between Chip Selects × f_{GCLK}

Bits 19:16 – PCS[3:0] Peripheral Chip Select
This field is only used if fixed peripheral select is active (PS = 0).
If PCSDEC = 0:
PCS = xxx0 NPCS[3:0] = 1110
PCS = xx01 NPCS[3:0] = 1101
PCS = x011 NPCS[3:0] = 1011
PCS = 0111 NPCS[3:0] = 0111
PCS = 1111 forbidden (no peripheral is selected)
(x = don't care)
If PCSDEC = 1:
NPCS[3:0] output signals = PCS

Bit 12 – CMPMODE Comparison Mode

Value	Name	Description
0	FLAG_ONLY	Any character is received and comparison function drives CMP flag.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
1	START_CONDITION	Comparison condition must be met to start reception of all incoming characters until REQCLR is set.

Bit 10 – MLCE MOSI Line Check Enable

Value	Description
0	Disables the MOSI line check.
1	Enables the MOSI line check during a character transfer.

Bit 8 – LSBHALF Last Bit Half Period Compatibility

Value	Description
0	Normal SPI mode of operation: all bits have a 1-bit time duration (standard SPI mode)
1	Compatibility mode when connected to an SPI client having only a half bit period duration time for the last bit of the frame (non-standard SPI mode)

Bit 7 – LLB Local Loopback Enable

LLB controls the local loopback on the data shift register for testing in Host mode only (MISO is internally connected on MOSI).

Value	Description
0	Local loopback path disabled.
1	Local loopback path enabled.

Bit 5 – WDRBT Wait Data Read Before Transfer

Value	Description
0	No Effect. In Host mode, a transfer can be initiated regardless of the FLEX_SPI_RDR state.
1	In Host mode, a transfer can start only if FLEX_SPI_RDR is empty, i.e., does not contain any unread data. This mode prevents overrun error in reception.

Bit 4 – MODFDIS Mode Fault Detection

Value	Description
0	Mode fault detection is enabled.
1	Mode fault detection is disabled.

Bit 3 – BRSRCCLK Bit Rate Source Clock

If the bit BRSRCCLK = 1, the FLEX_US_CSRx.SCBR field must be programmed with a value greater than 1.

Value	Name	Description
0	PERIPH_CLK	The peripheral clock is the source clock for the bit rate generation.
1	GCLK	GCLK is the source clock for the bit rate generation, thus the bit rate can be independent of the core/peripheral clock.

Bit 2 – PCSDEC Chip Select Decode

When PCSDEC equals one, up to 15 Chip Select signals can be generated with the four NPCS lines using an external 4- to 16-bit decoder. The Chip Select registers define the characteristics of the 15 chip selects, with the following rules:
FLEX_SPI_CSR0 defines peripheral chip select signals 0 to 3.
FLEX_SPI_CSR1 defines peripheral chip select signals 4 to 7.
FLEX_SPI_CSR2 defines peripheral chip select signals 8 to 11.
FLEX_SPI_CSR3 defines peripheral chip select signals 12 to 14.

Value	Description
0	The chip selects are directly connected to a peripheral device.
1	The four NPCS chip select lines are connected to a 4- to 16-bit decoder.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 1 – PS Peripheral Select

Value	Description
0	Fixed Peripheral Select
1	Variable Peripheral Select

Bit 0 – MSTR Host/Client Mode

Value	Description
0	SPI is in Client mode.
1	SPI is in Host mode.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.39.SPI Receive Data Register (Default Mode)

Name: FLEX_SPI_RDR (DEFAULT_MODE)
Offset: 0x408
Reset: 0x00000000
Property: Read-only

If FIFO is enabled (FLEX_SPI_CR.FIFOEN) and FLEX_SPI_FMR.RXRDYM = 0, see SPI Single Data Access for details.

Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	RD[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 19:16 – PCS[3:0] Peripheral Chip Select
In Host mode only, these bits indicate the value on the NPCS pins at the end of a transfer. Otherwise, these bits are read as zero.
Note: When using Variable Peripheral Select mode (FLEX_SPI_MR.PS = 1), it is mandatory to set the FLEX_SPI_MR.WDRBT bit to 1 if the PCS field must be processed in FLEX_SPI_RDR.

Bits 15:0 – RD[15:0] Receive Data
Data received by the SPI Interface is stored in this register in a right-justified format. Unused bits are read as zero.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.40.SPI Receive Data Register (Multiple Data, 8-bit)

Name: FLEX_SPI_RDR (FIFO_MULTI_DATA_8)
Offset: 0x408
Reset: 0x00000000
Property: Read-only

To read multi-data, the FIFO must be enabled (FLEX_SPI_CR.FIFOEN=1, FLEX_SPI_MR.MSTR=0, FLEX_SPI_MR.PS=0). The access type (byte, halfword or word) determines the number of data written in a single access (1, 2 or 4). See SPI Multiple Data Access for details.

Bit	31	30	29	28	27	26	25	24
	RD3[7:0]							
Access	R	R	R	R	R	R	R	R

Reset	0	0	0	0	0	0	0	0

Bits 0:7, 8:15, 16:23, 24:31 – RDx Receive Data
First unread data in the Receive FIFO. Data received by the SPI Interface is stored in this register in a right-justified format. Unused bits are read as zero.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.41.SPI Receive Data Register (Multiple Data, 16-bit)

Name: FLEX_SPI_RDR (FIFO_MULTI_DATA_16)
Offset: 0x408
Reset: 0x00000000
Property: Read-only

To read multi-data, the FIFO must be enabled (FLEX_SPI_CR.FIFOEN=1, FLEX_SPI_MR.MSTR=0, FLEX_SPI_MR.PS=0). The access type (byte, halfword or word) determines the number of data written in a single access (1 or 2). See SPI Multiple Data Access for details.

74.10.42.SPI Transmit Data Register (Default Mode)

Name: FLEX_SPI_TDR (DEFAULT_MODE)
Offset: 0x40C
Reset: –
Property: Write-only

If FIFO is enabled (FLEX_SPI_CR.FIFOEN=1), a byte/halfword access on FLEX_SPI_TDR writes one byte/halfword, see SPI Single Data Access for details.

Bit	31	30	29	28	27	26	25	24
								LASTXFER
Access								W
Reset								–

Bit	23	22	21	20	19	18	17	16
					PCS[3:0]			
Access					W	W	W	W
Reset					–	–	–	–

Bit	15	14	13	12	11	10	9	8
	TD[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	TD[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit 24 – LASTXFER Last Transfer
This field is only used if variable peripheral select is active (FLEX_SPI_MR.PS = 1).

Value	Description
0	No effect.
1	The current NPCS is de-asserted after the transfer of the character written in TD. When FLEX_SPI_CSRx.CSAAT is set, the communication with the current serial peripheral can be closed by raising the corresponding NPCS line as soon as TD transfer is completed.

Bits 19:16 – PCS[3:0] Peripheral Chip Select
This field is only used if variable peripheral select is active (FLEX_SPI_MR.PS = 1).
If FLEX_SPI_MR.PCSDEC = 0:
PCS = xxx0 NPCS[3:0] = 1110
PCS = xx01 NPCS[3:0] = 1101
PCS = x011 NPCS[3:0] = 1011
PCS = 0111 NPCS[3:0] = 0111
PCS = 1111 forbidden (no peripheral is selected)
(x = don't care)
If FLEX_SPI_MR.PCSDEC = 1:
NPCS[3:0] output signals = PCS

Bits 15:0 – TD[15:0] Transmit Data
Data to be transmitted by the SPI Interface is stored in this register. Information to be transmitted must be written to the transmit data register in a right-justified format.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.43.SPI Transmit Data Register (Multiple Data, 8- to 16-bit)

Name: FLEX_SPI_TDR (FIFO_MULTI_DATA)
Offset: 0x40C
Reset: –
Property: Write-only

To write multi-data, the FIFO must be enabled (FLEX_SPI_CR.FIFOEN=1) and FLEX_SPI_MR.PS=0. The access type (byte, halfword or word) determines the number of data written in a single access (1 or 2). See SPI Single Data Access for details.

Bit	31	30	29	28	27	26	25	24

					OVRES	MODF	TDRE	RDRF
Access					R	R	R	R
Reset					0	0	0	0

Bit 31 – RXFPTEF Receive FIFO Underflow Error Flag
See FIFO Overflow/Underflow Error for details.
This bit reads ‘0’ if the FIFO is disabled (see FLEX_SPI_CR to enable/disable the internal FIFO).

Value	Description
0	No Receive FIFO underflow occurred.
1	Receive FIFO underflow error occurred due to an incorrect software access (read data exceeding available data in FIFO). Receiver must be reset by writing FLEX_SPI_CR.SWRST=1.

Bit 30 – TXFPTEF Transmit FIFO Overflow Error Flag
See FIFO Overflow/Underflow Error for details.
This bit reads ‘0’ if the FIFO is disabled (see FLEX_SPI_CR to enable/disable the internal FIFO).

Value	Description
0	No Transmit FIFO overflow occurred.
1	Transmit FIFO overflow error occurred due to an incorrect software access (written data exceeding available space). Transceiver must be reset by writing FLEX_SPI_CR.SWRST=1.

Bit 29 – RXFTHF Receive FIFO Threshold Flag
This bit reads ‘0’ if the FIFO is disabled (see FLEX_SPI_CR to enable/disable the internal FIFO).

Value	Description
0	Number of unread data in Receive FIFO is below RXFTHRES threshold or RXFTH flag has been cleared.
1	Number of unread data in Receive FIFO has reached RXFTHRES threshold (changing states from “below threshold” to “equal to or above threshold”).

Bit 28 – RXFFF Receive FIFO Full Flag
This bit reads ‘0’ if the FIFO is disabled (see FLEX_SPI_CR to enable/disable the internal FIFO).

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Receive FIFO is not empty or RXFE flag has been cleared.
1	Receive FIFO has been filled (changing states from “not full” to “full”).

Bit 27 – RXFEF Receive FIFO Empty Flag
This bit reads ‘0’ if the FIFO is disabled (see FLEX_SPI_CR to enable/disable the internal FIFO).

Value	Description
0	Receive FIFO is not empty or RXFE flag has been cleared.
1	Receive FIFO has been emptied (changing states from “not empty” to “empty”).

Bit 26 – TXFTHF Transmit FIFO Threshold Flag (cleared on read)
This bit reads ‘0’ if the FIFO is disabled (see FLEX_SPI_CR to enable/disable the internal FIFO).

Value	Description
0	Number of data in Transmit FIFO is above TXFTHRES threshold.
1	Number of data in Transmit FIFO has reached TXFTHRES threshold since the last read of FLEX_SPI_SR.

Bit 25 – TXFFF Transmit FIFO Full Flag (cleared on read)
This bit reads ‘0’ if the FIFO is disabled (see FLEX_SPI_CR to enable/disable the internal FIFO).

Value	Description
0	Transmit FIFO is not full or TXFF flag has been cleared.
1	Transmit FIFO has been filled since the last read of FLEX_SPI_SR.

Bit 24 – TXFEF Transmit FIFO Empty Flag (cleared on read)
This bit reads ‘0’ if the FIFO is disabled (see FLEX_SPI_CR to enable/disable the internal FIFO).

Value	Description
0	Transmit FIFO is not empty.
1	Transmit FIFO has been emptied since the last read of FLEX_SPI_SR.

Bit 16 – SPIENS SPI Enable Status

Value	Description
0	SPI is disabled.
1	SPI is enabled.

Bit 14 – SECE Security/Safety Error (cleared on read)

Value	Description
0	No error detected on NPCS0/MOSI and/or SPCK pad output and no access violation of a write-protected register since the last read of FLEX_SPI_SR.
1	An error has been detected on TXD and/or SCK pad output (FLEX_SPI_WPSR.PADERR=1) and/or a violation of a write-protected register (FLEX_SPI_WPSR.WPVS=1) since the last read of FLEX_SPI_SR.

Bit 12 – SFERR Client Mode Frame Error (cleared on read)

Value	Description
0	No frame error has been detected for a client access since the last read of FLEX_SPI_SR.
1	In Client mode, the chip select raised while the character defined in FLEX_SPI_CSR0.BITS was not complete.

Bit 11 – CMP Comparison Status (cleared on read)

Value	Description
0	No received character matched the comparison criteria programmed in VAL1 and VAL2 fields in FLEX_SPI_CMPR since the last read of FLEX_SPI_SR.
1	A received character matched the comparison criteria since the last read of FLEX_SPI_SR.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 10 – UNDES Underrun Error Status (Client mode only) (cleared on read)

Value	Description
0	No underrun has been detected since the last read of FLEX_SPI_SR.
1	A transfer starts whereas no data has been loaded in FLEX_SPI_TDR, cleared when FLEX_SPI_SR is read.

Bit 9 – TXEMPTY Transmission Registers Empty (cleared by writing FLEX_SPI_TDR)

Value	Description
0	As soon as data is written in FLEX_SPI_TDR.
1	FLEX_SPI_TDR and internal shift register are empty. If a transfer delay has been defined, TXEMPTY is set after the end of this delay.

Bit 8 – NSSR NSS Rising (cleared on read)

Value	Description
0	No rising edge detected on NSS pin since the last read of FLEX_SPI_SR.
1	A rising edge occurred on NSS pin since the last read of FLEX_SPI_SR.

Bit 3 – OVRES Overrun Error Status (cleared on read)

An overrun occurs when FLEX_SPI_RDR is loaded at least twice from the shift register since the last read of FLEX_SPI_RDR.

Value	Description
0	No overrun has been detected since the last read of FLEX_SPI_SR.
1	An overrun has occurred since the last read of FLEX_SPI_SR.

Bit 2 – MODF Mode Fault Error (cleared on read)

Value	Description
0	No mode fault has been detected since the last read of FLEX_SPI_SR.
1	A mode fault occurred since the last read of FLEX_SPI_SR.

Bit 1 – TDRE Transmit Data Register Empty (cleared by writing FLEX_SPI_TDR)

When FIFOs are disabled:
0: Data has been written to FLEX_SPI_TDR and not yet transferred to the internal shift register.
1: The last data written to FLEX_SPI_TDR has been transferred to the internal shift register.
TDRE is cleared when the SPI is disabled or at reset. Enabling the SPI sets the TDRE flag.
When FIFOs are enabled:
0: Transmit FIFO cannot accept more data.
1: Transmit FIFO can accept data; one or more data can be written according to TXRDYM field configuration.
TDRE behavior with FIFOs enabled is illustrated in TXEMPTY, TDRE and RDRF Behavior.

Bit 0 – RDRF Receive Data Register Full (cleared by reading FLEX_SPI_RDR)

When FIFOs are disabled:
0: No data has been received since the last read of FLEX_SPI_RDR.
1: Data has been received and the received data has been transferred from the internal shift register to FLEX_SPI_RDR since the last read of FLEX_SPI_RDR.
When FIFOs are enabled:
0: Receive FIFO is empty; no data to read.
1: At least one unread data is in the Receive FIFO.
RDRF behavior with FIFOs enabled is illustrated in TXEMPTY, TDRE and RDRF Behavior.

74.10.45.SPI Interrupt Enable Register

Name: FLEX_SPI_IER
Offset: 0x414
Reset: –
Property: Write-only

This register can only be written if the WPITEN bit is cleared in the SPI Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24

74.10.48.SPI Chip Select Register

Name: FLEX_SPI_CSRx
Offset: 0x0430 + x*0x04 [x=0..3]
Reset: 0x00000000
Property: R/W

This register can only be written if the WPEN bit is cleared in the SPI Write Protection Mode Register.

FLEX_SPI_CSRx must be written even if the user wants to use the default reset values. The BITS field is not updated with the translated value unless the register is written.

Bit	31	30	29	28	27	26	25	24
	DLYBCT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	SCBR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	BITS[3:0]				CSAAT	CSNAAT	NCPHA	CPOL
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:24 – DLYBCT[7:0] Delay Between Consecutive Transfers
This field defines the delay between two consecutive transfers with the same peripheral without removing the chip select. The delay is always inserted after each transfer and before removing the chip select if needed.
When DLYBCT = 0, no delay between consecutive transfers is inserted and the clock keeps its duty cycle over the character transfers.
Otherwise, the following equations determine the delay:
If FLEX_SPI_MR.BRSRCCLK = 0: DLYBCT = Delay Between Consecutive Transfers × $f_{peripheral\ clock}$ / 32
If FLEX_SPI_MR.BRSRCCLK = 1: DLYBCT = Delay Between Consecutive Transfers × f_{GCLK} / 32

Bits 23:16 – DLYBS[7:0] Delay Before SPCK
This field defines the delay from NPCS falling edge (activation) to the first valid SPCK transition.
When DLYBS = 0, the delay is half the SPCK clock period.
Otherwise, the following equations determine the delay:
If FLEX_SPI_MR.BRSRCCLK = 0: DLYBS = Delay Before SPCK × $f_{peripheral\ clock}$
If FLEX_SPI_MR.BRSRCCLK = 1: DLYBS = Delay Before SPCK × f_{GCLK}

Bits 15:8 – SCBR[7:0] Serial Clock Bit Rate
In Host mode, the SPI Interface uses a modulus counter to derive the SPCK bit rate from the clock defined by the bit BRSRCCLK. The bit rate is selected by writing a value from 1 to 255 in the SCBR field. The following equations determine the SPCK bit rate:
If FLEX_SPI_MR.BRSRCCLK = 0: SCBR = $f_{peripheral\ clock}$ / SPCK Bit Rate
If FLEX_SPI_MR.BRSRCCLK = 1: SCBR = f_{GCLK} / SPCK Bit Rate

© 2025 Microchip Technology Inc. and its subsidiaries

Programming the SCBR field to 0 is forbidden. Triggering a transfer while SCBR is at 0 can lead to unpredictable results.
If BRSRCCLK = 1 in FLEX_SPI_MR, SCBR must be programmed with a value greater than 1.
At reset, SCBR is 0 and the user has to program it at a valid value before performing the first transfer.
Note: If one of the FLEX_SPI_CSRx.SCBR fields is set to 1, the other FLEX_SPI_CSRx.SCBR fields must be set to 1 as well, if they are used to process transfers. If they are not used to transfer data, they can be set at any value.

Bits 7:4 – BITS[3:0] Bits Per Transfer
See Note.
The BITS field determines the number of data bits transferred. Reserved values should not be used.

Value	Name	Description
0	8_BIT	8 bits for transfer
1	9_BIT	9 bits for transfer
2	10_BIT	10 bits for transfer
3	11_BIT	11 bits for transfer
4	12_BIT	12 bits for transfer
5	13_BIT	13 bits for transfer
6	14_BIT	14 bits for transfer
7	15_BIT	15 bits for transfer
8	16_BIT	16 bits for transfer
9–15	Reserved	

Bit 3 – CSAAT Chip Select Active After Transfer

Value	Description
0	The Peripheral Chip Select Line rises as soon as the last transfer is achieved.
1	The Peripheral Chip Select does not rise after the last transfer is achieved. It remains active until a new transfer is requested on a different chip select.

Bit 2 – CSNAAT Chip Select Not Active After Transfer (Ignored if CSAAT = 1)
If FLEX_SPI_MR.BRSRCCLK = 0: $\frac{\text{DLYBCS}}{\text{f}_{\text{peripheral clock}}}$(if DLYBCS ≠ 0)
If FLEX_SPI_MR.BRSRCCLK = 1: $\frac{\text{DLYBCS}}{\text{f}_{GCLK}}$
If DLYBCS < 6, a minimum of six periods is introduced.

Value	Description
0	The Peripheral Chip Select does not rise between two transfers if the FLEX_SPI_TDR is reloaded before the end of the first transfer and if the two transfers occur on the same Chip Select.
1	The Peripheral Chip Select rises systematically after each transfer performed on the same client. It remains inactive after the end of transfer for a minimal duration of:

Bit 1 – NCPHA Clock Phase
NCPHA determines which edge of SPCK causes data to change and which edge causes data to be captured. NCPHA is used with CPOL to produce the required clock/data relationship between host and client devices.

Value	Description
0	Data are changed on the leading edge of SPCK and captured on the following edge of SPCK.
1	Data are captured on the leading edge of SPCK and changed on the following edge of SPCK.

Bit 0 – CPOL Clock Polarity
CPOL is used to determine the inactive state value of the serial clock (SPCK). It is used with NCPHA to produce the required clock/data relationship between host and client devices.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	The inactive state value of SPCK is logic level zero.
1	The inactive state value of SPCK is logic level one.

74.10.49.SPI FIFO Mode Register

Name: FLEX_SPI_FMR
Offset: 0x440
Reset: 0x00000000
Property: Read/Write

This register reads '0' if the FIFO is disabled (see FLEX_SPI_CR to enable/disable the internal FIFO)

Bit	31	30	29	28	27	26	25	24
			RXFTHRES[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
			TXFTHRES[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
			RXRDYM[1:0]				TXRDYM[1:0]	
Access			R/W	R/W			R/W	R/W
Reset			0	0			0	0

Bits 29:24 – RXFTHRES[5:0] Receive FIFO Threshold

Value	Description
0–32	Defines the Receive FIFO threshold value (number of data). The FLEX_SPI_SR.RXFTH flag will be set when Receive FIFO goes from "below" threshold state to "equal to or above" threshold state.

Bits 21:16 – TXFTHRES[5:0] Transmit FIFO Threshold

Value	Description
0–32	Defines the Transmit FIFO threshold value (number of data). The FLEX_SPI_SR.TXFTH flag will be set when Transmit FIFO goes from "above" threshold state to "equal to or below" threshold state.

Bits 5:4 – RXRDYM[1:0] Receive Data Register Full Mode
If FIFOs are enabled, the FLEX_SPI_SR.RDRF flag behaves as follows.

Value	Name	Description
0	ONE_DATA	RDRF will be at level '1' when at least one unread data is in the receive FIFO. When DMA is enabled to transfer data and FLEX_SPI_CSR0.BITS=0 (8 bits transferred on SPI line), the chunk of 1 byte must be configured in the DMA. When FLEX_SPI_CSR0.BITS>0 (9 to 16 bits transferred on SPI line), the chunk of 1 halfword must be configured in the DMA. If the transfer is performed by software, the access type can be defined as byte or halfword depending on FLEX_SPI_CSR0.BITS.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
1	TWO_DATA	RDRF will be at level '1' when at least two unread data are in the receive FIFO. To minimize system bus load, when DMA is enabled to transfer data and FLEX_SPI_CSR0.BITS=0 (8 bits transferred on SPI line), the chunk of 1 halfword (1 halfword carries 2 bytes) must be configured in the DMA. When FLEX_SPI_CSR0.BITS>0 (9 to 16 bits transferred on SPI line), the chunk of 1 word (1 word carries 2 halfwords) must be configured in the DMA. If the transfer is performed by software, the access type can be defined as halfword (2 bytes per access, 1 access when FLEX_SPI_CSR0.BITS=0), or word (2 halfwords per access, 2 accesses when FLEX_SPI_CSR0.BITS>0).
2	FOUR_DATA	RDRF will be at level '1' when at least four unread data are in the receive FIFO. To minimize system bus load, when DMA is enabled to transfer data and FLEX_SPI_CSR0.BITS=0 (8 bits transferred on SPI line), the chunk of 1 word (1 halfword carries 4 bytes) must be configured in the DMA. When FLEX_SPI_CSR0.BITS>0 (9 to 16 bits transferred on SPI line), the chunk of 2 words (1 word carries 4 bytes) must be configured in the DMA. If the transfer is performed by software, the access type can be defined as word (4 bytes per access, 1 access when FLEX_SPI_CSR0.BITS=0 or 2 halfwords per access, 2 accesses when FLEX_SPI_CSR0.BITS>0).
3	EIGHT_DATA	RDRF will be at level '1' when at least eight unread data are in the receive FIFO. To minimize system bus load, when DMA is enabled to transfer data and FLEX_SPI_CSR0.BITS=0 (8 bits transferred on SPI line), the chunk of 2 words (1 halfword carries 4 bytes) must be configured in the DMA. When FLEX_SPI_CSR0.BITS>0 (9 to 16 bits transferred on SPI line), the chunk of 4 words (1 word carries 4 bytes) must be configured in the DMA. If the transfer is performed by software, the access type can be defined as word (4 bytes per access, 2 accesses when FLEX_SPI_CSR0.BITS=0 or 2 halfwords per access, 4 accesses when FLEX_SPI_CSR0.BITS>0).

Bits 1:0 – TXRDYM[1:0] Transmit Data Register Empty Mode
If FIFOs are enabled, the FLEX_SPI_SR.TDRE flag behaves as follows.

Value	Name	Description
0	ONE_DATA	TDRE will be at level '1' when at least one data can be written in the transmit FIFO. When DMA is enabled to transfer data, the chunk of 1 data (byte or halfword) must be configured in the DMA depending on FLEX_SPI_CSR0.BITS. If the transfer is performed by software, the access type (byte, halfword) must be defined depending on FLEX_SPI_CSR0.BITS.
1	TWO_DATA	TDRE will be at level '1' when at least two data can be written in the transmit FIFO. To minimize system bus load, when DMA is enabled to transfer data, the chunk of 1 word (1 word carries 2 data) must be configured in the DMA. If the transfer is performed by software, the access type must be defined as word (2 data per access, 1 access).
2	FOUR_DATA	TDRE will be at level '1' when at least four unread data can be written in the transmit FIFO. To minimize system bus load, when DMA is enabled to transfer data, the chunk of 2 words (1 word carries 2 data) must be configured in the DMA. If the transfer is performed by software, the access type must be defined as word (2 data per access, 2 accesses).
3	EIGHT_DATA	TDRE will be at level '1' when at least eight data can be written in the transmit FIFO. To minimize system bus load, when DMA is enabled to transfer data, the chunk of 4 words (1 word carries 2 data) must be configured in the DMA. If the transfer is performed by software, the access type must be defined as word (2 data per access, 4 accesses).

74.10.50.SPI FIFO Level Register

Name: FLEX_SPI_FLR
Offset: 0x444
Reset: 0x00000000
Property: Read-only

This register reads '0' if the FIFO is disabled (see FLEX_SPI_CR to enable/disable the internal FIFO).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
			RXFL[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
			TXFL[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bits 21:16 – RXFL[5:0] Receive FIFO Level

Value	Description
0	There is no unread data in the Receive FIFO.
1–32	Indicates the number of unread data in the Receive FIFO.

Bits 5:0 – TXFL[5:0] Transmit FIFO Level

Value	Description
0	There is no data in the Transmit FIFO.
1–32	Indicates the number of data in the Transmit FIFO.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.51.SPI Comparison Register

Name: FLEX_SPI_CMPR
Offset: 0x448
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the SPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	VAL2[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	VAL2[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	VAL1[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	VAL1[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:16 – VAL2[15:0] Second Comparison Value for Received Character

Value	Description
0–65535	The received character must be lower than or equal to the value of VAL2 and higher than or equal to VAL1 to set the FLEX_SPI_CSR.CMP flag. If asynchronous partial wakeup is enabled in PMC_SLPWK_ER, the SPI requests a system wakeup if condition is met.

Bits 15:0 – VAL1[15:0] First Comparison Value for Received Character

Value	Description
0–65535	The received character must be higher than or equal to the value of VAL1 and lower than or equal to VAL2 to set the FLEX_SPI_SR.CMP flag. If asynchronous partial wakeup is enabled in PMC_SLPWK_ER, the SPI requests a system wakeup if the condition is met.

Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
						WPCREN	WPITEN	WPEN
Access						R/W	R/W	R/W
Reset						0	0	0

Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x535049	PASSWD	Writing any other value in this field aborts the write operation of bits WPEN, WPITEN and WPCREN. Always reads as 0.

Bit 2 – WPCREN Write Protection Control Enable

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to 0x535049 (“SPI” in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x535049 (“SPI” in ASCII).

Bit 1 – WPITEN Write Protection Interrupt Enable

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x535049 (“SPI” in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x535049 (“SPI” in ASCII).

Bit 0 – WPEN Write Protection Enable

See SPI Register Write Protection for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x535049 (“SPI” in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x535049 (“SPI” in ASCII).

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.53.SPI Write Protection Status Register

Name: FLEX_SPI_WPSR
Offset: 0x4E8
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	WPVSRC[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
							PADERR	WPVS
Access							R	R
Reset							0	0

Bits 15:8 – WPVSRC[7:0] Write Protection Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

Bit 1 – PADERR Output Pad Error (cleared on read)

Value	Description
0	No error detected during a character transfer.
1	Two successive bit periods with a difference between the data read at the output of the MOSI or NPCS0 pad buffers and the corresponding inputs driven by SPI or abnormal number of SPCK edges (or no clock edge) at the output of SPCK pad buffer in synchronous mode. This may be due to erroneous IO multiplexing configuration, external short circuits, etc.

Bit 0 – WPVS Write Protection Violation Status

Value	Description
0	No write protect violation has occurred since the last read of FLEX_SPI_WPSR.
1	A write protect violation has occurred since the last read of FLEX_SPI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.54.TWI Control Register (Default Mode)

Name: FLEX_TWI_CR (DEFAULT_MODE)
Offset: 0x600
Reset: –
Property: Write-only

This register can only be written if the WPCREN bit is cleared in the TWI Write Protection Mode register.

Bit	31	30	29	28	27	26	25	24
			FIFODIS	FIFOEN		LOCKCLR		THRCLR
Access			W	W		W		W
Reset			–	–		–		–

Bit	23	22	21	20	19	18	17	16
					SCLRBE	SCLRBD	ACMDIS	ACMEN
Access					W	W	W	W
Reset					–	–	–	–

Bit	15	14	13	12	11	10	9	8
	CLEAR	PECRQ	PECDIS	PECEN	SMBDIS	SMBEN	HSDIS	HSEN
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	SWRST	QUICK	SVDIS	SVEN	MSDIS	MSEN	STOP	START
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit 29 – FIFODIS FIFO Disable

Value	Description
0	No effect.
1	Disable the Transmit and Receive FIFOs

Bit 28 – FIFOEN FIFO Enable

Value	Description
0	No effect.
1	Enable the Transmit and Receive FIFOs

Bit 26 – LOCKCLR Lock Clear

Value	Description
0	No effect.
1	Clear the TWI FSM lock.

Bit 24 – THRCLR Transmit Holding Register Clear

Value	Description
0	No effect.
1	Clear the Transmit Holding register and set TXRDY, TXCOMP flags.

Bit 19 – SCLRBE SCL Rise Boost Enable

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	SCL rise time is boosted in High-Speed mode. Duration of the boost is configured with FLEX_TWI_MMR.SCLRBL. See SCL Rising Time Control for details.

Bit 18 – SCLRBD SCL Rise Boost Disable

Value	Description
0	No effect.
1	SCL rise time boost is disabled. See SCL Rising Time Control for details.

Bit 17 – ACMDIS Alternative Command Mode Disable

Value	Description
0	No effect.
1	Alternative Command mode disabled.

Bit 16 – ACMEN Alternative Command Mode Enable

Value	Description
0	No effect.
1	Alternative Command mode enabled.

Bit 15 – CLEAR Bus CLEAR Command

When TWD (SDA)=0, the Bus Clear command must be performed via the PIO. When TWCK=0, no Bus Clear command can be issued.

Value	Description
0	No effect.
1	When Host mode is enabled and TWD (SDA)=1, sends a Bus Clear command.

Bit 14 – PECRQ PEC Request

Value	Description
0	No effect.
1	A PEC check or transmission is requested.

Bit 13 – PECDIS Packet Error Checking Disable

Value	Description
0	No effect.
1	SMBus PEC (CRC) generation and check disabled.

Bit 12 – PECEN Packet Error Checking Enable

Value	Description
0	No effect.
1	SMBus PEC (CRC) generation and check enabled.

Bit 11 – SMBDIS SMBus Mode Disabled

Value	Description
0	No effect.
1	SMBus mode disabled.

Bit 10 – SMBEN SMBus Mode Enabled

Value	Description
0	No effect.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
1	If SMBDIS = 0, SMBus mode enabled.

Bit 9 – HSDIS TWI High-Speed Mode Disabled

Value	Description
0	No effect.
1	High-speed mode disabled.

Bit 8 – HSEN TWI High-Speed Mode Enabled

Value	Description
0	No effect.
1	High-speed mode enabled.

Bit 7 – SWRST Software Reset

Value	Description
0	No effect.
1	Equivalent to a system reset.

Bit 6 – QUICK SMBus Quick Command

Value	Description
0	No effect.
1	If Host mode is enabled, an SMBus Quick Command is sent.

Bit 5 – SVDIS TWI Client Mode Disabled

Value	Description
0	No effect.
1	Client mode is disabled. The shifter and holding characters (if it contains data) are transmitted in the case of a read operation. In a write operation, the character being transferred must be completely received before disabling.

Bit 4 – SVEN TWI Client Mode Enabled
Switching from Host to Client mode is only permitted when TXCOMP = 1.

Value	Description
0	No effect.
1	Enables Client mode (SVDIS must be written to 0).

Bit 3 – MSDIS TWI Host Mode Disabled

Value	Description
0	No effect.
1	Host mode is disabled, all pending data is transmitted. The shifter and holding characters (if it contains data) are transmitted in case of write operation. In read operation, the character being transferred must be completely received before disabling.

Bit 2 – MSEN TWI Host Mode Enabled
Switching from Client to Host mode is only permitted when TXCOMP = 1.

Value	Description
0	No effect.
1	Enables Host mode (MSDIS must be written to 0).

Bit 1 – STOP Send a STOP Condition

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	STOP condition is sent just after completing the current byte transmission in Host Read mode. – In single data byte host read, both START and STOP must be set. – In multiple data bytes host read, the STOP must be set after the last data received but one. – In Host Read mode, if a NACK bit is received, the STOP is automatically performed. – In host data write operation, a STOP condition will be sent after the transmission of the current data is finished.

Bit 0 – START Send a START Condition

This action is necessary when the TWI peripheral needs to read data from a client. When configured in Host mode with a write operation, a frame is sent as soon as the user writes a character in the Transmit Holding register (FLEX_TWI_THR).

Value	Description
0	No effect.
1	A frame beginning with a START bit is transmitted according to the features defined in the TWI Host Mode register (FLEX_TWI_MMR).

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.55.TWI Control Register (FIFO_ENABLED)

Name: FLEX_TWI_CR (FIFO_ENABLED)
Offset: 0x600
Reset: –
Property: Write-only

If FIFO is enabled (FLEX_US_CR.FIFOEN=1), see TWI Multiple Data Access for details.

Bit	31	30	29	28	27	26	25	24
			FIFODIS	FIFOEN		TXFLCLR	RXFCLR	TXFCLR
Access			W	W		W	W	W
Reset			–	–		–	–	–

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit 29 – FIFODIS FIFO Disable

Value	Description
0	No effect.
1	Disable the Transmit and Receive FIFOs.

Bit 28 – FIFOEN FIFO Enable

Value	Description
0	No effect.
1	Enable the Transmit and Receive FIFOs.

Bit 26 – TXFLCLR Transmit FIFO Lock CLEAR

Value	Description
0	No effect.
1	Clears the Transmit FIFO Lock.

Bit 25 – RXFCLR Receive FIFO Clear

Value	Description
0	No effect.
1	Empties the Receive FIFO.

Bit 24 – TXFCLR Transmit FIFO Clear

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	Empties the Transmit FIFO.

Bit 17 – ACMDIS Alternative Command Mode Disable

Value	Description
0	No effect.
1	Alternative Command mode disabled.

Bit 16 – ACMEN Alternative Command Mode Enable

Value	Description
0	No effect.
1	Alternative Command mode enabled.

Bit 15 – CLEAR Bus CLEAR Command

Value	Description
0	No effect.
1	If Host mode is enabled, send a bus clear command.

Bit 14 – PECRQ PEC Request

Value	Description
0	No effect.
1	A PEC check or transmission is requested.

Bit 13 – PECDIS Packet Error Checking Disable

Value	Description
0	No effect.
1	SMBus PEC (CRC) generation and check disabled.

Bit 12 – PECEN Packet Error Checking Enable

Value	Description
0	No effect.
1	SMBus PEC (CRC) generation and check enabled.

Bit 11 – SMBDIS SMBus Mode Disabled

Value	Description
0	No effect.
1	SMBus mode disabled.

Bit 10 – SMBEN SMBus Mode Enabled

Value	Description
0	No effect.
1	If SMBDIS = 0, SMBus mode enabled.

Bit 9 – HSDIS TWI High-Speed Mode Disabled

Value	Description
0	No effect.
1	High-speed mode disabled.

Bit 8 – HSEN TWI High-Speed Mode Enabled

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	High-speed mode enabled.

Bit 7 – SWRST Software Reset

Value	Description
0	No effect.
1	Equivalent to a system reset.

Bit 6 – QUICK SMBus Quick Command

Value	Description
0	No effect.
1	If Host mode is enabled, a SMBus Quick Command is sent.

Bit 5 – SVDIS TWI Client Mode Disabled

Value	Description
0	No effect.
1	Client mode is disabled. The shifter and holding characters (if it contains data) are transmitted in the case of a read operation. In a write operation, the character being transferred must be completely received before disabling.

Bit 4 – SVEN TWI Client Mode Enabled

Switching from Host to Client mode is only permitted when TXCOMP = 1.

Value	Description
0	No effect.
1	Enables Client mode (SVDIS must be written to 0).

Bit 3 – MSDIS TWI Host Mode Disabled

Value	Description
0	No effect.
1	Host mode is disabled, all pending data is transmitted. The shifter and holding characters (if it contains data) are transmitted in the case of a write operation. In a read operation, the character being transferred must be completely received before disabling.

Bit 2 – MSEN TWI Host Mode Enabled

Switching from Client to Host mode is only permitted when TXCOMP = 1.

Value	Description
0	No effect.
1	Enables Host mode (MSDIS must be written to 0).

Bit 1 – STOP Send a STOP Condition

Value	Description
0	No effect.
1	STOP condition is sent just after completing the current byte transmission in Host Read mode. – In single data byte host read, both START and STOP must be set. – In multiple data bytes host read, the STOP must be set after the last data received but one. – In Host Read mode, if a NACK bit is received, the STOP is automatically performed. – In host data write operation, a STOP condition will be sent after the transmission of the current data is finished.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 0 – START Send a START Condition

This action is necessary when the TWI peripheral needs to read data from a client. When configured in Host mode with a write operation, a frame is sent as soon as the user writes a character in the Transmit Holding register (FLEX_TWI_THR).

Value	Description
0	No effect.
1	A frame beginning with a START bit is transmitted according to the features defined in the TWI Host Mode register (FLEX_TWI_MMR).

© 2025 Microchip Technology Inc. and its subsidiaries

Access		R/W	R/W	R/W			R/W	R/W
Reset		0	0	0			0	0

Bit	7	6	5	4	3	2	1	0
Access								
Reset								

Bit 24 – NOAP No Auto-Stop On NACK Error

Value	Description
0	A stop condition is sent automatically upon Not-Acknowledge error detection.
1	No automatic action is performed upon Not-Acknowledge error detection.

Bits 22:16 – DADR[6:0] Device Address
The device address is used to access client devices in Read or Write mode. Those bits are only used in Host mode.

Bits 14:13 – SCLRBL[1:0] SCL Rise Boost Level
Number of clock periods during which SCL rise is boosted (meaning line driven to level ‘1’).

Bit 12 – MREAD Host Read Direction

Value	Description
0	Host write direction.
1	Host read direction.

Bits 9:8 – IADRSZ[1:0] Internal Device Address Size

Value	Name	Description
0	NONE	No internal device address
1	1_BYTE	One-byte internal device address
2	2_BYTE	Two-byte internal device address
3	3_BYTE	Three-byte internal device address

74.10.57.TWI Client Mode Register

Name: FLEX_TWI_SMR
Offset: 0x608
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the TWI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	DATAMEN	SADR3EN	SADR2EN	SADR1EN				
Access	R/W	R/W	R/W	R/W				
Reset	0	0	0	0				

Bit	23	22	21	20	19	18	17	16
		SADR[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
		MASK[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	SNIFF	SCLWSDIS	BSEL	SADAT	SMHH	SMDA		NACKEN
Access	R/W	R/W	R/W	R/W	R/W	R/W		R/W
Reset	0	0	0	0	0	0		0

Bit 31 – DATAMEN Data Matching Enable

Value	Description
0	Data matching on first received data is disabled.
1	Data matching on first received data is enabled.

Bit 30 – SADR3EN Client Address 3 Enable

Value	Description
0	Client address 3 matching is disabled.
1	Client address 3 matching is enabled.

Bit 29 – SADR2EN Client Address 2 Enable

Value	Description
0	Client address 2 matching is disabled.
1	Client address 2 matching is enabled.

Bit 28 – SADR1EN Client Address 1 Enable

Value	Description
0	Client address 1 matching is disabled.
1	Client address 1 matching is enabled.

© 2025 Microchip Technology Inc. and its subsidiaries

Bits 22:16 – SADR[6:0] Client Address

The client device address is used in Client mode in order to be accessed by host devices in Read or Write mode.
SADR must be programmed before enabling Client mode or after a general call. Writes at other times have no effect.

Bits 14:8 – MASK[6:0] Client Address Mask

A mask can be applied on the client device address in Client mode in order to allow multiple address answer. For each bit of the MASK field set to one, the corresponding SADR bit will be masked.
If the MASK field is set to 0, no mask is applied to the SADR field.

Bit 7 – SNIFF Client Sniffer Mode

Value	Description
0	Client Sniffer mode is disabled.
1	Client Sniffer mode is enabled.

Bit 6 – SCLWSDIS Clock Wait State Disable

Value	Description
0	No effect.
1	Clock stretching disabled in Client mode, OVRE and UNRE will indicate overrun and underrun.

Bit 5 – BSEL TWI Bus Selection

Value	Description
0	TWI analyzes the TWCK and TWD pins from its TWI bus.
1	TWIn analyzes the TWCK and TWD pins of the peripheral TWIn+1 (TWImax analyzes TWI0).

Bit 4 – SADAT Client Address Treated as Data

When Client Sniffer Mode is enabled, the client address is always received as data in FLEX_TWI_RHR and SADAT has no effect.

Value	Description
0	Client address is handled normally (will not trig RXRDY flag and will not fill FLEX_TWI_RHR upon reception).
1	Client address is handled as data field, RXRDY will be set and FLEX_TWI_RHR filled upon client address reception.

Bit 3 – SMHH SMBus Host Header

Value	Description
0	Acknowledge of the SMBus Host Header disabled.
1	Acknowledge of the SMBus Host Header enabled.

Bit 2 – SMDA SMBus Default Address

Value	Description
0	Acknowledge of the SMBus Default Address disabled.
1	Acknowledge of the SMBus Default Address enabled.

Bit 0 – NACKEN Client Receiver Data Phase NACK Enable

Value	Description
0	Normal value to be returned in the ACK cycle of the data phase in Client Receiver mode.
1	NACK value to be returned in the ACK cycle of the data phase in Client Receiver mode.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.58.TWI Internal Address Register

Name: FLEX_TWI_IADR
Offset: 0x60C
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	IADR[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	IADR[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	IADR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 23:0 – IADR[23:0] Internal Address
0, 1, 2 or 3 bytes depending on IADRSZ.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.59.TWI Clock Waveform Generator Register

Name: FLEX_TWI_CWGR
Offset: 0x610
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the TWI Write Protection Mode Register.

FLEX_TWI_CWGR is only used in Host mode.

Bit	31	30	29	28	27	26	25	24
			HOLD[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
				BRSRCCLK		CKDIV[2:0]		
Access				R/W		R/W	R/W	R/W
Reset				0		0	0	0
Bit	15	14	13	12	11	10	9	8
	CHDIV[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	CLDIV[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 29:24 – HOLD[5:0] TWD Hold Time Versus TWCK Falling
If High-speed mode is selected TWD is internally modified on the TWCK falling edge to meet the I2C specified maximum hold time, else if High-speed mode is not configured TWD is kept unchanged after TWCK falling edge for a period of (HOLD + 3) × $t_{peripheral\ clock}$.

Bit 20 – BRSRCCLK Bit Rate Source Clock

Value	Name	Description
0	PERIPH_CLK	The peripheral clock is the source clock for the bit rate generation.
1	GCLK	GCLK is the source clock for the bit rate generation, thus the bit rate can be independent of the core/peripheral clock.

Bits 18:16 – CKDIV[2:0] Clock Divider
The CKDIV is used to increase both SCL high and low periods.

Bits 15:8 – CHDIV[7:0] Clock High Divider
The SCL high period is defined as follows:
If FLEX_TWI_FILTR.FILT = 0

- If BRSRCCLK = 0: CHDIV = $((t_{high}/t_{peripheral\ clock}) - 3)/2^{CKDIV}$
- If BRSRCCLK = 1: CHDIV = $(t_{high}/t_{ext_ck})/2^{CKDIV}$

If FLEX_TWI_FILTR.FILT = 1

- If BRSRCCLK = 0: CHDIV = $((t_{high}/t_{peripheral\ clock}) - 3 - (THRES+1))/2^{CKDIV}$

© 2025 Microchip Technology Inc. and its subsidiaries

- If BRSRCCLK = 1: CHDIV = ((t_{high} - (THRES+1) * $t_{peripheral\ clock}$)/t_{ext_ck})/2^{CKDIV}

Bits 7:0 – CLDIV[7:0] Clock Low Divider

The SCL low period is defined as follows:

If FLEX_TWI_FILTR.FILT = 0

- If BRSRCCLK = 0: CLDIV = ((t_{low}/$t_{peripheral\ clock}$) - 3)/2^{CKDIV}
- If BRSRCCLK = 1: CLDIV = (t_{low}/t_{ext_ck})/2^{CKDIV}

If FLEX_TWI_FILTR.FILT = 1

- If BRSRCCLK = 0: CLDIV = ((t_{low}/$t_{peripheral\ clock}$) - 3 - (THRES+1))/2^{CKDIV}
- If BRSRCCLK = 1: CLDIV = ((t_{low} - (THRES+1) * $t_{peripheral\ clock}$)/t_{ext_ck})/2^{CKDIV}

74.10.60.TWI Status Register (Default Mode)

Name: FLEX_TWI_SR (DEFAULT_MODE)
Offset: 0x620
Reset: 0x03000009
Property: Read-only

Bit	31	30	29	28	27	26	25	24
				SECE		SR	SDA	SCL
Access				R		R	R	R
Reset				0		0	1	1

Bit	23	22	21	20	19	18	17	16
	LOCK		SMBHHM	SMBDAM	PECERR	TOUT		MCACK
Access	R		R	R	R	R		R
Reset	0		0	0	0	0		0

Bit	15	14	13	12	11	10	9	8
					EOSACC	SCLWS	ARBLST	NACK
Access					R	R	R	R
Reset					0	0	0	0

Bit	7	6	5	4	3	2	1	0
	UNRE	OVRE	GACC	SVACC	SVREAD	TXRDY	RXRDY	TXCOMP
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	1	0	0	1

Bit 28 – SECE Security/Safety Error (cleared on read)

Value	Description
0	No error detected on TWD and/or TWCK pad output and no access violation of a write-protected register since the last read of FLEX_TWI_SR.
1	An error has been detected on TWD and/or TWCK pad output (FLEX_TWI_WPSR.PADERR=1) and/or a violation of a write-protected register (FLEX_TWI_WPSR.WPVS=1) since the last read of FLEX_TWI_SR.

Bit 26 – SR Start Repeated

Value	Description
0	No repeated start has been detected since last FLEX_TWI_SR read.
1	At least one repeated start has been detected since last FLEX_TWI_SR read.

Bit 25 – SDA SDA Line Value

Value	Description
0	SDA line sampled value is ‘0’.
1	SDA line sampled value is ‘1’.

Bit 24 – SCL SCL Line Value

Value	Description
0	SCL line sampled value is ‘0’.
1	SCL line sampled value is ‘1.’

Bit 23 – LOCK TWI Lock Due to Frame Errors

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	The TWI is not locked.
1	The TWI is locked due to frame errors (see Handling Errors in Alternative Command and TWI FIFOs).

Bit 21 – SMBHHM SMBus Host Header Address Match (cleared on read)

Value	Description
0	No SMBus Host Header Address received.
1	A SMBus Host Header Address was received.

Bit 20 – SMBDAM SMBus Default Address Match (cleared on read)

Value	Description
0	No SMBus Default Address received.
1	A SMBus Default Address was received.

Bit 19 – PECERR PEC Error (cleared on read)

Value	Description
0	No SMBus PEC error occurred.
1	A SMBus PEC error occurred.

Bit 18 – TOUT Timeout Error (cleared on read)

Value	Description
0	No SMBus timeout occurred.
1	SMBus timeout occurred.

Bit 16 – MCACK Host Code Acknowledge (cleared on read)
MACK used in Client mode:

Value	Description
0	No host code has been received.
1	A host code has been received.

Bit 11 – EOSACC End Of Client Access (cleared on read)
This bit is only used in Client mode.
EOSACC behavior can be seen in figures Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

Value	Description
0	A client access is being performed.
1	Client Access is finished. End Of Client Access is automatically set as soon as SVACC is reset.

Bit 10 – SCLWS Clock Wait State
This bit is only used in Client mode.
SCLWS behavior can be seen in figures Clock Stretching in Read Mode and Clock Stretching in Write Mode.

Value	Description
0	The clock is not stretched.
1	The clock is stretched. FLEX_TWI_THR / FLEX_TWI_RHR buffer is not filled / emptied before the transmission / reception of a new character.

Bit 9 – ARBLST Arbitration Lost (cleared on read)
This bit is only used in Host mode.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Arbitration won.
1	Arbitration lost. Another host of the TWI bus has won the multi-host arbitration. TXCOMP is set at the same time.

Bit 8 – NACK Not Acknowledged (cleared on read)

NACK used in Host mode:
0: Each data byte has been correctly received by the far-end side TWI client component.
1: A data or address byte has not been acknowledged by the client component. Set at the same time as TXCOMP.
NACK used in Client Read mode:
0: Each data byte has been correctly received by the host.
1: In Read mode, a data byte has not been acknowledged by the host. When NACK is set, the user must not fill FLEX_TWI_THR even if TXRDY is set, because it means that the host will stop the data transfer or reinitiate it.
Note that in Client Write mode, all data are acknowledged by the TWI.

Bit 7 – UNRE Underrun Error (cleared on read)

This bit is only used in Client mode if clock stretching is disabled.

Value	Description
0	FLEX_TWI_THR has been filled on time.
1	FLEX_TWI_THR has not been filled on time.

Bit 6 – OVRE Overrun Error (cleared on read)

This bit is only used in Client mode if clock stretching is disabled.

Value	Description
0	FLEX_TWI_RHR has not been loaded while RXRDY was set.
1	FLEX_TWI_RHR has been loaded while RXRDY was set. Reset by read in FLEX_TWI_SR when TXCOMP is set.

Bit 5 – GACC General Call Access (cleared on read)

This bit is only used in Client mode.
GACC behavior can be seen in figure Host Performs a General Call.

Value	Description
0	No general call has been detected.
1	A general call has been detected. After the detection of general call, if need be, the user may acknowledge this access and decode the following bytes and respond according to the value of the bytes.

Bit 4 – SVACC Client Access

This bit is only used in Client mode.
SVACC behavior can be seen in figures Read Access Ordered by a Host, Write Access Ordered by a Host, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

Value	Description
0	TWI is not addressed. SVACC is automatically cleared after a NACK or a STOP condition is detected.
1	Indicates that the address decoding sequence has matched (a host has sent SADR). SVACC remains high until a NACK or a STOP condition is detected.

Bit 3 – SVREAD Client Read

This bit is only used in Client mode. When SVACC is low (no client access has been detected) SVREAD is irrelevant.
SVREAD behavior can be seen in figures Read Access Ordered by a Host, Write Access Ordered by a Host, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Indicates that a write access is performed by a host.
1	Indicates that a read access is performed by a host.

Bit 2 – TXRDY Transmit Holding Register Ready (cleared by writing FLEX_TWI_THR)

TXRDY used in Host mode:
0: The transmit holding register has not been transferred into the internal shifter. Set to 0 when writing into FLEX_TWI_THR.
1: As soon as a data byte is transferred from FLEX_TWI_THR to internal shifter or if a NACK error is detected, TXRDY is set at the same time as TXCOMP and NACK. TXRDY is also set when MSEN is set (enables TWI).
TXRDY behavior in Host mode can be seen in figures Host Write with One Data Byte,Host Write with Multiple Data Bytes and Host Write with One Byte Internal Address and Multiple Data Bytes.
TXRDY used in Client mode:
0: As soon as data is written in FLEX_TWI_THR, until this data has been transmitted and acknowledged (ACK or NACK).
1: Indicates that FLEX_TWI_THR is empty and that data has been transmitted and acknowledged.
If TXRDY is high and if a NACK has been detected, the transmission will be stopped. Thus when TRDY = NACK = 1, the user must not fill FLEX_TWI_THR to avoid losing it.
TXRDY behavior in Client mode can be seen in figures Read Access Ordered by a Host, Clock Stretching in Read Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.
When FIFOs are enabled:
0: Transmit FIFO is full and cannot accept more data.
1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.
TXRDY behavior with FIFOs enabled is illustrated in TXRDY and RXRDY Behavior.

Bit 1 – RXRDY Receive Holding Register Ready (cleared when reading FLEX_TWI_RHR)

When FIFOs are disabled:
0: No character has been received since the last FLEX_TWI_RHR read operation.
1: A byte has been received in FLEX_TWI_RHR since the last read.
RXRDY behavior in Host mode can be seen in figure Host Read with Multiple Data Bytes.
RXRDY behavior in Client mode can be seen in figures Write Access Ordered by a Host, Clock Stretching in Write Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.
When FIFOs are enabled:
0: Receive FIFO is empty; no data to read.
1: At least one unread data is in the Receive FIFO.
RXRDY behavior with FIFO enabled is illustrated in TXRDY and RXRDY Behavior.

Bit 0 – TXCOMP Transmission Completed (cleared by writing FLEX_TWI_THR)

TXCOMP used in Host mode:
0: During the length of the current frame.
1: When both the holding register and the internal shifter are empty and STOP condition has been sent.
TXCOMP behavior in Host mode can be seen in figures Host Write with One Byte Internal Address and Multiple Data Bytes and Host Read with Multiple Data Bytes.
TXCOMP used in Client mode:
0: As soon as a Start is detected.
1: After a Stop or a Repeated Start + an address different from SADR is detected.
TXCOMP behavior in Client mode can be seen in figures Clock Stretching in Read Mode, Clock Stretching in Write Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

Reset	0	0	0	0	1	0	0	1

Bit 28 – SECE Security/Safety Error (cleared on read)

Value	Description
0	No error detected on TWD and/or TWCK pad output and no access violation of a write-protected register since the last read of FLEX_TWI_SR.
1	An error has been detected on TWD and/or TWCK pad output (FLEX_TWI_WPSR.PADERR=1) and/or a violation of a write-protected register (FLEX_TWI_WPSR.WPVS=1) since the last read of FLEX_TWI_SR.

Bit 26 – SR Start Repeated

Value	Description
0	No repeated start has been detected since last FLEX_TWI_SR read.
1	At least one repeated start has been detected since last FLEX_TWI_SR read.

Bit 25 – SDA SDA Line Value

Value	Description
0	SDA line sampled value is ‘0’.
1	SDA line sampled value is ‘1’.

Bit 24 – SCL SCL Line Value

Value	Description
0	SCL line sampled value is ‘0’.
1	SCL line sampled value is ‘1.’

Bit 23 – TXFLOCK Transmit FIFO Lock

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	The Transmit FIFO is not locked.
1	The Transmit FIFO is locked.

Bit 21 – SMBHHM SMBus Host Header Address Match (cleared on read)

Value	Description
0	No SMBus Host Header Address received.
1	A SMBus Host Header Address was received.

Bit 20 – SMBDAM SMBus Default Address Match (cleared on read)

Value	Description
0	No SMBus Default Address received.
1	A SMBus Default Address was received.

Bit 19 – PECERR PEC Error (cleared on read)

Value	Description
0	No SMBus PEC error occurred.
1	A SMBus PEC error occurred.

Bit 18 – TOUT Timeout Error (cleared on read)

Value	Description
0	No SMBus timeout occurred.
1	SMBus timeout occurred.

Bit 16 – MCACK Host Code Acknowledge (cleared on read)
MACK used in Client mode:

Value	Description
0	No host code has been received.
1	A host code has been received.

Bit 11 – EOSACC End Of Client Access (cleared on read)
This bit is only used in Client mode.
EOSACC behavior can be seen in figures Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

Value	Description
0	A Client Access is being performed.
1	Client Access is finished. End Of Client Access is automatically set as soon as SVACC is reset.

Bit 10 – SCLWS Clock Wait State
This bit is only used in Client mode.
SCLWS behavior can be seen in figures Clock Stretching in Read Mode and Clock Stretching in Write Mode.

Value	Description
0	The clock is not stretched.
1	The clock is stretched. FLEX_TWI_THR / FLEX_TWI_RHR buffer is not filled / emptied before the transmission / reception of a new character.

Bit 9 – ARBLST Arbitration Lost (cleared on read)
This bit is only used in Host mode.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Arbitration won.
1	Arbitration lost. Another host of the TWI bus has won the multi-host arbitration. TXCOMP is set at the same time.

Bit 8 – NACK Not Acknowledged (cleared on read)

NACK used in Host mode:
0: Each data byte has been correctly received by the far-end side TWI client component.
1: A data or address byte has not been acknowledged by the client component. Set at the same time as TXCOMP.
NACK used in Client Read mode:
0: Each data byte has been correctly received by the host.
1: In Read mode, a data byte has not been acknowledged by the host. When NACK is set the user must not fill FLEX_TWI_THR even if TXRDY is set, because it means that the host will stop the data transfer or re initiate it.
Note that in Client Write mode all data are acknowledged by the TWI.

Bit 7 – UNRE Underrun Error (cleared on read)

This bit is only used in Client mode if clock stretching is disabled.

Value	Description
0	FLEX_TWI_THR has been filled on time.
1	FLEX_TWI_THR has not been filled on time.

Bit 6 – OVRE Overrun Error (cleared on read)

This bit is only used in Client mode if clock stretching is disabled.

Value	Description
0	FLEX_TWI_RHR has not been loaded while RXRDY was set.
1	FLEX_TWI_RHR has been loaded while RXRDY was set. Reset by read in FLEX_TWI_SR when TXCOMP is set.

Bit 5 – GACC General Call Access (cleared on read)

This bit is only used in Client mode.
GACC behavior can be seen in figure Host Performs a General Call.

Value	Description
0	No general call has been detected.
1	A general call has been detected. After the detection of general call, if need be, the user may acknowledge this access and decode the following bytes and respond according to the value of the bytes.

Bit 4 – SVACC Client Access

This bit is only used in Client mode.
SVACC behavior can be seen in figures Read Access Ordered by a Host, Write Access Ordered by a Host, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

Value	Description
0	TWI is not addressed. SVACC is automatically cleared after a NACK or a STOP condition is detected.
1	Indicates that the address decoding sequence has matched (a host has sent SADR). SVACC remains high until a NACK or a STOP condition is detected.

Bit 3 – SVREAD Client Read

This bit is only used in Client mode. When SVACC is low (no client access has been detected) SVREAD is irrelevant.
SVREAD behavior can be seen in figures Read Access Ordered by a Host, Write Access Ordered by a Host, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Indicates that a write access is performed by a host.
1	Indicates that a read access is performed by a host.

Bit 2 – TXRDY Transmit Holding Register Ready (cleared by writing FLEX_TWI_THR)

TXRDY used in Host mode:
0: The transmit holding register has not been transferred into the internal shifter. Set to 0 when writing into FLEX_TWI_THR.
1: As soon as a data byte is transferred from FLEX_TWI_THR to internal shifter or if a NACK error is detected, TXRDY is set at the same time as TXCOMP and NACK. TXRDY is also set when MSEN is set (enables TWI).
TXRDY behavior in Host mode can be seen in figures Host Write with One Data Byte,Host Write with Multiple Data Bytes and Host Write with One Byte Internal Address and Multiple Data Bytes.
TXRDY used in Client mode:
0: As soon as data is written in FLEX_TWI_THR, until this data has been transmitted and acknowledged (ACK or NACK).
1: Indicates that FLEX_TWI_THR is empty and that data has been transmitted and acknowledged.
If TXRDY is high and if a NACK has been detected, the transmission will be stopped. Thus when TRDY = NACK = 1, the user must not fill FLEX_TWI_THR to avoid losing it.
TXRDY behavior in Client mode can be seen in figures Read Access Ordered by a Host, Clock Stretching in Read Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.
When FIFOs are enabled:
0: Transmit FIFO is full and cannot accept more data.
1: Transmit FIFO is not full; one or more data can be written according to TXRDYM field configuration.
TXRDY behavior with FIFOs enabled is illustrated in TXRDY and RXRDY Behavior.

Bit 1 – RXRDY Receive Holding Register Ready (cleared when reading FLEX_TWI_RHR)

When FIFOs are disabled:
0: No character has been received since the last FLEX_TWI_RHR read operation.
1: A byte has been received in FLEX_TWI_RHR since the last read.
RXRDY behavior in Host mode can be seen in figure Host Read with Multiple Data Bytes.
RXRDY behavior in Client mode can be seen in figures Write Access Ordered by a Host, Clock Stretching in Write Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.
When FIFOs are enabled:
0: Receive FIFO is empty; no data to read.
1: At least one unread data is in the Receive FIFO.
RXRDY behavior with FIFO enabled is illustrated in TXRDY and RXRDY Behavior.

Bit 0 – TXCOMP Transmission Completed (cleared by writing FLEX_TWI_THR)

TXCOMP used in Host mode:
0: During the length of the current frame.
1: When both holding register and internal shifter are empty and STOP condition has been sent.
TXCOMP behavior in Host mode can be seen in figures Host Write with One Byte Internal Address and Multiple Data Bytes and Host Read with Multiple Data Bytes.
TXCOMP used in Client mode:
0: As soon as a Start is detected.
1: After a Stop or a Repeated Start + an address different from SADR is detected.
TXCOMP behavior in Client mode can be seen in figures Clock Stretching in Read Mode, Clock Stretching in Write Mode, Repeated Start and Reversal from Read Mode to Write Mode and Repeated Start and Reversal from Write Mode to Read Mode.

74.10.62.TWI Interrupt Enable Register

Name: FLEX_TWI_IER
Offset: 0x624
Reset: –
Property: Write-only

This register can only be written if the WPITEN bit is cleared in the TWI Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
				SECE				
Access				W				
Reset				–				

Bit	23	22	21	20	19	18	17	16

	RXDATA[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 12:11 – ASTATE[1:0] Acknowledge State (Client Sniffer Mode only)

Value	Name	Description
0	NONE	No Acknowledge or Nacknowledge detected after previously logged data
1	ACK	Acknowledge (A) detected after previously logged data
2	NACK	Nacknowledge (NA) detected after previously logged data
3	UNDEF	Not defined

Bit 10 – PSTATE Stop State (Client Sniffer Mode only)

Value	Description
0	No STOP (P) detected after previous logged data.
1	Stop detected (P) after previous logged data.

Bits 9:8 – SSTATE[1:0] Start State (Client Sniffer Mode only)

Value	Name	Description
0	NOSTART	No START detected with the logged data
1	START	START (S) detected with the logged data
2	RSTART	Repeated START (Sr) detected with the logged data
3	UNDEF	Not defined

Bits 7:0 – RXDATA[7:0] Host or Client Receive Holding Data

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.66.TWI Receive Holding Register (FIFO Enabled)

Name: FLEX_TWI_RHR (FIFO_ENABLED)
Offset: 0x630
Reset: 0x00000000
Property: Read-only

To read multi-data, the FIFO must be enabled (FLEX_TWI_CR.FIFOEN=1) and Sniffer mode disabled (FLEX_TWI_SMR.SNIFF=0). The access type (byte, halfword or word) determines the number of data written in a single access (1, 2 or 4), see TWI Multiple Data Access for details.

Bit	7	6	5	4	3	2	1	0
					PRESC[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bits 31:24 – THMAX[7:0] Clock High Maximum Cycles
Clock cycles in clock high maximum count. Prescaled by PRESC. Used for bus free detection. Used to time THIGH:MAX.

Bits 23:16 – TLOWM[7:0] Main System Bus Clock Stretch Maximum Cycles

Value	Description
0	TLOW:MEXT timeout check disabled.
1–255	Clock cycles in main system bus maximum clock stretch count. Prescaled by PRESC. Used to time TLOW:MEXT.

Bits 15:8 – TLOWS[7:0] Client Clock Stretch Maximum Cycles

Value	Description
0	TLOW:SEXT timeout check disabled.
1–255	Clock cycles in client maximum clock stretch count. Prescaled by PRESC. Used to time TLOW:SEXT.

Bits 3:0 – PRESC[3:0] SMBus Clock Prescaler
Used to specify how to prescale the TLOWS, TLOWM and THMAX counters in SMBTR. Counters are prescaled according to the following formula: PRESC = Log(fMCK / $f_{Prescaled}$) / Log(2) - 1

Reset	0	0	0	0	0	0	0	0

Bit 25 – NPEC Next PEC Request (SMBus Mode only)

Value	Description
0	The next transfer does not use a PEC byte.
1	The next transfer uses a PEC byte.

Bit 24 – NDIR Next Transfer Direction

Value	Description
0	Write direction.
1	Read direction.

Bits 23:16 – NDATAL[7:0] Next Data Length

Value	Description
0	No data to send (see Alternative Command).
1–255	Number of bytes to send for the next transfer.

Bit 9 – PEC PEC Request (SMBus Mode only)

Value	Description
0	The transfer does not use a PEC byte.
1	The transfer uses a PEC byte.

Bit 8 – DIR Transfer Direction

Value	Description
0	Write direction.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Read direction.

Bits 7:0 – DATAL[7:0] Data Length

Value	Description
0	No data to send (see Alternative Command).
1–255	Number of bytes to send during the transfer.

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.72.TWI Filter Register

Name: FLEX_TWI_FILTR
Offset: 0x644
Reset: 0x00000000
Property: Read/Write

Important:
FILT and THRES are used to configure digital filters on data and clock lines.

In Standard, Fast and Fast Plus modes, the digital filter must be enabled (FILT=1) and a pulse width threshold defined (THRES > 0).

The field THRES must be set according to the peripheral clock to suppress spikes lower than 50 ns. The recommended value is calculated using the formula below:

THRES > 50 ns/$t_{peripheral_clock\ (ns)}$

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Bit	15	14	13	12	11	10	9	8
						THRES[2:0]		
Access						R/W	R/W	R/W
Reset						0	0	0

Bit	7	6	5	4	3	2	1	0
							PADFEN	FILT
Access							R/W	R/W
Reset							0	0

Bits 10:8 – THRES[2:0] Digital Filter Threshold

Value	Description
0	No filtering applied on TWI inputs.
1–7	Maximum pulse width of spikes which will be suppressed by the input filter, defined in peripheral clock cycles.

Bit 1 – PADFEN PAD Filter Enable

Value	Description
0	PAD analog filter is disabled.
1	PAD analog filter is enabled. (The analog filter must be enabled if High-speed mode is enabled.)

Bit 0 – FILT RX Digital Filter

TWI digital input filtering follows a majority decision based on three samples from SDA/SCL lines at peripheral clock frequency.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No filtering applied on TWI inputs.
1	TWI input filtering is active. (Only in Standard and Fast modes)

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.73.TWI High-Speed Clock Waveform Generator Register

Name: FLEX_TWI_HSCWGR
Offset: 0x648
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the TWI Write Protection Mode Register.

FLEX_TWI_HSCWGR is only used in High-Speed Host mode.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
						HSCKDIV[2:0]		
Access						R/W	R/W	R/W
Reset						0	0	0

Bit	15	14	13	12	11	10	9	8
	HSCHDIV[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

	HSCLDIV[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 18:16 – HSCKDIV[2:0] High-Speed Clock Divider
The CKDIV is used to increase both SCL high and low periods.

Bits 15:8 – HSCHDIV[7:0] High-Speed Clock High Divider
The SCL high period is defined as follows:

- If BRSRCCLK = 0: CHDIV = $((t_{high}/t_{peripheralclock}) - 3)/2^{CKDIV}$
- If BRSRCCLK = 1: CHDIV = $(t_{high}/t_{ext_ck})/2^{CKDIV}$

Bits 7:0 – HSCLDIV[7:0] High-Speed Clock Low Divider
The SCL low period is defined as follows:

- If BRSRCCLK = 0: CLDIV = $((t_{low}/t_{peripheralclock}) - 3)/2^{CKDIV}$
- If BRSRCCLK = 1: CLDIV = $(t_{low}/t_{ext_ck})/2^{CKDIV}$

Reset		0	0	0	0	0	0	0

Bits 31:24 – DATAM[7:0] Data Match
The TWI module will extend the matching process to the first received data, comparing it with DATAM if the DATAMEN bit is enabled.

Bits 22:16 – SADR3[6:0] Client Address 3
Client address 3. The TWI module will match on this additional address if the SADR3EN bit is enabled.

Bits 14:8 – SADR2[6:0] Client Address 2
Client address 2. The TWI module will match on this additional address if the SADR2EN bit is enabled.

Bits 6:0 – SADR1[6:0] Client Address 1
Client address 1. The TWI module will match on this additional address if the SADR1EN bit is enabled.

74.10.75.TWI FIFO Mode Register

Name: FLEX_TWI_FMR
Offset: 0x650
Reset: 0x00000000
Property: Read/Write

This register reads '0' if the FIFO is disabled (see FLEX_TWI_CR to enable/disable the internal FIFO). This register can only be written if the WPEN bit is cleared in the TWI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
			RXFTHRES[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
			TXFTHRES[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
			RXRDYM[1:0]				TXRDYM[1:0]	
Access			R/W	R/W			R/W	R/W
Reset			0	0			0	0

Bits 29:24 – RXFTHRES[5:0] Receive FIFO Threshold

Value	Description
0–32	Defines the Receive FIFO threshold value (number of bytes). The FLEX_TWI_FSR.RXFTH flag will be set when Receive FIFO goes from "below" threshold state to "equal to or above" threshold state.

Bits 21:16 – TXFTHRES[5:0] Transmit FIFO Threshold

Value	Description
0–32	Defines the Transmit FIFO threshold value (number of bytes). The FLEX_TWI_FSR.TXFTH flag will be set when Transmit FIFO goes from "above" threshold state to "equal to or below" threshold state.

Bits 5:4 – RXRDYM[1:0] Receiver Ready Mode
If FIFOs are enabled, the FLEX_TWI_SR.RXRDY flag behaves as follows.

Value	Name	Description
0	ONE_DATA	RXRDY will be at level '1' when at least one unread data is in the receive FIFO. When DMA is enabled to transfer data the chunk of 1 byte must be configured in the DMA. If the transfer is performed by software, the access type (byte, halfword) must be defined accordingly.
1	TWO_DATA	RXRDY will be at level '1' when at least two unread data are in the receive FIFO. To minimize system bus load, when DMA is enabled to transfer data, the chunk of 1 halfword (1 halfword carries 2 bytes) must be configured in the DMA. If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 2 accesses) or halfword (2 bytes per access, 1 single access).

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
2	FOUR_DATA	RXRDY will be at level '1' when at least four unread data are in the receive FIFO. To minimize system bus load, when DMA is enabled to transfer data, the chunk of 1 word (1 word carries 4 bytes) must be configured in the DMA. If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 4 accesses), halfword (2 bytes per access, 2 accesses) or word (4 bytes per access, 1 single access).
3	EIGHT_DATA	RXRDY will be at level '1' when at least eight unread data are in the receive FIFO. To minimize system bus load, when DMA is enabled to transfer data, the chunk of 2 words (1 word carries 4 bytes) must be configured in the DMA. If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 8 accesses), halfword (2 bytes per access, 4 accesses) or word (4 bytes per access, 2 accesses).

Bits 1:0 – TXRDYM[1:0] Transmitter Ready Mode
If FIFOs are enabled, the FLEX_TWI_SR.TXRDY flag behaves as follows.

Value	Name	Description
0	ONE_DATA	TXRDY will be at level '1' when at least one data can be written in the transmit FIFO. When DMA is enabled to transfer data, the chunk of 1 byte must be configured in the DMA. If the transfer is performed by software, the access type must be defined as byte.
1	TWO_DATA	TXRDY will be at level '1' when at least two data can be written in the transmit FIFO. To minimize system bus load, when DMA is enabled to transfer data, the chunk of 1 halfword (1 halfword carries 2 bytes) must be configured in the DMA. If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 2 accesses) or halfword (2 bytes per access, 1 single access).
2	FOUR_DATA	TXRDY will be at level '1' when at least four data can be written in the transmit FIFO. To minimize system bus load, when DMA is enabled to transfer data, the chunk of 1 word (1 word carries 4 bytes) must be configured in the DMA. If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 4 accesses), halfword (2 bytes per access, 2 accesses) or word (4 bytes per access, 1 single access).
3	EIGHT_DATA	TXRDY will be at level '1' when at least eight data can be written in the transmit FIFO. To minimize system bus load, when DMA is enabled to transfer data, the chunk of 2 words (1 word carries 4 bytes) must be configured in the DMA. If the transfer is performed by software, the access type can be defined as byte (1 byte per access, 8 accesses), halfword (2 bytes per access, 4 accesses) or word (4 bytes per access, 2 accesses).

			TXFL[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bits 21:16 – RXFL[5:0] Receive FIFO Level

Value	Description
0	There is no unread data in the Receive FIFO.
1–32	Indicates the number of unread data in the Receive FIFO.

Bits 5:0 – TXFL[5:0] Transmit FIFO Level

Value	Description
0	There is no data in the Transmit FIFO.
1–32	Indicates the number of data in the Transmit FIFO.

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit 7 – RXFPTEF Receive FIFO Underflow Error Flag
See FIFO Overflow/Underflow Error for details.

Value	Description
0	No Receive FIFO underflow occurred.
1	Receive FIFO underflow error occurred due to an incorrect software access (read data exceeding available data in FIFO). Receiver must be reset by writing FLEX_SPI_CR.SWRST=1.

Bit 6 – TXFPTEF Transmit FIFO Overflow Error Flag
See FIFO Overflow/Underflow Error for details.

Value	Description
0	No Transmit FIFO overflow occurred.
1	Transmit FIFO overflow error occurred due to an incorrect software access (written data exceeding available space). Transceiver must be reset by writing FLEX_SPI_CR.SWRST=1.

Bit 5 – RXFTHF Receive FIFO Threshold Flag

Value	Description
0	Number of unread data in Receive FIFO is below RXFTHRES threshold.
1	Number of unread data in Receive FIFO has reached RXFTHRES threshold since the last read of FLEX_TWI_FSR.

Bit 4 – RXFFF Receive FIFO Full Flag

Value	Description
0	Receive FIFO is not empty.
1	Receive FIFO has been filled since the last read of FLEX_TWI_FSR.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 3 – RXFEF Receive FIFO Empty Flag

Value	Description
0	Receive FIFO is not empty.
1	Receive FIFO has been emptied since the last read of FLEX_TWI_FSR.

Bit 2 – TXFTHF Transmit FIFO Threshold Flag (cleared on read)

Value	Description
0	Number of data in Transmit FIFO is above TXFTHRES threshold.
1	Number of data in Transmit FIFO has reached TXFTHRES threshold since the last read of FLEX_TWI_FSR.

Bit 1 – TXFFF Transmit FIFO Full Flag (cleared on read)

Value	Description
0	Transmit FIFO is not full.
1	Transmit FIFO has been filled since the last read of FLEX_TWI_FSR.

Bit 0 – TXFEF Transmit FIFO Empty Flag (cleared on read)

Value	Description
0	Transmit FIFO is not empty.
1	Transmit FIFO has been emptied since the last read of FLEX_TWI_FSR.

Access	W	W	W	W	W	W	W	W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
						WPCREN	WPITEN	WPEN
Access						R/W	R/W	R/W
Reset						0	0	0

Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x545749	PASSWD	Writing any other value in this field aborts the write operation of bits WPEN, WPITEN and WPCREN. Always reads as 0.

Bit 2 – WPCREN Write Protection Control Enable

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to 0x545749 (“TWI” in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x545749 (“TWI” in ASCII).

Bit 1 – WPITEN Write Protection Interrupt Enable

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x545749 (“TWI” in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x545749 (“TWI” in ASCII).

Bit 0 – WPEN Write Protection Enable

See TWI Register Write Protection for the list of registers that can be write-protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x545749 (“TWI” in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x545749 (“TWI” in ASCII).

© 2025 Microchip Technology Inc. and its subsidiaries

74.10.82.TWI Write Protection Status Register

Name: FLEX_TWI_WPSR
Offset: 0x6E8
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	WPVSRC[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPVSRC[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPVSRC[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
							PADERR	WPVS
Access							R	R
Reset							0	0

Bits 31:8 – WPVSRC[23:0] Write Protection Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

Bit 1 – PADERR Output Pad Error (cleared on read)
This flag can be set if the TWI client stretches the clock by asserting a low level.

Value	Description
0	No error detected during a character transfer in host mode. Cleared in client mode.
1	Stuck-at 1 detected on TWCK output pad for more than 1 period or 2 successive erroneous bit value on TWD (transmitting a 1 and reading 0 at the end of the bit period) detected. This may be due to erroneous IO multiplexing configuration, external short circuits, etc.

Bit 0 – WPVS Write Protect Violation Status

Value	Description
0	No Write Protection Violation has occurred since the last read of FLEX_TWI_WPSR.
1	A Write Protection Violation has occurred since the last read of FLEX_TWI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

© 2025 Microchip Technology Inc. and its subsidiaries

75. Quad Serial Peripheral Interface (QSPI)

75.1. Description

The Quad Serial Peripheral Interface (QSPI) is a synchronous serial data link that provides communication with external devices in Host mode.

The QSPI allows the system to execute code directly from a serial Flash memory (XiP) without code shadowing to RAM. In the system, the mapped serial Flash memory is seen as any other memory.

With the support of the Quad SPI protocol, the QSPI allows the system to use high-performance serial Flash memories which are small and inexpensive, instead of larger and more expensive parallel Flash memories.

The QSPI can be used in SPI legacy mode to interface to serial peripherals such as ADCs, DACs, LCD controllers, CAN controllers and sensors using register accesses, or in Serial Memory mode to interface to serial Flash memories or other devices in an automated way.

Note: Stacked devices with a rollover in the memory address space at each die boundary are not supported.

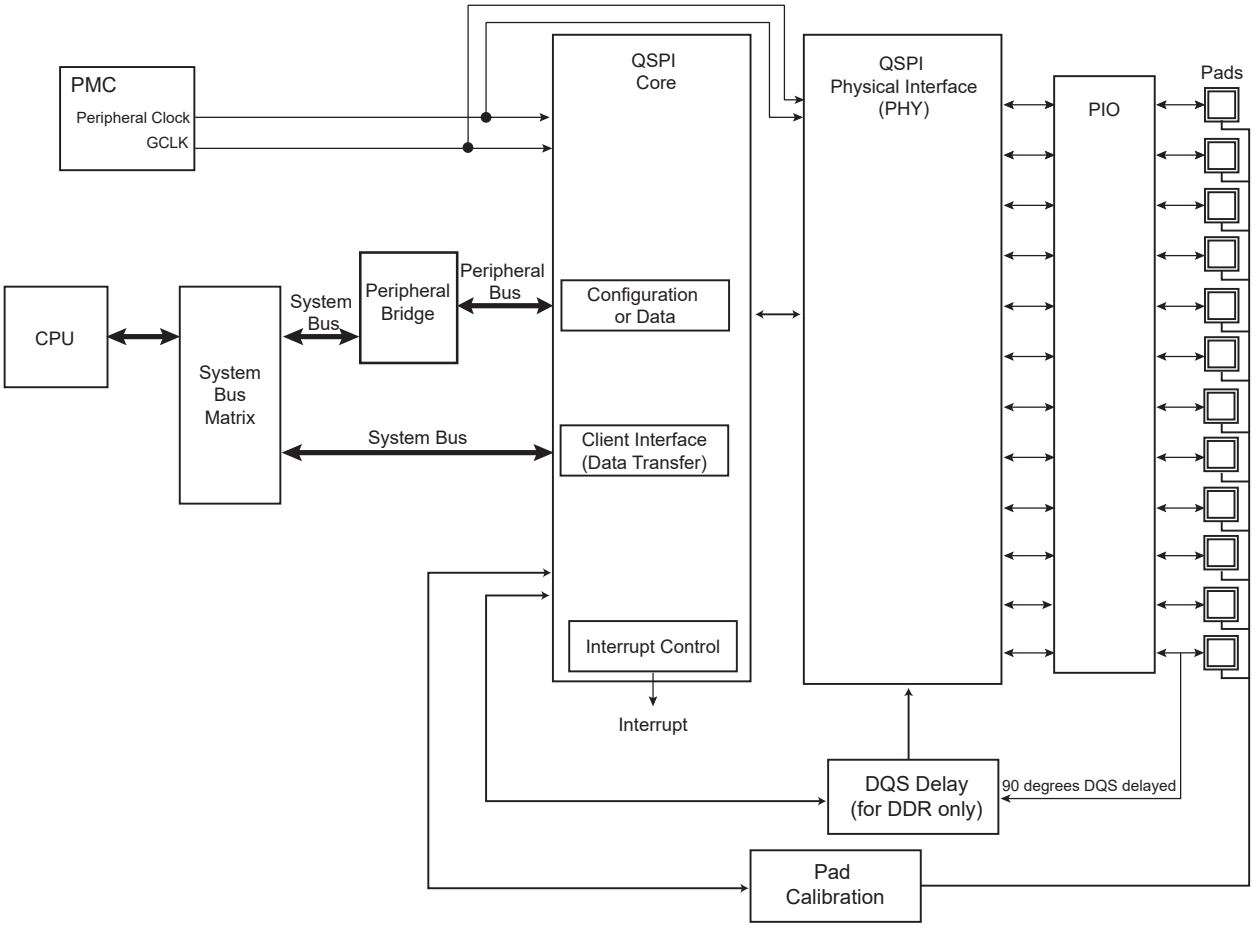
75.2. Embedded Characteristics

- Host SPI Interface
  - Octal/Quad/Dual/Single/Twin-Quad communication support
  - Single Data Rate (SDR) and Dual Data Rate (DDR) support
  - Flash/NANDmemory support (supports various vendors and modes)
  - Supports “Execute in Place” (XiP)—code execution by the system directly from a serial memory
- Legacy SPI Mode
  - Interface to serial peripherals such as ADCs and sensors
  - 8-bit/16-bit programmable data length
- Serial Memory Mode
  - Versatile instruction and timing registers for compatibility with all serial Flash memories and SPI devices
  - Up to 32-bit address mode to support serial Flash memories larger than 128 Mbits
  - “On-the-fly” zero latency scrambling/unscrambling
- Functional Safety Monitors and Reports
  - Abnormal functional behavior reports (access to undefined device address, access to locked registers, abnormal DMA requests, etc.)
  - Register write protection
- Connection to DMA Channel Capabilities for DMA Chip-Wide Integration
  - One channel for the receiver, one channel for the transmitter
- One Octal Serial Peripheral Interface (QSPI0) supporting DDR. Octal, Twin-Quad, HyperFlash™ and OctaFlash™ protocols supported
- One Quad Serial Peripheral Interface (QSPI1) supporting DDR/SDR
- Supported standards are:
  - JESD251 (xSPI)
  - JESD251-1 (x4 Quad I/O with Data Strobe)
  - JESD216D (SFDP)

© 2025 Microchip Technology Inc. and its subsidiaries

75.3. Block Diagram

Figure 75.1. QSPI Block Diagram



75.4. Signal Description

Table 75.1. Signal Description for External IOs

Pin Name	Pin Description	Type
QSCK	Serial clock	Output
QSCKN[1]	QSPI negated serial clock	Output
MOSI (QIO0)[234]	Data output (data input/output 0)	Output (input/output)
MISO (QIO1)[234]	Data input (data input/output 1)	Input (input/output)
QIO2[4]	Data input/output 2	Input/output
QIO3[4]	Data input/output 3	Input/output
QIO4[5]	Data input/output 4	Input/output
QIO5[5]	Data input/output 5	Input/output
QIO6[5]	Data input/output 6	Input/output
QIO7[5]	Data input/output 7	Input/output
QCS	Peripheral chip select	Output
QINT	Optional. Interrupt output of an external memory device. Set to 0 if not used.	Input
QDQS[6789]	Data strobe (input for read accesses, output for write accesses)	Input

© 2025 Microchip Technology Inc. and its subsidiaries

Notes:

1. QSCKN is not required for 3V HyperFlash.
2. MOSI and MISO are used for Single-bit SPI operation.
3. QIO0–QIO1 are used for Dual SPI operation.
4. QIO0–QIO3 are used for Quad SPI operation.
5. QIO4–QIO7 are used for Octal SPI operation.
6. QDQS is supplied by most Octal SPI memories.
7. Pre-cycle is not supported on the QDQS signal.
8. Preamble bits are not supported on the QDQS signal.
9. OCTAL SDR with DQS is not supported (QSPI_IFR.DDREN=0, QSPI_IFR.WIDTH=OCT_OUTPUT/OCT_IO/OCT_CMD, QSPI_IFR.DQSEN=1).

75.5. Product Dependencies

75.5.1. I/O Lines

The pins used to interface compliant external devices may be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the QSPI pins to their peripheral functions.

75.5.2. Power Management

The QSPI must be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the QSPI clocks.

75.5.3. Interrupt Sources

The QSPI has an interrupt line connected to the Interrupt Controller. Handling the QSPI interrupt requires programming the interrupt controller before configuring the QSPI.

75.5.4. Direct Memory Access Controller (DMAC)

The QSPI can be used in conjunction with the system-wide Direct Memory Access Controller (DMAC) in order to reduce processor overhead. For a full description of the DMAC, refer to the section “DMA Controller (XDMAC)”.

75.6. Functional Description

75.6.1. Register Synchronization

As the Quad Serial Peripheral Interface and the QSPI Controller core use different clocks, the following events must be synchronized with the core after being configured:

- QSPI_CR.QSPIEN
- QSPI_CR.QSPIDIS
- QSPI_CR.SRFRSH
- QSPI_CR.SWRST
- QSPI_CR.UPDCFG
- QSPI_CR.STTFR
- QSPI_CR.RTOUT
- QSPI_CR.LASTXFER
- QSPI_RDR.RD (synchronization only when QSPI_MR.SMM is set to ‘1 ‘)
- QSPI_TDR.TD

© 2025 Microchip Technology Inc. and its subsidiaries

- QSPI_WRACNT.NBWRA

Before accessing any of these bits/fields, check that the SYNCBSY bit in the Status register (QSPI_SR) is at 0 to ensure that no synchronization process is ongoing.

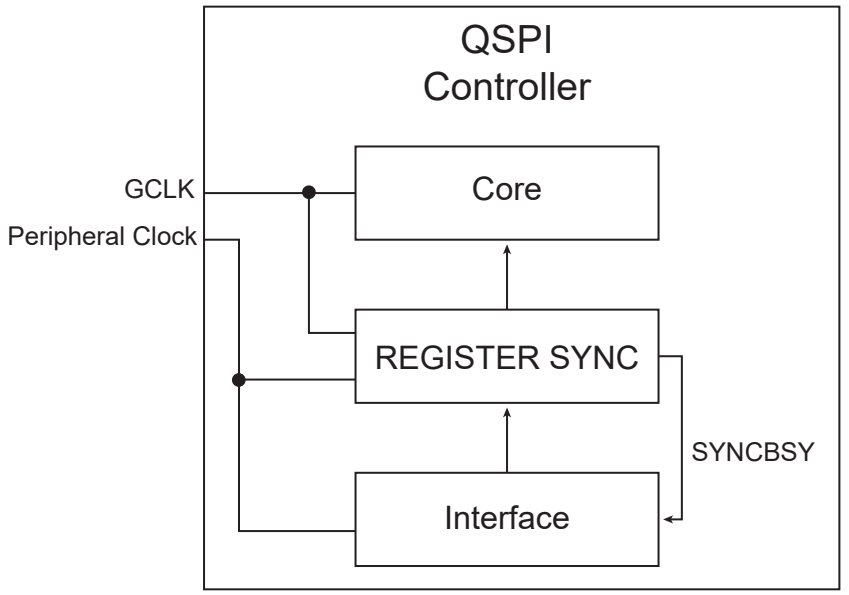
When synchronization is in progress, SYNCBSY is at 1.

As long as SYNCBSY is at 1, no access to the registers requiring synchronization is allowed.

When using UPDCFG in the Control register (QSPI_CR) to update the system configuration, SYNCBSY must be at 0 before and after writing UPDCFG. This ensures that the update is completed before going on to the next step.

Note: If the TDRE or RDRF flag is checked, checking QSPI_SR.SYNCBSY for QSPI_RDR.RD and QSPI_TDR.TD is not necessary. See Figure 75.13, Figure 75.17 and Figure 75.23 for detailed procedures.

Figure 75.2. Register Synchronization with QSPI Controller Core



75.6.2. Updating the QSPI Configuration

Once written in the registers, the configuration must be synchronized with the QSPI core.

At any time, the QSPI Controller core configuration can be updated by writing the QSPI_CR.UPDCFG bit to 1. This will update the QSPI core with the current register configuration. Note that QSPI_SR.SYNCBSY must be 0 before writing QSPI_CR.UPDCFG.

The configuration registers that require synchronization (writing QSPI_CR.UPDCFG to 1) with the QSPI Controller core are:

- QSPI Mode Register(1)
- QSPI Serial Clock Register
- QSPI Instruction Address Register
- QSPI Write Instruction Code Register
- QSPI Read Instruction Code Register
- QSPI Scrambling Mode Register
- QSPI Scrambling Key Register
- QSPI Refresh Register

© 2025 Microchip Technology Inc. and its subsidiaries

- QSPI Write Access Counter Register
- QSPI Pad Calibration Configuration Register
- QSPI Pad Calibration Bypass Register
- QSPI Instruction Frame Register

Note:

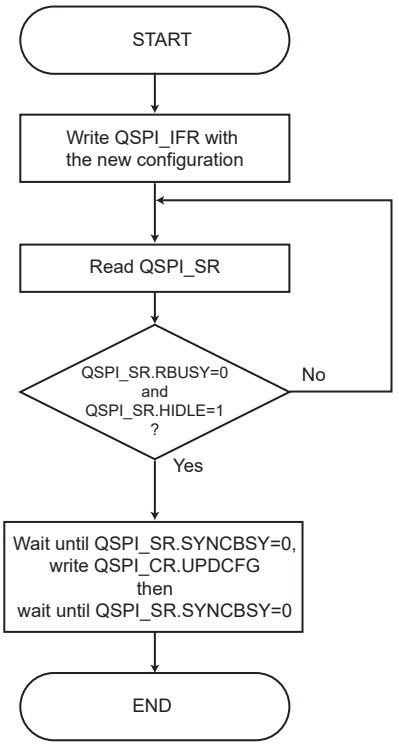
1. TAMPCLR in the Mode register (QSPI_MR) does not require synchronization with the QSPI core.

75.6.2.1. Changing Frame Configuration in Serial Memory Mode (XiP)

Accesses in Serial Memory mode (QSPI_MR.SMM=1) are triggered by QSPI register accesses or by performing accesses in the QSPI memory space depending on the configuration of SMRM and TFRTYP in the Instruction Frame register (QSPI_IFR).

To modify QSPI_IFR after the initial configuration, proceed as illustrated in the figure below to ensure no frame loss. For details, see Instruction Frame and Table 75.3.

Figure 75.3. Changing QSPI_IFR



75.6.3. Serial Clock Phase and Polarity

Only Mode 0 is supported with QSPI_MR.SMM=1.

Four combinations of polarity and phase are available for data transfers. The clock polarity is programmed with the CPOL bit in the QSPI Serial Clock register (QSPI_SCR). QSPI_SCR.CPHA programs the clock phase. These two parameters determine the edges of the clock signal on which data is driven and sampled. Each of these parameters has two possible states, resulting in four possible combinations that are incompatible with one another. Thus, the interfaced client must use the same parameter values to communicate.

The table below shows the four modes and the corresponding parameter settings.

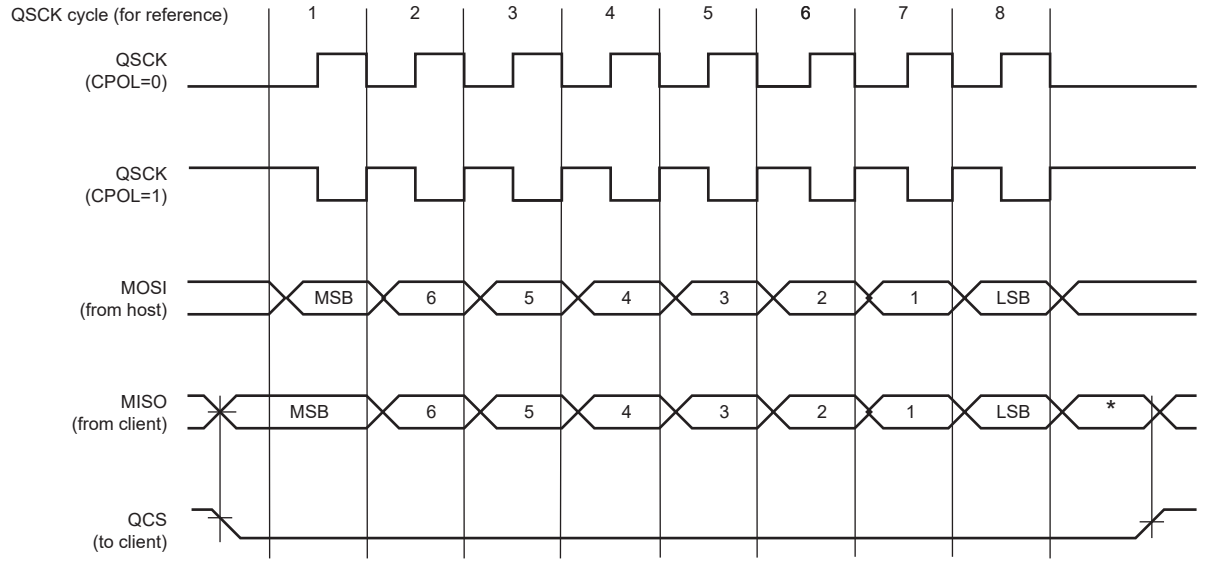
© 2025 Microchip Technology Inc. and its subsidiaries

Table 75.2. QSPI Bus Clock Modes

QSPI Clock Mode	QSPI_SCR.CPOL	QSPI_SCR.CPHA	Shift QSCK Edge	Capture QSCK Edge	QSCK Inactive Level
0	0	0	Falling	Falling	Low
1	0	1	Rising	Rising	Low
2	1	0	Rising	Rising	High
3	1	1	Falling	Falling	High

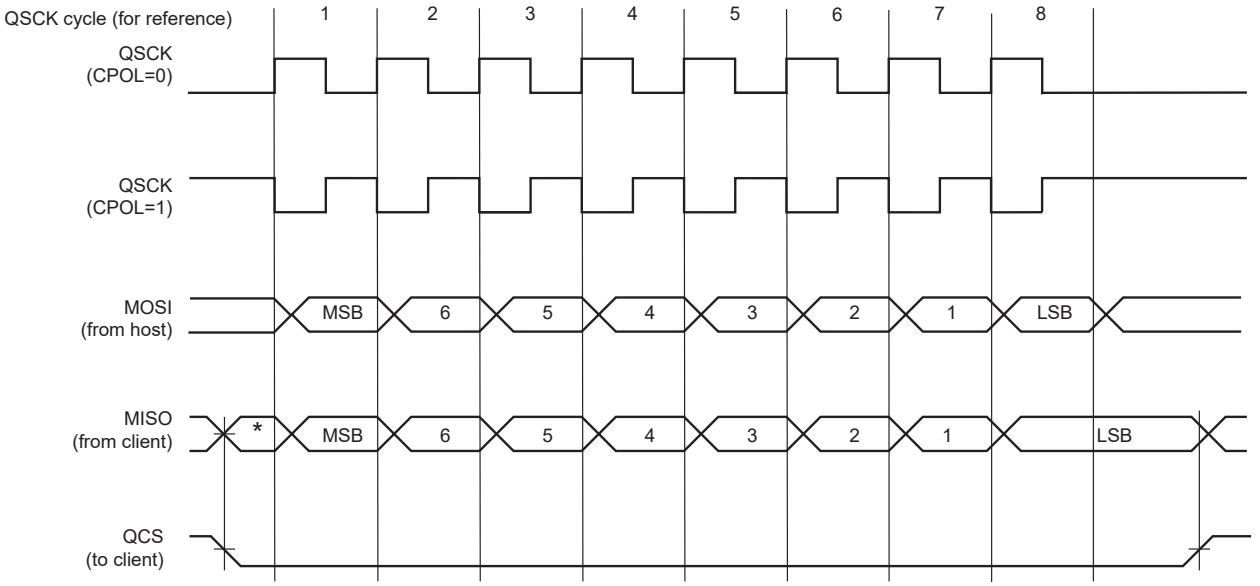
The figures below show examples of data transfers.

Figure 75.4. QSPI Transfer Format (QSPI_SCR.CPHA=0, 8 bits per transfer)



* Not defined, but normally the MSB of the previous character is received.

Figure 75.5. QSPI Transfer Format (QSPI_SCR.CPHA=1, 8 bits per transfer)



* Not defined, but normally the LSB of the previous character is transmitted.

75.6.4. Transfer Delays

Figure 75.6 and Figure 75.7 show several consecutive transfers while the chip select is active. Three delays can be programmed to modify the transfer waveforms:

- The delay between the deactivation and the activation of QCS, programmed by writing QSPI_MR.DLYCS—to adjust the minimum time of QCS at high level.
- The delay before QSCK, programmed by writing QSPI_SCR.DLYBS—to start delaying QSCK after the chip select has been asserted.
- The delay between consecutive transfers, programmed by writing QSPI_MR.DLYBCT.
  - QSPI_MR.SMM=0, to insert a delay between two consecutive transfers
  - QSPI_MR.SMM=1, to insert a delay between the last QSCK pulse and the QCS rise.
- The delay between consecutive transfers when SMM=1, programmed by writing QSPI_SCR.DLYBCT.

These delays allow the QSPI to be adapted to the interfaced peripherals and their speed and bus release time.

Figure 75.6. Programmable Delays (SMM=0)

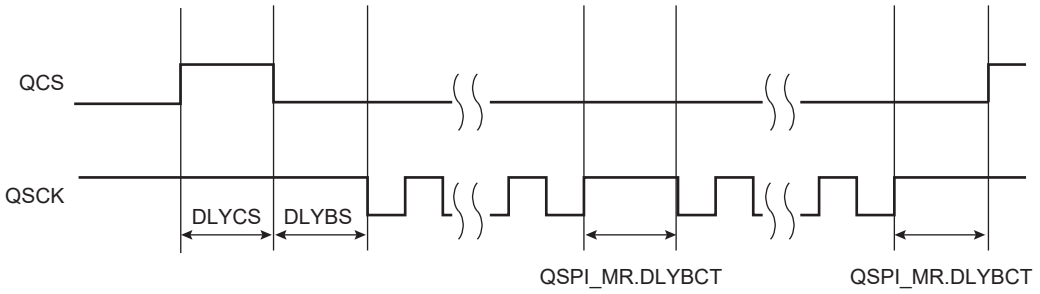

Figure 75.7. DLYBCT with SMM=1

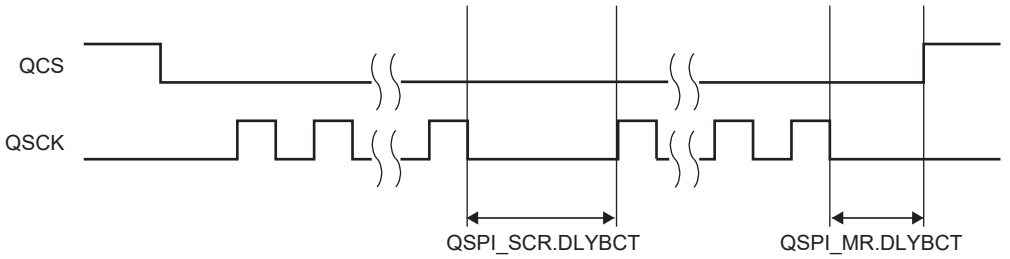

75.6.5. DQS Delay

The DQS Delay analog cell is used to delay the DQS signal in order to use it for data sampling. It is mandatory to enable the DQS Delay cell if QSPI_IFR.DQSEN is set to '1'.

To enable the DQS Delay cell, set QSPI_MR.DQSDLYEN to 1. This must be done before enabling the QSPI.

Periodically, the DQS Delay cell must be calibrated. The calibration can be performed automatically or manually through a refresh. The calibration process is described in the section Refresh Sequence.

75.6.6. Pad Calibration

The need for output impedance calibration arises with higher data rates. As the data rate increases, some transmission line effects may occur and lead to the generation of undershoots and overshoots, hence degrading the signal quality.

© 2025 Microchip Technology Inc. and its subsidiaries

To avoid these transmission problems, a pad calibration cell is used to adjust the output impedance to the driven I/Os.

The pad calibration sequence can be started manually by writing a 1 to QSPI_CR.STPCAL. Then QSPI_SR.CALBSY indicates the state of the I/O calibration. It is advised to run manual pad calibration while the QSPI is disabled (QSPI_SR.QSPIENS=0) to avoid conflicts with the automatic refresh sequence.

The pad calibration sequence can also be performed automatically through a refresh. See Refresh Sequence.

The pad calibration cell requires a start-up time defined by the CALCNT field in the Pad Calibration Configuration register (QSPI_PCALCFG). The default value of this field is adequate for start-up. A different value may be configured in CALCNT.

If QSPI_PCALCFG.AAON is set to 1, the analog circuitry is not shut down at the end of the calibration and the start-up time is only required for the first calibration sequence, thus increasing performance. If QSPI_PCALCFG.AAON is set to 0, the analog circuitry is shut down at the end of the calibration sequence and power consumption is reduced. In this case, the start-up time is performed each time a calibration sequence is started and performance is reduced.

Automatic I/O calibration during the refresh sequence is disabled by writing QSPI_PCALCFG.DAPCAL to 1. For more details, see Refresh Sequence.

Notes:

1. QSPI_PCALCFG must not be configured while the QSPI is enabled.
2. QSPI_PCALCFG and QSPI_PCALBP are not affected by a software reset (QSPI_CR.SWRST=1).

75.6.7. Refresh Sequence

The QSPI uses some analog blocks:

- A DQS delay line
- Pad calibration

Once calibrated at first start of the QSPI, the product properties (power, voltage, temperature, etc.) continue to change over time, so the analog blocks used by the QSPI require an updated calibration.

The QSPI refresh sequence allows the QSPI to stop transfers on a regular basis to perform a calibration update. A 1 ms refresh interval is a safe value for Refresh register (QSPI_REFRESH).

The following analog blocks are refreshed during the refresh sequence:

- DQS delay
- Pad calibration

75.6.7.1. Automatic Refresh

QSPI_REFRESH defines the periodicity of the automatic refresh sequence.

Automatic refresh is enabled if the following conditions are met:

- The QSPI is enabled (QSPI_CR.QSPIEN is written to 1).
- QSPI_REFRESH.REFRESH is not set to 0.
- QSPI_MR.DQSDLYEN is set or QSPI_PCALCFG.DAPCAL is not set.

An automatic refresh sequence of analog blocks is performed:

- after the first QSPI enable,
- when the internal refresh counter is set to 0 if REFRESH is not set to 0.

© 2025 Microchip Technology Inc. and its subsidiaries

75.6.7.2. On-Demand Refresh

A refresh sequence can be launched at any time by writing QSPI_CR.STPCAL to 1. This minimizes the latency of the first access as the first calibration is always longer than the one generated by a refresh. To avoid conflicts with an automatic refresh, automatic refresh must be disabled, or the on-demand refresh process should be started only when the QSPI is disabled. The QSPI_ISR.RFRSHD flag indicates the end of the refresh process.

75.6.8. QSPI SPI Mode

In SPI mode, the QSPI acts as a standard SPI host.

To activate this mode, QSPI_MR.SMM must be written to 0.

75.6.8.1. SPI Mode Operations

The QSPI in standard SPI mode operates on the GCLK clock. It fully controls the data transfers to and from the client connected to the SPI bus. The QSPI drives the chip select line to the client (QCS) and the serial clock signal (QSCK).

The QSPI features two holding registers, the Transmit Data register (QSPI_TDR) and the Receive Data register (QSPI_RDR), and a single internal shift register. The holding registers maintain the data flow at a constant rate.

After enabling the QSPI, a data transfer begins when the processor writes to QSPI_TDR. The written data is immediately transferred to the internal shift register and transfer on the SPI bus starts. While the data in the internal shift register is shifted on the MOSI line, the MISO line is sampled and shifted to the internal shift register. Receiving data cannot occur without transmitting data. If receiving mode is not needed, for example when communicating with a client receiver only (such as an LCD), the receive status flags in the Interrupt Status register (QSPI_ISR) can be discarded.

If new data is written in QSPI_TDR during the transfer, it is retained there until the current transfer is completed. Then, the received data is transferred from the internal shift register to QSPI_RDR, the data in QSPI_TDR is loaded in the internal shift register and a new transfer starts.

The transfer of a data written in QSPI_TDR in the internal shift register is indicated by the Transmit Data Register Empty (TDRE) bit in QSPI_ISR. When new data is written in QSPI_TDR, this bit is cleared. QSPI_ISR.TDRE is used to trigger the Transmit DMA channel.

The end of transfer is indicated by the TXEMPTY flag in QSPI_ISR. If a transfer delay (DLYBCT) is greater than 0 for the last transfer, QSPI_ISR.TXEMPTY is set after the completion of this delay. The peripheral clock and GCLK clock can be switched off at this time (after the current frame has ended). See Deactivation Procedure for a detailed suspend procedure.

The transfer of received data from the internal shift register in QSPI_RDR is indicated by the Receive Data Register Full (RDRF) bit in QSPI_ISR. When the received data is read, the QSPI_ISR.RDRF bit is cleared.

If QSPI_RDR has not been read before new data is received, the Overrun Error Status (OVRES) bit in QSPI_ISR is set. As long as this flag is set, new data will overwrite the old QSPI_RDR.RD value. The user must read QSPI_ISR to clear the OVRES bit.

The figure below shows a block diagram of the SPI when operating in Host mode. Figure 75.9 shows a flow chart describing how transfers are handled.

75.6.8.2. Legacy SPI Mode Block Diagram

See QSPI SPI Mode.

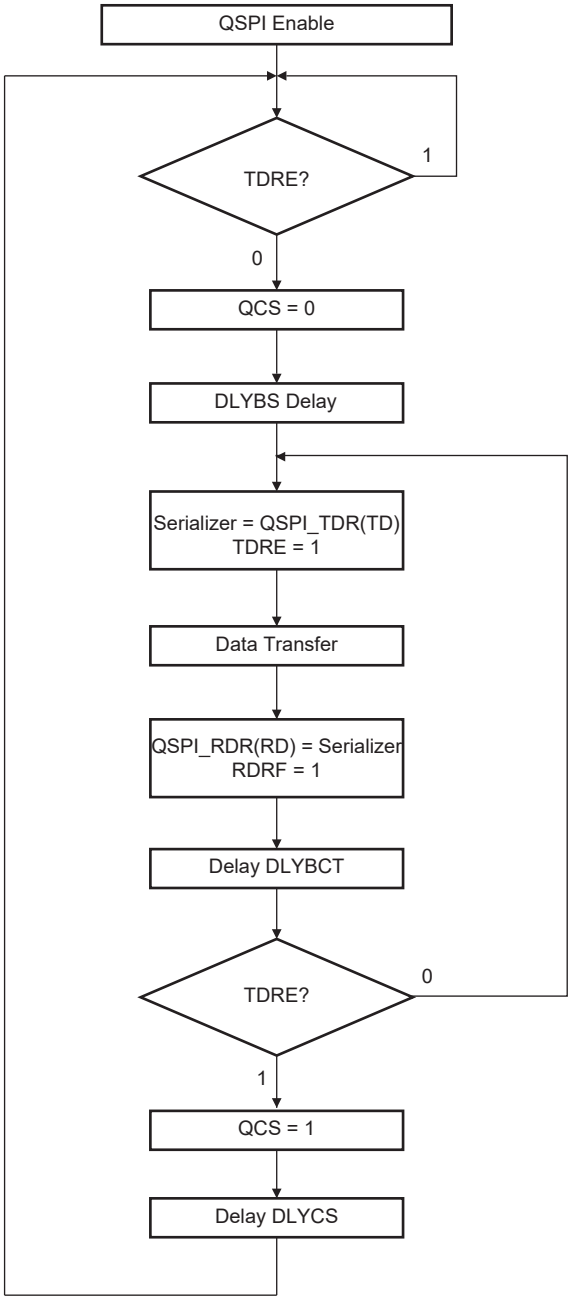
75.6.8.3.SPI Mode Flow Diagram

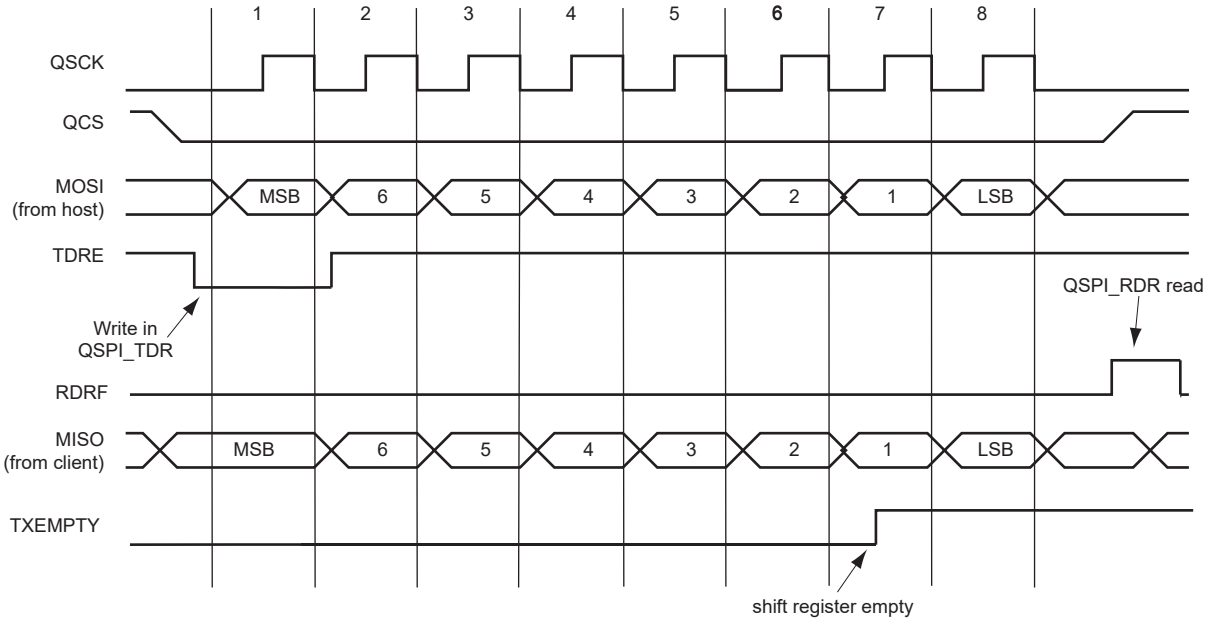
Figure 75.9. SPI Mode Flow Diagram



The figure below shows Transmit Data Register Empty (TDRE), Receive Data Register Full (RDRF) and Transmission Register Empty (TXEMPTY) status flags behavior within the QSPI_ISR during an 8-bit data transfer, without DMA.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 75.10. Status Register Flags Behavior



Notes: Due to the internal architecture (see Block Diagram):

- A latency occurs between the TXEMPTY rise and the end of the frame
- A delay occurs between the end of the frame and the RDRF flag rise

75.6.8.4.Chip Select Management without DMA

During a transfer of more than one data on a chip select without the DMA, the QSPI_TDR is loaded by the processor and the flag TDRE rises as soon as the content of the QSPI_TDR is transferred into the internal shift register. When this flag is detected high, the QSPI_TDR can be reloaded. If this reload by the processor occurs before the end of the current transfer, the chip select is not deasserted between the two transfers. Depending on the application software handling the QSPI_ISR flags (by interrupt or polling method) or servicing other interrupts or other tasks, the processor may not reload the QSPI_TDR in time to keep the chip select active (low). A null Delay Between Consecutive Transfer (DLYBCT) value in the QSPI_MR gives even less time for the processor to reload the QSPI_TDR. With some SPI client peripherals, requiring the chip select line to remain active (low) during a full set of transfers may lead to communication errors.

To facilitate interfacing with such devices, QSPI_MR.CSMODE may be configured to 1. This allows the chip select lines to remain in their current state (low=active) until the end of transfer is indicated by the Last Transfer (LASTXFER) bit in the Control register (QSPI_CR). Even if the QSPI_TDR is not reloaded, the chip select remains active. To have the chip select line rise at the end of the last data transfer, QSPI_CR.LASTXFER must be written to 1 at the same time or after writing the last data to transmit into the QSPI_TDR.

75.6.8.5.Peripheral Deselection with DMA

When the DMA Controller is used, the chip select line remains low during the transfer since the TDRE flag is managed by the DMA itself. Reloading QSPI_TDR by the DMA is done as soon as the TDRE flag is set. In this case, writing QSPI_MR.CSMODE to 1 may not be needed. However, when other DMA channels connected to other peripherals are also in use, the QSPI DMA could be delayed by another DMA with a higher priority on the bus. Having DMA buffers in slower memories like Flash memory or SDRAM compared to fast internal SRAM may lengthen the reload time of QSPI_TDR by the DMA as well. This means that QSPI_TDR might not be reloaded in time to keep the chip select line low. In this case, the chip select line may toggle between data transfer and, on some SPI client devices, the communication might get lost. It may be necessary to configure CSMODE to 1.

© 2025 Microchip Technology Inc. and its subsidiaries

75.6.9. QSPI Serial Memory Mode

In Serial Memory mode, the QSPI acts as a serial Flash memory controller. The QSPI can be used to read data from the serial Flash memory allowing the CPU to execute code from it (XiP, or Execute in Place). The QSPI can also be used to control the serial Flash memory (Program, Erase, Lock, etc.) by sending specific commands. In this mode, the QSPI is compatible with Single-bit SPI, Dual SPI, Quad and Octal SPI protocols.

To activate this mode, QSPI_MR.SMM must be written to 1.

In Serial Memory mode, data is transferred either by QSPI_TDR and QSPI_RDR or by writing or reading in the QSPI memory space depending on QSPI_IFR.TFRTYP and QSPI_IFR.SMRM configuration.

75.6.9.1. Initialization Procedure

The QSPI initialization procedure must follow the specific steps below to ensure proper behavior.

1. Enable the GCLK clock.
2. Configure QSPI_PCALCFG.
3. Write:
   - QSPI_CR.STPCAL
4. Wait for:
   - QSPI_SR.CALBSY=0
5. Configure QSPI_REFRESH, QSPI_MR, QSPI_SCR, QSPI_SMR, etc.
6. Wait for QSPI_SR.SYNCBSY=0, then write QSPI_CR.UPDCFG. Wait for QSPI_SR.SYNCBSY=0.
7. Write QSPI_CR.QSPIEN.
8. Wait for QSPI_SR.QSPIENS=1.
9. If automatic refresh is enabled, wait for QSPI_ISR.RFRSHD=1 by polling or interrupt (see Automatic Refresh).

75.6.9.2. Deactivation Procedure

The QSPI deactivation procedure is as follows.

1. Wait for QSPI_SR.RBUSY=0 and QSPI_SR.HIDLE=1.
2. Send a QSPI_CR.LASTXFER command.
3. If QSPI_SR.CSS=0, wait for QSPI_ISR.CSRA=1.
4. Set QSPI_CR.QSPIDIS and wait for QSPI_SR.QSPIENS=0.
5. Disable the GCLK clock.
6. Wait for QSPI_SR.CALBSY=0.
7. Disable the peripheral clock.

75.6.9.3. GCLK Frequency Change Procedure

The GCLK frequency change procedure is as follows.

1. Wait for QSPI_SR.RBUSY=0 and QSPI_SR.HIDLE=1.
2. Send a QSPI_CR.LASTXFER command.
3. If QSPI_SR.CSS=0, wait for QSPI_ISR.CSRA=1.
4. Set QSPI_CR.QSPIDIS and wait for QSPI_SR.QSPIENS=0.
5. Disable the GCLK clock.
6. If QSPI_SR.CSS=0, wait for QSPI_ISR.CSRA=1.
7. Wait for QSPI_SR.CALBSY=0.

© 2025 Microchip Technology Inc. and its subsidiaries

8. Change GCLK frequency.
9. Write:
   - QSPI_CR.STPCAL
10. Wait for:
    - QSPI_SR.CALBSY=0
11. Write QSPI_CR.QSPIEN.
12. Wait for QSPI_SR.QSPIENS=1.
13. If automatic refresh is enabled, wait for QSPI_ISR.RFRSHD=1 by polling or interrupt (see Automatic Refresh).

75.6.9.4. End of Frame Procedure

If the QSPI needs reconfiguring, first apply the following procedure to close the current frame safely:

1. Wait for QSPI_SR.RBUSY=0 and QSPI_SR.HIDLE=1.
2. Send a QSPI_CR.LASTXFER command.
3. If QSPI_SR.CSS=0 or QSPI_SR.CSS1=0, wait for QSPI_ISR.CSRA=1.
4. Set QSPI_CR.QSPIDIS and wait for QSPI_SR.QSPIENS=0.

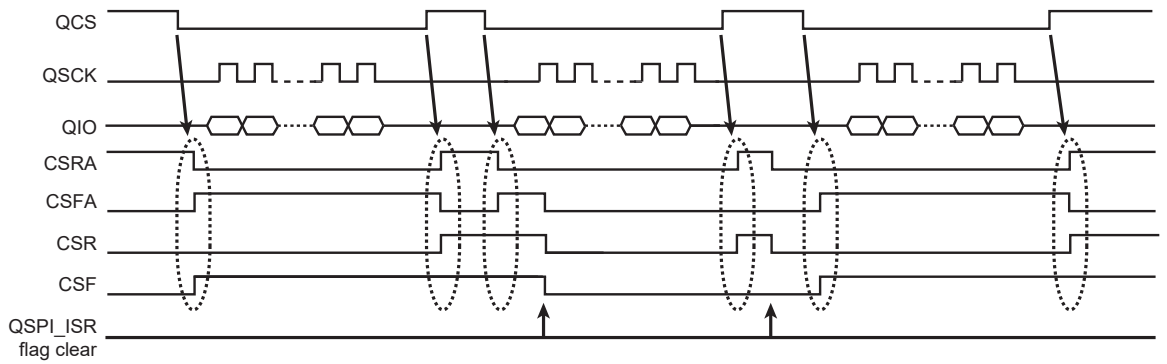
Note: Consider using a memory barrier when writing the application code before executing the above procedure.

75.6.9.5. Device Selection Flags

To control the QSPI frames, the following flags showing the state of the device selection are available in QSPI_ISR:

- CSR and CSRA indicate when a rising edge of QCS has been detected. CSRA is automatically cleared when a QCS falling edge is detected.
- CSF and CSFA indicate when a falling edge of QCS has been detected. CSFA is automatically cleared when a QCS rising edge is detected.

Figure 75.11. Device Selection Flags



75.6.9.6. Instruction Frame

In order to control serial Flash memories, the QSPI can send instructions via the SPI bus (READ, PROGRAM, ERASE, LOCK, etc.). The QSPI includes a complete Instruction Frame register (QSPI_IFR) to ensure compatibility with all serial Flash memories.

An instruction frame includes:

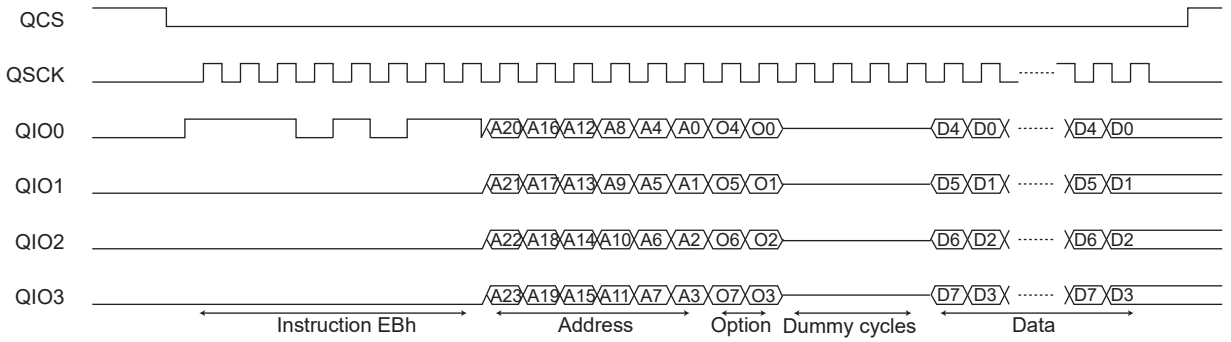
- (Optional) An instruction code (see Continuous Read Mode).
- An address (size: 8, 16, 24 or 32 bits). The address is optional but is required by instructions such as READ, PROGRAM, ERASE, LOCK. By default, the address is 8 bits long, but can be increased up to 32 bits to support serial Flash memories larger than 128 Mbits.

© 2025 Microchip Technology Inc. and its subsidiaries

- An option code (size: 1/2/4/8 bits). The option code can be used to activate some memory features.
- Dummy cycles. Dummy are required by some instructions.
- Data bytes. Data bytes are present for data transfer instructions such as READ or PROGRAM.

The instruction code, the address/option and the data can be sent with the Single-bit SPI, Dual SPI, Quad SPI or Octal SPI protocol.

Figure 75.12. Instruction Frame



75.6.9.7.Instruction Frame Transmission

If the instruction frame includes the instruction code and/or the option code, the user must configure the fields WRINST, WROPT, RDINST and RDOPT in the Write Instruction Code register (QSPI_WICR) and the Read Instruction Code register (QSPI_RICR). QSPI_WICR configures instruction code and option code for write accesses, and QSPI_RICR configures instruction code and option code for read accesses. For a frame without data (QSPI_IFR.DATAEN=0), QSPI_WICR is used for instruction and option codes.

QSPI_IFR must be configured with the instruction frame to send.

The instruction frame is configured by the following QSPI_IFR bits and fields:

- WIDTH field—configures which data lanes are used to send the instruction code, the address, the option code and to transfer the data.
- INSTEN bit—enables an instruction code.
- ADDREN bit—enables an address after the instruction code.
- OPTEN bit—enables an option code after the address.
- DATAEN bit—enables the transfer of data (READ or PROGRAM instruction).
- OPTL field—configures the option code length. The value written in OPTL must be consistent with the value written in the field WIDTH. For example: OPTL=0 (1-bit option code) is not consistent with WIDTH = 6 (option code sent with QuadSPI protocol, thus the minimum length of the option code is 4 bits).
- ADDRL bit—configures the QSPI address field size.
- TFRTYP field—defines the type of memory access. See the table below.
- CRM bit—enables Continuous Read mode, see Continuous Read Mode.
- DDREN bit—configures the Double Data Rate mode; the instruction code is still transmitted in Single Data Rate mode. The instruction code can be transmitted in DDR mode by writing a 1 to QSPI_IFR.DDRCMDEN.
- NBDUM field—configures the number of dummy cycles when reading data from the serial Flash memory. Between the address/option and the data, with some instructions, dummy cycles are required by the serial Flash memory.

© 2025 Microchip Technology Inc. and its subsidiaries

- END bit—defines the endianness of the targeted memory.
- SMRM bit—when TFRTYP=0, defines if the instruction frame transmission is triggered by register accesses or QSPI memory space accesses.
- APBTFRTYP bit—defines the peripheral bus register transfer to memory type (read or write) when QSPI_IFR.TFRTYP is written to 0.
- DQSEN bit—defines if the targeted memory supplies a DQS signal.
- DDRCMDEN bit—defines if the instruction code must be sent in DDR mode when QSPI_IFR.DDREN bit is written to 1.
- HFWBEN field—enables the HyperFlash Write Buffer command support. In this mode, a new command is generated for each write access. See HyperFlash Mode.
- PROTTYP bit—defines the QSPI protocol type.

See Instruction Frame register.

Depending on TFRTYP and SMRM memory accesses, the applicable methods are as follows.

Table 75.3. Memory Access Methods

QSPI_IFR Configuration	Memory Accesses via the System Bus	Memory Accesses via the Peripheral Bus
TFRTYP=0 and SMRM=1	No	Yes
TFRTYP=0 and SMRM=0	Yes	No
TFRTYP=1 or SMRM=0	Yes	No

75.6.9.7.1.Memory Registers/Commands Access

To perform memory register/command accesses, QSPI_IFR.TFRTYP must be set to 0.

If the frame does not contain any data (such as the WRITE ENABLE command) or if QSPI_IFR.SMRM is set to 1, the user must first configure the address to send by writing ADDR in the Instruction Address register (QSPI_IAR) (if the frame contains an address field).

- SMRM=1
  When QSPI_IFR.SMRM is set to 1, accesses to the memory are triggered and controlled by QSPI registers.
  QSPI_IAR.ADDR must be configured if the frame contains an address field.
  QSPI_IFR.APBTFRTYP defines whether the access is a read or a write access. Write frames are triggered by writing QSPI_TDR, and read frames (or frames with no data such as WRITE_ENABLE) are triggered by setting QSPI_CR.STTFR. Each time a new transfer is issued, an SPI transfer is performed with a byte size or halfword size if the QSPI_IFR.WIDTH field is configured to either OCT_OUTPUT, OCT_IO or OCT_CMD and QSPI_IFR.DDREN=1. Reading QSPI_RDR triggers a new read access to the next sequential data in the memory(1). QSPI_TDR can be written when the flag TDRE is set. The QSPI transfer ends by writing QSPI_CR.LASTXFER. See Figure 75.13 for details.
- SMRM=0
  When QSPI_IFR.SMRM is set to 0, accesses to the memory are triggered by performing an access in the QSPI memory space. The address of the instruction frame is defined by the address of the first data access in the QSPI memory space. The addresses of the next accesses are not used by the QSPI.

© 2025 Microchip Technology Inc. and its subsidiaries

Note:

a. If QSPI_RDR is read while the QPSI controller is busy receiving the data, the QSPI_ISR.RBSYERR error flag is set, indicating a possible data corruption.

75.6.9.7.2.Write Access Counter

The field NBWRA, in the Write Access Counter register (QSPI_WRACNT) defines the number of bytes to be sent to the memory before QSPI_ISR.LWRA rises, which indicates that the last byte has been transmitted. NBWRA is reset and begins counting after each start of the instruction frame. If QSPI_IFR.PROTTYP=3 and QSPI_IFR.HFWBEN=1, NBWRA is reset after setting QSPI_IFR.HFWBEN bit to 1 and counts data on every frame.

75.6.9.7.3.Memory Array Access

To access the memory array, QSPI_IFR.TFRTYP must be set to 1. In the case of write access to the memory array, TFRTYP can be set to 0 with QSPI_IFR.SMRM set to 1.

- TFRTYP=0 and SMRM=1
  This configuration is allowed for write memory array access only (read access to the memory array is not supported in this configuration). When QSPI_IFR.SMRM is set to 1, accesses to the memory are triggered and controlled by QSPI registers. QSPI_IAR.ADDR must be configured with the address of the first data to write if the frame contains an address field, this field is the one used for the instruction frame address field. The QSPI_IFR.APBTFRTYP must be set to 0. Write frames are triggered by writing QSPI_TDR. Each time a new transfer trigger is issued, an SPI transfer is performed with a byte size or halfword size if the QSPI_IFR.WIDTH field is set to OCT_OUTPUT, OCT_IO or OCT_CMD and QSPI_IFR.DDREN=1. Another byte or halfword is written each time QSPI_TDR is written (flag TDRE shows when a new data can be written). If a data is not consecutive to the previously sent data, a new frame must be issued. The SPI transfer ends by writing QSPI_CR.LASTXFER. See Figure 75.17 for details.
- TFRTYP=1
  When QSPI_IFR.TFRTYP is set to 1, accesses to the memory are triggered by performing an access in the QSPI memory space. The address of the instruction frame is defined by the address of the first data access in the QSPI memory space. Each time the accesses become non-sequential (addresses are not consecutive), a new instruction frame may be sent (depending on optimization) with the last system bus access address. This way, the system can read/write data at a random location in the serial memory. QSPI_WRACNT.NBWRA generates a rising flag when a given number of bytes have been sent to the memory. QSPI_ISR.LWRA indicates the transmission of the last byte. The NBWRA internal counter is reset and begins counting after each start of instruction frame except when QSPI_IFR.PROTTYP=3 and QSPI_IFR.HFWBEN=1 where the NBWRA counter is reset after setting the QSPI_IFR.HFWBEN bit to 1 and counts data on every frame.

  In the case of read accesses to the memory array, QSPI_SR.RBUSY must be at 0 and QSPI_SR.HIDLE at 1 before terminating the frame. The last SPI transfer ends by writing QSPI_CR.LASTXFER. See Figure 75.19 and Figure 75.21 for details.

75.6.9.8. Write Memory Transfer

Many QSPI Flash memories impose a sequential write of their data buffer. When using this type of memory, the access to the memory must be performed in a strongly ordered way.

75.6.9.9. Read Memory Transfer

The user can access the data of the serial memory by sending an instruction with QSPI_IFR.DATAEN=1 and QSPI_IFR.TFRTYP=1.

In this mode, the QSPI is able to read data at a random address into the serial Flash memory, allowing the CPU to execute code directly from it (XiP, or Execute in Place).

In order to read data, the user must first configure the instruction frame by writing the QSPI_IFR. Then data can be read at any address in the QSPI address space mapping. The address of the system bus read accesses matches the address of the data inside the serial Flash memory.

When the Read mode is used, several instruction frames can be sent before writing QSPI_CR.LASTXFR. Each time the system bus read accesses become non-sequential (addresses are not consecutive), a new instruction frame may be sent (depending on optimization) with the corresponding address.

75.6.9.10. Continuous Read Mode

The QSPI is compatible with the Continuous Read mode which is implemented in some serial Flash memories.

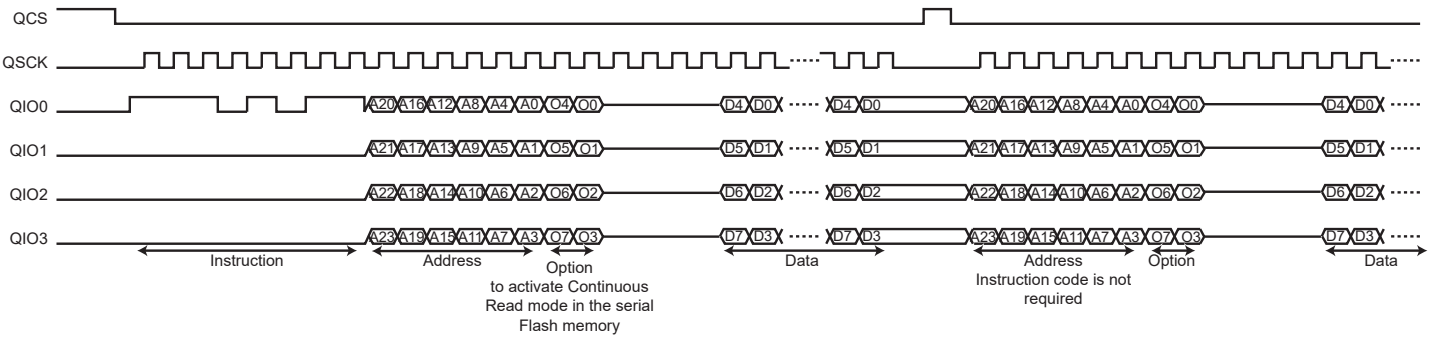
In Continuous Read mode, the instruction overhead is reduced by excluding the instruction code from the instruction frame. When the Continuous Read mode is activated in a serial Flash memory by a specific option code, the instruction code is stored in the memory. For the next instruction frames, the instruction code is not required as the memory uses the stored one.

In the QSPI, Continuous Read mode is used when reading data from the memory (QSPI_IFR.TFRTYP=1). The addresses of the system bus read accesses are often nonsequential and this may lead to many instruction frames that have the same instruction code. By disabling the send of the instruction code, the Continuous Read mode reduces the access time of the data.

To be functional, this mode must be enabled in both the QSPI and the serial Flash memory. The Continuous Read mode is enabled in the QSPI by writing CRM to 1 in the QSPI_IFR (TFRTYP set to 1). The Continuous Read mode is enabled in the serial Flash memory by sending a specific option code.

CAUTION Check the connected Memory Continuous read mode compatibility before enabling.

Figure 75.25. Continuous Read Mode



75.6.9.11. Instruction Frame Transmission Examples

All waveforms in the following examples describe SPI transfers in SPI Clock mode 0 (QSPI_SCR.CPOL = 0 and QSPI_SCR.CPHA = 0. See Serial Clock Phase and Polarity).

© 2025 Microchip Technology Inc. and its subsidiaries

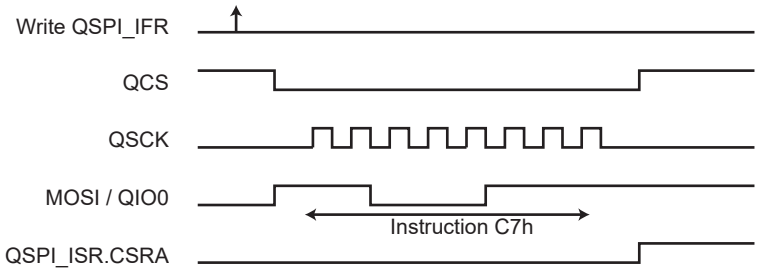
Example 1:

Instruction in Single-bit SPI, without address, without option, without data.

Command: CHIP ERASE (C7h).

- Write 0x0000_00C7 in QSPI_WICR.
- Write 0x0000_0010 in QSPI_IFR.
- Update configuration (see Updating the QSPI Configuration).
- Write QSPI_CR.STTFR to 1.
- Wait for QSPI_ISR.CSRA to rise.

Figure 75.26. Instruction Transmission Waveform 1



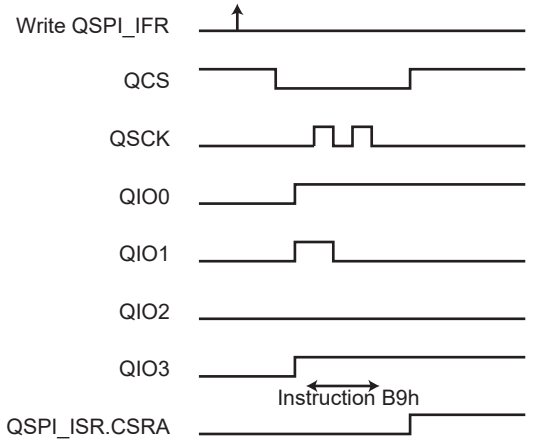
Example 2:

Instruction in Quad SPI, without address, without option, without data.

Command: POWER DOWN (B9h)

- Write 0x0000_00B9 in QSPI_WICR.
- Write 0x0000_0016 in QSPI_IFR.
- Update configuration (see Updating the QSPI Configuration).
- Write QSPI_CR.STTFR to 1.
- Wait for QSPI_ISR.CSRA to rise.

Figure 75.27. Instruction Transmission Waveform 2



Example 3:

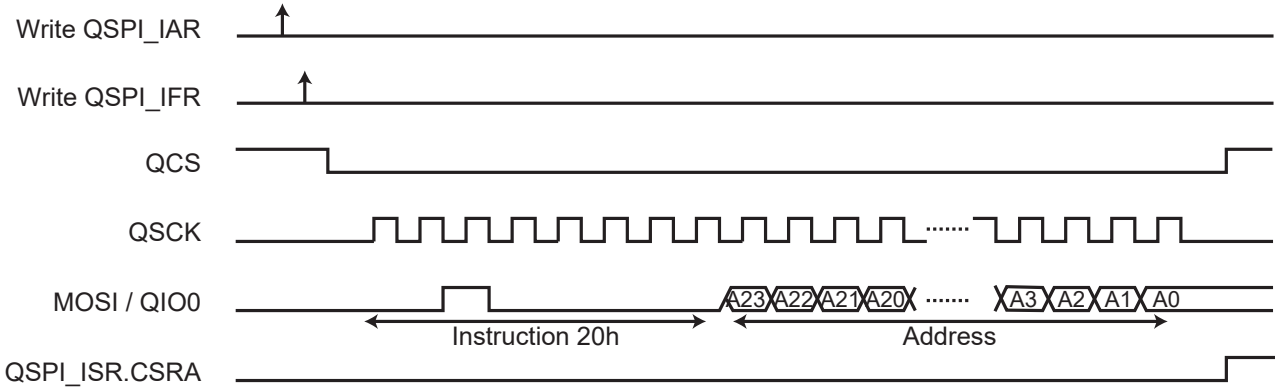
Instruction in Single-bit SPI, with address in Single-bit SPI, without option, without data.

Command: BLOCK ERASE (20h)

© 2025 Microchip Technology Inc. and its subsidiaries

- Write the address (of the block to erase) in QSPI_IAR.
- Write 0x0000_0020 in QSPI_WICR.
- Write 0x0000_0030 in QSPI_IFR.
- Update configuration (see Updating the QSPI Configuration).
- Write QSPI_CR.STTFR to 1.
- Wait for QSPI_ISR.CSRA to rise.

Figure 75.28. Instruction Transmission Waveform 3



Example 4:

Instruction in Single-bit SPI, without address, without option, with data write in Single-bit SPI.

Command: SET BURST (77h)

- Write 0x0000_0077 in QSPI_WICR.
- Write 0x0000_0090 in QSPI_IFR.
- Write QSPI_WRACNT.NBWRA with the number of bytes to write.
- Update configuration (see Updating the QSPI Configuration).
- Write data in the system bus memory space (0x20000000 - 0x30000000) for QSPI0 or (0x30000000 - 0x40000000) for QSPI1.
  The address of system bus write accesses is not used.
- Wait for QSPI_ISR.LWRA to rise.
- Write a 1 to QSPI_CR.LASTXFR.
- Wait for QSPI_ISR.CSRA to rise.

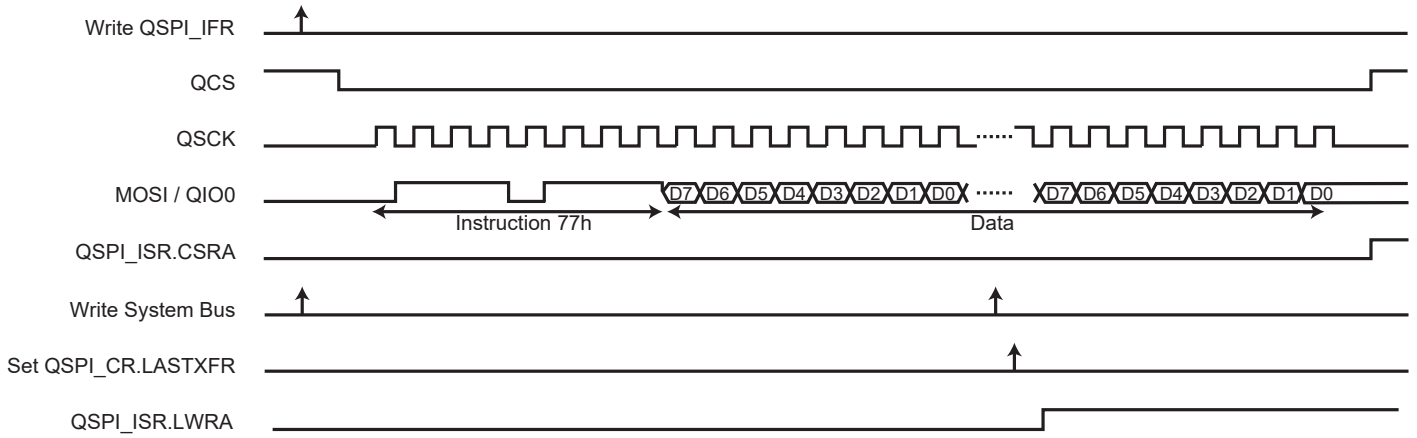
Figure 75.29. Instruction Transmission Waveform 4



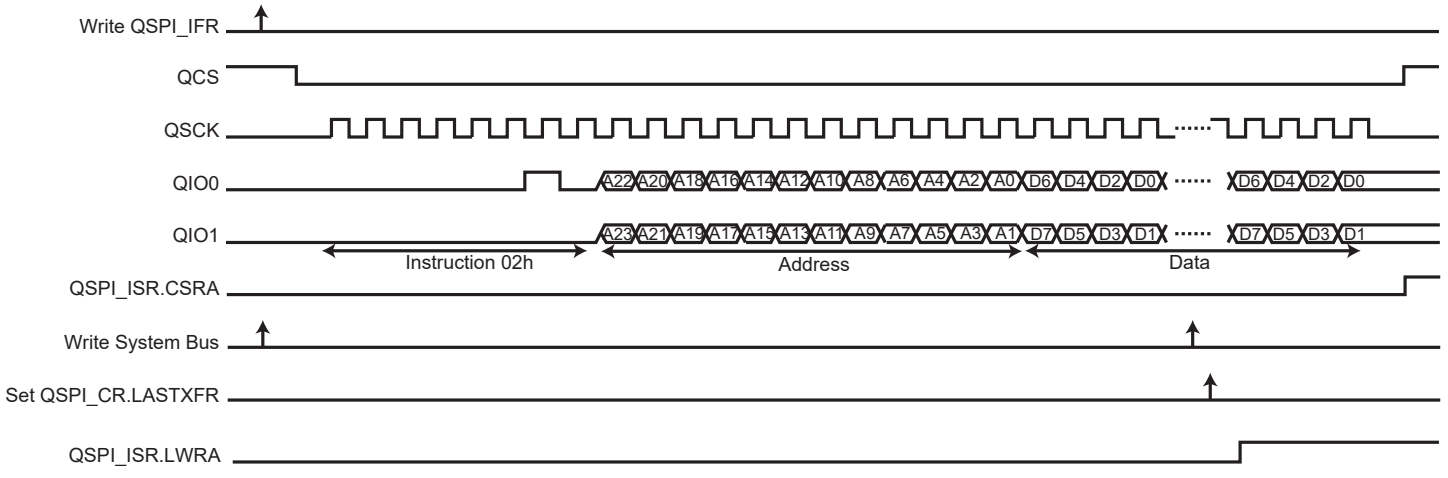
Example 5:

Instruction in Single-bit SPI, with 24-bit address in Dual SPI, without option, with data write in Dual SPI.

Command: BYTE/PAGE PROGRAM (02h)

- Write 0x0000_0002 in QSPI_WICR.
- Write 0x0000_18B3 in QSPI_IFR.
- Write QSPI_WRACNT.NBWRA with the number of bytes to write.
- Update configuration (see Updating the QSPI Configuration).
- Write data in the QSPI system bus memory space (0x20000000 - 0x30000000) for QSPI0 or (0x30000000 - 0x40000000) for QSPI1.
  The address of the first system bus write access is sent in the instruction frame.
  The address of the next system bus write accesses is not used.
- Wait for QSPI_ISR.LWRA to rise.
- Write a 1 to QSPI_CR.LASTXFR.
- Wait for QSPI_ISR.CSRA to rise.

Figure 75.30. Instruction Transmission Waveform 5



Example 6:

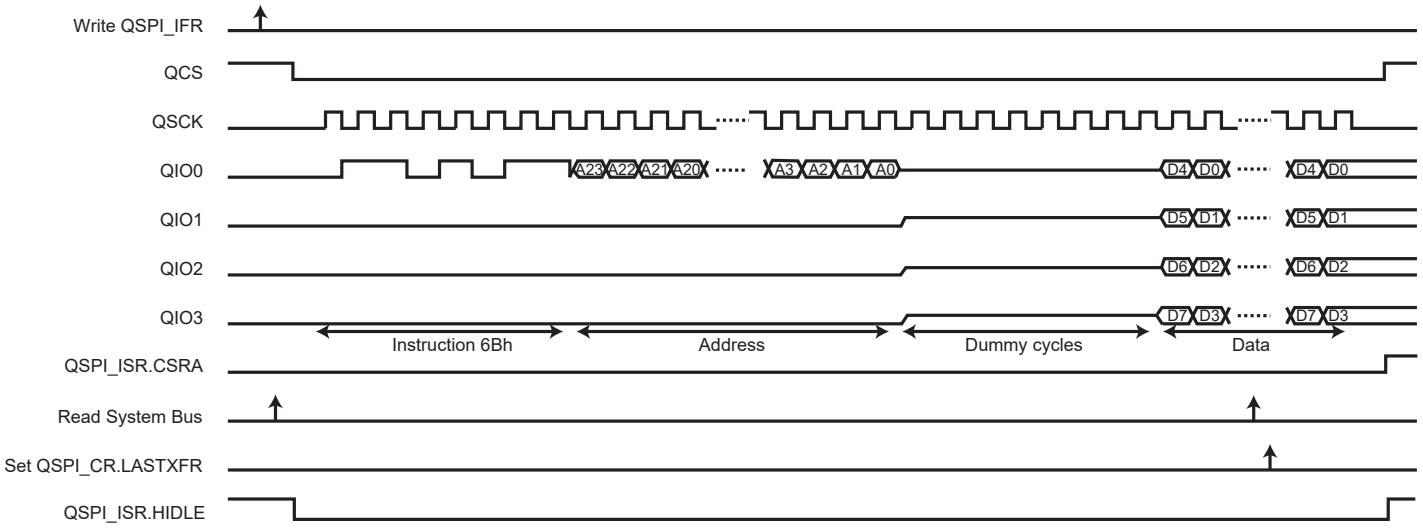
© 2025 Microchip Technology Inc. and its subsidiaries

Instruction in Single-bit SPI, with 24-bit address in Single-bit SPI, without option, with data read in Quad SPI, with eight dummy cycles.

Command: QUAD_OUTPUT READ ARRAY (6Bh)

- Write 0x0000_006B in QSPI_RICR.
- Write 0x0008_18B2 in QSPI_IFR.
- Update configuration (see Updating the QSPI Configuration).
- Read data in the QSPI system bus memory space (0x20000000 - 0x30000000) for QSPI0 or (0x30000000 - 0x40000000) for QSPI1.
  The address of the first system bus read access is sent in the instruction frame.
  The address of the next system bus read accesses is not used.
- Wait for QSPI_SR.RBUSY=0 and QSPI_SR.HIDLE=1.
- Write a 1 to QSPI_CR.LASTXFR.
- If QSPI_SR.CSS=0, wait for QSPI_ISR.CSRA to rise.

Figure 75.31. Instruction Transmission Waveform 6



Example 7:

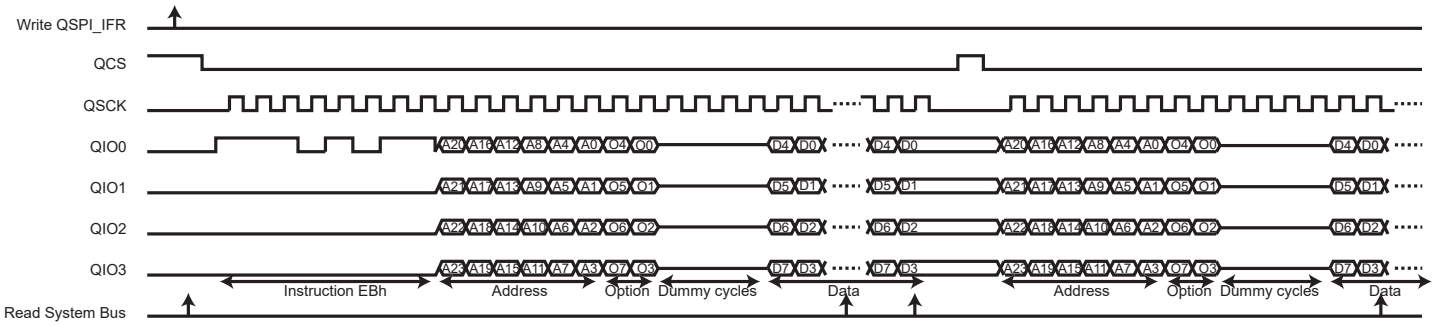
Instruction in Single-bit SPI, with 24-bit address and option in Quad SPI, with data read in Quad SPI, with four dummy cycles and continuous read.

Command: FAST READ QUAD I/O (EBh) - 8-BIT OPTION (0x30h)

- Write 0x0030_00EB in QSPI_RICR.
- Write 0x0004_1BF4 in QSPI_IFR.
- Update configuration (see Updating the QSPI Configuration).
- Read data in the QSPI system bus memory space (0x20000000 - 0x30000000) for QSPI0 or (0x30000000 - 0x40000000) for QSPI1.
  The address of the system bus read accesses is always used.
- Wait for QSPI_SR.RBUSY=0 and QSPI_SR.HIDLE=1.
- Write a 1 to QSPI_CR.LASTXFR.
- If QSPI_SR.CSS=0, wait for QSPI_ISR.CSRA to rise.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 75.32. Instruction Transmission Waveform 7



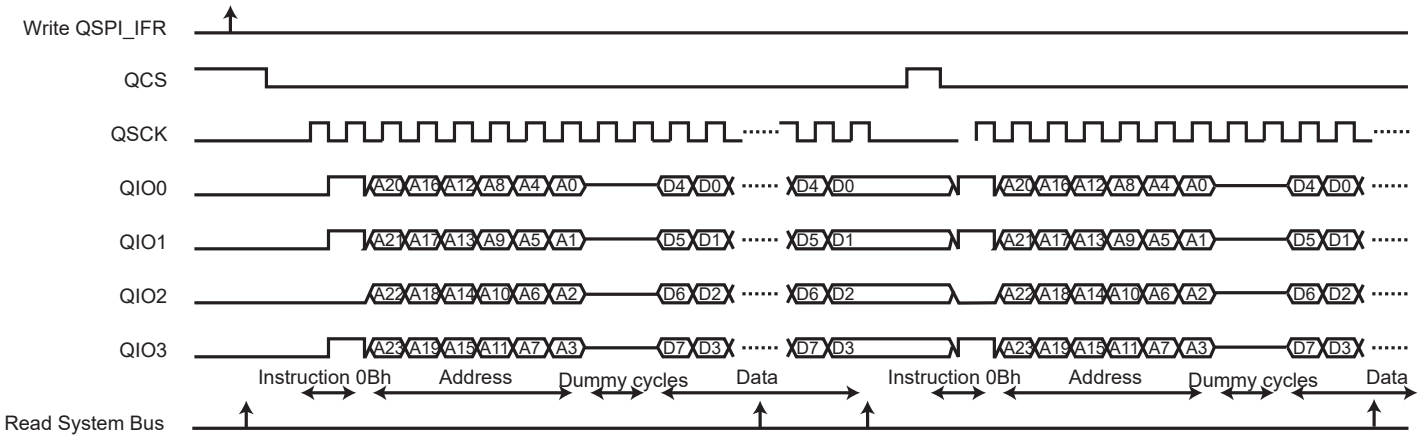
Example 8:

Instruction in Quad SPI, with 24-bit address in Quad SPI, without option, with data read in Quad SPI and two dummy cycles.

Command: HIGH-SPEED READ (0Bh)

- Write 0x0000_000B in QSPI_RICR.
- Write 0x0002_08B6 in QSPI_IFR.
- Update configuration (see Updating the QSPI Configuration).
- Read data in the QSPI system bus memory space (0x20000000 - 0x30000000) for QSPI0 or (0x30000000 - 0x40000000) for QSPI1.
  The address of the system bus read accesses is always used.
- Wait for QSPI_SR.RBUSY=0 and QSPI_SR.HIDLE=1.
- Write a 1 to QSPI_CR.LASTXFR.
- If QSPI_SR.CSS=0, wait for QSPI_ISR.CSRA to rise.

Figure 75.33. Instruction Transmission Waveform 8



Example 9:

Instruction in Quad SPI, without address, without option, with data read in Quad SPI, without dummy cycles, without fetch.

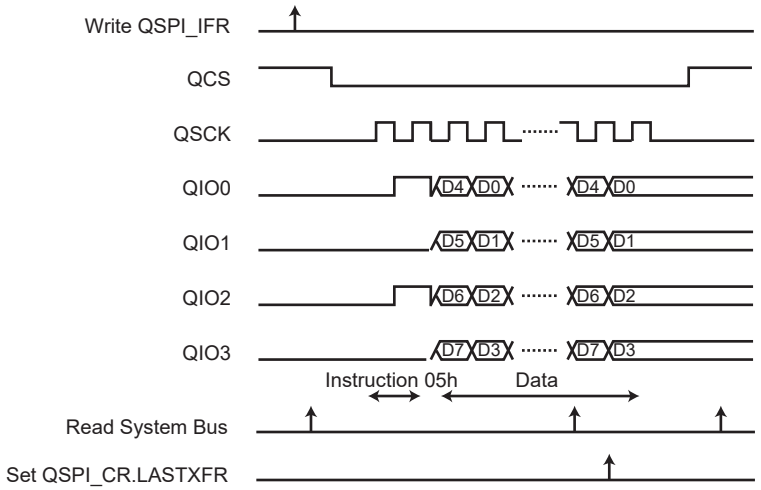
Command: Read Status register (05h)

- Write 0x0000_0005 in QSPI_RICR.
- Write 0x0000_0096 in QSPI_IFR.

© 2025 Microchip Technology Inc. and its subsidiaries

- Update configuration (see Updating the QSPI Configuration).
- Read data in the QSPI system bus memory space (0x20000000 - 0x30000000) for QSPI0 or (0x30000000 - 0x40000000) for QSPI1.
  Fetch is disabled.
- Wait for QSPI_SR.RBUSY=0 and QSPI_SR.HIDLE=1.
- Write a 1 to QSPI_CR.LASTXFR.
- Wait for QSPI_ISR.CSRA to rise.

Figure 75.34. Instruction Transmission Waveform 9



Example 10:

Instruction in Quad SPI, without address, without option, with data read in Quad SPI, without dummy cycles, and read launched through the peripheral bus.

Command: Read Status register (05h)

- Set SMRM to 1 and TFRTYP to 0 in QSPI_MR
- Write 0x0000_0005 in QSPI_RICR.
- Write 0x0100_0096 in QSPI_IFR.
- Update configuration (see Updating the QSPI Configuration).
- Write a 1 to QSPI_CR.STTFR.
- Wait for flag RDRF and Read data in QSPI_RDR.
- Write a 1 to QSPI_CR.LASTXFR.
- Wait for QSPI_ISR.CSRA to rise.
- Read data in QSPI_RDR.

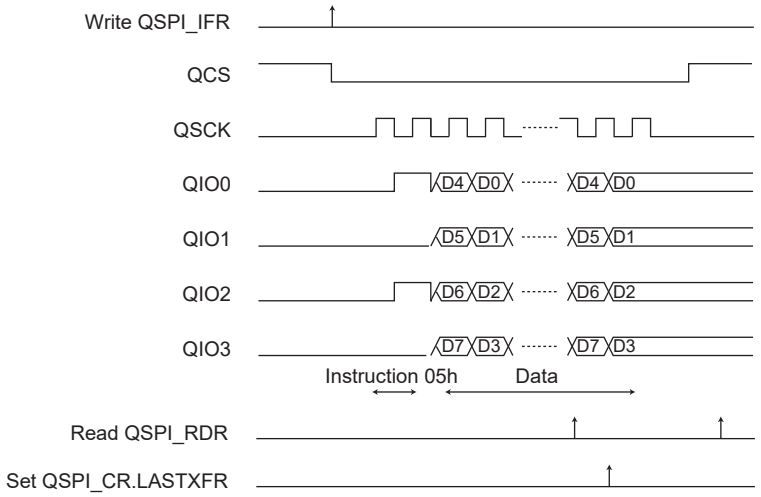
Figure 75.35. Instruction Transmission Waveform 10



Example 11:

Instruction in Octal Twin-Quad SPI, with 24-bit address in Octal Twin-Quad SPI, without option, with data read in Octal Twin-Quad SPI and two dummy cycles.

Command: HIGH-SPEED READ (0Bh)

- Write 0x0000_000B in QSPI_RICR.
- Write 0x1002_18B9 in QSPI_IFR.
- Update configuration (see Updating the QSPI Configuration).
- Read data in the QSPI system bus memory space (0x20000000 - 0x30000000) for QSPI0 or (0x30000000 - 0x40000000) for QSPI1.
  The address of the system bus read accesses is always used.
- Wait for QSPI_SR.RBUSY=0 and QSPI_SR.HIDLE=1'.
- Write a 1 to QSPI_CR.LASTXFR.
- If QSPI_SR.CSS=0, wait for QSPI_ISR.CSRA to rise.

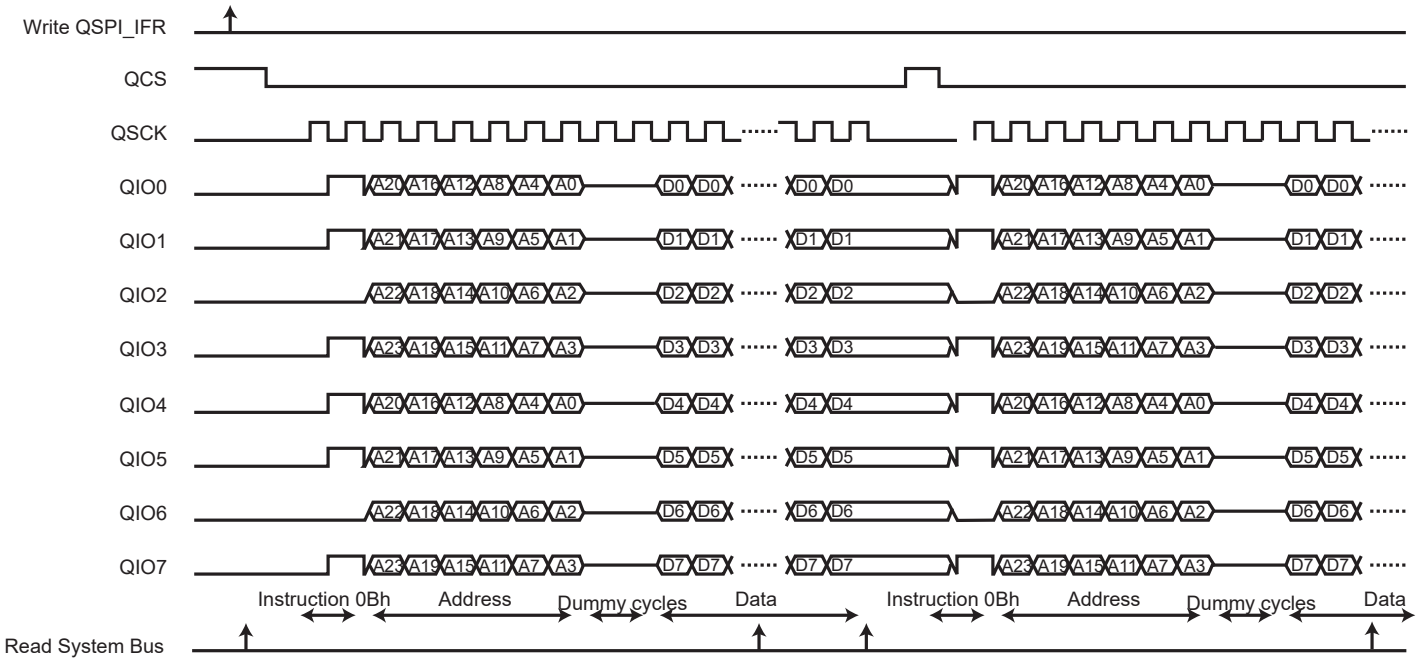
Figure 75.36. Instruction Transmission Waveform 11



Example 12:

Instruction in Octal Twin-Quad SPI, without address, without option, with data read in Octal Twin-Quad SPI, without dummy cycles and read launched through the peripheral bus.

Command: Read Status register (05h)

- Write a 1 to QSPI_MR.SMRM and a 0 to TFRTYP.
- Write 0x0000_0005 in QSPI_RICR.
- Write 0x1100_0099 in QSPI_IFR.
- Update configuration (see Updating the QSPI Configuration).
- Write a 1 to QSPI_CR.STTFR.
- Wait flag RDRF and Read data in the QSPI_RDR register.
- Write a 1 to QSPI_CR.LASTXFR.
- Wait for QSPI_ISR.CSRA to rise.
- Read data in the QSPI_RDR register.

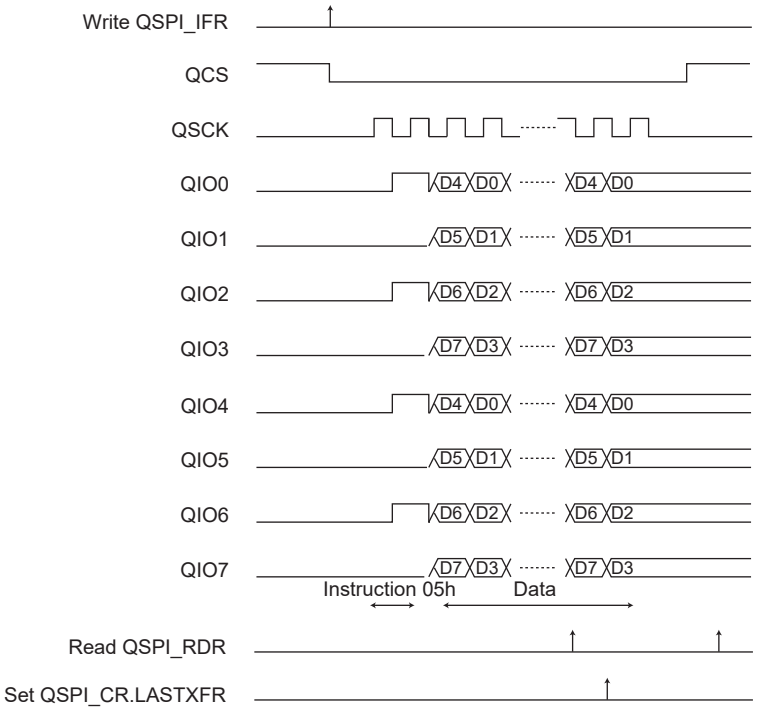
Figure 75.37. Instruction Transmission Waveform 12



Example 13:

Classic HyperFlash command. Instruction in Octal DDR SPI, HyperFlash mode, without option, with data write, without dummy cycles and write launched through the peripheral bus.

Command: Data 0xAA at address 0x555

- Write 0x36C0_8099 in QSPI_IFR.
- Write 0x555 to QSPI_IADR.
- Update configuration (see Updating the QSPI Configuration).
- Wait QSPI_ISR.TDRE Flag
- Write 0xAA to QSPI_TDR.
- Wait QSPI_ISR.TXEMPTY Flag.
- Write a 1 to QSPI_CR.LASTXFR.
- Wait for QSPI_ISR.CSRA to rise.

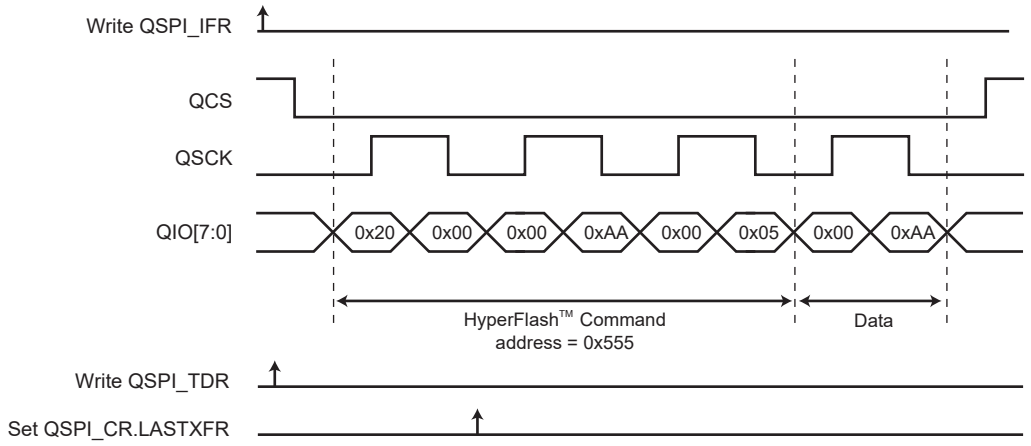
Figure 75.38. Instruction Transmission Waveform 13



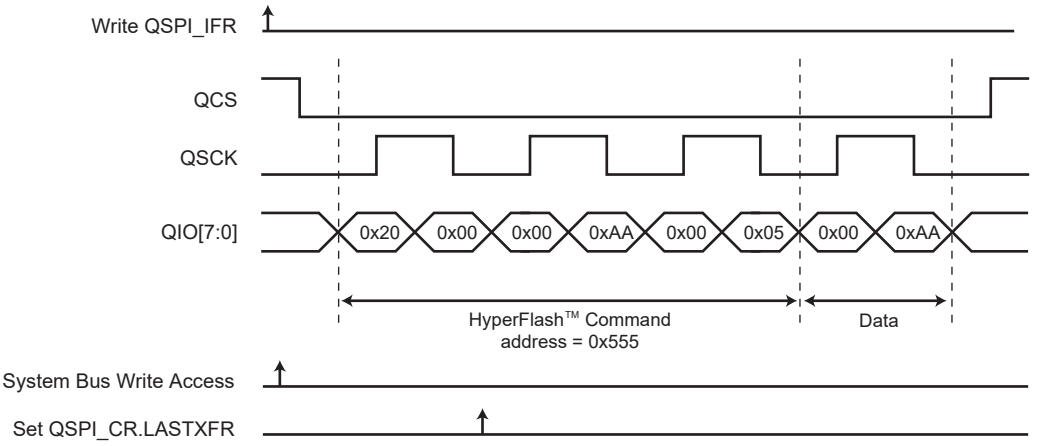
Example 14:

Classic HyperFlash command. Instruction in Octal DDR SPI, HyperFlash mode, without option, with data write, without dummy cycles, without fetch, write launched through the system bus interface.

Command: Data 0xAA at address 0x555

- Write 0x3640_8099 in QSPI_IFR.
- Write 0x01 in QSPI_WRACNT
- Update configuration (see Updating the QSPI Configuration).
- Write data 0xAA (byte access) in the QSPI system bus memory space with LSB address bytes=0x555 (0x20000000 - 0x30000000) for QSPI0 or (0x30000000 - 0x40000000) for QSPI1.
- Wait for QSPI_ISR.LWRA to rise.
- Write a 1 to QSPI_CR.LASTXFR.
- Wait for QSPI_ISR.CSRA to rise.

Figure 75.39. Instruction Transmission Waveform 14



75.6.9.12.Twin-Quad Mode

The Twin-Quad mode is activated by writing a 1 to QSPI_IFR.PROTTYP (Twin-Quad protocol). In this mode, the QSPI communicates with two Quad SPI memories as a single octal memory.

See examples 11 and 12 in Instruction Frame Transmission Examples.

© 2025 Microchip Technology Inc. and its subsidiaries

In this mode, only the DUAL_CMD, OCT_OUTPUT, OCT_IO and OCT_CMD configurations are supported by QSPI_IFR.WIDTH.

- DUAL_CMD: addresses both dies included in the Twin-Quad memory in single bit SPI for the Instruction, Address and Data phases (1-1-1).
- OCT_OUTPUT: addresses both dies included in the Twin-Quad memory in single bit SPI for the Instruction and Address phases, then in Quad SPI for the Data phase (1-1-4).
- OCT_IO: addresses both dies included in the Twin-Quad memory in single bit SPI for the Instruction phase, then in Quad SPI for the Address and Data phases (1-4-4).
- OCT_CMD: addresses both dies included in the Twin-Quad memory in Quad SPI for the Instruction, Address and Data phases (4-4-4).

When QSPI_IFR.TFRTYP is written to 1, programming is the same as in the standard Quad SPI protocol.

When QSPI_IFR.TFRTYP is written to 0, programming differs due to the fact that each Quad SPI die has its own internal registers.

If QSPI_MR.SMRM is written to 0 (see Instruction Frame Transmission), a halfword read/write transfer must be issued instead of a byte transfer (one byte for each register of each die) to the Twin-Quad memory to write/read the registers of both dies.

- For read transfers, the halfword read is as follows: {reg_byte[3:0], reg_byte[3:0], reg_byte[7:4], reg_byte[7:4]}.
  - Example: if data 0xA7 is to be read in both registers of both dies, the halfword read will be 0x77AA.
- For write transfers, the halfword must be sent as follows: {reg_byte[3:0], reg_byte[3:0], reg_byte[7:4], reg_byte[7:4]}.
  - Example: if data 0xB5 is to be written in both registers of both dies, the halfword to write is 0x55BB.

If QSPI_MR.SMRM is written to 1 (see Instruction Frame Transmission), a two-byte read/write transfer must be issued instead of a one-byte transfer (one byte for each register of each die) to the Twin-Quad memory to write/read the registers of both dies.

- For read transfers, the first byte read is {reg_byte[3:0], reg_byte[3:0]}. The second byte read is {reg_byte[7:4], reg_byte[7:4]}.
  - Example: if data 0xA7 is read in both registers of both dies, the first byte read is 0xAA and the second byte read is 0x77.
- For write transfers, the first byte sent must be {reg_byte[3:0], reg_byte[3:0]}. The second byte sent must be {reg_byte[7:4], reg_byte[7:4]}.
  - Example: if data 0xB5 is to be written in both registers of both dies, the first byte to write is 0xBB and the second byte to write is 0x55.

If QSPI_IFR.WIDTH is configured to OCT_CMD, and DDREN is written to 1, then a halfword must be read/written instead of a byte for each QSPI_RDR or QSPI_TDR access.

In this configuration, the halfword to write in QSPI_TDR in case of a write transfer is {reg_byte[7:4], reg_byte[7:4], reg_byte[3:0], reg_byte[3:0]}.

For example, if data 0xB5 is to be written in both registers of both dies, the halfword to write in QSPI_TDR is 0xBB55.

In this configuration, the halfword read in QSPI_RDR in case of a read transfer is {reg_byte[7:4], reg_byte[7:4], reg_byte[3:0], reg_byte[3:0]}.

For example, if data 0xA7 is to be read in both registers of both dies, the halfword read in QSPI_RDR is 0xAA77.

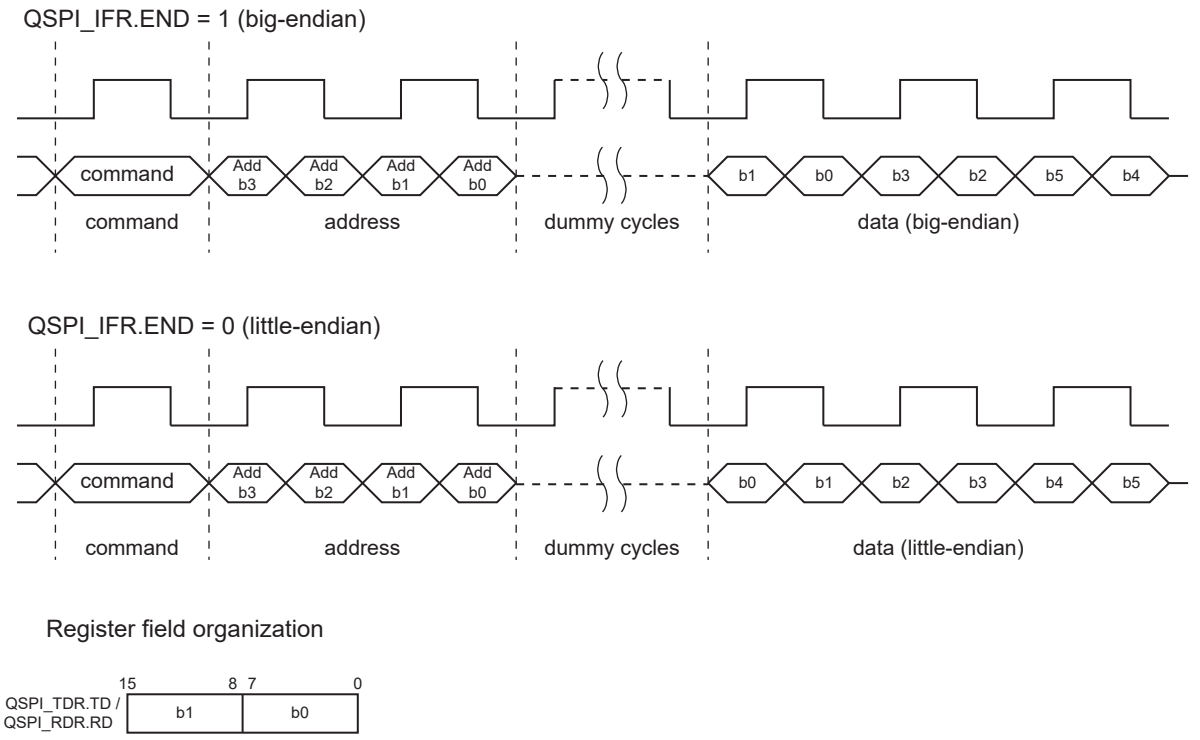
© 2025 Microchip Technology Inc. and its subsidiaries

75.6.9.13.Endianness

If the QSPI is not configured in Octal DDR mode, endianness does not matter and QSPI_IFER.END should be left at 0 (default=little-endian).

When the QSPI is configured in Octal DDR mode, halfwords are sent/received instead of bytes. Endianness must be configured according to the memory data sheet.

Figure 75.40. Instruction Frame Endianness



75.6.9.14.Octal DDR Mode

Some memories support Octal DDR communication. To enable Octal DDR mode, configure QSPI_IFR.WIDTH to either '7', '8' or '9' and QSPI_IFR.DDREN to 1. Configure the other parameters in QSPI_IFR to the targeted memory.

In this mode, QSPI_TDR.TD and QSPI_RDR.RD use the full 16-bit width.

For memories using 8-bit registers:

- SMRM=0
  The memory register can be read/written by performing a byte access in the QSPI memory space. In the case of a read, only the first byte read is considered. In the case of a write, check if the memory supports receiving the register value only on the first byte. If not, a halfword access must be performed (refer to the memory data sheet to build the halfword).
- SMRM=1
  In Octal DDR mode, QSPI_TDR.TD and QSPI_RDR.RD use the full 16-bit width. Therefore, it is mandatory to write/read a halfword in this configuration.

75.6.9.15.HyperFlash Mode

The QSPI supports HyperFlash memories. To enable HyperFlash mode, set QSPI_IFR.PROTTYP to 3.

See examples 13 and 14 in Instruction Frame Transmission Examples.

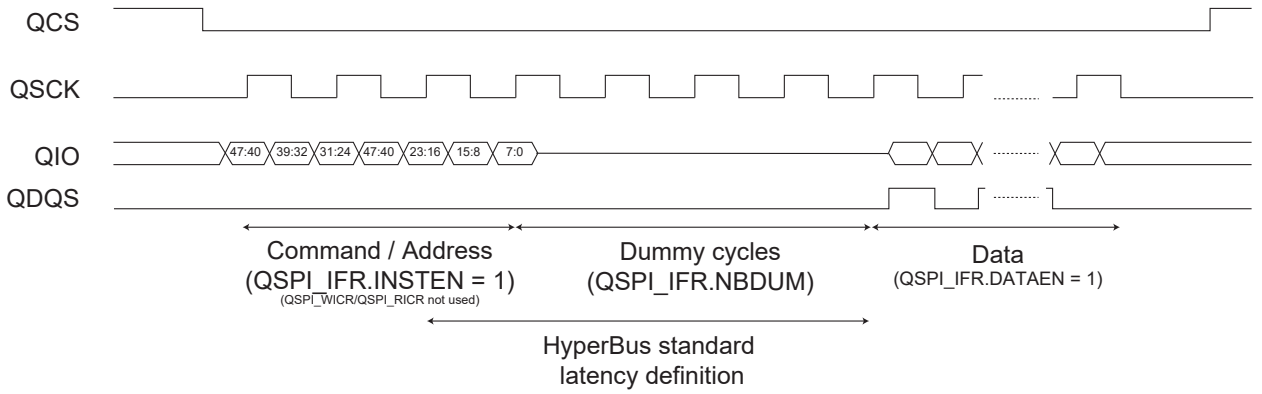
HyperFlash memories use Octal DDR communication. Recommendations provided in Octal DDR Mode must be followed.

© 2025 Microchip Technology Inc. and its subsidiaries

HyperFlash memories define a “command/address” field where the address of the transfer is included and merged in the command. For this reason, in this mode QSPI_IFR.ADDREN must be set to 0 and QSPI_IFR.INSTEN must be set to 1.

The HyperFlash “command/address” field merges the transfer address and the transfer characteristics (such as read/write, memory/register space, burst type, etc.) so that there is no specific opcode per transfer type. As a consequence, QSPI_WICR and QSPI_RICR are not used in this mode. See the following figure.

Figure 75.41. HyperBus Frame



Once HyperFlash mode is enabled, the procedure to access the memory is the same as for classic QSPI memories. See Instruction Frame Transmission (see Figure 75.14, Figure 75.15, Figure 75.18, Figure 75.20, Figure 75.22).

For the HyperFlash Write Buffer procedure, QSPI_IFR.HFWBEN must be set. When this bit is set, a new command is issued for each halfword written. In this mode, halfword accesses are mandatory. See Figure 75.23 and Figure 75.24.

Note:

1. In HyperFlash mode, some bits of the HyperFlash command are set automatically. For instance, the “Burst Type” bit of the HyperFlash command (bit 45) is always set to 1 (linear burst).
2. The HyperFlash standard latency definition counts the latency starting from the fourth byte of the instruction, whereas the QSPI counts the dummy cycles starting from the end of the instruction field. Therefore, the value to set in QSPI_IFR.NBDUM is the HyperFlash latency value minus 1.

75.6.9.16.Time-Out

The QSPI includes a time-out counter. This time-out counter detects any blocking state on the memory side (hardware connection issue, unknown command sent, etc.). If the QSPI is expecting data from the memory, it starts counting and if the counter reaches the value set in the TCNTM field of the Timeout register (QSPI_TOUT), the flag QSPI_ISR.TOUT rises.

When the TOUT flag rises, any access waiting on the QSPI core is released with an error response so that the system bus is released. Any further access to the QSPI core receives an error response until the TOUT flag is cleared.

After a time-out error, the TOUT flag must be cleared by writing QSPI_CR.RTOUT to 1. This also resets the QSPI internal state machines.

If QSPI_TOUT.TCNTM is set to 0, the time-out feature is disabled.

75.6.10. Scrambling/Unscrambling Function

The scrambling/unscrambling function cannot be performed on devices other than memories.

© 2025 Microchip Technology Inc. and its subsidiaries

Scrambling is possible only if SMM =1.

If TFRTYP=1, on-the-fly scrambling via system bus accesses is possible (see Figure 75.19, Figure 75.21 and Figure 75.24 for specific flowcharts).

If TFRTYP=0 and SMRM=1, scrambling via peripheral bus accesses is possible for write accesses (see Figure 75.17 and Figure 75.23 for specific flowcharts).

The external data lines can be scrambled in order to prevent intellectual property data located in off-chip memories from being easily recovered by analyzing data at the package pin level of either the microcontroller or the QSPI client device (memory, for example).

The scrambling/unscrambling function can be enabled by writing a 1 to the SCREN bit in the QSPI Scrambling Mode register (QSPI_SMR).

The scrambling and unscrambling are performed on-the-fly without impacting the throughput.

The scrambling method depends on the user-configurable user scrambling key (field USRK) in the QSPI Scrambling Key register (QSPI_SKR). QSPI_SKR is only accessible in Write mode.

When QSPI_SMR.SCRKL has been written once to 1, QSPI_SKR.USRK cannot be written again until the next reset.

If QSPI_SMR.RVDIS is written to 0, the scrambling/unscrambling algorithm includes the user scrambling key plus a random value depending on device processing characteristics. Data scrambled by a given microcontroller cannot be unscrambled by another.

If QSPI_SMR.RVDIS is written to 1, the scrambling/unscrambling algorithm includes only the user scrambling key. No random value is part of the key.

The user scrambling key or the seed for key generation must be securely stored in a reliable nonvolatile memory in order to recover data from the off-chip memory. Any data scrambled with a given key cannot be recovered if the key is lost.

75.6.10.1.Clearing Scrambling Keys on a Tamper Event

On a tamper detection event, an immediate clear of the scrambling key (in the Scrambling Key register QSPI_SKR) is performed if QSPI_MR.TAMPCLR is set. For details about the tamper event source, refer to sections Safety and Security Features and/or Pinout.

75.6.11. Register Write Protection

To prevent any single software error from corrupting QSPI behavior, certain registers can be write-protected by setting the WPEN bit in the Write Protection Mode register (QSPI_WPMR).

If a write access to a write-protected register is detected, the WPVS flag in the WPEN bit in the Write Protection Status register (QSPI_WPSR) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS bit is automatically cleared after reading QSPI_WPSR.

The following registers can be write-protected when WPEN is set in QSPI_WPMR:

- QSPI Mode Register
- QSPI Serial Clock Register
- QSPI Scrambling Mode Register
- QSPI Scrambling Key Register
- QSPI Write Instruction Code Register
- QSPI Read Instruction Code Register
- QSPI Instruction Address Register
- QSPI Instruction Frame Register

© 2025 Microchip Technology Inc. and its subsidiaries

- QSPI Refresh Register
- QSPI Write Access Counter Register
- QSPI Pad Calibration Configuration Register
- QSPI Pad Calibration Bypass Register
- QSPI Timeout Register

The following register can be write-protected when WPCREN is set in QSPI_WPMR:

- QSPI Control Register

The following registers can be write-protected when WPITEN is set in QSPI_WPMR:

- QSPI Interrupt Enable Register
- QSPI Interrupt Disable Register

75.6.12. Peripheral Bus Access Errors

Some peripheral bus accesses (to the QSPI register interface) can result in errors if they generate an issue with the QSPI configuration.

Error flags considered as peripheral bus access errors are(1):

- QSPI_WPSR.WPVS
- QSPI_WPSR.SWE[2]
- QSPI_ISR.RBSYERR

In addition to the above error flags, any peripheral bus access error sets the QSPI_ISR.SECE flag.

Peripheral bus access errors are reported through interrupts (via QSPI_ISR.SECE) and the QSPI_WPSR flags.

Notes:

1. When a peripheral bus access error occurs, disable the QSPI and then check and/or reconfigure all registers.
2. QSPI_WPSR.SWETYP indicates the software error type when QSPI_WPSR.SWE is set. Note that SWETYP=UNDEF_DEVICE and SWETYP=UNEXP_DMACMD are not peripheral bus access errors.

75.7.1. QSPI Control Register

Name: QSPI_CR
Offset: 0x00
Reset: –
Property: Write-only

This register can only be written if the WPCREN bit is cleared in the QSPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
								LASTXFER
Access								W
Reset								–

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
						RTOUT	STTFR	UPDCFG
Access						W	W	W
Reset						–	–	–

Bit	7	6	5	4	3	2	1	0
	SWRST		SRFRSH	STPCAL			QSPIDIS	QSPIEN
Access	W		W	W			W	W
Reset	–		–	–			–	–

Bit 24 – LASTXFER Last Transfer

Value	Description
0	No effect.
1	The chip select is deasserted after the end of character transmission.

Bit 10 – RTOUT Reset Time-out

Value	Description
0	No effect.
1	Request a TOUT flag reset.

Bit 9 – STTFR Start Transfer

Value	Description
0	No effect.
1	Starts the transfer when TFRTYP=0 and SMRM=1 or when DATAEN=0.

Bit 8 – UPDCFG Update Configuration

Value	Description
0	No effect.
1	Requests an update of the QSPI Controller core configuration.

Bit 7 – SWRST QSPI Software Reset
DMA channels state and QSPI_PADCTRL are not affected by a software reset.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	Resets the QSPI. A software reset of the QSPI interface is performed.

Bit 5 – SRFRSH Start Refresh

Value	Description
0	No effect.
1	Starts a refresh sequence. QSPI_ISR.RFRSHD indicates when the refresh sequence is over.

Bit 4 – STPCAL Start Pad Calibration

Value	Description
0	No effect.
1	Starts a QSPI pad calibration. QSPI_SR.CALBSY indicates the state of the calibration.

Bit 1 – QSPIDIS QSPI Disable

As soon as QSPIDIS is set, the QSPI finishes its transfer.
All pins are set in Input mode and no data is received or transmitted.
If a transfer is in progress, the transfer is finished before the QSPI is disabled.
If QSPIEN and QSPIDIS are set to 1 when QSPI_CR is written, the QSPI is disabled.

Value	Description
0	No effect.
1	Disables the QSPI.

Bit 0 – QSPIEN QSPI Enable

Value	Description
0	No effect.
1	Enables the QSPI.

© 2025 Microchip Technology Inc. and its subsidiaries

75.7.2. QSPI Mode Register

Name: QSPI_MR
Offset: 0x04
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the QSPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	DLYCS[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	DLYBCT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
			AQICMEN		NBBITS[3:0]			
Access			R/W		R/W	R/W	R/W	R/W
Reset			0		0	0	0	0

Bit	7	6	5	4	3	2	1	0
	TAMPCLR		CSMODE[1:0]		DQSDLYEN	WDRBT		SMM
Access	R/W		R/W	R/W	R/W	R/W		R/W
Reset	0		0	0	0	0		0

Bits 31:24 – DLYCS[7:0] Minimum Inactive QCS Delay
This field defines the minimum delay between the deactivation and the activation of QCS. The DLYCS time ensures the client minimum deselect time is respected.
If DLYCS is written to 0, one GCLK period is inserted by default.
Otherwise, the following equation determines the delay:

- DLYCS=Minimum inactive × f_{GCLK}

Bits 23:16 – DLYBCT[7:0] Delay Between Consecutive Transfers

- SMM=0
  This field defines the delay between two consecutive transfers without releasing the chip select. The delay is always inserted after each transfer and before removing the chip select if needed.
  The following equation determines the delay:
  - DLYBCT=(Delay Between Consecutive Transfers × f_{GCLK}) / 32
- SMM=1
  This field defines the delay between last QSCK pulse and QCS rise.
  When DLYBCT is written to 0, no delay is inserted and the clock keeps its duty cycle over the character transfers.
  The following equation determines the delay:
  - DLYBCT=Delay Between Consecutive Transfers × f_{GCLK}

Bit 13 – AQICMEN QSPI Inter-Chip Communication Mode Enable All

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
0	DISABLED	The QSPI Inter-Chip mode is disabled.
1	ENABLED	The QSPI Inter-Chip mode is enabled.

Bits 11:8 – NBBITS[3:0] Number of Bits per Transfer
NBBITS is used only when SMM is set to '0'.

Value	Name	Description
0	8_BIT	8 bits for transfer
8	16_BIT	16 bits for transfer

Bit 7 – TAMPCLR Tamper Clear Enable

Value	Description
0	A tamper detection event has no effect on QSPI scrambling keys.
1	A tamper detection event immediately clears QSPI scrambling keys.

Bits 5:4 – CSMODE[1:0] Chip Select Mode
The CSMODE field determines how the chip select is deasserted.
This field is forced to LASTXFER when SMM is written to 1 and QSPI_IFR.PROTYP is not selecting a RAM memory.

Value	Name	Description
0	NOT_RELOADED	The chip select is deasserted if QSPI_TDR.TD has not been reloaded before the end of the current transfer.
1	LASTXFER	The chip select is deasserted when the bit LASTXFER is written to 1 and the character written in QSPI_TDR.TD has been transferred.
2	SYSTEMATICALLY	The chip select is deasserted systematically after each transfer.

Bit 3 – DQSDLYEN DQS Delay Enable

Value	Name	Description
0	DISABLED	The DQS Delay cell is disabled.
1	ENABLED	The DQS Delay cell is enabled. The DQS Delay cell automatic refresh is triggered according to the QSPI_REFRESH configuration.

Bit 2 – WDRBT Wait for Data Read Before Transfer

Value	Name	Description
0	DISABLED	No effect. In SPI mode, a transfer can be initiated whatever the state of QSPI_RDR is.
1	ENABLED	In SPI mode, a transfer can start only if QSPI_RDR is empty, i.e., does not contain any unread data. This mode prevents overrun error in reception.

Bit 0 – SMM Serial Memory Mode

Value	Name	Description
0	SPI	The QSPI is in SPI mode.
1	MEMORY	The QSPI is in Serial Memory mode.

© 2025 Microchip Technology Inc. and its subsidiaries

75.7.3. QSPI Receive Data Register

Name: QSPI_RDR
Offset: 0x08
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	RD[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	RD[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 15:0 – RD[15:0] Receive Data
Data received by the QSPI is stored in this register right-justified. Unused bits read zero.

- QSPI_MR.SMM=0
  RD is defined by QSPI_MR.NBBITS.
- QSPI_MR.SMM=1
  RD is 8 bits or 16 bits in Octal DDR mode.

© 2025 Microchip Technology Inc. and its subsidiaries

75.7.4. QSPI Transmit Data Register

Name: QSPI_TDR
Offset: 0x0C
Reset: –
Property: Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	TD[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	TD[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bits 15:0 – TD[15:0] Transmit Data

Data to be transmitted by the QSPI is stored in this register. Information to be transmitted must be written to the Transmit Data register in a right-justified format.

- QSPI_MR.SMM=0
  TD is defined by QSPI_MR.NBBITS field.
- QSPI_MR.SMM=1
  TD is 8 bits or 16 bits in Octal DDR mode.

© 2025 Microchip Technology Inc. and its subsidiaries

75.7.5. QSPI Interrupt Status Register

Name: QSPI_ISR
Offset: 0x10
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
							TOUT	RFRSHD
Access							R	R
Reset							0	0

Bit	15	14	13	12	11	10	9	8
	CSRA	CSFA	QITR	QITF	LWRA	INSTRE	CSF	CSR

Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
					OVRES	TXEMPTY	TDRE	RDRF
Access					R	R	R	R
Reset					0	0	0	0

Bit 17 – TOUT QSPI Time-out (cleared by writing QSPI_CR.RTOUT)

Value	Description
0	No QSPI time-out occurred.
1	At least one QSPI time-out occurred.

Bit 16 – RFRSHD Refresh Done (cleared on read)

Value	Description
0	No ‘refresh done’ event occurred since the last read of QSPI_ISR.
1	One ‘refresh done’ event has been detected since the end of the last refresh command or the last read of QSPI_ISR.

Bit 15 – CSRA Chip Select Rise Autoclear
See Device Selection Flags.

Value	Description
0	No chip select rise has been detected since beginning of the last command or the last read of QSPI_ISR.
1	One chip select rise has been detected since the beginning of the last command or the last read of QSPI_ISR.

Bit 14 – CSFA Chip Select Fall Autoclear
See Device Selection Flags.

Value	Description
0	No chip select fall has been detected since end of the last command or the last read of QSPI_ISR.
1	One chip select fall has been detected since the end of the last command or the last read of QSPI_ISR.

Bit 13 – QITR QSPI Interrupt Rise (cleared on read)

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No rising of the QSPI memory interrupt line has been detected since the last read of QSPI_ISR.
1	At least one QSPI memory interrupt line rising edge occurred since the last read of QSPI_ISR.

Bit 12 – QITF QSPI Interrupt Fall (cleared on read)

Value	Description
0	No falling of the QSPI memory interrupt line has been detected since the last read of QSPI_ISR.
1	At least one QSPI memory interrupt line falling edge occurred since the last read of QSPI_ISR.

Bit 11 – LWRA Last Write Access (cleared on read)

Value	Description
0	Last write access has not been sent since the last read of QSPI_ISR or NBWRA=0.
1	At least one last write access has been sent since the last read of QSPI_ISR.

Bit 10 – INSTRE Instruction End Status (cleared on read)

Value	Description
0	No instruction end has been detected since the last read of QSPI_ISR.
1	At least one instruction end has been detected since the last read of QSPI_ISR.

Bit 9 – CSF Chip Select Fall (cleared on read)
See Device Selection Flags.

Value	Description
0	No chip select rise has been detected since the last read of QSPI_ISR.
1	At least one chip select rise has been detected since the last read of QSPI_ISR.

Bit 8 – CSR Chip Select Rise (cleared on read)
See Device Selection Flags.

Value	Description
0	No chip select rise has been detected since the last read of QSPI_ISR.
1	At least one chip select rise has been detected since the last read of QSPI_ISR.

Bit 3 – OVRES Overrun Error Status (cleared on read)
An overrun occurs when QSPI_RDR is loaded at least twice from the serializer since the last read of the QSPI_RDR.

Value	Description
0	No overrun has been detected since the last read of QSPI_ISR.
1	At least one overrun error has occurred since the last read of QSPI_ISR.

Bit 2 – TXEMPTY Transmission Registers Empty (cleared by writing QSPI_TDR)
TXEMPTY is set to zero when the QSPI is disabled or at reset. The QSPI enable command sets this bit to one.

Value	Description
0	As soon as data is written in QSPI_TDR.
1	QSPI_TDR and the internal shifter are empty. If a transfer delay has been defined, TXEMPTY is set after the completion of such delay.

Bit 1 – TDRE Transmit Data Register Empty (cleared by writing QSPI_TDR)
TDRE is set to zero when the QSPI is disabled or at reset. The QSPI enable command sets this bit to one.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Data has been written to QSPI_TDR and not yet transferred to the serializer.
1	The last data written in the QSPI_TDR has been transferred to the serializer.

Bit 0 – RDRF Receive Data Register Full (cleared by reading QSPI_RDR)

Value	Description
0	No data has been received since the last read of QSPI_RDR.
1	Data has been received and the received data has been transferred from the serializer to QSPI_RDR since the last read of QSPI_RDR.

© 2025 Microchip Technology Inc. and its subsidiaries

75.7.6. QSPI Interrupt Enable Register

Name: QSPI_IER
Offset: 0x14
Reset: –
Property: Write-only

This register can only be written if the WPITEN bit is cleared in the QSPI Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

Bit 3 – OVRES Overrun Error Interrupt Enable

Bit 2 – TXEMPTY Transmission Registers Empty Enable

Bit 1 – TDRE Transmit Data Register Empty Interrupt Enable

Bit 0 – RDRF Receive Data Register Full Interrupt Enable

© 2025 Microchip Technology Inc. and its subsidiaries

75.7.7. QSPI Interrupt Disable Register

Name: QSPI_IDR
Offset: 0x18
Reset: –
Property: Write-only

This register can only be written if the WPITEN bit is cleared in the QSPI Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

75.7.9. QSPI Serial Clock Register

Name: QSPI_SCR
Offset: 0x20
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the QSPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	DLYBS[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
							CPHA	CPOL
Access							R/W	R/W
Reset							0	0

Bits 23:16 – DLYBS[7:0] Delay Before QSCK
This field defines the delay from QCS valid to the first valid QSCK transition.
When DLYBS is set to zero, the QCS valid to QSCK transition is half the QSCK clock period.
Otherwise, the following equation determines the delay:

- DLYBS = Delay Before QSCK × f_{GCLK}

Bit 1 – CPHA Clock Phase
CPHA determines which edge of QSCK causes data to change and which edge causes data to be captured. CPHA is used with CPOL to produce the required clock/data relationship between host and client devices.

Value	Description
0	Data is captured on the leading edge of QSCK and changed on the following edge of QSCK.
1	Data is changed on the leading edge of QSCK and captured on the following edge of QSCK.

Bit 0 – CPOL Clock Polarity
CPOL is used to determine the inactive state value of the serial clock (QSCK). It is used with CPHA to produce the required clock/data relationship between host and client devices.

Value	Description
0	The inactive state value of QSCK is logic level zero.
1	The inactive state value of QSCK is logic level one.

© 2025 Microchip Technology Inc. and its subsidiaries

75.7.10. QSPI Status Register

Name: QSPI_SR
Offset: 0x24
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Access		R		R	R	R	R	R
Reset		0		0	0	0	0	0

Bit 6 – CALBSY Pad Calibration Busy

Value	Description
0	Pad calibration is not ongoing.
1	Pad calibration is ongoing.

Bit 4 – HIDLE QSPI Idle

Value	Description
0	The QSPI is not in Idle state (either transmitting or chip select is active).
1	The QSPI is in Idle state (not transmitting and chip select is inactive).

Bit 3 – RBUSY Read Busy

Value	Description
0	The client bus interface has no activity.
1	The client bus interface is currently processing accesses.

Bit 2 – CSS Chip Select Status

Value	Description
0	The chip select is asserted.
1	The chip select is not asserted.

Bit 1 – QSPIENS QSPI Enable Status

Value	Description
0	The QSPI is disabled.
1	The QSPI is enabled.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 0 – SYNCBSY Synchronization Busy

Value	Description
0	Allows access to any register.
1	Some register accesses must not be accessed. See Register Synchronization.

© 2025 Microchip Technology Inc. and its subsidiaries

75.7.11. QSPI Instruction Address Register

Name: QSPI_IAR
Offset: 0x30
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the "QSPI Write Protection Mode Register" .

Bit	31	30	29	28	27	26	25	24
	ADDR[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

75.7.12. QSPI Write Instruction Code Register

Name: QSPI_WICR
Offset: 0x34
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the QSPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	WROPT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	WRINST[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	WRINST[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 23:16 – WROPT[7:0] Write Option Code
Option code to send to the serial Flash memory in case of write transfer.

Bits 15:0 – WRINST[15:0] Write Instruction Code
Instruction code to send to the serial Flash memory in case of write transfer.

© 2025 Microchip Technology Inc. and its subsidiaries

75.7.13. QSPI Instruction Frame Register

Name: QSPI_IFR
Offset: 0x38
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the QSPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
		PROTTYP[2:0]			HFWBEN	DDRCMDEN	DQSEN	APBTFRTYP
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	SMRM	END	NBDUM[5:0]					
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	DDREN	CRM		TFRTYP	ADDRL[1:0]		OPTL[1:0]	
Access	R/W	R/W		R/W	R/W	R/W	R/W	R/W
Reset	0	0		0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
	DATAEN	OPTEN	ADDREN	INSTEN	WIDTH[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 30:28 – PROTTYP[2:0] Protocol Type

Value	Name	Description
0	STD_SPI	Standard (Q)SPI protocol (to be selected if no other value matches the device)
1	TWIN_QUAD	Twin-Quad protocol
2	OCTAFLASH	OctaFlash protocol or Octal DDR protocol with 16-bit instruction code
3	HYPERFLASH	HyperFlash protocol

Bit 27 – HFWBEN HyperFlash Write Buffer Enable

Value	Description
0	No effect.
1	Each write access received on the system bus interface generates a new command. **Mandatory if the HyperFlash Write Buffer feature is used.**

Bit 26 – DDRCMDEN DDR Mode Command Enable

Value	Name	Description
0	DISABLED	Transfer of instruction field is performed in Single Data Rate mode even if DDREN is written to 1.
1	ENABLED	Transfer of instruction field is performed in Double Data Rate mode if DDREN bit is written to 1. If DDREN is written to 0, the instruction field is sent in Single Data Rate mode.

Bit 25 – DQSEN DQS Sampling Enable

Value	Description
0	Data from the memory are not sampled with the DQS signal.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Data from the memory are sampled with the DQS signal.

Bit 24 – APBTFRTYP Peripheral Bus Transfer Type

Value	Description
0	Register transfer to the memory is a write transfer. Used when TRFTYP is written to 0 and SMRM to 1.
1	Register transfer to the memory is a read transfer. Used when TRFTYP is written to 0 and SMRM to 1.

Bit 23 – SMRM Serial Memory Register Mode
See Instruction Frame Transmission for details.

Value	Description
0	Serial Memory registers are written via system bus access.
1	Serial Memory registers are written via peripheral bus access.

Bit 22 – END Endianness

Value	Description
0	Data are sent in little-endian format to the memory.
1	Data are sent in big-endian format to the memory.

Bits 21:16 – NBDUM[5:0] Number Of Dummy Cycles
Defines the number of dummy cycles (also called read latency) required by the serial memory before data transfer.

Bit 15 – DDREN DDR Mode Enable
DDRCMDEN defines how the instruction field is sent when Double Data Rate mode is enabled. If DDRCMDEN is at 0, the instruction field is sent in Single Data Rate mode.

Value	Name	Description
0	DISABLED	Transfers are performed in Single Data Rate mode.
1	ENABLED	Transfers are performed in Double Data Rate mode, whereas the instruction field is still transferred in Single Data Rate mode.

Bit 14 – CRM Continuous Read Mode

Value	Name	Description
0	DISABLED	Continuous Read mode is disabled.
1	ENABLED	Continuous Read mode is enabled.

Bit 12 – TFRTYP Data Transfer Type

Value	Name	Description
0	TRSFR_REGISTER	Read/Write of memory register, write of memory page buffer. This configuration implies the following: • Either the system bus or the peripheral bus can be used to initiate the transfer (SMRM bit). • If the peripheral bus is used, the RDRF and TDRE flags help to control the frame. • Scrambling is possible only for write accesses and if the peripheral bus is used. • For HyperFlash memories the “target” bit is set to register space in the HyperFlash header.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
1	TRSFR_MEMORY	Read/Write accesses to the memory space. This configuration implies the following: • Only the System Bus interface can be used to trigger accesses. • Access to random location is possible. • Address mask is applied and full system bus size accesses only are performed. • The internal optimization algorithm is enabled to minimize latency, and protocol specificities are handled automatically. • Seamless scrambling is possible. • Seamless handling of HyperFlash Write Buffer programming command (one command for each data) • Address shift is handled seamlessly (halfword memories, for example).

Bits 11:10 – ADDRL[1:0] Address Length

The ADDRL bit determines the length of the address.

Value	Name	Description
0	8_BIT	8-bit address size
1	16_BIT	16-bit address size
2	24_BIT	24-bit address size
3	32_BIT	32-bit address size

Bits 9:8 – OPTL[1:0] Option Code Length

Determines the length of the option code. The value written in OPTL must be consistent with the value written in the field WIDTH. For example, OPTL = 0 (1-bit option code) is not consistent with WIDTH = 6 (option code sent with the Quad SPI protocol, requiring a minimum length of 4 bits).

Value	Name	Description
0	OPTION_1BIT	The option code is 1 bit long.
1	OPTION_2BIT	The option code is 2 bits long.
2	OPTION_4BIT	The option code is 4 bits long.
3	OPTION_8BIT	The option code is 8 bits long.

Bit 7 – DATAEN Data Enable

Value	Description
0	No data is sent/received to/from the serial Flash memory.
1	Data is sent/received to/from the serial Flash memory.

Bit 6 – OPTEN Option Enable

Value	Description
0	The option is not sent to the serial Flash memory.
1	The option is sent to the serial Flash memory.

Bit 5 – ADDREN Address Enable

Value	Description
0	The transfer address is not sent to the serial Flash memory.
1	The transfer address is sent to the serial Flash memory.

Bit 4 – INSTEN Instruction Enable

Value	Description
0	The instruction is not sent to the serial Flash memory.
1	The instruction is sent to the serial Flash memory.

© 2025 Microchip Technology Inc. and its subsidiaries

Bits 3:0 – WIDTH[3:0] Width of Instruction Code, Address, Option Code and Data
OCT_OUTPUT, OCT_IO and OCT_CMD are supported only in DDR mode (QSPI_IFR.DDREN must be set). However, the instruction code can still be sent in SDR or DDR mode depending on DDRCMDEN configuration.

Value	Name	Description
0	SINGLE_BIT_SPI	Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Single-bit SPI
1	DUAL_OUTPUT	Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Dual SPI
2	QUAD_OUTPUT	Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Quad SPI
3	DUAL_IO	Instruction: Single-bit SPI / Address-Option: Dual SPI / Data: Dual SPI
4	QUAD_IO	Instruction: Single-bit SPI / Address-Option: Quad SPI / Data: Quad SPI
5	DUAL_CMD	Instruction: Dual SPI / Address-Option: Dual SPI / Data: Dual SPI
6	QUAD_CMD	Instruction: Quad SPI / Address-Option: Quad SPI / Data: Quad SPI
7	OCT_OUTPUT	Instruction: Single-bit SPI / Address-Option: Single-bit SPI / Data: Octal SPI
8	OCT_IO	Instruction: Single-bit SPI / Address-Option: Octal SPI / Data: Octal SPI
9	OCT_CMD	Instruction: Octal SPI / Address-Option: Octal SPI / Data: Octal SPI

75.7.14. QSPI Read Instruction Code Register

Name: QSPI_RICR
Offset: 0x3C
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the QSPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	RDOPT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	RDINST[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	RDINST[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 23:16 – RDOPT[7:0] Read Option Code
Option code to send to the serial Flash memory in case of read transfer.

Bits 15:0 – RDINST[15:0] Read Instruction Code
Instruction code to send to the serial Flash memory in case of read transfer.

© 2025 Microchip Technology Inc. and its subsidiaries

75.7.15. QSPI Scrambling Mode Register

Name: QSPI_SMR
Offset: 0x40
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the QSPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
						SCRKL	RVDIS	SCREN
Access						R/W	R/W	R/W
Reset						0	0	0

Bit 2 – SCRKL Scrambling Key Lock

Value	Description
0	No action.
1	QSPI_SKR.USRK cannot be written until the next VDDCORE reset.

Bit 1 – RVDIS Scrambling/Unscrambling Random Value Disable

Value	Description
0	The scrambling/unscrambling algorithm includes the user scrambling key plus a random value that may differ between devices.
1	The scrambling/unscrambling algorithm includes only the user scrambling key.

Bit 0 – SCREN Scrambling/Unscrambling Enable

Value	Name	Description
0	DISABLED	Scrambling/unscrambling is disabled.
1	ENABLED	Scrambling/unscrambling is enabled.

© 2025 Microchip Technology Inc. and its subsidiaries

75.7.16. QSPI Scrambling Key Register

Name: QSPI_SKR
Offset: 0x44
Reset: –
Property: Write-only

This register can only be written if the WPEN bit is cleared in the QSPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	USRK[31:24]							
Access	W	W	W	W	W	W	W	W

Reset	–	–	–	–	–	–	–	–

Bits 31:0 – USRK[31:0] User Scrambling Key

© 2025 Microchip Technology Inc. and its subsidiaries

75.7.17. QSPI Refresh Register

Name: QSPI_REFRESH
Offset: 0x50
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the QSPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	REFRESH[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	REFRESH[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	REFRESH[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	REFRESH[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – REFRESH[31:0] Refresh Delay Counter
Defines in GCLK clock periods the delay between two refreshes of analog blocks. See Refresh Sequence.

© 2025 Microchip Technology Inc. and its subsidiaries

75.7.18. QSPI Write Access Counter Register

Name: QSPI_WRACNT
Offset: 0x54
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the QSPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	NBWRA[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	NBWRA[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	NBWRA[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	NBWRA[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – NBWRA[31:0] Number of Write Accesses

© 2025 Microchip Technology Inc. and its subsidiaries

75.7.19. QSPI Pad Calibration Configuration Register

Name: QSPI_PCALCFG
Offset: 0x5C
Reset: 0x00019030
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the QSPI Write Protection Mode Register.

This register is not affected by a software reset (QSPI_CR.SWRST).

Bit	31	30	29	28	27	26	25	24
	CALN[3:0]				CALP[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
								CALCNT[8]
Access								R/W
Reset								1

Bit	15	14	13	12	11	10	9	8
	CALCNT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	0	0	1	0	0	0	0

Bit	7	6	5	4	3	2	1	0
		CLKDIV[2:0]				DIFFPM	DAPCAL	AAON
Access		R/W	R/W	R/W		R/W	R/W	R/W
Reset		0	1	1		0	0	0

Bits 31:28 – CALN[3:0] Calibration Code for N-channel (Read-only)

Bits 27:24 – CALP[3:0] Calibration Code for P-channel (Read-only)

Bits 16:8 – CALCNT[8:0] Pad Calibration Counter
Defines in Peripheral Clock periods the delay between the start of pad calibration analog circuitry and the calibration request.

Bits 6:4 – CLKDIV[2:0] Calibration Clock Division
The clock applied to the calibration cell is divided by CLKDIV + 1.

Bit 2 – DIFFPM Differential Pad Mode
This bit is not used by the QSPI core. Therefore it does not need to be synchronized using QSPI_CR.UPDCFG.

Value	Description
0	Pad differential mode is not enabled.
1	Pad differential mode is enabled.

Bit 1 – DAPCAL Disable Automatic Pad Calibration

Value	Description
0	Pad calibration is started automatically depending on the configuration of QSPI_REFRESH.
1	Pad calibration is not started automatically.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 0 – AAON Analog Always On

Value	Description
0	The analog part of the pad calibration circuitry is switched off after each calibration (long delay for each calibration).
1	The analog part of the pad calibration circuitry is not switched off after each calibration (shorter delay after the first calibration).

© 2025 Microchip Technology Inc. and its subsidiaries

75.7.20. QSPI Pad Calibration Bypass Register

Name: QSPI_PCALBP
Offset: 0x60
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the QSPI Write Protection Mode Register.

This register is not affected by a software reset (QSPI_CR.SWRST).

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
					CALNBP[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit	15	14	13	12	11	10	9	8
					CALPBP[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit	7	6	5	4	3	2	1	0
								BPEN
Access								R/W
Reset								0

Bits 19:16 – CALNBP[3:0] Calibration Code Bypass for N-channel

Bits 11:8 – CALPBP[3:0] Calibration Code Bypass for P-channel

Bit 0 – BPEN Bypass Enable

Value	Description
0	The calibration code is not overridden by values of CALNBP and CALPBP.
1	The calibration code is overridden by values of CALNBP and CALPBP.

© 2025 Microchip Technology Inc. and its subsidiaries

75.7.21. QSPI Timeout Register

Name: QSPI_TOUT
Offset: 0x64
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the QSPI Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	TCNTM[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	TCNTM[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 15:0 – TCNTM[15:0] Time-out Counter Maximum Value
Indicates the time in GCLK clock periods when the connected client does not answer and before the TOUT flag is set.

© 2025 Microchip Technology Inc. and its subsidiaries

75.7.22. QSPI Write Protection Mode Register

Name: QSPI_WPMR
Offset: 0xE4
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	23	22	21	20	19	18	17	16
	WPKEY[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
						WPCREN	WPITEN	WPEN
Access						R/W	R/W	R/W
Reset						0	0	0

Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x515350	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0.

Bit 2 – WPCREN Write Protection Control Register Enable

Value	Description
0	Disables the write protection on the Control register if WPKEY corresponds to 0x515350.
1	Enables the write protection on the Control register if WPKEY corresponds to 0x515350.

Bit 1 – WPITEN Write Protection Interrupt Enable

Value	Description
0	Disables the write protection on Interrupt registers if WPKEY corresponds to 0x515350.
1	Enables the write protection on Interrupt registers if WPKEY corresponds to 0x515350.

Bit 0 – WPEN Write Protection Enable

See Register Write Protection for the list of registers that can be protected.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x515350 (“QSP” in ASCII)
1	Enables the write protection if WPKEY corresponds to 0x515350 (“QSP” in ASCII)

© 2025 Microchip Technology Inc. and its subsidiaries

75.7.23. QSPI Write Protection Status Register

Name: QSPI_WPSR
Offset: 0xE8
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	WPVSRC[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
								WPVS
Access								R
Reset								0

Bits 15:8 – WPVSRC[7:0] Write Protection Violation Source
When WPVS=1, WPVSRC indicates the register address offset at which a write access has been attempted. When SWE=1, indicates the faulty register address, if relevant.

Bit 0 – WPVS Write Protection Violation Status (cleared on read)

Value	Description
0	No write protection violation has occurred since the last read of the QSPI_WPSR.
1	A write protection violation has occurred since the last read of the QSPI_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

76. Secure Digital MultiMedia Card Controller (SDMMC)

76.1. Description

The Secure Digital MultiMedia Card Controller (SDMMC) supports the embedded MultiMedia Card (e.MMC) Specification V5.1, the SD Memory Card Specification V3.0, and the SDIO V3.0 specification. It is compliant with the SD Host Controller Standard V3.0 specification.

The SDMMC includes the register set defined in the “SD Host Controller Simplified Specification V3.00” and additional registers to manage e.MMC devices, sampling tuning procedure, PAD calibration and enhanced features.

The SDMMC is clocked by two asynchronous clocks (HCLOCK, GCLK) (see Block Diagram) and requires the PMC to be configured first.

76.2. Embedded Characteristics

- Compatible with SD Host Controller Standard Specification Version 3.00
- Compatible with MultiMedia Card Specification Version V5.1
- Compatible with SD Memory Card Specification Version 3.00
- Compatible with SDIO Specification Version 3.00
- Support for 1-bit/4-bit SD/SDIO Devices
- Support for 1-bit/4-bit/8-bit e.MMC Devices
- Support for SD/SDIO Default Speed (Maximum SDCLK Frequency = 25 MHz)
- Support for SD/SDIO High Speed (Maximum SDCLK Frequency = 50 MHz)
- Support for SD/SDIO UHS-I SDR12 (Maximum SDCLK Frequency = 25 MHz)
- Support for SD/SDIO UHS-I SDR25 (Maximum SDCLK Frequency = 50 MHz)
- Support for SD/SDIO UHS-I SDR50 (Maximum SDCLK Frequency = 100 MHz)
- Support for SD/SDIO UHS-I SDR104 (Maximum SDCLK Frequency = 200 MHz)
- Support for SD/SDIO UHS-I DDR50 (Maximum SDCLK Frequency = 50 MHz)
- Support for SDSC, SDHC and SDXC
- Support for MMC/e.MMC Default Speed (Maximum SDCLK Frequency = 26 MHz)
- Support for MMC/e.MMC High Speed (Maximum SDCLK Frequency = 52 MHz)
- Support for e.MMC High Speed DDR (Maximum SDCLK Frequency = 52 MHz)
- Support for e.MMC HS200 (Maximum SDCLK Frequency = 200 MHz SDR)
- Support for e.MMC HS400 (Maximum SDCLK Frequency = 200 MHz DDR)
- e.MMC Boot Operation Mode Support
- Support for Block Size from 1 to 512 Bytes
- Support for Stream, Block and Multiblock Data Read and Write
  - Advanced DMA and SDMA capability
- Internal 1024-byte Dual Port RAM
- Support for both Synchronous and Asynchronous Abort
- Support for SDIO Card Interrupt

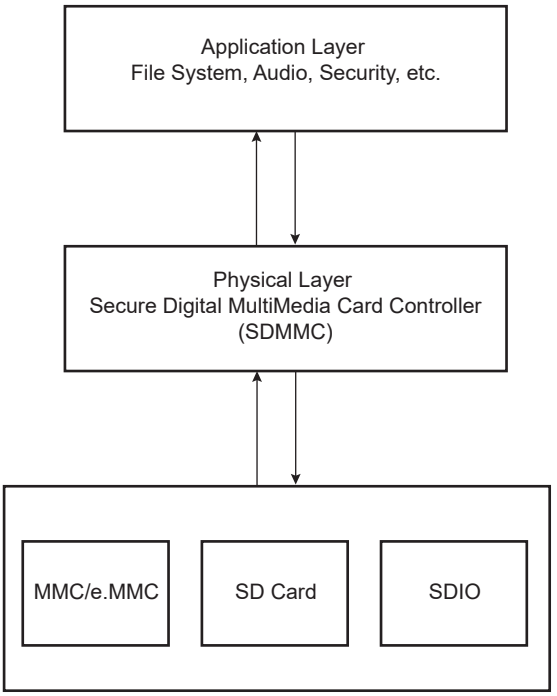
Figure 76.2. Application Block Diagram



76.6. Pin Name List

Table 76.2. I/O Lines Description for 8-bit Configuration

Pin Name	Pin Description	Type
SDMMC_CD	SD Card/SDIO/e.MMC Card detect	Input
SDMMC_CMD	SD Card/SDIO/e.MMC command/response line	I/O
SDMMC_WP	SD Card connector write protect signal	Input
SDMMC_RSTN	e.MMC reset signal	Output
SDMMC_1V8SEL	SD Card signal voltage selection	Output
SDMMC_CK	SD Card/SDIO/e.MMC clock signal	Output
SDMMC_DAT[7:0]	SD Card/SDIO/e.MMC data lines	I/O
SDMMC_DS	e.MMC HS400 data strobe	Input

Note: When several SDMMCs are embedded in a product, SDMMC_CK refers to SDMMCx_CK, SDMMC_CMD to SDMMCx_CMD, SDMMC_DATy to SDMMCx_DATy, SDMMC_WP to SDMMCx_WP, SDMMC_1V8SEL to SDMMCx_1V8SEL, SDMMC_CD to SDMMCx_CD, SDMMC_DS to SDMMCx_DS and SDMMC_RSTN to SDMMCx_RSTN.

76.7. Product Dependencies

76.7.1. I/O Lines

The pins used for interfacing the Secure Digital MultiMedia Card (SDMMC) Controller are multiplexed with PIO lines. The programmer must first program the PIO controller to assign the peripheral functions to SDMMC pins.

© 2025 Microchip Technology Inc. and its subsidiaries

76.7.2. Power Management

The SDMMC is clocked through the Power Management Controller (PMC), so the programmer must first configure the PMC to enable the SDMMC clocks.

76.7.3. Interrupt Sources

The SDMMC has an interrupt line connected to the interrupt controller.

Handling the SDMMC interrupt requires programming the interrupt controller before configuring the SDMMC.

76.8. SD/SDIO Operating Mode

The SDMMC is fully compliant with the “SD Host Controller Simplified Specification V3.00” for SD/SDIO devices. See this specification for the SDMMC configuration.

See “Physical Layer Simplified Specification V3.01” and “SDIO Simplified Specification V3.00” for SD/SDIO management.

76.9. e.MMC Operating Mode

The SDMMC supports management of e.MMC devices. As the “SD Host Controller Simplified Specification V3.00” does not apply to e.MMC devices, some registers have been added to those described in this specification in order to manage e.MMC devices. Most of the registers described in the “SD Host Controller Simplified Specification V3.00” must be used for e.MMC management, but e.MMC-specific features are managed using SDMMC_MC1R and SDMMC_MC2R.

76.9.1. Boot Operation Mode

In Boot Operation mode, the processor can read boot data from the e.MMC device by keeping the CMD line low after power-on before issuing the CMD1. The data can be read from either one of the boot partitions or the User area according to BOOT_PARTITION_ENABLE in the Extended CSD register (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51”).

76.9.1.1. Boot Procedure, Processor Mode

1. Configure the SDMMC:
   a. Set the data bus width using SDMMC_HC1R.DW and SDMMC_HC1R.EXTDW according to the BOOT_BUS_WIDTH in the Extended CSD Register (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51”).
   b. Select the speed mode (using SDMMC_HC1R.HSEN or SDMMC_MC1R.DDR) according to BOOT_MODE in the Extended CSD Register.
   c. Set the SDCLK frequency according to the selected speed mode.
   d. If the Boot Acknowledge is sent by the e.MMC device (BOOT_ACK = 1 in the Extended CSD Register), set the Boot Acknowledge Enable to ‘1’ (SDMMC_MC1R.BOOTA = 1).
   e. Enable the interrupt on Boot Acknowledge Received (SDMMC_NISTER.BOOTAR = 1 and SDMMC_NISIER.BOOTAR = 1).
   f. Set the e.MMC Command Type to BOOT (SDMMC_MC1R.CMDTYP = 3)
   g. Set SDMMC_TMR to read multiple blocks for the e.MMC device (SDMMC_TMR.MSBSEL = 1 and SDMMC_TMR.DTDSEL = 1).
   h. Select the NonDMA transfer (SDMMC_TMR.DMAEN = 0).
   i. Optional: select the Auto CMD method (using SDMMC_TMR.ACMDEN).
   j. Set the block size to 512 bytes (SDMMC_BSR.BLKSIZE = 512).
   k. Set the required number of read blocks (using SDMMC_BCR.BLKCNT). SDMMC_TMR.BCEN must be set to ‘1’.
2. Write SDMMC_CR = 20(hexa) to set the e.MMC in Boot Operation mode.
3. Wait for interrupt on Boot Acknowledge Received (BOOTAR).

© 2025 Microchip Technology Inc. and its subsidiaries

4. The user can copy the boot data sequentially as soon as the BRDRDY flag is asserted.
5. When the data transfer is completed, the boot operation must be terminated by setting SDMMC_MC2R.ABOOT to '1'.

76.9.1.2.Boot Procedure, SDMA Mode

1. Configure SDMMC:
   a. Set the data bus width using SDMMC_HC1R.DW and SDMMC_HC1R.EXTDW according to BOOT_BUS_WIDTH in the Extended CSD Register (see "Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51").
   b. Select the speed mode (SDMMC_HC1R.HSEN or SDMMC_MC1R.DDR) according to BOOT_MODE in the Extended CSD Register.
   c. Set the SDCLK frequency according to the selected speed mode.
   d. If the Boot Acknowledge is sent by the e.MMC device (BOOT_ACK = 1 in the Extended CSD Register), set the Boot Acknowledge Enable to 1 (SDMMC_MC1R.BOOTA = 1).
   e. Enable interrupt on Boot Acknowledge Received (SDMMC_NISTER.BOOTAR = 1 and SDMMC_NISIER.BOOTAR = 1).
   f. Set the e.MMC Command Type to BOOT (SDMMC_MC1R.CMDTYP = 3).
   g. Set SDMMC_TMR to read multiple blocks for the e.MMC device (SDMMC_TMR.MSBSEL = 1 and SDMMC_TMR.TDSEL = 1).
   h. Select the SDMA transfer (SDMMC_TMR.DMAEN = 1 and SDMMC_HC1R.DMASEL = 0).
   i. Write the SDMA system address where the boot data will be copied (SDMMC_SSAR.ADDR).
   j. Optional: select the Auto CMD method (SDMMC_TMR.ACMDEN).
   Note: Auto CMD23 cannot be used with SDMA.
   k. Set the block size to 512 bytes (SDMMC_BSR.BLKSIZE = 512).
   l. Set the required number of read blocks (SDMMC_BCR.BLKCNT). SDMMC_TMR.BCEN must be set to 1.
2. Write SDMMC_CR = 20(hexa) to set the e.MMC in Boot Operation mode.
3. Wait for interrupt on Boot Acknowledge Received (BOOTAR).
4. The user can copy the boot data sequentially as soon as the BRDRDY flag is asserted.
5. When the data transfer is completed, the boot operation must be terminated by setting SDMMC_MC2R.ABOOT to '1'.

76.9.1.3.Boot Procedure, ADMA Mode

1. Configure the SDMMC:
   a. Set the data bus width using SDMMC_HC1R.DW and SDMMC_HC1R.EXTDW according to BOOT_BUS_WIDTH in the Extended CSD Register (see "Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51").
   b. Select the speed mode (SDMMC_HC1R.HSEN or SDMMC_MC1R.DDR) according to BOOT_MODE in the Extended CSD register.
   c. Set the SDCLK frequency according to the selected speed mode.
   d. If the Boot Acknowledge is sent by the e.MMC device (BOOT_ACK = 1 in the Extended CSD Register), set the Boot Acknowledge Enable to '1' (SDMMC_MC1R.BOOTA = 1).
   e. Enable interrupt on Boot Acknowledge Received (SDMMC_NISTER.BOOTAR = 1 and SDMMC_NISIER.BOOTAR = 1).
   f. Set the e.MMC Command Type to BOOT (SDMMC_MC1R.CMDTYP = 3).
   g. Set SDMMC_TMR to read multiple blocks for the e.MMC device (SDMMC_TMR.MSBSEL = 1 and SDMMC_TMR.DTDSEL = 1).
   h. Select the ADMA transfer (SDMMC_TMR.DMAEN = 1 and SDMMC_HC1R.DMASEL = 2 or 3).

© 2025 Microchip Technology Inc. and its subsidiaries

i. Write the address of the descriptor table in the ADMA system address (SDMMC_ASARx [1:0].ADMASA).

j. Optional: select the Auto CMD method (SDMMC_TMR.ACMDEN).

k. Set the block size to 512 bytes (SDMMC_BSR.BLKSIZE = 512).

l. Set the required number of read blocks (SDMMC_BCR.BLKCNT). SDMMC_TMR.BCEN must be set to '1'.

2. Write SDMMC_CR = 20(hexa) to set the e.MMC in Boot Operation Mode.
3. Wait for interrupt on Boot Acknowledge Received (BOOTAR).
4. The user can copy the boot data sequentially as soon as the BRDRDY flag is asserted.
5. When the data transfer is completed, the boot operation must be terminated by setting SDMMC_MC2R.ABOOT to '1'.

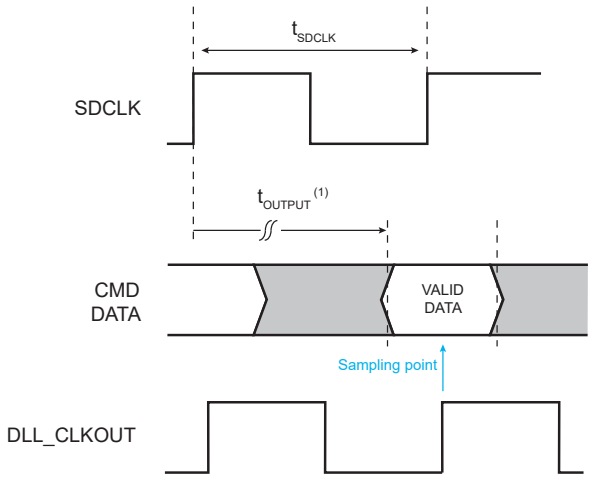
76.10. SDR104 / HS200 Tuning

76.10.1. DLL and Sampling Point

In SD/SDIO SDR104 mode (SDMMC_HC2R.VS18EN = 1 and SDMMC_HC2R.UHSMS = 3) or e.MMC HS200 mode (HS200EN = $B_{(hexa)}$), a tuning procedure must be performed first in order to adjust the sampling point for read transactions. For more details regarding the basic tuning procedure, see section "Sampling Clock Tuning Procedure" in the "SD Host Controller Simplified Specification V3.00" .

As the position of data and command coming from the device varies, a DLL is used to generate an accurate sampling point (DLL_CLKOUT) (see the figure below).

Figure 76.3. DLL Sampling Point



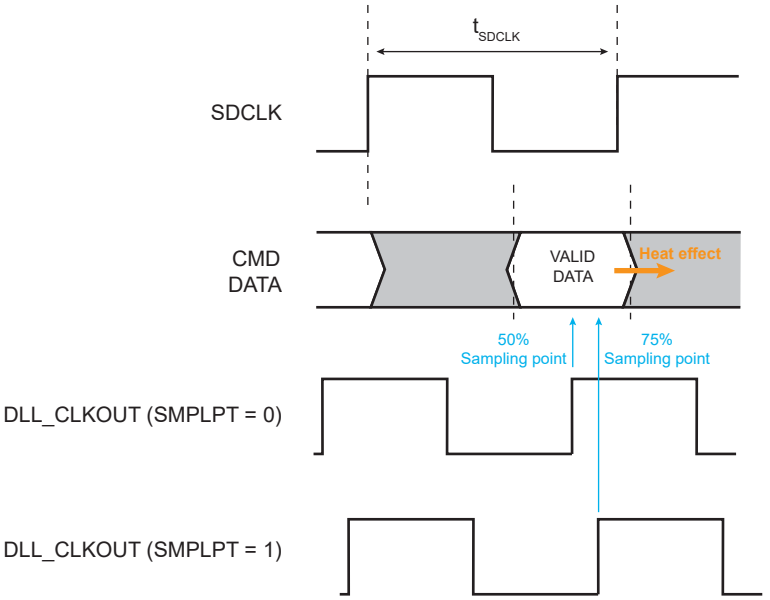
Note: 1. t_{OUTPUT} varies from 0 to 2 x t_{SDCLK}

The minimum SDLCK frequency is 100 MHz when SD/SDIO SDR104 or e.MMC HS200 is selected.

The sampling point can be selected to be located at 50% or 75% of the data window to anticipate the effect of the temperature rise. If SDMMC_TUNCR.SMPLPT is cleared, the sampling point is centered (50% of the data window). If SDMMC_TUNCR.SMPLPT is set to '1', the sampling point is set at 75% of the data window (see the figure below).

© 2025 Microchip Technology Inc. and its subsidiaries

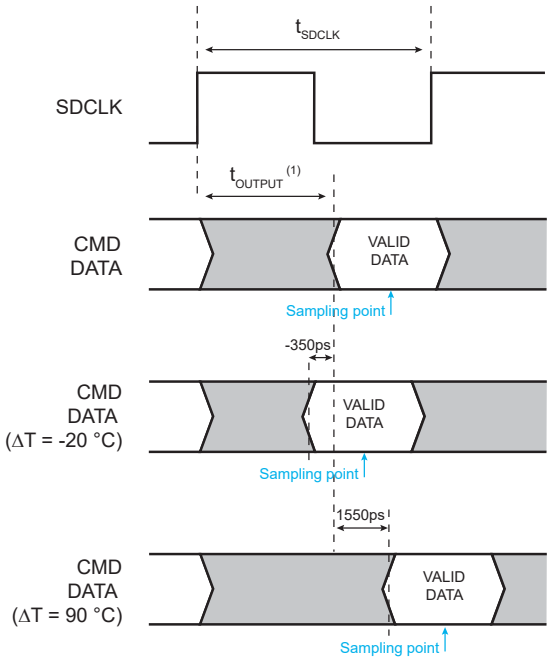
Figure 76.4. SDR104/HS200 Sampling Point Selection



76.10.2. Retuning Method

Once the data window sampling point has been tuned following the tuning procedure, the data window can be shifted by temperature drift. Thus, the tuning procedure must be applied periodically to adjust the sampling point position. The SDMMC implements a retuning timer which periodically instructs the software to restart the tuning procedure.

Figure 76.5. Temperature Effect on Data Window



Note: 1. t_{OUTPUT} varies from 0 to 2 x t_{SDCLK}

© 2025 Microchip Technology Inc. and its subsidiaries

76.10.2.1.SDMMC Tuning Sequence

The SDMMC tuning sequence must only be done when SD/SDIO SDR104 , e.MMC HS200 or HS400 is selected and for a 100-MHz SDCLK frequency or higher.

1. Enable the retuning timer (SDMMC_RTC1R.TMREN = 1).
2. Configure the retuning period by setting SDMMC_RTCVR.TCVAL.
3. Set SDMMC_RTISTER.TEVT to '1' so that the TEVT status flag in SDMMC_RTISTR rises each time the retuning timer counter period elapses.
4. Set SDMMC_RTISIER.TEVT to '1' to generate an interrupt on the TEVT status flag assertion (optional).
5. Execute the tuning procedure as defined in "Sampling Clock Tuning Procedure" in the "SD Host Controller Simplified Specification V3.00" .
6. Start the retuning timer count (write SDMMC_RTC2R.RLD to 1). At this step, data can be read by the SDMMC.
7. Each time SDMMC_RTISTR.TEVT is set to '1':
   a. Execute the tuning procedure as defined in "Sampling Clock Tuning Procedure" in the "SD Host Controller Simplified Specification V3.00" before issuing the next command.
   b. Restart the retuning timer count (write SDMMC_RTC2R.RLD to '1').
   c. Resume data reading from the device.

When several instances of SDMMC are implemented in a product, the TEVT status flag of each SDMMC instance can be checked by reading SDMMC_RTSSR.

76.11. I/O Calibration

The need for output impedance calibration arises with higher data rates. As the data rate increases, some transmission line effects can occur and lead to the generation of undershoots and overshoots, hence degrading the signal quality.

To avoid these transmission problems, an I/O calibration cell is used to adjust the output impedance to the driven I/Os.

The I/O calibration sequence is mandatory when one of the SD/SDIO UHS-I modes (SDMMC_HC2R.VS18EN = 1) or e.MMC HS200 (HS200EN = $B_{(hexa)}$) is selected. It must be performed periodically to prevent the output impedance drift. Once the calibration is finished, the I/O calibration cell provides two four-bit control words (CALP[3:0] and CALN[3:0] in the Calibration Control register (SDMMC_CALCR)) to tune the output impedance, and thus reach the best transmission performances.

The I/O calibration sequence can be started manually by writing a '1' to SDMMC_CALCR.EN. This bit is cleared automatically at the end of the calibration.

The I/O calibration sequence can also be performed automatically if SDMMC_CALCR.TUNDIS is cleared. In this case, the calibration starts automatically at the beginning of the tuning procedure when writing a '1' to SDMMC_HC2R.EXTUN.

The I/O calibration cell requires a startup time defined by SDMMC_CALCR.CNTVAL. Thus, CNTVAL must be configured prior to starting the calibration sequence. If SDMMC_CALCR.ALWYSON is set to '1', the startup time is only required for the first calibration sequence as the analog circuitry is not shut down at the end of the calibration. In order to reduce the power consumption, the analog circuitry can be shut down at the end of the calibration sequence by clearing ALWYSON. In this case, the startup time is performed each time a calibration sequence is started.

76.12. e.MMC HS400 Timing Mode Selection

The HS400 mode has the following features:

- DDR data sampling method

© 2025 Microchip Technology Inc. and its subsidiaries

- SDCLK frequency up to 200 MHz, Data rate is up to 400MB/s
- Only 8-bit bus width supported
- Signaling levels of 1.8V and 1.2V
- Data strobe signal is toggled only for data read, CRC response and CMD response (if Enhanced Strobe mode is supported)

HS400 mode is not supported during Boot Operation mode.

After the host driver initializes the device, it checks whether the device supports the HS400 mode by reading the field DEVICE_TYPE in the Extended CSD register of the e.MMC device (see “Embedded MultiMedia Card (e.MMC) Electrical Standard 5.01”). Then it enables the HS400 mode in the device before changing the clock frequency to a frequency higher than 52 MHz.

76.12.1. Enhanced Strobe Mode Disabled

In order to switch to HS400 mode, the host driver must perform the following steps:

- Initialize the device.
- Select the device with CMD7.
- Read the DEVICE_TYPE[196] field of the Extended CSD register to validate whether the device supports HS400.
- Read the DRIVER_STRENGTH[197] field of the Extended CSD register to find the supported device drive strengths.
  Note: This step may be skipped if changes to driver strength are not needed.
- Set the “Selected Driver Strength” parameter in the HS_TIMING[185] field of the Extended CSD register to the appropriate driver strength for HS400 operation and set the “Timing Interface” parameter to 0x2 to switch the device to HS200 mode.
- Set SDMMC_HC2R.HS200EN to $B_{(HEXA)}$ to switch the controller to HS200 mode.
- Set the SDCLK frequency to the HS400 target operating frequency.
- Perform the tuning sequence (see section “SDMMC Tuning Sequence”). The tuning sequence in HS200 mode is required to synchronize the command response on the SDCMD line to SDCLK for HS400 operation.
- Set the “Timing Interface” parameter in the HS_TIMING[185] field of the Extended CSD register to 0x1 to switch the device to High Speed mode.
- Set SDMMC_HC1R.HSEN to ‘1’ to switch the controller to High Speed mode.
- Set the clock frequency to a value not greater than 52 MHz.
- Set BUS_WIDTH[183] to 0x06 to select the dual data rate x8 bus mode.
- Set the “Timing Interface” parameter in the HS_TIMING [185] field of the Extended CSD register to 0x3 to switch the device to HS400 mode.
- Set SDMMC_MC3R.HS400EN to ‘1’ to switch the controller to HS400 mode.
- Change the SDCLK frequency to the HS400 operating frequency.

76.12.2. Enhanced Strobe Mode Enabled

In order to switch to HS400 mode, the host driver must perform the following steps:

- Initialize the device.
- Select the device with CMD7.
- Read the DEVICE_TYPE[196] field of the Extended CSD register to validate whether the device supports HS400.
- Read the STROBE_SUPPORT[184] field of the Extended CSD register to validate whether the device supports HS400.

© 2025 Microchip Technology Inc. and its subsidiaries

- If supported, set the SDMMC_MC3R.ESMEN to '1' to enable the Enhanced Strobe mode in the controller.
- Set the "Timing Interface" parameter in the HS_TIMING[185] field of the Extended CSD register to 0x1 to switch the device to High Speed mode.
- Set SDMMC_HC1R.HSEN to '1' to switch the controller to High Speed mode.
- Set the clock frequency to a value not greater than 52 MHz.
- Read the DRIVER_STRENGTH[197] field of the Extended CSD register to find the supported device drive strengths.
  Note: This step may be skipped if changes to driver strength are not needed.
- Set the "Selected Driver Strength" parameter in the HS_TIMING[185] field of the Extended CSD register to the appropriate driver strength for HS400 operation.
- Set BUS_WIDTH[183] to 0x06 to select the dual data rate x8 bus mode.
- Set the "Timing Interface" parameter in the HS_TIMING [185] field of the Extended CSD register to 0x3 to switch the device to HS400 mode.
- Set SDMMC_MC3R.HS400EN to '1' to switch controller to HS400 mode.
- Change the SDCLK frequency to the HS400 operating frequency.

76.13.1. SDMMC SDMA System Address Register (Default Mode)

Name: SDMMC_SSAR (DEFAULT_MODE)
Offset: 0x00
Reset: 0x00000000
Property: Read/Write

This register contains the physical system memory address used for SDMA transfers.

Bit	31	30	29	28	27	26	25	24
	ADDR[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	ADDR[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	ADDR[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	ADDR[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – ADDR[31:0] SDMA System Address
The system memory address for an SDMA transfer. When the SDMMC stops an SDMA transfer, this field points to the system address of the next contiguous data position. This field can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value. An interrupt can be generated to instruct the software to update this field. Writing the next system address of the next data position restarts the SDMA transfer.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.2. SDMMC SDMA Argument 2 Register

Name: SDMMC_SSAR (CMD23)
Offset: 0x00
Reset: 0x00000000
Property: Read/Write

This register contains the physical system memory address used for the second argument for Auto CMD23.

Bit	31	30	29	28	27	26	25	24
	ARG2[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	ARG2[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	ARG2[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	ARG2[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – ARG2[31:0] SDMA Argument 2
Used with Auto CMD23 to set a 32-bit block count value to the CMD23 argument while executing Auto CMD23. If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without ADMA, the available block count value is limited by SDMMC_BCR. In this case, 65535 blocks is the maximum value.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.3. SDMMC Block Size Register

Name: SDMMC_BSR
Offset: 0x04
Reset: 0x0000
Property: Read/Write

Bit	15	14	13	12	11	10	9	8
		BOUNDARY[2:0]					BLKSIZE[9:8]	
Access		R/W	R/W	R/W			R/W	R/W
Reset		0	0	0			0	0

Bit	7	6	5	4	3	2	1	0
	BLKSIZE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 14:12 – BOUNDARY[2:0] SDMA Buffer Boundary
Specifies the size of the contiguous buffer in the system memory. The SDMA transfer waits at every boundary specified by this field and the SDMMC generates the DMA Interrupt to instruct the software to update SDMMC_SSAR. If this field is set to 0 (buffer size = 4 Kbytes), the lowest 12 bits of SDMMC_SSAR.ADDRESS point to data in the contiguous buffer, and the upper 20 bits point to the location of the buffer in the system memory. This function is active when SDMMC_TMR.DMAEN is set.

Value	Name	Description
0	4K	4-Kbyte boundary
1	8K	8-Kbyte boundary
2	16K	16-Kbyte boundary
3	32K	32-Kbyte boundary
4	64K	64-Kbyte boundary
5	128K	128-Kbyte boundary
6	256K	256-Kbyte boundary
7	512K	512-Kbyte boundary

Bits 9:0 – BLKSIZE[9:0] Transfer Block Size
Specifies the block size of data transfers for CMD14, CMD17, CMD18, CMD19, CMD24, CMD25, CMD53 and other data transfer commands such as CMD6, CMD8, ACMD13 and ACMD51. Values ranging from 1 to 512 can be set. It can be accessed only if no transaction is executing (i.e., after a transaction has stopped). Read operations during transfers may return an invalid value, and write operations are ignored.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.4. SDMMC Block Count Register

Name: SDMMC_BCR
Offset: 0x06
Reset: 0x0000
Property: Read/Write

Bit	15	14	13	12	11	10	9	8
	BLKCNT[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	BLKCNT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 15:0 – BLKCNT[15:0] Block Count for Current Transfer

This field is used only if SDMMC_TMR.BCEN (Block Count Enable) is set to 1 and is valid only for multiple block transfers. BLKCNT is the number of blocks to be transferred and it must be set to a value between 1 and the maximum block count. The SDMMC decrements the block count after each block transfer and stops when the count reaches 0. When this field is set to 0, no data block is transferred.

This register should be accessed only when no transaction is executing (i.e., after transactions are stopped). During data transfer, read operations on this register may return an invalid value and write operations are ignored.

When a suspend command is completed, the number of blocks yet to be transferred can be determined by reading this register. Before issuing a resume command, the previously saved block count is restored.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.5. SDMMC Argument 1 Register

Name: SDMMC_ARG1R
Offset: 0x08
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
	ARG1[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	ARG1[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	ARG1[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	ARG1[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – ARG1[31:0] Argument 1

This register contains the SD command argument which is specified as the bit 39-8 of Command-Format in the “Physical Layer Simplified Specification V3.01” or “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” .

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.6. SDMMC Transfer Mode Register

Name: SDMMC_TMR
Offset: 0x0C
Reset: 0x0000
Property: Read/Write

This register is used to control data transfers. The user shall set this register before issuing a command which transfers data (see SDMMC_CR.DPSEL), or before issuing a Resume command. The user must save the value of this register when the data transfer is suspended (as a result of a Suspend command) and restore it before issuing a Resume command. To prevent data loss, this register cannot be written while data transactions are in progress. Writes to this register are ignored when SDMMC_PSR.CMDINHD is 1.

Table 76.3. Determining the Transfer Type

MSBSEL	BCEN	BLKCNT (SDMMC_BCR)	Function
0	Don't care	Don't care	Single Transfer
1	0	Don't care	Infinite Transfer
1	1	Not Zero	Multiple Transfer
1	1	Zero	Stop Multiple Transfer

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
			MSBSEL	DTDSEL	ACMDEN[1:0]		BCEN	DMAEN
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit 5 – MSBSEL Multi/Single Block Selection
This bit is set to 1 when issuing multiple-block transfer commands using DAT line(s). For any other commands, set this bit to 0. If this bit is 0, it is not necessary to set SDMMC_BCR (see the table Determining the Transfer Type).

Bit 4 – DTDSEL Data Transfer Direction Selection
This bit defines the direction of the DAT lines data transfers. Set this bit to 1 to transfer data from the device (SD card/SDIO/e.MMC) to the SDMMC, and to 0 for all other commands.

Value	Name	Description
0	WRITE	Writes data from the SDMMC to the device.
1	READ	Reads data from the device to the SDMMC.

Bits 3:2 – ACMDEN[1:0] Auto Command Enable
Two methods can be used to stop Multiple-block read and write operation:

- Auto CMD12: when the ACMDEN field is set to 1, the SDMMC issues CMD12 automatically when the last block transfer is completed. An Auto CMD12 error is indicated to SDMMC_ACESR. Auto CMD12 is not enabled if the command does not require CMD12.
- Auto CMD23: when the ACMDEN field is set to 2, the SDMMC issues a CMD23 automatically before issuing a command specified in SDMMC_CR.

The following conditions are required to use Auto CMD23:

- A memory card that supports CMD23 (SCR[33] = 1)

© 2025 Microchip Technology Inc. and its subsidiaries

- If DMA is used, it must be ADMA (SDMA not supported).
- Only CMD18 or CMD25 is issued.

Note: The SDMMC does not check the command index.

Auto CMD23 can be used with or without ADMA. By writing SDMMC_CR, the SDMMC issues a CMD23 first and then issues a command specified by the SDMMC_CR.CMDIDX field. If CMD23 response errors are detected, the second command is not issued. A CMD23 error is indicated in SDMMC_ACESR. The CMD23 argument (32-bit block count value) is set in SDMMC_SSAR.
This field determines the use of auto command functions.

Value	Name	Description
0	DISABLED	Auto Command Disabled
1	CMD12	Auto CMD12 Enabled
2	CMD23	Auto CMD23 Enabled
3	–	Reserved

Bit 1 – BCEN Block Count Enable

This bit is used to enable SDMMC_BCR, which is only relevant for multiple block transfers. When this bit is 0, SDMMC_BCR is disabled, which is useful when executing an infinite transfer (see the table Determining the Transfer Type). If an ADMA2 transfer is more than 65535 blocks, this bit is set to 0 and the data transfer length is designated by the Descriptor Table.

Value	Name	Description
0	DISABLED	Block count is disabled.
1	ENABLED	Block count is enabled.

Bit 0 – DMAEN DMA Enable

This bit enables the DMA functionality described in section “Supporting DMA” in “SD Host Controller Simplified Specification V3.00” . DMA can be enabled only if it is supported as indicated by the bit SDMMC_CA0R.ADMA2SUP. One of the DMA modes can be selected using the field SDMMC_HC1R.DMASEL. If DMA is not supported, this bit is meaningless and then always reads 0. When this bit is set to 1, a DMA operation begins when the user writes to the upper byte of SDMMC_CR.

Value	Name	Description
0	DISABLED	DMA functionality is disabled.
1	ENABLED	DMA functionality is enabled.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.7. SDMMC Command Register

Name: SDMMC_CR
Offset: 0x0E
Reset: 0x0000
Property: Read/Write

Bit	15	14	13	12	11	10	9	8
			CMDIDX[5:0]					
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	CMDTYP[1:0]		DPSEL	CMDICEN	CMDCCEN		RESPTYP[1:0]	
Access	R/W	R/W	R/W	R/W	R/W		R/W	R/W
Reset	0	0	0	0	0		0	0

Bits 13:8 – CMDIDX[5:0] Command Index
This bit shall be set to the command number (CMD0–63, ACMD0–63) that is specified in bits 45–40 of the Command-Format in the “Physical Layer Simplified Specification V3.01” , “SDIO Simplified Specification V3.00” , and “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” .

Bits 7:6 – CMDTYP[1:0] Command Type

Value	Name	Description
0	NORMAL	Other commands
1	SUSPEND	CMD52 to write “Bus Suspend” in the Card Common Control registers (CCCR) (for SDIO only)
2	RESUME	CMD52 to write “Function Select” in the Card Common Control registers (CCCR) (for SDIO only)
3	ABORT	CMD12, CMD52 to write “I/O Abort” in the Card Common Control registers (CCCR) (for SDIO only)

Bit 5 – DPSEL Data Present Select
This bit is set to 1 to indicate that data is present and shall be transferred using the DAT lines. It is set to 0 for the following:

- Commands using only CMD line (Ex. CMD52)
- Commands with no data transfer but using Busy signal on DAT[0] line (Ex. CMD38)
- Resume command

Value	Description
0	No data present
1	Data present

Bit 4 – CMDICEN Command Index Check Enable
If this bit is set to 1, the SDMMC checks the Index field in the response to see if it has the same value as the command index. If it has not, it is reported as a Command Index Error (CMDIDX) in SDMMC_EISTR. If this bit is set to 0, the Index field of the response is not checked.

Value	Name	Description
0	DISABLED	The Command Index Check is disabled.
1	ENABLED	The Command Index Check is enabled.

Bit 3 – CMDCCEN Command CRC Check Enable
If this bit is set to 1, the SDMMC checks the CRC field in the response. If an error is detected, it is reported as a Command CRC Error (CMDCRC) in SDMMC_EISTR. If this bit is set to 0, the CRC field is not checked. The position of the CRC field is determined according to the length of the response.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
0	DISABLED	The Command CRC Check is disabled.
1	ENABLED	The Command CRC Check is enabled.

Bits 1:0 – RESPTYP[1:0] Response Type
This field is set according to the response type expected for the command index (CMDIDX).

Value	Name	Description
0	NORESP	No Response
1	RL136	Response Length 136
2	RL48	Response Length 48
3	RL48BUSY	Response Length 48 with Busy

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.8. SDMMC Response Register x

Name: SDMMC_RRx
Offset: 0x10 + x*0x04 [x=0..3]
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
	CMDRESP[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	CMDRESP[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	CMDRESP[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

	CMDRESP[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – CMDRESP[31:0] Command Response

The table below describes the mapping of command responses from the SD_SDIO/e.MMC bus to these registers for each responses type. In this table, R[] refers to a bit range of the response data as transmitted on the SD_SDIO/e.MMC bus.

Type of Response	Meaning of Response	Response Field	Response Register
R1, R1b (normal response)	Card Status	R[39:8]	SDMMC_RR0[31:0]
R1b (Auto CMD12 response)	Card Status for Auto CMD12	R[39:8]	SDMMC_RR3[31:0]
R1 (Auto CMD23 response)	Card Status for Auto CMD23	R[39:8]	SDMMC_RR3[31:0]
R2 (CID, CSD register)	CID or CSD register	R[127:8]	SDMMC_RR0[31:0] SDMMC_RR1[31:0] SDMMC_RR2[31:0] SDMMC_RR3[23:0]
R3 (OCR register)	OCR register for memory	R[39:8]	SDMMC_RR0[31:0]
R4 (OCR register)	OCR register for I/O	R[39:8]	SDMMC_RR0[31:0]
R5, R5b	SDIO response	R[39:8]	SDMMC_RR0[31:0]
R6 (Published RCA response)	New published RCA[31:16] and Card status bits	R[39:8]	SDMMC_RR0[31:0]

Bits 31:0 – BUFDATA[31:0] Buffer Data
The SDMMC data buffer can be accessed through this 32-bit Data Port register.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.10.SDMMC Present State Register

Name: SDMMC_PSR
Offset: 0x24
Reset: 0x01F80000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
								CMDLL
Access								R
Reset								1

Bit	23	22	21	20	19	18	17	16
	DATLL[3:0]				WRPPL	CARDDPL	CARDSS	CARDINS
Access	R	R	R	R	R	R	R	R
Reset	1	1	1	1	1	0	0	0

Bit	15	14	13	12	11	10	9	8
					BUFRDEN	BUFWREN	RTACT	WTACT
Access					R	R	R	R
Reset					0	0	0	0

Bit	7	6	5	4	3	2	1	0
						DLACT	CMDINHD	CMDINHC
Access						R	R	R
Reset						0	0	0

Bit 24 – CMDLL CMD Line Level
This status is used to check the CMD line level to recover from errors, and for debugging.

Bits 23:20 – DATLL[3:0] DAT[3:0] Line Level
This status is used to check the DAT line level to recover from errors, and for debugging. This is especially useful in detecting the Busy signal level from DAT[0].

Bit 19 – WRPPL Write Protect Pin Level
The Write Protect Switch is supported for memory and combo cards. This bit reflects the SDMMC_WP pin.

Value	Description
0	Write protected (SDMMC_WP = 0)
1	Write enabled (SDMMC_WP = 1)

Bit 18 – CARDDPL Card Detect Pin Level
This bit reflects the inverse value of the SDMMC_CD pin. Debouncing is not performed on this bit. This bit may be valid when CARDSS is set to 1, but it is not guaranteed because of the propagation delay. Use of this bit is limited to testing since it must be debounced by software.

Value	Description
0	No card present (SDMMC_CD = 1).
1	Card present (SDMMC_CD = 0).

Bit 17 – CARDSS Card State Stable
This bit is used for testing. If it is 0, the CARDDPL is not stable. If this bit is set to 1, it means that the CARDDPL is stable. No Card state can be detected if this bit is set to 1 and CARDINS is set to 0.

© 2025 Microchip Technology Inc. and its subsidiaries

The Software Reset For All (SWRSTALL) in SDMMC_SRR does not affect this bit.

Value	Description
0	Reset or debouncing.
1	No card or card inserted.

Bit 16 – CARDINS Card Inserted

This bit indicates whether a card has been inserted. The SDMMC debounces this signal so that the user does not need to wait for it to stabilize.
A change from 0 to 1 raises the Card Insertion (CINS) status flag in SDMMC_NISTR if SDMMC_NISTER.CINS is set to 1. An interrupt is generated if SDMMC_NISIER.CINS is set to 1.
A change from 1 to 0 raises the Card Removal (CREM) status flag in SDMMC_NISTR if SDMMC_NISTER.CREM is set to 1. An interrupt is generated if SDMMC_NISIER.CREM is set to 1.
The Software Reset For All (SWRSTALL) in SDMMC_SRR does not affect this bit.

Bit 11 – BUFRDEN Buffer Read Enable

This bit is used for nonDMA read transfers. This flag indicates that valid data exists in the SDMMC data buffer. If this bit is 1, readable data exists in the buffer.
A change from 1 to 0 occurs when all the block data is read from the buffer.
A change from 0 to 1 occurs when block data is ready in the buffer. This raises the Buffer Read Ready (BRDRDY) status flag in SDMMC_NISTR if SDMMC_NISTER.BRDRDY is set to 1. An interrupt is generated if SDMMC_NISIER.BRDRDY is set to 1.

Bit 10 – BUFWREN Buffer Write Enable

This bit is used for nonDMA write transfers. This flag indicates if space is available for write data. If this bit is 1, data can be written to the buffer.
A change from 1 to 0 occurs when all the block data are written to the buffer.
A change from 0 to 1 occurs when top of block data can be written to the buffer. This raises the Buffer Write Ready (BWRRDY) status flag in SDMMC_NISTR if SDMMC_NISTER.BWRRDY is set to 1. An interrupt is generated if SDMMC_NISIER.BWRRDY is set to 1.

Bit 9 – RTACT Read Transfer Active

This bit is used to detect completion of a read transfer. See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.
This bit is set to 1 in either of the following conditions:

- After the end bit of the read command.
- When a read operation is restarted by writing a 1 to SDMMC_BGCR.CONTR (Continue Request).

This bit is cleared to 0 in either of the following conditions:

- When the last data block as specified by Transfer Block Size (BLKSIZE) is transferred to the system.
- In case of ADMA2, end of read is designated by the descriptor table.
- When all valid data blocks in the SDMMC have been transferred to the system and no current block transfers are being sent as a result of the Stop At Block Gap Request (STPBGR) of SDMMC_BGCR being set to 1.

A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC_NISTR if SDMMC_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC_NISIER.TRFC is set to 1.

Bit 8 – WTACT Write Transfer Active

This bit indicates a write transfer is active. If this bit is 0, it means no valid write data exists in the SDMMC. See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.
This bit is set to 1 in either of the following conditions:

© 2025 Microchip Technology Inc. and its subsidiaries

- After the end bit of the write command.
- When a write operation is restarted by writing a 1 to SDMMC_BGCR.CONTR (Continue Request).

This bit is cleared to 0 in either of the following conditions:

- After getting the CRC status of the last data block as specified by the transfer count (single and multiple). In case of ADMA2, transfer count is designated by the descriptor table.
- After getting the CRC status of any block where a data transmission is about to be stopped by a Stop At Block Gap Request (STPBGR) of SDMMC_BGCR.

During a write transaction and as the result of the Stop At Block Gap Request (STPBGR) being set, a change from 1 to 0 raises the Block Gap Event (BLKGE) status flag in SDMMC_NISTR if SDMMC_NISTER.BLKGE is set to 1. An interrupt is generated if BLKGE is set to 1 in SDMMC_NISIER. This status is useful to determine whether nonDAT line commands can be issued during Write Busy.

Bit 2 – DLACT DAT Line Active

This bit indicates whether one of the DAT lines on the bus is in use.
In the case of read transactions:

- This status indicates whether a read transfer is executing on the bus. A change from 1 to 0 resulting from setting the Stop At Block Gap Request (STPBGR) raises the Block Gap Event (BLKGE) status flag in SDMMC_NISTR if SDMMC_NISTER.BLKGE is set to 1. An interrupt is generated if SDMMC_NISIER.BLKGE is set to 1. See the section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for details on timing.
- This bit is set in either of the following cases:
  - After the end bit of the read command.
  - When writing 1 to SDMMC_BGCR.CONTR (Continue Request) to restart a read transfer.
- This bit is SDMMC cleared in either of the following cases:
  - When the end bit of the last data block is sent from the bus to the SDMMC. In case of ADMA2, the last block is designated by the last transfer of the Descriptor Table.
  - When a read transfer is stopped at the block gap initiated by a Stop At Block Gap Request (STPBGR).
- The SDMMC stops a read operation at the start of the interrupt cycle by driving the Read Wait (DAT[2] line) or by stopping the SD Clock. If the Read Wait signal is already driven (due to the fact that the data buffer cannot receive data), the SDMMC can continue to stop the read operation by driving the Read Wait signal. It is necessary to support the Read Wait in order to use the Suspend/Resume operation.

In the case of write transactions:

- This status indicates that a write transfer is executing on the bus. A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC_NISTR if SDMMC_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC_NISIER.TRFC is set to 1. See the section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for details on timing.
- This bit is set in either of the following cases:
  - After the end bit of the write command.
  - When writing 1 to SDMMC_BGCR.CONTR (Continue Request) to continue a write transfer.
- This bit is cleared in either of the following cases:
  - When the card releases Write Busy of the last data block. If the card does not drive a Busy signal for 8 SDCLK, the SDMMC considers the card drive “Not Busy”. In the case of ADMA2, the last block is designated by the last transfer of the Descriptor Table.
  - When the card releases Write Busy prior to waiting for a write transfer as a result of a Stop At Block Gap Request (STPBGR).

© 2025 Microchip Technology Inc. and its subsidiaries

Command with Busy:
This status indicates whether a command that indicates Busy (ex. erase command for memory) is executing on the bus. This bit is set to 1 after the end bit of the command with Busy and cleared when Busy is deasserted. A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC_NISTR if SDMMC_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC_NISIER.TRFC is set to 1. See Figures 2.11 to 2.13 in the "SD Host Controller Simplified Specification V3.00" .

Value	Description
0	DAT line inactive.
1	DAT line active.

Bit 1 – CMDINHD Command Inhibit (DAT)
This status bit is 1 if either the DAT Line Active (DLACT) or the Read Transfer Active (RTACT) is set to 1. If this bit is 0, it indicates that the SDMMC can issue the next command. Commands with a Busy signal belong to Command Inhibit (DAT) (ex. R1b, R5b type). A change from 1 to 0 raises the Transfer Complete (TRFC) status flag in SDMMC_NISTR if SDMMC_NISTER.TRFC is set to 1. An interrupt is generated if SDMMC_NISIER.TRFC is set to 1.
Note: The software can save registers in the 000–00Dh range for a suspend transaction after this bit has changed from 1 to 0.

Value	Description
0	Can issue a command which uses the DAT line(s).
1	Cannot issue a command which uses the DAT line(s).

Bit 0 – CMDINHC Command Inhibit (CMD)
If this bit is 0, it indicates the CMD line is not in use and the SDMMC can issue a command using the CMD line. This bit is set to 1 immediately after SDMMC_CR is written. This bit is cleared when the command response is received. Auto CMD12 and Auto CMD23 consist of two responses. In this case, this bit is not cleared by the CMD12 or CMD23 response, but by the Read/Write command response.
Status issuing Auto CMD12 is not read from this bit. So, if a command is issued during Auto CMD12 operation, the SDMMC manages to issue both commands: CMD12 and a command set by SDMMC_CR.
Even if the Command Inhibit (DAT) is set to 1, commands using only the CMD line can be issued if this bit is 0.
A change from 1 to 0 raises the Command Complete (CMDC) status flag in SDMMC_NISTR if SDMMC_NISTER.CMDC is set to 1. An interrupt is generated if SDMMC_NISIER.CMDC is set to 1.
If the SDMMC cannot issue the command because of a command conflict error (see SDMMC_EISTR.CMDCRC) or because of a 'Command Not Issued By Auto CMD12' error (see section "SDMMC Auto CMD Error Status Register"), this bit remains 1 and Command Complete is not set.

Value	Description
0	Can issue a command using only CMD line.
1	Cannot issue a command.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.11.SDMMC Host Control 1 Register (SD_SDIO)

Name: SDMMC_HC1R (SD_SDIO)
Offset: 0x28
Reset: 0x00
Property: Read/Write

Note: This register configuration is specific to the SD/SDIO operation mode.

Bit	7	6	5	4	3	2	1	0
	CARDDSEL	CARDDTL		DMASEL[1:0]		HSEN	DW	LEDCTRL
Access	R/W	R/W		R/W	R/W	R/W	R/W	R/W
Reset	0	0		0	0	0	0	0

Bit 7 – CARDDSEL Card Detect Signal Selection
This bit selects the source for the card detection.

Value	Description
0	The SDMMC_CD pin is selected.
1	The Card Detect Test Level (CARDDTL) is selected (for test purposes).

Bit 6 – CARDDTL Card Detect Test Level
This bit is enabled while the Card Detect Signal Selection (CARDDSEL) is set to 1 and it indicates whether the card is inserted or not.

Value	Description
0	No card.
1	Card inserted.

Bits 4:3 – DMASEL[1:0] DMA Select
One of the supported DMA modes can be selected. The DMA modes supported are given in SDMMC_CA0R. Use of a selected DMA is determined by DMA Enable (DMAEN) in SDMMC_TMR.

Value	Name	Description
0	SDMA	SDMA is selected
1	–	Reserved
2	ADMA32	32-bit Address ADMA2 is selected
3	–	Reserved

Bit 2 – HSEN High Speed Enable
Before setting this bit, the user must check High Speed Support (HSSUP) in SDMMC_CA0R.
If this bit is set to 0 (default), the SDMMC outputs CMD line and DAT lines at the falling edge of the SD clock (up to 25 MHz). If this bit is set to 1, the SDMMC outputs the CMD line and the DAT lines at the rising edge of the SD clock (up to 50 MHz).
If Preset Value Enable (PVALEN) in SDMMC_HC2R is set to 1, the user needs to reset SD Clock Enable (SDCLKEN) before changing this bit to avoid generating clock glitches. After setting this bit to 1, the user sets SDCLEN to 1 again.
Note: This bit is effective only if SDMMC_MC1R.DDR is set to 0.

Note: The clock divider (DIV) in the Clock Control register (SDMMC_CCR) must be set to a value different from 0 when HSEN is 1.

Value	Description
0	Normal Speed mode.
1	High Speed mode.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 1 – DW Data Width

This bit selects the data width of the SDMMC. It must be set to match the data width of the card.
Note: If the Extended Data Transfer Width is 1, this bit has no effect and the data width is 8-bit mode.

Value	Name	Description
0	1_BIT	1-bit mode.
1	4_BIT	4-bit mode.

Bit 0 – LEDCTRL LED Control

This bit is used to caution the user not to remove the card while it is being accessed. If the software is going to issue multiple commands, this bit is set to 1 during all transactions.

Value	Name	Description
0	OFF	LED off.
1	ON	LED on.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.12.SDMMC Host Control 1 Register (e.MMC)

Name: SDMMC_HC1R (EMMC)
Offset: 0x28
Reset: 0x00
Property: Read/Write

Note: This register configuration is specific to the e.MMC operation mode.

Bit	7	6	5	4	3	2	1	0
			EXTDW	DMASEL[1:0]		HSEN	DW	
Access			R/W	R/W	R/W	R/W	R/W	
Reset			0	0	0	0	0	

Bit 5 – EXTDW Extended Data Width
This bit controls the 8-bit Bus Width mode for embedded devices. Support of this function is indicated in 8-bit Support for Embedded Device in SDMMC_CA0R. If a device supports the 8-bit mode, this may be set to 1. If this bit is 0, the bus width is controlled by Data Width (DW).

Bits 4:3 – DMASEL[1:0] DMA Select
One of the supported DAM modes can be selected. The DMA modes supported are given in SDMMC_CA0R. Use of selected DMA is determined by DMA Enable (DMAEN) in SDMMC_TMR.

Value	Name	Description
0	SDMA	SDMA is selected
1	–	Reserved
2	ADMA32	32-bit Address ADMA2 is selected
3	–	Reserved

Bit 2 – HSEN High Speed Enable
Before setting this bit, the user must check High Speed Support (HSSUP) in SDMMC_CA0R.
If this bit is set to 0 (default), the SDMMC outputs CMD line and DAT lines at the falling edge of the SD clock (up to 25 MHz). If this bit is set to 1, the SDMMC outputs the CMD line and the DAT lines at the rising edge of the SD clock (up to 50 MHz).
If Preset Value Enable (PVALEN) in SDMMC_HC2R is set to 1, the user needs to reset the SD Clock Enable (SDCLKEN) before changing this bit to avoid generating clock glitches. After setting this bit to 1, the user sets SDCLEN to 1 again.
This bit is effective only if SDMMC_MC1R.DDR is set to 0.
Note: The clock divider (DIV) in SDMMC_CCR must be set to a value different from 0 when HSEN is 1.

Value	Description
0	Normal Speed mode.
1	High Speed mode.

Bit 1 – DW Data Width
This bit selects the data width of the SDMMC. It must be set to match the data width of the card.
Note: If the Extended Data Transfer Width is 1, this bit has no effect and the data width is 8-bit mode.

Value	Name	Description
0	1_BIT	1-bit mode.
1	4_BIT	4-bit mode.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.13.SDMMC Power Control Register

Name: SDMMC_PCR
Offset: 0x29
Reset: 0x0E
Property: Read/Write

Bit	7	6	5	4	3	2	1	0
								SDBPWR
Access								R/W
Reset								0

Bit 0 – SDBPWR SD Bus Power
This bit is automatically cleared by the SDMMC if the card is removed. If this bit is cleared, the SDMMC stops driving SDMMC_CMD and SDMMC_DAT[7:0] (tri-state) and drives SDMMC_CK to low level.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.14.SDMMC Block Gap Control Register (SD_SDIO)

Name: SDMMC_BGCR (SD_SDIO)
Offset: 0x2A
Reset: 0x00
Property: Read/Write

Note: This register configuration is specific to the SD/SDIO operation mode.

Bit	7	6	5	4	3	2	1	0
					INTBG	RWCTRL	CONTR	STPBGR
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit 3 – INTBG Interrupt at Block Gap
This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. Setting to 1 enables interrupt detection at the block gap for a multiple block transfer. If the SDIO card cannot signal an interrupt during a multiple block transfer, this bit should be set to 0. When the software detects an SDIO card insertion, it sets this bit according to the CCCR of the SDIO card.

Value	Name	Description
0	DISABLED	Interrupt detection disabled.
1	ENABLED	Interrupt detection enabled.

Bit 2 – RWCTRL Read Wait Control
The Read Wait control is optional for SDIO cards. If the card supports Read Wait, set this bit to enable use of the Read Wait protocol to stop read data using the SDMMC_DAT[2] line. Otherwise, the SDMMC stops the SDCLK to hold read data, which restricts command generation. When the software detects an SD card insertion, this bit must be set according to the CCCR of the SDIO card. If the card does not support Read Wait, this bit shall never be set to 1, otherwise an SDMMC_DAT line conflict may occur. If this bit is set to 0, Suspend/Resume cannot be supported.

Value	Description
0	Disables Read Wait control.
1	Enables Read Wait control.

Bit 1 – CONTR Continue Request
This bit is used to restart a transaction which was stopped using a Stop At Block Gap Request (STPBGR). To cancel stop at the block gap, set STPBGR to 0 and set this bit to 1 to restart the transfer.
The SDMMC automatically clears this bit in either of the following cases:
– In the case of a read transaction, the DAT Line Active (DLACT) changes from 0 to 1 as a read transaction restarts.
– In the case of a write transaction, the Write Transfer Active (WTACT) changes from 0 to 1 as the write transaction restarts.
Therefore, it is not necessary to set this bit to 0. If STPBGR is set to 1, any write to this bit is ignored. See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

Value	Description
0	No effect.
1	Restart.

Bit 0 – STPBGR Stop At Block Gap Request
This bit is used to stop executing read and write transactions at the next block gap for nonDMA, SDMA, and ADMA transfers. The user must leave this bit set to 1 until Transfer Complete (TRFC) in

© 2025 Microchip Technology Inc. and its subsidiaries

SDMMC_NISTR. Clearing both Stop At Block Gap Request and Continue Request does not cause the transaction to restart. This bit can be set whether the card supports the Read Wait signal or not. During read transfers, the SDMMC stops the transaction by using the Read Wait signal (SDMMC_DAT[2]) if supported, or by stopping the SD clock otherwise.
In case of write transfers in which the user writes data to SDMMC_BDPR, this bit must be set to 1 after all the block of data is written. If this bit is set to 1, the user does not write data to SDMMC_BDPR.
This bit affects Read Transfer Active (RTACT), Write Transfer Active (WTACT), DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINHD) in SDMMC_PSR.
See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

Value	Description
0	Transfer
1	Stop

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.15.SDMMC Block Gap Control Register (e.MMC)

Name: SDMMC_BGCR (EMMC)
Offset: 0x2A
Reset: 0x00
Property: Read/Write

Note: This register configuration is specific to the e.MMC operation mode.

Bit	7	6	5	4	3	2	1	0
							CONTR	STPBGR
Access							R/W	R/W
Reset							0	0

Bit 1 – CONTR Continue Request

This bit is used to restart a transaction which was stopped using a Stop At Block Gap Request (STPBGR). To cancel stop at the block gap, set STPBGR to 0 and set this bit to 1 to restart the transfer.
The SDMMC automatically clears this bit in either of the following cases:
– In the case of a read transaction, the DAT Line Active (DLACT) changes from 0 to 1 as a read transaction restarts.
– In the case of a write transaction, the Write Transfer Active (WTACT) changes from 0 to 1 as the write transaction restarts.
Therefore, it is not necessary to set this bit to 0. If STPBGR is set to 1, any write to this bit is ignored.
See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

Value	Description
0	No effect.
1	Restart.

Bit 0 – STPBGR Stop At Block Gap Request

This bit is used to stop executing read and write transactions at the next block gap for nonDMA, SDMA, and ADMA transfers. The user must leave this bit set to 1 until Transfer Complete (TRFC) in SDMMC_NISTR. Clearing both Stop At Block Gap Request and Continue Request does not cause the transaction to restart. This bit can be set whether the card supports the Read Wait signal or not.
During read transfers, the SDMMC stops the transaction by using the Read Wait signal (SDMMC_DAT[2]) if supported, or by stopping the SD clock otherwise.
In case of write transfers in which the user writes data to SDMMC_BDPR, this bit must be set to 1 after all the block of data is written. If this bit is set to 1, the user does not write data to SDMMC_BDPR.
This bit affects Read Transfer Active (RTACT), Write Transfer Active (WTACT), DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINHD) in SDMMC_PSR.
See the “Abort Transaction” and “Suspend/Resume” sections in the “SD Host Controller Simplified Specification V3.00” for more details.

Value	Description
0	Transfer
1	Stop

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.16.SDMMC Wake-up Control Register (SD_SDIO)

Name: SDMMC_WCR (SD_SDIO)
Offset: 0x2B
Reset: 0x00
Property: Read/Write

Note: This register configuration is specific to the SD/SDIO operation mode.

Bit	7	6	5	4	3	2	1	0
						WKENCREM	WKENCINS	WKENCINT
Access						R/W	R/W	R/W
Reset						0	0	0

Bit 2 – WKENCREM Wake-up Event Enable on Card Removal
This bit enables a wake-up event via Card Removal (CREM) in SDMMC_NISTR. FN_WUS (Wake-up Support) in the CIS (Card Information Structure) does not affect this bit.
0 (DISABLED): Wake-up Event disabled.
1 (ENABLED): Wake-up Event enabled.

Bit 1 – WKENCINS Wake-up Event Enable on Card Insertion
This bit enables a wake-up event via Card Insertion (CINS) in SDMMC_NISTR. FN_WUS (Wake-up Support) in the CIS (Card Information Structure) does not affect this bit.
0 (DISABLED): Wake-up Event disabled.
1 (ENABLED): Wake-up Event enabled.

Bit 0 – WKENCINT Wake-up Event Enable on Card Interrupt
This bit enables a wake-up event via Card Interrupt (CINT) in SDMMC_NISTR. This bit can be set to 1 if FN_WUS (Wake-up Support) in the CIS (Card Information Structure) is set to 1 in the SDIO card.
0 (DISABLED): Wake-up Event disabled.
1 (ENABLED): Wake-up Event enabled.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.17.SDMMC Clock Control Register

Name: SDMMC_CCR
Offset: 0x2C
Reset: 0x0000
Property: Read/Write

Bit	15	14	13	12	11	10	9	8
	SDCLKFSEL[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	USDCLKFSEL[1:0]		CLKGSEL			SDCLKEN	INTCLKS	INTCLKEN
Access	R/W	R/W	R/W			R/W	R/W	R/W
Reset	0	0	0			0	0	0

Bits 15:8 – SDCLKFSEL[7:0] SDCLK Frequency Select
This register is used to select the frequency of the SDCLK pin. There are two SDCLK Frequency modes according to Clock Generator Select (CLKGSEL).
The length of the clock divider (DIV) is extended to 10 bits (DIV[9:8] = USDCLKFSEL, DIV[7:0] = SDCLKFSEL)

- 10-bit Divided Clock Mode (CLKGSEL = 0): $f_{SDCLK} = f_{BASECLK}/(2 \times DIV)$. If DIV = 0 then $f_{SDCLK} = f_{BASECLK}$
- Programmable Clock Mode (CLKGSEL = 1): $f_{SDCLK} = f_{MULTCLK}/(DIV + 1)$

This field depends on the setting of Preset Value Enable (PVALEN) in SDMMC_HC2R.
If PVALEN = 0, this field is set by the user.
If PVALEN = 1, this field is automatically set to a value specified in one of the SDMMC_PVR.

Bits 7:6 – USDCLKFSEL[1:0] Upper Bits of SDCLK Frequency Select
These bits expand the SDCLK Frequency Select (SDCLKFSEL) to 10 bits. These two bits are assigned to bit 09-08 of the clock divider as described in SDCLKFSEL.

Bit 5 – CLKGSEL Clock Generator Select
This bit is used to select the clock generator mode in the SDCLK Frequency Select field. If the Programmable mode is not supported (SDMMC_CA1R.CLKMULT (Clock Multiplier) set to 0), then this bit cannot be written and is always read at 0.
This bit depends on the setting of Preset Value Enable (PVALEN) in SDMMC_HC2R.
If PVALEN = 0, this bit is set by the user.
If PVALEN = 1, this bit is automatically set to a value specified in one of the SDMMC_PVRx.

Value	Description
0	Divided Clock mode (BASECLK is used to generate SDCLK).
1	Programmable Clock mode (MULTCLK is used to generate SDCLK).

Bit 2 – SDCLKEN SD Clock Enable
The SDMMC stops the SD Clock when writing this bit to 0. SDCLK Frequency Select (SDCLKFSEL) can be changed when this bit is 0. Then, the SDMMC maintains the same clock frequency until SDCLK is stopped (Stop at SDCLK = 0). If Card Inserted (CARDINS) in SDMMC_PSR is cleared, this bit is also cleared.

Value	Description
0	SD Clock disabled

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
1	SD Clock enabled

Bit 1 – INTCLKS Internal Clock Stable

This bit is set to 1 when the SD clock is stable after setting SDMMC_CCR.INTCLKEN (Internal Clock Enable) to 1. The user must wait to set SD Clock Enable (SDCLKEN) until this bit is set to 1.

Value	Description
0	Internal clock not ready.
1	Internal clock ready.

Bit 0 – INTCLKEN Internal Clock Enable

This bit is set to 0 when the SDMMC is not used or is awaiting a wake-up interrupt. In this case, its internal clock is stopped to reach a very low power state. Registers are still able to be read and written. The clock starts to oscillate when this bit is set to 1. Once the clock oscillation is stable, the SDMMC sets Internal Clock Stable (INTCLKS) in this register to 1.
This bit does not affect card detection.

Value	Description
0	The internal clock stops.
1	The internal clock oscillates.

76.13.18.SDMMC Timeout Control Register

Name: SDMMC_TCR
Offset: 0x2E
Reset: 0x00
Property: Read/Write

Bit	7	6	5	4	3	2	1	0
					DTCVAL[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bits 3:0 – DTCVAL[3:0] Data Timeout Counter Value
This value determines the interval at which DAT line timeouts are detected. For more information about timeout generation, see Data Timeout Error (DATTEO) in SDMMC_EISTR. When setting this register, the user can prevent inadvertent timeout events by clearing the Data Timeout Error Status Enable (in SDMMC_EISTER).

$$\mathrm{TIMEOUT}_{(\mu s)} = \frac{2^{13 + \mathrm{DTCVAL}}}{f_{\mathrm{FTEOCLK(MHz)}}}$$

Note: DTCVAL = $f_{(Hexa)}$ is reserved.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.19.SDMMC Software Reset Register

Name: SDMMC_SRR
Offset: 0x2F
Reset: 0x00000000
Property: Read/Write

Bit	7	6	5	4	3	2	1	0
						SWRSTDAT	SWRSTCMD	SWRSTALL
Access						R/W	R/W	R/W
Reset						0	0	0

Bit 2 – SWRSTDAT Software Reset for DAT Line
Only part of a data circuit is reset. The DMA circuit is also reset.
The following registers and bits are cleared by this bit:

- SDMMC Buffer Data Port Register
  - Buffer is cleared and initialized.
- SDMMC Present State Register
  - Buffer Read Enable (BUFRDEN)
  - Buffer Write Enable (BUFWREN)
  - Read Transfer Active (RTACT)
  - Write Transfer Active (WTACT)
  - DAT Line Active (DATLL)
  - Command Inhibit (DAT) (CMDINHD)
- SDMMC Block Gap Control Register (SD_SDIO)
  - Continue Request (CONTR)
  - Stop At Block Gap Request (STPBGR)
- SDMMC Normal Interrupt Status Register (SD_SDIO)
  - Buffer Read Ready (BRDRDY)
  - Buffer Write Ready (BWRRDY)
  - DMA Interrupt (DMAINT)
  - Block Gap Event (BLKGE)
  - Transfer Complete (TRFC)

Value	Description
0	Work
1	Reset

Bit 1 – SWRSTCMD Software Reset for CMD Line
Only part of a command circuit is reset.
The following registers and bits are cleared by this bit:

- SDMMC Present State Register
  - Command Inhibit (CMD) (CMDINHC)
- SDMMC Normal Interrupt Status Register (SD_SDIO) and SDMMC Normal Interrupt Status Register (e.MMC)
  - Command Complete (CMDC)

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Work
1	Reset

Bit 0 – SWRSTALL Software Reset for All

This reset affects the entire SDMMC except the card detection circuit. During initialization, the SDMMC must be reset by setting this bit to '1'. This bit is automatically cleared to '0' when SDMMC_CA0R and SDMMC_CA1R are valid and the user can read them. If this bit is set to '1', the user should issue a reset command and reinitialize the card.
List of registers cleared to '0':

- SDMMC SDMA System Address / Argument 2 Register
- SDMMC Block Size Register
- SDMMC Block Count Register
- SDMMC Argument 1 Register
- SDMMC Command Register
- SDMMC Transfer Mode Register
- SDMMC Response Register
- SDMMC Buffer Data Port Register
- SDMMC Present State Register (except CMDLL, DATLL, WRPPL, CARDDDPL, CARDSS, CARDINS)
- SDMMC Host Control 1 Register (SD_SDIO)
- SDMMC Host Control 1 Register (e.MMC)
- SDMMC Power Control Register
- SDMMC Block Gap Control Register (SD_SDIO)
- SDMMC Block Gap Control Register (e.MMC)
- SDMMC Wake-up Control Register (SD_SDIO)
- SDMMC Clock Control Register
- SDMMC Timeout Control Register
- SDMMC Normal Interrupt Status Register (SD_SDIO)
- SDMMC Error Interrupt Status Register (SD_SDIO)
- SDMMC Normal Interrupt Status Enable Register (SD_SDIO)
- SDMMC Error Interrupt Status Enable Register (SD_SDIO)
- SDMMC Normal Interrupt Signal Enable Register (SD_SDIO)
- SDMMC Error Interrupt Signal Enable Register (SD_SDIO)
- SDMMC Auto CMD Error Status Register
- SDMMC Host Control 2 Register (SD_SDIO)
- SDMMC ADMA Error Status Register
- SDMMC ADMA System Address Register
- SDMMC Slot Interrupt Status Register
- SDMMC e.MMC Control 1 Register
- SDMMC e.MMC Control 2 Register
- SDMMC AHB Control Register
- SDMMC Clock Control 2 Register
- SDMMC Retuning Control 1 Register

© 2025 Microchip Technology Inc. and its subsidiaries

- SDMMC Retuning Counter Value Register
- SDMMC Retuning Interrupt Status Enable Register
- SDMMC Retuning Interrupt Signal Enable Register
- SDMMC Retuning Interrupt Status Register
- SDMMC Tuning Control Register
- SDMMC Capabilities Control Register (except KEY)
- SDMMC Calibration Control Register (except CALN, CALP)

76.13.20.SDMMC Normal Interrupt Status Register (SD_SDIO)

Name: SDMMC_NISTR (SD_SDIO)
Offset: 0x30
Reset: 0x0000
Property: Read/Write

Note: This register configuration is specific to the SD/SDIO operation mode.

Bit	15	14	13	12	11	10	9	8
	ERRINT							CINT
Access	R							R/W
Reset	0							0

Bit	7	6	5	4	3	2	1	0
	CREM	CINS	BRDRDY	BWRRDY	DMAINT	BLKGE	TRFC	CMDC
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 15 – ERRINT Error Interrupt
If any of the bits in SDMMC_EISTR are set, then this bit is set. Therefore, the user can efficiently test for an error by checking this bit first. This bit is read-only.

Value	Description
0	No error.
1	Error.

Bit 8 – CINT Card Interrupt
Writing this bit to '1' does not clear this bit. It is cleared by resetting the SD card interrupt factor. In 1-bit mode, the SDMMC detects the Card Interrupt without SDCLK to support wake-up. In 4-bit mode, the Card Interrupt signal is sampled during the interrupt cycle, so there are some sample delays between the interrupt signal from the SD card and the interrupt to the system.
When this bit is set to '1' and the user needs to start this interrupt service, Card Interrupt Status Enable (CINT) in SDMMC_NISTER may be set to '0' in order to clear the card interrupt statuses latched in the SDMMC and to stop driving the interrupt signal to the system. After completion of the card interrupt service (it should reset interrupt factors in the SD card and the interrupt signal may not be asserted), set SDMMC_NISTER.CINT to '1' and start sampling the interrupt signal again. Interrupt detected by DAT[1] is supported when there is one card per slot.
This bit can only be set to 1 if SDMMC_NISTER.CINT is set to 1. An interrupt can only be generated if SDMMC_NISIER.CINT is set to 1.

Value	Description
0	No card interrupt.
1	Card interrupt.

Bit 7 – CREM Card Removal
This status is set to '1' if Card Inserted (CARDINS) in SDMMC_PSR changes from '1' to '0'. When the user writes this bit to '1' to clear this status, the status of SDMMC_PSR.CARDINS must be confirmed because the card detect state may possibly be changed when the user clears this bit and no interrupt event can be generated.
This bit can only be set to '1' if SDMMC_NISTER.CREM is set to '1'. An interrupt can only be generated if SDMMC_NISIER.CREM is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	Card state unstable or card inserted.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Card removed.

Bit 6 – CINS Card Insertion

This status is set if Card Inserted (CARDINS) in SDMMC_PSR changes from '0' to '1'. When the user writes this bit to '1' to clear this status, the status of SDMMC_PSR.CARDINS must be confirmed because the card detect state may possibly be changed when the user clears this bit and no interrupt event can be generated.
This bit can only be set to '1' if SDMMC_NISTER.CINS is set to '1'. An interrupt can only be generated if SDMMC_NISIER.CINS is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	Card state unstable or card removed.
1	Card inserted.

Bit 5 – BRDRDY Buffer Read Ready

This status is set to '1' if the Buffer Read Enable (BUFRDEN) changes from '0' to '1'. See BUFRDEN in SDMMC_PSR. While processing the tuning procedure (Execute Tuning (EXTUN) in SDMMC_HC2R is set to '1'), BRDRDY is set to '1' for every CMD19 execution.
This bit can only be set to '1' if SDMMC_NISTER.BRDRDY is set to '1'. An interrupt can only be generated if SDMMC_NISIER.BRDRDY is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	Not ready to read buffer.
1	Ready to read buffer.

Bit 4 – BWRRDY Buffer Write Ready

This status is set to '1' if the Buffer Write Enable (BUFWREN) changes from '0' to '1'. See BUFWREN in SDMMC_PSR.
This bit can only be set to '1' if SDMMC_NISTER.BWRRDY is set to '1'. An interrupt can only be generated if SDMMC_NISIER.BWRRDY is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	Not ready to write buffer.
1	Ready to write buffer.

Bit 3 – DMAINT DMA Interrupt

This status is set if the SDMMC detects the Host SDMA Buffer boundary during transfer. See SDMA Buffer Boundary (BOUNDARY) in SDMMC_BSR.
In case of ADMA, by setting the “int” field in the descriptor table, the SDMMC raises this status flag when the descriptor line is completed. This status flag does not rise after Transfer Complete (TRFC).
This bit can only be set to '1' if SDMMC_NISTER.DMAINT is set to '1'. An interrupt can only be generated if SDMMC_NISIER.DMAINT is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No DMA Interrupt.
1	DMA Interrupt.

Bit 2 – BLKGE Block Gap Event

If the Stop At Block Gap Request (STPBGR) in SDMMC_BGCR is set to 1, this bit is set when either a read or a write transaction is stopped at a block gap. If STPBGR is not set to 1, this bit is not set to 1.
In the case of a Read transaction:

© 2025 Microchip Technology Inc. and its subsidiaries

This bit is set at the falling edge of the DAT Line Active (DLACT) status (when the transaction is stopped at SD bus timing). The Read Wait must be supported in order to use this function. See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” about the detailed timing.
In the case of a Write transaction:
This bit is set at the falling edge of the Write Transfer Active (WTACT) status (after getting the CRC status at SD bus timing). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.
This bit can only be set to '1' if SDMMC_NISTER.BLKGE is set to '1'. An interrupt can only be generated if SDMMC_NISIER.BLKGE is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No block gap event.
1	Transaction stopped at block gap.

Bit 1 – TRFC Transfer Complete
This bit is set when a read/write transfer and a command with Busy is completed.
In the case of a Read Transaction:
This bit is set at the falling edge of the Read Transfer Active Status. The interrupt is generated in two cases. The first is when a data transfer is completed as specified by the data length (after the last data was read to the system). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request (STPBGR) in SDMMC_BGCR (after valid data was read to the system). See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.
In the case of a Write Transaction:
This bit is set at the falling edge of the DAT Line Active (DLACT) status. This interrupt is generated in two cases. The first is when the last data is written to the card as specified by the data length and the Busy signal is released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request (STPBGR) in SDMMC_BGCR and data transfers are completed. (After valid data is written to the card and the Busy signal is released). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.
In the case of command with Busy:
This bit is set when Busy is deasserted. See DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINHD) in SDMMC_PSR.
This bit can only be set to '1' if SDMMC_NISTER.TRFC is set to '1'. An interrupt can only be generated if SDMMC_NISIER.TRFC is set to '1'.
Writing this bit to '1' clears the bit.
The table below shows that Transfer Complete (TRFC) has a higher priority than Data Timeout Error (DATTEO). If both bits are set to '1', execution of a command can be considered to be completed.

TRFC	DATTEO	Status Meaning
0	0	Interrupted by another factor
0	1	Timeout occurred during transfer
1	Don’t Care	Command execution complete

Value	Description
0	Command execution is not complete.
1	Command execution is complete.

Bit 0 – CMDC Command Complete
This bit is set when getting the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23, but it is generated by the response of a read/write command. See Command Inhibit (CMD) in SDMMC_PSR for details on how to control this bit.

© 2025 Microchip Technology Inc. and its subsidiaries

This bit can only be set to 1 if SDMMC_NISTER.CMDC is set to 1. An interrupt can only be generated if SDMMC_NISIER.CMDC is set to 1.
Writing this bit to 1 clears the bit.
The table below shows that Command Timeout Error (CMDTEO) has a higher priority than Command Complete (CMDC). If both bits are set to 1, it can be considered that the response was not received correctly.

CMDC	CMDTEO	Status Meaning
0	0	Interrupted by another factor
Don't care	1	Response not received within 64 SDCLK cycles
1	0	Response received

Value	Description
0	No command complete.
1	Command complete.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.21.SDMMC Normal Interrupt Status Register (e.MMC)

Name: SDMMC_NISTR (EMMC)
Offset: 0x30
Reset: 0x0000
Property: Read/Write

Note: This register configuration is specific to the e.MMC operation mode.

Bit	15	14	13	12	11	10	9	8
	ERRINT	BOOTAR						
Access	R	R/W						
Reset	0	0						

Bit	7	6	5	4	3	2	1	0
			BRDRDY	BWRRDY	DMAINT	BLKGE	TRFC	CMDC
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit 15 – ERRINT Error Interrupt
If any of the bits in SDMMC_EISTR are set, then this bit is set. Therefore, the user can efficiently test for an error by checking this bit first. This bit is read-only.

Value	Description
0	No error.
1	Error.

Bit 14 – BOOTAR Boot Acknowledge Received
This bit is set to '1' when the SDMMC received a Boot Acknowledge pattern from the e.MMC. This bit can only be set to '1' if SDMMC_NISTER.BOOTAR is set to '1'. An interrupt can only be generated if SDMMC_NISIER.BOOTAR is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	Boot Acknowledge pattern not received.
1	Boot Acknowledge pattern received.

Bit 5 – BRDRDY Buffer Read Ready
This status is set to '1' if Buffer Read Enable (BUFRDEN) changes from '0' to '1'. See Buffer Read Enable (BUFRDEN) in SDMMC_PSR. While processing the tuning procedure (Execute Tuning (EXTUN) in SDMMC_HC2R is set to '1'), BRDRDY is set to '1' for every CMD19 execution.
This bit can only be set to '1' if SDMMC_NISTER.BRDRDY is set to '1'. An interrupt can only be generated if SDMMC_NISIER.BRDRDY is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	Not ready to read buffer.
1	Ready to read buffer.

Bit 4 – BWRRDY Buffer Write Ready
This status is set to 1 if Buffer Write Enable (BUFWREN) changes from '0' to '1'. See Buffer Write Enable (BUFWREN) in SDMMC_PSR.
This bit can only be set to '1' if SDMMC_NISTER.BWRRDY is set to '1'. An interrupt can only be generated if SDMMC_NISIER.BWRRDY is set to '1'.
Writing this bit to '1' clears the bit.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Not ready to write buffer.
1	Ready to write buffer.

Bit 3 – DMAINT DMA Interrupt

This status is set if the SDMMC detects the Host SDMA Buffer boundary during transfer. See SDMA Buffer Boundary (BOUNDARY) in SDMMC_BSR.
In case of ADMA, by setting “int” field in the descriptor table, the SDMMC raises this status flag when the descriptor line is completed. This status flag does not rise after the Transfer Complete (TRFC).
This bit can only be set to '1' if SDMMC_NISTER.DMAINT is set to '1'. An interrupt can only be generated if SDMMC_NISIER.DMAINT is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No DMA interrupt.
1	DMA interrupt.

Bit 2 – BLKGE Block Gap Event

If the Stop At Block Gap Request (STPBGR) in SDMMC_BGCR is set to '1', this bit is set when either a read or a write transaction is stopped at a block gap. If STPBGR is not set to '1', this bit is not set to '1'.
In the case of a Read transaction:
This bit is set at the falling edge of the DAT Line Active (DLACT) status (when the transaction is stopped at SD bus timing). The Read Wait must be supported in order to use this function. See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” about the detailed timing.
In the case of a Write transaction:
This bit is set at the falling edge of the Write Transfer Active (WTACT) status (after getting the CRC status at SD bus timing). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.
This bit can only be set to '1' if SDMMC_NISTER.BLKGE is set to '1'. An interrupt can only be generated if SDMMC_NISIER.BLKGE is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No block gap event.
1	Transaction stopped at block gap.

Bit 1 – TRFC Transfer Complete

This bit is set when a read/write transfer and a command with Busy is completed.
In the case of a Read Transaction:
This bit is set at the falling edge of the Read Transfer Active Status. The interrupt is generated in two cases. The first is when a data transfer is completed as specified by the data length (after the last data was read to the system). The second is when data has stopped at the block gap and completed the data transfer by setting the Stop At Block Gap Request (STPBGR) in SDMMC_BGCR (after valid data was read to the system). See section “Read Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.
In the case of a Write Transaction:
This bit is set at the falling edge of the DAT Line Active (DLACT) status. This interrupt is generated in two cases. The first is when the last data is written to the card as specified by the data length and the Busy signal is released. The second is when data transfers are stopped at the block gap by setting Stop At Block Gap Request (STPBGR) in SDMMC_BGCR and data transfers are completed. (After valid data is written to the card and the Busy signal is released). See section “Write Transaction Wait / Continue Timing” in the “SD Host Controller Simplified Specification V3.00” for more details on the sequence of events.
In the case of command with Busy:

© 2025 Microchip Technology Inc. and its subsidiaries

This bit is set when Busy is deasserted. See DAT Line Active (DLACT) and Command Inhibit (DAT) (CMDINHD) in SDMMC_PSR.
This bit can only be set to '1' if SDMMC_NISTER.TRFC is set to '1'. An interrupt can only be generated if SDMMC_NISIER.TRFC is set to '1'.
Writing this bit to '1' clears the bit.
The table below shows that Transfer Complete (TRFC) has a higher priority than Data Timeout Error (DATTEO). If both bits are set to '1', execution of a command can be considered to be completed.

TRFC	DATTEO	Status Meaning
0	0	Interrupted by another factor
0	1	Timeout occurred during transfer
1	Don't Care	Command execution complete

Value	Description
0	Command execution is not complete.
1	Command execution is complete.

Bit 0 – CMDC Command Complete

This bit is set when getting the end bit of the command response. Auto CMD12 and Auto CMD23 consist of two responses. Command Complete is not generated by the response of CMD12 or CMD23, but it is generated by the response of a read/write command. See CMRINHC in SDMMC_PSR for details on how to control this bit.
This bit can only be set to '1' if SDMMC_NISTER.CMDC is set to '1'. An interrupt can only be generated if SDMMC_NISIER.CMDC is set to '1'.
Writing this bit to '1' clears the bit.
The table below shows that Command Timeout Error (CMDTEO) has a higher priority than Command Complete (CMDC). If both bits are set to '1', it can be considered that the response was not received correctly.

CMDC	CMDTEO	Status Meaning
0	0	Interrupted by another factor
Don't care	1	Response not received within 64 SDCLK cycles
1	0	Response received

Value	Description
0	No command complete.
1	Command complete.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.22.SDMMC Error Interrupt Status Register (SD_SDIO)

Name: SDMMC_EISTR (SD_SDIO)
Offset: 0x32
Reset: 0x0000
Property: Read/Write

Note: This register configuration is specific to the SD/SDIO operation mode.

Bit	15	14	13	12	11	10	9	8
						TUNING	ADMA	ACMD
Access						R/W	R/W	R/W
Reset						0	0	0

Bit	7	6	5	4	3	2	1	0
	CURLIM	DATEND	DATCRC	DATTEO	CMDIDX	CMDEND	CMDCRC	CMDTEO
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 10 – TUNING Tuning Error
This bit is set to 1 when an unrecoverable error is detected in a tuning circuit, except during a tuning procedure (occurrence of an error during a tuning procedure is indicated by Sampling Clock Select (SCLKSEL) in SDMMC_HC2R).
When detecting a tuning error, the user needs to abort the execution of a command and to perform tuning. To reset the tuning circuit, SCLKSEL must be set to 0 before executing the tuning procedure (see Figure 2-29 in the “SD Host Controller Simplified Specification V3.00”).
Tuning Error has a higher priority than the other error statuses generated during data transfer.
When detecting a tuning error, the user should discard any data transferred by a current read/write command and retry the transfer after the SDMMC recovered from tuning circuit error.
This bit can only be set to '1' if SDMMC_EISTER.TUNING is set to '1'. An interrupt can only be generated if SDMMC_EISIER.TUNING is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 9 – ADMA ADMA Error
This bit is set to '1' when the SDMMC detects errors during an ADMA-based data transfer. The state of the ADMA at an error occurrence is saved in SDMMC_AESR.
In addition, the SDMMC raises this status flag when it detects some invalid description data (Valid = 0) at the ST_FDS state (see section “Advanced DMA” in the “SD Host Controller Simplified Specification V3.00”). ADMA Error Status (ERRST) in SDMMC_AESR indicates that an error occurred in ST_FDS state. The user may find that the Valid bit is not set at the error descriptor.
This bit can only be set to '1' if SDMMC_EISTER.ADMA is set to '1'. An interrupt can only be generated if SDMMC_EISIER.ADMA is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 8 – ACMD Auto CMD Error
Auto CMD12 and Auto CMD23 use this error status. This bit is set to '1' when detecting that one of the 0 to 4 bits in SDMMC_ACESR[4:0] has changed from '0' to '1'. In the case of Auto CMD12, this bit

© 2025 Microchip Technology Inc. and its subsidiaries

is set to '1', not only when errors occur in Auto CMD12 but also when auto CMD12 is not executed due to the previous command error.
This bit can only be set to '1' if SDMMC_EISTER.ACMD is set to '1'. An interrupt can only be generated if SDMMC_EISIER.ACMD is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 7 – CURLIM Current Limit Error

By setting SD Bus Power (SDBPWR) in SDMMC_PCR, the SDMMC is requested to supply power for the SD Bus. The SDMMC is protected from an illegal card by stopping power supply to the card, in which case this bit indicates a failure status. Reading 1 means the SDMMC is not supplying power to the card due to some failure. Reading 0 means that the SDMMC is supplying power and no error has occurred. The SDMMC may require some sampling time to detect the current limit.
This bit can only be set to '1' if SDMMC_EISTER.CURLIM is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CURLIM is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 6 – DATEND Data End Bit Error

This bit is set to '1' either when detecting 0 at the end bit position of read data which uses the DAT line or at the end bit position of the CRC Status.
This bit can only be set to '1' if SDMMC_EISTER.DATEND is set to '1'. An interrupt can only be generated if SDMMC_EISIER.DATEND is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 5 – DATCRC Data CRC error

This bit is set to '1' when detecting a CRC error when transferring read data which uses the DAT line or when detecting that the Write CRC Status has a value other than '010'.
This bit can only be set to '1' if SDMMC_EISTER.DATCRC is set to '1'. An interrupt can only be generated if SDMMC_EISIER.DATCRC is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 4 – DATTEO Data Timeout Error

This bit is set to '1' when detecting one of following timeout conditions.
– Busy timeout for R1b, R5b response type (see “Physical Layer Simplified Specification V3.01” and “SD Host Controller Simplified Specification V3.00”).
– Busy timeout after Write CRC status.
– Write CRC Status timeout.
– Read data timeout
This bit can only be set to '1' if SDMMC_EISTER.DATTEO is set to '1'. An interrupt can only be generated if SDMMC_EISIER.DATTEO is set to '1'.
Writing this bit to '1' clears the bit.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No error.
1	Error.

Bit 3 – CMDIDX Command Index Error

This bit is set to '1' if a Command Index error occurs in the command response.
This bit can only be set to '1' if SDMMC_EISTER.CMDIDX is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDIDX is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 2 – CMDEND Command End Bit Error

This bit is set to '1' when detecting that the end bit of a command response is 0.
This bit can only be set to '1' if SDMMC_EISTER.CMDEND is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDEND is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 1 – CMDCRC Command CRC Error

The Command CRC Error is generated in two cases.
If a response is returned and the Command Timeout Error (CMDTEO) is set to 0 (indicating no command timeout), this bit is set to '1' when detecting a CRC error in the command response.
The SDMMC detects a CMD line conflict by monitoring the CMD line when a command is issued. If the SDMMC drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SDCLK edge, then the SDMMC aborts the command (stops driving the CMD line) and sets this bit to '1'. CMDTEO is also set to '1' to indicate a CMD line conflict (see the table above).
This bit can only be set to '1' if SDMMC_EISTER.CMDCRC is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDCRC is set to '1'.
Writing this bit to '1' clears the bit.

Bit 0 – CMDTEO Command Timeout Error

This bit is set to '1' only if no response is returned within 64 SDCLK cycles from the end bit of the command. If the SDMMC detects a CMD line conflict, in which case Command CRC Error (CMDCRC) is also set to '1' as shown in the table below, this bit is set without waiting for 64 SDCLK cycles because the command is aborted by the SDMMC.
This bit can only be set to '1' if SDMMC_EISTER.CMDTEO is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDTEO is set to '1'.
Writing this bit to '1' clears the bit.

CMDCRC	CMDTEO	Error Types
0	0	No error
0	1	Response timeout error
1	0	Response CRC error
1	1	CMD line conflict

76.13.23.SDMMC Error Interrupt Status Register (e.MMC)

Name: SDMMC_EISTR (EMMC)
Offset: 0x32
Reset: 0x0000
Property: Read/Write

Note: This register configuration is specific to the e.MMC operation mode.

Bit	15	14	13	12	11	10	9	8
				BOOTAE		TUNING	ADMA	ACMD
Access				R/W		R/W	R/W	R/W
Reset				0		0	0	0

Bit	7	6	5	4	3	2	1	0
	CURLIM	DATEND	DATCRC	DATTEO	CMDIDX	CMDEND	CMDCRC	CMDTEO
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 12 – BOOTAE Boot Acknowledge Error
This bit is set to '1' when detecting that the e.MMC Boot Acknowledge Status has a value other than '010'.
This bit can only be set to '1' if SDMMC_EISTER.BOOTAE is set to '1'. An interrupt can only be generated if SDMMC_EISIER.BOOTAE is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 10 – TUNING Tuning Error
This bit is set to 1 when an unrecoverable error is detected in a tuning circuit, except during a tuning procedure (occurrence of an error during tuning procedure is indicated by Sampling Clock Select (SCLKSEL) in SDMMC_HC2R).
When detecting a tuning error, the user needs to abort the execution of a command and to perform tuning. To reset the tuning circuit, SCLKSEL must be set to 0 before executing the tuning procedure (see Figure 2-29 in the “SD Host Controller Simplified Specification V3.00”).
Tuning Error has a higher priority than the other error statuses generated during data transfer.
When detecting a tuning error, the user should discard any data transferred by a current read/write command and retry the transfer after the SDMMC recovered from tuning circuit error.
This bit can only be set to '1' if SDMMC_EISTER.TUNING is set to '1'. An interrupt can only be generated if SDMMC_EISIER. TUNING is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 9 – ADMA ADMA Error
This bit is set to 1 when the SDMMC detects errors during an ADMA-based data transfer. The state of the ADMA at an error occurrence is saved in SDMMC_AESR.
In addition, the SDMMC raises this status flag when it detects some invalid description data (Valid = 0) at the ST_FDS state (see section “Advanced DMA” in the “SD Host Controller Simplified Specification V3.00”). ADMA Error Status (ERRST) in SDMMC_AESR indicates that an error occurred in ST_FDS state. The user may find that the Valid bit is not set at the error descriptor.

© 2025 Microchip Technology Inc. and its subsidiaries

This bit can only be set to '1' if SDMMC_EISTER.ADMA is set to '1'. An interrupt can only be generated if SDMMC_EISIER.ADMA is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 8 – ACMD Auto CMD Error

Auto CMD12 and Auto CMD23 use this error status. This bit is set to '1' when detecting that one of the 0 to 4 bits in SDMMC_ACESR[4:0] has changed from 0 to 1. In the case of Auto CMD12, this bit is set to '1', not only when errors occur in Auto CMD12, but also when Auto CMD12 is not executed due to the previous command error.
This bit can only be set to '1' if SDMMC_EISTER.ACMD is set to '1'. An interrupt can only be generated if SDMMC_EISIER.ACMD is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 7 – CURLIM Current Limit Error

By setting SD Bus Power (SDBPWR) in SDMMC_PSR, the SDMMC is requested to supply power for the SD Bus. The SDMMC is protected from an illegal card by stopping power supply to the card, in which case this bit indicates a failure status. Reading 1 means the SDMMC is not supplying power to the card due to some failure. Reading 0 means that the SDMMC is supplying power and no error has occurred. The SDMMC may require some sampling time to detect the current limit.
This bit can only be set to '1' if SDMMC_EISTER.CURLIM is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CURLIM is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 6 – DATEND Data End Bit Error

This bit is set to '1' either when detecting 0 at the end bit position of read data which uses the DAT line or at the end bit position of the CRC Status.
This bit can only be set to '1' if SDMMC_EISTER.DATEND is set to '1'. An interrupt can only be generated if SDMMC_EISIER.DATEND is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 5 – DATCRC Data CRC Error

This bit is set to '1' when detecting a CRC error during a transfer of read data which uses the DAT line or when detecting that the Write CRC Status has a value other than '010'.
This bit can only be set to '1' if SDMMC_EISTER.DATCRC is set to '1'. An interrupt can only be generated if SDMMC_EISIER. DATCRC is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 4 – DATTEO Data Timeout error

This bit is set to '1' when detecting one of following timeout conditions.
– Busy timeout for R1b, R5b response type (see “Physical Layer Simplified Specification V3.01” and “SDIO Simplified Specification V3.00”).
– Busy timeout after Write CRC Status.
– Write CRC Status timeout.
– Read data timeout
This bit can only be set to '1' if SDMMC_EISTER.DATTEO is set to '1'. An interrupt can only be generated if SDMMC_EISIER.DATTEO is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 3 – CMDIDX Command Index Error

This bit is set to '1' if a Command Index error occurs in the command response.
This bit can only be set to '1' if SDMMC_EISTER.CMDIDX is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDIDX is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 2 – CMDEND Command End Bit Error

This bit is set to '1' when detecting that the end bit of a command response is 0.
This bit can only be set to '1' if SDMMC_EISTER.CMDEND is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDEND is set to '1'.
Writing this bit to '1' clears the bit.

Value	Description
0	No error.
1	Error.

Bit 1 – CMDCRC Command CRC Error

The Command CRC Error is generated in two cases.
If a response is returned and Command Timeout Error (CMDTEO) is set to 0 (indicating no command timeout), this bit is set to '1' when detecting a CRC error in the command response.
The SDMMC detects a CMD line conflict by monitoring the CMD line when a command is issued. If the SDMMC drives the CMD line to 1 level, but detects 0 level on the CMD line at the next SDCLK edge, then the SDMMC aborts the command (stops driving the CMD line) and sets this bit to '1'. CMDTEO is also set to '1' to indicate a CMD line conflict (see he table “Relations between CMDCRC and CMDTEO”).
This bit can only be set to '1' if SDMMC_EISTER.CMDCRC is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDCRC is set to '1'.
Writing this bit to 1 clears the bit.

Bit 0 – CMDTEO Command Timeout Error

This bit is set to '1' only if no response is returned within 64 SDCLK cycles from the end bit of the command. If the SDMMC detects a CMD line conflict, in which case Command CRC Error (CMDCRC) is also set to '1' as shown in the table “Relations between CMDCRC and CMDTEO”, this bit is set without waiting for 64 SDCLK cycles because the command is aborted by the SDMMC.
This bit can only be set to '1' if SDMMC_EISTER.CMDTEO is set to '1'. An interrupt can only be generated if SDMMC_EISIER.CMDTEO is set to '1'.
Writing this bit to '1' clears the bit.

Reset	0	0	0	0	0	0	0	0

Bit 8 – CINT Card Interrupt Status Enable
If this bit is set to 0, the SDMMC clears interrupt requests to the system. The Card Interrupt detection is stopped when this bit is cleared and restarted when this bit is set to 1. The user may clear this bit before servicing the Card Interrupt and may set this bit again after all interrupt requests from the card are cleared to prevent inadvertent interrupts.
0 (MASKED): The CINT status flag in SDMMC_NISTR is masked.

1 (ENABLED): An interrupt is generated when the BWRRDY status rises in SDMMC_NISTR.

Bit 3 – DMAINT DMA Interrupt Signal Enable
0 (MASKED): No interrupt is generated when the DMAINT status rises in SDMMC_NISTR.
1 (ENABLED): An interrupt is generated when the DMAINT status rises in SDMMC_NISTR.

Bit 2 – BLKGE Block Gap Event Signal Enable
0 (MASKED): No interrupt is generated when the BLKGE status rises in SDMMC_NISTR.
1 (ENABLED): An interrupt is generated when the BLKGE status rises in SDMMC_NISTR.

Bit 1 – TRFC Transfer Complete Signal Enable
0 (MASKED): No interrupt is generated when the TRFC status rises in SDMMC_NISTR.
1 (ENABLED): An interrupt is generated when the TRFC status rises in SDMMC_NISTR.

Bit 0 – CMDC Command Complete Signal Enable
0 (MASKED): No interrupt is generated when the CMDC status rises in SDMMC_NISTR.
1 (ENABLED): An interrupt is generated when the CMDC status rises in SDMMC_NISTR.

76.13.30.SDMMC Error Interrupt Signal Enable Register (SD_SDIO)

Name: SDMMC_EISIER (SD_SDIO)
Offset: 0x3A
Reset: 0x0000
Property: Read/Write

Note: This register configuration is specific to the SD/SDIO operation mode.

Bit	15	14	13	12	11	10	9	8
						TUNING	ADMA	ACMD
Access						R/W	R/W	R/W
Reset						0	0	0

Bit	7	6	5	4	3	2	1	0
	CURLIM	DATEND	DATCRC	DATTEO	CMDIDX	CMDEND	CMDCRC	CMDTEO
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 10 – TUNING Tuning Error Signal Enable
0 (MASKED): No interrupt is generated when the TUNING status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the TUNING status rises in SDMMC_EISTR.

Bit 9 – ADMA ADMA Error Signal Enable
0 (MASKED): No interrupt is generated when the ADMA status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the ADMA status rises in SDMMC_EISTR.

Bit 8 – ACMD Auto CMD Error Signal Enable
0 (MASKED): No interrupt is generated when the ACMD status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the ACMD status rises in SDMMC_EISTR.

Bit 7 – CURLIM Current Limit Error Signal Enable
0 (MASKED): No interrupt is generated when the CURLIM status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the CURLIM status rises in SDMMC_EISTR.

Bit 6 – DATEND Data End Bit Error Signal Enable
0 (MASKED): No interrupt is generated when the DATEND status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the DATEND status rises in SDMMC_EISTR.

Bit 5 – DATCRC Data CRC Error Signal Enable
0 (MASKED): No interrupt is generated when the DATCRC status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the DATCRC status rises in SDMMC_EISTR.

Bit 4 – DATTEO Data Timeout Error Signal Enable
0 (MASKED): No interrupt is generated when the DATTEO status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the DATTEO status rises in SDMMC_EISTR.

Bit 3 – CMDIDX Command Index Error Signal Enable
0 (MASKED): No interrupt is generated when the CMDIDX status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the CMDIDX status rises in SDMMC_EISTR.

Bit 2 – CMDEND Command End Bit Error Signal Enable
0 (MASKED): No interrupt is generated when the CMDEND status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the CMDEND status rises in SDMMC_EISTR.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 1 – CMDCRC Command CRC Error Signal Enable
0 (MASKED): No interrupt is generated when the CDMCRC status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the CMDCRC status rises in SDMMC_EISTR.

Bit 0 – CMDTEO Command Timeout Error Signal Enable
0 (MASKED): No interrupt is generated when the CMDTEO status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the CMDTEO status rises in SDMMC_EISTR.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.31.SDMMC Error Interrupt Signal Enable Register (e.MMC)

Name: SDMMC_EISIER (EMMC)
Offset: 0x3A
Reset: 0x0000
Property: Read/Write

Note: This register configuration is specific to the e.MMC operation mode.

Bit	15	14	13	12	11	10	9	8
				BOOTAE		TUNING	ADMA	ACMD
Access				R/W		R/W	R/W	R/W
Reset				0		0	0	0

Bit	7	6	5	4	3	2	1	0
	CURLIM	DATEND	DATCRC	DATTEO	CMDIDX	CMDEND	CMDCRC	CMDTEO
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 12 – BOOTAE Boot Acknowledge Error Signal Enable
0 (MASKED): No interrupt is generated when the BOOTAE status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the BOOTAE status rises in SDMMC_EISTR.

Bit 10 – TUNING Tuning Error Signal Enable
0 (MASKED): No interrupt is generated when the TUNING status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the TUNING status rises in SDMMC_EISTR.

Bit 9 – ADMA ADMA Error Signal Enable
0 (MASKED): No interrupt is generated when the ADMA status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the ADMA status rises in SDMMC_EISTR.

Bit 8 – ACMD Auto CMD Error Signal Enable
0 (MASKED): No interrupt is generated when the ACMD status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the ACMD status rises in SDMMC_EISTR.

Bit 7 – CURLIM Current Limit Error Signal Enable
0 (MASKED): No interrupt is generated when the CURLIM status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the CURLIM status rises in SDMMC_EISTR.

Bit 6 – DATEND Data End Bit Error Signal Enable
0 (MASKED): No interrupt is generated when the DATEND status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the DATEND status rises in SDMMC_EISTR.

Bit 5 – DATCRC Data CRC Error Signal Enable
0 (MASKED): No interrupt is generated when the DATCRC status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the DATCRC status rises in SDMMC_EISTR.

Bit 4 – DATTEO Data Timeout Error Signal Enable
0 (MASKED): No interrupt is generated when the DATTEO status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the DATTEO status rises in SDMMC_EISTR.

Bit 3 – CMDIDX Command Index Error Signal Enable
0 (MASKED): No interrupt is generated when the CMDIDX status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the CMDIDX status rises in SDMMC_EISTR.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 2 – CMDEND Command End Bit Error Signal Enable
0 (MASKED): No interrupt is generated when the CMDEND status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the CMDEND status rises in SDMMC_EISTR.

Bit 1 – CMDCRC Command CRC Error Signal Enable
0 (MASKED): No interrupt is generated when the CDMCRC status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the CMDCRC status rises in SDMMC_EISTR.

Bit 0 – CMDTEO Command Timeout Error Signal Enable
0 (MASKED): No interrupt is generated when the CMDTEO status rises in SDMMC_EISTR.
1 (ENABLED): An interrupt is generated when the CMDTEO status rises in SDMMC_EISTR.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.32.SDMMC Auto CMD Error Status Register

Name: SDMMC_ACESR
Offset: 0x3C
Reset: 0x0000
Property: Read-only

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	CMDNI			ACMDIDX	ACMDEND	ACMDCRC	ACMDTEO	ACMD12NE
Access	R			R	R	R	R	R
Reset	0			0	0	0	0	0

Bit 7 – CMDNI Command Not Issued by Auto CMD12 Error
This bit is set to 1 when CMD_wo_DAT is not executed due to an Auto CMD12 error (SDMMC_ACESR[4:1]). This bit is set to 0 when Auto CMD Error is generated by Auto CMD23.

Value	Description
0	No error.
1	Error.

Bit 4 – ACMDIDX Auto CMD Index Error
This bit is set to 1 when the Command Index error occurs in response to a command.

Value	Description
0	No error.
1	Error.

Bit 3 – ACMDEND Auto CMD End Bit Error
This bit is set to 1 when detecting that the end bit of the command response is 0.

Value	Description
0	No error.
1	Error.

Bit 2 – ACMDCRC Auto CMD CRC Error
This bit is set to 1 when detecting a CRC error in the command response (see table Relation between ACMDCRC and ACMDTEO for more details).

Bit 1 – ACMDTEO Auto CMD Timeout Error
This bit is set to 1 if no response is returned within 64 SDCLK cycles from the end bit of the command. If this bit is set to 1, the other error status bits (SDMMC_ACESR[4:2]) are meaningless.

Table 76.4. Relation between ACMDCRC and ACMDTEO

ACMDCRC	ACMDTEO	Error Types
0	0	No error
0	1	Response Timeout error
1	0	Response CRC error
1	1	CMD line conflict

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 0 – ACMD12NE Auto CMD12 Not Executed

If a memory multiple block data transfer is not started due to a command error, this bit is not set to 1 because it is not necessary to issue Auto CMD12. Setting this bit to 1 means the SDMMC cannot issue Auto CMD12 to stop a memory multiple block data transfer due to some error. If this bit is set to 1, other error status bits (SDMMC_ACESR[4:1]) are meaningless.
This bit is set to 0 when an Auto CMD error is generated by Auto CMD23.

Value	Description
0	No error.
1	Error.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.33.SDMMC Host Control 2 Register (SD_SDIO)

Name: SDMMC_HC2R (SD_SDIO)
Offset: 0x3E
Reset: 0x0000
Property: Read/Write

Note: This register configuration is specific to the SD/SDIO operation mode.

Bit	15	14	13	12	11	10	9	8
	PVALEN	ASINTEN						
Access	R/W	R/W						
Reset	0	0						

Bit	7	6	5	4	3	2	1	0
	SCLKSEL	EXTUN	DRVSEL[1:0]		VS18EN	UHSMS[2:0]		
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 15 – PVALEN Preset Value Enable

As the operating SDCLK frequency and I/O driver strength depend on the system implementation, it is difficult to determine these parameters in the standard host driver. When PVALEN is set to 1, automatic SDCLK frequency generation and driver strength selection are performed without considering system-specific conditions. This bit enables the functions defined in SDMMC_PVR.
If this bit is set to 0, SDMMC_HC2R.DRVSEL, SDMMC_CCR.SDCLKFSEL and SDMMC_CCR.CLKGSEL are set by the user.
If this bit is set to 1, SDMMC_HC2R.DRVSEL, SDMMC_CCR.SDCLKFSEL and SDMMC_CCR.CLKGSEL are set by the SDMMC as specified in SDMMC_PVR.

Value	Description
0	SDCLK and Driver strength are controlled by the user.
1	Automatic selection by Preset Value is enabled.

Bit 14 – ASINTEN Asynchronous Interrupt Enable

This bit can be set to 1 if a card supports asynchronous interrupts and Asynchronous Interrupt Support (ASINTSUP) is set to 1 in SDMMC_CA0R. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode. If this bit is set to 1, the user can stop the SDCLK during the asynchronous interrupt period to save power. During this period, the SDMMC continues to deliver the Card Interrupt to the host when it is asserted by the card.

Value	Description
0	Disabled
1	Enabled

Bit 7 – SCLKSEL Sampling Clock Select

The SDMMC uses this bit to select the sampling clock to receive CMD and DAT.
This bit is set by the tuning procedure and is valid after completion of tuning (when EXTUN is cleared). Setting 1 means that tuning is completed successfully and setting 0 means that tuning has failed.
Writing 1 to this bit is meaningless and ignored. A tuning circuit is reset by writing to 0. This bit can be cleared by setting EXTUN to 1. Once the tuning circuit is reset, it takes time to complete the tuning sequence. Therefore, the user should keep this bit to 1 to perform a retuning sequence to complete a retuning sequence in a short time. Changing this bit is not allowed while the SDMMC is receiving a response or a read data block. See Figure 2.29 in the “SD Host Controller Simplified Specification V3.00”.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	The fixed clock is used to sample data.
1	The tuned clock is used to sample data.

Bit 6 – EXTUN Execute Tuning

This bit is set to 1 to start the tuning procedure and is automatically cleared when the tuning procedure is completed. The result of tuning is indicated to Sampling Clock Select (SCLKSEL). The tuning procedure is aborted by writing 0. See Figure 2.29 in the “SD Host Controller Simplified Specification V3.00”.

Value	Description
0	Not tuned or tuning completed.
1	Execute tuning.

Bits 5:4 – DRVSEL[1:0] Driver Strength Select

The SDMMC output driver in 1.8V signaling is selected by this bit. In 3.3V signaling, this field is not effective. This field can be set according to the Driver Type A, C and D support bits in SDMMC_CA1R. This field depends on the setting of Preset Value Enable (PVALEN):
– PVALEN = 0: This field is set by the user.
– PVALEN = 1: This field is automatically set by a value specified in one of the SDMMC_PVRx.

Value	Name	Description
0	TYPEB	Driver Type B is selected (Default)
1	TYPEA	Driver Type A is selected
2	TYPEC	Driver Type C is selected
3	TYPED	Driver Type D is selected

Bit 3 – VS18EN 1.8V Signaling Enable

This bit controls the SDMMC_1V8SEL output, which in turn may control an external voltage regulator for the I/O cell and card I/Os. 3.3V or some other fixed voltage is supplied to the card/device regardless of the signaling voltage.
Setting this bit from 0 to 1 starts changing the signal voltage from 3.3V to 1.8V. The 1.8V regulator output must be stable within 5 ms.
Clearing this bit from 1 to 0 starts changing the signal voltage from 1.8V to 3.3V. The 3.3V regulator output must be stable within 5 ms.
The user can set this bit to 1 when the SDMMC supports 1.8V signaling (one of the support bits is set to 1: SDR50SUP, SDR104SUP or DDR50SUP in SDMMC_CA1R) and the card or device supports UHS-I (S18A = 1. See “Bus Switch Voltage Switch Sequence in the “Physical Layer Simplified Specification V3.01”).

Value	Description
0	3.3V signaling.
1	1.8V signaling.

Bits 2:0 – UHSMS[2:0] UHS Mode Select

This field is used to select one of the UHS-I modes and is effective when 1.8V Signal Enable (VS18EN) is set to 1.
This field is effective only if SDMMC_MC1R.DDR is set to 0.
If Preset Value Enable is set to 1, the SDMMC sets SDCLK Frequency Select (SDCLKFSEL), Clock Generator Select (CLKGSEL) in SDMMC_CCR and Driver Strength Select (DRVSEL) according to SDMMC_PVR. In this case, one of the preset value registers is selected by this field. The user needs to reset SD Clock Enable (SDCLKEN) before changing this field to avoid generating a clock glitch. After setting this field, the user sets SDCLKEN to 1 again.

Value	Name	Description
0	SDR12	UHS SDR12 Mode
1	SDR25	UHS SDR25 Mode

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
2	SDR50	UHS SDR50 Mode
3	SDR104	UHS SDR104 Mode
4	DDR50	UHS DDR50 Mode

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.34.SDMMC Host Control 2 Register (e.MMC)

Name: SDMMC_HC2R (EMMC)
Offset: 0x3E
Reset: 0x0000
Property: Read/Write

Note: This register configuration is specific to the e.MMC operation mode.

Bit	15	14	13	12	11	10	9	8
	PVALEN							
Access	R/W							
Reset	0							

Bit	7	6	5	4	3	2	1	0
	SCLKSEL	EXTUN	DRVSEL[1:0]		HS200EN[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 15 – PVALEN Preset Value Enable

As the operating SDCLK frequency and I/O driver strength depend on the system implementation, it is difficult to determine these parameters in the standard host driver. When Preset Value Enable (PVALEN) is set to 1, automatic SDCLK frequency generation and driver strength selection are performed without considering system-specific conditions. This bit enables the functions defined in SDMMC_PVR.
If this bit is set to 0, SDMMC_HC2R.DRVSEL, SDMMC_CCR.SDCLKFSEL and SDMMC_CCR.CLKGSEL are set by the user.
If this bit is set to 1, SDMMC_HC2R.DRVSEL, SDMMC_CCR.SDCLKFSEL and SDMMC_CCR.CLKGSEL are set by the SDMMC as specified in SDMMC_PVR.

Value	Description
0	SDCLK and Driver strength are controlled by the user.
1	Automatic selection by Preset Value is enabled.

Bit 7 – SCLKSEL Sampling Clock Select

The SDMMC uses this bit to select the sampling clock to receive CMD and DAT.
This bit is set by the tuning procedure and is valid after completion of tuning (when EXTUN is cleared). Setting 1 means that tuning is completed successfully and setting 0 means that tuning has failed.
Writing 1 to this bit is meaningless and ignored. A tuning circuit is reset by writing to 0. This bit can be cleared by setting EXTUN to 1. Once the tuning circuit is reset, it takes time to complete a tuning sequence. Therefore, the user should keep this bit to 1 to perform a retuning sequence to complete a retuning sequence in a short time. Changing this bit is not allowed while the SDMMC is receiving a response or a read data block. See Figure 2.29 in the “SD Host Controller Simplified Specification V3.00”.

Value	Description
0	The fixed clock is used to sample data.
1	The tuned clock is used to sample data.

Bit 6 – EXTUN Execute Tuning

This bit is set to 1 to start the tuning procedure and is automatically cleared when the tuning procedure is completed. The result of tuning is indicated to Sampling Clock Select (SCLKSEL). The tuning procedure is aborted by writing 0. See Figure 2.29 in the “SD Host Controller Simplified Specification V3.00”.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Not tuned or tuning completed
1	Execute tuning

Bits 5:4 – DRVSEL[1:0] Driver Strength Select

The SDMMC output driver in 1.8V signaling is selected by this bit. In 3.3V signaling, this field is not effective. This field can be set according to the Driver Type A, C and D support bits in SDMMC_CA1R. This field depends on setting of Preset Value Enable (PVALEN):
– PVALEN = 0: This field is set by the user.
– PVALEN = 1: This field is automatically set by a value specified in one of the SDMMC_PVRx.

Value	Name	Description
0	TYPEB	Driver Type B is selected (Default)
1	TYPEA	Driver Type A is selected
2	TYPEC	Driver Type C is selected
3	TYPED	Driver Type D is selected

Bits 3:0 – HS200EN[3:0] HS200 Mode Enable

This field is used to select the e.MMC HS200 mode. When HS200EN is set to $B_{(hexa)}$, the HS200 mode is enabled. Any other value except 0 is forbidden when interfacing an e.MMC device.
If Preset Value Enable is set to 1, SDMMC sets SDCLK Frequency Select (SDCLKFSEL), Clock Generator Select (CLKGSEL) in SDMMC_CCR and Driver Strength Select (DRVSEL) according to SDMMC_PVR. In this case, one of the preset value registers is selected by this field. The user needs to reset SD Clock Enable (SDCLKEN) before changing this field to avoid generating a clock glitch. After setting this field, the user sets SDCLKEN to 1 again.
Note: This field is effective only if DDR in SDMMC_MC1R is set to 0.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.35.SDMMC Capabilities 0 Register

Name: SDMMC_CA0R
Offset: 0x40
Property: Read/Write

Reset: The register reset values depend on the instance of the SDMMC:

Instance	Reset Value
SDMMC0	0x27EC6499
SDMMC1, SDMMC2	0x27E86499

Note: The reset values match the capabilities of the MPU alone. The user should adjust the capability registers so that they also match the board design. Modify preset values only if the Capabilities Write Enable (CAPWREN) bit is set to 1 in SDMMC_CACR.

Bit	31	30	29	28	27	26	25	24
	SLTYPE[1:0]		ASINTSUP	SB64SUP		V18VSUP	V30VSUP	V33VSUP
Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset								

Bit	23	22	21	20	19	18	17	16
	SRSUP	SDMASUP	HSSUP		ADMA2SUP	ED8SUP	MAXBLKL[1:0]	
Access	R	R	R		R	R	R	R
Reset								

Bit	15	14	13	12	11	10	9	8
	BASECLKF[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset								

Bit	7	6	5	4	3	2	1	0
	TEOCLKU		TEOCLKF[5:0]					
Access	R/W		R/W	R/W	R/W	R/W	R/W	R/W
Reset								

Bits 31:30 – SLTYPE[1:0] Slot Type
Indicates usage of a slot by a specific system. An SDMMC control register set is defined per slot. Embedded Slot for One Device means that only one nonremovable device is connected to a bus slot. The Standard Host Driver controls a removable card (SLTYPE = 0) or one embedded device (SLTYPE = 1) connected to an SD bus slot.

Value	Name	Description
0	REMOVABLECARD	Removable Card Slot
1	EMBEDDED	Embedded Slot for One Device
2	–	Reserved
3	–	Reserved

Bit 29 – ASINTSUP Asynchronous Interrupt Support
See section “Asynchronous Interrupt” in the “SDIO Simplified Specification V3.00” .

Value	Description
0	Asynchronous interrupt not supported
1	Asynchronous interrupt supported

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 28 – SB64SUP 64-Bit System Bus Support
Reading this bit to 1 means that the SDMMC supports the 64-bit Address Descriptor mode and is connected to the 64-bit address system bus.

Value	Description
0	64-bit address bus not supported
1	64-bit address bus supported

Bit 26 – V18VSUP Voltage Support 1.8V

Value	Description
0	1.8V voltage supply not supported
1	1.8V voltage supply supported

Bit 25 – V30VSUP Voltage Support 3.0V

Value	Description
0	3.0V voltage supply not supported
1	3.0V voltage supply supported

Bit 24 – V33VSUP Voltage Support 3.3V

Value	Description
0	3.3V voltage supply not supported
1	3.3V voltage supply supported

Bit 23 – SRSUP Suspend/Resume Support (read-only)
Indicates whether the SDMMC supports the Suspend/Resume functionality. If set to 0, the user does not issue either Suspend or Resume commands because the Suspend and Resume mechanism (see “Suspend and Resume Mechanism” in the “SD Host Controller Simplified Specification V3.00”) is not supported.

Value	Description
0	Suspend/Resume not supported
1	Suspend/Resume supported

Bit 22 – SDMASUP SDMA Support (read-only)
Indicates whether the SDMMC is capable of using SDMA to transfer data between system memory and the SDMMC directly.

Value	Description
0	SDMA not supported
1	SDMA supported

Bit 21 – HSSUP High Speed Support (read-only)
Indicates whether the SDMMC and the system support High Speed mode and they can supply SDCLK frequency from 25 MHz to 50 MHz.

Value	Description
0	High Speed not supported
1	High Speed supported

Bit 19 – ADMA2SUP ADMA2 Support (read-only)
Indicates whether the SDMMC is capable of using ADMA2.

Value	Description
0	ADMA2 not supported
1	ADMA2 supported

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 18 – ED8SUP 8-Bit Support for Embedded Device (read-only)

Indicates whether the SDMMC is capable of using the 8-bit bus width mode.

Value	Description
0	8-bit bus width not supported
1	8-bit bus width supported

Bits 17:16 – MAXBLKL[1:0] Max Block Length (read-only)

Indicates the maximum block size that the user can read and write to the buffer in the SDMMC. Three sizes can be defined, as shown below. It is noted that the transfer block length is always 512 bytes for SD Memory Cards regardless of this field.

Value	Name	Description
0	512	512 bytes
1	1024	1024 bytes
2	2048	2048 bytes
3	NONE	Reserved

Bits 15:8 – BASECLKF[7:0] Base Clock Frequency

Indicates the frequency of the base clock (BASECLK). The user uses this value to calculate the clock divider value (see SDCLK Frequency Select (SDCLKFSEL) in SDMMC_CCR).
If this field is set to 0, the user must get the information via another method.
$f_{\mathrm{BASECLK}} = \mathrm{BASECLKF}_{\mathrm{MHz}}$

Bit 7 – TEOCLKU Timeout Clock Unit

Indicates the unit of the base clock frequency used to detect Data Timeout Error.

Value	Description
0	KHz
1	MHz

Bits 5:0 – TEOCLKF[5:0] Timeout Clock Frequency

Shows the timeout clock frequency (TEOCLK) used to detect Data Timeout Error.
If set to 0, the user must get the information via another method.
The Timeout Clock Unit (TEOCLKU) defines the unit of this field's value.
– TEOCLKU = 0: $f_{\mathrm{TEOCLK}} = \mathrm{TEOCLKF}_{\mathrm{KHz}}$
– TEOCLKU = 1: $f_{\mathrm{TEOCLK}} = \mathrm{TEOCLKF}_{\mathrm{MHz}}$

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.36.SDMMC Capabilities 1 Register

Name: SDMMC_CA1R
Offset: 0x44
Reset: 0x00010F77
Property: Read/Write

Note: The reset values match the capabilities of the MPU alone. The user should adjust the capability registers so that they also match the board design. Modify preset values only if the Capabilities Write Enable (CAPWREN) bit is set to 1 in SDMMC_CACR.

Bits 23:16 – CLKMULT[7:0] Clock Multiplier
This field indicates the multiplier factor between the Base Clock (BASECLK) used for the Divided Clock Mode and the Multiplied Clock (MULTCLK) used for the Programmable Clock mode (see SDMMC_CCR).
Reading this field to 0 means that the Programmable Clock mode is not supported.
$f_{\mathrm{MULTCLK}} = f_{\mathrm{BASECLK}} \times (\mathrm{CLKMULT} + 1)$

Bits 15:14 – RTMOD[1:0] Retuning Modes
This field selects the retuning method and limits the maximum data length.
There are two retuning timings: Retuning Request (RTREQ) controlled by the SDMMC, and expiration of a Retuning timer controlled by the user. By receiving either timing, the user executes the retuning procedure just before a next command issue.
The maximum data length per read/write command is restricted so that retuning procedures can be inserted during data transfers.
Retuning Mode 1:
The SDMMC does not have any internal logic to detect when retuning needs to be performed. In this case, the user should maintain all retuning timings by using the Retuning Timer. To enable inserting the retuning procedure during data transfers, the data length per Read/Write command must be limited to 4 Mbytes.
Retuning Mode 2:
The SDMMC has the capability to indicate the retuning timing by Retuning Request (RTREQ) during data transfers. Then the data length per Read/Write command must be limited to 4 Mbytes.

© 2025 Microchip Technology Inc. and its subsidiaries

During nondata transfer, retuning timing is determined by either Retuning Request or Retuning Timer. If Retuning Request is used, Retuning Timer should be disabled.

Retuning Mode 3:

The SDMMC has the capability to take care of the retuning during data transfer (Auto Retuning). Retuning Request is not generated during data transfers and there is no limitation to data length per Read/Write command.

During nondata transfer, retuning timing is determined either by Retuning Request or Retuning Timer. If Retuning Request is used, Retuning Timer should be disabled.

Value	Name	Description	Data Length
0	MODE1	Timer	4 Mbytes (Max)
1	MODE2	Timer and Retuning Request	4 Mbytes (Max)
2	MODE3	Auto Retuning (for transfer) Timer and Retuning Request	Any
3	–	Reserved	–

Bit 13 – TSDR50 Use Tuning for SDR50

If this bit is set to 1, the SDMMC requires tuning to operate SDR50 (tuning is always required to operate SDR104).

Value	Description
0	SDR50 does not require tuning.
1	SDR50 requires tuning.

Bits 11:8 – TCNTRT[3:0] Timer Count For Retuning

This field indicates an initial value of the Retuning Timer for Retuning Mode (RTMOD) 1 to 3. Reading this field at 0 means that the Retuning Timer is disabled. The Retuning Timer initial value ranges from 0 to 1024 seconds.

$t_{TIMER} = 2^{(TCNTRT - 1)}$Seconds

Bit 6 – DRVDSUP Driver Type D Support

Value	Description
0	Driver type D is not supported.
1	Driver type D is supported.

Bit 5 – DRVCSUP Driver Type C Support

Value	Description
0	Driver type C is not supported.
1	Driver type C is supported.

Bit 4 – DRVASUP Driver Type A Support

Value	Description
0	Driver type A is not supported.
1	Driver type A is supported.

Bit 2 – DDR50SUP DDR50 Support

Value	Description
0	DDR50 mode is not supported.
1	DDR50 mode is supported.

Bit 1 – SDR104SUP SDR104 Support

Value	Description
0	SDR104 mode is not supported.
1	SDR104 mode is supported.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 0 – SDR50SUP SDR50 Support

Value	Description
0	SDR50 mode is not supported.
1	SDR50 mode is supported.

76.13.37.SDMMC Maximum Current Capabilities Register

Name: SDMMC_MCCAR
Offset: 0x48
Reset: 0x00000000
Property: Read/Write

Note: The user should adjust the Maximum Current Capabilities register so that it matches board design. The preset values can be modified only if the Capabilities Write Enable (CAPWREN) bit is set to 1 in SDMMC_CACR.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	MAXCUR18V[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

	MAXCUR33V[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 23:16 – MAXCUR18V[7:0] Maximum Current for 1.8V
This field indicates the maximum current capability for 1.8V voltage. This value is meaningful only if V18VSUP is set to 1 in SDMMC_CA0R. Reading MAXCUR18V at 0 means that the user must get information via another method.
$\mathrm{Imax}_{\mathrm{mA}} = 4 \times \mathrm{MAXCURR18}V$

Bits 15:8 – MAXCUR30V[7:0] Maximum Current for 3.0V
This field indicates the maximum current capability for 3.0V voltage. This value is meaningful only if V30VSUP is set to 1 in SDMMC_CA0R. Reading MAXCUR30V at 0 means that the user must get information via another method.
$\mathrm{Imax}_{\mathrm{mA}} = 4 \times \mathrm{MAXCURR30}V$

Bits 7:0 – MAXCUR33V[7:0] Maximum Current for 3.3V
This field indicates the maximum current capability for 3.3V voltage. This value is meaningful only if V33VSUP is set to 1 in SDMMC_CA0R. Reading MAXCUR33V at 0 means that the user must get information via another method.
$\mathrm{Imax}_{\mathrm{mA}} = 4 \times \mathrm{MAXCURR33}V$

76.13.38.SDMMC Force Event Register for Auto CMD Error Status

Name: SDMMC_FERACES
Offset: 0x50
Reset: –
Property: Write-only

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	CMDNI			ACMDIDX	ACMDEND	ACMDCRC	ACMDTEO	ACMD12NE
Access	W			W	W	W	W	W
Reset	–			–	–	–	–	–

Bit 7 – CMDNI Force Event for Command Not Issued by Auto CMD12 Error
For test purposes, the user can write this bit to 1 to raise the CMDNI status flag in SDMMC_ACESR.
Writing this bit to 0 has no effect.

Bit 4 – ACMDIDX Force Event for Auto CMD Index Error
For test purposes, the user can write this bit to 1 to raise the ACMDIDX status flag in SDMMC_ACESR.
Writing this bit to 0 has no effect.

Bit 3 – ACMDEND Force Event for Auto CMD End Bit Error
For test purposes, the user can write this bit to 1 to raise the ACMDEND status flag in SDMMC_ACESR.
Writing this bit to 0 has no effect.

Bit 2 – ACMDCRC Force Event for Auto CMD CRC Error
For test purposes, the user can write this bit to 1 to raise the ACMDCRC status flag in SDMMC_ACESR.
Writing this bit to 0 has no effect.

Bit 1 – ACMDTEO Force Event for Auto CMD Timeout Error
For test purposes, the user can write this bit to 1 to raise the ACMDTEO status flag in SDMMC_ACESR.
Writing this bit to 0 has no effect.

Bit 0 – ACMD12NE Force Event for Auto CMD12 Not Executed
For test purposes, the user can write this bit to 1 to raise the ACMD12NE status flag in SDMMC_ACESR.
Writing this bit to 0 has no effect.

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit 12 – BOOTAE Force Event for Boot Acknowledge Error
For test purposes, the user can write this bit to 1 to raise the BOOTAE status flag in SDMMC_EISTR.
Writing this bit to 0 has no effect.

Bit 9 – ADMA Force Event for ADMA Error
For test purposes, the user can write this bit to 1 to raise the ADMA status flag in SDMMC_EISTR.
Writing this bit to 0 has no effect.

Bit 8 – ACMD Force Event for Auto CMD Error
For test purposes, the user can write this bit to 1 to raise the ACMD status flag in SDMMC_EISTR.
Writing this bit to 0 has no effect.

Bit 7 – CURLIM Force Event for Current Limit Error
For test purposes, the user can write this bit to 1 to raise the CURLIM status flag in SDMMC_EISTR.
Writing this bit to 0 has no effect.

Bit 6 – DATEND Force Event for Data End Bit Error
For test purposes, the user can write this bit to 1 to raise the DATEND status flag in SDMMC_EISTR.
Writing this bit to 0 has no effect.

Bit 5 – DATCRC Force Event for Data CRC error
For test purposes, the user can write this bit to 1 to raise the DATCRC status flag in SDMMC_EISTR.
Writing this bit to 0 has no effect.

Bit 4 – DATTEO Force Event for Data Timeout error
For test purposes, the user can write this bit to 1 to raise the DATTEO status flag in SDMMC_EISTR.
Writing this bit to 0 has no effect.

Bit 3 – CMDIDX Force Event for Command Index Error
For test purposes, the user can write this bit to 1 to raise the CMDIDX status flag in SDMMC_EISTR.
Writing this bit to 0 has no effect.

Bit 2 – CMDEND Force Event for Command End Bit Error
For test purposes, the user can write this bit to 1 to raise the CDMEND status flag in SDMMC_EISTR.
Writing this bit to 0 has no effect.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 1 – CMDCRC Force Event for Command CRC Error
For test purposes, the user can write this bit to 1 to raise the CMDCRC status flag in SDMMC_EISTR.
Writing this bit to 0 has no effect.

Bit 0 – CMDTEO Force Event for Command Timeout Error
For test purposes, the user can write this bit to 1 to raise the CMDTEO status flag in SDMMC_EISTR.
Writing this bit to 0 has no effect.

76.13.40.SDMMC ADMA Error Status Register

Name: SDMMC_AESR
Offset: 0x54
Reset: 0x00
Property: Read-only

Bit	7	6	5	4	3	2	1	0
						LMIS	ERRST[1:0]	
Access						R	R	R
Reset						0	0	0

Bit 2 – LMIS ADMA Length Mismatch Error
This error occurs in the following two cases:
– While Block Count Enable (BCEN) is being set, the total data length specified by the Descriptor table is different from that specified by the Block Count (BLKCNT) and Transfer Block Size (BLKSIZE).
– The total data length cannot be divided by the Transfer Block Size (BLKSIZE).

Value	Description
0	No error
1	Error

Bits 1:0 – ERRST[1:0] ADMA Error State
This field indicates the state of ADMA when an error has occurred during an ADMA data transfer. This field never reads 2 because ADMA never stops in this state.

Value	Name	Description
0	STOP	(Stop DMA) SDMMC_ASAR points to the descriptor following the error descriptor
1	FDS	(Fetch Descriptor) SDMMC_ASAR points to the error descriptor
2	–	(Not used)
3	TFR	(Transfer Data) SDMMC_ASAR points to the descriptor following the error descriptor

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.41.SDMMC ADMA System Address Register 0

Name: SDMMC_ASAR0
Offset: 0x58
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
	ADMASA[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	23	22	21	20	19	18	17	16
	ADMASA[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	ADMASA[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	ADMASA[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – ADMASA[31:0] ADMA System Address

This field holds the byte address of the executing command of the descriptor table. The 32-bit address descriptor uses SDMMC_ASAR. At the start of ADMA, the user must set the start address of the descriptor table. The ADMA increments this register address, which points to the next Descriptor line to be fetched.

When the ADMA Error (ADMA) status flag rises, this field holds a valid descriptor address depending on the ADMA Error State (ERRST). The user must program Descriptor Table on 32-bit boundary and set 32-bit boundary address to this register. ADMA2 ignores the lower 2 bits of this register and assumes it to be 0.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.42.SDMMC Preset Value Register

Name: SDMMC_PVRx
Offset: 0x60 + x*0x02 [x=0..7]
Reset: 0x0000
Property: Read/Write

One of the Preset Value registers is effective based on the selected bus speed mode. The table below defines the conditions to select one of the SDMMC_PVRs.

Table 76.5. Preset Value Register Select Condition

Selected Bus Speed Mode	VS18EN (SDMMC_HC2R)	HSEN (SDMMC_HC1R)	UHSMS (SDMMC_HC2R)
Default Speed	0	0	don't care
High Speed	0	1	don't care
SDR12	1	don't care	0
SDR25	1	don't care	1
SDR50	1	don't care	2
SDR104/HS200	1	don't care	3
DDR50	1	don't care	4
Reserved	1	don't care	Other values

The table below shows the effective Preset Value Register according to the Selected Bus Speed mode.

Table 76.6. Preset Value Registers

SDMMC_PVRx	Selected Bus Speed Mode	Signal Voltage
SDMMC_PVR0	Initialization	3.3V
SDMMC_PVR1	Default Speed	3.3V
SDMMC_PVR2	High Speed	3.3V
SDMMC_PVR3	SDR12	1.8V
SDMMC_PVR4	SDR25	1.8V
SDMMC_PVR5	SDR50	1.8V
SDMMC_PVR6	SDR104/HS200	1.8V
SDMMC_PVR7	DDR50	1.8V

When Preset Value Enable (PVALEN) in SDMMC_HC2R is set to 1, Driver Strength Select (DRVSEL) in SDMMC_HC2R and SDCLK Frequency Select (SDLCKFSEL) and Clock Generator Select (CLKGSEL) in SDMMC_CCR are automatically set based on the Selected Bus Speed mode. This means that the user does not need to set these fields when preset is enabled. A Preset Value Register for Initialization (SDMMC_PVR0) is not selected by Bus Speed mode. Before starting the initialization sequence, the user needs to set a clock preset value to SDCLKFSEL in SDMMC_CCR.PVALEN can be set to 1 after the initialization is completed.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit	15	14	13	12	11	10	9	8
	DRVSEL[1:0]					CLKGSEL	SDCLKFSEL[9:8]	
Access	R/W	R/W				R/W	R/W	R/W
Reset	0	0				0	0	0

					HDATLL[3:0]			
Access					R	R	R	R
Reset					–	–	–	–

Bits 3:0 – HDATLL[3:0] DAT[7:4] High Line Level
This status is used to check the DAT[7:4] line level to recover from errors, and for debugging.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.46.SDMMC e.MMC Control 1 Register

Name: SDMMC_MC1R
Offset: 0x204
Reset: 0x00
Property: Read/Write

Bit	7	6	5	4	3	2	1	0
	FCD	RSTN	BOOTA	OPD	DDR		CMDTYP[1:0]	
Access	R/W	R/W	R/W	R/W	R/W		R/W	R/W
Reset	0	0	0	0	0		0	0

Bit 7 – FCD e.MMC Force Card Detect
When using e.MMC, the user can set this bit to 1 to bypass the card detection procedure using the SDMMC_CD signal.
0 (DISABLED): e.MMC Forced Card Detect is disabled. The SDMMC_CD signal is used and debounce timing is applied.
1 (ENABLED): e.MMC Forced Card Detect is enabled.

Bit 6 – RSTN e.MMC Reset Signal
This bit controls the e.MMC reset signal.

Value	Description
0	Reset signal is inactive.
1	Reset signal is active.

Bit 5 – BOOTA e.MMC Boot Acknowledge Enable
This bit must be set according to the value of BOOT_ACK in the Extended CSD Register (see "Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51").
When this bit is set to 1, the SDMMC waits for boot acknowledge pattern from the e.MMC before receiving boot data.
If the boot acknowledge pattern is wrong, the BOOTAE status flag rises in SDMMC_EISTR if BOOTAE is set in SDMMC_EISTER. An interrupt is generated if BOOTAE is set in SDMMC_EISIER.
If the no boot acknowledge pattern is received, the DATTEO status flag rises in SDMMC_EISTR if DATTEO is set in SDMMC_EISTER. An interrupt is generated if DATTEO is set in SDMMC_EISIER.

Bit 4 – OPD e.MMC Open Drain Mode
This bit sets the command line in open drain.

Value	Description
0	The command line is in push-pull.
1	The command line is in open drain.

Bit 3 – DDR e.MMC HSDDR Mode
This bit selects the High Speed DDR mode.
The clock divider (DIV) in SDMMC_CCR must be set to a value different from 0 when DDR is 1.

Value	Description
0	High Speed DDR is not selected.
1	High Speed DDR is selected.

Bits 1:0 – CMDTYP[1:0] e.MMC Command Type

Value	Name	Description
0	NORMAL	The command is not an e.MMC specific command.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
1	WAITIRQ	This bit must be set to 1 when the e.MMC is in Interrupt mode (CMD40). See “Interrupt Mode” in the “Embedded MultiMedia Card (e.MMC) Electrical Standard 4.51” .
2	STREAM	This bit must be set to 1 in the case of Stream Read(CMD11) or Stream Write (CMD20). Only effective for e.MMC up to revision 4.41.
3	BOOT	Starts a Boot Operation mode at the next write to SDMMC_CR. Boot data are read directly from e.MMC device.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.47.SDMMC e.MMC Control 2 Register

Name: SDMMC_MC2R
Offset: 0x205
Reset: –
Property: Write-only

Bit	7	6	5	4	3	2	1	0
							ABOOT	SRESP
Access							W	W
Reset							–	–

Bit 1 – ABOOT e.MMC Abort Boot
This bit is used to exit from Boot mode. Writing this bit to 1 exits the Boot Operation mode. Writing 0 is ignored.

Bit 0 – SRESP e.MMC Abort Wait IRQ
This bit is used to exit from the Interrupt mode. When this bit is written to 1, the SDMMC sends the CMD40 response automatically. This brings the e.MMC from Interrupt mode to the standard Data Transfer mode. Writing this bit to 0 is ignored.
This bit is only effective when CMD_TYP in SDMMC_MC1R is set to WAITIRQ.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.48.SDMMC e.MMC Control 3 Register

Name: SDMMC_MC3R
Offset: 0x206
Reset: 0x00
Property: Read/Write

Bit	7	6	5	4	3	2	1	0
		DQSUPVAL[2:0]					ESMEN	HS400EN
Access		R/W	R/W	R/W			R/W	R/W
Reset		0	0	0			0	0

Bits 6:4 – DQSUPVAL[2:0] DQS Delay Update Timer Value
0: DQS delay update is performed each time a command is sent to the device.
n: DQS delay update is performed before sending the command only if a timer delay is elapsed. The timer delay t is defined as follows:
$t = \left(2^{n+1} - 1\right) \times t_{SLCK}$

Bit 1 – ESMEN Enhanced Strobe Mode Enable
This field is used to enable the Enhanced Strobe Mode. User must ensure that this mode is supported by the e.MMC device (Only devices compliant with the Embedded Multimedia Card (e.MMC) Electrical Standard 5.1 and further support this mode).
0 (DISABLED): Enhanced Strobe mode is disabled.
1 (ENABLED): Enhanced Strobe mode is enabled.

Bit 0 – HS400EN HS400 Mode Enable
This field is used to select the e.MMC HS400 mode.
0 (DISABLED): HS400 mode is disabled.
1 (ENABLED): HS400 mode is enabled.
If Preset Value Enable is set to 1, SDMMC sets SDCLK Frequency Select (SDCLKFSEL), Clock Generator Select (CLKGSEL) in SDMMC_CCR and Driver Strength Select (DRVSEL) according to SDMMC_PVR. In this case, SDMMC_EPVR8 register is selected by this bit. The user needs to reset SD Clock Enable (SDCLKEN) before changing this field to avoid generating a clock glitch. After setting this field, the user sets SDCLKEN to 1 again.

Bits 15:12 – DFQOS[3:0] Descriptor Fetch QOS
This field defines the QOS value of ADMA AHB access when fetching descriptor. For all other accesses, the QOS is set to 0.

Bits 9:8 – BUFM[1:0] AHB Bufferable Mode
This field defines if last access of data transfer is bufferable or not.

Value	Name	Description
0	NEVER	All SDMA/ADMA AHB accesses are not bufferable.
1	ALWAYS	All SDMA/ADMA AHB accesses are bufferable.
2	BLOCK	All SDMA/ADMA AHB accesses are bufferable except the last access of a data block.
3	TRANSFER	All SDMA/ADMA AHB accesses are bufferable except the last access of a data transfer.

Bits 1:0 – BMAX[1:0] AHB Maximum Burst
This field selects the maximum burst size in case of DMA transfer.

Value	Name	Description
0	INCR16	The maximum burst size is INCR16.
1	INCR8	The maximum burst size is INCR8.
2	INCR4	The maximum burst size is INCR4.
3	SINGLE	Only SINGLE transfers are performed.

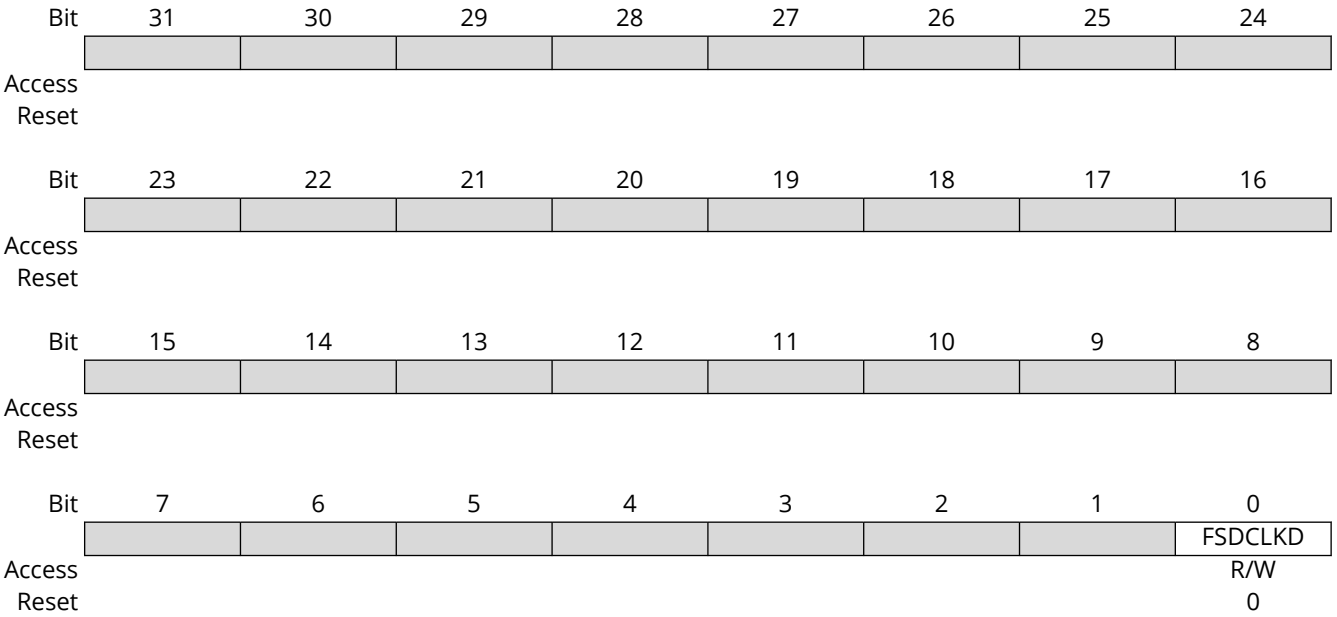
76.13.51.SDMMC Clock Control 2 Register

Name: SDMMC_CC2R
Offset: 0x20C
Reset: 0x00000000
Property: Read/Write



Bit 0 – FSDCLKD Force SDCLK Disabled

The user can choose to maintain the SDCLK during 8 SDCLK cycles after the end bit of the last data block in case of a read transaction, or after the end bit of the CRC status in case of a write transaction.

Value	Description
0	The SDCLK is forced and it cannot be stopped immediately after the transaction.
1	The SDCLK is not forced and it can be stopped immediately after the transaction.

76.13.52.SDMMC Retuning Control 1 Register

Name: SDMMC_RTC1R
Offset: 0x210
Reset: 0x00
Property: Read/Write

Bit	7	6	5	4	3	2	1	0
								TMREN
Access								R/W
Reset								0

Bit 0 – TMREN Retuning Timer Enable
Enable the retuning timer.
0 (DISABLED): The retuning timer is disabled.
1 (ENABLED): The retuning timer is enabled.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.53.SDMMC Retuning Control 2 Register

Name: SDMMC_RTC2R
Offset: 0x211
Reset: –
Property: Write-only

Bit	7	6	5	4	3	2	1	0
								RLD
Access								W
Reset								–

Bit 0 – RLD Retuning Timer Reload
This bit is only efficient if the Retuning timer is enabled (SDMMC_RTC1R.TMREN set to 1). Once the Timer Counter Value (TCVAL) is set to a nonzero value in SDMMC_RTCVR, setting this bit to 1 starts the timer count. The retuning timer count restarts each time this bit is written to 1.
Writing this bit to 0 has no effect.

© 2025 Microchip Technology Inc. and its subsidiaries

76.13.54.SDMMC Retuning Counter Value Register

Name: SDMMC_RTCVR
Offset: 0x214
Reset: 0x00000000
Property: Read/Write

Bits 31:28 – CALPBP[3:0] Calibration P Bypass Value
Calibration code applied for the p-channel transistors when BPEN is set to 1. This field is ignored if BPEN is 0.

Bits 27:24 – CALP[3:0] Calibration P Status
Calibration code for the p-channel transistors to match the required output impedance.

Bits 23:20 – CALNBP[3:0] Calibration N Bypass Value
Calibration code applied for the n-channel transistors when BPEN is set to 1. This field is ignored if BPEN is 0.

Bits 19:16 – CALN[3:0] Calibration N Status
Calibration code for the n-channel transistors to match the required output impedance.

Bits 15:8 – CNTVAL[7:0] Calibration Counter Value
Defines the number of XXXX cycles (divided by 4) required to cover the I/O calibration cell startup time.

$$\mathrm{CNTVAL}_{\mathrm{Minimum}} = \frac{t_{\mathrm{STARTUP}}}{4 \times t_{\mathrm{HCLOCK}}}$$

$t_{STARTUP}$ = 2 µs

Bit 6 – BPEN Calibration Bypass Enabled

Value	Description
0	Calibration bypass is not enabled.
1	Calibration bypass is enabled. CALPBP and CALNBP codes are applied to the calibration cell.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 5 – TUNDIS Calibration During Tuning Disabled

Value	Description
0	Calibration is launched before each tuning.
1	Calibration is not launched at tuning.

Bit 4 – ALWYSON Calibration Analog Always ON

Value	Description
0	Calibration analog is shut down after each calibration.
1	Calibration analog remains powered after calibration.

Bits 3:1 – CLKDIV[2:0] Calibration Clock Division
The clock applied to the calibration cell is divided by (CLKDIV + 1)*2.

Bit 0 – EN PADs Calibration Enable

Value	Description
0	SDMMC I/O calibration disabled.
1	SDMMC I/O calibration enabled.

76.13.63.SDMMC Extended Preset Value Register 8

Name: SDMMC_EPVR8
Offset: 0x244
Reset: 0x0000
Property: Read/Write

The Preset Value register 8 is effective based on the selected bus speed mode. The table below defines the conditions to select SDMMC_EPVR8.

Table 76.7. Preset Value Register Select Condition

Selected Bus Speed Mode	HS400EN (SDMMC_MC3R)
HS400	1

When Preset Value Enable (PVALEN) in SDMMC_HC2R is set to 1, SDCLK Frequency Select (SDLCKFSEL) and Clock Generator Select (CLKGSEL) in SDMMC_CCR, and Driver Strength Select (DRVSEL) in SDMMC_HC2R are automatically set based on the selected bus speed mode. This means that the user does not need to set these fields when preset is enabled. Before starting the initialization sequence, the user needs to set a clock preset value to SDMMC_CCR.SDCLKFSEL. Bit PVALEN can be set to 1 after the initialization is completed.

Bit	15	14	13	12	11	10	9	8
	DRVSEL[1:0]					CLKGSEL	SDCLKFSEL[9:8]	
Access	R/W	R/W				R/W	R/W	R/W

77. Controller Area Network (MCAN)

77.1. Description

The Controller Area Network (MCAN) performs communication according to ISO 11898-1:2015 and to Bosch CAN FD specification. Additional transceiver hardware is required for connection to the physical layer.

All functions concerning the handling of messages are implemented by the Rx Handler and the Tx Handler. The Rx Handler manages message acceptance filtering, the transfer of received messages from the CAN core to the Message RAM, as well as providing receive message status information. The Tx Handler is responsible for the transfer of transmit messages from the Message RAM to the CAN core, as well as providing transmit status information.

Acceptance filtering is implemented by a combination of up to 128 filter elements, where each element can be configured as a range, as a bit mask, or as a dedicated ID filter.

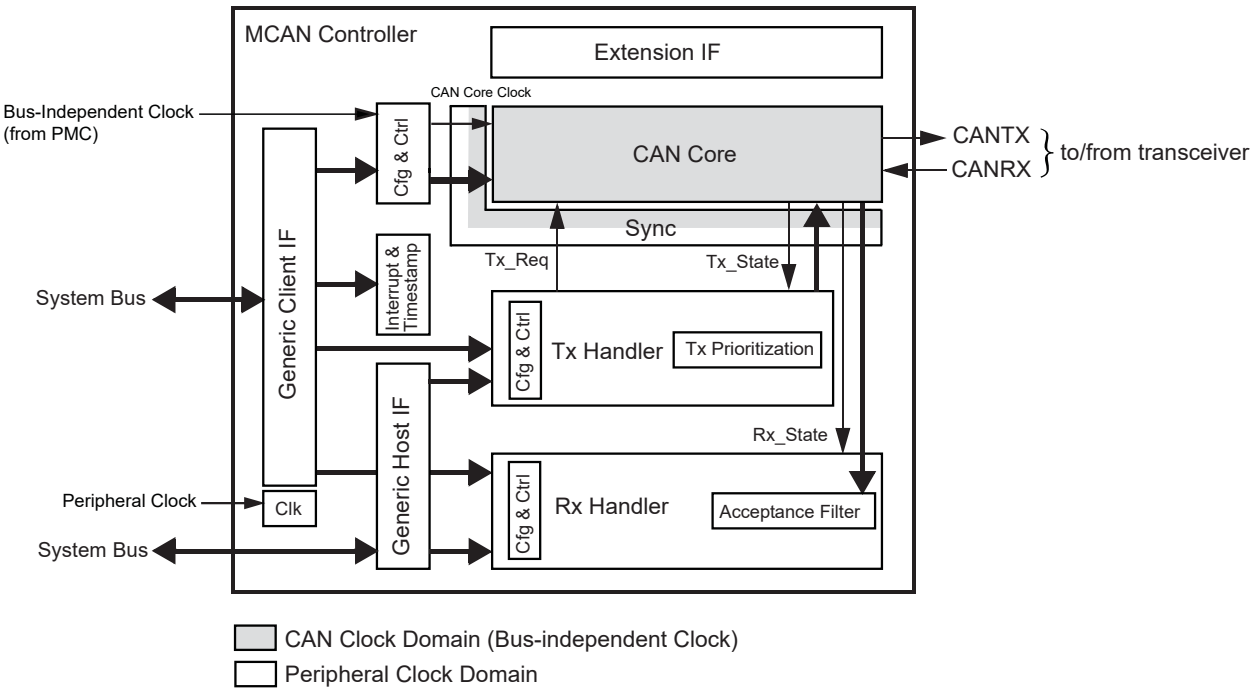
77.2. Embedded Characteristics

- Compliant with CAN Protocol Version 2.0 Part A, B and ISO 11898-1
- CAN FD with up to 64 Data Bytes Supported
- CAN Error Logging
- AUTOSAR Optimized
- SAE J1939 Optimized
- Improved Acceptance Filtering
- Two Configurable Receive FIFOs
- Separate Signalling on Reception of High Priority Messages
- Up to 64 Dedicated Receive Buffers
- Up to 32 Dedicated Transmit Buffers
- Configurable Transmit FIFO
- Configurable Transmit Queue
- Configurable Transmit Event FIFO
- Direct Message RAM Access for Processor
- Multiple MCANs May Share the Same Message RAM
- Programmable Loop-back Test Mode
- Maskable Module Interrupts
- Support for Asynchronous CAN and System Bus Clocks
- Power-down Support
- Debug on CAN Support

© 2025 Microchip Technology Inc. and its subsidiaries

77.3. Block Diagram

Figure 77.1. MCAN Block Diagram



Note: Refer to section "Power Management Controller (PMC)" for details about the bus-independent clock (GCLK).

77.4. Product Dependencies

77.4.1. I/O Lines

The pins used to interface to the compliant external devices can be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the CAN pins to their peripheral functions.

77.4.2. Power Management

The MCAN can be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the MCAN clock.

In order to achieve a stable function of the MCAN, the system bus clock must always be faster than or equal to the CAN clock.

It is recommended to use the CAN clock at frequencies of 20, 40 or 80 MHz. To achieve these frequencies, PMC GCLK must select the UPLLCK (480 MHz) as source clock and divide by 24,12, or 6. GCLK allows the system bus and processor clock to be modified without affecting the bit rate communication.

77.4.3. Interrupt Sources

The two MCAN interrupt lines (MCAN_INT0, MCAN_INT1) are connected on internal sources of the Interrupt Controller.

Using the MCAN interrupts requires the Interrupt Controller to be programmed first.

Interrupt sources can be routed either to MCAN_INT0 or to MCAN_INT1. By default, all interrupt sources are routed to interrupt line MCAN_INT0/1. By programming MCAN_ILE.EINT0 and MCAN_ILE.EINT1, the interrupt sources can be enabled or disabled separately.

© 2025 Microchip Technology Inc. and its subsidiaries

77.4.4. Address Configuration

The LSBs [bits 15:2] for each section of the CAN Message RAM are configured in the respective buffer configuration registers as detailed in Message RAM.

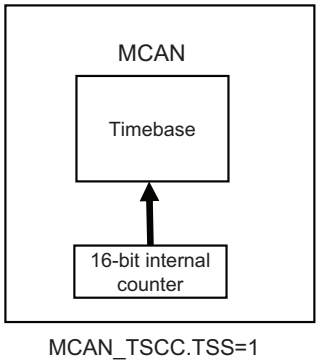
The MSBs [bits 31:16] of the CAN Message RAM for CAN0 and CAN1 are configured in SFR CAN SRAM Selection register (SFR_CAN_SRAM_SEL).

77.4.5. Timestamping

77.4.5.1. Internal 16-bit Timestamp Generation

Set MCAN_TSCC.TSS to 1 to use an internal 16-bit timestamp. See the following figure.

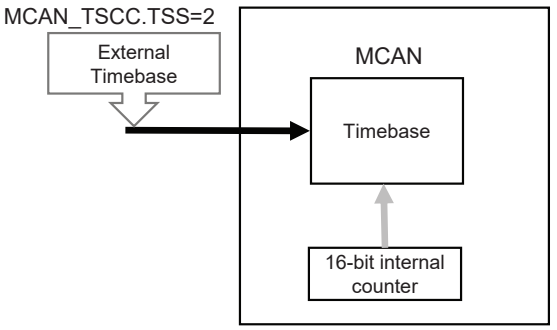
Figure 77.2. 16-Bit Timestamping with Internal Counter



77.4.5.2. External 16-bit Timestamp Generation

An external timebase is provided by TSU when MCAN_TSCC.TSS is set to 2. See the following figure.

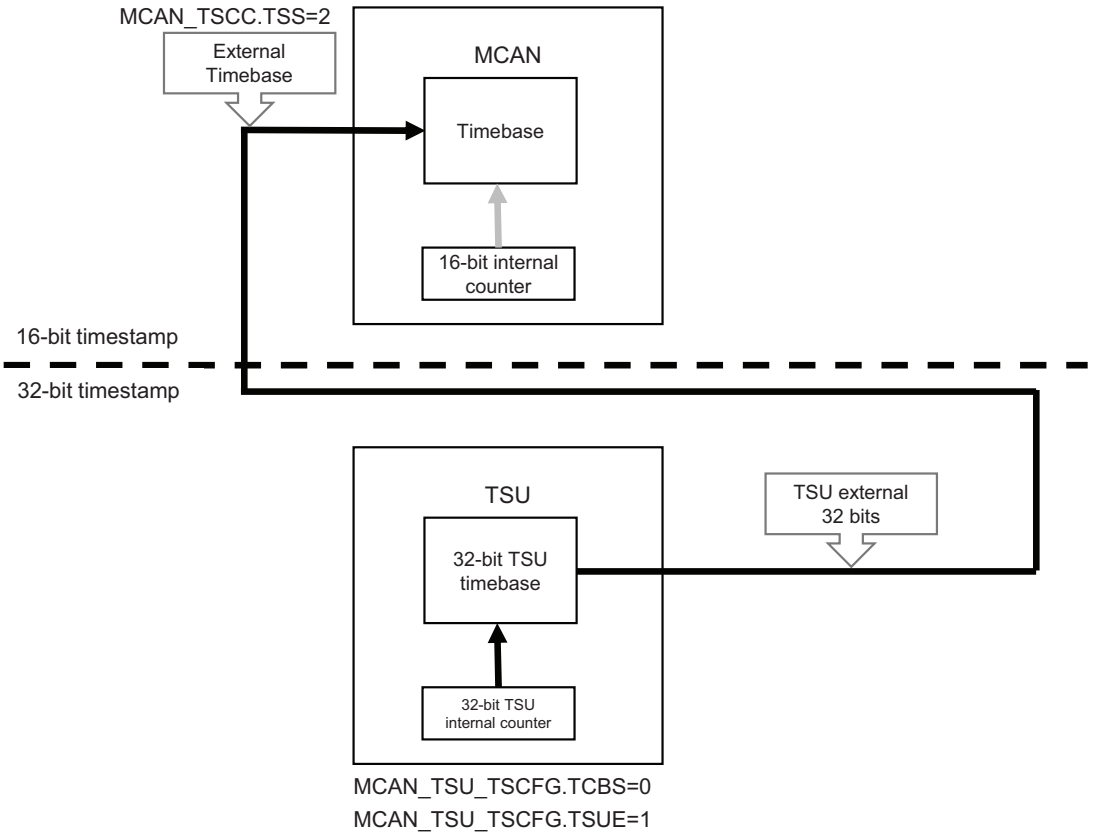
Figure 77.3. 16-Bit Timestamping with External Timebase



Timestamping uses the value of the TSU counter. In this case, both the register in MCAN (external timebase) and the register in TSU must be programmed to configure the counter. See the following figure.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 77.4. 16-Bit and 32-Bit Timestamping with External TSU



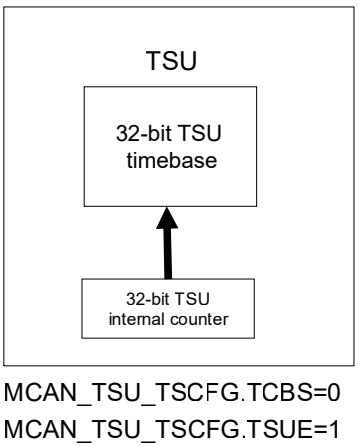
77.4.5.3. Internal Only 32-bit Timestamp Generation

To select a 32-bit TSU internal timebase for timestamping, set MCAN_TSCC.TSS to 2 and MCAN_TSU_TSCFG.TCBS to 0.

Each TSU provides the timebase of the corresponding MCAN and must be enabled by setting MCAN_TSU_TSCFG.TSUE to 1.

The timestamp values are stored in the MCAN_TSU_TS registers available in the TSU.

Figure 77.5. 32-bit Timestamping with Internal TSU Counter



© 2025 Microchip Technology Inc. and its subsidiaries

77.5. Functional Description

77.5.1. Operating Modes

77.5.1.1. Software Initialization

Software initialization is started by setting bit MCAN_CCCR.INIT, either by software or by a hardware reset, when an uncorrected bit error was detected in the Message RAM, or by going Bus_Off. While MCAN_CCCR.INIT is set, message transfer from and to the CAN bus is stopped and the status of the CAN bus output CANTX is recessive (HIGH). The counters of the Error Management Logic EML are unchanged. Setting MCAN_CCCR.INIT does not change any configuration register. Resetting MCAN_CCCR.INIT finishes the software initialization. Afterwards the Bit Stream Processor BSP synchronizes itself to the data transfer on the CAN bus by waiting for the occurrence of a sequence of 11 consecutive recessive bits (≡ Bus_Idle) before it can take part in bus activities and start the message transfer.

Access to the MCAN configuration registers is only enabled when both bits MCAN_CCCR.INIT and MCAN_CCCR.CCE are set (protected write).

MCAN_CCCR.CCE can only be configured when MCAN_CCCR.INIT = '1'. MCAN_CCCR.CCE is automatically cleared when MCAN_CCCR.INIT = '0'.

The following registers are cleared when MCAN_CCCR.CCE = '1':

- High Priority Message Status (MCAN_HPMS)
- Receive FIFO 0 Status (MCAN_RXF0S)
- Receive FIFO 1 Status (MCAN_RXF1S)
- Transmit FIFO/Queue Status (MCAN_TXFQS)
- Transmit Buffer Request Pending (MCAN_TXBRP)
- Transmit Buffer Transmission Occurred (MCAN_TXBTO)
- Transmit Buffer Cancellation Finished (MCAN_TXBCF)
- Transmit Event FIFO Status (MCAN_TXEFS)

The Timeout Counter value MCAN_TOCV.TOC is loaded with the value configured by MCAN_TOCC.TOP when MCAN_CCCR.CCE = '1'.

In addition, the state machines of the Tx Handler and Rx Handler are held in idle state while MCAN_CCCR.CCE = '1'.

The following registers are only writeable while MCAN_CCCR.CCE = '0'

- Transmit Buffer Add Request (MCAN_TXBAR)
- Transmit Buffer Cancellation Request (MCAN_TXBCR)

MCAN_CCCR.TEST and MCAN_CCCR.MON can only be set when MCAN_CCCR.INIT = '1' and MCAN_CCCR.CCE = '1'. Both bits may be cleared at any time. MCAN_CCCR.DAR can only be configured when MCAN_CCCR.INIT = '1' and MCAN_CCCR.CCE = '1'.

77.5.1.2. Normal Operation

Once the MCAN is initialized and MCAN_CCCR.INIT is cleared, the MCAN synchronizes itself to the CAN bus and is ready for communication.

After passing the acceptance filtering, received messages including Message ID and DLC are stored into a dedicated Rx Buffer or into Rx FIFO 0 or Rx FIFO 1.

For messages to be transmitted, dedicated Tx Buffers and/or a Tx FIFO or a Tx Queue can be initialized or updated. Automated transmission on reception of remote frames is not implemented.

© 2025 Microchip Technology Inc. and its subsidiaries

77.5.1.3.CAN FD Operation

There are two variants in the CAN FD frame format, first the CAN FD frame without bit rate switching where the data field of a CAN frame may be longer than 8 bytes. The second variant is the CAN FD frame where control field, data field, and CRC field of a CAN frame are transmitted with a higher bit rate than the beginning and the end of the frame.

The previously reserved bit in CAN frames with 11-bit identifiers and the first previously reserved bit in CAN frames with 29-bit identifiers will now be decoded as FDF bit. FDF = recessive signifies a CAN FD frame, FDF = dominant signifies a Classic CAN frame. In a CAN FD frame, the two bits following FDF, res and BRS, decide whether the bit rate inside of this CAN FD frame is switched. A CAN FD bit rate switch is signified by res = dominant and BRS = recessive. The coding of res = recessive is reserved for future expansion of the protocol. In case the MCAN receives a frame with FDF = recessive and res = recessive, it will signal a Protocol Exception Event by setting bit MCAN_PSR.PXE. When Protocol Exception Handling is enabled (MCAN_CCCR.PXHD = 0), this causes the operation state to change from Receiver (MCAN_PSR.ACT = 2) to Integrating (MCAN_PSR.ACT = 00) at the next sample point. In case Protocol Exception Handling is disabled (MCAN_CCCR.PXHD = 1), the MCAN will treat a recessive res bit as an form error and will respond with an error frame.

CAN FD operation is enabled by programming CCCR.FDOE. In case CCCR.FDOE = '1', transmission and reception of CAN FD frames is enabled. Transmission and reception of Classic CAN frames is always possible. Whether a CAN FD frame or a Classic CAN frame is transmitted can be configured via bit FDF in the respective Tx Buffer element. With CCCR.FDOE = '0', received frames are interpreted as Classic CAN frames, which leads to the transmission of an error frame when receiving a CAN FD frame. When CAN FD operation is disabled, no CAN FD frames are transmitted even if bit FDF of a Tx Buffer element is set. CCCR.FDOE and CCCR.BRSE can only be changed while CCCR.INIT and CCCR.CCE are both set.

With MCAN_CCCR.FDOE = 0, the setting of bits FDF and BRS is ignored and frames are transmitted in Classic CAN format. With MCAN_CCCR.FDOE = 1 and MCAN_CCCR.BRSE = 0, only bit FDF of a Tx Buffer element is evaluated. With MCAN_CCCR.FDOE = 1 and MCAN_CCCR.BRSE = 1, transmission of CAN FD frames with bit rate switching is enabled. All Tx Buffer elements with bits FDF and BRS set are transmitted in CAN FD format with bit rate switching.

A mode change during CAN operation is only recommended under the following conditions:

- The failure rate in the CAN FD data phase is significant higher than in the CAN FD arbitration phase. In this case disable the CAN FD bit rate switching option for transmissions.
- During system start-up all nodes are transmitting according to ISO11898-1 until it is verified that they are able to communicate in CAN FD format. If this is true, all nodes switch to CAN FD operation.
- Wake-up messages in CAN Partial Networking have to be transmitted in Classic CAN format.
- End-of-line programming in case not all nodes are CAN FD-capable. Non-CAN FD nodes are held in Silent mode until programming has completed. Then all nodes revert to Classic CAN communication.

In the CAN FD format, the coding of the DLC differs from the standard CAN format. The DLC codes 0 to 8 have the same coding as in standard CAN, the codes 9 to 15, which in standard CAN all code a data field of 8 bytes, are coded according to the table below.

Table 77.1. Coding of DLC in CAN FD

DLC	9	10	11	12	13	14	15
Number of Data Bytes	12	16	20	24	32	48	64

In CAN FD frames, the bit timing will be switched inside the frame, after the BRS (Bit Rate Switch) bit, if this bit is recessive. Before the BRS bit, in the CAN FD arbitration phase, the nominal CAN bit timing is used as defined by the Nominal Bit Timing and Prescaler register (MCAN_NBTP). In the following CAN FD data phase, the data phase CAN bit timing is used as defined by the Data Bit

© 2025 Microchip Technology Inc. and its subsidiaries

Timing and Prescaler register (MCAN_DBTP). The bit timing reverts back from the data phase timing at the CRC delimiter or when an error is detected, whichever occurs first.

The maximum configurable bit rate in the CAN FD data phase depends on the CAN core clock frequency. Example: with a CAN clock frequency of 20 MHz and the shortest configurable bit time of 4 t_q, the bit rate in the data phase is 5 Mbit/s.

In both data frame formats, CAN FD and CAN FD with bit rate switching, the value of the bit ESI (Error Status Indicator) is determined by the transmitter's error state at the start of the transmission. If the transmitter is error passive, ESI is transmitted recessive, else it is transmitted dominant.

77.5.1.4.Transmitter Delay Compensation

During the data phase of a CAN FD transmission only one node is transmitting, all others are receivers. The length of the bus line has no impact. When transmitting via pin CANTX the protocol controller receives the transmitted data from its local CAN transceiver via pin CANRX. The received data is delayed by the transmitter delay. In case this delay is greater than TSEG1 (time segment before sample point), a bit error is detected. In order to enable a data phase bit time that is even shorter than the transmitter delay, the delay compensation is introduced. Without delay compensation, the bit rate in the data phase of a CAN FD frame is limited by the delay.

77.5.1.4.1.Description

The MCAN protocol unit has implemented a delay compensation mechanism to compensate the delay, thereby enabling transmission with higher bit rates during the CAN FD data phase independent of the delay of a specific CAN transceiver.

To check for bit errors during the data phase, the delayed transmit data is compared against the received data at the secondary sample point. If a bit error is detected, the transmitter will react to this bit error at the next following regular sample point. During arbitration phase the delay compensation is always disabled.

The transmitter delay compensation enables configurations where the data bit time is shorter than the transmitter delay, it is described in detail in the new ISO11898-1. It is enabled by setting bit MCAN_DBTP.TDC.

The received bit is compared against the transmitted bit at the SSP. The SSP position is defined as the sum of the measured delay from the MCAN's transmit output CANTX through the transceiver to the receive input CANRX plus the transmitter delay compensation offset as configured by MCAN_TDCR.TDCO. The transmitter delay compensation offset is used to adjust the position of the SSP inside the received bit (for example, half of the bit time in the data phase). The position of the secondary sample point is rounded down to the next integer number of CAN core clock periods.

MCAN_PSR.TDCV shows the actual transmitter delay compensation value. MCAN_PSR.TDCV is cleared when MCAN_CCCR.INIT is set and is updated at each transmission of an FD frame while MCAN_DBTP.TDC is set.

The following boundary conditions have to be considered for the delay compensation implemented in the MCAN:

- The sum of the measured delay from CANTX to CANRX and the configured delay compensation offset MCAN_TDCR.TDCO has to be less than 6 bit times in the data phase.
- The sum of the measured delay from CANTX to CANRX and the configured delay compensation offset MCAN_TDCR.TDCO has to be less or equal 127 CAN core clock periods. In case this sum exceeds 127 CAN core clock periods, the maximum value of 127 CAN core clock periods is used for delay compensation.
- The data phase ends at the sample point of the CRC delimiter, that stops checking of receive bits at the SSPs.

77.5.1.4.2.Transmitter Delay Measurement

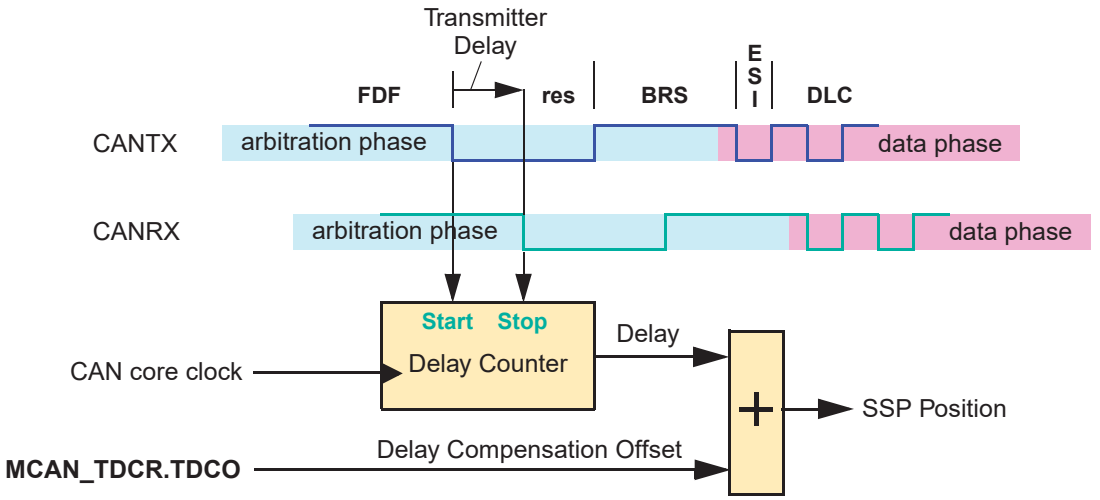
If transmitter delay compensation is enabled by programming MCAN_DBTP.TDC = '1', the measurement is started within each transmitted CAN FD frame at the falling edge of bit FDF to

© 2025 Microchip Technology Inc. and its subsidiaries

bit res. The measurement is stopped when this edge is seen at the receive input CANRX of the transmitter.

The resolution of this measurement is one mtq.

Figure 77.6. Transmitter Delay Measurement



To avoid that a dominant glitch inside the received FDF bit ends the delay compensation measurement before the falling edge of the received res bit, resulting in a to early SSP position, the use of a transmitter delay compensation filter window can be enabled by programming MCAN_TDCR.TDCF.

This defines a minimum value for the SSP position. Dominant edges on CANRX, that would result in an earlier SSP position are ignored for transmitter delay measurement. The measurement is stopped when the SSP position is at least MCAN_TDCR.TDCF AND CANRX is low.

77.5.1.5.Restricted Operation Mode

In Restricted Operation mode, the node is able to receive data and remote frames and to give acknowledge to valid frames, but it does not send data frames, remote frames, active error frames, or overload frames. In case of an error condition or overload condition, it does not send dominant bits, instead it waits for the occurrence of bus idle condition to resynchronize itself to the CAN communication. The error counters are not incremented. The processor can set the MCAN into Restricted Operation mode by setting bit MCAN_CCCR.ASM. The bit can only be set by the processor when both MCAN_CCCR.CCE and MCAN_CCCR.INIT are set to '1'. The bit can be reset by the processor at any time.

Restricted Operation mode is automatically entered when the Tx Handler was not able to read data from the Message RAM in time. To leave Restricted Operation mode, the processor has to reset MCAN_CCCR.ASM.

The Restricted Operation mode can be used in applications that adapt themselves to different CAN bit rates. In this case the application tests different bit rates and leaves the Restricted Operation mode after it has received a valid frame.

Note: The Restricted Operation Mode must not be combined with the Loop Back mode (internal or external).

77.5.1.6.Bus Monitoring Mode

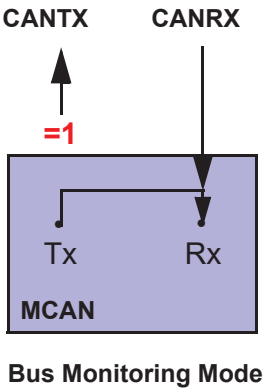
The MCAN is set in Bus Monitoring mode by setting MCAN_CCCR.MON. In Bus Monitoring mode (see ISO11898-1, 10.12 Bus monitoring), the MCAN is able to receive valid data frames and valid remote frames, but cannot start a transmission. In this mode, it sends only recessive bits on the CAN bus. If the MCAN is required to send a dominant bit (ACK bit, overload flag, active error flag), the bit is

© 2025 Microchip Technology Inc. and its subsidiaries

rerouted internally so that the MCAN monitors this dominant bit, although the CAN bus may remain in recessive state. In Bus Monitoring mode, the Tx Buffer Request Pending register (MCAN_TXBRP) is held in reset state.

The Bus Monitoring mode can be used to analyze the traffic on a CAN bus without affecting it by the transmission of dominant bits. The figure below shows the connection of signals CANTX and CANRX to the MCAN in Bus Monitoring mode.

Figure 77.7. Pin Control in Bus Monitoring Mode



77.5.1.7.Disabled Automatic Retransmission

According to the CAN Specification (see ISO11898-1, 6.3.3 Recovery Management), the MCAN provides means for automatic retransmission of frames that have lost arbitration or that have been disturbed by errors during transmission. By default automatic retransmission is enabled. To support time-triggered communication as described in ISO 11898-1, chapter 9.2, the automatic retransmission may be disabled via MCAN_CCCR.DAR.

77.5.1.7.1.Frame Transmission in DAR Mode

In DAR mode, all transmissions are automatically cancelled after they start on the CAN bus. A Tx Buffer's Tx Request Pending bit TXBRP.TRPx is reset after successful transmission, when a transmission has not yet been started at the point of cancellation, has been aborted due to lost arbitration, or when an error occurred during frame transmission.

- Successful transmission:
  - Corresponding Tx Buffer Transmission Occurred bit MCAN_TXBTO.TOx set
  - Corresponding Tx Buffer Cancellation Finished bit MCAN_TXBCF.CFx not set
- Successful transmission in spite of cancellation:
  - Corresponding Tx Buffer Transmission Occurred bit MCAN_TXBTO.TOx set
  - Corresponding Tx Buffer Cancellation Finished bit MCAN_TXBCF.CFx set
- Arbitration lost or frame transmission disturbed:
  - Corresponding Tx Buffer Transmission Occurred bit MCAN_TXBTO.TOx not set
  - Corresponding Tx Buffer Cancellation Finished bit MCAN_TXBCF.CFx set

In case of a successful frame transmission, and if storage of Tx events is enabled, a Tx Event FIFO element is written with Event Type ET = "10" (transmission in spite of cancellation).

77.5.1.8.Power-down (Sleep Mode)

The MCAN can be set into Power-down mode via bit MCAN_CCCR.CSR.

When all pending transmission requests have completed, the MCAN waits until bus idle state is detected. Then the MCAN sets MCAN_CCCR.INIT to prevent any further CAN transfers. Now the MCAN acknowledges that it is ready for power down by setting to one the bit MCAN_CCCR.CSA. In this state, before the clocks are switched off, further register accesses can be made. A write access

© 2025 Microchip Technology Inc. and its subsidiaries

to MCAN_CCCR.INIT will have no effect. Now the bus clock (peripheral clock) and the CAN core clock may be switched off.

To leave Power-down mode, the application has to turn on the MCAN clocks before clearing CC Control Register flag MCAN_CCCR.CSR. The MCAN will acknowledge this by clearing MCAN_CCCR.CSA. The application can then restart CAN communication by clearing the bit CCCR.INIT.

77.5.1.9.Test Modes

To enable write access to the MCAN Test register (MCAN_TEST) (see Section 7.6), bit MCAN_CCCR.TEST must be set. This allows the configuration of the test modes and test functions.

Four output functions are available for the CAN transmit pin CANTX by programming MCAN_TEST.TX. Additionally to its default function – the serial data output – it can drive the CAN Sample Point signal to monitor the MCAN's bit timing and it can drive constant dominant or recessive values. The actual value at pin CANRX can be read from MCAN_TEST.RX. Both functions can be used to check the CAN bus' physical layer.

Due to the synchronization mechanism between CAN clock and system bus clock domain, there may be a delay of several system bus clock periods between writing to MCAN_TEST.TX until the new configuration is visible at output pin CANTX. This applies also when reading input pin CANRX via MCAN_TEST.RX.

Note: Test modes should be used for production tests or self-test only. The software control for pin CANTX interferes with all CAN protocol functions. It is not recommended to use test modes for application.

77.5.1.9.1.External Loop Back Mode

The MCAN can be set in External Loop Back mode by setting the bit MCAN_TEST.LBCK. In Loop Back mode, the MCAN treats its own transmitted messages as received messages and stores them (if they pass acceptance filtering) into an Rx Buffer or an Rx FIFO. The figure below shows the connection of signals CANTX and CANRX to the MCAN in External Loop Back mode.

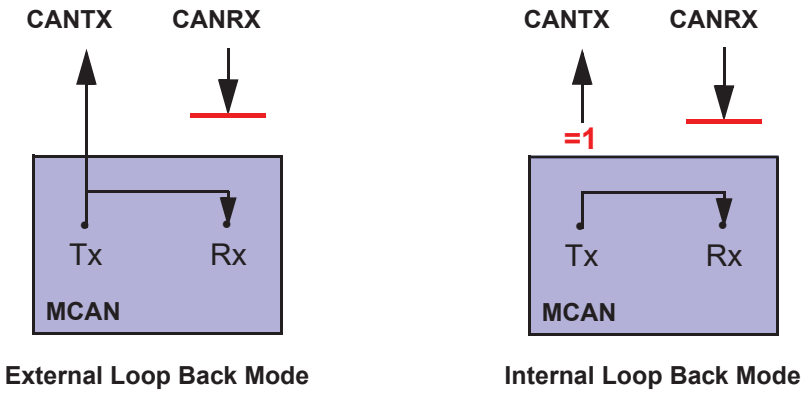
This mode is provided for hardware self-test. To be independent from external stimulation, the MCAN ignores acknowledge errors (recessive bit sampled in the acknowledge slot of a data/remote frame) in Loop Back mode. In this mode, the MCAN performs an internal feedback from its Tx output to its Rx input. The actual value of the CANRX input pin is disregarded by the MCAN. The transmitted messages can be monitored at the CANTX pin.

77.5.1.9.2.Internal Loop Back Mode

Internal Loop Back mode is entered by setting bits MCAN_TEST.LBCK and MCAN_CCCR.MON. This mode can be used for a "Hot Selftest", meaning the MCAN can be tested without affecting a running CAN system connected to the pins CANTX and CANRX. In this mode, pin CANRX is disconnected from the MCAN, and pin CANTX is held recessive. The figure below shows the connection of CANTX and CANRX to the MCAN when Internal Loop Back mode is enabled.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 77.8. Pin Control in Loop Back Modes



77.5.2. Timestamp Generation

- **Internal Timestamp Generation**

For internal timestamp generation, the MCAN supplies a 16-bit wrap-around counter. A prescaler (MCAN_TSCC.TCP) can be configured to clock the counter in multiples of CAN bit times (1...16). The counter is readable via MCAN_TSCV.TSC. A write access to the Timestamp Counter Value register (MCAN_TSCV) resets the counter to zero. When the timestamp counter wraps around, the interrupt flag MCAN_IR.TSW is set.

On start of frame (SOF) reception/transmission, the counter value is captured and stored in the timestamp section of an Rx Buffer/Rx FIFO (RXTS[15:0]) or Tx Event FIFO (TXTS[15:0]) element.

MCAN_TSCC.TSS can be used to capture the external 16-bit timebase vector input of the MCAN as timestamp instead of the internal 16-bit counter.

- **Timestamp Generation Using an External TSU**

A timestamping unit (TSU) for generation of 32-bit timestamps according to CiA 603 is connected to the MCAN TSU interface. External timestamping is enabled when MCAN_CCCR.UTSU = 1.

To filter for Sync messages, a Standard or Extended Filter element must be configured with the Sync message ID and bit SSYNC resp. ESYNC set to 1.

At the end of frame (EOF) reception/transmission, the timestamp is captured by the TSU. The number of the TSU Timestamp register which holds the captured timestamp is sent to the MCAN by a timestamp pointer (TSP) and stored in the related Rx Buffer/Rx FIFO element (R1B.RXTSP[2:0]) resp. Tx Event FIFO element (E1B.TXTSP[2:0]).

77.5.3. Timeout Counter

To signal timeout conditions for Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO, the MCAN supplies a 16-bit Timeout Counter. It operates as down-counter and uses the same prescaler controlled by TSCC.TCP as the Timestamp Counter. The Timeout Counter is configured via the Timeout Counter Configuration register (MCAN_TOCC). The actual counter value can be read from MCAN_TOCV.TOC. The Timeout Counter can only be started while MCAN_CCCR.INIT = '0'. It is stopped when MCAN_CCCR.INIT = '1', for example, when the MCAN enters Bus_Off state.

The operating mode is selected by MCAN_TOCC.TOS. When operating in Continuous mode, the counter starts when MCAN_CCCR.INIT is reset. A write to MCAN_TOCV presets the counter to the value configured by MCAN_TOCC.TOP and continues down-counting.

When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MCAN_TOCC.TOP. Down-counting is started when the first FIFO element is stored. Writing to MCAN_TOCV has no effect.

© 2025 Microchip Technology Inc. and its subsidiaries

When the counter reaches zero, interrupt flag MCAN_IR.TOO is set. In Continuous mode, the counter is immediately restarted at MCAN_TOCC.TOP.

Note: The clock signal for the Timeout Counter is derived from the CAN Core's sample point signal. Therefore the point in time where the Timeout Counter is decremented may vary due to the synchronization / re-synchronization mechanism of the CAN Core. If the bit rate switch feature in CAN FD is used, the timeout counter is clocked differently in arbitration and data field.

77.5.4. Rx Handling

The Rx Handler controls the acceptance filtering, the transfer of received messages to the Rx Buffers or to one of the two Rx FIFOs, as well as the Rx FIFO's Put and Get Indices.

77.5.4.1. Acceptance Filtering

The MCAN offers the possibility to configure two sets of acceptance filters, one for standard identifiers and one for extended identifiers. These filters can be assigned to an Rx Buffer or to Rx FIFO 0,1. For acceptance filtering each list of filters is executed from element #0 until the first matching element. Acceptance filtering stops at the first matching element. The following filter elements are not evaluated for this message.

The main features are:

- Each filter element can be configured as
  - range filter (from - to)
  - filter for one or two dedicated IDs
  - classic bit mask filter
- Each filter element is configurable for acceptance or rejection filtering
- Each filter element can be enabled / disabled individually
- Filters are checked sequentially, execution stops with the first matching filter element

Related configuration registers are:

- Global Filter Configuration (MCAN_GFC)
- Standard ID Filter Configuration (MCAN_SIDFC)
- Extended ID Filter Configuration (MCAN_XIDFC)
- Extended ID and Mask (MCAN_XIDAM)

Depending on the configuration of the filter element (SFEC/EFEC) a match triggers one of the following actions:

- Store received frame in FIFO 0 or FIFO 1
- Store received frame in Rx Buffer
- Store received frame in Rx Buffer and generate pulse at filter event pin
- Reject received frame
- Set High Priority Message interrupt flag (MCAN_IR.HPM)
- Set High Priority Message interrupt flag (MCAN_IR.HPM) and store received frame in FIFO 0 or FIFO 1

Acceptance filtering is started after the complete identifier has been received. After acceptance filtering has completed, and if a matching Rx Buffer or Rx FIFO has been found, the Message Handler starts writing the received message data in portions of 32 bit to the matching Rx Buffer or Rx FIFO. If the CAN protocol controller has detected an error condition (for example, CRC error), this message is discarded with the following impact on the effected Rx Buffer or Rx FIFO:

© 2025 Microchip Technology Inc. and its subsidiaries

- Rx Buffer
  New Data flag of matching Rx Buffer is not set, but Rx Buffer (partly) overwritten with received data. For error type, see MCAN_PSR.LEC and MCAN_PSR.DLEC.
- Rx FIFO
  Put index of matching Rx FIFO is not updated, but related Rx FIFO element (partly) overwritten with received data. For error type, see MCAN_PSR.LEC and MCAN_PSR.DLEC. In case the matching Rx FIFO is operated in Overwrite mode, the boundary conditions described in Rx FIFO Overwrite Mode have to be considered.

Note: When an accepted message is written to one of the two Rx FIFOs, or into an Rx Buffer, the unmodified received identifier is stored independent of the filter(s) used. The result of the acceptance filter process is strongly depending on the sequence of configured filter elements.

77.5.4.1.1.Range Filter

The filter matches for all received frames with Message IDs in the range defined by SF1ID/SF2ID resp. EF1ID/EF2ID.

There are two possibilities when range filtering is used together with extended frames:

- EFT = “00”: The Message ID of received frames is ANDed with MCAN_XIDAM before the range filter is applied.
- EFT = “11”: MCAN_XIDAM is not used for range filtering.

77.5.4.1.2.Filter for Specific IDs

A filter element can be configured to filter for one or two specific Message IDs. To filter for one specific Message ID, the filter element has to be configured with SF1ID = SF2ID resp. EF1ID = EF2ID.

77.5.4.1.3.Classic Bit Mask Filter

Classic bit mask filtering is intended to filter groups of Message IDs by masking single bits of a received Message ID. With classic bit mask filtering SF1ID/EF1ID is used as Message ID filter, while SF2ID/EF2ID is used as filter mask.

A zero bit at the filter mask will mask out the corresponding bit position of the configured ID filter, for example, the value of the received Message ID at that bit position is not relevant for acceptance filtering. Only those bits of the received Message ID where the corresponding mask bits are one are relevant for acceptance filtering.

In case all mask bits are one, a match occurs only when the received Message ID and the Message ID filter are identical. If all mask bits are zero, all Message IDs match.

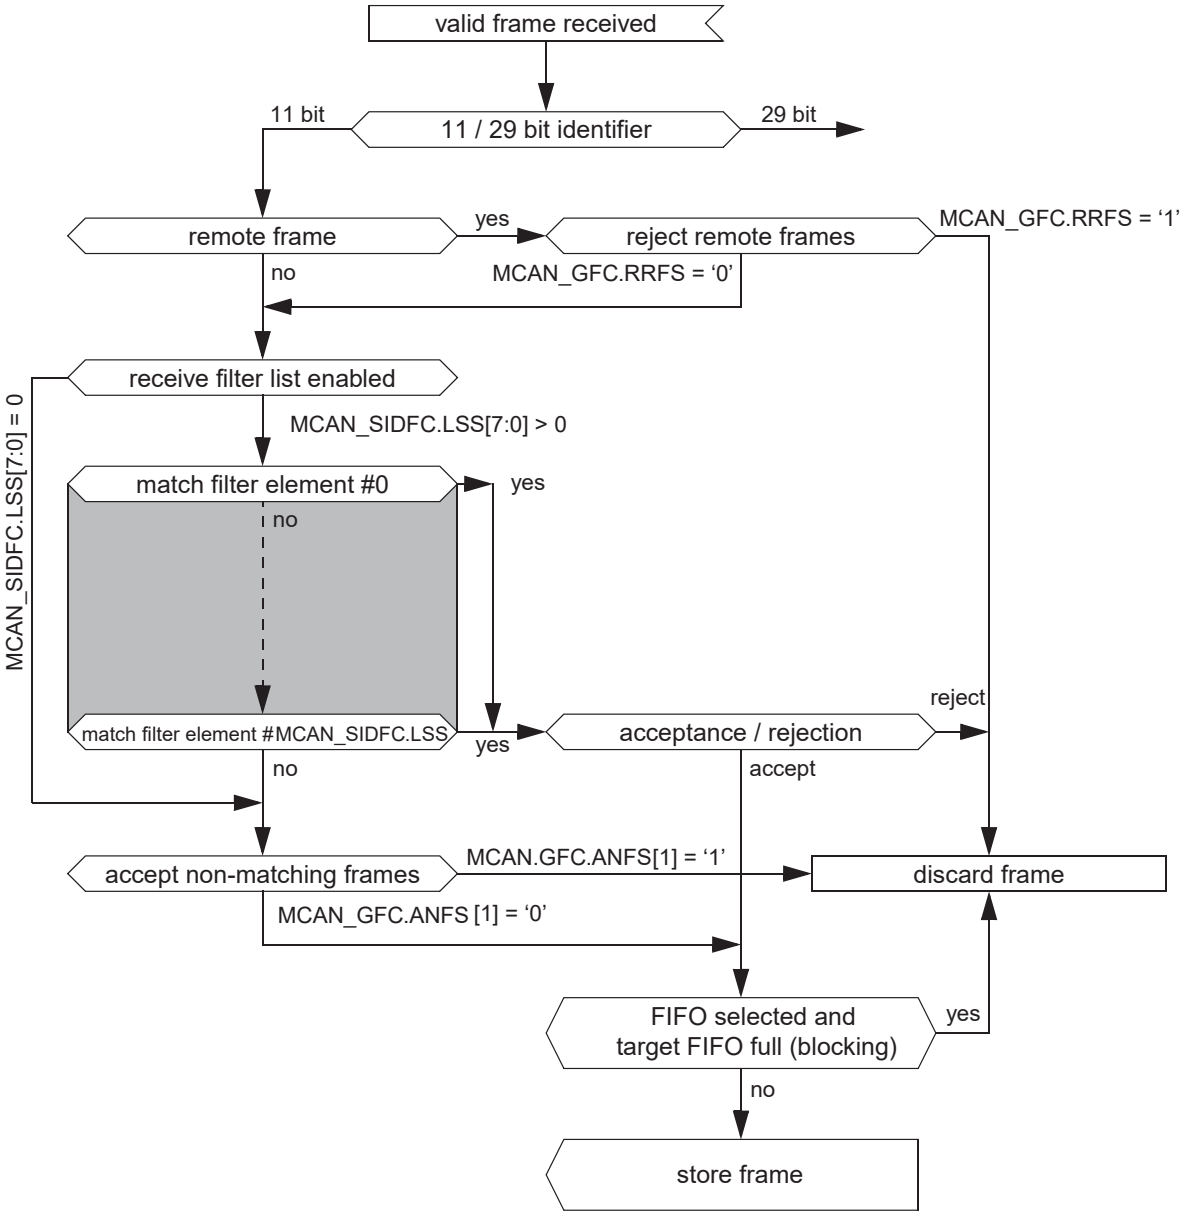
77.5.4.1.4.Standard Message ID Filtering

The figure below shows the flow for standard Message ID (11-bit Identifier) filtering. The Standard Message ID Filter element is described in Standard Message ID Filter Element.

Controlled by MCAN_GFC and MCAN_SIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 77.9. Standard Message ID Filter Path



Extended Message ID Filtering

The figure below shows the flow for extended Message ID (29-bit Identifier) filtering. The Extended Message ID Filter element is described in Extended Message ID Filter Element.

Controlled by MCAN_GFC and MCAN_XIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

MCAN_XIDAM is ANDed with the received identifier before the filter list is executed.

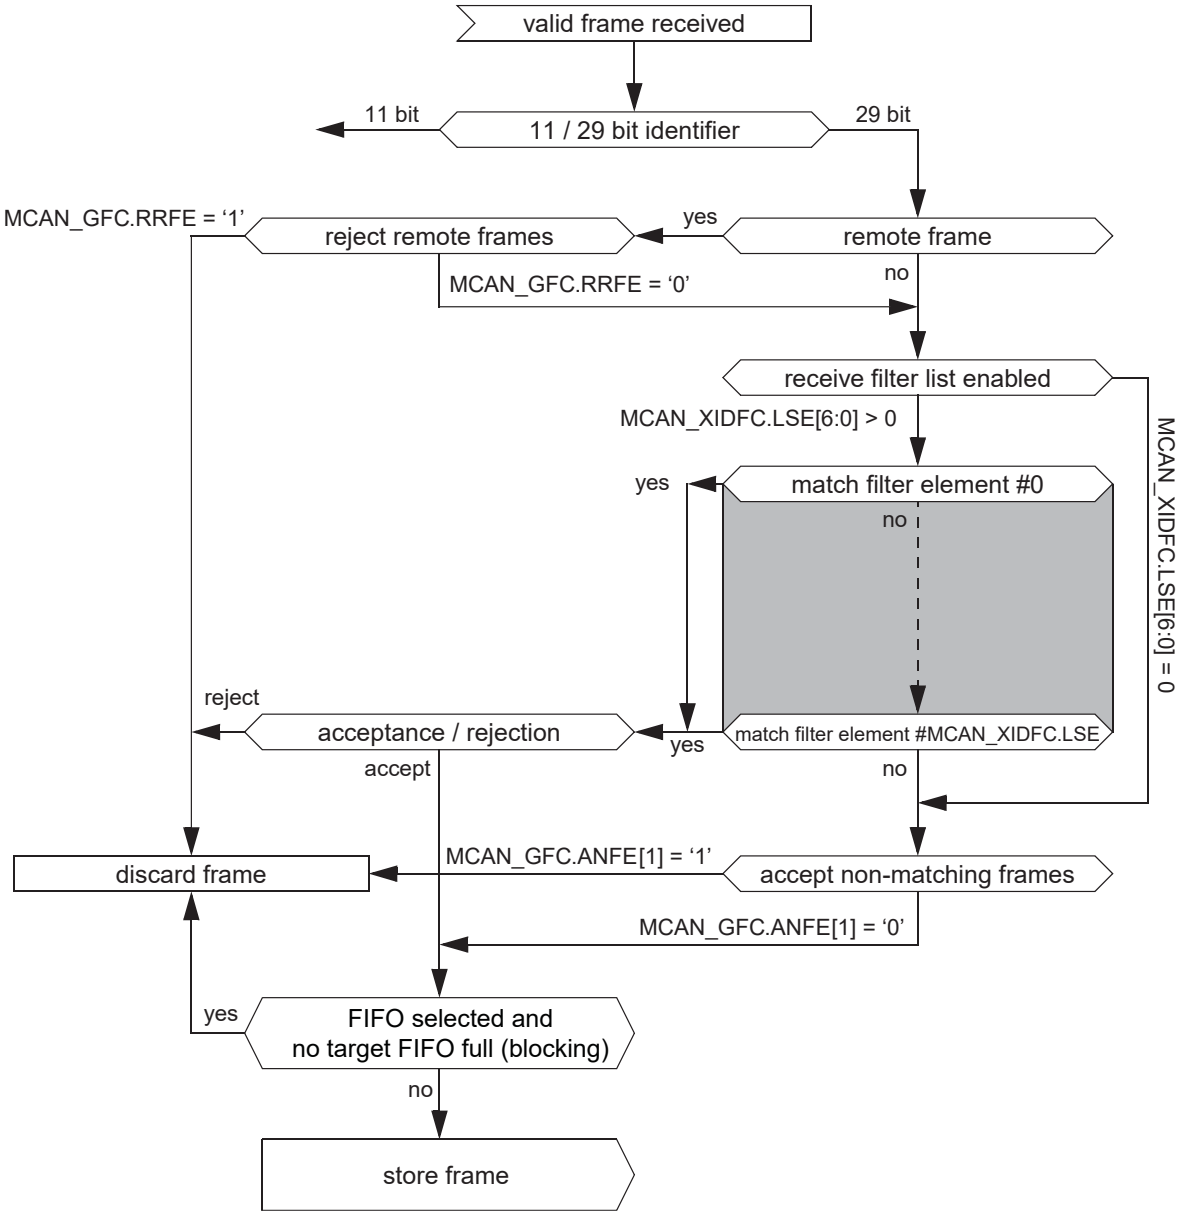
Figure 77.10. Extended Message ID Filter Path



77.5.4.2.Rx FIFOs

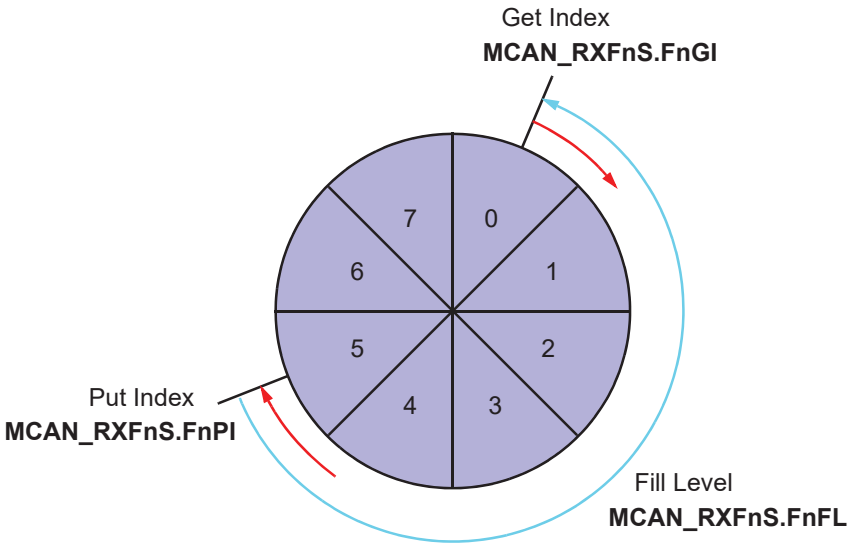
Rx FIFO 0 and Rx FIFO 1 can be configured to hold up to 64 elements each. Configuration of the two Rx FIFOs is done via the Rx FIFO 0 Configuration register (MCAN_RXF0C) and the Rx FIFO 1 Configuration register (MCAN_RXF1C).

Received messages that passed acceptance filtering are transferred to the Rx FIFO as configured by the matching filter element. For a description of the filter mechanisms available for Rx FIFO 0 and Rx FIFO 1, see Acceptance Filtering. The Rx FIFO element is described in Rx Buffer and FIFO Element.

To avoid an Rx FIFO overflow, the Rx FIFO watermark can be used. When the Rx FIFO fill level reaches the Rx FIFO watermark configured by MCAN_RXFnC.FnWM, interrupt flag MCAN_IR.RFnW is set. When the Rx FIFO Put Index reaches the Rx FIFO Get Index, an Rx FIFO Full condition is signalled by MCAN_RXFnS.FnF. In addition, the interrupt flag MCAN_IR.RFnF is set.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 77.11. Rx FIFO Status



When reading from an Rx FIFO, Rx FIFO Get Index MCAN_RXFnS.FnGI × FIFO Element Size has to be added to the corresponding Rx FIFO start address MCAN_RXFnC.FnSA.

Table 77.2. Rx Buffer / FIFO Element Size

MCAN_RXESC.RBDS[2:0] MCAN_RXESC.FnDS[2:0]	Data Field [bytes]	FIFO Element Size [RAM words]
0	8	4
1	12	5
2	16	6
3	20	7
4	24	8
5	32	10
6	48	14
7	64	18

77.5.4.2.1.Rx FIFO Blocking Mode

The Rx FIFO Blocking mode is configured by MCAN_RXFnC.FnOM = '0'. This is the default operating mode for the Rx FIFOs.

When an Rx FIFO full condition is reached (MCAN_RXFnS.FnPI = MCAN_RXFnS.FnGI), no further messages are written to the corresponding Rx FIFO until at least one message has been read out and the Rx FIFO Get Index has been incremented. An Rx FIFO full condition is signalled by MCAN_RXFnS.FnF = '1'. In addition, the interrupt flag MCAN_IR.RFnF is set.

In case a message is received while the corresponding Rx FIFO is full, this message is discarded and the message lost condition is signalled by MCAN_RXFnS.RFnL = '1'. In addition, the interrupt flag MCAN_IR.RFnL is set.

77.5.4.2.2.Rx FIFO Overwrite Mode

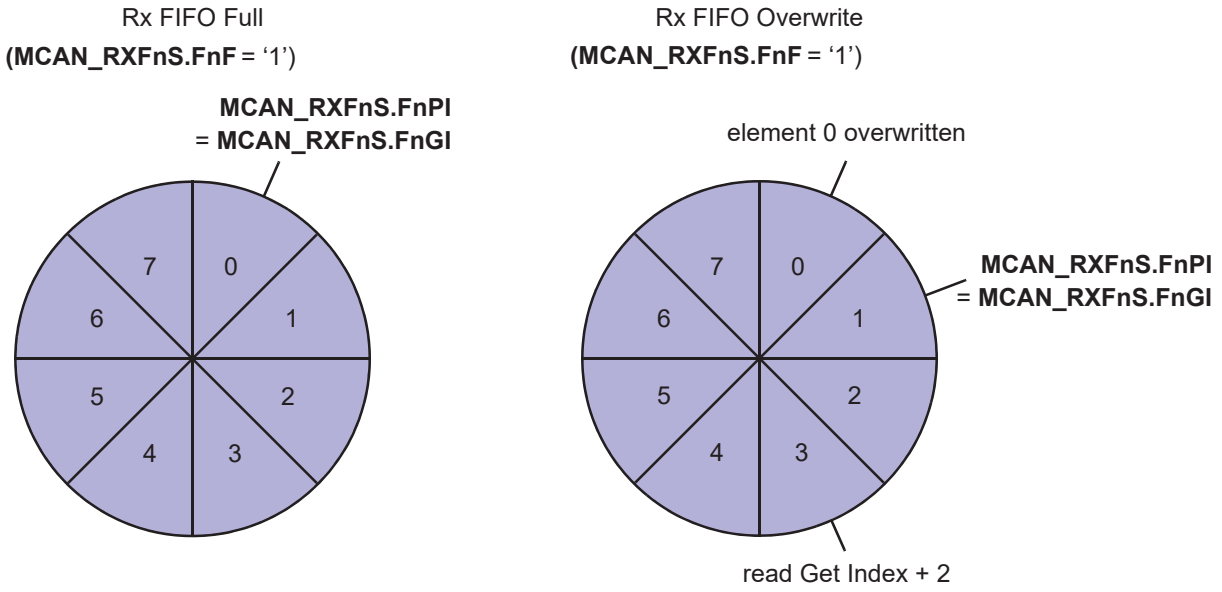
The Rx FIFO Overwrite mode is configured by MCAN_RXFnC.FnOM = '1'.

When an Rx FIFO full condition (MCAN_RXFnS.FnPI = MCAN_RXFnS.FnGI) is signalled by MCAN_RXFnS.FnF = '1', the next message accepted for the FIFO will overwrite the oldest FIFO message. Put and get index are both incremented by one.

© 2025 Microchip Technology Inc. and its subsidiaries

When an Rx FIFO is operated in Overwrite mode and an Rx FIFO full condition is signalled, reading of the Rx FIFO elements should start at least at get index + 1. The reason for that is, that it might happen, that a received message is written to the Message RAM (put index) while the processor is reading from the Message RAM (get index). In this case inconsistent data may be read from the respective Rx FIFO element. Adding an offset to the get index when reading from the Rx FIFO avoids this problem. The offset depends on how fast the processor accesses the Rx FIFO. The figure below shows an offset of two with respect to the get index when reading the Rx FIFO. In this case the two messages stored in element 1 and 2 are lost.

Figure 77.12. Rx FIFO Overflow Handling



After reading from the Rx FIFO, the number of the last element read has to be written to the Rx FIFO Acknowledge Index MCAN_RXFnA.FnA. This increments the get index to that element number. In case the put index has not been incremented to this Rx FIFO element, the Rx FIFO full condition is reset (MCAN_RXFnS.FnF = '0').

77.5.4.3.Dedicated Rx Buffers

The MCAN supports up to 64 dedicated Rx Buffers. The start address of the dedicated Rx Buffer section is configured via MCAN_RXBC.RBSA.

For each Rx Buffer, a Standard or Extended Message ID Filter Element with SFEC / EFEC = 7 and SFID2 / EFID2[10:9] = 0 has to be configured.

After a received message has been accepted by a filter element, the message is stored into the Rx Buffer in the Message RAM referenced by the filter element. The format is the same as for an Rx FIFO element. In addition, the flag MCAN_IR.DRX (Message stored in dedicated Rx Buffer) in MCAN_IR is set.

Table 77.3. Example Filter Configuration for Rx Buffers

Filter Element	SFID1[10:0] EFID1[28:0]	SFID2[10:9] EFID2[10:9]	SFID2[5:0] EFID2[5:0]
0	ID message 1	0	0
1	ID message 2	0	1
2	ID message 3	0	2

After the last word of a matching received message has been written to the Message RAM, the respective New Data flag in the New Data 1 register (MCAN_NDAT1) and New Data 2 register

© 2025 Microchip Technology Inc. and its subsidiaries

(MCAN_NDAT2) is set. As long as the New Data flag is set, the respective Rx Buffer is locked against updates from received matching frames. The New Data flags have to be reset by the processor by writing a '1' to the respective bit position.

While an Rx Buffer's New Data flag is set, a Message ID Filter Element referencing this specific Rx Buffer will not match, causing the acceptance filtering to continue. Following Message ID Filter Elements may cause the received message to be stored into another Rx Buffer, or into an Rx FIFO, or the message may be rejected, depending on filter configuration.

77.5.4.3.1.Rx Buffer Handling

- Reset interrupt flag IR.DRX
- Read New Data registers
- Read messages from Message RAM
- Reset New Data flags of processed messages

77.5.4.4.Debug on CAN Support

Debug messages are stored into Rx Buffers. For debug handling three consecutive Rx buffers (for example, #61, #62, #63) have to be used for storage of debug messages A, B, and C. The format is the same as for an Rx Buffer or an Rx FIFO element (see Rx Buffer and FIFO Element).

Advantage: Fixed start address for the DMA transfers (relative to MCAN_RXBC.RBSA), no additional configuration required.

For filtering of debug messages Standard / Extended Filter Elements with SFEC / EFEC = '111' have to be set up. Messages matching these filter elements are stored into the Rx Buffers addressed by SFID2 / EFID2[5:0].

After message C has been stored, the DMA request output m_can_dma_req is activated and the three messages can be read from the Message RAM under DMA control. The RAM words holding the debug messages will not be changed by the MCAN while m_can_dma_req is activated. The behavior is similar to that of an Rx Buffer with its New Data flag set.

After the DMA has completed, the MCAN is prepared to receive the next set of debug messages.

77.5.4.4.1.Filtering for Debug Messages

Filtering for debug messages is done by configuring one Standard / Extended Message ID Filter Element for each of the three debug messages. To enable a filter element to filter for debug messages SFEC / EFEC has to be programmed to "111". In this case fields SFID1 / SFID2 and EFID1 / EFID2 have a different meaning. While SFID2 / EFID2[10:9] controls the debug message handling state machine, SFID2 / EFID2[5:0] controls the location for storage of a received debug message.

When a debug message is stored, neither the respective New Data flag nor MCAN_IR.DRX are set. The reception of debug messages can be monitored via RXF1S.DMS.

Table 77.4. Example Filter Configuration for Debug Messages

Filter Element	SFID1[10:0] EFID1[28:0]	SFID2[10:9] EFID2[10:9]	SFID2[5:0] EFID2[5:0]
0	ID debug message A	1	11 1101
1	ID debug message B	2	11 1110
2	ID debug message C	3	11 1111

77.5.4.4.2.Debug Message Handling

The debug message handling state machine ensures that debug messages are stored to three consecutive Rx Buffers in the correct order. If some messages are missing, the process is restarted. The DMA request is activated only when all three debug messages A, B, C have been received in the correct order.

The status of the debug message handling state machine is signalled via MCAN_RXF1S.DMS.

T5: reception of debug messages A, B

T6: reception of debug message C

T7: DMA transfer completed

T8: reception of debug message A,B,C (message rejected)

77.5.5. Tx Handling

The Tx Handler handles transmission requests for the dedicated Tx Buffers, the Tx FIFO, and the Tx Queue. It controls the transfer of transmit messages to the CAN Core, the Put and Get Indices, and the Tx Event FIFO. Up to 32 Tx Buffers can be set up for message transmission. The CAN mode for transmission (Classic CAN or CAN FD) can be configured separately for each Tx Buffer element. The Tx Buffer element is described in Tx Buffer Element. The following table describes the possible configurations for frame transmission.

Table 77.5. Possible Configurations for Frame Transmission

MCAN_CCCR		Tx Buffer Element		Frame Transmission
BRSE	FDOE	FDF	BRS	
ignored	0	ignored	ignored	Classic CAN
0	1	0	ignored	Classic CAN
0	1	1	ignored	FD without bit rate switching
1	1	0	ignored	Classic CAN
1	1	1	0	FD without bit rate switching
1	1	1	1	FD with bit rate switching

Note: AUTOSAR requires at least three Tx Queue Buffers and support of transmit cancellation.

The Tx Handler starts a Tx scan to check for the highest priority pending Tx request (Tx Buffer with lowest Message ID) when MCAN_TXBRP is updated, or when a transmission has been started.

© 2025 Microchip Technology Inc. and its subsidiaries

77.5.5.1. Transmit Pause

The transmit pause feature is intended for use in CAN systems where the CAN message identifiers are (permanently) specified to specific values and cannot easily be changed. These message identifiers may have a higher CAN arbitration priority than other defined messages, while in a specific application their relative arbitration priority should be inverse. This may lead to a case where one ECU sends a burst of CAN messages that cause another ECU's CAN messages to be delayed because that other messages have a lower CAN arbitration priority.

If, for example, CAN ECU-1 has the transmit pause feature enabled and is requested by its application software to transmit four messages, it will, after the first successful message transmission, wait for two CAN bit times of bus idle before it is allowed to start the next requested message. If there are other ECUs with pending messages, those messages are started in the idle time, they would not need to arbitrate with the next message of ECU-1. After having received a message, ECU-1 is allowed to start its next transmission as soon as the received message releases the CAN bus.

The transmit pause feature is controlled by bit MCAN_CCCR.TXP. If the bit is set, the MCAN will, each time it has successfully transmitted a message, pause for two CAN bit times before starting the next transmission. This enables other CAN nodes in the network to transmit messages even if their messages have lower prior identifiers. Default is transmit pause disabled (MCAN_CCCR.TXP = '0').

This feature looses up burst transmissions coming from a single node and it protects against "babbling idiot" scenarios where the application program erroneously requests too many transmissions.

77.5.5.2. Dedicated Tx Buffers

Dedicated Tx Buffers are intended for message transmission under complete control of the processor. Each dedicated Tx Buffer is configured with a specific Message ID. In case that multiple Tx Buffers are configured with the same Message ID, the Tx Buffer with the lowest buffer number is transmitted first. These Tx Buffers shall be requested in ascending order, with the lowest buffer number first. Alternatively, all Tx Buffers configured with the same Message ID can be requested simultaneously by a single write access to TXBAR.

If the data section has been updated, a transmission is requested by an Add Request via MCAN_TXBAR.ARn. The requested messages arbitrate internally with messages from an optional Tx FIFO or Tx Queue and externally with messages on the CAN bus, and are sent out according to their Message ID.

A dedicated Tx Buffer allocates Element Size 32-bit words in the Message RAM (see the table below). Therefore the start address of a dedicated Tx Buffer in the Message RAM is calculated by adding transmit buffer index (0...31) × Element Size to the Tx Buffer Start Address TXBC.TBSA.

Table 77.6. Tx Buffer/FIFO/Queue Element Size

TXESC.TBDS[2:0]	Data Field [bytes]	Element Size [RAM words]
0	8	4
1	12	5
2	16	6
3	20	7
4	24	8
5	32	10
6	48	14
7	64	18

77.5.5.3.Tx FIFO

Tx FIFO operation is configured by programming MCAN_TXBC.TFQM to '0'. Messages stored in the Tx FIFO are transmitted starting with the message referenced by the Get Index MCAN_TXFQS.TFGI. After each transmission the Get Index is incremented cyclically until the Tx FIFO is empty. The Tx FIFO enables transmission of messages with the same Message ID from different Tx Buffers in the order these messages have been written to the Tx FIFO. The MCAN calculates the Tx FIFO Free Level MCAN_TXFQS.TFFL as difference between Get and Put Index. It indicates the number of available (free) Tx FIFO elements.

New transmit messages have to be written to the Tx FIFO starting with the Tx Buffer referenced by the Put Index MCAN_TXFQS.TFQPI. An Add Request increments the Put Index to the next free Tx FIFO element. When the Put Index reaches the Get Index, Tx FIFO Full (MCAN_TXFQS.TFQF = '1') is signalled. In this case no further messages should be written to the Tx FIFO until the next message has been transmitted and the Get Index has been incremented.

When a single message is added to the Tx FIFO, the transmission is requested by writing a '1' to the TXBAR bit related to the Tx Buffer referenced by the Tx FIFO's Put Index.

When multiple (n) messages are added to the Tx FIFO, they are written to n consecutive Tx Buffers starting with the Put Index. The transmissions are then requested via MCAN_TXBAR. The Put Index is then cyclically incremented by n. The number of requested Tx buffers should not exceed the number of free Tx Buffers as indicated by the Tx FIFO Free Level.

When a transmission request for the Tx Buffer referenced by the Get Index is cancelled, the Get Index is incremented to the next Tx Buffer with pending transmission request and the Tx FIFO Free Level is recalculated. When transmission cancellation is applied to any other Tx Buffer, the Get Index and the FIFO Free Level remain unchanged.

A Tx FIFO element allocates Element Size 32-bit words in the Message RAM (see the table Tx Buffer/ FIFO/Queue Element Size). Therefore the start address of the next available (free) Tx FIFO Buffer is calculated by adding Tx FIFO/Queue Put Index MCAN_TXFQS.TFQPI (0...31) × Element Size to the Tx Buffer Start Address MCAN_TXBC.TBSA.

77.5.5.4.Tx Queue

Tx Queue operation is configured by programming MCAN_TXBC.TFQM to '1'. Messages stored in the Tx Queue are transmitted starting with the message with the lowest Message ID (highest priority). In case that multiple Tx Queue buffers are configured with the same Message ID, the transmission order depends on numbers of buffers where messages were stored for transmission. As these buffer numbers depend on the then current states of the Put index, a prediction of the transmission order is not possible

New messages have to be written to the Tx Buffer referenced by the Put Index MCAN_TXFQS.TFQPI. The Put index always points to the free buffer of the Tx Queue with the lowest buffer number. In case that the Tx Queue is full (MCAN_TXFQS.TFQF = '1'), the Put Index is not valid and no further message should be written to the Tx Queue until at least one of the requested messages has been sent out or a pending transmission request has been cancelled.

The application may use register MCAN_TXBRP instead of the Put Index and may place messages to any Tx Buffer without pending transmission request.

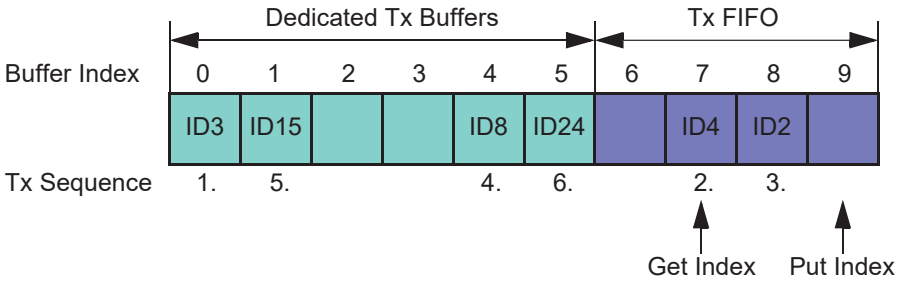
A Tx Queue Buffer allocates Element Size 32-bit words in the Message RAM (see the table Tx Buffer/ FIFO/Queue Element Size). Therefore the start address of the next available (free) Tx Queue Buffer is calculated by adding Tx FIFO/Queue Put Index MCAN_TXFQS.TFQPI (0...31) × Element Size to the Tx Buffer Start Address MCAN_TXBC.TBSA.

77.5.5.5.Mixed Dedicated Tx Buffers / Tx FIFO

In this case the Tx Buffers section in the Message RAM is subdivided into a set of dedicated Tx Buffers and a Tx FIFO. The number of dedicated Tx Buffers is configured by MCAN_TXBC.NDTB. The number of Tx Buffers assigned to the Tx FIFO is configured by MCAN_TXBC.TFQS. In case MCAN_TXBC.TFQS is programmed to zero, only dedicated Tx Buffers are used.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 77.14. Example of Mixed Configuration Dedicated Tx Buffers / Tx FIFO



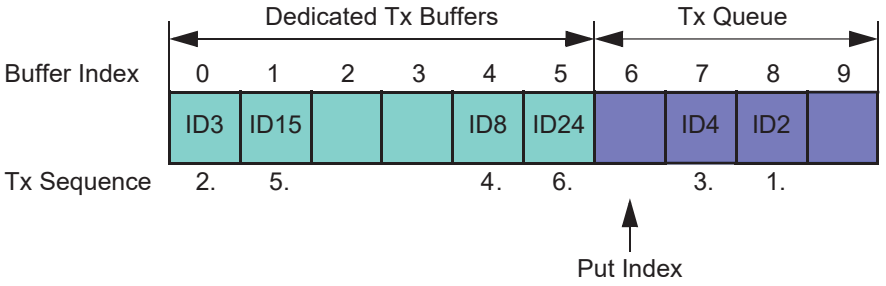
Tx prioritization:

- Scan dedicated Tx Buffers and oldest pending Tx FIFO Buffer (referenced by MCAN_TXFS.TFGI)
- Buffer with lowest Message ID gets highest priority and is transmitted next

77.5.5.6. Mixed Dedicated Tx Buffers / Tx Queue

In this case the Tx Buffers section in the Message RAM is subdivided into a set of dedicated Tx Buffers and a Tx Queue. The number of dedicated Tx Buffers is configured by MCAN_TXBC.NDTB. The number of Tx Queue Buffers is configured by MCAN_TXBC.TFQS. In case MCAN_TXBC.TFQS is programmed to zero, only dedicated Tx Buffers are used.

Figure 77.15. Example of Mixed Configuration Dedicated Tx Buffers / Tx Queue



Tx prioritization:

- Scan all Tx Buffers with activated transmission request
- Tx Buffer with lowest Message ID gets highest priority and is transmitted next

77.5.5.7. Transmit Cancellation

The MCAN supports transmit cancellation. This feature is especially intended for gateway applications and AUTOSAR-based applications. To cancel a requested transmission from a dedicated Tx Buffer or a Tx Queue Buffer, the processor has to write a '1' to the corresponding bit position (=number of Tx Buffer) of register MCAN_TXBCR. Transmit cancellation is not intended for Tx FIFO operation.

Successful cancellation is signalled by setting the corresponding bit of register MCAN_TXBCF to '1'.

In case a transmit cancellation is requested while a transmission from a Tx Buffer is already ongoing, the corresponding TXBRP bit remains set as long as the transmission is in progress. If the transmission was successful, the corresponding MCAN_TXBTO and MCAN_TXBCF bits are set. If the transmission was not successful, it is not repeated and only the corresponding MCAN_TXBCF bit is set.

Note: In case a pending transmission is cancelled immediately before this transmission could have been started, there follows a short time window where no transmission is started even if another message is also pending in this node. This may enable another node to transmit a message which may have a lower priority than the second message in this node.

© 2025 Microchip Technology Inc. and its subsidiaries

77.5.5.8.Tx Event Handling

To support Tx event handling the MCAN has implemented a Tx Event FIFO. After the MCAN has transmitted a message on the CAN bus, Message ID and timestamp are stored in a Tx Event FIFO element. To link a Tx event to a Tx Event FIFO element, the Message Marker from the transmitted Tx Buffer is copied into the Tx Event FIFO element.

The Tx Event FIFO can be configured to a maximum of 32 elements. The Tx Event FIFO element is described in Debug on CAN Support.

When a Tx Event FIFO full condition is signalled by IR.TEFF, no further elements are written to the Tx Event FIFO until at least one element has been read out and the Tx Event FIFO Get Index has been incremented. In case a Tx event occurs while the Tx Event FIFO is full, this event is discarded and interrupt flag MCAN_IR.TEFL is set.

To avoid a Tx Event FIFO overflow, the Tx Event FIFO watermark can be used. When the Tx Event FIFO fill level reaches the Tx Event FIFO watermark configured by MCAN_TXEFC.EFWM, interrupt flag MCAN_IR.TEFW is set.

When reading from the Tx Event FIFO, two times the Tx Event FIFO Get Index MCAN_TXEFS.EFGI has to be added to the Tx Event FIFO start address MCAN_TXEFC.EFSA.

77.5.6. FIFO Acknowledge Handling

The Get Indices of Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO are controlled by writing to the corresponding FIFO Acknowledge Index in the registers MCAN_RXF0A, MCAN_RXF1A and MCAN_TXEFA. Writing to the FIFO Acknowledge Index will set the FIFO Get Index to the FIFO Acknowledge Index plus one and thereby updates the FIFO Fill Level. There are two use cases:

When only a single element has been read from the FIFO (the one being pointed to by the Get Index), this Get Index value is written to the FIFO Acknowledge Index.

When a sequence of elements has been read from the FIFO, it is sufficient to write the FIFO Acknowledge Index only once at the end of that read sequence (value: Index of the last element read), to update the FIFO's Get Index.

Due to the fact that the processor has free access to the MCAN's Message RAM, special care has to be taken when reading FIFO elements in an arbitrary order (Get Index not considered). This might be useful when reading a High Priority Message from one of the two Rx FIFOs. In this case the FIFO's Acknowledge Index should not be written because this would set the Get Index to a wrong position and also alters the FIFO's Fill Level. In this case some of the older FIFO elements would be lost.

Note: The application has to ensure that a valid value is written to the FIFO Acknowledge Index. The MCAN does not check for erroneous values.

77.5.7. Message RAM

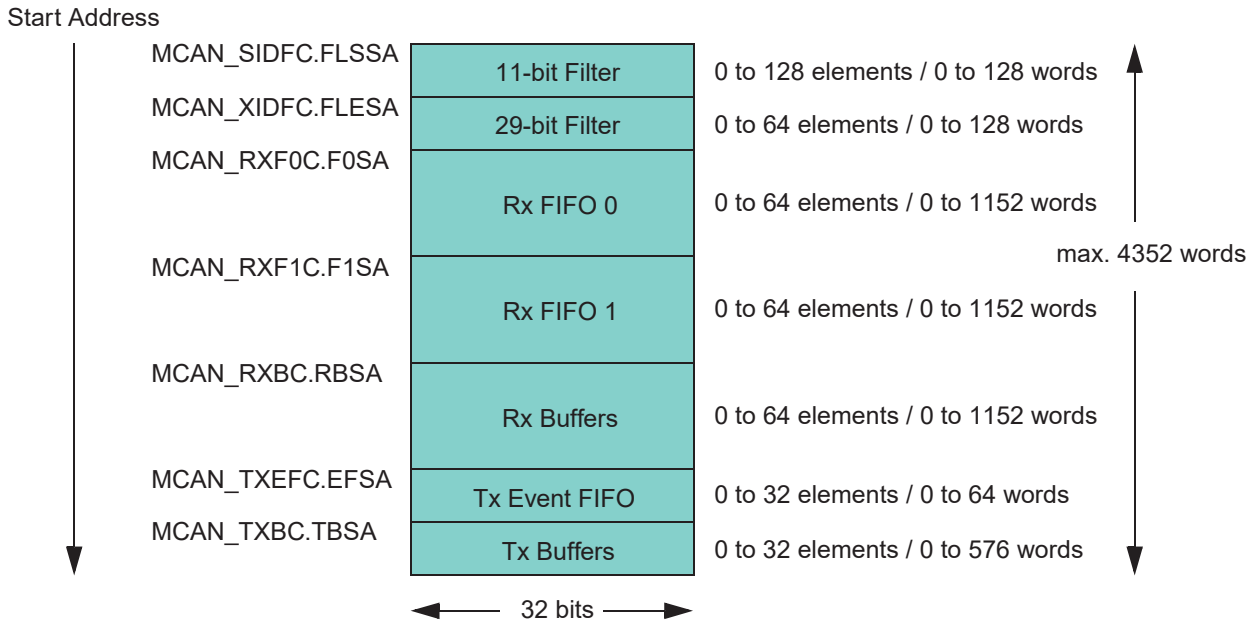
77.5.7.1.Message RAM Configuration

The Message RAM has a width of 32 bits. The MCAN module can be configured to allocate up to 4352 words in the Message RAM. It is not necessary to configure each of the sections listed in the figure below, nor is there any restriction with respect to the sequence of the sections.

When operated in CAN FD mode, the required Message RAM size depends on the element size configured for Rx FIFO0, Rx FIFO1, Rx Buffers, and Tx Buffers via MCAN_RXESC.F0DS, MCAN_RXESC.F1DS, MCAN_RXESC.RBDS, and MCAN_TXESC.TBDS.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 77.16. Message RAM Configuration



When the MCAN addresses the Message RAM, it addresses 32-bit words, not single bytes. The configurable start addresses are 32-bit word addresses; i.e., only bits 15 to 2 are evaluated, the two least significant bits are ignored.

Note: The MCAN does not check for erroneous configuration of the Message RAM. The configuration of the start addresses of the different sections and the number of elements of each section must be checked carefully to avoid falsification or loss of data.

77.5.7.2.Rx Buffer and FIFO Element

Up to 64 Rx Buffers and two Rx FIFOs can be configured in the Message RAM. Each Rx FIFO section can be configured to store up to 64 received messages. The structure of a Rx Buffer / FIFO element is shown in the table below. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register MCAN_RXESC.

R1A: When no TSU is used (CCCR.UTSU = '0'), R1A.RXTS[15:0] holds the 16-bit timestamp generated by the MCAN internal timestamping logic.

R1B: When a TSU is used (CCCR.UTSU = '1') and when bit SSYNC/ESYNC of the matching filter element is set, R1B.TSC = '1' and R1B.RXTSP[3:0] holds the number of the TSU Timestamp register which holds the 32-bit timestamp captured by the TSU. Else R1B.TSC = '0' and R1B.RXTSP[3:0] is not valid.

Table 77.7. Rx Buffer and FIFO Element

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

• **R0 Bit 31 ESI:** Error State Indicator

0: Transmitting node is error active.

© 2025 Microchip Technology Inc. and its subsidiaries

1: Transmitting node is error passive.

• **R0 Bit 30 XTD:** Extended Identifier

Signals to the processor whether the received frame has a standard or extended identifier.

0: 11-bit standard identifier.

1: 29-bit extended identifier.

• **R0 Bit 29 RTR:** Remote Transmission Request

Signals to the processor whether the received frame is a data frame or a remote frame.

0: Received frame is a data frame.

1: Received frame is a remote frame.

Note: There are no remote frames in CAN FD format. In case a CAN FD frame was received (FDF = 1), bit RTR reflects the state of the reserved bit r1.

• **R0 Bits 28:0 ID[28:0]:** Identifier

Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].

• **R1A/B Bit 31 ANMF:** Accepted Non-matching Frame

Acceptance of non-matching frames may be enabled via MCAN_GFC.ANFS and MCAN_GFC.ANFE.

0: Received frame matching filter index FIDX.

1: Received frame did not match any Rx filter element.

• **R1A/B Bits 30:24 FIDX[6:0]:** Filter Index

0-127: Index of matching Rx acceptance filter element (invalid if ANMF = '1').
Range is 0 to MCAN_SIDFC.LSS - 1 resp. MCAN_XIDFC.LSE - 1.

• **R1A/B Bit 21 FDF:** FD Format

0: Standard frame format.

1: CAN FD frame format (new DLC-coding and CRC).

• **R1A/B Bit 20 BRS:** Bit Rate Switch

0: Frame received without bit rate switching.

1: Frame received with bit rate switching.

Note:
Bits ESI, FDF, and BRS are only evaluated when CAN FD operation is enabled (MCAN_CCCR.FDOE = 1). Bit BRS is only evaluated when in addition MCAN_CCCR.BRSE = 1.

• **R1A/B Bits 19:16 DLC[3:0]:** Data Length Code

0-8: CAN + CAN FD: received frame has 0-8 data bytes.

9-15: CAN: received frame has 8 data bytes.

9-15: CAN FD: received frame has 12/16/20/24/32/48/64 data bytes.

• **R1A/B Bits 15:0 RXTS[15:0]:** Rx Timestamp

Timestamp Counter value captured on start of frame reception. Resolution depending on configuration of the Timestamp Counter Prescaler MCAN_TSCC.TCP.

• **R1B Bits 3:0 RXTSP[3:0]: Rx Timestamp Pointer**

Number of the TSU Timestamp register (TS0..15) where the related timestamp is stored.

© 2025 Microchip Technology Inc. and its subsidiaries

- **R1B Bit 4 TSC: Timestamp Captured**

0: No timestamp captured.

1: Timestamp captured and stored in TSU Timestamp register referenced by R1B.RXTSP.

- **R2 Bits 31:24 DB3[7:0]:** Data Byte 3
- **R2 Bits 23:16 DB2[7:0]:** Data Byte 2
- **R2 Bits 15:8 DB1[7:0]:** Data Byte 1
- **R2 Bits 7:0 DB0[7:0]:** Data Byte 0
- **R3 Bits 31:24 DB7[7:0]:** Data Byte 7
- **R3 Bits 23:16 DB6[7:0]:** Data Byte 6
- **R3 Bits 15:8 DB5[7:0]:** Data Byte 5
- **R3 Bits 7:0 DB4[7:0]:** Data Byte 4

... ...

- **Rn Bits 31:24 DBm[7:0]:** Data Byte m
- **Rn Bits 23:16 DBm-1[7:0]:** Data Byte m-1
- **Rn Bits 15:8 DBm-2[7:0]:** Data Byte m-2
- **Rn Bits 7:0 DBm-3[7:0]:** Data Byte m-3

Note: Depending on the configuration of the element size (MCAN_RXESC), between two and sixteen 32-bit words (Rn = 3 ..17) are used for storage of a CAN message's data field.

77.5.7.3.Tx Buffer Element

The Tx Buffers section can be configured to hold dedicated Tx Buffers as well as a Tx FIFO / Tx Queue. In case that the Tx Buffers section is shared by dedicated Tx buffers and a Tx FIFO / Tx Queue, the dedicated Tx Buffers start at the beginning of the Tx Buffers section followed by the buffers assigned to the Tx FIFO or Tx Queue. The Tx Handler distinguishes between dedicated Tx Buffers and Tx FIFO / Tx Queue by evaluating the Tx Buffer configuration TXBC.TFQS and TXBC.NDTB. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register TXESC.

Table 77.8. Tx Buffer Element

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
T0	ESI	XTD	RTR	ID[28:0]																												
T1	MM[7:0]								EFC	TFCE	FDF	BRS	DLC[3:0]				MM[15:8]								reserved							
T2	DB3[7:0]								DB2[7:0]								DB1[7:0]								DB0[7:0]							
T3	DB7[7:0]								DB6[7:0]								DB5[7:0]								DB4[7:0]							
...	..								...								...								...							
Tn	DBm[7:0]								DBm-1[7:0]DBM[7:0]								DBm-2[7:0]DBM[7:0]								DBm-3[7:0]DBM[7:0]							

- **T0 Bit 30 ESI:** Error State Indicator

0: ESI bit in CAN FD format depends only on error passive flag

1: ESI bit in CAN FD format transmitted recessive

Note: The ESI bit of the transmit buffer is or'ed with the error passive flag to decide the value of the ESI bit in the transmitted FD frame. As required by the CAN FD protocol specification, an error active node may optionally transmit the ESI bit recessive, but an error passive node will always transmit the ESI bit recessive. This feature can be used in gateway applications when a message from an error passive node is routed to another CAN network.

© 2025 Microchip Technology Inc. and its subsidiaries

• **T0 Bit 30 XTD:** Extended Identifier

0: 11-bit standard identifier.

1: 29-bit extended identifier.

• **T0 Bit 29 RTR:** Remote Transmission Request

0: Transmit data frame.

1: Transmit remote frame.

Note: When RTR = 1, the MCAN transmits a remote frame according to ISO11898-1, even if MCAN_CCCR.FDOE enables the transmission in CAN FD format.

• **T0 Bits 28:0 ID[28:0]:** Identifier

Standard or extended identifier depending on bit XTD. A standard identifier has to be written to ID[28:18].

• **T1 Bits 31:24 MM[7:0]:** Message Marker

Written by processor during Tx Buffer configuration. Copied into Tx Event FIFO element for identification of Tx message status.

• **T1 Bit 23 EFC:** Event FIFO Control

0: Do not store Tx events.

1: Store Tx events.

• **T1 Bit 22 TSCE:** Timestamp Capture Enable for TSU

Only available when CCCR.UTSU = '1'. When this bit is set and the message is transmitted, a pulse is generated to signal the transmission of a Sync message to the Timestamping Unit (TSU) connected to the MCAN.

0: Timestamp Capture disabled

1: Timestamp Capture enabled

• **T1 Bit 21 FDF:** FD Format

0: Frame transmitted in Classic CAN format

1: Frame transmitted in CAN FD format

• **T1 Bit 20 BRS:** Bit Rate Switching

0: CAN FD frames transmitted without bit rate switching

1: CAN FD frames transmitted with bit rate switching

Note:
Bits ESI, FDF, and BRS are only evaluated when CAN FD operation is enabled (MCAN_CCCR.FDOE = 1). Bit BRS is only evaluated when in addition MCAN_CCCR.BRSE = 1.

• **T1 Bits 19:16 DLC[3:0]:** Data Length Code

0-8: CAN + CAN FD: transmit frame has 0-8 data bytes.

9-15: CAN: transmit frame has 8 data bytes.

9-15: CAN FD: transmit frame has 12/16/20/24/32/48/64 data bytes.

• **T1 Bits 15:8 MM[15:8]:** Message Marker

High byte of Wide Message Marker, written by CPU during Tx Buffer configuration. Copied into Tx Event FIFO element for identification of Tx message status. Available only when CCCR.WMM = '1' or when CCCR.UTSU = '1'.

© 2025 Microchip Technology Inc. and its subsidiaries

- **Tn Bits 23:16 DBm-1[7:0]:** Data Byte m-1
- **Tn Bits 15:8 DBm-2[7:0]:** Data Byte m-2
- **Tn Bits 7:0 DBm-3[7:0]:** Data Byte m-3

Note: Depending on the configuration of the element size (MCAN_TXESC), between two and sixteen 32-bit words (Tn = 3 ..17) are used for storage of a CAN message's data field.

77.5.7.4.Tx Event FIFO Element

Each element stores information about transmitted messages. By reading the Tx Event FIFO the processor gets this information in the order the messages were transmitted. Status information about the Tx Event FIFO can be obtained from register TXEFS.

E1A: When CCCR.WMM = '0' and no TSU is used (CCCR.UTSU = '0'), E1A.TXTS[15:0] holds the 16-bit timestamp generated by the MCAN internal timestamping logic.

E1B: When 16-bit Message Markers are enabled (CCCR.WMM ='1') or when CCCR.UTSU = '1', E1B.MM[15:8] holds the upper 8 bit of the Wide Message Marker. When a TSU is used (CCCR.UTSU = '1') and when bit TSCE of the related Tx Buffer element is set, E1B.TSC = '1' and E1B.TXTSP[3:0] holds the number of the TSU Timestamp register which holds the 32-bit timestamp captured by the TSU. Else E1B.TSC = '0' and E1B.TXTSP[3:0] is not valid.

Table 77.9. Tx Event FIFO Element

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

0: Data frame transmitted.

1: Remote frame transmitted.

© 2025 Microchip Technology Inc. and its subsidiaries

• **E0 Bits 28:0 ID[28:0]:** Identifier

Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].

• **E1A/B Bits 31:24 MM[7:0]:** Message Marker

Copied from Tx Buffer into Tx Event FIFO element for identification of Tx message status.

• **E1A/B Bit 23:22 ET[1:0]:** Event Type

0: Reserved

1: Tx event

2: Transmission in spite of cancellation (always set for transmissions in DAR mode)

3: Reserved

• **E1A/B Bit 21 FDF:** FD Format

0: Standard frame format.

1: CAN FD frame format (new DLC-coding and CRC).

• **E1A/B Bit 20 BRS:** Bit Rate Switch

0: Frame transmitted without bit rate switching.

1: Frame transmitted with bit rate switching.

• **E1A/B Bits 19:16 DLC[3:0]:** Data Length Code

0-8: CAN + CAN FD: frame with 0-8 data bytes transmitted.

9-15: CAN: frame with 8 data bytes transmitted.

9-15: CAN FD: frame with 12/16/20/24/32/48/64 data bytes transmitted

• **E1A/B Bits 15:0 TXTS[15:0]:** Tx Timestamp

Timestamp Counter value captured on start of frame transmission. Resolution depending on configuration of the Timestamp Counter Prescaler MCAN_TSCC.TCP.

• **E1B Bit 4 TSC: Timestamp Captured**

0: No timestamp captured

1: Timestamp captured and stored in TSU Timestamp register referenced by E1B.TXTSP

• **E1B Bits 3:0 TXTSP[3:0]: Tx Timestamp Pointer**

Number of the TSU Timestamp register (TS0..15) where the related timestamp is stored.

77.5.7.5. Standard Message ID Filter Element

Up to 128 filter elements can be configured for 11-bit standard IDs. When accessing a Standard Message ID Filter element, its address is the Filter List Standard Start Address MCAN_SIDFC.FLSSA plus the index of the filter element (0...127).

Table 77.10. Standard Message ID Filter Element

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
S0	SFT[1:0]		SFEC[2:0]			SFID[10:0]											SSYNC	–				SFID[10:0]									

• **Bits 31:30 SFT[1:0]:** Standard Filter Type

Value	Description
0	Range filter from SF1ID to SF2ID (SF2ID ≥ SF1ID)
1	Dual ID filter for SF1ID or SF2ID
2	Classic filter: SF1ID = filter, SF2ID = mask

© 2025 Microchip Technology Inc. and its subsidiaries

Standard Message ID Filter Element (continued)	
Value	**Description**
3	Reserved

• **Bit 29:27 SFEC[2:0]:** Standard Filter Element Configuration

All enabled filter elements are used for acceptance filtering of standard frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If SFEC = “100”, “101”, or “110” a match sets interrupt flag MCAN_IR.HPM and, if enabled, an interrupt is generated. In this case register HPMS is updated with the status of the priority match.

Value	Description
0	Disable filter element
1	Store in Rx FIFO 0 if filter matches
2	Store in Rx FIFO 1 if filter matches
3	Reject ID if filter matches
4	Set priority if filter matches
5	Set priority and store in FIFO 0 if filter matches
6	Set priority and store in FIFO 1 if filter matches
7	Store into Rx Buffer or as debug message, configuration of SFT[1:0] ignored

• **Bits 26:16 SFID1[10:0]:** Standard Filter ID 1

First ID of standard ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of a standard message to be stored. The received identifiers must match exactly, no masking mechanism is used.

• **Bit 15 SSYNC: Standard Sync Message**

Only evaluated when CCCR.UTSU = ‘1’. When this bit is set and a matching message is received, a pulse is generated to signal the reception of a Sync message to the Timestamping Unit (TSU) connected to the MCAN.

Value	Description
0	Timestamping for the matching Sync message disabled
1	Timestamping for the matching Sync message enabled

• **Bits 10:0 SFID2[10:0]:** Standard Filter ID 2

This field has a different meaning depending on the configuration of SFEC:

- SFEC = “001”...“110”–Second ID of standard ID filter element
- SFEC = “111”–Filter for Rx Buffers or for debug messages

SFID2[10:9] decides whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.

Value	Description
0	Store message in a Rx buffer
1	Debug Message A
2	Debug Message B
3	Debug Message C

SFID2[5:0] defines the index of the dedicated Rx Buffer element to which a matching message is stored.

© 2025 Microchip Technology Inc. and its subsidiaries

77.5.7.6. Extended Message ID Filter Element

Up to 64 filter elements can be configured for 29-bit extended IDs. When accessing an Extended Message ID Filter element, its address is the Filter List Extended Start Address MCAN_XIDFC.FLESA plus two times the index of the filter element (0...63).

Table 77.11. Extended Message ID Filter Elemen

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
F0	EFEC[2:0]			EFID[28:0]																												
F1	EFT[1:0]		ESYNC	EFID[28:0]																												

• **F0 Bit 31:29 EFEC[2:0]:** Extended Filter Element Configuration

All enabled filter elements are used for acceptance filtering of extended frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If EFEC = “100”, “101”, or “110”, a match sets the interrupt flag MCAN_IR.HPM and, if enabled, an interrupt is generated. In this case, register MCAN_HPMS is updated with the status of the priority match.

Value	Description
0	Disable filter element
1	Store in Rx FIFO 0 if filter matches
2	Store in Rx FIFO 1 if filter matches
3	Reject ID if filter matches
4	Set priority if filter matches
5	Set priority and store in FIFO 0 if filter matches
6	Set priority and store in FIFO 1 if filter matches
7	Store into Rx Buffer or as debug message, configuration of EFT[1:0] ignored

• **F0 Bits 28:0 EFID1[28:0]:** Extended Filter ID 1

First ID of extended ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of an extended message to be stored. The received identifiers must match exactly, only MCAN_XIDAM masking mechanism (see Extended Message ID Filtering) is used.

• **F1 Bit 29 ESYNC: Extended Sync Message**

Only evaluated when CCCR.UTSU = ‘1’. When this bit is set and a matching message is received, a pulse is generated to signal the reception of a Sync message to the Timestamping Unit (TSU) connected to the MCAN.

Value	Description
0	Timestamping for the matching Sync message disabled
1	Timestamping for the matching Sync message enabled

• **F1 Bits 31:30 EFT[1:0]:** Extended Filter Type

Value	Description
0	Range filter from EF1ID to EF2ID (EF2ID ≥ EF1ID)
1	Dual ID filter for EF1ID or EF2ID
2	Classic filter: EF1ID = filter, EF2ID = mask
3	Range filter from EF1ID to EF2ID (EF2ID ≥ EF1ID), MCAN_XIDAM mask not applied

• **F1 Bits 28:0 EFID2[28:0]:** Extended Filter ID 2

This field has a different meaning depending on the configuration of EFEC:

© 2025 Microchip Technology Inc. and its subsidiaries

- EFEC = “001”...“110”–Second ID of extended ID filter element
- EFEC = “111”–Filter for Rx Buffers or for debug messages

EFID2[10:9] decides whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.

Value	Description
0	Store message in an Rx buffer
1	Debug Message A
2	Debug Message B
3	Debug Message C

EFID2[5:0] defines the index of the dedicated Rx Buffer element to which a matching message is stored.

77.5.8. Hardware Reset Description

After hardware reset, the registers of the MCAN hold the reset values listed in the register descriptions. Additionally the Bus_Off state is reset and the output CANTX is set to recessive (HIGH). The value 0x0001 (MCAN_CCCR.INIT = ‘1’) in the CC Control register enables software initialization. The MCAN does not influence the CAN bus until the processor resets MCAN_CCCR.INIT to ‘0’.

77.5.9. Access to Reserved Register Addresses

In case the application software accesses one of the reserved addresses in the MCAN register map (read or write access), interrupt flag MCAN_IR.ARA is set and, if enabled, the selected interrupt line is risen.

77.6.2. MCAN Data Bit Timing and Prescaler Register

Name: MCAN_DBTP
Offset: 0x0C
Reset: 0x00000A33
Property: Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

The CAN bit time may be programmed in the range of 4 to 25 time quanta. The CAN time quantum may be programmed in the range of 1 to 32 CAN core clock periods. t_q = (DBRP + 1) CAN core clock periods.

DTSEG1 is the sum of Prop_Seg and Phase_Seg1. DTSEG2 is Phase_Seg2.

Therefore the length of the bit time is (programmed values) [DTSEG1 + DTSEG2 + 3] t_q or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] t_q.

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

With a CAN core clock frequency of 8 MHz, the reset value of 0x00000A33 configures the MCAN for a fast bit rate of 500 kbit/s.

The bit rate configured for the CAN FD data phase via MCAN_DBTP must be higher than or equal to the bit rate configured for the arbitration phase via MCAN_NBTP.

Bit	31	30	29	28	27	26	25	24

Access	R/W	R/W	R/W	R/W		R/W	R/W	R/W
Reset	0	0	1	1		0	1	1

Bit 23 – TDC Transmitter Delay Compensation
0 (DISABLED): Transmitter Delay Compensation disabled.
1 (ENABLED): Transmitter Delay Compensation enabled.

Bits 20:16 – DBRP[4:0] Data Bit Rate Prescaler
The value by which the peripheral clock is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Bit Rate Prescaler are 0 to 31. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

© 2025 Microchip Technology Inc. and its subsidiaries

Bits 12:8 – DTSEG1[4:0] Data Time Segment Before Sample Point
0: Forbidden.
1 to 31: The duration of time segment is t_q x (DTSEG1 + 1).

Bits 7:4 – DTSEG2[3:0] Data Time Segment After Sample Point
The duration of time segment is t_q x (DTSEG2 + 1).

Bits 2:0 – DSJW[2:0] Data (Re) Synchronization Jump Width
The duration of a synchronization jump is t_q x (DSJW + 1).

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.3. MCAN Test Register

Name: MCAN_TEST
Offset: 0x10
Reset: 0x00000000
Property: Read/Write

To enable write access to the Test register, set bit MCAN_CCCR.TEST to 1.

All MCAN Test Register functions are set to their reset values when bit MCAN_CCCR.TEST is cleared.

Loop Back mode and software control of pin CANTX are hardware test modes. Programming of TX ≠ 0 disturbs the message transfer on the CAN bus.

The reset value for bit 7, MCAN_TEST.RX, is undefined. Bits 4 to 6 read 0. Bit 7 reads 1 when operating in CAN environments.

Access	R	R/W	R/W	R/W				
Reset	x	0	0	0				

Bit 21 – SVAL Started Valid
Monitors the actual value of pin CANRX.
The reset value for this bit is undefined.

Value	Description
0 (DISABLED)	TXBNS value is not valid.
1 (ENABLED)	TXBNS value is valid.

Bits 20:16 – TXBNS[4:0] TX Buffer Number Started
In TX buffer, number of messages whose transmission was started last. Valid when SVAL is set. Valid values are 0 to 31.

Bit 13 – PVAL Prepared Valid
In TX buffer, number of messages whose transmission was started last. Valid when SVAL is set. Valid values are 0 to 31.

Value	Description
0 (DISABLED)	TXBNP value is not valid.
1 (ENABLED)	TXBNP value is valid.

© 2025 Microchip Technology Inc. and its subsidiaries

Bits 12:8 – TXBNP[4:0] TX Buffer Number Prepared

Five digits. In TX buffer, number of messages that are ready for transmission. Valid when PVAL is set. Valid values are 0 to 31.

Bit 7 – RX Receive Pin

Monitors the actual value of pin CANRX.
The reset value for this bit is undefined. The bit reads 1 when operating in CAN environments.

Value	Description
0	The CAN bus is dominant (CANRX = '0').
1	The CAN bus is recessive (CANRX = '1').

Bits 6:5 – TX[1:0] Control of Transmit Pin

Value	Name	Description
0	RESET	Reset value, CANTX controlled by the CAN Core, updated at the end of the CAN bit time.
1	SAMPLE_POINT_MONITORING	Sample Point can be monitored at pin CANTX.
2	DOMINANT	Dominant ('0') level at pin CANTX.
3	RECESSIVE	Recessive ('1') at pin CANTX.

Bit 4 – LBCK Loop Back Mode

0 (DISABLED): Reset value. Loop Back mode is disabled.
1 (ENABLED): Loop Back mode is enabled (see Test Modes).

77.6.4. MCAN RAM Watchdog Register

Name: MCAN_RWD
Offset: 0x14
Reset: 0x00000000
Property: Read/Write

The RAM Watchdog monitors the Message RAM response time. A Message RAM access via the MCAN's Generic Host Interface starts the Message RAM Watchdog Counter with the value configured by MCAN_RWD.WDC. The counter is reloaded with MCAN_RWD.WDC when the Message RAM signals successful completion by activating its READY output. In case there is no response from the Message RAM until the counter has counted down to zero, the counter stops and interrupt flag MCAN_IR.WDI is set. The RAM Watchdog Counter is clocked by the system bus clock (peripheral clock).

Reset	0	0	0	0	0	0	0	0

Bits 15:8 – WDV[7:0] Watchdog Value (read-only)
Watchdog Counter Value for the current message located in RAM.

Bits 7:0 – WDC[7:0] Watchdog Configuration (read/write)
Start value of the Message RAM Watchdog Counter. The counter is disabled when WDC is cleared.

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.5. MCAN CC Control Register

Name: MCAN_CCCR
Offset: 0x18
Reset: 0x00000001
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	NISO	TXP	EFBI	PXHD	WMM	UTSU	BRSE	FDOE
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	TEST	DAR	MON	CSR	CSA	ASM	CCE	INIT
Access	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	1

Bit 15 – NISO Non-ISO Operation
If this bit is set, the MCAN uses the CAN FD frame format as specified by the Bosch CAN FD Specification V1.0.

Value	Description
0	CAN FD frame format according to ISO11898-1 (default).
1	CAN FD frame format according to Bosch CAN FD Specification V1.0.

Bit 14 – TXP Transmit Pause (write protection)
If this bit is set, the MCAN pauses for two CAN bit times before starting the next transmission after itself has successfully transmitted a frame (see Tx Handling).

Value	Description
0	Transmit pause disabled.
1	Transmit pause enabled.

Bit 13 – EFBI Edge Filtering during Bus Integration (write protection)

Value	Description
0	Edge filtering is disabled.
1	Edge filtering is enabled. Two consecutive dominant tq required to detect an edge for hard synchronization.

Bit 12 – PXHD Protocol Exception Event Handling (write protection)

Value	Description
0	Protocol exception handling enabled.
1	Protocol exception handling disabled.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 11 – WMM Wide Message Marker (write protection)
0 (DISABLED): 8-bit message marker is used.
1 (ENABLED): 16-bit message marker is used, replacing 16-bit timestamps in TX Event FIFO.

Bit 10 – UTSU Use Timestamping Unit (write protection)
When UTSU is set, 16-bit Wide Message Marker (WMM) is also enabled regardless of the value of WMM.
0 (DISABLED): Internal timestamping.
1 (ENABLED): External timestamping by TSU.

Bit 9 – BRSE Bit Rate Switching Enable (write protection)
0 (DISABLED): Bit rate switching for transmissions disabled.
1 (ENABLED): Bit rate switching for transmissions enabled.

Bit 8 – FDOE CAN FD Operation Enable (write protection)
0 (DISABLED): FD operation disabled.
1 (ENABLED): FD operation enabled.

Bit 7 – TEST Test Mode Enable (write protection against '1')
0 (DISABLED): Normal operation, MCAN_TEST register holds reset values.
1 (ENABLED): Test mode, write access to MCAN_TEST register enabled.

Bit 6 – DAR Disable Automatic Retransmission (write protection)
0 (AUTO_RETX): Automatic retransmission of messages not transmitted successfully enabled.
1 (NO_AUTO_RETX): Automatic retransmission disabled.

Bit 5 – MON Bus Monitoring Mode (write protection against '1')
0 (DISABLED): Bus Monitoring mode is disabled.
1 (ENABLED): Bus Monitoring mode is enabled.

Bit 4 – CSR Clock Stop Request
0 (NO_CLOCK_STOP): No clock stop is requested.
1 (CLOCK_STOP): Clock stop requested. When clock stop is requested, first INIT and then CSA will be set after all pending transfer requests have been completed and the CAN bus reached idle.

Bit 3 – CSA Clock Stop Acknowledge

Value	Description
0	No clock stop acknowledged.
1	MCAN may be set in power down by stopping the peripheral clock and the CAN core clock.

Bit 2 – ASM Restricted Operation Mode (write protection against '1')
For a description of the Restricted Operation mode see Restricted Operation Mode.
0 (NORMAL): Normal CAN operation.
1 (RESTRICTED): Restricted Operation mode active.

Bit 1 – CCE Configuration Change Enable (write protection)
0 (PROTECTED): The processor has no write access to the protected configuration registers.
1 (CONFIGURABLE): The processor has write access to the protected configuration registers (while MCAN_CCCR.INIT = '1').

Bit 0 – INIT Initialization
Due to the synchronization mechanism between the two clock domains, there may be a delay until the value written to INIT can be read back. Therefore the programmer has to ensure that the previous value written to INIT has been accepted by reading INIT before setting INIT to a new value.

© 2025 Microchip Technology Inc. and its subsidiaries

0 (DISABLED): Normal operation.
1 (ENABLED): Initialization is started.

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.6. MCAN Nominal Bit Timing and Prescaler Register

Name: MCAN_NBTP
Offset: 0x1C
Reset: 0x06000A03
Property: Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN_CCCR.

The CAN bit time may be programmed in the range of 4 to 385 time quanta. The CAN time quantum may be programmed in the range of 1 to 512 CAN core clock periods. $t_q = t_{core\ clock}$ x (NBRP + 1).

NTSEG1 is the sum of Prop_Seg and Phase_Seg1. NTSEG2 is Phase_Seg2.

Therefore the length of the bit time is (programmed values) [NTSEG1 + NTSEG2 + 3] t_q or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] t_q.

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

With a CAN core clock frequency of 8 MHz, the reset value of 0x06000A03 configures the MCAN for a bit rate of 500 kbit/s.

Bit	31	30	29	28	27	26	25	24
	NSJW[6:0]							NBRP[8]
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	23	22	21	20	19	18	17	16
	NBRP[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	NTSEG1[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	1	0	1	0

Bit	7	6	5	4	3	2	1	0
		NTSEG2[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	1	1

Bits 31:25 – NSJW[6:0] Nominal (Re) Synchronization Jump Width
0 to 127: The duration of a synchronization jump is t_q x (NSJW + 1).

Bits 24:16 – NBRP[8:0] Nominal Bit Rate Prescaler
0 to 511: The value by which the oscillator frequency is divided for generating the CAN time quanta. The CAN time is built up from a multiple of this quanta. CAN time quantum (tq) = $t_{core\ clock}$ x (NBRP + 1)

Bits 15:8 – NTSEG1[7:0] Nominal Time Segment Before Sample Point

Value	Description
0	Reserved; do not use.
1 to 255	The duration of time segment is t_q x (NTSEG1 + 1).

© 2025 Microchip Technology Inc. and its subsidiaries

Bits 6:0 – NTSEG2[6:0] Nominal Time Segment After Sample Point

Value	Description
0	Reserved; do not use.
1 to 127	The duration of time segment is t_q x (NTSEG2 + 1).

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.7. MCAN Timestamp Counter Configuration Register

Name: MCAN_TSCC
Offset: 0x20
Reset: 0x00000000
Property: Read/Write

For a description of the Timestamp Counter see Timestamp Generation.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
					TCP[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
							TSS[1:0]	
Access							R/W	R/W
Reset							0	0

Bits 19:16 – TCP[3:0] Timestamp Counter Prescaler
Configures the timestamp and timeout counters time unit in multiples of CAN bit times [1...16].
The actual interpretation by the hardware of this value is such that one more than the value programmed here is used.

Bits 1:0 – TSS[1:0] Timestamp Select
With CAN FD, an external counter is required for timestamp generation (TSS = 2).

Value	Name	Description
0	ALWAYS_0	Timestamp counter value always 0x0000
1	TCP_INC	Timestamp counter value incremented according to TCP
2	EXT_TIMESTAMP	External timestamp counter value used
3	ALWAYS_0	Timestamp counter value always 0x0000

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.8. MCAN Timestamp Counter Value Register

Name: MCAN_TSCV
Offset: 0x24
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	TSC[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	TSC[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 15:0 – TSC[15:0] Timestamp Counter (cleared on write)

The internal/external Timestamp Counter value is captured on start of frame (both Receive and Transmit). When MCAN_TSCC.TSS = 1, the Timestamp Counter is incremented in multiples of CAN bit times [1...16] depending on the configuration of MCAN_TSCC.TCP. A wrap around sets interrupt flag MCAN_IR.TSW. Write access resets the counter to zero.

When MCAN_TSCC.TSS = 2, TSC reflects the external Timestamp Counter value. Thus a write access has no impact.

Note: A “wrap around” is a change of the Timestamp Counter value from non-zero to zero not caused by write access to MCAN_TSCV.

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.9. MCAN Timeout Counter Configuration Register

Name: MCAN_TOCC
Offset: 0x28
Reset: 0xFFFF0000
Property: Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

For a description of the Timeout Counter, see Timeout Counter.

Bit	31	30	29	28	27	26	25	24
	TOP[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1

Bit	23	22	21	20	19	18	17	16
	TOP[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
						TOS[1:0]		ETOC
Access						R/W	R/W	R/W
Reset						0	0	0

Bits 31:16 – TOP[15:0] Timeout Period
Start value of the Timeout Counter (down-counter). Configures the Timeout Period.

Bits 2:1 – TOS[1:0] Timeout Select
When operating in Continuous mode, a write to MCAN_TOCV presets the counter to the value configured by MCAN_TOCC.TOP and continues down-counting. When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MCAN_TOCC.TOP. Down-counting is started when the first FIFO element is stored.

Value	Name	Description
0	CONTINUOUS	Continuous operation.
1	TX_EV_TIMEOUT	Timeout controlled by Tx Event FIFO.
2	RX0_EV_TIMEOUT	Timeout controlled by Receive FIFO 0.
3	RX1_EV_TIMEOUT	Timeout controlled by Receive FIFO 1.

Bit 0 – ETOC Enable Timeout Counter
0 (NO_TIMEOUT): Timeout Counter disabled.
1 (TOS_CONTROLLED): Timeout Counter enabled.
For use of timeout function with CAN FD, see Timeout Counter.

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.10. MCAN Timeout Counter Value Register

Name: MCAN_TOCV
Offset: 0x2C
Reset: 0x0000FFFF
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	TOC[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1

Bit	7	6	5	4	3	2	1	0
	TOC[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1

Bits 15:0 – TOC[15:0] Timeout Counter (cleared on write)
The Timeout Counter is decremented in multiples of CAN bit times [1...16] depending on the configuration of MCAN_TSCC.TCP. When decremented to zero, interrupt flag MCAN_IR.TOO is set and the Timeout Counter is stopped. Start and reset/restart conditions are configured via MCAN_TOCC.TOS.

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.11. MCAN Error Counter Register

Name: MCAN_ECR
Offset: 0x40
Reset: 0x00000000
Property: Read-only

When MCAN_CCCR.ASM is set, the CAN protocol controller does not increment TEC and REC when a CAN protocol error is detected, but CEL is still incremented.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	CEL[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	RP	REC[6:0]						
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	TEC[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 23:16 – CEL[7:0] CAN Error Logging (cleared on read)
The counter is incremented each time when a CAN protocol error causes the Transmit Error Counter or the Receive Error Counter to be incremented. It is reset by read access to CEL. The counter stops at 0xFF; the next increment of TEC or REC sets interrupt flag IR.ELO.

Bit 15 – RP Receive Error Passive

Value	Description
0	The Receive Error Counter is below the error passive level of 128.
1	The Receive Error Counter has reached the error passive level of 128.

Bits 14:8 – REC[6:0] Receive Error Counter
Actual state of the Receive Error Counter, values between 0 and 127.

Bits 7:0 – TEC[7:0] Transmit Error Counter
Actual state of the Transmit Error Counter, values between 0 and 255.

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.12. MCAN Protocol Status Register

Name: MCAN_PSR
Offset: 0x44
Reset: 0x00000707
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
		TDCV[6:0]						
Access		R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
		PXE	RFDF	RBRS	RESI	DLEC[2:0]		
Access		R	R	R	R	R	R	R
Reset		0	0	0	0	1	1	1

Bit	7	6	5	4	3	2	1	0
	BO	EW	EP	ACT[1:0]		LEC[2:0]		
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	1	1	1

Bits 22:16 – TDCV[6:0] Transmitter Delay Compensation Value
0 to 127: Position of the secondary sample point, in CAN core clock periods, defined by the sum of the measured delay from CANTX to CANRX and MCAN_TDCR.TDCO.

Bit 14 – PXE Protocol Exception Event (cleared on read)

Value	Description
0	No protocol exception event occurred since last read access
1	Protocol exception event occurred

Bit 13 – RFDF Received a CAN FD Message (cleared on read)
This bit is set independently from acceptance filtering.

Value	Description
0	Since this bit was reset by the CPU, no CAN FD message has been received
1	Message in CAN FD format with FDF flag set has been received

Bit 12 – RBRS BRS Flag of Last Received CAN FD Message (cleared on read)
This bit is set together with RFDF, independently from acceptance filtering.

Value	Description
0	Last received CAN FD message did not have its BRS flag set.
1	Last received CAN FD message had its BRS flag set.

Bit 11 – RESI ESI Flag of Last Received CAN FD Message (cleared on read)
This bit is set together with RFDF, independently from acceptance filtering.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Last received CAN FD message did not have its ESI flag set.
1	Last received CAN FD message had its ESI flag set.

Bits 10:8 – DLEC[2:0] Data Phase Last Error Code (set to 111 on read)
Type of last error that occurred in the data phase of a CAN FD format frame with its BRS flag set. Coding is the same as for LEC. This field will be cleared to zero when a CAN FD format frame with its BRS flag set has been transferred (reception or transmission) without error.

Bit 7 – BO Bus_Off Status

Value	Description
0	The MCAN is not Bus_Off.
1	The MCAN is in Bus_Off state.

Bit 6 – EW Warning Status

Value	Description
0	Both error counters are below the Error_Warning limit of 96.
1	At least one of error counter has reached the Error_Warning limit of 96.

Bit 5 – EP Error Passive

Value	Description
0	The MCAN is in the Error_Active state. It normally takes part in bus communication and sends an active error flag when an error has been detected.
1	The MCAN is in the Error_Passive state.

Bits 4:3 – ACT[1:0] Activity
Monitors the CAN communication state of the CAN module.

Value	Name	Description
0	SYNCHRONIZING	Node is synchronizing on CAN communication
1	IDLE	Node is neither receiver nor transmitter
2	RECEIVER	Node is operating as receiver
3	TRANSMITTER	Node is operating as transmitter

Bits 2:0 – LEC[2:0] Last Error Code (set to 111 on read)
The LEC indicates the type of the last error to occur on the CAN bus. This field is cleared when a message has been transferred (reception or transmission) without error.

Value	Name	Description
0	NO_ERROR	No error occurred since LEC has been reset by successful reception or transmission.
1	STUFF_ERROR	More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed.
2	FORM_ERROR	A fixed format part of a received frame has the wrong format.
3	ACK_ERROR	The message transmitted by the MCAN was not acknowledged by another node.
4	BIT1_ERROR	During transmission of a message (with the exception of the arbitration field), the device tried to send a recessive level (bit of logical value ‘1’), but the monitored bus value was dominant.
5	BIT0_ERROR	During transmission of a message (or acknowledge bit, or active error flag, or overload flag), the device tried to send a dominant level (data or identifier bit logical value ‘0’), but the monitored bus value was recessive. During Bus_Off recovery, this status is set each time a sequence of 11 recessive bits has been monitored. This enables the processor to monitor the proceeding of the Bus_Off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed).
6	CRC_ERROR	The CRC check sum of a received message was incorrect. The CRC of an incoming message does not match the CRC calculated from the received data.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
7	NO_CHANGE	Any read access to the Protocol Status Register re-initializes the LEC to '7'. When the LEC shows value '7', no CAN bus event was detected since the last processor read access to the Protocol Status Register.

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.13. MCAN Transmitter Delay Compensation Register

Name: MCAN_TDCR
Offset: 0x48
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
		TDCO[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
		TDCF[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

Bits 14:8 – TDCO[6:0] Transmitter Delay Compensation Offset
0 to 127: Offset value, in CAN core clock periods, defining the distance between the measured delay from CANTX to CANRX and the secondary sample point.

Bits 6:0 – TDCF[6:0] Transmitter Delay Compensation Filter
0 to 127: defines the minimum value for the SSP position, in CAN core clock periods. Dominant edges on CANRX that would result in an earlier SSP position are ignored for transmitter delay measurement. The feature is enabled when TDCF is configured to a value greater than TDCO.

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.14. MCAN Interrupt Register

Name: MCAN_IR
Offset: 0x50
Reset: 0x00000000
Property: Read/Write

The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the processor clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register. The configuration of IE controls whether an interrupt is generated. The configuration of ILS controls on which interrupt line an interrupt is signalled.

Bit	31	30	29	28	27	26	25	24
			ARA	PED	PEA	WDI	BO	EW
Access			R/W	R/W	R/W	R/W	R/W	R/W

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 29 – ARA Access to Reserved Address

Value	Description
0	No access to reserved address occurred
1	Access to reserved address occurred

Bit 28 – PED Protocol Error in Data Phase

Value	Description
0	No protocol error in data phase
1	Protocol error in data phase detected (MCAN_PSR.DLEC differs from 0 or 7)

Bit 27 – PEA Protocol Error in Arbitration Phase

Value	Description
0	No protocol error in arbitration phase
1	Protocol error in arbitration phase detected (MCAN_PSR.LEC differs from 0 or 7)

Bit 26 – WDI Watchdog Interrupt

Value	Description
0	No Message RAM Watchdog event occurred.
1	Message RAM Watchdog event due to missing READY.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 25 – BO Bus_Off Status

Value	Description
0	Bus_Off status unchanged.
1	Bus_Off status changed.

Bit 24 – EW Warning Status

Value	Description
0	Error_Warning status unchanged.
1	Error_Warning status changed.

Bit 23 – EP Error Passive

Value	Description
0	Error_Passive status unchanged.
1	Error_Passive status changed.

Bit 22 – ELO Error Logging Overflow

Value	Description
0	CAN Error Logging Counter did not overflow.
1	Overflow of CAN Error Logging Counter occurred.

Bit 19 – DRX Message stored to Dedicated Receive Buffer

The flag is set whenever a received message has been stored into a dedicated Receive Buffer.

Value	Description
0	No Receive Buffer updated.
1	At least one received message stored into a Receive Buffer.

Bit 18 – TOO Timeout Occurred

Value	Description
0	No timeout.
1	Timeout reached.

Bit 17 – MRAF Message RAM Access Failure

The flag is set, when the Rx Handler

- has not completed acceptance filtering or storage of an accepted message until the arbitration field of the following message has been received. In this case acceptance filtering or message storage is aborted and the Rx Handler starts processing of the following message.
- was not able to write a message to the Message RAM. In this case message storage is aborted.

In both cases the FIFO put index is not updated resp. the New Data flag for a dedicated Receive Buffer is not set, a partly stored message is overwritten when the next message is stored to this location.
The flag is also set when the Tx Handler was not able to read a message from the Message RAM in time. In this case message transmission is aborted. In case of a Tx Handler access failure the MCAN is switched into Restricted Operation mode (see Restricted Operation Mode). To leave Restricted Operation mode, the processor has to reset MCAN_CCCR.ASM.

Value	Description
0	No Message RAM access failure occurred.
1	Message RAM access failure occurred.

Bit 16 – TSW Timestamp Wraparound

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No timestamp counter wrap-around.
1	Timestamp counter wrapped around.

Bit 15 – TEFL Tx Event FIFO Element Lost

Value	Description
0	No Tx Event FIFO element lost.
1	Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero.

Bit 14 – TEFF Tx Event FIFO Full

Value	Description
0	Tx Event FIFO not full.
1	Tx Event FIFO full.

Bit 13 – TEFW Tx Event FIFO Watermark Reached

Value	Description
0	Tx Event FIFO fill level below watermark.
1	Tx Event FIFO fill level reached watermark.

Bit 12 – TEFN Tx Event FIFO New Entry

Value	Description
0	Tx Event FIFO unchanged.
1	Tx Handler wrote Tx Event FIFO element.

Bit 11 – TFE Tx FIFO Empty

Value	Description
0	Tx FIFO non-empty.
1	Tx FIFO empty.

Bit 10 – TCF Transmission Cancellation Finished

Value	Description
0	No transmission cancellation finished.
1	Transmission cancellation finished.

Bit 9 – TC Transmission Completed

Value	Description
0	No transmission completed.
1	Transmission completed.

Bit 8 – HPM High Priority Message

Value	Description
0	No high priority message received.
1	High priority message received.

Bit 7 – RF1L Receive FIFO 1 Message Lost

Value	Description
0	No Receive FIFO 1 message lost.
1	Receive FIFO 1 message lost, also set after write attempt to Receive FIFO 1 of size zero.

Bit 6 – RF1F Receive FIFO 1 Full

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Receive FIFO 1 not full.
1	Receive FIFO 1 full.

Bit 5 – RF1W Receive FIFO 1 Watermark Reached

Value	Description
0	Receive FIFO 1 fill level below watermark.
1	Receive FIFO 1 fill level reached watermark.

Bit 4 – RF1N Receive FIFO 1 New Message

Value	Description
0	No new message written to Receive FIFO 1.
1	New message written to Receive FIFO 1.

Bit 3 – RF0L Receive FIFO 0 Message Lost

Value	Description
0	No Receive FIFO 0 message lost.
1	Receive FIFO 0 message lost, also set after write attempt to Receive FIFO 0 of size zero.

Bit 2 – RF0F Receive FIFO 0 Full

Value	Description
0	Receive FIFO 0 not full.
1	Receive FIFO 0 full.

Bit 1 – RF0W Receive FIFO 0 Watermark Reached

Value	Description
0	Receive FIFO 0 fill level below watermark.
1	Receive FIFO 0 fill level reached watermark.

Bit 0 – RF0N Receive FIFO 0 New Message

Value	Description
0	No new message written to Receive FIFO 0.
1	New message written to Receive FIFO 0.

77.6.16. MCAN Interrupt Line Select Register

Name: MCAN_ILS
Offset: 0x58
Reset: 0x00000000
Property: Read/Write

The Interrupt Line Select register assigns an interrupt generated by a specific interrupt flag from the Interrupt Register to one of the two module interrupt lines.

0: Interrupt assigned to interrupt line MCAN_INT0.

1: Interrupt assigned to interrupt line MCAN_INT1.

Bit	31	30	29	28	27	26	25	24

77.6.17. MCAN Interrupt Line Enable

Name: MCAN_ILE
Offset: 0x5C
Reset: 0x00000000
Property: Read/Write

Each of the two interrupt lines to the processor can be enabled/disabled separately by programming bits EINT0 and EINT1.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

77.6.18. MCAN Global Filter Configuration

Name: MCAN_GFC
Offset: 0x80
Reset: 0x00000000
Property: Read/Write

Global settings for Message ID filtering. The Global Filter Configuration controls the filter path for standard and extended messages as illustrated in Standard Message ID Filter Path and Extended Message ID Filter Path.

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
			ANFS[1:0]		ANFE[1:0]		RRFS	RRFE
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bits 5:4 – ANFS[1:0] Accept Non-matching Frames Standard
Defines how received messages with 11-bit IDs that do not match any element of the filter list are treated.

Value	Name	Description
0	RX_FIFO_0	Accept in Rx FIFO 0
1	RX_FIFO_1	Accept in Rx FIFO 1
2-3	REJECTED	Message rejected

Bits 3:2 – ANFE[1:0] Accept Non-matching Frames Extended
Defines how received messages with 29-bit IDs that do not match any element of the filter list are treated.

Value	Name	Description
0	RX_FIFO_0	Accept in Rx FIFO 0
1	RX_FIFO_1	Accept in Rx FIFO 1
2-3	REJECTED	Message rejected

Bit 1 – RRFS Reject Remote Frames Standard
0 (FILTER): Filter remote frames with 11-bit standard IDs.
1 (REJECT): Reject all remote frames with 11-bit standard IDs.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 0 – RRFE Reject Remote Frames Extended
0 (FILTER): Filter remote frames with 29-bit extended IDs.
1 (REJECT): Reject all remote frames with 29-bit extended IDs.

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.19. MCAN Standard ID Filter Configuration

Name: MCAN_SIDFC
Offset: 0x84
Reset: 0x00000000
Property: Read/Write

Settings for 11-bit standard Message ID filtering. The Standard ID Filter Configuration controls the filter path for standard messages as illustrated in Standard Message ID Filter Path.

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	LSS[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8

	FLSSA[5:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W		
Reset	0	0	0	0	0	0		

Bits 23:16 – LSS[7:0] List Size Standard
>128: Values greater than 128 are interpreted as 128.

Value	Description
0	No standard Message ID filter.
1–128	Number of standard Message ID filter elements.

Bits 15:2 – FLSSA[13:0] Filter List Standard Start Address
Start address of standard Message ID filter list (32-bit word address, see Message RAM Configuration).
Write FLSSA with the bits [15:2] of the 32-bit address.

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.20. MCAN Extended ID Filter Configuration

Name: MCAN_XIDFC
Offset: 0x88
Reset: 0x00000000
Property: Read/Write

Settings for 29-bit extended Message ID filtering. The Extended ID Filter Configuration controls the filter path for standard messages as described in Extended Message ID Filter Path.

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
		LSE[6:0]

	FLESA[5:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W		
Reset	0	0	0	0	0	0		

Bits 22:16 – LSE[6:0] List Size Extended

Value	Description
0	No extended Message ID filter.
1-64	Number of extended Message ID filter elements.
>64	Values greater than 64 are interpreted as 64.

Bits 15:2 – FLESA[13:0] Filter List Extended Start Address
Start address of extended Message ID filter list (32-bit word address, see Message RAM Configuration).
Write FLESA with the bits [15:2] of the 32-bit address.

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.21. MCAN Extended ID AND Mask

Name: MCAN_XIDAM
Offset: 0x90
Reset: 0x1FFFFFFF
Property: Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

Bit	31	30	29	28	27	26	25	24
				EIDM[28:24]				
Access				R/W	R/W	R/W	R/W	R/W
Reset				1	1	1	1	1

Bit	23	22	21	20	19	18	17	16
	EIDM[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1

Bit	15	14	13	12	11	10	9	8
	EIDM[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1

Bit	7	6	5	4	3	2	1	0
	EIDM[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	1	1	1	1	1	1	1	1

Bits 28:0 – EIDM[28:0] Extended ID Mask
For acceptance filtering of extended frames the Extended ID AND Mask is ANDed with the Message ID of a received frame. Intended for masking of 29-bit IDs in SAE J1939. With the reset value of all bits set to one the mask is not active.

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.22. MCAN High Priority Message Status

Name: MCAN_HPMS
Offset: 0x94
Reset: 0x00000000
Property: Read-only

This register is updated every time a Message ID filter element configured to generate a priority event matches. This can be used to monitor the status of incoming high priority messages and to enable fast access to these messages.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	FLST	FIDX[6:0]						
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	MSI[1:0]		BIDX[5:0]					
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit 15 – FLST Filter List
Indicates the filter list of the matching filter element.

Value	Description
0	Standard filter list
1	Extended filter list

Bits 14:8 – FIDX[6:0] Filter Index
Index of matching filter element. Range is 0 to MCAN_SIDFC.LSS - 1 resp. MCAN_XIDFC.LSE - 1.

Bits 7:6 – MSI[1:0] Message Storage Indicator

Value	Name	Description
0	NO_FIFO_SEL	No FIFO selected.
1	LOST	FIFO message lost.
2	FIFO_0	Message stored in FIFO 0.
3	FIFO_1	Message stored in FIFO 1.

Bits 5:0 – BIDX[5:0] Buffer Index
Index of Receive FIFO element to which the message was stored. Only valid when MSI[1] = '1'.

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.23. MCAN New Data 1

Name: MCAN_NDAT1
Offset: 0x98
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
	ND31	ND30	ND29	ND28	ND27	ND26	ND25	ND24
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	ND23	ND22	ND21	ND20	ND19	ND18	ND17	ND16
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	ND15	ND14	ND13	ND12	ND11	ND10	ND9	ND8
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – NDx New Data

The register holds the New Data flags of Receive Buffers 0 to 31. The flags are set when the respective Receive Buffer has been updated from a received frame. The flags remain set until the processor clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register.

Value	Description
0	Receive Buffer not updated
1	Receive Buffer updated from new message

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.24. MCAN New Data 2

Name: MCAN_NDAT2

Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – NDx New Data

The register holds the New Data flags of Receive Buffers 32 to 63. The flags are set when the respective Receive Buffer has been updated from a received frame. The flags remain set until the processor clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register.

Value	Description
0	Receive Buffer not updated.
1	Receive Buffer updated from new message.

77.6.25. MCAN Receive FIFO 0 Configuration

Name: MCAN_RXF0C
Offset: 0xA0
Reset: 0x00000000
Property: Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

Bit	31	30	29	28	27	26	25	24
	F0OM	F0WM[6:0]						
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

	F0SA[5:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W		
Reset	0	0	0	0	0	0		

Bit 31 – F0OM FIFO 0 Operation Mode
FIFO 0 can be operated in Blocking or in Overwrite mode (see Rx FIFOs).

Value	Description
0	FIFO 0 Blocking mode.
1	FIFO 0 Overwrite mode.

Bits 30:24 – F0WM[6:0] Receive FIFO 0 Watermark

Value	Description
0	Watermark interrupt disabled.
1-64	Level for Receive FIFO 0 watermark interrupt (MCAN_IR.RF0W).
>64	Watermark interrupt disabled.

Bits 22:16 – F0S[6:0] Receive FIFO 0 Size
The Receive FIFO 0 elements are indexed from 0 to F0S-1.

Value	Description
0	No Receive FIFO 0
1-64	Number of Receive FIFO 0 elements.
>64	Values greater than 64 are interpreted as 64.

Bits 15:2 – F0SA[13:0] Receive FIFO 0 Start Address
Start address of Receive FIFO 0 in Message RAM (32-bit word address, see Message RAM Configuration).
Write F0SA with the bits [15:2] of the 32-bit address.

		F0FL[6:0]						
Access		R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0

Bit 25 – RF0L Receive FIFO 0 Message Lost
This bit is a copy of interrupt flag MCAN_IR.RF0L. When MCAN_IR.RF0L is reset, this bit is also reset. Overwriting the oldest message when MCAN_RXF0C.F0OM = '1' will not set this flag.

Value	Description
0	No Receive FIFO 0 message lost
1	Receive FIFO 0 message lost, also set after write attempt to Receive FIFO 0 of size zero

Bit 24 – F0F Receive FIFO 0 Full

Value	Description
0	Receive FIFO 0 not full.
1	Receive FIFO 0 full.

Bits 21:16 – F0PI[5:0] Receive FIFO 0 Put Index
Receive FIFO 0 write index pointer, range 0 to 63.

Bits 13:8 – F0GI[5:0] Receive FIFO 0 Get Index
Receive FIFO 0 read index pointer, range 0 to 63.

Bits 6:0 – F0FL[6:0] Receive FIFO 0 Fill Level
Number of elements stored in Receive FIFO 0, range 0 to 64.

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.27. MCAN Receive FIFO 0 Acknowledge

Name: MCAN_RXF0A
Offset: 0xA8
Reset: 0x00000000
Property: Read/Write

	F1SA[5:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W		
Reset	0	0	0	0	0	0		

Bit 31 – F1OM FIFO 1 Operation Mode
FIFO 1 can be operated in Blocking or in Overwrite mode (see Rx FIFOs).

Value	Description
0	FIFO 1 Blocking mode.
1	FIFO 1 Overwrite mode.

Bits 30:24 – F1WM[6:0] Receive FIFO 1 Watermark

Value	Description
0	Watermark interrupt disabled
1-64	Level for Receive FIFO 1 watermark interrupt (MCAN_IR.RF1W).
>64	Watermark interrupt disabled.

Bits 22:16 – F1S[6:0] Receive FIFO 1 Size
The elements in Receive FIFO 1 are indexed from 0 to F1S - 1.

Value	Description
0	No Receive FIFO 1
1-64	Number of elements in Receive FIFO 1.
>64	Values greater than 64 are interpreted as 64.

Bits 15:2 – F1SA[13:0] Receive FIFO 1 Start Address
Start address of Receive FIFO 1 in Message RAM (32-bit word address, see Message RAM Configuration).
Write F1SA with the bits [15:2] of the 32-bit address.

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.30. MCAN Receive FIFO 1 Status

Name: MCAN_RXF1S
Offset: 0xB4
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	DMS[1:0]						RF1L	F1F
Access	R	R					R	R
Reset	0	0					0	0

Access		R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0

Bits 31:30 – DMS[1:0] Debug Message Status

Value	Name	Description
0	IDLE	Idle state, wait for reception of debug messages, DMA request is cleared.
1	MSG_A	Debug message A received.
2	MSG_AB	Debug messages A, B received.
3	MSG_ABC	Debug messages A, B, C received, DMA request is set.

Bit 25 – RF1L Receive FIFO 1 Message Lost
This bit is a copy of interrupt flag IR.RF1L. When IR.RF1L is reset, this bit is also reset.
Overwriting the oldest message when MCAN_RXF1C.F1OM = '1' will not set this flag.

Value	Description
0	No Receive FIFO 1 message lost.
1	Receive FIFO 1 message lost, also set after write attempt to Receive FIFO 1 of size zero.

Bit 24 – F1F Receive FIFO 1 Full

Value	Description
0	Receive FIFO 1 not full.
1	Receive FIFO 1 full.

Bits 21:16 – F1PI[5:0] Receive FIFO 1 Put Index
Receive FIFO 1 write index pointer, range 0 to 63.

Bits 13:8 – F1GI[5:0] Receive FIFO 1 Get Index
Receive FIFO 1 read index pointer, range 0 to 63.

© 2025 Microchip Technology Inc. and its subsidiaries

Bits 6:0 – F1FL[6:0] Receive FIFO 1 Fill Level
Number of elements stored in Receive FIFO 1, range 0 to 64.

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.31. MCAN Receive FIFO 1 Acknowledge

Name: MCAN_RXF1A

Bits 5:0 – F1AI[5:0] Receive FIFO 1 Acknowledge Index
After the processor has read a message or a sequence of messages from Receive FIFO 1 it has to write the buffer index of the last element read from Receive FIFO 1 to F1AI. This will set the Receive FIFO 1 Get Index MCAN_RXF1S.F1GI to F1AI + 1 and update the FIFO 1 Fill Level MCAN_RXF1S.F1FL.

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.32. MCAN Receive Buffer / FIFO Element Size Configuration

Name: MCAN_RXESC
Offset: 0xBC
Reset: 0x00000000
Property: Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

Configures the number of data bytes belonging to a Receive Buffer / Receive FIFO element. Data field sizes >8 bytes are intended for CAN FD operation only.

In case the data field size of an accepted CAN frame exceeds the data field size configured for the matching Receive Buffer or Receive FIFO, only the number of bytes as configured by MCAN_RXESC are stored to the Receive Buffer resp. Receive FIFO element. The rest of the frame's data field is ignored.

77.6.33. MCAN Tx Buffer Configuration

Name: MCAN_TXBC
Offset: 0xC0
Reset: 0x00000000
Property: Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

The sum of TFQS and NDTB may not exceed 32. There is no check for erroneous configurations. The Tx Buffers section in the Message RAM starts with the dedicated Tx Buffers.

Bit	31	30	29	28	27	26	25	24
		TFQM	TFQS[5:0]					
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W

Access	R/W	R/W	R/W	R/W	R/W	R/W		
Reset	0	0	0	0	0	0		

Bit 30 – TFQM Tx FIFO/Queue Mode

Value	Description
0	Tx FIFO operation.
1	Tx Queue operation.

Bits 29:24 – TFQS[5:0] Transmit FIFO/Queue Size

Value	Description
0	No Tx FIFO/Queue.
1-32	Number of Tx Buffers used for Tx FIFO/Queue.
>32	Values greater than 32 are interpreted as 32.

Bits 21:16 – NDTB[5:0] Number of Dedicated Transmit Buffers

Value	Description
0	No dedicated Tx Buffers.
1-32	Number of dedicated Tx Buffers.
>32	Values greater than 32 are interpreted as 32.

Bits 15:2 – TBSA[13:0] Tx Buffers Start Address
Start address of Tx Buffers section in Message RAM (32-bit word address, see Message RAM Configuration).
Write TBSA with the bits [15:2] of the 32-bit address.

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.34. MCAN Tx FIFO/Queue Status

Name: MCAN_TXFQS
Offset: 0xC4
Reset: 0x00000000
Property: Read-only

The Tx FIFO/Queue status is related to the pending Tx requests listed in register MCAN_TXBRP. Therefore the effect of Add/Cancellation requests may be delayed due to a running Tx scan (MCAN_TXBRP not yet updated).

In case of mixed configurations where dedicated Tx Buffers are combined with a Tx FIFO or a Tx Queue, the Put and Get Indices indicate the number of the Tx Buffer starting with the first dedicated Tx Buffers.
Example: For a configuration of 12 dedicated Tx Buffers and a Tx FIFO of 20 Buffers a Put Index of 15 points to the fourth buffer of the Tx FIFO.

Bit 21 – TFQF Tx FIFO/Queue Full

Value	Description
0	Tx FIFO/Queue not full.
1	Tx FIFO/Queue full.

Bits 20:16 – TFQPI[4:0] Tx FIFO/Queue Put Index
Tx FIFO/Queue write index pointer, range 0 to 31.

Bits 12:8 – TFGI[4:0] Tx FIFO Get Index
Tx FIFO read index pointer, range 0 to 31. Read as zero when Tx Queue operation is configured (MCAN_TXBC.TFQM = ‘1’).

Bits 5:0 – TFFL[5:0] Tx FIFO Free Level
Number of consecutive free Tx FIFO elements starting from TFGI, range 0 to 32. Read as zero when Tx Queue operation is configured (MCAN_TXBC.TFQM = ‘1’).

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.35. MCAN Tx Buffer Element Size Configuration

Name: MCAN_TXESC
Offset: 0xC8
Reset: 0x00000000
Property: Read/Write

This register can only be written if the bits CCE and INIT are set in MCAN CC Control Register.

Configures the number of data bytes belonging to a Tx Buffer element. Data field sizes > 8 bytes are intended for CAN FD operation only.

In case the data length code DLC of a Tx Buffer element is configured to a value higher than the Tx Buffer data field size MCAN_TXESC.TBDS, the bytes not defined by the Tx Buffer are transmitted as “0xCC” (padding bytes).

77.6.36. MCAN Transmit Buffer Request Pending

Name: MCAN_TXBRP
Offset: 0xCC
Reset: 0x00000000
Property: Read-only

MCAN_TXBRP bits which are set while a Tx scan is in progress are not considered during this particular Tx scan. In case a cancellation is requested for such a Tx Buffer, this Add Request is cancelled immediately, the corresponding MCAN_TXBRP bit is reset.

Bit	31	30	29	28	27	26	25	24

	TRP7	TRP6	TRP5	TRP4	TRP3	TRP2	TRP1	TRP0
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – TRPx Transmission Request Pending for Buffer x

Each Tx Buffer has its own Transmission Request Pending bit. The bits are set via register MCAN_TXBAR. The bits are reset after a requested transmission has completed or has been cancelled via register MCAN_TXBCR.
TXBRP bits are set only for those Tx Buffers configured via MCAN_TXBC. After a MCAN_TXBRP bit has been set, a Tx scan (see Tx Handling) is started to check for the pending Tx request with the highest priority (Tx Buffer with lowest Message ID).
A cancellation request resets the corresponding transmission request pending bit of register MCAN_TXBRP. In case a transmission has already been started when a cancellation is requested, this is done at the end of the transmission, regardless whether the transmission was successful or not. The cancellation request bits are reset directly after the corresponding TXBRP bit has been reset.
After a cancellation has been requested, a finished cancellation is signalled via MCAN_TXBCF.
• after successful transmission together with the corresponding MCAN_TXBTO bit.
• when the transmission has not yet been started at the point of cancellation.
• when the transmission has been aborted due to lost arbitration.
• when an error occurred during frame transmission.
In DAR mode, all transmissions are automatically cancelled if they are not successful. The corresponding MCAN_TXBCF bit is set for all unsuccessful transmissions.

Value	Description
0	No transmission request pending
1	Transmission request pending

77.6.37. MCAN Transmit Buffer Add Request

Name: MCAN_TXBAR
Offset: 0xD0
Reset: 0x00000000
Property: Read/Write

If an add request is applied for a Transmit Buffer with pending transmission request (corresponding MCAN_TXBRP bit already set), this Add Request is ignored.

Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31 – ARx Add Request for Transmit Buffer x

Each Transmit Buffer has its own Add Request bit. Writing a '1' will set the corresponding Add Request bit; writing a '0' has no impact. This enables the processor to set transmission requests for multiple Transmit Buffers with one write to MCAN_TXBAR. MCAN_TXBAR bits are set only for those Transmit Buffers configured via TXBC. When no Transmit scan is running, the bits are reset immediately, else the bits remain set until the Transmit scan process has completed.

Value	Description
0	No transmission request added.
1	Transmission requested added.

	EFSA[5:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W		
Reset	0	0	0	0	0	0		

Bits 29:24 – EFWM[5:0] Event FIFO Watermark

Value	Description
0	Watermark interrupt disabled.
1–32	Level for Tx Event FIFO watermark interrupt (MCAN_IR.TEFW).
>32	Watermark interrupt disabled.

Bits 21:16 – EFS[5:0] Event FIFO Size
The Tx Event FIFO elements are indexed from 0 to EFS - 1.

Value	Description
0	Tx Event FIFO disabled.
1–32	Number of Tx Event FIFO elements.
>32	Values greater than 32 are interpreted as 32.

Bits 15:2 – EFSA[13:0] Event FIFO Start Address
Start address of Tx Event FIFO in Message RAM (32-bit word address, see Message RAM Configuration).
Write EFSA with the bits [15:2] of the 32-bit address.

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.44. MCAN Tx Event FIFO Status

Name: MCAN_TXEFS
Offset: 0xF4
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
							TEFL	EFF
Access							R	R
Reset							0	0

Bit	23	22	21	20	19	18	17	16
				EFPI[4:0]				
Access				R	R	R	R	R
Reset				0	0	0	0	0

Reset				0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
			EFFL[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bit 25 – TEFL Tx Event FIFO Element Lost
This bit is a copy of interrupt flag MCAN_IR.TEFL. When MCAN_IR.TEFL is reset, this bit is also reset.

Value	Description
0	No Tx Event FIFO element lost.
1	Tx Event FIFO element lost, also set after write attempt to Tx Event FIFO of size zero.

Bit 24 – EFF Event FIFO Full

Value	Description
0	Tx Event FIFO not full.
1	Tx Event FIFO full.

Bits 20:16 – EFPI[4:0] Event FIFO Put Index
Tx Event FIFO write index pointer, range 0 to 31.

Bits 12:8 – EFGI[4:0] Event FIFO Get Index
Tx Event FIFO read index pointer, range 0 to 31.

Bits 5:0 – EFFL[5:0] Event FIFO Fill Level
Number of elements stored in Tx Event FIFO, range 0 to 32.

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.45. MCAN Tx Event FIFO Acknowledge

Name: MCAN_TXEFA
Offset: 0xF8
Reset: 0x00000000
Property: Read/Write

						SCP	TBCS	TSUE
Access						R/W	R/W	R/W
Reset						0	0	0

Bits 15:8 – TBPRE[7:0] Timebase Prescaler
The value by which the oscillator frequency is divided to generate the timebase counter clock. Valid values for the timebase prescaler are 0 to 255. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used. Affects only the TSU internal timebase.

Bit 2 – SCP Select Capturing Position

Value	Description
0	Timestamp captured at EOF
1	Timestamp captured at SOF

Bit 1 – TBCS Timebase Counter Select
No external timebase is connected. Set TBCS to 0.

Value	Description
0	Timestamp value captured from internal timebase counter (32 bits)
1	Timestamp value captured from external timebase counter (32 bits)

Bit 0 – TSUE Timestamp Unit Enable

Value	Description
0	TSU disabled
1	TSU enabled

© 2025 Microchip Technology Inc. and its subsidiaries

77.6.47. MCAN TSU Timestamp Status 1

Name: MCAN_TSU_TSS1
Offset: 0x168
Reset: 0x00000000
Property: Read-only

78. I3C Controller (I3CC)

78.1. Description

The MIPI I3C Controller (I3CC) implements the protocol functions related to the I3C bus host as defined in the MIPI I3C Specification. The I3CC provides an interface, as specified in MIPI I3C HCI 1.0 Specification, between the system (application) and the I3C bus, allowing communication between I3C devices and legacy I2C devices, with limitations as specified in MIPI I3C Specification.

The I3C system ensures reliable transmission and reception of data. The I3C interface is intended to improve upon the features of the I2C interface, while preserving backward compatibility, with some features not supported, such as clock stretching, clock synchronization, High-Speed mode, and 10-bit addressing.

78.1.1. Reference Documents

Table 78.1. Reference Documents

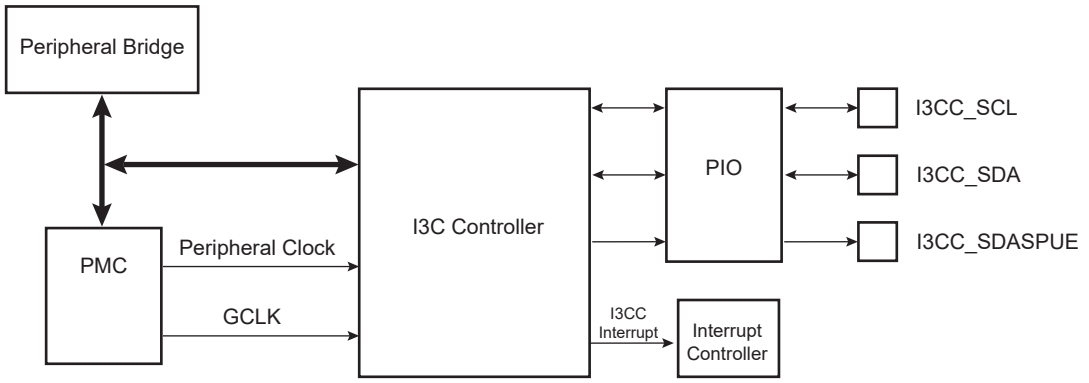
Document Title	Available
MIPI Alliance Specification for I3C® Improved Inter Integrated Circuit Version 1.1.1	https://www.mipi.org/specifications/i3c-sensor-specification
MIPI Alliance Specification for I3C Host Controller Interface (I3C HCI) Version 1.1	

78.2. Embedded Characteristics

- Supports I3C HCI 1.0 PIO Mode
- Supports Data Transfer to Legacy I2C Devices
- Supports Various Data Rates (FM, FM+, SDR, HDR-DDR)
- 8 Addressable Devices
- Command Queue Comprised of 16 Entries of 32 Bits
- Response Queue Comprised of 8 Entries
- Transmit Data Queue Comprised of 64 Entries of 32 Bits
- Receive Data Queue Comprised of 64 Entries

78.3. Block Diagram

Figure 78.1. I3CC Block Diagram



© 2025 Microchip Technology Inc. and its subsidiaries

78.3.1. I/O Lines Description

Table 78.2. I/O Lines Description

Pin Name	Pin Description	Type
I3CC_SCL	I3C Serial Clock	I/O
I3CC_SDA	I3C Serial Data	I/O
I3CC_SDASPUE	I3C Serial Data Pull-up Enable	O

78.4. Product Dependencies

78.4.1. I/O Lines

The pins used for interfacing the I3CC may be multiplexed with PIO lines. The programmer must first program the PIO Controller to assign the pins to their peripheral function. If I/O lines of the I3CC are not used by the application, they can be used for other purposes by the PIO Controller.

The user must not program I3CC_SCL and I3CC_SDA as open-drain. This is already done by the hardware.

When the I3CC requires the SDA line to be '1' while in Open-Drain mode, it sets I3CC_SDASPUE output high to enable the SDA pull-up resistor or equivalent current source.

78.4.2. Power Management

The I3CC is not continuously clocked. The user must first program the I3CC GCLK clock to 125 MHz and enable the I3CC peripheral clock in the Power Management Controller (PMC) before using it.

I3CC_GCLK period (GCLK_PER) is used to calculate timing on the I3C interface.

78.4.3. Interrupt Sources

The I3CC has an interrupt line connected to the interrupt controller. In order to handle interrupts, the interrupt controller must be programmed before configuring the I3CC.

78.5. Functional Description

78.5.1. Introduction

The I3CC is responsible for generating the I3C bus clock, issuing the commands, and controlling the data transfer.

Each I3C device has a unique address that is assigned by the I3CC through the Dynamic Address Assignment (DAA) during cold power-up or during a hot-join of the I3C device to the system.

The facing I3C devices are responsible for responding to the commands, transmitting or receiving data to/from the I3CC, and acknowledging to the I3CC that the transfer is successful.

78.5.2. I3C Bus Configuration

The I3CC supports three types of I3C bus configuration, as defined by the MIPI I3C Specification:

- Pure Bus — Only I3C devices present on the bus.
- Mixed Fast Bus — I3C devices and legacy I2C targets without host capability, without clock stretching and with a true I2C 50 ns glitch filter on I3CC_SCL.
- Mixed Slow/Limited Bus — I3C devices and legacy I2C targets without host capability, without clock stretching but without a true I2C 50 ns glitch filter on I3CC_SCL.

In a mixed fast bus configuration, the maximum possible data rate with I3C devices depends on the compliance of the I2C target as defined by the I2C Specification. The maximum data rate as specified in the I3C specification is possible only if all I2C targets have the 50 ns glitch filter.

© 2025 Microchip Technology Inc. and its subsidiaries

In the absence of glitch filters or if the presence of a filter is unknown, the maximum data rate is limited to only FM or FM+, even for I3C devices (as per the I3C Specification). I2C targets are not allowed to extend the clock.

78.5.3. I3CC Data Structures

78.5.3.1. Command and Response Structure

The command port of I3CC accepts the following four types of command structures to initiate a transfer on the I3C bus:

- Address Assignment
- Immediate Data Transfer
- Regular Data Transfer
- Combo Transfer

Each command comprises two 32-bit words. The I3CC issues the command on the I3CC line only after receiving two 32-bit words. If the I3CC receives a partial command, then the I3CC waits until it receives the complete command to initiate the transfer.

78.5.3.1.1. Address Assignment Command

This command is used for address assignment to the targets through either ENTDAA Broadcast transfer or SETDASA Directed transfer. The ENTDAA transfer is used to assign the dynamic addresses to the targets by receiving the PID, BCR, and DCR bytes of the targets. The SETDASA transfer is the compact version of the ENTDAA transfer, where the I3CC assigns a dynamic address to the targets for which static address is already known. Before issuing the Address Assignment command, the I3CC must program the DAT table. The I3CC application must issue the Address Assignment command in the following cases:

- During initialization of the I3CC system
- If any new device is connected to the system and indicated through hot-join IBI
- The command structure of the Address Assignment command is as described in the following table.

Table 78.3. Address Assignment Transfer Command Structure

Bits	Field Name	Memory Access	Reset Value	Description
63:32	Reserved	–	–	–
31	TOC	W	0x0	Terminate on Completion Controls which Bus condition to issue after the Transfer command completes. Values: • 0x0: RESTART: Repeated Start (Sr) is issued at the end of transfer. • 0x1: STOP: Stop (P) is issued at end of the transfer. TOC must always to be set to 0x1 for ENTDAA, and this bit is meaningful only for SETDASA transfers.
30	ROC	W	0x0	Response on Completion Controls whether Response Status is sent after successful completion of the Transfer command. The successful completion is read from register RESPONSE_QUEUE_PORT. Response Status is always sent after an unsuccessful transfer. Values: • 0x0: NOT_REQUIRED: Response Status is not required. • 0x1: REQUIRED: Response Status is required.
29:26	DEV_COUNT	W	0x0	Device Count Indicates the number of devices that the address is assigned to.

© 2025 Microchip Technology Inc. and its subsidiaries

Table 78.3. Address Assignment Transfer Command Structure (continued)

Bits	Field Name	Memory Access	Reset Value	Description
25:20	Reserved	–	–	–
19:16	DEV_INDEX	W	0x0	Device Index Indicates DAT table index where information related to Static and Device addressing is stored. The I3CC starts with the information from this Index and sequentially increments to the next location for assigning the address to subsequent devices until DEV_COUNT number of times.
15	Reserved	–	–	–
14:7	CMD	W	0x0	Transfer Command CCC Value This field specifies CCC indicating whether Address Assignment uses ENTDAA or SETDASA commands. The field comprises entire command code (ENTDAA or SETDASA)
6:3	TID	W	0x0	Transaction ID This field is used as tag for the command.
2:0	CMD_ATTR	W	0x0	Command Attributes This field defines Command type and bitfield format. Values: • 0x0: XFER: Regular Transfer • 0x1: IMMED_DATA_XFER: Immediate data transfer • 0x2: ADDR_ASSGN_CMD: Address Assignment command • 0x3: WWR_COMBO_XFER: Write + Write/Read combo transfer • 0x7: INTERNAL_CONTROL: Internal Control command • Values 0x4–0x6 are reserved.

This command is not used for the Address Assignment commands SETAASA Broadcast CCC transfer and SETNEWDA Directed CCC transfer. The application must use either Immediate Data Transfer or Regular Data Transfer command to issue the SETAASA or SETNEWDA commands.

78.5.3.1.2.Immediate Data Transfer Command

This command is used for short data write transfers including CCC transfers and Private SDR transfers (I3C/I2C), where the payload ranges from 0 to 4 bytes. The data payload is embedded inside the command itself.

The command structure of the Immediate Data Transfer command is described in the following table.

Table 78.4. Immediate Transfer Command Structure

Bits	Field Name	Memory Access	Reset Value	Description
63:56	DATA_BYTE_4	W	0x0	Immediate Data Transfer Data Byte 4 Direct argument
55:48	DATA_BYTE_3	W	0x0	Immediate Data Transfer Data Byte 3 Direct argument
47:40	DATA_BYTE_2	W	0x0	Immediate Data Transfer Data Byte 2 Direct argument
39:32	DATA_BYTE_1	W	0x0	Immediate Data Transfer Data Byte 1 Direct argument

© 2025 Microchip Technology Inc. and its subsidiaries

Table 78.4. Immediate Transfer Command Structure (continued)

Bits	Field Name	Memory Access	Reset Value	Description
31	TOC	W	0x0	Terminate on Completion Controls which bus condition is issued after completion of the data transfer. Values: • 0x0: RESTART: Repeated Start (Sr) is issued at the end of transfer • 0x1: STOP: Stop (P) is issued at end of the transfer
30	ROC	W	0x0	Immediate Data Transfer Response on Completion Controls whether a Response Status is required after successful completion of the Data Transfer command. The successful completion is read from RESPONSE_QUEUE_PORT register. The response status is always sent upon unsuccessful transfer. Values: • 0x0: NOT_REQUIRED: Response Status is not required • 0x1: REQUIRED: Response Status is required
29	RNW	W	0x0	Immediate Data Transfer R/ W Identifies direction of the transfer. This field must always be set to '0', because immediate transfers are valid for Write transactions only. Values: • 0x0: WRITE transfer • 0x1: READ transfer
28:26	MODE	W	0x0	Immediate Data Transfer Mode and Speed Mode and speed of the transfer. This field is used to program the mode and speed in which I3C or I2C are to be initiated. The value of this field is decoded based on mode, which can be either I3C or I2C, as determined by the 'DEVICE' field in the DAT entry pointed by the 'DEV_INDEX' field of the command. DEVICE value of 1 indicates I2C mode. DEVICE value of 0 indicates I3C mode. Values (I3C mode): • 0x0: I3C SDR0.I3C SDR0 represents standard SDR Speed (0 to $f_{SCL\ Max}$). • 0x1: I3C SDR1. The I3C SDR1 represents sustainable data rate of 8 MHz. • 0x2: I3C SDR2. The I3C SDR2 represents sustainable data rate of 6 MHz • 0x3: I3C SDR3. The I3C SDR3 represents sustainable data rate of 4 MHz. • 0x4: I3C SDR4. TheI3C SDR4 represents sustainable data rate of 2 MHz. • 0x5: Reserved (I3C HDR-TS:HDR-Ternary mode) • 0x6: I3C HDR-DDR (HDR-Double Data Rate mode) • 0x7: RESERVED Values (I2C mode): • 0x0: I2C FM • 0x1: I2C FM+ • 0x2: I2C UDR1 (I2C SS). The I2C UDR1 represents the user-defined data rate 1 (Used for standard speed mode). • 0x3: I2C UDR2. The I2C UDR2 represents the user-defined data rate 2. Currently, it is Reserved. • 0x4: I2C UDR3. The I2C UDR3 represents the user-defined data rate 3. Currently, it is Reserved. • 0x5–0x7: Reserved

© 2025 Microchip Technology Inc. and its subsidiaries

Table 78.4. Immediate Transfer Command Structure (continued)

Bits	Field Name	Memory Access	Reset Value	Description
25:23	BYTE_CNT	W	0x0	Immediate Data Transfer Byte Count Number of valid data bytes to use in this Immediate Data Transfer Descriptor. Values: • 0: No payload • 1–4: Bytes 1–4 valid • 5–7: Reserved
22:20	Reserved	–	–	–
19:16	DEV_INDEX	W	0x0	Immediate Data Transfer Device Index Device Index indicates DAT table index, where information related to Static and Device addressing is stored. This field indicates target device addressed with the transfer.
15	CP	W	0x0	Immediate Data Transfer Command Present Command Present. Indicates whether CMD field is valid for CCC or HDR Transfer. Values: • 0x0: TRANSFER: Describes SDR transfer. CMD field is not valid. • 0x1: CCC_HDR: Describes CCC or HDR transfer. CMD field is valid.
14:7	CMD	W	0x0	Immediate Data Transfer CCC / HDR Command Code Value Transfer Command field specifies Command code for CCC (8-bit) or HDR 7-bit).
6:3	TID	W	0x0	Immediate Data Transfer Transaction ID Used as an identification tag for this command. This field is populated by the software driver, and the same value is reflected in the Response Descriptor.
2:0	CMD_ATTR	W	0x0	Immediate Data Transfer Command Attribute Command attribute field defines Command type and bitfield format. Values: • 0x0: XFER: Regular Transfer • 0x1: IMMED_DATA_XFER: Immediate Data Transfer • 0x2: ADDR_ASSGN_CMD: Address Assignment Command • 0x3: WWR_COMBO_XFER: Write + Write/Read Combo Transfer • 0x7: INTERNAL_CONTROL: Internal Control command • Values 0x4–0x6 are reserved.

78.5.3.1.3.Regular Data Transfer Command

This command is used for CCC transfers, private I3C/I2C SDR data transfers, and private I3C HDR transfers. The application must transfer the Write-data payload or retrieve the Read-data payload from DATA_PORT based on the type of the command (Read/Write). Single Regular Data Transfer command can be used for the payload, which can range from 0 to 65535 bytes. If the payload is more than 65535 bytes, the application must initiate Multiple Regular Data Transfer commands based on the required data length of the transfer.

The command structure of the Regular Data Transfer command is described in the following table.

Table 78.5. Regular Transfer Command Structure

Bits	Field Name	Memory Access	Reset Value	Description
63:48	DATA_LENGTH	W	0x0	Data Transfer Data Length Data Length field is used to indicate the length of the transfer in bytes. **Note:** This field must be set to a non-zero value, except for CCCs that do not have a defined payload.
47:32	Reserved	–	–	–

© 2025 Microchip Technology Inc. and its subsidiaries

Table 78.5. Regular Transfer Command Structure (continued)

Bits	Field Name	Memory Access	Reset Value	Description
31	TOC	W	0x0	Data Transfer Terminate on Completion Controls which bus condition is issued after completion of the transfer. Values: • 0x0: RESTART: Repeated Start (Sr) is issued at the end of transfer • 0x1: STOP: Stop (P) is issued at end of the transfer
30	ROC	W	0x0	Data Transfer Response on Completion Controls whether Response Status is required after successful completion of the Transfer command. The successful completion is read from RESPONSE_QUEUE_PORT register. The Response Status is always sent after an unsuccessful transfer. Values: • 0x0: NOT_REQUIRED: Response Status is not required • 0x1: REQUIRED: Response Status is required
29	RNW	W	0x0	Data Transfer R/ W Identifies the direction of this transfer. Values: • 0x0: WRITE: Write transfer • 0x1: READ: Read transfer
28:26	MODE	W	0x0	Data Transfer Speed and Mode Speed and mode of the transfer. This field is used to program the speed/mode in which I3C or I2C must be initiated by the I3CC. The value of this field is decoded based on whether the transfer is targeted to I3C device or I2C device as determined by the 'DEVICE' field in the Device address table pointed by the 'DEV_INDEX' field of the command. Values: • 0x0: I3C SDR0/ I2C FM I3C SDR0 represents standard SDR Speed (0 to $f_{SCL\ Max}$) • 0x1: I3C SDR1 / I2C FM+ I3C SDR1 represents sustainable data rate of 8 MHz • 0x2: I3C SDR2 / I2C UD (I2C SS) I3C SDR2 represents sustainable data rate of 6 MHz. I2C UD represents the user-defined standard speed I2C Speed. • 0x3: I3C SDR3/ I2C Reserved I3C SDR3 represents sustainable data rate of 4 MHz. I2C UD represents the user-defined I2C Speed (currently it is Reserved). • 0x4: I3C SDR4/ I2C Reserved I3C SDR4 represents sustainable data date of 2 MHz. I2C UD represents the user-defined I2C Speed (Currently it is Reserved). • 0x5: Reserved (I3C HDR-TS: HDR-Ternary mode) / I2C Reserved • 0x6: I3C HDR-DDR (HDR-Double Data Rate mode) / I2C Reserved • 0x7: Reserved
25:20	Reserved	–	–	–
19:16	DEV_INDEX	W	0x0	Data Transfer Device Index Device Index indicates DAT table index, where information related to static and device addressing is stored. Field indicates target device addressed with the transfer.

Table 78.5. Regular Transfer Command Structure (continued)

Bits	Field Name	Memory Access	Reset Value	Description
15	CP	W	0x0	Data Transfer Command Present Command present. Indicates whether CMD field is valid for CCC or HDR transfer. Values: • 0x0: TRANSFER: Describes SDR transfer. CMD field is not valid. • 0x1: CCC_HDR: Describes CCC or HDR transfer. CMD field is valid.
14:7	CMD	W	0x0	Data Transfer CCC / HDR Command Code Value Transfer Command field specifies command code for CCC (8-bit) or HDR (7-bit).
6:3	TID	W	0x0	Data Transfer Transaction ID Transaction ID field is used as identification tag for the command.
2:0	CMD_ATTR	W	0x0	Data Transfer Command Attribute Command Attribute field defines Command type and bitfield format. Values: • 0x0: XFER: Regular Transfer • 0x1: IMMED_DATA_XFER: Immediate Data Transfer • 0x2: ADDR_ASSGN_CMD: Address Assignment Command • 0x3: WWR_COMBO_XFER: Write + Write/Read Combo transfer • 0x7: INTERNAL_CONTROL: Internal Control command • Values 0x4–0x6 are reserved.

78.5.3.1.4.Combo Transfer Command

This command is used to issue the 'Write followed by Write transfer' or 'Write followed by Read transfer' as a single atomic transaction. This command is used when the application must indicate the sub-address of the device first and then either write or read data from the sub-address pointed by the first write transfer. The first write transfer payload is embedded inside the command itself and the subsequent transfer Write-data/Read-data is written or accessed through DATA_PORT. The Combo Transfer is applicable to both I3C and I2C transfers. The command structure of the Combo Transfer command is described in the following table.

Table 78.6. Combo Transfer Command Structure

Bits	Field Name	Memory Access	Reset Value	Description
63:48	DATA_LENGTH	W	0x0	Combo Transfer Data Length Data length field is used to indicate the length of the transfer in bytes. This field must be set to a non-zero value.
47:32	OFFSET/SUBOFFSET	–	–	Combo Transfer Offset / Sub-Offset Offset/sub-offset to select offset of target operation
31	TOC	W	0x0	Combo Transfer Terminate on Completion Controls which bus condition is issued after completion of the transfer. Values: • 0x0: RESTART: Repeated Start (Sr) is issued at the end of transfer • 0x1: STOP: Stop (P) is issued at end of the transfer

Table 78.6. Combo Transfer Command Structure (continued)

Bits	Field Name	Memory Access	Reset Value	Description
24	FIRST_PHASE _MODE	W	0x0	Combo Transfer First Phase Mode Indicates whether the first phase of the combo transfer is executed in SDR mode, or the mode indicated by the MODE field. Values: • 0: SDR: First phase is executed in SDR mode • 1: MODE: First phase is executed in the mode indicated by the MODE field **Note:** This field is not supported by I3CC and must be set to '0'.
23:22	DATA_LENGTH _POSITION	W	0x0	Data Length Field Position Indicates whether and where to put data length (DATA_LENGTH) in the first phase of the transfer. This field is only applicable if first phase of the transfer is executed in HDR mode. Whether 8-bit or 16-bit of data length field is used is indicated with 16_BIT_SUBOFFSET field. For 8-bit value, it is encoded in lower byte of DATA_LENGTH field. Values: • 2'b0: NO: Do not put Length field • 2'b1: FIRST: Put Length as first field • 2'b2: SECOND: Put Length as second field • 2'b3: RESERVED: Do not use **Note:** This field is not supported by I3CC and must be set to '0'.
21:20	Reserved	–	–	–
19:16	DEV_INDEX	W	0x0	Combo Transfer Device Index Device Index indicates DAT table index where information related to static and device addressing is stored. Field indicates target device addressed with the transfer.
15	CP	W	0x0	Combo Transfer Command Present Indicates whether the CMD field is valid for an HDR Transfer. Values: • 0: TRANFSER: This structure describes an SDR transfer, so the CMD field is not valid. • 1: CCC_HDR: This structure describes an HDR transfer, so the CMD field is valid. **Note:** This field is not supported by I3CC and must be set to '0'.
14:7	CMD	W	0x0	Combo Transfer HDR Command Code Value Specifies the I3C command code (7 bits). This field is not supported by I3CC and must be set to '0'.
6:3	TID	W	0x0	Combo Transfer Transaction ID Transaction ID field is used as an identification tag for the command.
2:0	CMD_ATTR	W	0x0	Combo Transfer Command Attribute Command attribute field defines Command type and bitfield format. Values: • 0x0: XFER: Regular Transfer • 0x1: IMMED_DATA_XFER: Immediate Data Transfer • 0x2: ADDR_ASSGN_CMD: Address Assignment Command • 0x3: WWR_COMBO_XFER: Write + Write/Read Combo Transfer • Values 0x4-0x6 are reserved. • 0x7: INTERNAL_CONTROL: Internal Control command

© 2025 Microchip Technology Inc. and its subsidiaries

78.5.3.1.5.Response Data Structure

The I3CC returns the status of the Transfer command into the response queue with this data structure.

Table 78.7. Response Data Structure

Bit	Field Name	Memory Access	Reset Value	Description
31:28	ERR_STATUS	R	0x0	Response Error Status Indicates the Response status, that is, either success or the error type encountered for the processed command. Values: • 0x0: SUCCESS: Transfer successful, no error • 0x1: CRC: CRC Error • 0x2: PARITY: Parity Error • 0x3: FRAME: Frame Error • 0x4: ADDR_HEADER: Address Header Error • 0x5: NACK: Address NACK'ed or Dynamic Address Assignment NACK'ed • 0x6: OVL: Receive Overflow or Transfer Underflow Error • 0x7: RESERVED • 0x8: ABORTED: Aborted • 0x9: I2C_WR_DATA_NACK: NACK received for the I2C Write Data transfer • 0xA: NOT_SUPPORTED: Command with specific parameters not supported by the I3CC implementation (For example, specific Internal control codes are not supported) • 0xB–0xF: RESERVED
27:24	TID	R	0x0	Command/Response Transaction ID Transaction ID field is used as an identification tag for the command. This value matches one of commands sent on the bus. Valid IDs are 0x0–0x7. Values 0x8–0xF are reserved.
23:16	Reserved	–	–	–
15:0	DATA_LENGTH	R	0x0	Data Length / Device Count For write transfers, this field represents the remaining data length of the transfer if the transfer is terminated early (remaining data length = requested data length - transferred data length). For read transfers, this field represents the actual amount of data received in bytes. For Address Assignment command, this field represents the remaining device count.

78.5.3.2.IBI Status Descriptor

The IBI status descriptor is a read-only structure describing an IBI event received from a target device on the I3C bus.

© 2025 Microchip Technology Inc. and its subsidiaries

Table 78.8. IBI Status Data Structure

Bits	Field Name	Access Type	Reset Value	Description
31	IBI_STS	R	0x0	IBI Status Indicates the status of the response returned for the received IBI. 0: The received IBI is responded with ACK. Any non-zero value of the DATA_LENGTH field indicates the presence of data payload for the ACK'ed IBI. 1: The received IBI is responded with NACK. An Auto Disable CCC command is issued if the received IBI address is valid and matching with the DAT entry. If an IBI is received from an unknown address (not a valid entry in DAT), the IBI_STS is set to '1'.
30	ERROR	R	0x0	Error Indicates that during IBI Auto command, an error is encountered and the data from the target device is partially or fully discarded. The following errors are detected: • CRC/Parity Error (applicable for HDR transaction) • Target Address NACK • 0x7E Address NACK • IBI buffer overflow (applicable for IBI HDR mode) 0: No Error. Transaction completed with no errors. 1: Error. Error encountered during IBI Auto command phase.
29	Reserved	–	–	–
28:26	HW_CONTEXT	R	0x0	IBI Hardware Context Hardware specific context for IBI processing. Opaque for driver. This field is reserved for the I3CC.
25	TS	R	0x0	IBI Timestamp Present Indicates whether a timestamp is available for the IBI. Values: • 1: ON: IBI is timestamped • 0: OFF: IBI is not timestamped This field is reserved for the I3CC.
24	LAST_STATUS	R	0x0	Last Status When set, indicates that this status is the last for the received IBI. If the payload of the received IBI exceeds the programmed IBI data threshold, then the I3CC splits the IBI payload into multiple chunks of IBI_DATA_THLD size (max) which includes the timestamp bytes, if enabled.
23:16	Reserved	–	–	–
15:8	IBI_ID	R	8'h00	IBI Identifier This field indicates the target address byte along with the R/W bit received from the target device.
7:0	DATA_LENGTH	R	8'h00	IBI Data Length Number of data bytes received from the target device either along with the IBI or with the Auto command (read). The data length is limited by I3CC_QUEUE_THLD_CTRL.IBI_DATA_THLD.

The I3CC receives the bytes in the same order as on the bus and places the first byte received in the Least Significant Byte (LSB) position, and the following bytes in the LSB + 1 location, until all the four bytes of a word are received in the IBI queue. The data is always preceded with IBI status and indicates the number of valid IBI data bytes as shown in the following figure. See In-Band Interrupt (IBI) Detection and Handling for more information on how IBI status and data are packed and arranged in IBI queue.

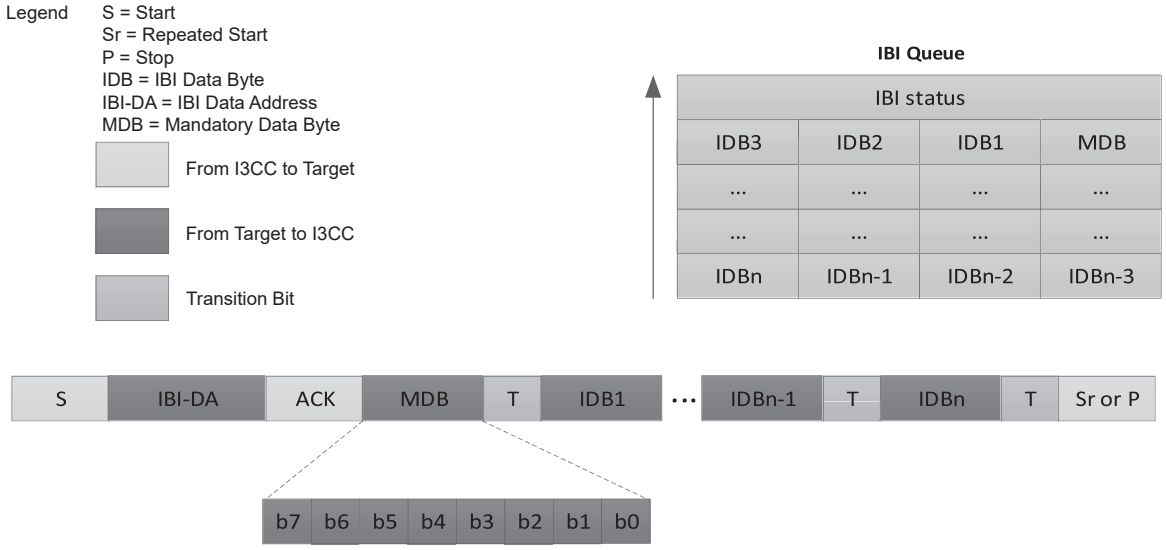
Figure 78.2. IBI with Payload Data Structure



78.5.3.3. Device Address Table (DAT)

The Device Address Table (DAT) stores the information of the device addresses and attributes (I2C or I3C, IBI Capable, etc.) of the devices (targets) present in the I3C bus. Each entity is composed of two 32-bit words. These entries are referred to in the DEV_INDEX field of the command. DAT offset, in Capabilities registers, indicates the offset to the DAT and number of entries. There are two entries for each device. These are described in the following table. The DAT is part of the register set.

The following table is populated by the application and the I3CC uses it in the following cases:

- Dynamic Address Assignment process: Application control over the dynamic address allows for device prioritization in terms of address arbitration for IBIs from targets.
- Regular Data transfers: I3CC retrieves the dynamic address, I2C or I3C device or device NACK retry count fields which are required to initiate the transfer on the line.
- IBI transfers: I3CC retrieves the dynamic address or IBI-related fields like Auto-command Mask, which are required for the I3CC to determine the next steps to perform based on the incoming IBI and MDB.

Table 78.9. Device Address Table Structure

Bits	Field Name	Memory Access	Reset Value	Description
63:59	Reserved	–	–	–
58:51	AUTOCMD_HDR_CODE	R/W	0x0	Device Auto-Command HDR Command Code Specifies Auto-Command Read Command Code. Valid only if a Read is executed in HDR mode. If the value is below 0x80, then the I3CC uses 0x80 for HDR Command Code.

© 2025 Microchip Technology Inc. and its subsidiaries

Table 78.9. Device Address Table Structure (continued)

Bits	Field Name	Memory Access	Reset Value	Description
50:48	AUTOCMD_MODE	R/W	0x0	Device Auto-Command Mode Speed and mode of the IBI Auto command transfer. This field is used to program the speed/mode in which IBI Auto command transfer must be initiated by the I3CC. Values: • 0x0: I3C SDR0: I3C SDR0 represents standard SDR Speed (0 to $f_{SCL\ Max}$) • 0x1: I3C SDR1 I3C SDR1 represents sustainable data rate of 8 MHz • 0x2: I3C SDR2 I3C SDR2 represents sustainable data rate of 6 MHz. • 0x3: I3C SDR3 I3C SDR3 represents sustainable data rate of 4 MHz. • 0x4: I3C SDR4 I3C SDR4 represents sustainable data rate of 2 MHz. • 0x5: Reserved (I3C HDR-TS: HDR-Ternary mode) / I2C Reserved IBI Auto command Transfer are supported in only SDR mode and not in HDR mode. • 0x6: Reserved (I3C HDR-DDR: HDR-Double Data Rate mode) / I2C Reserved IBI Auto command Transfer are supported in only SDR mode and not in HDR mode. • 0x7: Reserved
47:40	AUTOCMD_VALUE	R/W	0x0	Device Auto-Command IBI Mandatory Byte Value of IBI mandatory byte that triggers automatic Read transaction on the bus (Auto Command feature)
39:32	AUTOCMD_MASK	R/W	0x0	Device Auto-Command Mask Mask of IBI mandatory byte that triggers an automatic Read transaction on the bus (Auto Command feature)
31	DEVICE	R/W	0x0	Device Type Type of Device Values: • 0x0: I3C: I3C Device • 0x1: I2C: I2C Device
30:29	DEV_NACK_RETRY_CNT	R/W	0x0	Device NACK Retry Count Device specific retry count
28:26	RING_ID	R/W	0x0	Device Ring Group ID Ring group identification. This field is used to put IBI from specific device to appropriate ring bundle. This field is reserved for the I3CC.
25:24	Reserved	R/W	0x0	–
23:16	DYNAMIC_ADDRESS	R/W	0x0	Device I3C Dynamic Address I3C Dynamic Address (with parity bit) Parity bit is encoded in bit 23.

© 2025 Microchip Technology Inc. and its subsidiaries

Table 78.9. Device Address Table Structure (continued)

Bits	Field Name	Memory Access	Reset Value	Description
15	TS	R/W	0x0	Device IBI Timestamp Marker for Timestamping IBI for specific device. Whether IBI was timestamped or not is provided in IBI Status Descriptor Values: • 0x0: NO_TS: Do not timestamp IBI with I3CC Timestamps • 0x1: TS: Timestamp IBI with I3CC Timestamps This field is reserved for the I3CC.
14	CRR_REJECT	R/W	0x0	Device In-Band Controller-role Request Reject In-Band Controller-role Request Reject field is used to control, per Device, whether to accept Controller-role Request from devices. This bit must always be set to 0x1. Values: • 0x0: ACCEPT: ACK the Controller-role Request • 0x1: REJECT: NACK the Controller-role Request and send auto disable CCC
13	IBI_REJECT	R/W	0x0	Device In-Band Interrupt Request Reject In-Band Interrupt Request reject field is used to control, per device, whether to accept In-Band Interrupt Request from devices. Values: • 0x0: ACCEPT: ACK the IBI • 0x1: REJECT: NACK the IBI and send auto disable CCC
12	IBI_PAYLOAD	R/W	0x0	Device IBI Payload Data payload. This field reflects the IBI payload bit in the device's Bus Characteristics Register (BCR). During IBI handling for this device, the I3CC uses this field to determine whether or not to drive reception of the IBI data payload. Data continuation is indicated by the bit T. Values: • 0x0: NO_PAYLOAD: IBI does not carry data payload • 0x1: PAYLOAD: IBI carries data payload
11:7	Reserved	R/W	0x0	–
6:0	STATIC_ADDRESS	R/W	0x0	I3C/I2C Static Address

Note: The application writes DAT registers. Reading DAT registers before writing to them results in undefined values, as these data structures are stored in a RAM-based memory.

78.5.3.4. Device Characteristic Table (DCT)

The Device Characteristic Table (DCT) captures the device characteristics (PID, BCR, DCR) and the assigned dynamic address of the participating services during the ENTDAA procedure. Each entity consists of four 32-bit locations. This information can be used by the application to know what dynamic address is assigned to a particular target with the captured characteristics.

The DAT table must be updated by the application based on the characteristics received during the ENTDAA procedure, for example, whether the device is capable of sending IBI payload or not (BCR[2]), and must reflect this in the bit IBI_PAYLOAD of the DAT table for the particular target.

The DCT is part of the register set as defined in the following table.

DCT offset, in Capabilities registers, indicates the offset to the DCT and the number of entries. There is an entry for each device, described in the following table.

© 2025 Microchip Technology Inc. and its subsidiaries

Table 78.10. Device Characteristic Table (DCT)

Bits	Field Name	Memory Access	Reset Value	Description
127:104	Reserved	–	–	–
103:96	DYNAMIC_ADDRESS	R	0x0	I3C Dynamic Address (with parity bit)
95:80	Reserved	–	–	–
79:72	BCR	R	0x0	Bus Characteristic Register
71:64	DCR	R	0x0	Device Characteristic Register
63:48	Reserved	–	–	–
47:32	PID	R	0x0	Provisional ID [15:0]
31:0	PID	R	0x0	Provisional ID [48:16]

Note: The I3CC writes DCT registers. Reading DCT registers before writing to them results in undefined values, as these data structures are stored in a RAM-based memory.

78.5.4. Operation Modes of I3CC

78.5.4.1. Bus Communication Protocols

The I3CC supports the following bus communication protocols to transfer data to/from the target.

- Single Data Rate (SDR) Transfers
- High Data Rate-Double Data Rate (HDR-DDR)

78.5.4.1.1. Single Data Rate (SDR) Transfers

In SDR mode, a single bit is sent on each I3CC_SCL clock. All data is transmitted in byte format, with no limit on the number of bytes transferred per data transfer. After the I3CC sends the address and R/W bit, or the I3CC transmits a byte of data to the target. The target must respond with the acknowledge signal (ACK). When a target does not respond with an ACK pulse, the I3CC aborts the transfer by issuing a STOP condition. The target must leave the I3CC_SDA line high so that the I3CC can abort the transfer.

The single data rate transfers are initiated by the application through the command as explained in Command and Response Structure.

Based on the command initiated by the application and device address pointed to by the DEV_INDEX field of the command, or in case of no DAT or DCT configuration on the DYNAMIC_ADDRESS field present on the queued command, the I3CC initiates the transfers on the bus.

The following table illustrates the decoded transfer type based on Transfer command and DAT or I2CNI3C command field in case of no DAT or DCT configuration.

Table 78.11. Transfer Type Decoding Based on Command and Device Address Table

Transfer Command (Command Port)				DEVICE Field in DAT Structure	Decoded Transfer Type
CP	CMD[14]	Speed Mode	RnW		
0	NA	0 to 4	0	0	I3C Private Write Transfer
0	NA	0 to 4	1	0	I3C Private Read Transfer
1	0	0	0	0	I3C Broadcast CCC Write Transfer
1	1	0	0	0	I3C Directed CCC Write Transfer
1	1	0	1	0	I3C Directed CCC Read Transfer
0	x	0 to 2	0	1	I2C Private Write Transfer
0	x	0 to 2	1	1	I2C Private Read Transfer
Others					Illegal Combination

78.5.4.1.2. Broadcast or Directed CCC Transfers

The CCC transfers are used for bus management procedures such as the following:

© 2025 Microchip Technology Inc. and its subsidiaries

- Receiving the device characteristics
- Setting the max write or read data length
- Enabling or disabling the event generation in the I3C devices
- Informing all the existing devices of the bus characteristics
- Entering the high data rate transfer modes

78.5.4.1.3.Broadcast CCC Write Transfers

The Broadcast CCC Write transfers are initiated on the bus based on the COMMAND_PORT settings as shown in the following table.

Table 78.12. Broadcast CCC Write Transfer Required Programming Values

Command Attribute	Field Name	Programmed Value	Description
Transfer Command	CP	1	Indicates to the I3CC to consider the CMD field.
	CMD[14]	0	Indicates to the I3CC that the transfer is Broadcast CCC transfer.
	CMD[13:7]	0x0 – 0x7F	Indicates to the CCC command to be transferred.
	DEV_INDEX	NA	This field is not used since the transfer is Broadcast CCC.
	MODE	0 (SDR0)	Indicates to the I3CC that the transfer must go in SDR mode. All CCC transfers are initiated with SDR0 Speed.
	CMD_ATTR	0 or 1	0: Indicates to the I3CC to consider the transmit data from the Transmit FIFO if RnW is set to '0'. 1: Indicates to the I3CC to consider the transmit data from the command if RnW is set to '0'.
	RnW	0	Indicates the transfer is either write or read transfer. 0: Write Transfer 1: Read Transfer
Regular Transfer (CMD_ATTR=0)	DATA_LENGTH	0 - 65535	Indicates the transfer length of the transfer.
Immediate Transfer (CMD_ATTR=1)	BYTE_CNT	0 to 4	Indicates the respective data bytes of Immediate command are valid.

Data in the transmit FIFO (Regular transfer) or data bytes (Immediate Data Transfer) are not required for some broadcast CCCs which do not have payload data indicated through DATA_LENGTH (Regular transfer) or BYTE_CNT (Immediate transfer). If the Broadcast CCC does not consist of a payload, this must be indicated by a zero in either DATA_LENGTH or BYTE_CNT fields based on the command issued.

The I3CC halts if a NACK is received for the address header of the Broadcast CCC transfer. The I3CC updates ERR_STATUS in the Response Data structure with appropriate error information, halts the I3CC and gives back the control to the application to resume the operation of the I3CC through writing '1' to I3CC_HC_CONTROL.RESUME.

78.5.4.1.4.Directed Write and Read Transfers

The Directed CCC Write/Read transfers are initiated on the bus based on the COMMAND_PORT settings as shown in the following table.

© 2025 Microchip Technology Inc. and its subsidiaries

Table 78.13. Directed CCC Write/Read Transfers Required Programming Values

Command Attribute	Field Name	Programmed Value	Description
Transfer Command	CP	1	Indicates to the I3CC to consider the CMD field.
	CMD[14]	1	Indicates to the I3CC that the transfer is Directed CCC transfer.
	CMD[13:7]	0x0 - 0x7F	Indicates the CCC command to be transferred.
	I2CNI3C	0	Indicates if the target is I2C (1) or I3C (0) only used in configurations with no DAT or DCT reserved otherwise.
	DEV_INDEX	DEV_INDEX	Indicates the Index of the Device Table which consists of the target address.
	MODE	0 (SDR0)	Indicates to the I3CC that the transfer must go in SDR mode. All CCC transfers are initiated with SDR0 Speed.
	CMD_ATTR	0 or 1	0: Indicates to consider the transmit data from the Transmit FIFO if RnW is set to '0'. 1: Indicates to the I3CC to consider the transmit data from the command if RnW is set to '0'.
	RnW	0 or 1	0: Indicates the transfer is write transfer. 1: Indicates the transfer is read transfer.
Regular Transfer (CMD_ATTR=0)	DATA_LENGTH	0 - 65535	Indicates the transfer length of the transfer.
Immediate Transfer (CMD_ATTR=1)	BYTE_CNT	0 to 4	Indicates the respective data bytes of the Immediate command are valid.

The data in the transmit FIFO (Regular transfer) or data bytes (Immediate Data transfer) are not required for some directed write CCCs which do not have payload data indicated through DATA_LENGTH (Regular transfer) or BYTE_CNT (Immediate transfer). If the directed CCC does not consist of a payload, this must be indicated by '0' in either DATA_LENGTH or BYTE_CNT fields based on the command issued.

78.5.4.1.5.Directed CCC Transfer Targeted to Multiple Targets

Each Transfer command initiates Directed CCC transfer to only one target since it consists of only one DEV_INDEX field. To transfer the directed CCC command to multiple devices, pipeline the multiple Transfer commands in the COMMAND_PORT with TOC bits set to zero and with the different DEV_INDEX fields pointing to multiple targets. The I3CC decodes the pipelined 'Transfer command' during the transfer of Directed CCC transfer and decides the next transfer based on the following:

- If the current command and the pipelined command has the same Directed CCC, then the I3CC targets the next device without ending the CCC command.
- If the current command and the pipelined command are not the same Directed CCC commands, then the I3CC ends the CCC command and starts issuing the next transfer as indicated by the pipelined Transfer command.

The application can set the ROC bit to '0' for the subsequent Directed CCC commands and enable the ROC bit in the last CCC command if Directed CCC transfer is targeted to multiple devices to avoid unnecessary responses.

The I3CC halts if:

- NACK is received for the address header of the Directed CCC transfer
- NACK is received for the target address of the Directed CCC transfer

The I3CC updates ERR_STATUS in the Response Data structure with appropriate error information, halts the I3CC and gives back the control to the application to resume the operation of I3CC through writing '1' to I3CC_HC_CONTROL.RESUME.

© 2025 Microchip Technology Inc. and its subsidiaries

78.5.4.1.6.I3C Private Write or Read Transfers

The I3C private write and read transfers are initiated on the bus based on the COMMAND_PORT and settings shown in the following table.

Table 78.14. I3C Private Write/Read Transfers Required Programming Values

Command Attribute	Field Name	Programmed Value	Description
Transfer Command	CP	0	Indicates to the I3CC to not consider the CMD field.
	CMD[14]	NA	This field is not applicable since CP bit is set to '0'
	CMD[13:7]	NA	This field is not applicable since CP bit is set to '0'
	I2CNI3C	0	Indicates if the target is I2C (1) or I3C (0); only used in configurations with no DAT or DCT reserved otherwise.
	DEV_INDEX	DEV_INDEX	Indicates the index of the Device Table which consists of the target address.
	MODE	0 to 4	Indicates to the I3CC that the transfer must be in SDR mode.
	CMD_ATTR	0 or 1	0: Indicates to consider the transmit data from the Transmit FIFO if RnW is set to '0'. 1: Indicates to the I3CC to consider the transmit data from the command if RnW is set to '0'.
	RnW (Read and Write)	0 or 1	0: Indicates the transfer is write transfer. 1: Indicates the transfer is read transfer.
Regular Transfer (CMD_ATTR=0)	DATA_LENGTH	0 - 65535	Indicates the transfer length of the transfer.
Immediate Transfer (CMD_ATTR=1)	BYTE_CNT	0 to 4	Indicates the respective data bytes of the Immediate command are valid.

Notes:

1. For configuration with DAT, the DEVICE bit in the DAT pointed to by the DEV_INDEX field of the Transfer command must be set to zero for the I3C private transfers.
2. To avoid the initial latencies of the transfer, the I3CC uses I3CC_DATA_BUFFER_THLD_CTRL.TX/RX_START_THLD before initiating the transfer. I3CC_DATA_BUFFER_THLD_CTRL.TX_START_THLD ensures that the threshold level of data is present in the Transmit buffer for write transfer and I3CC_DATA_BUFFER_THLD_CTRL.RX_START_THLD level of space is available in the Receive buffer for the Read transfer before initiating the transfer. This threshold is applicable only for the transfers which are initiated with the START condition and not applicable for the transfers which are initiated with the RESTART condition for SDR transfers.
3. To allow the priority for IBI from the devices, the I3CC can include address header for the I3C private transfers by enabling I3CC_HC_CONTROL.IBA_INCLUDE.

The I3CC halts if:

- NACK is received for the Address header of the private transfers if I3CC_HC_CONTROL.IBA_INCLUDE is enabled.
- NACK is received for the target address of the private transfers.

The I3CC updates ERR_STATUS in the Response Data structure with appropriate error information. The I3CC is then halted and gives back the control to the application to resume operation of the I3CC by writing '1' to I3CC_HC_CONTROL.RESUME.

78.5.4.1.7.I2C Private Write or Read Transfers

The I2C private write and read transfers are initiated on the bus based on the COMMAND_PORT settings as shown in the following table.

© 2025 Microchip Technology Inc. and its subsidiaries

Table 78.15. I2C Private Write/Read Transfers Required Programming Values

Command Attribute	Field Name	Programmed Value	Description
Transfer Command	CP	0	Indicates to the I3CC to not consider the CMD field.
	CMD[14]	NA	This field is not applicable since CP bit is set to '0'.
	CMD[13:7]	NA	This field is not applicable since CP bit is set to '0'.
	I2CNI3C	1	Indicates if the target is I2C (1) or I3C (0); only used in configurations with no DAT or DCT reserved otherwise.
	DEV_INDEX	DEV_INDEX	Indicates the index of the Device Table which consists of the target address.
	MODE	0 to 2	Indicates to the I3CC that the transfer must be in I2C SDR mode.
	CMD_ATTR	0 or 1	0: Indicates to consider the transmit data from the Transmit FIFO if RnW is set to '0'. 1: Indicates to the I3CC to consider the transmit data from the command if RnW is set to '0'.
	RnW (Read and Write)	0 or 1	0: Indicates the transfer is write transfer. 1: Indicates the transfer is read transfer.
Regular Transfer (CMD_ATTR=0)	DATA_LENGTH	0 - 65535	Indicates the transfer length of the transfer.
Immediate Transfer (CMD_ATTR=1)	BYTE_CNT	0 to 4	Indicates the respective data bytes of the Immediate command are valid.

Notes:

1. The DEVICE bit in the DAT pointed to by the DEV_INDEX field of the Transfer command must be set to '1' for the I2C private transfers.
2. The I3CC uses the I2C protocol to initiate I2C transfers for legacy I2C devices.
3. To allow the priority for the IBI from the I3C devices, the I3CC can include address header for the I2C private transfers by enabling I3CC_HC_CONTROL.RESUME.

The I3CC halts if:

- NACK is received for the Address header of the private transfers if I3CC_HC_CONTROL.IBA_INCLUDE is enabled.
- NACK is received for the target address of the private transfers.

The I3CC updates ERR_STATUS in the Response Data structure with appropriate error information. The I3CC is then halted and gives back the control to the application to resume the operation of the I3CC by writing '1' to I3CC_HC_CONTROL.RESUME.

78.5.4.1.8.Implication of Transmit FIFO Empty and Receive FIFO Full Conditions

At SDR speeds, the I3CC extends the clock by pulling the I3CC_SCL low under the following conditions:

- Transmit FIFO empty during the middle of a write data transfer at SDR speeds.
- Receive FIFO full during the middle of a read data transfer at SDR speeds.

78.5.4.1.9.Implication of TOC and ROC Bit Settings for SDR Transfers

The Termination on Completion (TOC) bit of the Transfer command is used to decide whether to generate a STOP or continue with the next transfer.

- If TOC is set to '1', then I3CC generates a STOP condition after the end of the transfer.
- If TOC is set to '0', then I3CC continues the next pipelined transfer based on the current transfer type:
  - If the current transfer is either Broadcast CCC write or private transfer, then the I3CC generates a RESTART after the end of the transfer.

© 2025 Microchip Technology Inc. and its subsidiaries

  - If the current transfer is a Directed CCC transfer, then the I3CC generates a RESTART followed by Reserved address (0x7E) after the end of the transfer.

- If TOC is set to '0' and the next pipelined command is not available, then the I3CC extends the clock through I3CC_SCL pulling low until the next command is available.

The Response on Completion (ROC) bit of the Transfer command is used to generate the Response status of the transfer after the end of the transfer. The Response status is automatically generated if any error condition occurs for the transfer, irrespective of the ROC bit.

78.5.4.1.10.High Data Rate-Double Data Rate (HDR-DDR) Transfers

The High Data Rate-Double Data Rate (HDR-DDR) transfer protocol transfers more data at the same frequency as in SDR mode. The HDR-DDR has bus-wide effect and the I3CC is required to enter HDR-DDR mode through CCC before initiating a transfer to the target. The targets decode the incoming CCC and enter into HDR-DDR mode for the reception of the transfer.

The HDR-DDR write and read transfers are initiated on the bus based on the COMMAND_PORT and the settings shown in the following table.

Table 78.16. HDR-DDR Transfer Required Programming Values

Command Attribute	Field Name	Programmed Value	Description
Transfer Command	CP	1	Indicates to the I3CC to consider the CMD field.
	CMD[13:7]	0x00 – 0xFF	This field indicates either Write or Read command used in the command code of HDR Transfer. 0x00–0x1F: I3C Reserved Write commands 0x20–0x7F: I3C Vendor Write commands 0x80–0x9F: I3C Reserved Read Commands 0xA0–0xFF: I3C Vendor Read Commands
	I2CNI3C	0	Indicates if the target is I2C (1) or I3C (0) only used in configurations with no DAT or DCT reserved otherwise.
	DEV_INDEX	DEV_INDEX	Indicates the Index of the Device Table which consists of the target address.
	MODE	6 (HDR-DDR)	Indicates to the I3CC that the transfer must go in HDR-DDR mode.
	CMD_ATTR	0	0: Indicates to consider the transmit data from the Transmit FIFO if RnW is set to '0'.
	RnW (Read and Write)	0 or 1	0: Indicates the transfer is write transfer. 1: Indicates the transfer is read transfer. This bit is used for the Write or Read command used in HDR-CMD (CMD[14]) field.
Regular Transfer (CMD_ATTR=0)	DATA_LENGTH	0–65535	Indicates the transfer length of the transfer.

Note: The HDR-DDR transfers are supported only with Regular Transfer command and not with Immediate Transfer command since a maximum of two words can be transferred in Immediate Transfer command format.

The I3CC generates 'ENTHDR0' CCC to enter the HDR-DDR mode and forms the command code through the CMD field of the Transfer command and target address. The Preamble and parity bits are generated by the I3CC as per the protocol and sends them with the write data word. The I3CC considers Word from the transmit FIFO and appends the parity bits and preamble bits to form the write data word and transmits the data. The HDR-RESTART and HDR-EXIT pattern is generated in place of RESTART and STOP condition.

To avoid the initial latencies of the transfer, the I3CC uses TX/RX_START_THLD before initiating the transfer. TX_START_THLD indicates whether the threshold level of data is present in the transmit buffer for write transfer or RX_START_THLD level of space is available in the receive buffer for the

© 2025 Microchip Technology Inc. and its subsidiaries

read transfer before initiating the transfer. This threshold is only applicable for the transfers which are initiated with the START or RESTART condition. If the threshold amount of write data in transmit FIFO or if empty space in the receive FIFO is not available, the I3CC waits until the threshold amount of data is available to initiate the transfer. If the threshold amount of data is not available for the HDR-DDR transfer initiated with RESTART, then the I3CC generates an EXIT pattern and waits for the threshold amount of data to initiate the transfer.

The I3CC halts if:

- NACK is received for the address header of the private transfers if I3CC_HC_CONTROL.IBA_INCLUDE is enabled.
- NACK is received for the target address (HDR-CMD) of the HDR-DDR private transfers.
- the I3CC experiences the transfer underflow or receive overflow during the HDR-DDR transfers.
- after executing software initiated abort.
- there is an error reported in ERR_STATUS in the Response Data structure after decoding the parity bits, CRC byte or Frame mismatch and validating them for the read transfer.

The I3CC updates ERR_STATUS in the Response Data structure with appropriate error information and halts the I3CC and gives back the control to the application to resume the operation of I3CC by writing '1' to I3CC_HC_CONTROL.RESUME.

78.5.4.1.11.Implication of Transmit FIFO Empty and Receive FIFO Full Conditions

Under the conditions listed below, the I3CC terminates the transfer abruptly and reports it in ERR_STATUS in the Response Data structure since the clock extension is not possible in HDR mode:

- Transmit FIFO empty during the middle of write data transfer.
- In HDR-DDR mode, receive FIFO full during the middle of read data transfer through 'Controller Abort' feature.

78.5.4.1.12.Implication of TOC and ROC Bit Settings for HDR_DDR Transfers

The Termination on Completion (TOC) of Transfer command is used to decide whether to generate HDR-EXIT or HDR-RESTART to continue with the next transfer.

- If TOC is set to '1', then the I3CC generates HDR-EXIT after the end of the transfer.
- If TOC is set to '0', then the I3CC continues the next pipelined transfer based on the current transfer type.

Table 78.17. Implication of TOC and ROC Bit Settings for HDR Mode

Current Transfer	Next Transfer	Start Threshold of Next Transfer	I3CC Action
HDR-DDR	HDR-DDR	Met	• Generates HDR-RESTART at the end of transfer. • Continues with the HDR command of next transfer.
HDR-DDR	HDR-DDR	Not met	• Generates HDR-EXIT at the end of transfer. • Waits for the Start threshold for the pipelined transfer to be met. • Generates the pipelined transfer with START after the start threshold is met.
HDR-DDR	SDR	NA	• Generates HDR-EXIT at the end of transfer. • Waits for Bus-free time. • Initiates the next SDR transfer with START condition.

The Response on Completion (ROC) bit of the Transfer command is used to generate the response status of the transfer after the end of the transfer. The response status is automatically generated if any error condition occurs for the transfer, irrespective of the ROC bit.

© 2025 Microchip Technology Inc. and its subsidiaries

78.5.4.2. Clock Stalling Conditions

The I3CC stalls I3CC_SCL clock during specific scenarios of non-HDR transfers. This is to accommodate intermittent system latencies during command pipelining, transmit data pre-fetching, response reading, and so on. The I3CC also provides additional options in the form of Start Thresholds and Buffer Thresholds to avoid clock stalling.

Clock stalling is a feature that helps avoid overrun and underrun errors when the I3CC is in SDR mode.

Table 78.18. I3CC Clock Stall Conditions

Transfer Command	Previous Command Condition	Condition to Enter Clock Stalling
I3C/I2C Transfer, ACK/NACK Phase		
Write Transfer Regular command	TOC bit set to '0'	Transmit FIFO is empty
Read Transfer Regular command	TOC bit set to '0'	Receive FIFO is full
Follow-up Directed CCC command without payload (Immediate/Regular) (Not 1st Directed CCC command)	Previous Directed CCC command, TOC bit set to '0'	CMD-QUEUE is empty.
Broadcast CCC Transfer with Regular command	TOC bit set to '0'	Transmit FIFO is empty
Directed CCC Write Transfer Regular command	TOC bit set to '0'	Transmit FIFO is empty
Directed CCC Read Transfer Regular command	TOC bit set to '0'	Receive FIFO is full
Directed CCC command without Payload and ROC bit is set to '1'	TOC bit set to '0'	RESP-Queue is full
Middle of I2C Write Transfer with Regular Transfer command	NA	Transmit FIFO is empty
Middle of I2C Read Transfer with Regular Transfer command	NA	Receive FIFO is full
End of I2C Write Transfer Regular command (Only I3CC Terminates) and TOC bit set to '0'.	NA	Next command unavailable

78.5.4.3.Data Packing and Unpacking

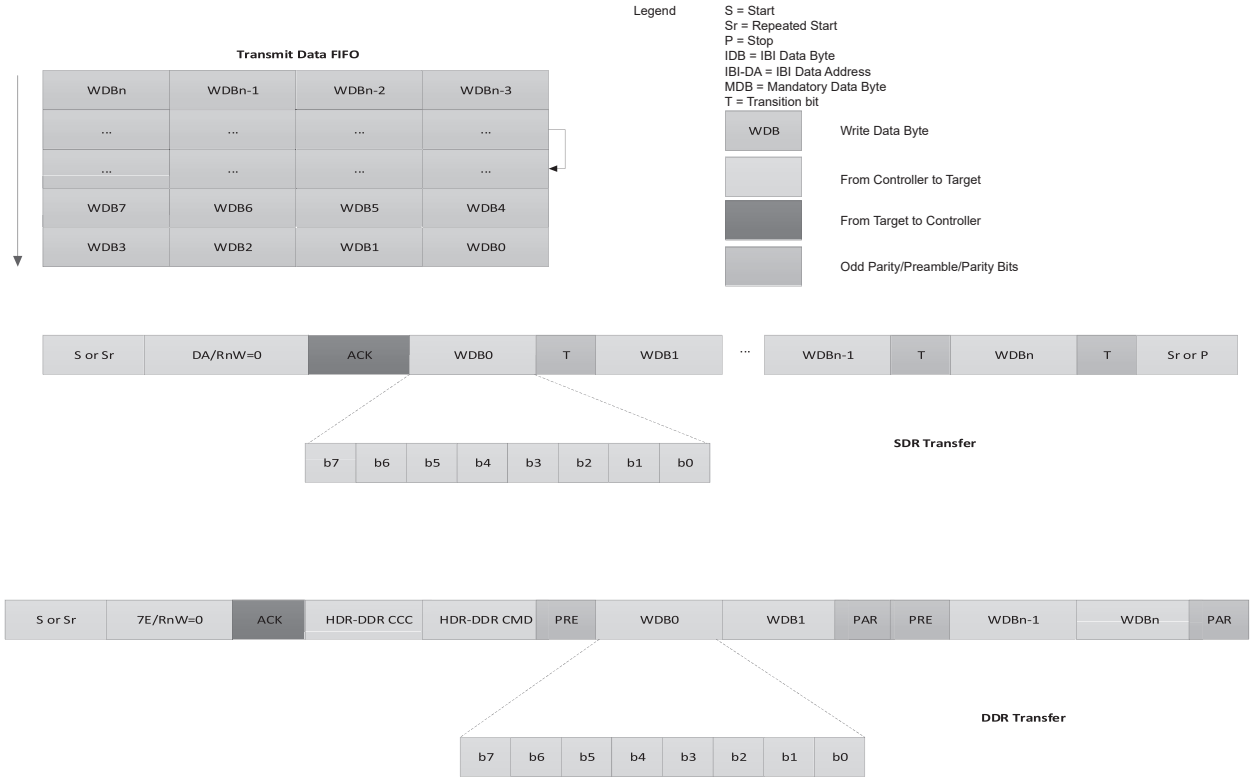
This section describes the Data packing (Receive FIFO) and Data unpacking (Transmit FIFO) during the transfers.

78.5.4.3.1.Transmission of Data by I3CC

The data to be transmitted is expected to be provided to the I3CC in the Transmit FIFO, as shown in the following figure.

The I3CC puts the Least Significant Byte of data as the first byte on the I3C bus, followed by successive bytes.

Figure 78.3. Byte Ordering -Transmit Data

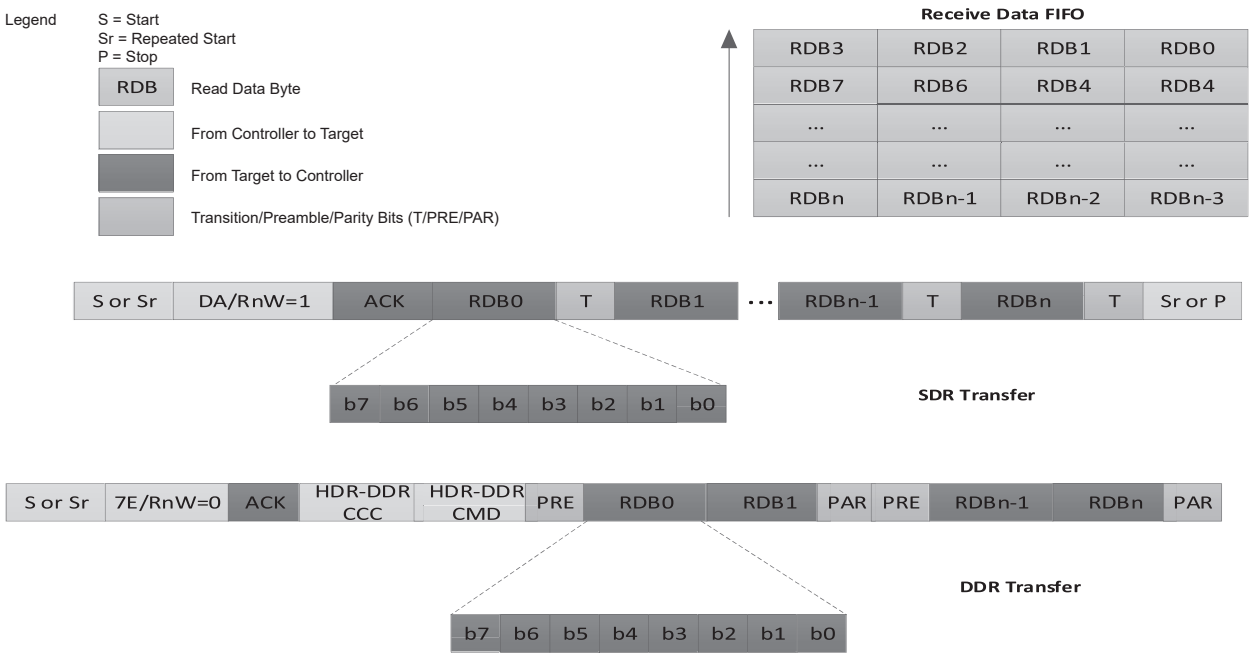


78.5.4.3.2.Packing of Private Read Data by I3CC into Receive FIFO

The I3CC receives the bytes in the same order as on the bus and places the first byte received in the Least Significant Byte (LSB) position, and the following bytes in the LSB + 1 location, until all the four bytes of a word are received in the Receive FIFO. This is shown in the following figure.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 78.4. Byte Ordering - Receive Data

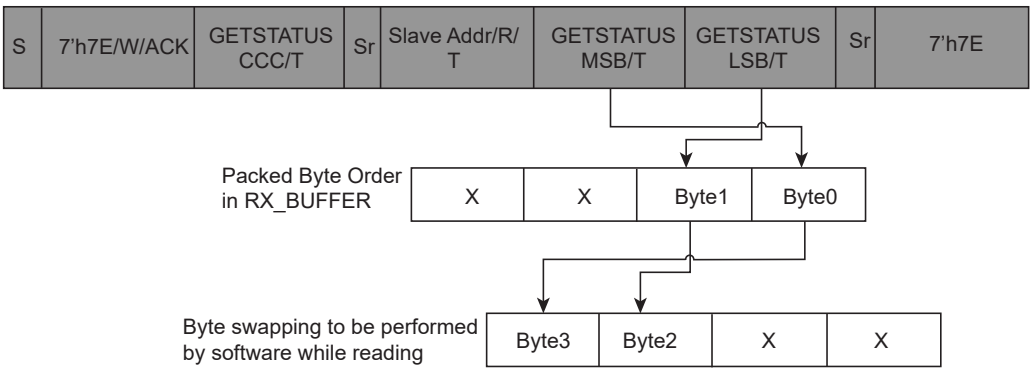


78.5.4.3.3.Packing of Any Read Data by I3CC into Receive FIFO

The I3CC does not differentiate read data coming from a private read transfer and read data coming from a CCC. The I3CC is also transparent to CCC, that is, it does not decode the CCC as an I3CC and does not treat CCCs differently from one another. The data packing logic for CCCs also follows the same rules as mentioned for private transfers. Therefore, for CCCs, it is expected that the software manages endianness while reading the data.

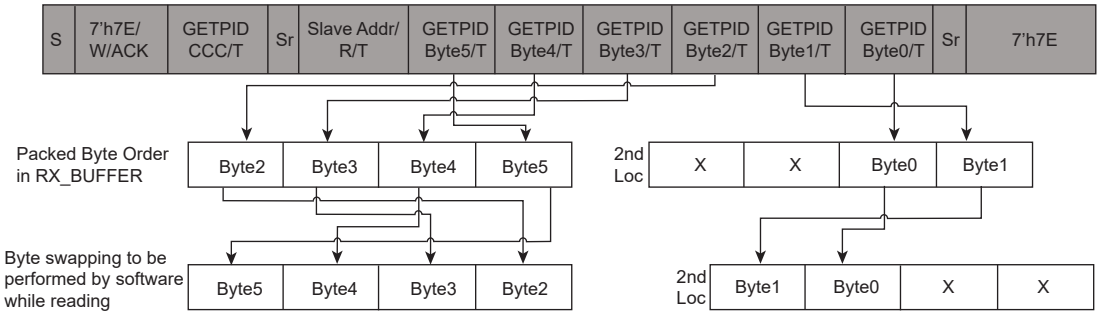
As an example, the figures below show the byte-swapping to be performed by software for GETSTATUS CCC and GETPID CCC, respectively.

Figure 78.5. Example 1: CCC - GETSTATUS (0x90)



© 2025 Microchip Technology Inc. and its subsidiaries

Figure 78.6. Example 2: CCC - GETPID (0x8D)

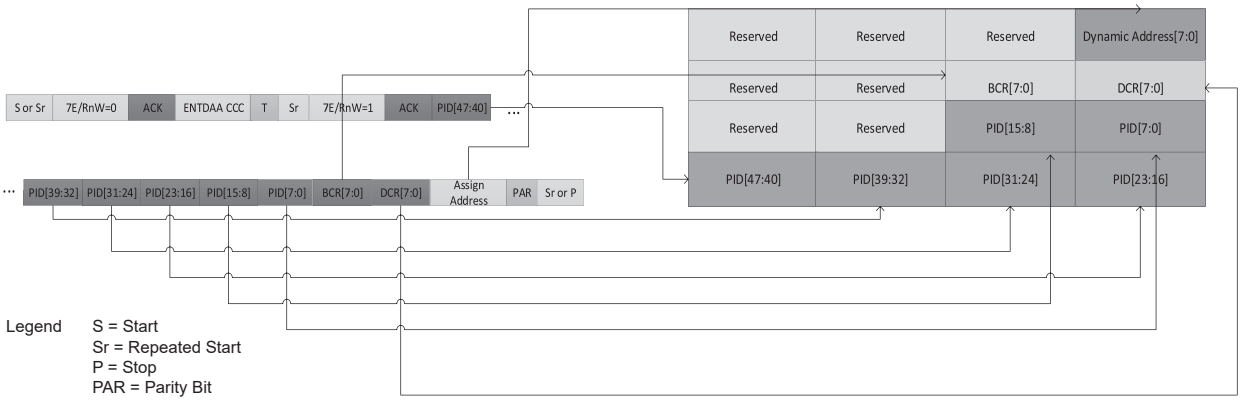


78.5.4.3.4.Packing of Received ENTDAA data by I3CC into DCT Table.

The I3CC receives the bytes for the ENTDAA transfer in the same order as on the bus and places the first byte received in the Least Significant Byte position, and the following bytes in the LSB + 1 location, until all the four bytes of a word have been received in the DCT. The PID[47:16] is stored in the DCT base offset.

DCT_SECTION_OFFSET[TABLE_OFFSET] location and PID[15:0] are stored at DCT base offset + 1 location, BCR, DCR bytes at DCT base offset + 2 location, and assigned dynamic address in DCT base offset + 3 location. This is shown in the following figure.

Figure 78.7. Byte-Ordering - ENTDAA Transfer



78.5.5. Device Address

In an I3C system, static address devices are those enhanced from an I2C to an I3C system and that obtain a dynamic address.

Dynamic address devices are developed for an I3C system, and they do not have an I2C static address.

Target devices obtain the dynamic address from the I3CC after they are enabled through any of the address assignment Common Command Codes (CCC) such as ENTDAA, SETDASA, or SETAASA. If required, the application can still program the dynamic address of the targets under special circumstances, such as after exiting the Low-Power mode when the old dynamic address programmed by the I3CC has to be re-programmed.

© 2025 Microchip Technology Inc. and its subsidiaries

78.5.6. In-Band Interrupt (IBI)

The I3C protocol also gives provision to support in-band interrupts within the two-wire interface, which reduces the device pin count and signal paths. The in-band interrupt is initiated by the I3C target device to the I3CC.

Additionally, I3C uses in-band interrupts to generate hot-join requests (to request the I3CC to assign an I3C dynamic address).

78.5.7. System Interrupts

The Interrupt Status register (I3CC_INTR_STATUS) and PIO Interrupt Status register (I3CC_PIO_INTR_STATUS) are associated with error and status condition reporting. These registers trigger the interrupt signal which is synchronous with the user interface clock.

The triggering of the interrupt line can be disabled by the Interrupt Signal Enable register (I3CC_INTR_SIGNAL_ENABLE) and the PIO Interrupt Signal Register (I3CC_PIO_INTR_SIGNAL_ENABLE). By default, all interrupts are enabled. When any bit of these registers is set to ‘0’, it disables the generation of interrupts in that specific interrupt pin. Thus, the interrupt signal outputs can be controlled by I3CC_INTR_SIGNAL_ENABLE and I3CC_PIO_INTR_SIGNAL_ENABLE.

The interrupt bit is always set in I3CC_INTR_STATUS or I3CC_PIO_INTR_STATUS, irrespective of I3CC_INTR_SIGNAL_ENABLE and I3CC_PIO_INTR_SIGNAL_ENABLE.

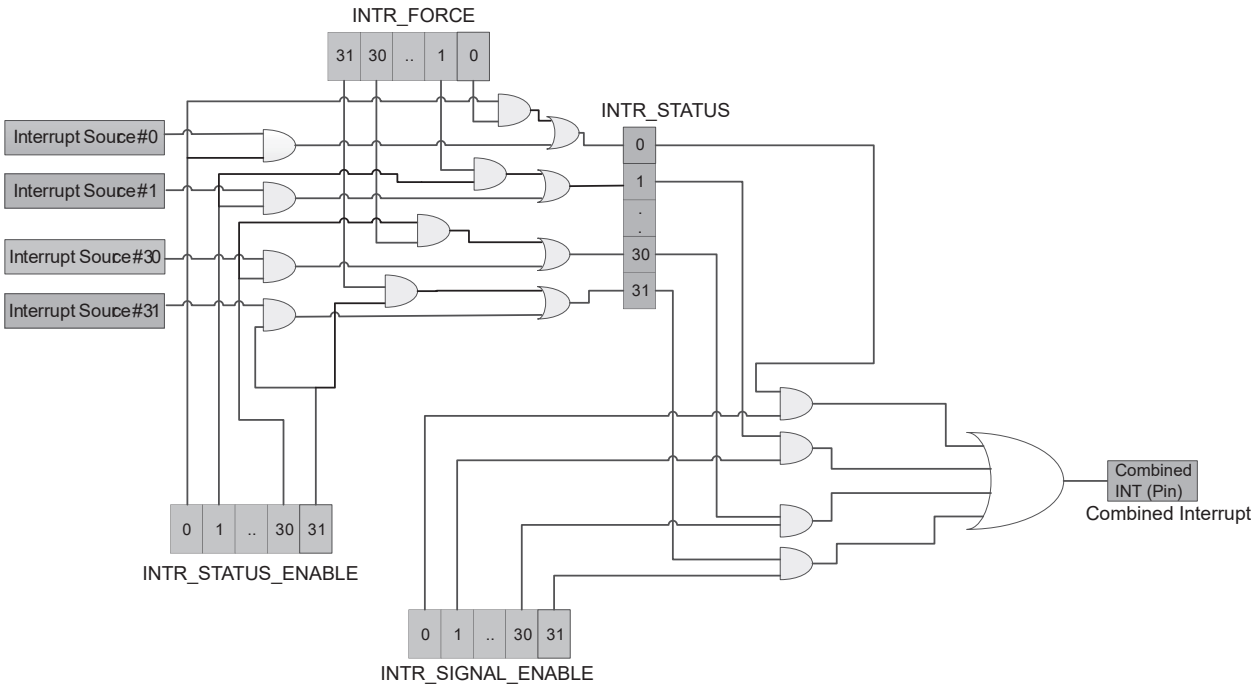
The Interrupt Force registers (I3CC_INTR_FORCE and I3CC_PIO_INTR_FORCE) are used for test purposes, and trigger interrupt events individually, without the need to activate the conditions that trigger the interrupt sources. Setting any bit of these registers to ‘1’ triggers the corresponding interrupt, provided the corresponding bit in I3CC_INTR_STATUS_ENABLE or I3CC_PIO_INTR_SIGNAL_ENABLE is set.

I3CC_INTR_STATUS and I3CC_PIO_INTR_STATUS are used to check the true status of the interrupt events which are activated through specific bits in I3CC_INTR_STATUS_ENABLE and I3CC_PIO_INTR_SIGNAL_ENABLE. This register consists of the status of interrupt sources irrespective of disabling in I3CC_INTR_SIGNAL_ENABLE and I3CC_PIO_INTR_SIGNAL_ENABLE. When any bit of I3CC_INTR_STATUS_ENABLE or I3CC_PIO_INTR_SIGNAL_ENABLE is set to ‘0’, it disables the generation of the interrupt in that specific I3CC_INTR_STATUS or I3CC_PIO_INTR_STATUS bit and the interrupt line.

The following figure shows the interrupt generation mechanism in the I3CC.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 78.8. Interrupt Mechanism



78.5.8. Dynamic Address Assignment (DAA)

78.5.8.1. Overview

The I3CC performs a Dynamic Address Assignment (DAA) procedure to provide a unique dynamic address to each I3C device connected to the I3C bus.

The I3CC provides a dynamic address to a device for the following conditions:

1. Upon initialization of the I3C bus
2. When the device is connected to an already configured I3C bus (indicated through hot-join or other methods)

Once a device receives a dynamic address, this dynamic address is used in all the device's subsequent transactions on the I3C bus.

78.5.8.2. Description of DAA Methods

78.5.8.2.1. SETDASA Procedure (Format 1: Primary)

The I3CC assigns a dynamic address to I3C devices with a known static address using the directed command code Set Dynamic Address from Static Address (SETDASA). This is faster than using the ENTDAA procedure (see ENTDAA Procedure). The SETDASA process is initiated by the I3CC after a cold power-up of the system.

The following flow describes the DAA using the SETDASA procedure:

1. The application initializes the I3CC.
2. The application programs the device address table with the data structure as shown in the following figure.
   Note: Do not use the Reserved fields during address assignment procedure. Doing so may result in unexpected behavior.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 78.9. SETDASA Device Address Table Data Structure

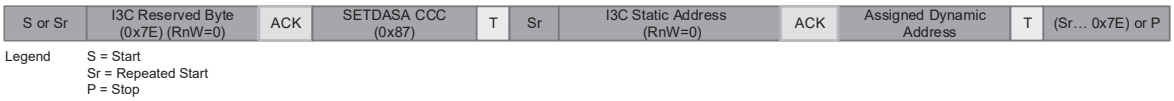
The number of locations to be programmed is determined by the following:

a. Number of I3C static address devices to be assigned with dynamic address with single Address Assignment command.

b. Number of locations available in the device address table.

3. The application issues the Address Assignment command with the following (see Address Assignment Command):
   a. SETDASA command code in the CMD field.
   b. DEV_INDEX field pointing the location in the device address table from where the dynamic address is to be assigned
   c. DEVICE_COUNT field indicates the number of devices to be assigned with the dynamic address by incrementing the DEV_INDEX field of the same command sequentially as many times as DEVICE_COUNT. Program the DEVICE_COUNT value in such a way that DEVICE_COUNT+DEV_INDEX must not cross the device address table depth.
4. The I3CC starts executing the SETDASA CCC transfer as soon as the Address Assignment command is issued as shown:

Figure 78.10. SETDASA CCC Transfer



5. The DAA continues until one of the following conditions occurs:
   a. NACK response is received for the header 0x7E, RnW=0 (No I3C devices present)
   b. NACK response is received for the static address (not a valid static address or the device does not exist)
   c. DEVICE_COUNT reaches zero (end of address assignment request)
6. The I3CC writes the Transfer Complete status into the Command Response queue. If the transfer is terminated abruptly due to a NACK response from the target, the field DATA_LENGTH of the Response Data Structure indicates the remaining device count.

78.5.8.2.2.SETDASA Procedure (Format 2: Point-to-point)

The SETDASA CCC may also be used for simple point-to-point communication in I3C minimal bus use cases. An I3C minimal bus is an I3C bus with one I3C device and one I3C target device.

In this special usage of the SETDASA CCC, the I3CC uses the fixed value 0x01 as the static address, and uses the fixed (and reserved) value of 0x01 as the dynamic address.

The following flow describes the Dynamic Address Assignment using the SETDASA procedure in point-to-point communication:

1. The application initializes the I3CC.
2. The application programs the device address table with the data structure as shown in the following figure.
   Note: Do not use the Reserved fields during address assignment procedure. Doing so may result in unexpected behavior.

© 2025 Microchip Technology Inc. and its subsidiaries

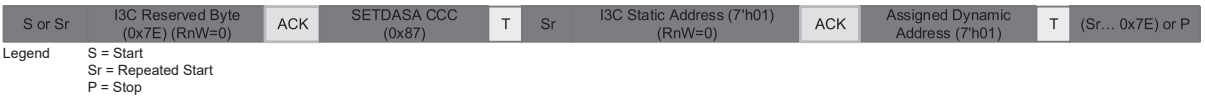
Figure 78.11. SETDASA Device Address Table Data Structure

The number of locations to be programmed is 1 as there is only one target in the system to assign the address.

The static address and the dynamic address field of the data structure must be programmed as 0x01.

3. The application issues the Address Assignment command with the following:
   a. SETDASA command code in the CMD field.
   b. DEV_INDEX field pointing to the location in the Device Address Table (DAT) in which the static address (0x01) and dynamic address (0x01) are assigned.
   c. DEVICE_COUNT field is programmed to '1' as there is only one device to be assigned with the dynamic address.
4. The I3CC starts executing the SETDASA CCC transfer as soon as the Address Assignment command is issued as shown:

Figure 78.12. SETDASA CCC Transfer



5. The Dynamic Address Assignment continues until one of the following conditions occur:
   a. NACK response is received for the header 0x7E, RnW=0 (No I3C devices present).
   b. NACK response is received for the static address (Not a valid static address or the device does not exist).
   c. DEVICE_COUNT reaches zero (End of address assignment request).
6. The I3CC writes the Transfer Complete status into the Command Response queue. The field DATA_LENGTH of the Response Data Structure indicates the remaining device count if the transfer is terminated abruptly due to NACK response from the target.

78.5.8.2.3.ENTDAA Procedure

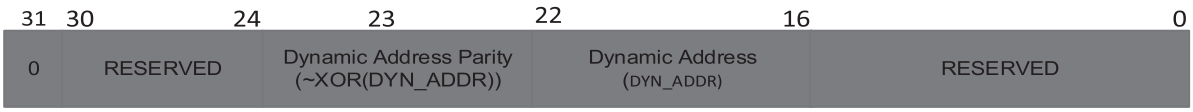
The I3CC assigns a dynamic address to any I3C device not assigned a dynamic address, using the broadcast command code Enter Dynamic Address Assignment (ENTDAA). This process is initiated by the I3CC after a cold power-up, after completing the Dynamic Address Assignment for static address devices using the SETDASA procedure, or if a hot-join request is received from any I3C device. The I3CC may choose to use a single or multiple ENTDAA Address Assignment commands to assign a dynamic address for all the connected I3C devices. The number of devices that can be assigned to a single command is limited by the configured value of the DAT and the Device Characteristics Table.

The following flow describes the Dynamic Address Assignment using ENTDAA procedure:

1. The application initializes the I3CC.
2. The application programs the DAT with the data structure as shown in the following figure:
   Note: Do not use the Reserved fields during address assignment procedure. Doing so may result in unexpected behavior

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 78.13. ENTDAA Device Address Table Data Structure



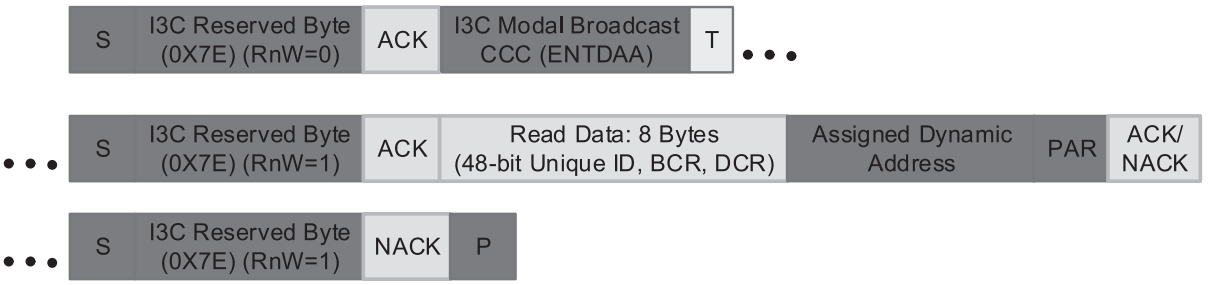
The number of locations to be programmed is determined by:

a. Number of I3C devices to be assigned with a dynamic address with a single Address Assignment command.

b. Number of locations available in the DAT.

3. The application issues the Address Assignment command with the following:
   a. ENTDAA command code in the CMD field.
   b. DEV_INDEX field pointing to the location in the DAT from where the dynamic address is to be assigned.
   c. DEVICE_COUNT field indicating the number of devices to be assigned with the dynamic address with the single command. DEVICE_COUNT value cannot be more than the IC_DEV_CHAR_TABLE_BUF_DEPTH/4, and the value must be programmed so that DEVICE_COUNT+DEV_INDEX must not exceed the DAT table depth.
4. The I3CC starts executing the ENTDAA CCC transfer as soon as the Address Assignment command is issued as shown in the following figure:

Figure 78.14. ENTDAA CCC Transfer



5. The first winning device gets the first dynamic address pointed to by the DEV_INDEX of the command. The second winning device gets the second dynamic address pointed to by the DEV_INDEX+1, and so on.
   The received 48-bit PID, BCR and DCR along with the assigned dynamic address are captured in the Device Characteristics Table.
6. The Dynamic Address Assignment continues until one of the following conditions occurs:
   a. NACK response is received for the header 0x7E, RnW=0 (No I3C devices present)
   b. NACK response is received for the restart header 0x7E, RnW=1 (All devices got the dynamic address)
   c. NACK response received for the assigned dynamic address (Error detected by the receiving I3C device on the dynamic address)
   d. DEVICE_COUNT reaches zero regardless of the number of devices yet to be assigned to the dynamic address (End of address assignment request)
7. The I3CC writes the Transfer Complete status into the Command Response queue. The field DATA_LENGTH of the Response Data Structure indicates the remaining device count in case the transfer is terminated abruptly due to a NACK response from the target.

© 2025 Microchip Technology Inc. and its subsidiaries

Notes:

1. Complete ENTDAA transfer from START condition to STOP condition is generated in I3C Open-Drain mode.
2. The application must calculate the dynamic address parity before populating the DAT location.

78.5.8.2.4.SETAASA Procedure

The I3CC can also request for all connected targets (which have a static address) to use their known static address as their dynamic address. This is the fastest method to assign I3C dynamic addresses to all targets with static addresses. This application must use the Regular Transfer command instead of the Address Assignment command to issue the SETAASA Transfer command.

The following flow describes the Dynamic Address Assignment using the SETAASA procedure:

1. The application initializes the I3CC.
2. The application issues the Regular Transfer command to generate Broadcast SETAASA CCC transfer without Data Payload.
3. The I3CC starts executing the SETAASA CCC transfer as soon as the Regular Transfer command is issued, as shown in the following figure.

Figure 78.15. SETAASA CCC Transfer

4. The Dynamic Address Assignment continues until it generates SETAASA CCC on the line or it ends if it receives NACK response for the header 0x7E, RnW=0 (No I3C devices present).
5. The I3CC writes the Transfer Complete status in the Command Response queue. ERR_STATUS in the Response Data structure indicates whether the transfer is completed successfully, or terminated abruptly due to NACK response from the targets.

Note: After successfully transmitting the SETAASA CCC command, the application must update the DAT[Dynamic Address] to DAT[Static Address] to reflect that the dynamic address is equivalent to the static address of the target.

78.5.9. In-Band Interrupt (IBI) Detection and Handling

In-Band Interrupt (IBI) allows I3C target devices to initiate communication with the I3CC. The following types of IBIs are possible on an I3C bus:

- Hot-Join request from a Hot-Join capable target
- In-Band Interrupt request (IBI) from a target
- Controller-role request (CRR) from a Controller-capable target (Secondary Controller)

The I3CC must be enabled to detect (I3CC_SDA low) and receive the In-Band interrupt (IBI ID). The I3CC detects the IBI in the following scenarios:

- Upon detecting low on the I3CC_SDA input port after a Power-On-Reset (POR).
- Upon detecting an arbitration loss during an address phase of any controller-initiated transfer following a START condition (not RESTART).
- Upon detecting the I3CC_SDA input port going (not initiated by the controller) low following a STOP condition (target-initiated IBI).

The following table captures the key controls that are available that determine the response to the target-initiated IBIs and notification to the I3CC application on any rejected IBI (NACK).

© 2025 Microchip Technology Inc. and its subsidiaries

Table 78.19. IBI Response and Notify Controls

IBI Context	I3CC Control
Controller Enable	I3CC_HC_CONTROL.BUS_ENABLE
CRR Response Control (to target)	DAT Entry [CRR_REJECT]
IBI Response Control (to target)	DAT Entry [IBI_REJECT]
HJ Response Control (to target)	I3CC_HC_CONTROL.HOT_JOIN_CTRL
CRR Reject Notify Control (to APP)	I3CC_IBI_NOTIFY_CTRL.NOTIFY_CRR_REJECTED
IBI Reject Notify Control (to APP)	I3CC_IBI_NOTIFY_CTRL.NOTIFY_IBI_REJECTED
HJ Reject Notify Control (to APP)	I3CC_IBI_NOTIFY_CTRL.NOTIFY_HJ_REJECTED
IBI Payload Control	DAT Entry [IBI_PAYLOAD]
IBI Data Chunk Size	I3CC_QUEUE_THLD_CTRL.IBI_DATA_THLD

78.5.9.1.I3C Hot-Join Request (HJ)

If the received IBI ID matches the hot-join ID (0x02, RnW=0), then the response for the received HJ request is based on the programmed HJ Response Control.

If the HJ Response Control is set to '0', then the controller responds to the HJ request with ACK and sets IBI_STS to ACK to indicate to the application that the controller has ACK'ed the received HJ request.

If the HJ Response Control is set to '1', then the controller responds to the HJ request with a NACK followed by a broadcast DISEC CCC command (DISHJ bit set) with the RESTART condition. This disables the HJ request generation from all the unaddressed devices at that instant. The controller sets the IBI_STS field in the IBI Status Data Structure (see IBI Status Data Structure) to NACK to indicate to the application that the controller has rejected the received HJ request. The application can optionally set the HJ Reject Notify Control to get an IBI status for a rejected HJ request. Otherwise, the controller moderates the IBI status generation for rejected HJ requests.

Based on the IBI status for the HJ request, the application must issue the ENTDAA to assign the dynamic address for the devices that generate the HJ request.

78.5.9.2.I3C Controller-Role Request (CRR)

The application must set the CRR Response Control to '1'. This requirement allows the I3CC to reject any CRR request if received unexpectedly from a malfunctioning device.

78.5.9.2.1.CRR Response Control

The I3CC handles the CRR response to the target through the CRR_REJECT control of the corresponding DAT entry.

The I3CC responds to the CRR with NACK followed by a directed DISEC CCC command with the RESTART condition to the CRR-initiated target. The I3CC sets the IBI_STS field as NACK to indicate to the application that the I3CC has rejected the received CRR. The application can optionally set the CRR Reject Notify Control to get an IBI Status for a rejected CRR. Otherwise, the I3CC moderates the IBI Status generation for rejected CRR.

If the received IBI ID (CRR) does not match any of the dynamic address entries of the DAT table, then the I3CC sends a NACK response and generates IBI status to the application. The I3CC does not send a disable event command and expects the application to take necessary action if the unknown device repeatedly interrupts. In this case, the generation of the IBI status is independent of the CRR Reject Notify Control settings.

78.5.9.3.I3C In-Band Interrupt Request (IBI)

If the received IBI ID matches the dynamic address of any one of the valid entries in the DAT and the received RnW bit is '1', then the response for the received IBI is based on the programmed IBI Response Control.

The table below captures the supported IBI features in different configurations.

© 2025 Microchip Technology Inc. and its subsidiaries

Table 78.20. In-Band Interrupt Request Feature Support

IBI Type	I3CC Support
IBI without Payload	Supported
IBI with Payload	Supported
IBI Auto command	Supported (SDR Only)

78.5.9.3.1.IBI Response Control

The I3CC handles the IBI response to the target through the IBI_REJECT control of the corresponding DAT entry.

If IBI Response Control is set to '1', the I3CC NACKs the IBI and issues a directed DISEC CCC command (DISINT bit set) with the RESTART condition targeting the matching dynamic address. This disables the IBI generation in the requested target device. The IBI status for the corresponding IBI indicates to the application that the incoming IBI is NACK'ed through the IBI_STS descriptor (see IBI Status Data Structure).

If IBI Response Control is set to '0', then the I3CC ACKs the IBI. If the IBI Payload Control is set to '1', then the I3CC continues to generate the I3CC_SCL clocks after the ACK to accept the IBI payload bytes starting from the Mandatory Data Byte (MDB) until the target terminates the transfer. The application must set the IBI Payload Control to '1' only when the target device supports the mandatory byte (BCR[2]=1). If the IBI Payload Control is set to '0', then the I3CC stops generating the I3CC_SCL clock after acknowledging the IBI. The I3CC then notifies the application to take necessary action for the accepted IBI. The application must not set the IBI Payload Control bit to '1' when the target device does not support the mandatory data byte (BCR[2]=0).

If the received IBI ID (IBI) does not match with any of the dynamic address entry of the DAT table, then the I3CC sends a NACK response and generates IBI status to the application. The I3CC does not send any Disable Event command and expects the application to take necessary action if the unknown device repeatedly interrupts. In this case, the generation of IBI status is independent of the IBI Reject Notify Control settings.

The I3CC supports the Auto command (read) feature. It issues a Read command to the interrupting device upon detecting an expected MDB value. The expected MDB value is set in the DAT by programming DAT[AUTOCMD_MASK] and DAT[AUTOCMD_VALUE] fields. The I3CC computes the match as per the following expression before issuing a Read command to the requesting device:

DAT[AUTOCMD_MASK] & MDB = DAT[AUTOCMD_VALUE]

This feature enables the application to read the target as soon as the data is available for reading (indicated through IBI). Thus any delay in issuing a Read command due to system latency is avoided.

If there is a match on the received MDB, the I3CC accepts the payload until the target device terminates and then issues a Read command to the same target with the RESTART condition. If there is no match on the received MDB, the I3CC does not issue the Auto command and waits for the target device to terminate the IBI transfer.

Auto command is issued only in SDR mode and is not supported in HDR mode.

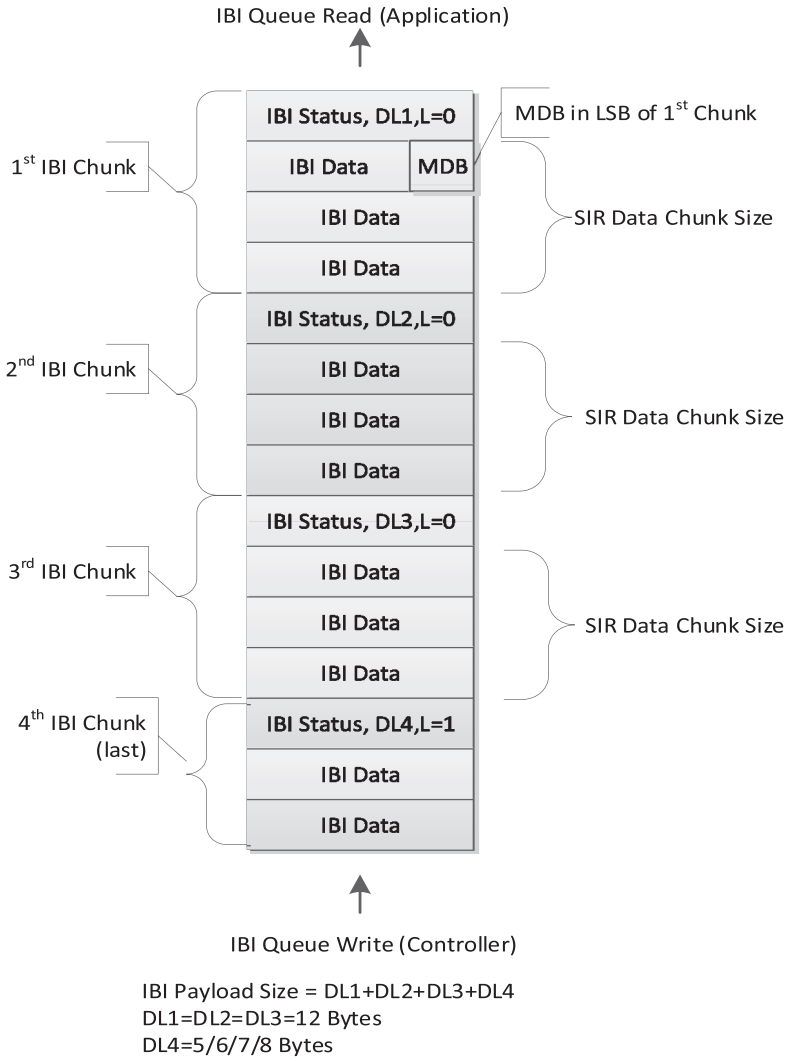
78.5.9.4.IBI Queue Data Structure

The IBI queue comprises of the interleaved data received from the target device, and the status generated from the I3CC for the respective data slice of IBI or HJ/CRR.

The data portion of the structure comprises the data received from the target device along with the IBI (MDB + other payload bytes if any) or the data received for the Auto command issued for the requesting device. If the data payload size of the IBI goes above the programmed IBI data chunk size, then the I3CC slices the incoming data into multiple chunks and generates an IBI status for each chunk. The last data chunk is indicated as LAST_STATUS=1 in the corresponding IBI status. The following figure shows an example of the IBI queue data structure holding the IBI data and the status for an IBI with non-multiple chunk size data.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 78.16. IBI with Payload Structure (with last data chunk less than programmed data chunk size)

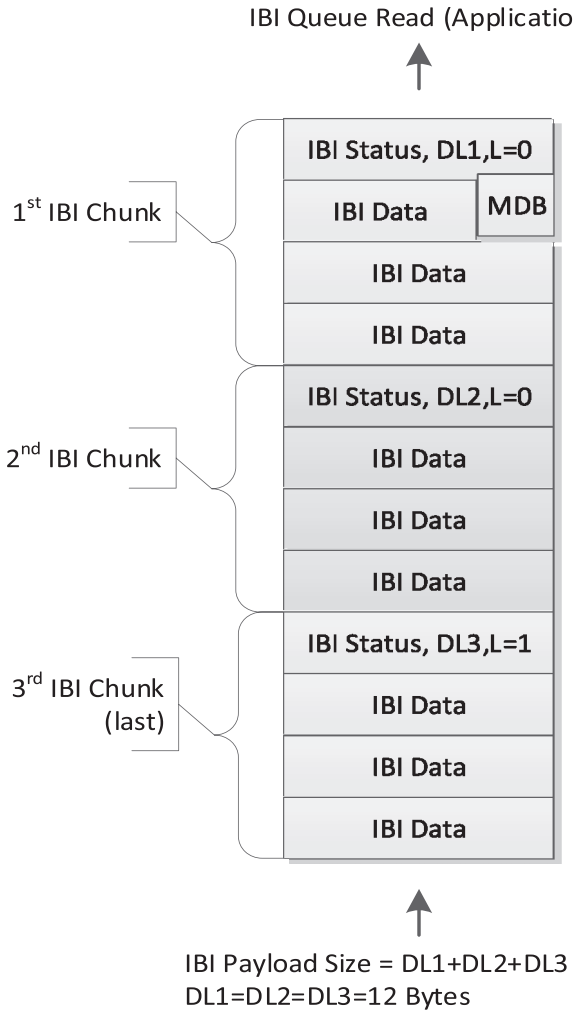


The application reads the IBI queue upon detecting the interrupt status I3CC_PIO_INTR_STATUS.IBI_STATUS_THLD_STAT. The interrupt can be moderated by setting the I3CC_QUEUE_THLD_CTRL.IBI_STATUS_THLD. The first location read always provides the IBI status for the first chunk, which includes the data length of that chunk in bytes. The application can read the data portion of the chunk without waiting for any further interrupt. The number of data reads must be limited to the data length field of the corresponding status.

The following figure shows an example of the IBI queue data structure holding the IBI data and the status for an IBI with exact multiples of the programmed IBI Data Chunk Size.

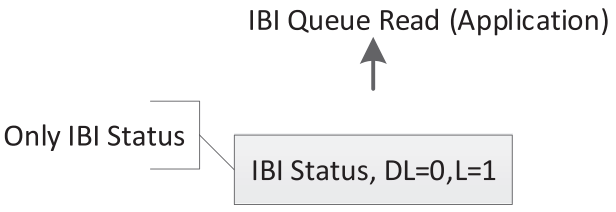
© 2025 Microchip Technology Inc. and its subsidiaries

Figure 78.17. IBI with Payload Structure (with the last chunk equal to the programmed chunk size)



The following figure shows an example of the IBI queue data structure holding only the IBI status. This structure is applicable for all IBIs that do not support the payload, which includes the HJ, the IBI without payload, and the CRR.

Figure 78.18. IBI without Payload Structure



78.5.9.5.IBI Notification Control

The I3CC generates an IBI response only for the received IBIs for which an ACK response is sent. Optionally, the response generation for the NACK'ed IBIs is enabled by setting the appropriate Reject Notify Control (see IBI Response and Notify Controls).

When the Hot-Join Reject Notify Control is set to '1', the I3CC notifies the application by generating an IBI response when a valid Hot-Join request is received for which a NACK response was sent followed by a broadcast Auto Disable CCC command.

© 2025 Microchip Technology Inc. and its subsidiaries

Assuming the CRR Reject Notify Control is set to '1', the I3CC notifies the application by generating an IBI response when a valid CRR is received, for which a NACK response is sent, followed by a directed Auto Disable CCC command to the requesting target device.

When the IBI Reject Notify Control is set to '1', the I3CC notifies the application by generating an IBI response when a valid IBI request is received, for which a NACK response is sent followed by a directed Auto Disable CCC command to the requesting target device.

When an unsupported/Invalid IBI (CRR, HJ/RnW=1) or an IBI from an unknown target device (no valid entry in DAT) is received, the I3CC responds with NACK regardless of Reject Notify Control and notifies the application. The I3CC does not issue any Auto Disable command in this case.

If the IBI Status Queue is full when any non-IBI request is detected, the I3CC continues to provide the I3CC_SCL clock to receive the IBI ID and responds with NACK at the end (But does not issue DISEC CCC). This allows the requesting target to re-attempt the IBI on the next START condition or upon detecting a bus available period

If the IBI Data Queue is full when an IBI request is detected, the I3CC continues to provide I3CC_SCL clock to receive the IBI ID and enters to clock stall state during the ACK space of the IBI ID until a free space is available in the IBI Data Queue. If the IBI Data Queue goes full in the middle of an IBI data reception (ACK'ed IBI), the I3CC stalls the I3CC_SCL clock by driving low until a free space is available to start accepting further bytes.

To avoid IBI Status and Data Queues becoming full, it is important to drain Status and Data from IBI queue as soon as they become available. Hence, set the IBI Status threshold be to '0'. This ensures that as soon as the first status from an IBI is available in the IBI queue, the application is notified through IBI Status Threshold Met interrupt.

78.5.10. Disabling I3CC

The I3CC can be disabled at any time by writing I3CC_HC_CONTROL.BUS_ENABLE to '0'. If I3C bus transfers are in progress (for example, receiving/transmitting an I3C transfer or receiving an IBI), then the I3CC enters the disabled state only after completing either the Transfer command with TOC=1 or the IBI reception. The disable state is entered when I3CC_HC_CONTROL.BUS ENABLE is confirmed to be '0'. Once the I3CC enters the Disabled state, it does not execute any commands from the Command Queue and does not provide a clock for a new IBI.

The application is expected to flush/drain all the queues and the FIFOs before re-enabling the I3CC.

78.5.11. Aborting Transfers of I3CC

The I3CC aborts any on-going I3C bus transfer by setting I3CC_HC_CONTROL.ABORT.

In response to an abort request, the I3CC issues the STOP condition after the on-going data byte is transferred or received. The I3CC then generates an interrupt, sets I3CC_INTR_STATUS.TRANSFER_ABORT_STAT and enters the halt state.

The I3CC then waits for the application to issue the Resume command by setting I3CC_HC_CONTROL.RESUME to exit the halt state.

The application is expected to flush/drain all the queues and the FIFOs before programming the I3CC_HC_CONTROL.RESUME to resume the I3CC.

78.5.12. SCL Generation and Timings Based on Bus Configuration

78.5.12.1.Overview of SCL Generation and Timings in I3CC

The I3C protocol supports three different bus configurations to determine the speed options. Bus configurations and their supported speed modes are shown in the following table.

© 2025 Microchip Technology Inc. and its subsidiaries

Table 78.21. Bus Configuration and Supported Speed Modes

Speed Mode	Bus Configuration		
	Pure Bus (Only I3C Devices)	Mixed Fast Bus (Both I3C and I2C devices)(1)	Mixed Slow and Limited Bus (Both I3C and I2C devices)(1)
SDR Mode	Any speed to f_{SCL} (Max)	FM, FM+, f_{SCL_MIXED} (Min) to f_{SCL_MIXED} (Max), or slower using duty cycle	FM or FM+ only
HDR-DDR Mode	Yes	Yes, using f_{SCL_MIXED}, or slower using duty cycle	No

Note:

1. In this configuration, I2C devices do not perform clock stretching but have a glitch filter.

As indicated in the table above, the I3C Protocol Specification recommends extending the low period (varying the duty-cycle), which changes the bus frequency in Pure Bus and Mixed Fast Bus system. The high period must never exceed 45 ns (corresponding to 11 MHz clock frequency), thus staying below the 50 ns required by the I2C glitch filter; however, the low period can be of any length permitted by the I3C device's allowed clock frequency range. The extended low period can be used for certain slow I3C devices supporting lower data rate (2, 4, 6, or 8 MHz).

The timing parameters for the subsequent transfer after the Address Header/Address Phase is selected based on the mode of the transfer:

- I3C Transfer: Push-Pull Timing
- I2C Transfer: Open-Drain Timing

Notes:

1. ACK for address phase of I3C transfer is always driven in Open-Drain mode.
2. Complete ENTDAA transfer from START condition to STOP condition is generated in I3C Open-Drain mode.

78.5.13. Derivation of I3C/I2C Timing Parameters from Timing Registers

This section describes how the timing parameters are derived from the Timing registers in different bus configurations.

Table 78.22. I3C Timing When Communication with I2C Legacy Devices(1)

Parameter	Symbol	Legacy Mode 400 kHz/FM	Legacy Mode 1 MHz/FM+	Units	Notes
I3CC_SCL Frequency	f_{SCL}	1/((I2C_FM_LCNT+ I2C_FM_HCNT)*GCLK_PER)	1/((I2C_FMP_LCNT, I2C_FMP_HCNT)*GCLK_PER)	MHz	–
Setup Time for a Repeated START	t_{SU_STA}	I2C_FM_HCNT*GCLK_PER	I2C_FMP_HCNT*GCLK_PER	ns	–
Hold Time for a Repeated START	t_{HD_STA}	I2C_FM_HCNT*GCLK_PER	I2C_FMP_HCNT*GCLK_PER	ns	–
I3CC_SCL Clock Low Period	t_{LOW}	I2C_FM_LCNT*CCLK _PER	I2C_FMP_LCNT*GCLK_PER	ns	–
I3CC_SCL Clock High Period	t_{HIGH}	I2C_FM_HCNT*GCLK_PER	I2C_FMP_HCNT*GCLK_PER	ns	–
Data Setup Time	t_{SU_DAT}	(I2C_FM_LCNT-SDA_TX_HOLD)*GCLK_PER	(I2C_FMP_LCNT-SDA_TX_HOLD)*GCLK_PER	ns	Data setup is considered for the write transfer from the I3CC alone point of view. The system delays are not considered.
Data Hold Time	t_{HD_DAT}	SDA_TX_HOLD*GCLK_PER	SDA_TX_HOLD*GCLK_PER	ns	Data hold is considered for the write transfer from the I3CC alone point of view. The system delays are not considered.
Setup Time for STOP	t_{SU_STO}	I2C_FM_HCNT*GCLK_PER	I2C_FMP_HCNT*GCLK_PER	ns	–
Bus Free Time between a STOP condition and a START condition	t_{BUF}	I3C_HC_FREE*GCLK_PER	I3C_HC_FREE*GCLK_PER	ns	–

© 2025 Microchip Technology Inc. and its subsidiaries

Note:

1. GCLK_PER is the period of the I3CC clock.

Table 78.23. I3C Open-Drain Timing Parameters[1]

Parameter	Symbol	I3C Open-Drain Mode	Units	Notes
Low Period of I3CC_SCL Clock	t_{LOW_OD}	I3C_OD_LCNT*GCLK_PER	ns	–
High Period of I3CC_SCL Clock	t_{HIGH}	I3C_OD_HCNT*GCLK_PER	ns	–
I3CC_SDA Data Setup Time During Open-Drain Mode	t_{SU_OD}	(I3C_OD_LCNT – SDA_TX_HOLD)*GCLK_PER	ns	–
Clock After START Condition	t_{CAS}	I3C_HC_FREE*GCLK_PER	ns	–
Clock Before STOP Condition	t_{CBP}	I3C_HC_FREE*GCLK_PER	ns	–

Note:

1. GCLK_PER is the period of the I3CC clock.

Table 78.24. I3C Push-Pull Timing Parameters for SDR and HDR-DDR Modes[1]

Parameter	Symbol	I3C Push-Pull Mode	Units	Notes
SCL Clock Frequency	f_{SCL}	1/((I3C_PP_LCNT+ I3C_PP_ HCNT)*GCLK_PER)	MHz	–
SCL Clock Low Period	t_{LOW}	I3C_PP_LCNT*GCLK_PER	ns	For HDR-DDR mode, the I3C_PP_HCNT register is considered for Low period. This is because the Legacy I2C devices must not see the transitions of DDR mode and it must be filtered out with spike filters in I2C.
SCL Clock High Period (Mixed and Pure Bus)	t_{HIGH}	I3C_PP_HCNT*GCLK_PER	ns	–
I3CC_SDA Signal Data Hold in Push-Pull mode	t_{HD_PP}	SDA_TX_HOLD*GCLK_PER	ns	Data hold is considered for the write transfer from the I3CC alone point of view. The system delays are not considered.
I3CC_SDA Signal Data Setup in Push-Pull mode	t_{SU_PP}	(I3C_PP_LCNT-SDA_TX_HOLD)*GCLK_PER	ns	Data setup is considered for the write transfer from the I3CC alone point of view. The system delays are not considered.
Clock After Repeated START	t_{CASr}	I3C_HC_FREE*GCLK_PER	ns	–
Clock Before Repeated START	t_{CBSr}	I3C_HC_FREE*GCLK_PER	ns	–

Note:

1. GCLK_PER is the period of the I3CC clock.

78.5.14. Error Detection

78.5.14.1.Detecting Error Type in the Processed Commands

The field RESPONSE_QUEUE_PORT.ERR_STATUS is used to detect the error type in the processed commands.

This field indicates errors based on the codes shown in the following table.

Table 78.25. Error Codes

ERROR_CODE	ERROR_TYPE	ERROR_DESCRIPTION
0x0	NO_ERR	Initiated transfer is successful without any errors
0x1	CRC_ERR	CRC Error occurred in the HDR-DDR Read Transfer
0x2	PARITY_ERR	Parity Error occurred in HDR-DDR Read Transfers
0x3	Reserved	–
0x4	ADDR_HDR_NACK_ERR	Received NACK for the Address Header. Indicates no I3C target is present in the system
0x5	ADDR_NACK_ERR	Received NACK for Target Address of Write/Read Transfer or Received NACK for Assign Address of ENTDAA Transfer

© 2025 Microchip Technology Inc. and its subsidiaries

Table 78.25. Error Codes (continued)

ERROR_CODE	ERROR_TYPE	ERROR_DESCRIPTION
0x6	OVL_URL_ERROR	Experienced Receive FIFO Overflow in HDR Transfers or Experienced Transmit FIFO Underflow in HDR Transfers
0x7	Reserved	–
0x8	ABORT_ERR	Transfer is Aborted based on the User-initiated Abort

78.5.14.2.SDR Error Detection and Recovery Methods

The following table lists the two error types for SDR transfers and their recovery methods.

Table 78.26. Error Types

Error Type	Description	Error Detection Method	Error Recovery Method
CE0	Transaction after sending CCC	Detects illegally formatted CCC	Stop the transmission, then send STOP and retry the transmission
CE2	No response to Broadcast Address (0x7E)	I3CC detects NACK after Broadcast Address (0x7E) transmission	Upon detection of NACK, I3CC transmits HDR Exit Pattern followed by STOP

78.5.14.2.1.Error Type CE0

If the I3CC detects an illegally formatted CCC, then the I3CC stops the transmission, sends a STOP, and retries the transmission.

An example of an illegally formatted CCC is the I3CC receiving just one byte from the target in a GETMWL CCC, when it expects two bytes.

I3CC does not decode the CCC as it is transparent for the application. The I3CC always initiates the CCC transfer and expects the number of bytes as mentioned in DATA_LENGTH field of Transfer argument.

If the target terminates earlier than the DATA_LENGTH expected by the I3CC, the I3CC represents it in the DATA_LENGTH of the RESPONSE.

The application has to decode this information through RESPONSE of the CCC transfer and can re-issue the same command in the COMMAND_QUEUE for re-transmission.

78.5.14.2.2.Error Type CE2

If the I3CC does not receive an ACK of a transmitted Broadcast Address (0x7E), then it transmits the HDR-EXIT pattern followed by STOP.

The I3CC always generates a STOP upon receiving NACK for the Broadcast Address(0x7E) and enters the HALT state. This can be detected in I3CC_INTR_STAT.TRANSFER_ERR_STAT.

78.5.15. Defining Byte Support

The Defining Byte Support feature is an extended feature to the existing CCC transfer model. The Defining Byte is included after the CCC and before the payload (Broadcast CCCs)/restart (Directed CCCs) to indicate an extended capability or an action associated with the CCC. The Defining Byte is supported for both Broadcast and Directed SDR CCC transfers. In both cases, the Defining Byte is included after CCC byte as a sub-command before the payload.

The following figures describe the placement of Defining Byte in Broadcast CCC and Directed CCC transfers, respectively.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 78.19. Broadcast CCC with Defining Byte

START S (Sr)	Address Header (0x7E,w)	Broadcast CCC Code (CCC,T)	Defining Byte (DF_Byte,T)	Data Payload (DB,T)	STOP (P/Sr)

Legend
S = Start
Sr = Repeated Start
T = Transition bit
DB = Data Byte
P = Stop

Figure 78.20. Directed CCC with Defining Byte

START (S/Sr)	Address Header (0x7E,w)	Directed CCC Code (CCC,T)	Defining Byte (DF_Byte,T)	RESTART (Sr)	...

...	Target Address (TA,w/r)	Data Payload (DB,T)	STOP (P/Sr)

Legend
S = Start
Sr = Repeated Start
T = Transition Bit
TA = Target Address
DB = Data Byte
P = Stop

The Defining Byte is enabled for Broadcast or Directed SDR CCC transfers by setting the 'Defining Byte Present (DBP)' bit in Transfer command and the Defining Byte value is captured from 'Defining Byte (DB)' field of Transfer argument or Short Data argument.

78.5.16. BUS_RESET Generation

To prevent a malfunctioning device from locking up the I3C bus, the I3CC supports the generation of the HDR-EXIT pattern. The following figure shows the HDR-EXIT pattern.

The Reset pattern is requested by writing a '1' to RESET_CONTROL.BUS_RESET. The I3CC considers this request only when it is in IDLE state and gives priority over scheduled regular commands. Once the I3CC completes the Reset pattern, the I3CC auto-clears I3CC RESET_CONTROL.BUS_RESET. The software polls this request bit to know whether the I3CC completes the generation of the requested Reset pattern. An interrupt is generated representing that the Request Reset pattern is issued.

Figure 78.21. HDR-EXIT Reset Pattern

78.6.2. I3CC Controller Control Register

Name: I3CC_HC_CONTROL
Offset: 0x004
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
	BUS_ENABLE	RESUME	ABORT					
Access	R/W	R/W	R/W					
Reset	0	0	0					

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
								HOT_JOIN_CTRL
Access								R/W
Reset								0

Bit	7	6	5	4	3	2	1	0
	I2C_DEV_PRESENT							IBA_INCLUDE
Access	R/W							R/W
Reset	0							0

Bit 31 – BUS_ENABLE I3CC Bus Enable

Value	Description
0	Disables I3CC bus operations when writing a '0' or indicates the I3CC operations are completed when reading '0'.
1	Enables I3CC bus operations.

Bit 30 – RESUME I3CC Resume

Used to resume I3CC operation following the Halt state. The I3CC enters the Halt state (as indicated in I3CC_PRESENT_STATE) as a result of any type of error occurring in a transfer. The error type is indicated in I3CC_RESPONSE_QUEUE_PORT.ERR_STATUS. After the I3CC has entered the Halt state, the application must write the value '1' to the RESUME bit to resume I3CC operation. The I3CC automatically clears the RESUME bit once it has resumed making transfers, that is, has initiated the next command.

Value	Name	Description
0	RUNNING	The I3CC running.
1	SUSPENDED	The I3CC is suspended.

Bit 29 – ABORT I3CC Abort

Value	Description
0	The driver clears the ABORT bit to allow operation on the bus.
1	The I3CC aborts a transfer by issuing the STOP condition on the I3C Bus after the complete data byte is transferred or received.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 8 – HOT_JOIN_CTRL Hot-Join ACK/NACK Control

Value	Description
0	ACK Hot-Join request.
1	NACK and send broadcast CCC to disable Hot-Join.

Bit 7 – I2C_DEV_PRESENT I2C Device Present on Bus

Value	Description
0	Legacy I2C devices must not be present on the I3C bus.
1	Legacy I2C devices can be present on the I3C bus.

Bit 0 – IBA_INCLUDE Include I3C Broadcast Address

Controls whether the I3C broadcast address (0x7E) is included for private transfers. If the I3C broadcast address is not included for private transfers, then In-band Interrupts (IBI) driven from target devices might not win the arbitration, potentially delaying acceptance of the IBIs.

Value	Description
0	Do not include I3C Broadcast Address for private transfers.
1	Include I3C Broadcast Address for private transfers.

© 2025 Microchip Technology Inc. and its subsidiaries

78.6.3. I3CC Controller Device Address Register

Name: I3CC_CONTROLLER_DEVICE_ADDR
Offset: 0x008
Reset: 0x80000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
	DYNAMIC_ADDR_VALID							
Access	R/W							
Reset	1							

Bit	23	22	21	20	19	18	17	16
		DYNAMIC_ADDR[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

Access								
Reset								

Bit	7	6	5	4	3	2	1	0
Access								
Reset								

Bit 31 – DYNAMIC_ADDR_VALID Device Dynamic Address Valid

Value	Description
0	Invalidates DYNAMIC_ADDR.
1	Validates DYNAMIC_ADDR.

Bits 22:16 – DYNAMIC_ADDR[6:0] Device Dynamic Address
Contains the I3CC dynamic address.

© 2025 Microchip Technology Inc. and its subsidiaries

78.6.4. I3CC Controller Capabilities Register

Name: I3CC_HC_CAPABILITIES
Offset: 0x00C
Reset: 0x0000004C
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Access	R	R	R		R	R		
Reset	0	1	0		1	1		

Bit 7 – HDR_TS_EN HDR Ternary Symbol Transfer

Value	Description
0	HDR-TS not supported.
1	HDR-TS supported.

Bit 6 – HDR_DDR_EN HDR-DDR transfers

Value	Description
0	HDR-DDR not supported.
1	HDR-DDR supported.

Bit 5 – STANDBY_CR_CAP Standby I3CC Capability

Value	Description
0	Not capable of acting as standby controller.
1	Capable acting as standby controller (i.e., secondary controller).

Bit 3 – AUTO_COMMAND Auto Command

Value	Description
0	IBI Auto Command transfers is not supported.
1	IBI Auto Command transfers is supported.

Bit 2 – COMBO_COMMAND Combo Command Transfers

Value	Description
0	Combo Command transfers not supported.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Combo Command transfers supported.

© 2025 Microchip Technology Inc. and its subsidiaries

78.6.5. I3CC Reset Control Register

Name: I3CC_RESET_CONTROL
Offset: 0x010
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0

Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit 5 – IBI_QUEUE_RST IBI Queue Reset

Value	Description
0	No effect.
1	The IBI queues in the I3CC are flushed. Cleared automatically upon IBI queue reset completion.

Bit 4 – RX_FIFO_RST Receive Queue Software Reset

Value	Description
0	No effect.
1	The Receive queues in the I3CC are flushed. Cleared automatically upon Receive queue reset completion.

Bit 3 – TX_FIFO_RST Transmit Queue Software Reset

Value	Description
0	No effect.
1	The Transmit queues in the I3CC are flushed. Cleared automatically upon Transmit queue reset completion.

Bit 2 – RESP_QUEUE_RST Response Queue Software Reset

Value	Description
0	No effect.
1	The Response queues in the I3CC are flushed. Cleared automatically upon Response queue reset completion.

Bit 1 – CMD_QUEUE_RST Command Queue Software reset

Value	Description
0	No effect.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
1	The Command queues in the I3CC are flushed. Cleared automatically upon Command queue reset completion.

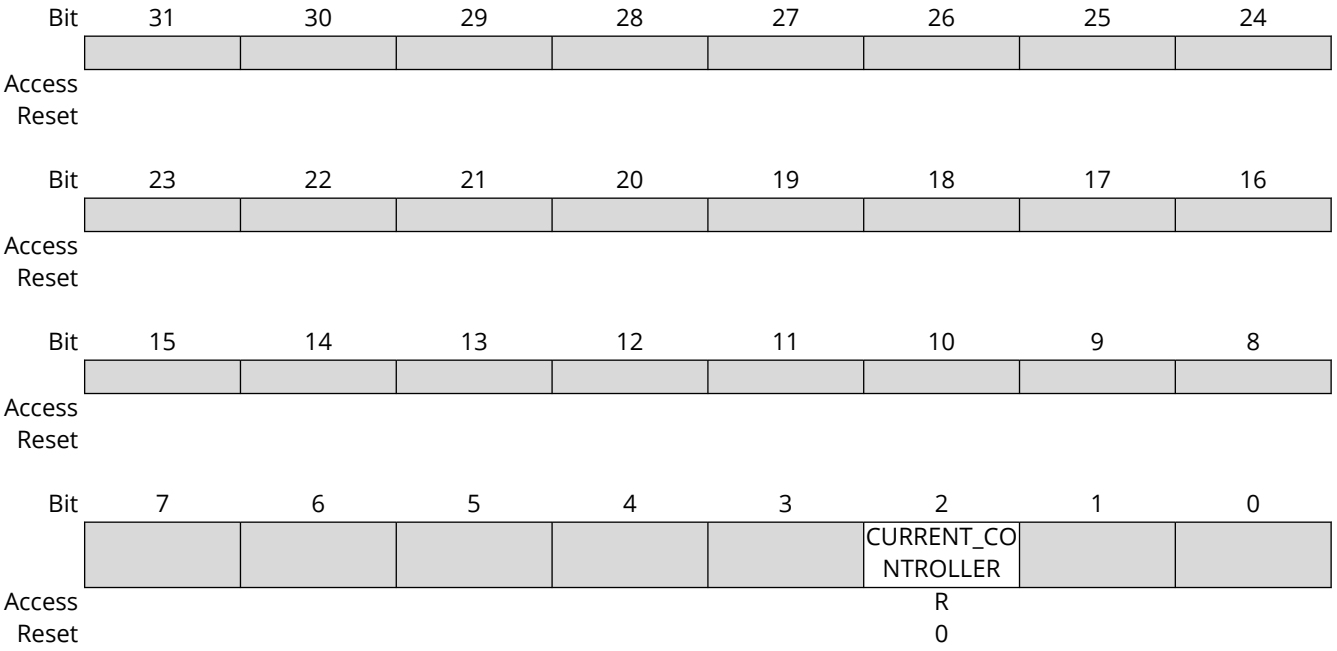
Bit 0 – SOFT_RST Core Software Reset
Cleared automatically upon I3CC reset completion. Resets all queues in the I3CC.

Value	Description
0	No effect.
1	The I3CC is reset and disabled. All registers return to their reset values, and the software must re-initialize the I3CC.

© 2025 Microchip Technology Inc. and its subsidiaries

78.6.6. I3CC Present State Register

Name: I3CC_PRESENT_STATE
Offset: 0x014
Reset: 0x00000000
Property: Read-only



Bit 2 – CURRENT_CONTROLLER Active Controller

Value	Name	Description
0	NOT_BUS_OWNER	The I3CC is not the active controller, and must request and acquire bus ownership before initiating any transfer.
1	BUS_OWNER	The I3CC is the active controller and, as a result, can initiate transfers.

© 2025 Microchip Technology Inc. and its subsidiaries

78.6.7. I3CC Interrupt Status Register

Name: I3CC_INTR_STATUS
Offset: 0x020
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
						HC_INTERNAL_ERR_STAT		
Access						R/W		
Reset						0		

Bit	7	6	5	4	3	2	1	0
Access								
Reset								

Bit 10 – HC_INTERNAL_ERR_STAT I3CC Internal Error
Reflects the interrupt status that is populated upon non-recoverable internal error of the I3CC. Cleared either by the software writing it to '1' or based on queue operations.

© 2025 Microchip Technology Inc. and its subsidiaries

78.6.8. I3CC Interrupt Status Enable Register

Name: I3CC_INTR_STATUS_ENABLE
Offset: 0x024
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8

Access						R/W		
Reset						0		

Bit	7	6	5	4	3	2	1	0
Access								
Reset								

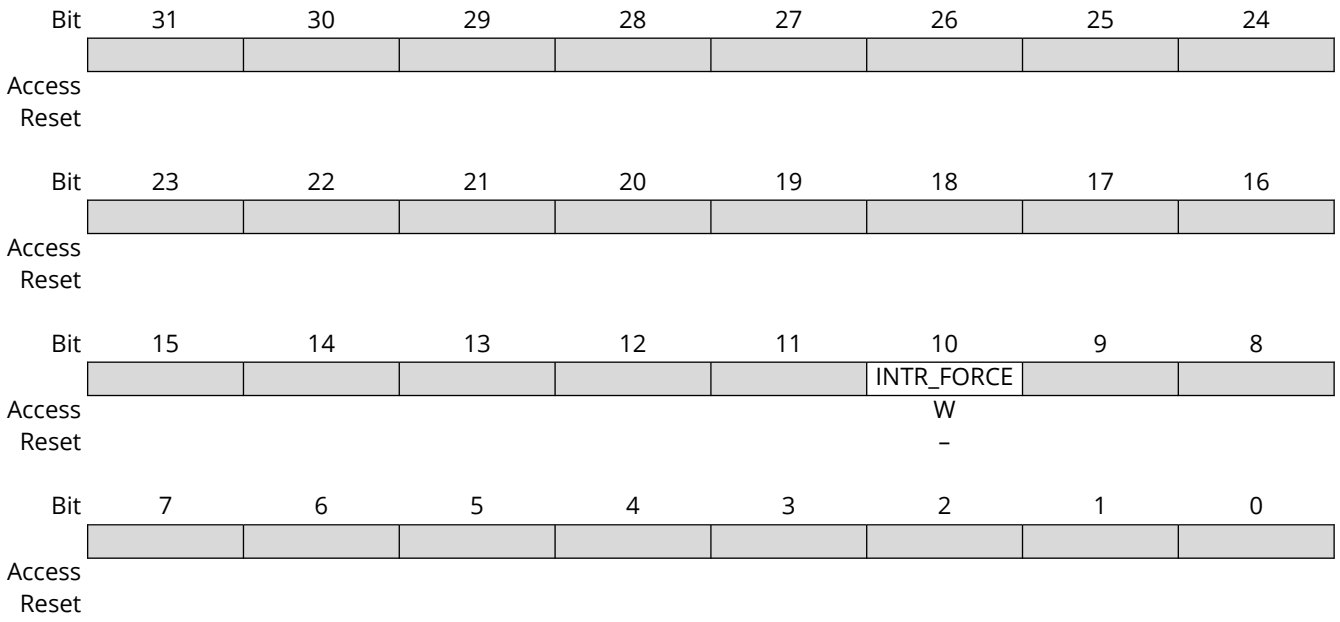
Bit 10 – HC_INTERNAL_ERR_SIGNAL_EN I3CC Internal Error Signal Enable

Value	Description
0	The I3CC interrupt line is not triggered by I3CC_INTR_STATUS.HC_INTERNAL_ERR_STAT.
1	If I3CC_INTR_STATUS.HC_INTERNAL_ERR_STAT is set to '1', the I3CC interrupt line is triggered.

© 2025 Microchip Technology Inc. and its subsidiaries

78.6.10. I3CC Interrupt Force Register

Name: I3CC_INTR_FORCE
Offset: 0x02C
Reset: –
Property: Write-only



Bit 10 – INTR_FORCE I3CC Internal Error Force

Value	Description
0	No effect.
1	Sets I3CC_INTR_STATUS.HC_INTERNAL_ERR_STAT interrupt source to ‘1’.

© 2025 Microchip Technology Inc. and its subsidiaries

78.6.11. I3CC Device Address Table Section Offset Register

Name: I3CC_DAT_SECTION_OFFSET
Offset: 0x030
Reset: 0x00010080
Property: Read-only

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 21:19 – TABLE_INDEX[2:0] DCT Table Index
Current index of the DCT, which is used as the starting index for the I3C ENTDAA CCC. Once the complete characteristics of the device that won the arbitration are written to the DCT (during ENTDAA using Address Assignment command), this index is incremented by 1. If necessary, the software may override the starting DCT index by setting this field.

Bits 18:12 – TABLE_SIZE[6:0] DCT Table Size
Size of the DCT, in 32-bit words.

Bits 11:0 – TABLE_OFFSET[11:0] DCT Table Offset
Offset of the DCT relative to the base address of the I3CC.

© 2025 Microchip Technology Inc. and its subsidiaries

78.6.13. I3CC Ring Headers Section Offset Register

Name: I3CC_RING_HEADERS_SECTION_OFFSET

					NOTIFY_IBI_REJECTED		NOTIFY_CRR_REJECTED	NOTIFY_HJ_REJECTED
Access					R/W		R/W	R/W
Reset					0		0	0

Bit 3 – NOTIFY_IBI_REJECTED Notify Rejected In-Band Interrupt Request Control

Value	Name	Description
0	DISABLED	Do not pass rejected IBI status to the IBI queue/rings, if the incoming IBI is NACK'ed and is auto-disabled based on the IBI_REJECT field in relevant DAT entry.
1	ENABLED	Pass rejected IBI status to the IBI queue/rings, if the incoming IBI is NACK'ed and is auto-disabled based on the IBI_REJECT field in the relevant DAT entry.

Bit 1 – NOTIFY_CRR_REJECTED Notify Rejected Controller-role Request Control

Value	Name	Description
0	DISABLED	Do not pass rejected IBI status to IBI queue/ring, if the incoming controller-role request is NACK'ed and is auto-disabled based on the CRR_REJECT field in the relevant DAT entry.
1	ENABLED	Pass rejected IBI status to the IBI queue, if the incoming controller-role request is NACK'ed and is auto-disabled based on the CRR_REJECT field in the relevant DAT entry.

Bit 0 – NOTIFY_HJ_REJECTED Notify Rejected Hot-Join Control

Value	Name	Description
0	DISABLED	Do not pass rejected IBI status to IBI queue, if the incoming hot-join request is NACK'ed and is auto-disabled based on I3CC_HC_CONTROL.HOT_JOIN_CTRL.
1	ENABLED	Pass rejected IBI status to the IBI queue, if the incoming hot join request is NACK'ed and is auto-disabled based on I3CC_HC_CONTROL.HOT_JOIN_CTRL.

	DATA_LENGTH[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 31:28 – ERR_STATUS[3:0] Response Error Status
Indicates the Response status for the processed command (i.e., either success or the error type encountered).

Value	Name	Description
0	SUCCESS	Transfer successful, no error
1	CRC	CRC error
2	PARITY	Parity error
3	FRAME	Frame error
4	ADDR_HEADER	Address header error
5	NACK	Address NACK'ed or Dynamic Address Assignment NACK'ed
6	OVL	Receive overflow or transfer underflow error
7	–	Reserved
8	ABORTED	Aborted
9–15	–	Reserved

Bits 27:24 – TID[3:0] Command/Response Transaction ID
This value must match the value of field TID for a previously enqueued command descriptor that was sent on the bus.

Bits 15:0 – DATA_LENGTH[15:0] Data Length/Device Count
For Write transfer: Remaining data length (in bytes).
For Read transfer: Received data length (in bytes).
For Address Assignment: Remaining device count.

Bits 31:0 – DATA[31:0] 32-bit Data

Read:
The I3C bus receive data stored in the Receive Data Buffer is always aligned to a 4-byte boundary. If the length of the data transfer is not aligned to a 4-byte boundary, then there are extra (unused) bytes at the end of the transferred data. The valid data must be identified using the DATA_LENGTH field in the Response Descriptor.

Write:
The I3C bus transmit data written to the Transmit Data Buffer must be aligned to a 4-byte boundary. If the length of the transfer is not aligned to a 4-byte boundary, then there will be extra (unused) bytes at the end of the transferred data. The I3CC shall only send the valid number of bytes indicated in the DATA_LENGTH field of the Command Descriptor.

Bits 31:0 – IBI_DATA[31:0] Data Read from IBI Data Buffer
The IBI port is mapped to the IBI data queue.
IBI data is always aligned to a 4-byte boundary and then put into the IBI queue. If the incoming data is not aligned to a 4-byte boundary, there are extra (unused) bytes at the end of the transferred IBI data. This can be determined from the value of field DATA_LENGTH in the IBI Status Descriptor.

Reset	0	0	0	0	0	0	0	1

Bits 31:24 – IBI_STATUS_THLD[7:0] IBI Status Threshold
Controls the generation of I3CC_PIO_INTR_STATUS.IBI_STATUS_THLD_STAT interrupt, based on the value of the IBI queue's outstanding IBI statuses.
0: Interrupt is triggered when the outstanding IBI status count in the IBI queue reaches 1 or above.
N: Interrupt is triggered when the outstanding IBI status count in the IBI queue reaches N+1 or above.
Each IBI status entry can represent either the complete IBI payload (if the IBI payload byte size <= 4 * IBI_DATA_SEGMENT_SIZE), or a segment of the IBI payload (if the IBI payload byte size > 4 * IBI_DATA_SEGMENT_SIZE).

Bits 23:16 – IBI_DATA_SEGMENT_SIZE[7:0] IBI Data Segment Size
IBI data segment size in 32-bit words.
The minimum supported segment size is 1 (4 bytes) and the maximum supported size is 63.
Enables the slicing of the incoming IBI data to generate individual status and support the cut-through readout of a long IBI payload data.

Bits 15:8 – RESP_BUF_THLD[7:0] Response Ready Buffer Threshold
Controls the minimum number of response queue entries needed to trigger I3CC_PIO_INTR_STATUS.RESP_READY_STAT interrupt.
The valid range is 0 to 7.
0: Interrupt is triggered when response queue contains 1 entry (32-bit word).
N: Interrupt is triggered when response queue contains at least N+1 entries (32-bit word).

Bits 7:0 – CMD_EMPTY_BUF_THLD[7:0] Command Ready Buffer Threshold
Controls the minimum number of empty command queue entries needed to trigger I3CC_PIO_INTR_STATUS.CMD_QUEUE_READY_STAT interrupt.

© 2025 Microchip Technology Inc. and its subsidiaries

The valid range is 0 to 15.
0: Interrupt is issued when command queue is completely empty.
N: Interrupt is issued when command queue contains at least N empty entries.

© 2025 Microchip Technology Inc. and its subsidiaries

78.6.24. I3CC Transfer Data Buffer Threshold Control Register

Name: I3CC_DATA_BUFFER_THLD_CTRL
Offset: 0x0D4

Reset						0	0	1

Bit	7	6	5	4	3	2	1	0
						TX_BUF_THLD[2:0]		
Access						R/W	R/W	R/W
Reset						0	0	1

Bits 26:24 – RX_START_THLD[2:0] Receive Start Threshold

When preparing to initiate a Read transfer on the I3C bus, the I3CC waits until the receive buffer has at least the programmed number of 32-bit word entries available to receive the data bytes.
The following configurable options are provided.

Store and Forward mode:

If the threshold number of entries is set to the receive buffer size (i.e. 64), then the I3CC waits for one of the following to be true to initiate the read command:

- Entire receive buffer to be empty, if the data length is more than the receive buffer size
- The data length number of locations to be empty in the receive buffer, if data length is smaller than the receive buffer size

Threshold mode:

In this case, if the threshold number of entries is less than the receive buffer size (i.e. 64), then the I3CC initiates the read command as soon as the programmed number of entries are empty in the receive buffer.

Value	Name	Description
0	1_ENTRY	1 available FIFO entry
1	4_ENTRIES	4 available FIFO entries
2	8_ENTRIES	8 available FIFO entries
3	16_ENTRIES	16 available FIFO entries
4	32_ENTRIES	32 available FIFO entries
5	64_ENTRIES	64 available FIFO entries

Bits 18:16 – TX_START_THLD[2:0] Transmit (Transfer) Start Threshold

When preparing to initiate a Write transfer on the I3C bus, the I3CC waits until the software has written at least the programmed number of 32-bit word entries into the transmit buffer.

© 2025 Microchip Technology Inc. and its subsidiaries

The following configurable options are provided.
Store and Forward mode:
If the threshold number of entries is set to the transmit buffer size (i.e. 64), then the I3CC waits for one of the following to be true to initiate the write command:

- Entire transmit buffer to be full, if the data length is more than the transmit buffer size.
- The data length number of locations to be filled in the transmit buffer, if data length is smaller than the transmit buffer size.

Threshold mode:
In this case, if the threshold number of entries is less than the transmit buffer size (i.e. 64), then the I3CC initiates the write command as soon as the programmed number of entries are filled in the transmit buffer.

Value	Name	Description
0	1_WORD	1 available transmit data
1	4_WORDS	4 available transmit data
2	8_WORDS	8 available transmit data
3	16_WORDS	16 available transmit data
4	32_WORDS	32 available transmit data
5	64_WORDS	64 available transmit data

Bits 10:8 – RX_BUF_THLD[2:0] Receive Buffer Threshold
Encodes the minimum number of receive FIFO entries of data received, in 32-bit words, that triggers the I3CC_PIO_INTR_STATUS.RX_THLD_STAT interrupt.
If the programmed value encodes for more than 64 data words, then the threshold is set to 64 entries.

Value	Name	Description
0	1_WORD	1 received data
1	4_WORDS	4 received data
2	8_WORDS	8 received data
3	16_WORDS	16 received data
4	32_WORDS	32 received data
5	64_WORDS	64 received data

Bits 2:0 – TX_BUF_THLD[2:0] Transmit Buffer Threshold
Encodes the minimum number of available transmit FIFO entries, in 32-bit words, that triggers the I3CC_PIO_INTR_STATUS.TX_THLD_STAT interrupt.
If the programmed value encodes for more than 64 entries, then the threshold is set to 64 entries.

Value	Name	Description
0	1_ENTRY	1 available FIFO entry
1	4_ENTRIES	4 available FIFO entries
2	8_ENTRIES	8 available FIFO entries
3	16_ENTRIES	16 available FIFO entries
4	32_ENTRIES	32 available FIFO entries
5	64_ENTRIES	64 available FIFO entries

			TRANSFER_ABORT_STAT	RESP_READY_STAT	CMD_QUEUE_READY_STAT	IBI_STATUS_THLD_STAT	RX_THLD_STAT	TX_THLD_STAT
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit 9 – TRANSFER_ERR_STAT Transfer Error Status
The I3CC sets this bit to ‘1’ when any transfer error occurs on the I3C bus. The error type for this error is available in the response structure corresponding to this transfer/command.
Writing '0' clears this bit.

Bit 5 – TRANSFER_ABORT_STAT Transfer Abort Status
The I3CC sets this bit to ‘1’ when any transfer is aborted.
Writing '0' clears this bit.

Bit 4 – RESP_READY_STAT Response Ready Status
The I3CC sets this bit to ‘1’ when the number of response queue entries meets or exceeds the value of QUEUE_THLD_CTRL.RESP_BUF_THLD.
The I3CC automatically clears this field to ‘0’ when the number of Response Queue entries falls below the RESP_BUF_THLD threshold.

Bit 3 – CMD_QUEUE_READY_STAT Command Queue Ready Status
The I3CC sets this bit to ‘1’ when the number of empty command queue entries meets or exceeds the value of QUEUE_THLD_CTRL.CMD_EMPTY_BUF_THLD.
The I3CC automatically clears this field to ‘0’ when the number of empty command queue entries falls below the CMD_EMPTY_BUF_THLD threshold.

Bit 2 – IBI_STATUS_THLD_STAT IBI Status Threshold Status
The I3CC sets this bit to ‘1’ when the number of IBI status entries in the IBI queue reaches the QUEUE_THLD_CTRL.IBI_STATUS_THLD threshold.

© 2025 Microchip Technology Inc. and its subsidiaries

The I3CC automatically clears this field to '0' when the number of IBI status entries in the IBI queue falls below the IBI_STATUS_THLD threshold as a result of application reads.

Bit 1 – RX_THLD_STAT Receive Data Buffer Threshold Status

The I3CC sets this bit to '1' when the number of entries in the receive data queue meets or exceeds the value of DATA_BUFFER_THLD_CTRL.RX_BUF_THLD.
The I3CC automatically clears this field to '0' when the number of receive data queue entries falls below the RX_BUF_THLD threshold.

Bit 0 – TX_THLD_STAT Transmit Data Buffer Threshold Status

The I3CC sets this bit to '1' when the number of available entries in the transmit data queue meets or exceeds the value of DATA_BUFFER_THLD_CTRL.TX_BUF_THLD.
The I3CC automatically clears this field to '0' when the number of transmit data queue entries falls below the TX_BUF_THLD threshold.

78.6.32. I3CC Component Version Register

Name: I3CC_COMP_VERSION
Offset: 0x208
Reset: 0x3130312A
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	I3C_VER_ID[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	1	1	0	0	0	1

Bit	23	22	21	20	19	18	17	16
	I3C_VER_ID[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	1	1	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	I3C_VER_ID[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	1	1	0	0	0	1

Bit	7	6	5	4	3	2	1	0
	I3C_VER_ID[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	1	0	1	0	1	0

Bits 31:0 – I3C_VER_ID[31:0] I3CC Component Version
Indicates the I3CC release number as 4 ASCII characters.

© 2025 Microchip Technology Inc. and its subsidiaries

78.6.33. I3CC Component Type Register

Name: I3CC_COMP_TYPE
Offset: 0x20C
Reset: 0x65613030
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	I3C_PRODUCT_ID[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	1	1	0	0	1	0	1

78.6.35. I3CC SCL I3C Open-Drain Timing Register

Name: I3CC_SCL_I3C_OD_TIMING
Offset: 0x214
Reset: 0x000A0010
Property: Read/Write

This register is not part of the HCI standard.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	I3C_OD_HCNT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	1	0	1	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	I3C_OD_LCNT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	1	0	0	0	0

Bits 23:16 – I3C_OD_HCNT[7:0] I3C Open-Drain High Count
SCL open-drain high count (I3C) for I3C transfers targeted to I3C devices.

Bits 7:0 – I3C_OD_LCNT[7:0] I3C Open-Drain Low Count
SCL open-drain low count for I3C transfers targeted to I3C devices.

© 2025 Microchip Technology Inc. and its subsidiaries

78.6.36. I3CC SCL I3C Push-Pull Timing Register

Name: I3CC_SCL_I3C_PP_TIMING
Offset: 0x218
Reset: 0x000A000A
Property: Read/Write

This register is not part of the HCI standard.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	I3C_PP_HCNT[7:0]

Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	I2C_FMP_LCNT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	1	0	0	0	0

Bits 23:16 – I2C_FMP_HCNT[7:0] I2C Fast Mode Plus High Count
SCL open-drain high count timing for I2C Fast mode plus transfers.

Bits 7:0 – I2C_FMP_LCNT[7:0] I2C Fast Mode Plus Low Count
SCL open-drain low count timing for I2C Fast mode plus transfers.

© 2025 Microchip Technology Inc. and its subsidiaries

78.6.39. I3CC SCL I2C Standard Speed Timing Register

Name: I3CC_SCL_I2C_SS_TIMING
Offset: 0x224
Reset: 0x00100010
Property: Read/Write

This register is not part of the HCI standard.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	I2C_SS_HCNT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	1	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	I2C_SS_LCNT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	1	0	0	0	0

Bits 23:16 – I2C_SS_HCNT[7:0] I2C Standard Speed High Count
SCL open-drain high count timing for I2C standard speed transfers.

Bits 7:0 – I2C_SS_LCNT[7:0] I2C Standard Speed Low Count
SCL open-drain low count timing for I2C standard speed transfers.

© 2025 Microchip Technology Inc. and its subsidiaries

78.6.40. I3CC SCL Extended Low Count Timing Register

Name: I3CC_SCL_EXT_LCNT_TIMING
Offset: 0x228
Reset: 0x20202020
Property: Read/Write

This register is not part of the HCI standard.

Bit	31	30	29	28	27	26	25	24
	I3C_EXT_LCNT_4[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	1	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	I3C_EXT_LCNT_3[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	1	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	I3C_EXT_LCNT_2[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	1	0	0	0	0	0

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	1	0	0	0	0	0

Bits 31:24 – I3C_EXT_LCNT_4[7:0] I3C Extended Low Count Register 4
SDR4 uses this register field for data transfer.

Bits 23:16 – I3C_EXT_LCNT_3[7:0] I3C Extended Low Count Register 3
SDR3 uses this register field for data transfer.

Bits 15:8 – I3C_EXT_LCNT_2[7:0] I3C Extended Low Count Register 2
SDR2 uses this register field for data transfer.

Bits 7:0 – I3C_EXT_LCNT_1[7:0] I3C Extended Low Count Register 1
SDR1 uses this register field for data transfer.

78.6.41. I3CC SCL Termination Bit Low count Timing Register

Name: I3CC_SCL_EXT_TERMN_LCNT_TIMING
Offset: 0x22C
Reset: 0x00030000
Property: Read/Write

This register is not part of the HCI standard.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
					I3C_EXT_TERMN_LCNT[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bits 3:0 – I3C_EXT_TERMN_LCNT[3:0] I3C Read Termination Bit Low count.
Extended I3C read termination bit low count for I3C Read transfers. Termination bit low period is derived based on the SDR speed as shown below:
SDR0 speed: I3C_PP_LCNT + I3C_EXT_TERMN_LCNT
SDR1 speed: I3C_EXT_LCNT_1 + I3C_EXT_TERMN_LCNT
SDR2 speed: I3C_EXT_LCNT_2 + I3C_EXT_TERMN_LCNT
SDR3 speed: I3C_EXT_LCNT_3 + I3C_EXT_TERMN_LCNT
SDR4 speed: I3C_EXT_LCNT_4 + I3C_EXT_TERMN_LCNT

© 2025 Microchip Technology Inc. and its subsidiaries

78.6.42. I3CC SDA Hold and Mode Switch Delay Timing Register

Name: I3CC_SDA_HOLD_SWITCH_DLY_TIMING
Offset: 0x230
Reset: 0x00010000
Property: Read/Write

This register is not part of the HCI standard.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
						SDA_TX_HOLD[2:0]		
Access						R/W	R/W	R/W
Reset						0	0	1

Bit	15	14	13	12	11	10	9	8
						SDA_PP_OD_SWITCH_DLY[2:0]		
Access						R/W	R/W	R/W
Reset						0	0	0

Bit	7	6	5	4	3	2	1	0
						SDA_OD_PP_SWITCH_DLY[2:0]		
Access						R/W	R/W	R/W
Reset						0	0	0

Bits 18:16 – SDA_TX_HOLD[2:0] I3CC_SDA Transmit Hold
Controls the hold time (in term of the GCLK period) of the transmit data (SDA) with respect to the I3CC_SCL edge in standard, FM, FM+, SDR and DDR speed mode of operations. Valid values range from 1 to 7.

Bits 10:8 – SDA_PP_OD_SWITCH_DLY[2:0] I3CC_SDA Push-Pull to Open-Drain Switch Delay
Delays the I3CC_SDA pad output with respect to I3CC_SDA pad drive control (in terms of the GCLK period) while switching the transfer from PP1 (Push-Pull mode I3CC_SDA=1) to OD1 (Open-Drain I3CC_SDA=1). Valid values range from 0 to 4.

Bits 2:0 – SDA_OD_PP_SWITCH_DLY[2:0] I3CC_SDA Open-Drain to Push-Pull Switch Delay
Delays the I3CC_SDA pad output with respect to I3CC_SDA pad drive control while switching the transfer from OD1 (Open-Drain mode I3CC_SDA=1) to PP1 (Push-Pull mode I3CC_SDA=1). Valid values range from 0 to 4.

	I3C_HC_FREE[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	1	0	0	0	0	0

Bits 15:0 – I3C_HC_FREE[15:0] I3C I3CC Free Count
In Pure Bus systems, this field represents t_{CAS}. In Mixed Bus systems, this field is expected to be programmed to t_{LOW} of I2C timing.

© 2025 Microchip Technology Inc. and its subsidiaries

78.6.44. I3CC SCL Low Master Extended Timeout Register

Name: I3CC_SCL_LOW_MST_EXT_TIMEOUT
Offset: 0x23C
Reset: 0x003567E0
Property: Read/Write

Bit	31	30	29	28	27	26	25	24

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	1	1	0	0

Bits 23:8 – CAP_LEN[15:0] Capability Structure Length
Number of debug specific registers of this Capability Structure including this one.
Reads as 0x0005.

Bits 7:0 – CAP_ID[7:0] Extended Capability ID
Indicates this Extended Capability structure is a debug specific structure.
Reads as 0x0C.

© 2025 Microchip Technology Inc. and its subsidiaries

78.6.46. I3CC Queue Status Level Register

Name: I3CC_QUEUE_STATUS_LEVEL
Offset: 0x244
Reset: 0x00000010
Property: Read-only

	CMD_QUEUE_FREE_LVL[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	1	0	0	0	0

Bits 31:24 – IBI_STATUS_CNT[7:0] IBI Buffer Status Count
Number of IBI status entries currently in the IBI queue.

Bits 23:16 – IBI_BUFFER_LVL[7:0] IBI Buffer Level
Number of buffer entries currently in the IBI queue.

Bits 15:8 – RESPONSE_BUFFER_LVL[7:0] Response Buffer Level
Number of buffer entries currently in the response queue.

Bits 7:0 – CMD_QUEUE_FREE_LVL[7:0] Command Queue Free Buffer Level
Number of free buffer entries currently in the command queue.

© 2025 Microchip Technology Inc. and its subsidiaries

78.6.47. I3CC Data Buffer Status Level Register

Name: I3CC_DATA_BUFFER_STATUS_LEVEL
Offset: 0x248
Reset: 0x00000040
Property: Read-only

Bit	31	30	29	28	27	26	25	24

Access	R	R	R	R	R	R	R	R
Reset	0	1	0	0	0	0	0	0

Bits 15:8 – RX_BUF_LVL[7:0] Receive Data Buffer Status Count
Number of receive data buffer entries in the receive data queue.

Bits 7:0 – TX_BUF_FREE_LVL[7:0] Transmit Data Buffer Status Count
Number of free transmit data buffer entries in the transmit data queue.

© 2025 Microchip Technology Inc. and its subsidiaries

78.6.48. I3CC Present State Debug Register

Name: I3CC_PRESENT_STATE_DEBUG
Offset: 0x24C
Reset: 0x10000003
Property: Read-only

Bit	31	30	29	28	27	26	25	24
				HC_IDLE	CMD_TID[3:0]			
Access				R	R	R	R	R
Reset				1	0	0	0	0

Bit	15	14	13	12	11	10	9	8
			CM_TFR_STATUS[5:0]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
							SDA_LINE_SIGNAL_LEVEL	SCL_LINE_SIGNAL_LEVEL
Access							R	R
Reset							1	1

Bit 28 – HC_IDLE I3CC Idle

Value	Name	Description
0	HC_NOT_IDLE	I3CC is not in Idle state.
1	HC_IDLE	I3CC is in Idle state. All of the queues (Command, Response, IBI) and buffers (Transmit and Receive) are empty.

Bits 27:24 – CMD_TID[3:0] Command Transaction ID
The Transaction ID is an optional software-defined tag for every command. It is useful for detection of the currently executed command while scheduling transfers.

Bits 21:16 – CM_TFR_ST_STATUS[5:0] I3CC Transfer State Status
Indicates the state of transfer that the I3CC is currently executing.

Value	Name	Description
0x00	IDLE	I3CC is in the Idle state, waiting for commands from the application or for target-initiated IBIs
0x01	START	START Generation state
0x02	RESTART	RESTART Generation state
0x03	STOP	STOP Generation state
0x04	START_HOLD	START Hold Generation for the target-initiated START state
0x05	BCAST_WRITE	Broadcast Write Address Header(0x7E,W) Generation state
0x06	BCAST_READ	Broadcast Read Address Header(0x7E,R) Generation state
0x07	DAA	Dynamic Address Assignment state
0x08	ADDR	Target Address Generation state
0x0B	CCC	CCC Byte Generation state
0x0C	HDR	HDR Command Generation state

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
0x0D	WR	Write Data Transfer state
0x0E	RD	Read Data Transfer state
0x0F	IBI_ADDR_READ	IBI Address Read Data state
0x10	IBI_DIS	IBI Auto-Disable state
0x11	HDR_DDR_CRC	HDR-DDR CRC Data Generation/Receive state
0x12	CLOCK_EXT	Clock Extension state
0x13	HALT	Halt state
0x14	IBI_READ	IBI Read Data state

Bits 13:8 – CM_TFR_STATUS[5:0] I3CC Transfer Type Status
Indicates the type of transfer the I3CC is currently executing.

Value	Name	Description
0x0	IDLE	I3CC is in the Idle state, waiting for commands from the application, or for target-initiated IBIs
0x1	BCAST_WRITE	Broadcast CCC Write transfer
0x2	TARGET_WRITE	Directed CCC Write transfer
0x3	TARGET_READ	Directed CCC Read transfer
0x4	ENTDAA	ENTDAA Address Assignment transfer
0x5	SETDASA	SETDASA Address Assignment transfer
0x6	I3C_SDR_WRITE	Private I3C SDR Write transfer
0x7	I3C_SDR_READ	Private I3C SDR Read transfer
0x8	I2C_SDR_WRITE	Private I2C SDR Write transfer
0x9	I2C_SDR_READ	Private I2C SDR Read transfer
0xC	HDR_DDR_WRITE	Private HDR Double-Data Rate (DDR) Write transfer
0xD	HDR_DDR_READ	Private HDR Double-Data Rate (DDR) Read transfer
0xE	IBI	Servicing IBI transfer
0xF	HALTED	I3CC is in the Halt state, waiting for the application to resume through I3CC_HC_CONTROL

Bit 1 – SDA_LINE_SIGNAL_LEVEL SDA Line Signal Level
Used to check the I3CC_SDA line level to recover from errors and for debugging.

Bit 0 – SCL_LINE_SIGNAL_LEVEL I3CC_SCL Line Signal Level
Used to check the I3CC_SCL line level to recover from errors and for debugging.

79. Pulse Width Modulation Controller (PWM)

79.1. Description

The Pulse Width Modulation Controller (PWM) generates output pulses on 4 channels independently according to parameters defined per channel. Each channel controls two complementary square output waveforms. Characteristics of the output waveforms such as period, duty-cycle, polarity and dead-times (also called dead-bands or non-overlapping times) are configured through the user interface. Each channel selects and uses one of the clocks provided by the clock generator. The clock generator provides several clocks resulting from the division of the PWM peripheral clock. External triggers can modify the output values in real time.

All accesses to the PWM are made through registers mapped on the peripheral bus. All channels integrate a double buffering system in order to prevent an unexpected output waveform while modifying the period, the spread spectrum, the duty-cycle or the dead-times.

Channels can be linked together as synchronous channels to be able to update their duty-cycle or dead-times at the same time.

The update of duty-cycles of synchronous channels can be performed by the DMA Controller channel which offers buffer transfer without processor Intervention.

The PWM includes a spread-spectrum counter to allow a constantly varying period (only for Channel 0). This counter may be useful to minimize electromagnetic interference or to reduce the acoustic noise of a PWM driven motor.

The PWM provides 8 independent comparison units capable of comparing a programmed value to the counter of the synchronous channels (counter of channel 0). These comparisons are intended to generate software interrupts, to trigger pulses on the 2 independent event lines (in order to synchronize ADC conversions with a lot of flexibility independently of the PWM outputs) and to trigger DMA Controller transfer requests.

PWM outputs can be overridden synchronously or asynchronously to their channel counter.

The PWM provides a fault protection mechanism with 5 fault inputs, capable to detect a fault condition and to override the PWM outputs asynchronously (outputs forced to ‘0’, ‘1’ or Hi-Z).

For safety usage, some configuration registers are write-protected.

79.2. Embedded Characteristics

- 4 Channels
- Common Clock Generator Providing Thirteen Different Clocks
  - A Modulo n counter providing eleven clocks
  - Two independent linear dividers working on Modulo n counter outputs
- Independent Channels
  - Independent 16-bit counter for each channel
  - Independent complementary outputs with 12-bit dead-time generator (also called dead-band or non-overlapping time) for each channel
  - Independent Push-Pull mode for each channel
  - Independent enable-disable command for each channel
  - Independent clock selection for each channel
  - Independent period, duty-cycle and dead-time for each channel
  - Independent double buffering of period, duty-cycle and dead-times for each channel

© 2025 Microchip Technology Inc. and its subsidiaries

  - Independent programmable selection of the output waveform polarity for each channel, with double buffering
  - Independent programmable center- or left-aligned output waveform for each channel
  - Independent output override for each channel
  - Independent interrupt for each channel, at each period for left-aligned or center-aligned configuration
  - Independent update time selection of double buffering registers (polarity, duty cycle) for each channel, at each period for left-aligned or center-aligned configuration
- External Trigger Input Management (e.g., for DC/DC or Lighting Control)
  - External PWM Reset mode
  - External PWM Start mode
  - Cycle-by-cycle duty cycle mode
  - Leading-edge blanking
- 2 2-bit Gray Up/Down Channels for Stepper Motor Control
- Spread Spectrum Counter to Allow a Constantly Varying Duty Cycle (only for Channel 0)
- Synchronous Channel Mode
  - Synchronous channels share the same counter
  - Mode to update the synchronous channels registers after a programmable number of periods
  - Synchronous channels support connection of one DMA Controller channel offers buffer transfer without processor intervention to update duty-cycle registers
- 2 Independent Event Lines Intended to Synchronize ADC Conversions
  - Programmable delay for event lines to delay ADC measurements
- 8 Comparison Units Intended to Generate Interrupts, Pulses on Event Lines and DMA Controller Transfer Requests
- 5 Programmable Fault Inputs Providing Asynchronous Protection of PWM Outputs
  - Two driven by the user through PIO inputs
  - Driven by the PMC when crystal oscillator clock fails
  - Driven by the ADC Controller through configurable comparison function
  - Driven by the Timer/Counter through configurable comparison function
- Register Write Protection

Table 79.1. I/O Lines Description (continued)

Name	Description	Type
PWMEXTRGy	PWM Trigger Input y	Input

79.5. Product Dependencies

79.5.1. I/O Lines

The pins used for interfacing the PWM are multiplexed with PIO lines. The programmer must first program the PIO controller to assign the desired PWM pins to their peripheral function. If I/O lines of the PWM are not used by the application, they can be used for other purposes by the PIO controller.

All of the PWM outputs may or may not be enabled. If an application requires only four channels, then only four PIO lines are assigned to PWM outputs.

79.5.2. Power Management

The PWM is not continuously clocked. The programmer must first enable the PWM clock in the Power Management Controller (PMC) before using the PWM. However, if the application does not require PWM operations, the PWM clock can be stopped when not needed and be restarted later. In this case, the PWM will resume its operations where it left off.

79.5.3. Interrupt Sources

The PWM interrupt line is connected on one of the internal sources of the Interrupt Controller. Using the PWM interrupt requires the Interrupt Controller to be programmed first.

79.5.4. Fault Inputs

The PWM has the fault inputs connected to the different modules. Refer to the implementation of these modules within the product for detailed information about the fault generation procedure. The PWM receives faults from:

- PIO inputs
- the PMC
- the ADC controller
- Timer/Counters

Table 79.2. Fault Inputs

Fault Generator	External PWM Fault Input Number	Polarity Level(1)	Fault Input ID
PB13	PWMFI0	User-defined	0
PB12	PWMFI1	User-defined	1
PMC	–	To be configured to 1	2
ADC	–	To be configured to 1	3
Timer0	–	To be configured to 1	4

Note:

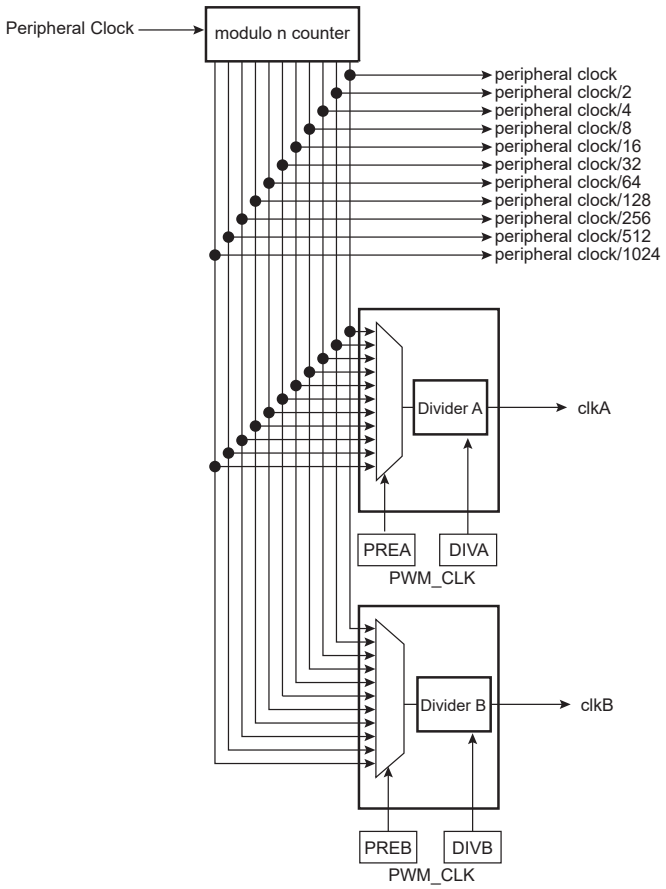
79.6. Functional Description

The PWM controller is primarily composed of a clock generator module and 4 channels.

- Clocked by the peripheral clock, the clock generator module provides 13 clocks.
- Each channel can independently choose one of the clock generator outputs.
- Each channel generates an output waveform with attributes that can be defined independently for each channel through the user interface registers.

79.6.1. PWM Clock Generator

Figure 79.2. Functional View of the Clock Generator Block Diagram



The PWM peripheral clock is divided in the clock generator module to provide different clocks available for all channels. Each channel can independently select one of the divided clocks.

The clock generator is divided into different blocks:

- a modulo n counter which provides 11 clocks:
  - $f_{peripheral\ clock}$
  - $f_{peripheral\ clock}/2$
  - $f_{peripheral\ clock}/4$
  - $f_{peripheral\ clock}/8$
  - $f_{peripheral\ clock}/16$
  - $f_{peripheral\ clock}/32$
  - $f_{peripheral\ clock}/64$

© 2025 Microchip Technology Inc. and its subsidiaries

  - $f_{peripheral\ clock}/128$
  - $f_{peripheral\ clock}/256$
  - $f_{peripheral\ clock}/512$
  - $f_{peripheral\ clock}/1024$
- two linear dividers (1, 1/2, 1/3, ... 1/255) that provide two separate clocks: clkA and clkB

Each linear divider can independently divide one of the clocks of the modulo n counter. The selection of the clock to be divided is made according to the PREA (PREB) field of the PWM Clock register (PWM_CLK). The resulting clock clkA (clkB) is the clock selected divided by DIVA (DIVB) field value.

After a reset of the PWM controller, DIVA (DIVB) and PREA (PREB) are set to '0'. This implies that after reset clkA (clkB) are turned off.

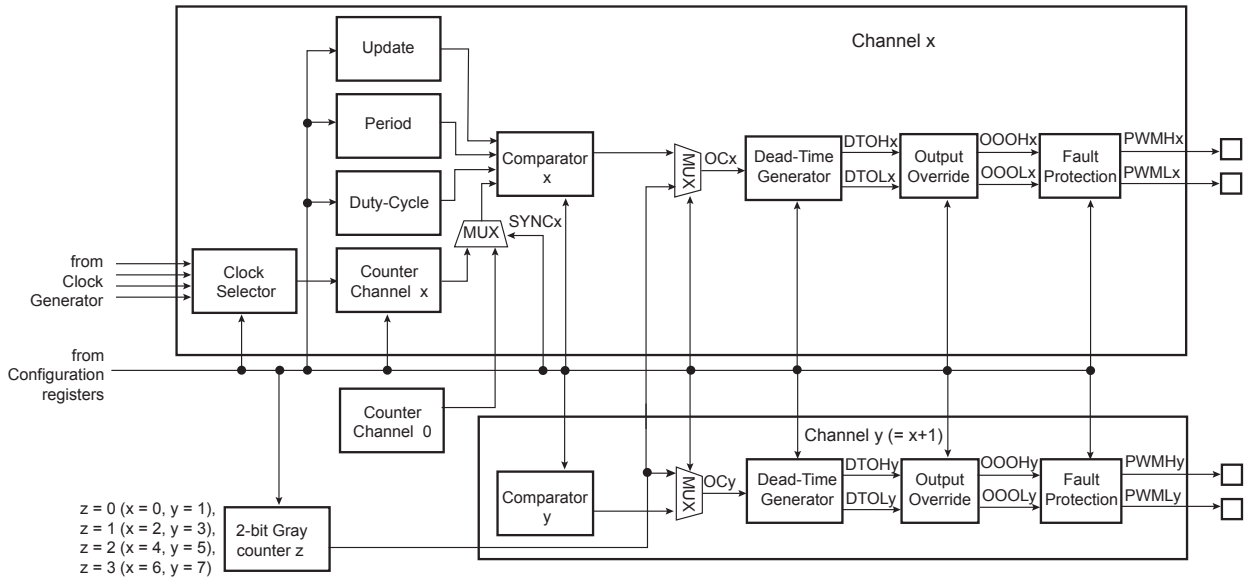
At reset, all clocks provided by the modulo n counter are turned off except the peripheral clock. This situation is also true when the PWM peripheral clock is turned off through the Power Management Controller.

CAUTION Before using the PWM controller, the programmer must first enable the peripheral clock in the Power Management Controller (PMC).

79.6.2. PWM Channel

79.6.2.1. Channel Block Diagram

Figure 79.3. Functional View of the Channel Block Diagram



Each of the 4 channels is composed of six blocks:

- A clock selector which selects one of the clocks provided by the clock generator (described in PWM Clock Generator).
- A counter clocked by the output of the clock selector. This counter is incremented or decremented according to the channel configuration and comparators matches. The size of the counter is 16 bits.

© 2025 Microchip Technology Inc. and its subsidiaries

- A comparator used to compute the OCx output waveform according to the counter value and the configuration. The counter value can be the one of the channel counter or the one of the channel 0 counter according to SYNCx bit in the PWM Sync Channels Mode Register (PWM_SCM).
- A 2-bit configurable Gray counter enables the stepper motor driver. One Gray counter drives 2 channels.
- A dead-time generator providing two complementary outputs (DTOHx/DTOLx) which allows to drive external power control switches safely.
- An output override block that can force the two complementary outputs to a programmed value (OOOHx/OOOLx).
- An asynchronous fault protection mechanism that has the highest priority to override the two complementary outputs (PWMHx/PWMLx) in case of fault detection (outputs forced to '0', '1' or Hi-Z).

79.6.2.2.Comparator

The comparator continuously compares its counter value with the channel period defined by CPRD in the PWM Channel Period Register (PWM_CPRDx) and the duty-cycle defined by CDTY in the PWM Channel Duty Cycle Register (PWM_CDTYx) to generate an output signal OCx accordingly.

The different properties of the waveform of the output OCx are:

- the clock selection. The channel counter is clocked by one of the clocks provided by the clock generator described in the previous section. This channel parameter is defined in the CPRE field of the PWM Channel Mode Register (PWM_CMRx). This field is reset at '0'.
- the waveform period. This channel parameter is defined in the CPRD field of the PWM_CPRDx register.
  If the waveform is left-aligned, then the output waveform period depends on the counter source clock and can be calculated:
  By using the PWM peripheral clock divided by a given prescaler value "X" (where X = 2^{PREA} is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

  $$\frac{(X \times \mathrm{CPRD})}{f_{\text{peripheral clock}}}$$

  By using the PWM peripheral clock divided by a given prescaler value "X" (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

  $$\frac{(X \times \mathrm{CPRD} \times \mathrm{DIVA})}{f_{\text{peripheral clock}}} \text{ or } \frac{(X \times \mathrm{CPRD} \times \mathrm{DIVB})}{f_{\text{peripheral clock}}}$$

  If the waveform is center-aligned, then the output waveform period depends on the counter source clock and can be calculated:
  By using the PWM peripheral clock divided by a given prescaler value "X" (where X = 2^{PREA} is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

  $$\frac{(2 \times X \times \mathrm{CPRD})}{f_{\text{peripheral clock}}}$$

  By using the PWM peripheral clock divided by a given prescaler value "X" (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

  $$\frac{(2 \times X \times \mathrm{CPRD} \times \mathrm{DIVA})}{f_{\text{peripheral clock}}} \text{ or}$$

© 2025 Microchip Technology Inc. and its subsidiaries

$$\frac{(2 \times X \times \text{CPRD} \times \text{DIVB})}{f_{\text{peripheral clock}}}$$

- the waveform duty-cycle. This channel parameter is defined in the CDTY field of the PWM_CDTYx register.
  If the waveform is left-aligned, then:

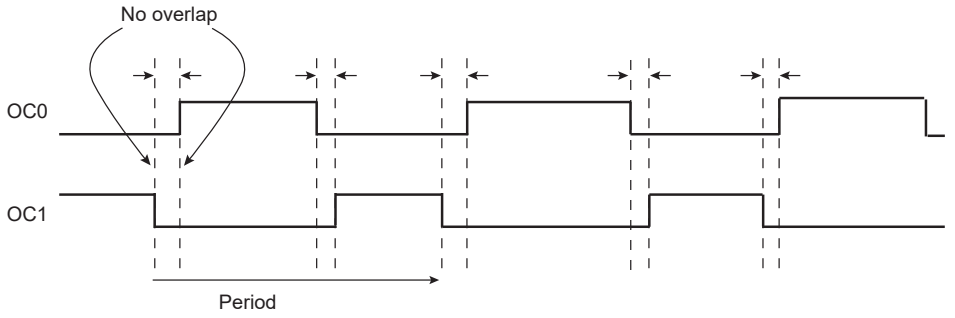
  $$\text{duty cycle} = \frac{\text{PWM_period} - ((1/\text{clkN}) \times \text{CDTY})}{\text{PWM_period}}$$

  If the waveform is center-aligned, then:

  $$\text{duty cycle} = \frac{((\text{PWM_period}/2) - 1) - ((1/\text{clkN}) \times \text{CDTY})}{\text{PWM_period}/2}$$

- the waveform polarity. At the beginning of the period, the signal can be at high or low level. This property is defined in the CPOL bit of PWM_CMRx. By default, the signal starts by a low level. The DPOLI bit in PWM_CMRx defines the PWM polarity when the channel is disabled (CHIDx = 0 in PWM_SR). For more details, see the figure *Waveform Properties.*
  - DPOLI = 0: PWM polarity when the channel is disabled is the same as the one defined for the beginning of the PWM period.
  - DPOLI = 1: PWM polarity when the channel is disabled is inverted compared to the one defined for the beginning of the PWM period.
- the waveform alignment. The output waveform can be left- or center-aligned. Center-aligned waveforms can be used to generate non-overlapped waveforms. This property is defined in the CALG bit of PWM_CMRx. The default mode is left-aligned.

Figure 79.4. Non-Overlapped Center-Aligned Waveforms



Note: See the figure Figure 79.5 for a detailed description of center-aligned waveforms.

When center-aligned, the channel counter increases up to CPRD and decreases down to 0. This ends the period.

When left-aligned, the channel counter increases up to CPRD and is reset. This ends the period.

Thus, for the same CPRD value, the period for a center-aligned channel is twice the period for a left-aligned channel.

Waveforms are fixed at 0 when:

- CDTY = CPRD and CPOL = 0 (Note that if TRGMODE = MODE3, the PWM waveform switches to 1 at the external trigger event (see Cycle-By-Cycle Duty Mode)).
- CDTY = 0 and CPOL = 1

Waveforms are fixed at 1 (once the channel is enabled) when:

- CDTY = 0 and CPOL = 0

© 2025 Microchip Technology Inc. and its subsidiaries

- CDTY = CPRD and CPOL = 1 (Note that if TRGMODE = MODE3, the PWM waveform switches to 0 at the external trigger event (see Cycle-By-Cycle Duty Mode)).

The waveform polarity must be set before enabling the channel. This immediately affects the channel output level.

Modifying CPOL in PWM Channel Mode Register while the channel is enabled can lead to an unexpected behavior of the device being driven by PWM.

In addition to generating the output signals OCx, the comparator generates interrupts depending on the counter value. When the output waveform is left-aligned, the interrupt occurs at the end of the counter period. When the output waveform is center-aligned, the bit CES of PWM_CMRx defines when the channel counter interrupt occurs. If CES is set to '0', the interrupt occurs at the end of the counter period. If CES is set to '1', the interrupt occurs at the end of the counter period and at half of the counter period.

The figure below illustrates the counter interrupts depending on the configuration.

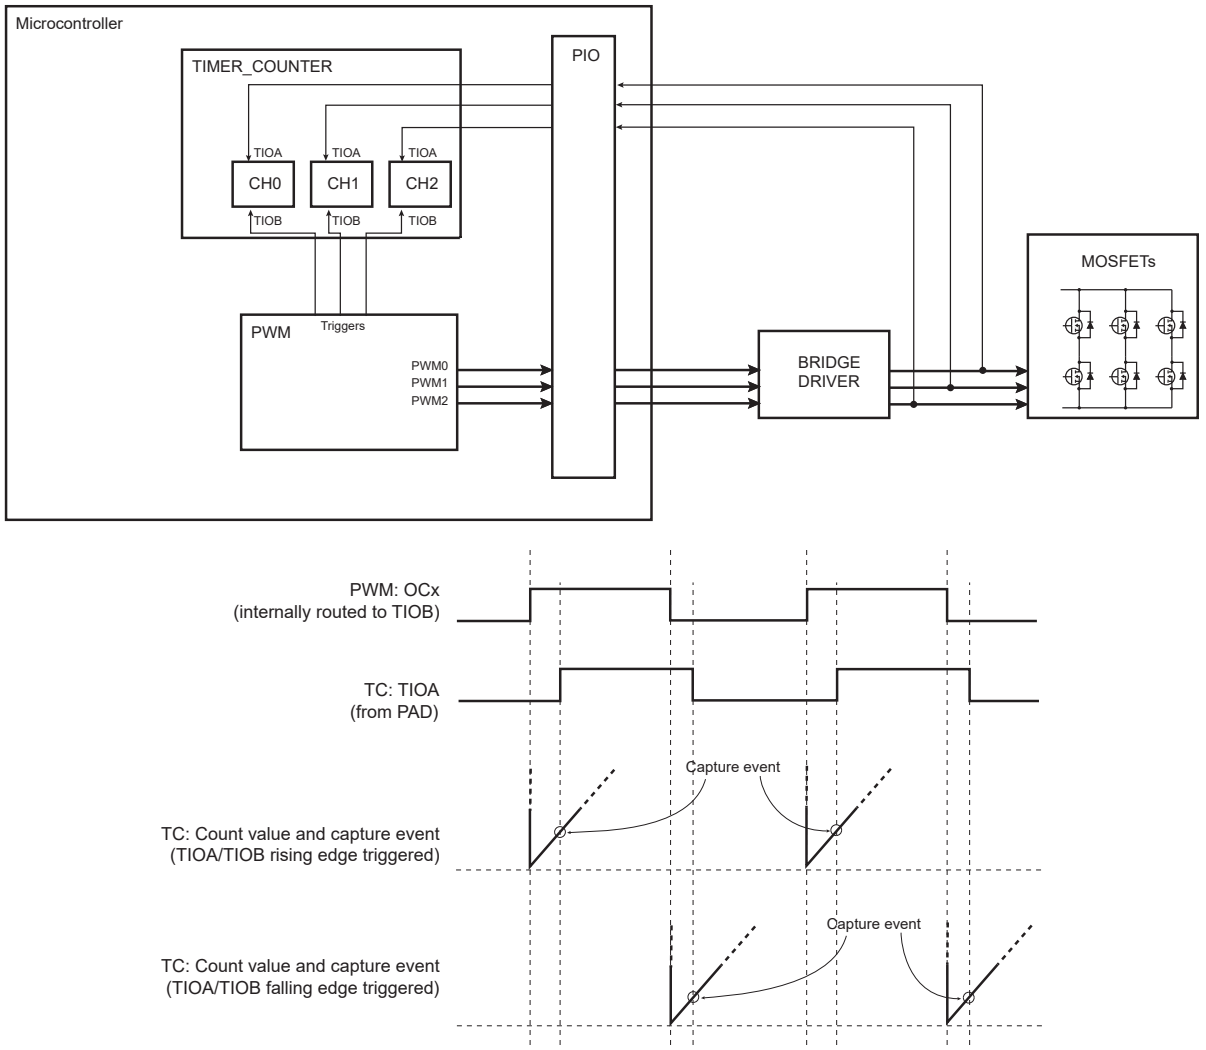
79.6.2.3.Trigger Selection for Timer Counter

The PWM controller can be used as a trigger source for the Timer Counter (TC) to achieve the two application examples described below.

79.6.2.3.1.Delay Measurement

To measure the delay between the channel x comparator output (OCx) and the feedback from the bridge driver of the MOSFETs (see the figure below), the bit TCTS in the PWM Channel Mode Register must be at 0. This defines the comparator output of the channel x as the TC trigger source. The TIOB trigger (TC internal input) is used to start the TC; the TIOA input (from PAD) is used to capture the delay.

Figure 79.6. Triggering the TC: Delay Measurement

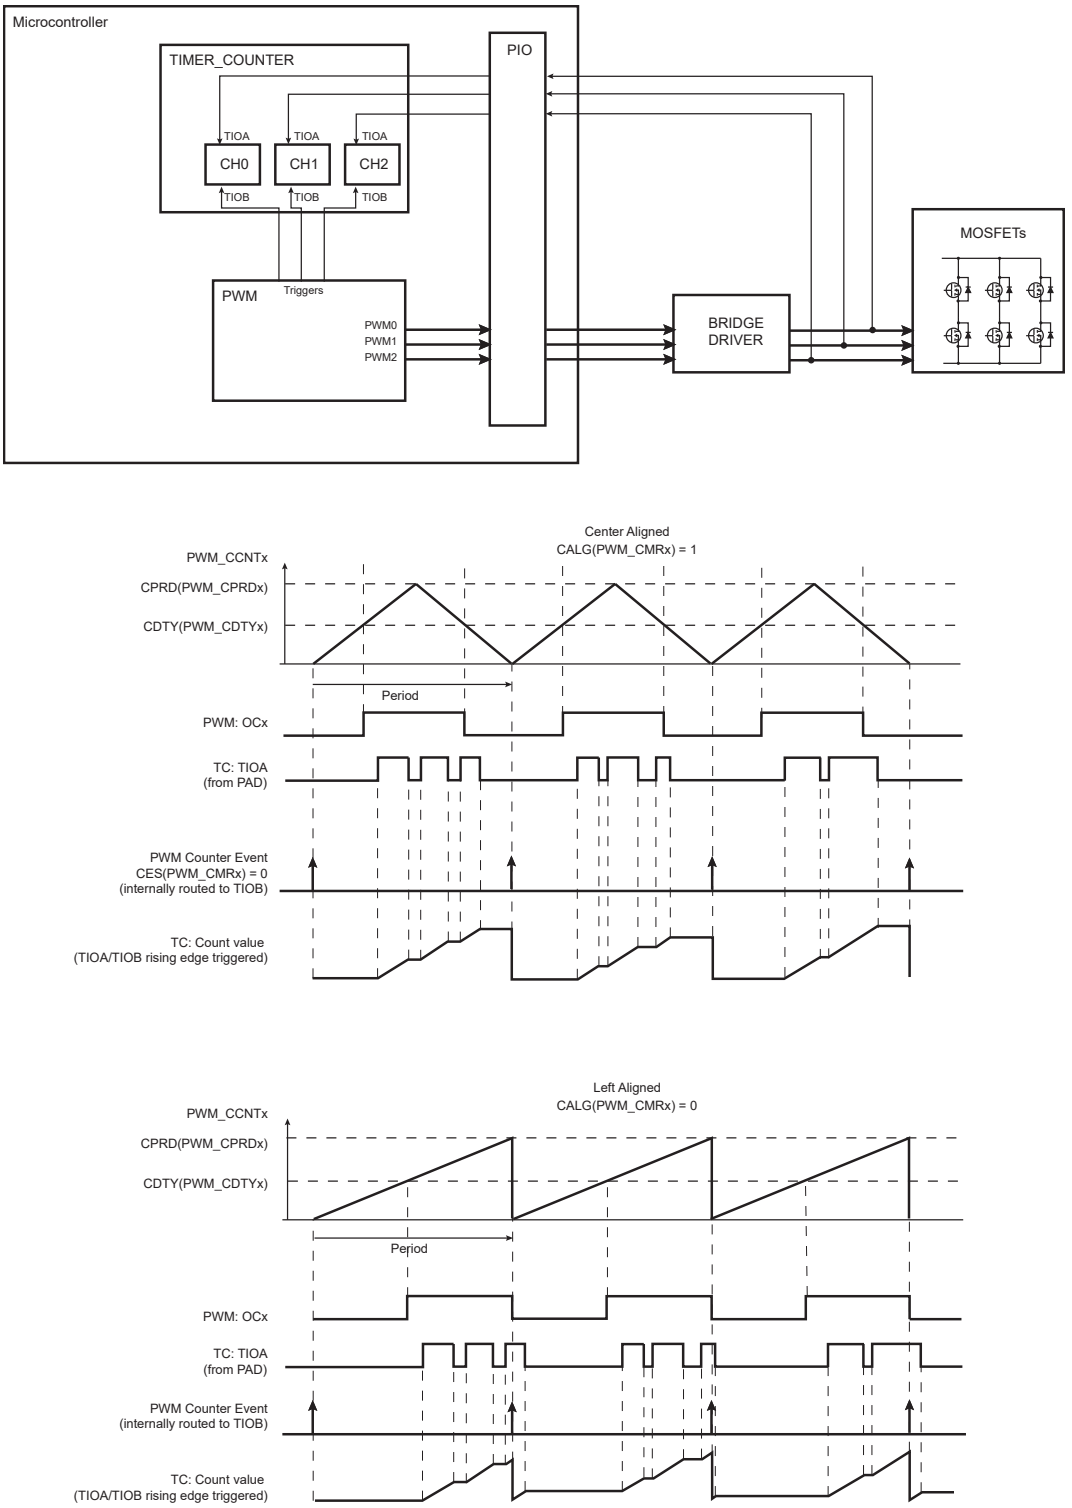


79.6.2.3.2.Cumulated ON Time Measurement

To measure the cumulated “ON” time of MOSFETs (see the figure below), the bit TCTS of the PWM Channel Mode Register must be set to 1 to define the counter event (see the figure *Waveform Properties*) as the Timer Counter trigger source.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 79.7. Triggering the TC: Cumulated “ON” Time Measurement



79.6.2.4.2-bit Gray Up/Down Counter for Stepper Motor

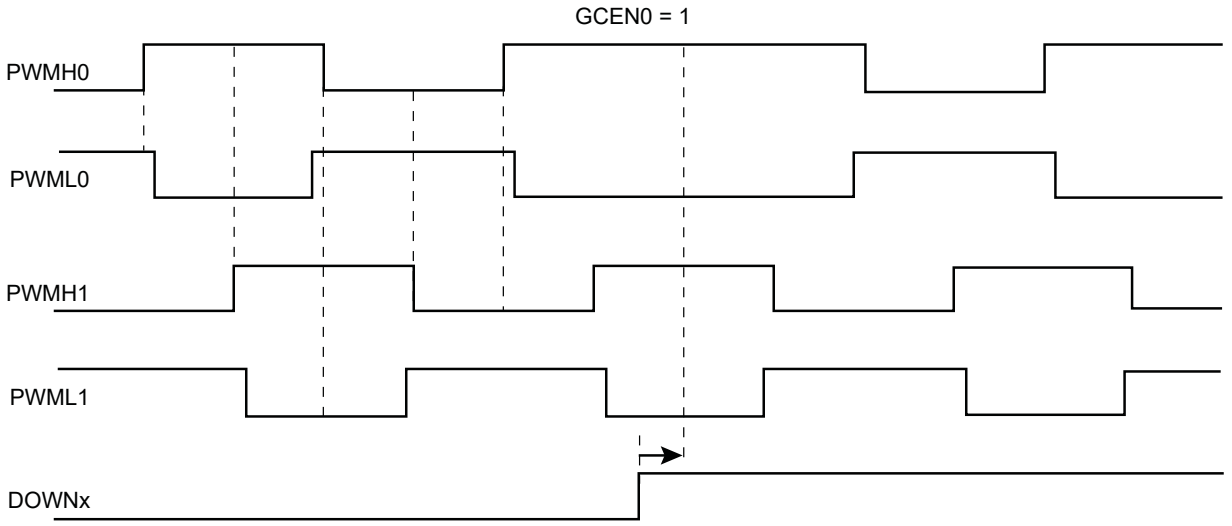
A pair of channels may provide a 2-bit Gray count waveform on two outputs. Dead-time generator and other downstream logic can be configured on these channels.

Up or Down Count mode can be configured on-the-fly by means of PWM_SMMR configuration registers.

© 2025 Microchip Technology Inc. and its subsidiaries

When GCEN0 is set to ‘1’, channels 0 and 1 outputs are driven with a Gray counter.

Figure 79.8. 2-bit Gray Up/Down Counter



79.6.2.5. Dead-Time Generator

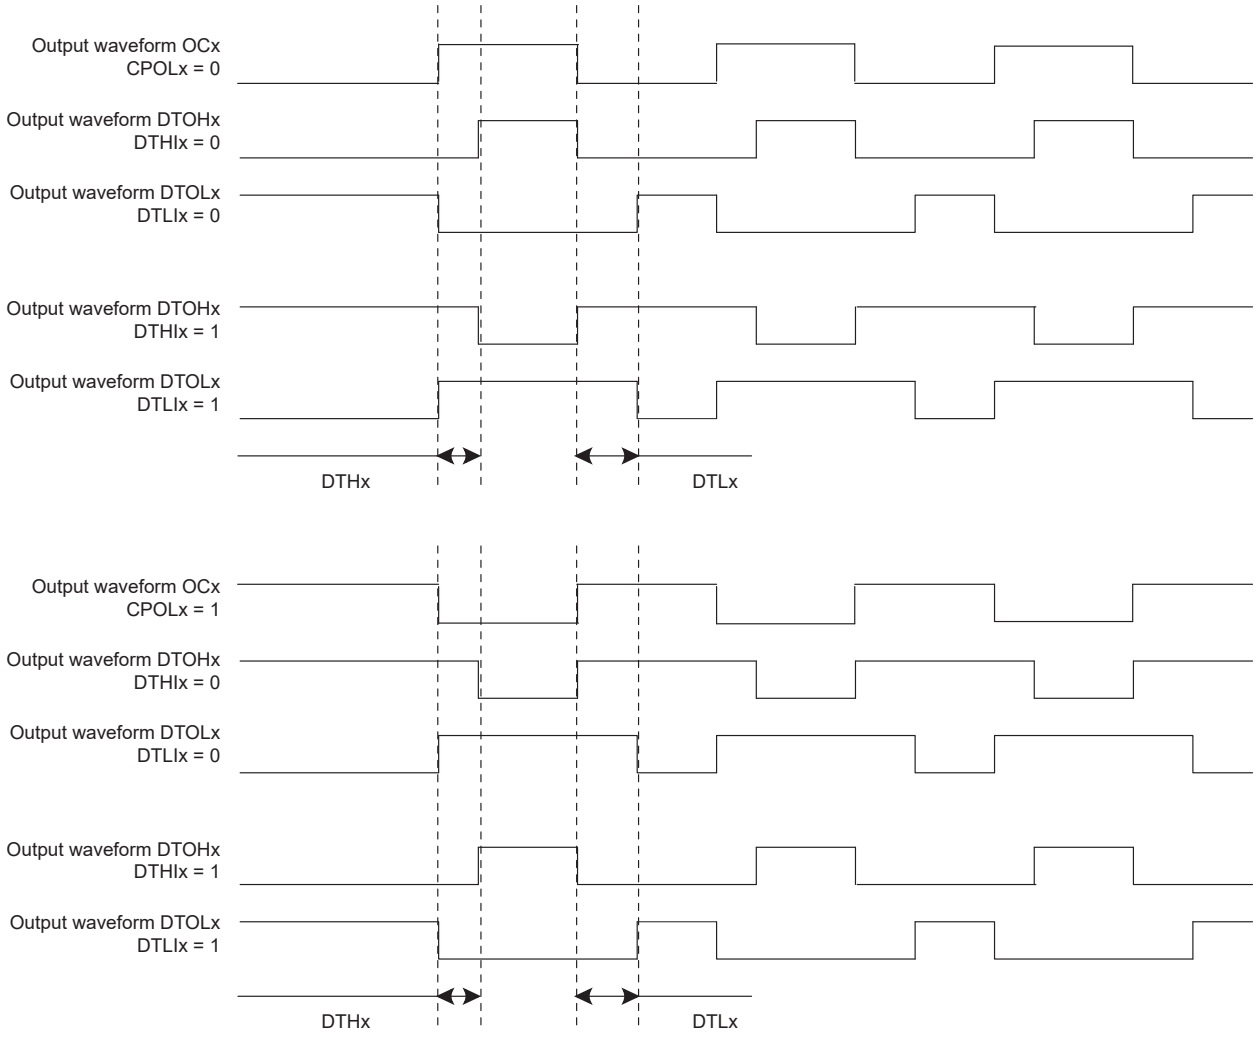
The dead-time generator uses the comparator output OCx to provide the two complementary outputs DTOHx and DTOLx, which allows the PWM macrocell to drive external power control switches safely. When the dead-time generator is enabled by setting the bit DTE to 1 or 0 in the PWM Channel Mode Register (PWM_CMRx), dead-times (also called dead-bands or non-overlapping times) are inserted between the edges of the two complementary outputs DTOHx and DTOLx. Note that enabling or disabling the dead-time generator is allowed only if the channel is disabled.

The dead-time is adjustable by the PWM Channel Dead Time Register (PWM_DTx). Each output of the dead-time generator can be adjusted separately by DTH and DTL. The dead-time values can be updated synchronously to the PWM period by using the PWM Channel Dead Time Update Register (PWM_DTUPDx).

The dead-time is based on a specific counter which uses the same selected clock that feeds the channel counter of the comparator. Depending on the edge and the configuration of the dead-time, DTOHx and DTOLx are delayed until the counter has reached the value defined by DTH or DTL. An inverted configuration bit (DTHI and DTLI bit in PWM_CMRx) is provided for each output to invert the dead-time outputs. The following figure shows the waveform of the dead-time generator.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 79.9. Complementary Output Waveforms



79.6.2.5.1.PWM Push-Pull Mode

When a PWM channel is configured in Push-Pull mode, the dead-time generator output is managed alternately on each PWM cycle. The polarity of the PWM line during the idle state of the Push-Pull mode is defined by the DPOLI bit in the PWM Channel Mode Register (PWM_CMRx). The Push-Pull mode can be enabled separately on each channel by writing a one to bit PPM in the PWM Channel Mode Register.

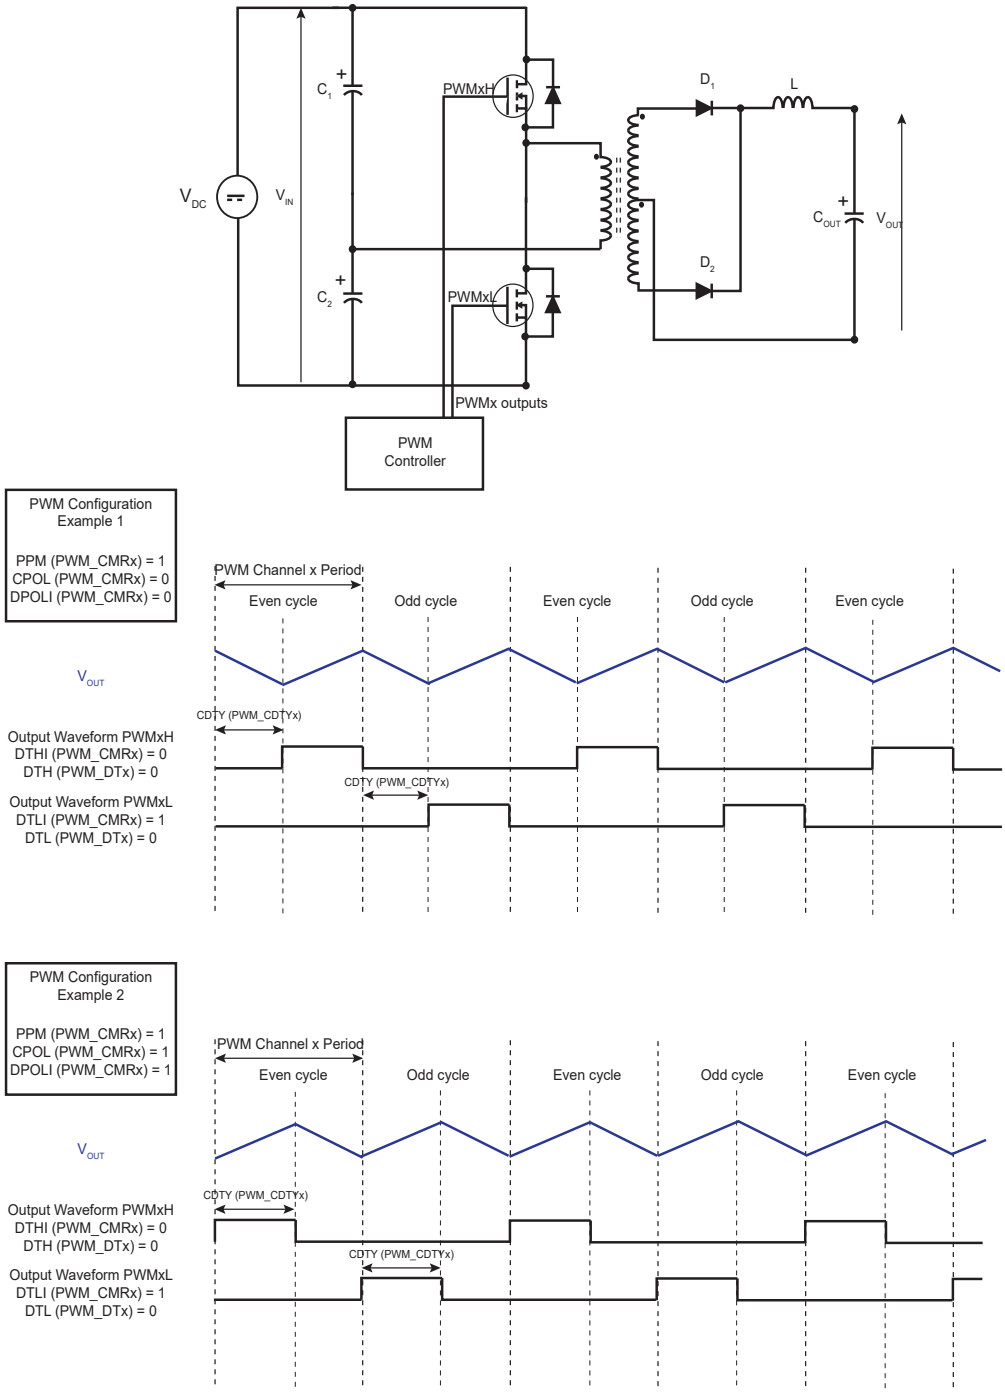
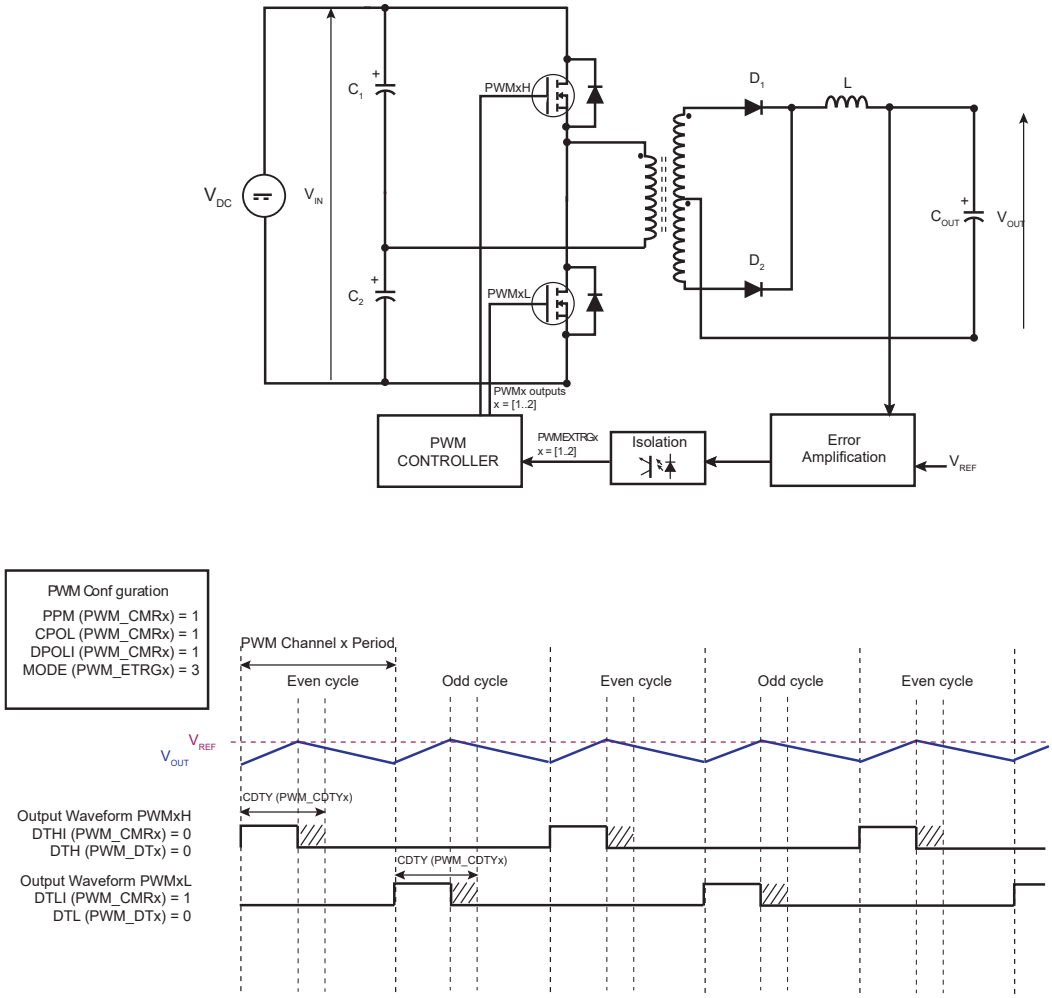
Figure 79.13. Half-Bridge Converter Application: No Feedback Regulation



© 2025 Microchip Technology Inc. and its subsidiaries

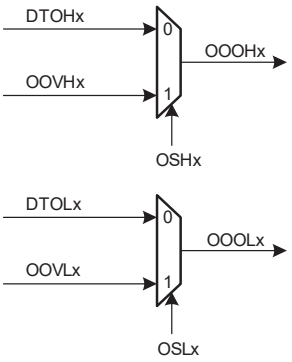
Figure 79.14. Half-Bridge Converter Application: Feedback Regulation



79.6.2.6.Output Override

The two complementary outputs DTOHx and DTOLx of the dead-time generator can be forced to a value defined by the software.

Figure 79.15. Override Output Selection



The fields OSHx and OSLx in the PWM Output Selection Register (PWM_OS) allow the outputs of the dead-time generator DTOHx and DTOLx to be overridden by the value defined in the fields OOVHx and OOVLx in the PWM Output Override Value Register (PWM_OOV).

© 2025 Microchip Technology Inc. and its subsidiaries

The set registers PWM Output Selection Set Register (PWM_OSS) and PWM Output Selection Set Update Register (PWM_OSSUPD) enable the override of the outputs of a channel regardless of other channels. In the same way, the clear registers PWM Output Selection Clear Register (PWM_OSC) and PWM Output Selection Clear Update Register (PWM_OSCUPD) disable the override of the outputs of a channel regardless of other channels.

By using buffer registers PWM_OSSUPD and PWM_OSCUPD, the output selection of PWM outputs is done synchronously to the channel counter, at the beginning of the next PWM period.

By using registers PWM_OSS and PWM_OSC, the output selection of PWM outputs is done asynchronously to the channel counter, as soon as the register is written.

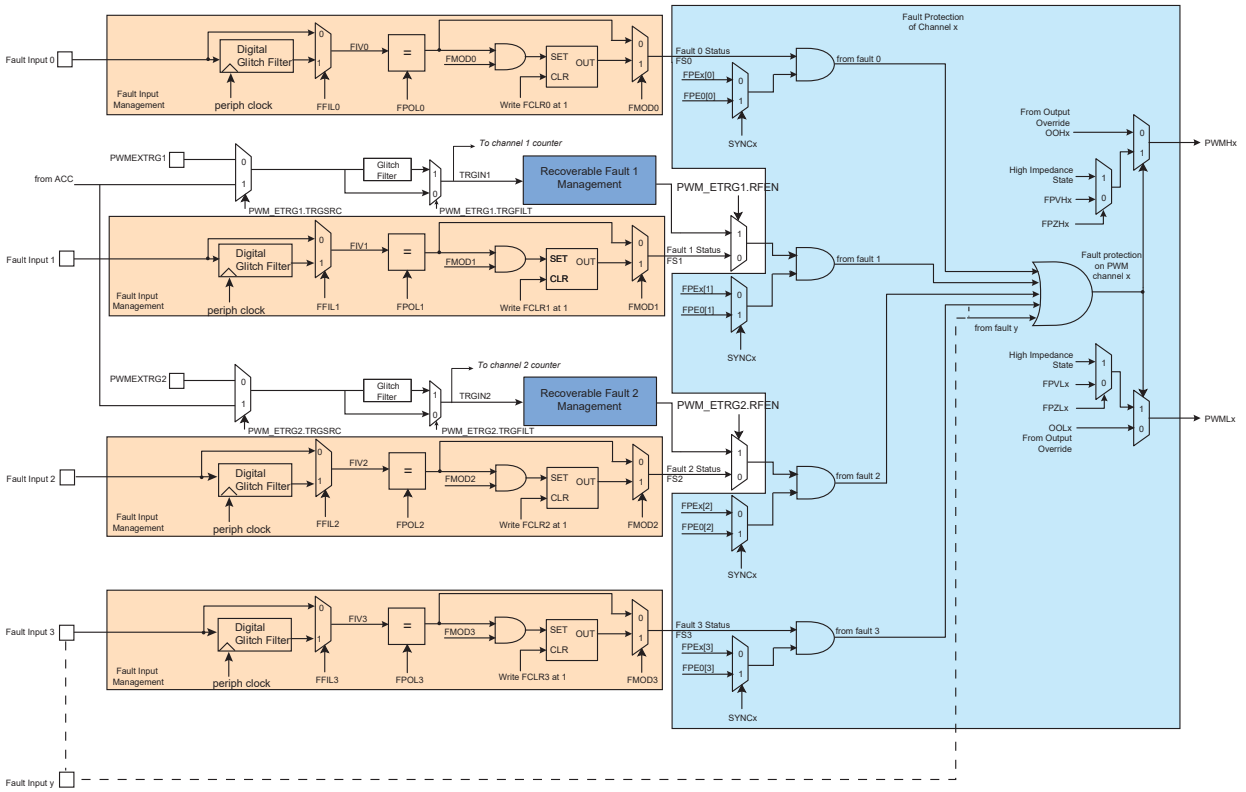
The value of the current output selection can be read in PWM_OS.

While overriding PWM outputs, the channel counters continue to run, only the PWM outputs are forced to user defined values.

79.6.2.7. Fault Protection

5 inputs provide fault protection which can force any of the PWM output pairs to a programmable value. This mechanism has priority over output overriding.

Figure 79.16. Fault Protection



The polarity level of the fault inputs is configured by the FPOL field in the PWM Fault Mode Register (PWM_FMR). For fault inputs coming from internal peripherals such as ADC or Timer Counter, the polarity level must be FPOL = 1. For fault inputs coming from external GPIO pins the polarity level depends on the user's implementation.

The configuration of the Fault Activation mode (FMOD field in PWMC_FMR) depends on the peripheral generating the fault. If the corresponding peripheral does not have “Fault Clear” management, then the FMOD configuration to use must be FMOD = 1, to avoid spurious fault

© 2025 Microchip Technology Inc. and its subsidiaries

detection. Refer to the corresponding peripheral documentation for details on handling fault generation.

Fault inputs may or may not be glitch-filtered depending on the FFIL field in PWM_FMR. When the filter is activated, glitches on fault inputs with a width inferior to the PWM peripheral clock period are rejected.

A fault becomes active as soon as its corresponding fault input has a transition to the programmed polarity level. If the corresponding bit FMOD is set to '0' in PWM_FMR, the fault remains active as long as the fault input is at this polarity level. If the corresponding FMOD field is set to '1', the fault remains active until the fault input is no longer at this polarity level and until it is cleared by writing the corresponding bit FCLR in the PWM Fault Clear Register (PWM_FCR). In the PWM Fault Status Register (PWM_FSR), the field FIV indicates the current level of the fault inputs and the field FIS indicates whether a fault is currently active.

Each fault can be taken into account or not by the fault protection mechanism in each channel. To be taken into account in the channel x, the fault y must be enabled by the bit FPEx[y] in the PWM Fault Protection Enable register (PWM_FPE). However, synchronous channels (see Synchronous Channels) do not use their own fault enable bits, but those of the channel 0 (bits FPE0[y]).

The fault protection on a channel is triggered when this channel is enabled and when any one of the faults that are enabled for this channel is active. It can be triggered even if the PWM peripheral clock is not running but only by a fault input that is not glitch-filtered.

When the fault protection is triggered on a channel, the fault protection mechanism resets the counter of this channel and forces the channel outputs to the values defined by the fields FPVHx and FPVLx in the PWM Fault Protection Value Register 1 (PWM_FPV) and fields FPZHx/FPZLx in the PWM Fault Protection Value Register 2, as shown in the table below. The output forcing is made asynchronously to the channel counter.

Table 79.3. Forcing Values of PWM Outputs by Fault Protection

FPZH/Lx	FPVH/Lx	Forcing Value of PWMH/Lx
0	0	0
0	1	1
1	–	High impedance state (Hi-Z)

CAUTION

- To prevent any unexpected activation of the status flag FSy in PWM_FSR, the FMODy bit can be set to '1' only if the FPOLy bit has been previously configured to its final value.
- To prevent any unexpected activation of the Fault Protection on the channel x, the bit FPEx[y] can be set to '1' only if the FPOLy bit has been previously configured to its final value.

If a comparison unit is enabled (see PWM Comparison Units) and if a fault is triggered in the channel 0, then the comparison cannot match.

As soon as the fault protection is triggered on a channel, an interrupt (different from the interrupt generated at the end of the PWM period) can be generated but only if it is enabled and not masked. The interrupt is reset by reading the interrupt status register, even if the fault which has caused the trigger of the fault protection is kept active.

79.6.2.7.1.Recoverable Fault

The PWM provides a Recoverable Fault mode on fault 1 and 2 (see figure Fault Protection).

The recoverable fault signal is an internal signal generated as soon as an external trigger event occurs (see PWM External Trigger Mode).

© 2025 Microchip Technology Inc. and its subsidiaries

When the fault 1 or 2 is defined as a recoverable fault, the corresponding fault input pin is ignored and bits FFIL1/2, FMOD1/2 and FFIL1/2 are not taken into account.

The fault 1 is managed as a recoverable fault by the PWMEXTRG1 input trigger when PWM_ETRG1.RFEN = 1, PWM_ENA.CHID1 = 1, and PWM_ETRG1.TRGMODE ≠ 0.

The fault 2 is managed as a recoverable fault by the PWMEXTRG2 input trigger when PWM_ETRG2.RFEN = 1, PWM_ENA.CHID2 = 1, and PWM_ETRG2.TRGMODE ≠ 0.

Recoverable fault 1 and 2 can be taken into account by all channels by enabling the bit FPEx[1/2] in the PWM Fault Protection Enable registers (PWM_FPEx). However the synchronous channels (see Synchronous Channels) do not use their own fault enable bits, but those of the channel 0 (bits FPE0[1/2]).

When a recoverable fault is triggered (according to the PWM_ETRGx.TRGMODE setting), the PWM counter of the affected channels is not cleared (unlike in the classic fault protection mechanism) but the channel outputs are forced to the values defined by the fields FPVHx and FPVLx in the PWM Fault Protection Value Register 1 (PWM_FPV), as per table *Forcing Values of PWM Outputs by Fault Protection*. The output forcing is made asynchronously to the channel counter and lasts from the recoverable fault occurrence to the end of the next PWM cycle (if the recoverable fault is no longer present) (see the figure below).

The recoverable fault does not trigger an interrupt. The Fault Status FSy (with y = 1 or 2) is not reported in the PWM Fault Status Register when the fault y is a recoverable fault.

See Cycle-By-Cycle Duty Mode: LED String Control for an application case associating the Recoverable Fault mode with the External Trigger mode.

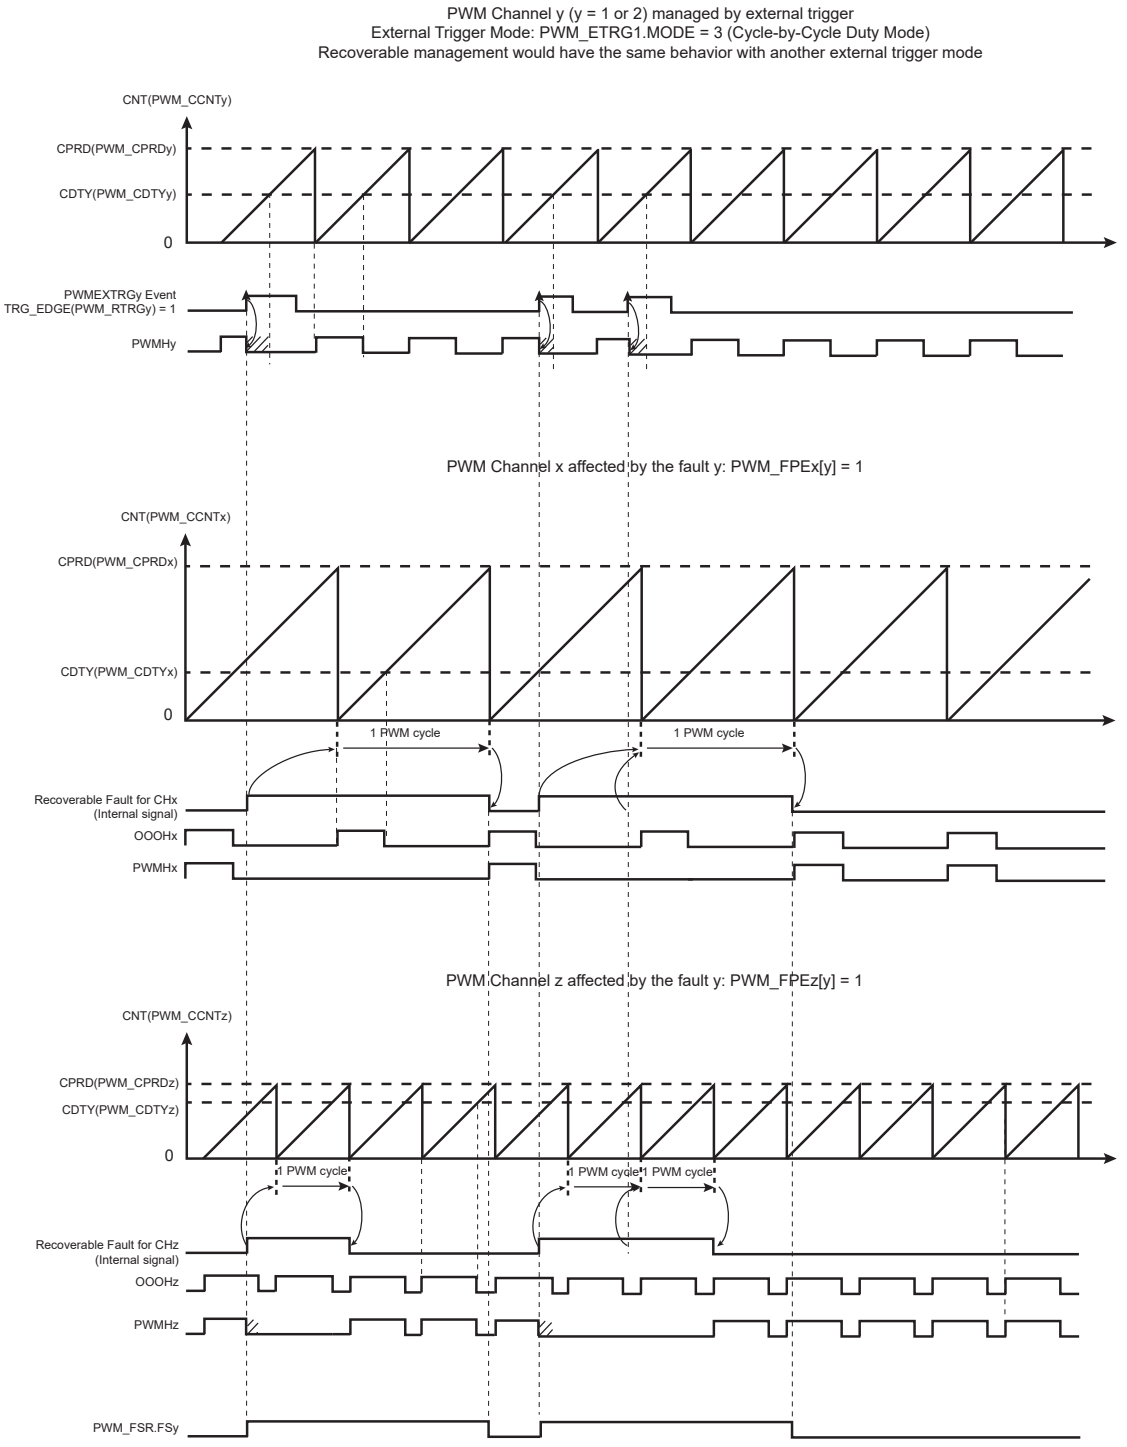
Figure 79.17. Recoverable Fault Management



79.6.2.8.Spread Spectrum Counter

The PWM macrocell includes a spread spectrum counter allowing the generation of a constantly varying duty cycle on the output PWM waveform (only for the channel 0). This feature may be useful to minimize electromagnetic interference or to reduce the acoustic noise of a PWM driven motor.

This is achieved by varying the effective period in a range defined by a spread spectrum value which is programmed by the field SPRD in the PWM Spread Spectrum Register (PWM_SSPR). The

© 2025 Microchip Technology Inc. and its subsidiaries

effective period of the output waveform is the value of the spread spectrum counter added to the programmed waveform period CPRD in the PWM Channel Period Register (PWM_CPRD0).

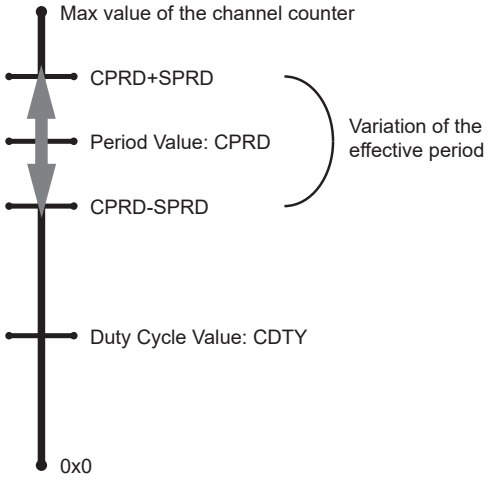
It will cause the effective period to vary from CPRD-SPRD to CPRD+SPRD. This leads to a constantly varying duty cycle on the PWM output waveform because the duty cycle value programmed is unchanged.

The value of the spread spectrum counter can change in two ways depending on the bit SPRDM in PWM_SSPR.

If SPRDM = 0, the Triangular mode is selected. The spread spectrum counter starts to count from -SPRD when the channel 0 is enabled or after reset and counts upwards at each period of the channel counter. When it reaches SPRD, it restarts to count from -SPRD again.

If SPRDM = 1, the Random mode is selected. A new random value is assigned to the spread spectrum counter at each period of the channel counter. This random value is between -SPRD and +SPRD and is uniformly distributed.

Figure 79.18. Spread Spectrum Counter



79.6.2.9.Synchronous Channels

Some channels can be linked together as synchronous channels. They have the same source clock, the same period, the same alignment and are started together. In this way, their counters are synchronized together.

The synchronous channels are defined by the SYNCx bits in the PWM Sync Channels Mode Register (PWM_SCM). Only one group of synchronous channels is allowed.

When a channel is defined as a synchronous channel, the channel 0 is also automatically defined as a synchronous channel. This is because the channel 0 counter configuration is used by all the synchronous channels.

If a channel x is defined as a synchronous channel, the fields/bits for the channel 0 are used instead of those of channel x:

- CPRE in PWM_CMR0 instead of CPRE in PWM_CMRx (same source clock)
- CPRD in PWM_CPRD0 instead of CPRD in PWM_CPRDx (same period)
- CALG in PWM_CMR0 instead of CALG in PWM_CMRx (same alignment)

Modifying the fields CPRE, CPRD and CALG of for channels with index greater than 0 has no effect on output waveforms.

Because counters of synchronous channels must start at the same time, they are all enabled together by enabling the channel 0 (by the CHID0 bit in PWM_ENA register). In the same way, they

© 2025 Microchip Technology Inc. and its subsidiaries

are all disabled together by disabling channel 0 (by the CHID0 bit in PWM_DIS register). However, a synchronous channel x different from channel 0 can be enabled or disabled independently from others (by the CHIDx bit in PWM_ENA and PWM_DIS registers).

Defining a channel as a synchronous channel while it is an asynchronous channel (by writing the bit SYNCx to '1' while it was at '0') is allowed only if the channel is disabled at this time (CHIDx = 0 in PWM_SR). In the same way, defining a channel as an asynchronous channel while it is a synchronous channel (by writing the SYNCx bit to '0' while it was '1') is allowed only if the channel is disabled at this time.

The UPDM field (Update Mode) in the PWM_SCM register selects one of the three methods to update the registers of the synchronous channels:

- Method 1 (UPDM = 0): The period value, the duty-cycle values and the dead-time values must be written by the processor in their respective update registers (respectively PWM_CPRDUPDx, PWM_CDTYUPDx and PWM_DTUPDx).The update is triggered at the next PWM period as soon as the bit UPDULOCK in the PWM Sync Channels Update Control Register (PWM_SCUC) is set to '1'.
- Method 2 (UPDM = 1): The period value, the duty-cycle values, the dead-time values and the update period value must be written by the processor in their respective update registers (respectively PWM_CPRDUPDx, PWM_CDTYUPDx and PWM_DTUPD). The update of the period value and of the dead-time values is triggered at the next PWM period as soon as the bit UPDULOCK in the PWM_SCUC register is set to '1'. The update of the duty-cycle values and the update period value is triggered automatically after an update period defined by the field UPR in the PWM Sync Channels Update Period Register (PWM_SCUP).
- Method 3 (UPDM = 2): Same as Method 2 apart from the fact that the duty-cycle values of ALL synchronous channels are written by the DMA Controller. The user can choose to synchronize the DMA Controller transfer request with a comparison match (see Section 7.3 "PWM Comparison Units"), by the fields PTRM and PTRCS in the PWM_SCM register. The DMA destination address must be configured to access only the PWM DMA Register (PWM_DMAR). The DMA buffer data structure must consist of sequentially repeated duty cycles. The number of duty cycles in each sequence corresponds to the number of synchronized channels. Duty cycles in each sequence must be ordered from the lowest to the highest channel index. The size of the duty cycle is 16 bits.

Table 79.4. Summary of the Update of Registers of Synchronous Channels

Register	UPDM = 0	UPDM = 1	UPDM = 2
Period Value (PWM_CPRDUPDx)	Write by the processor		
	Update is triggered at the next PWM period as soon as the bit UPDULOCK is set to '1'		
Dead-Time Values (PWM_DTUPDx)	Write by the processor		
	Update is triggered at the next PWM period as soon as the bit UPDULOCK is set to '1'		
Duty-Cycle Values (PWM_CDTYUPDx)	Write by the processor	Write by the processor	Write by the DMA Controller
	Update is triggered at the next PWM period as soon as the bit UPDULOCK is set to '1'	Update is triggered at the next PWM period as soon as the update period counter has reached the value UPR	
Update Period Value (PWM_SCUPUPD)	Not applicable	Write by the processor	
	Not applicable	Update is triggered at the next PWM period as soon as the update period counter has reached the value UPR	

79.6.2.9.1. Method 1: Manual write of duty-cycle values and manual trigger of the update

In this mode, the update of the period value, the duty-cycle values and the dead-time values must be done by writing in their respective update registers with the processor (respectively PWM_CPRDUPDx, PWM_CDTYUPDx and PWM_DTUPDx).

To trigger the update, the user must use the bit UPDULOCK in the PWM_SCUC register which allows to update synchronously (at the same PWM period) the synchronous channels:

© 2025 Microchip Technology Inc. and its subsidiaries

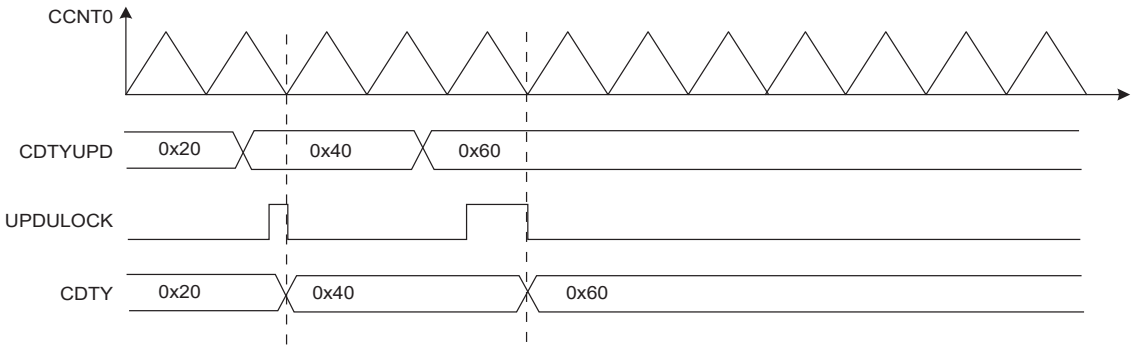
- If the bit UPDULOCK is set to ‘1’, the update is done at the next PWM period of the synchronous channels.
- If the UPDULOCK bit is not set to ‘1’, the update is locked and cannot be performed.

After writing the UPDULOCK bit to ‘1’, it is held at this value until the update occurs, then it is read 0.

Sequence for Method 1:

1. Select the manual write of duty-cycle values and the manual update by setting the UPDM field to ‘0’ in the PWM_SCM register.
2. Define the synchronous channels by the SYNCx bits in the PWM_SCM register.
3. Enable the synchronous channels by writing CHID0 in the PWM_ENA register.
4. If an update of the period value and/or the duty-cycle values and/or the dead-time values is required, write registers that need to be updated (PWM_CPRDUPDx, PWM_CDTYUPDx and PWM_DTUPDx).
5. Set UPDULOCK to ‘1’ in PWM_SCUC.
6. The update of the registers will occur at the beginning of the next PWM period. When the UPDULOCK bit is reset, go to Step 4. for new values.

Figure 79.19. Method 1 (UPDM = 0)



79.6.2.9.2.Method 2: Manual write of duty-cycle values and automatic trigger of the update

In this mode, the update of the period value, the duty-cycle values, the dead-time values and the update period value must be done by writing in their respective update registers with the processor (respectively PWM_CPRDUPDx, PWM_CDTYUPDx, PWM_DTUPDx and PWM_SCUPUPD).

To trigger the update of the period value and the dead-time values, the user must use the bit UPDULOCK in the PWM_SCUC register, which updates synchronously (at the same PWM period) the synchronous channels:

- If the bit UPDULOCK is set to ‘1’, the update is done at the next PWM period of the synchronous channels.
- If the UPDULOCK bit is not set to ‘1’, the update is locked and cannot be performed.

After writing the UPDULOCK bit to ‘1’, it is held at this value until the update occurs, then it is read 0.

The update of the duty-cycle values and the update period is triggered automatically after an update period.

To configure the automatic update, the user must define a value for the update period by the UPR field in the PWM_SCUP register. The PWM controller waits UPR+1 period of synchronous channels before updating automatically the duty values and the update period value.

The status of the duty-cycle value write is reported in the PWM Interrupt Status Register 2 (PWM_ISR2) by the following flags:

© 2025 Microchip Technology Inc. and its subsidiaries

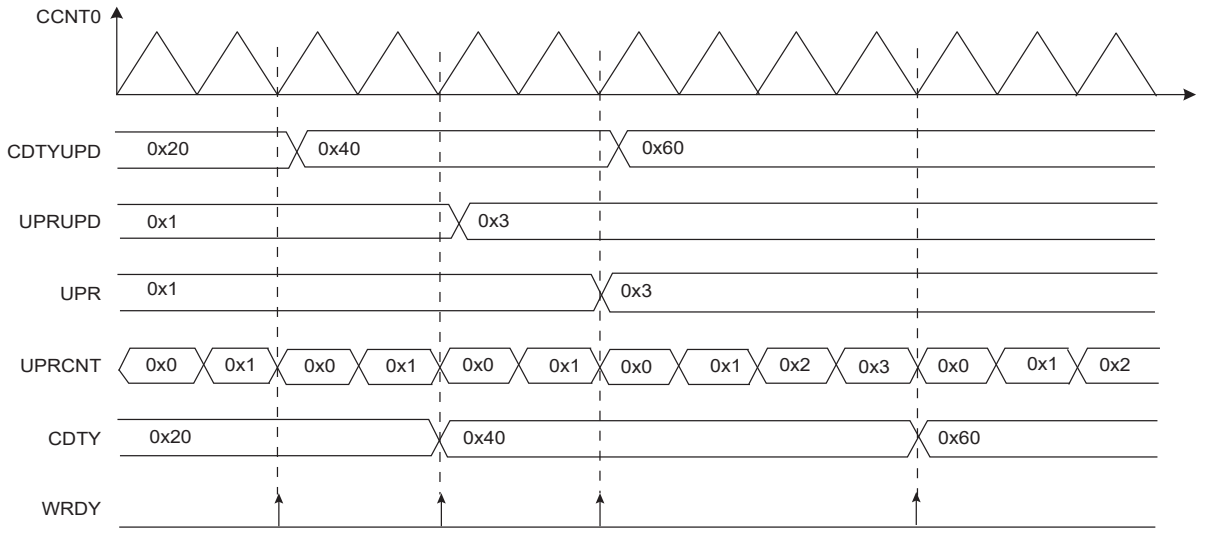
- WRDY: this flag is set to ‘1’ when the PWM Controller is ready to receive new duty-cycle values and a new update period value. It is reset to ‘0’ when the PWM_ISR2 register is read.

Depending on the interrupt mask in the PWM Interrupt Mask Register 2 (PWM_IMR2), an interrupt can be generated by these flags.

Sequence for Method 2:

1. Select the manual write of duty-cycle values and the automatic update by setting the field UPDM to ‘1’ in the PWM_SCM register
2. Define the synchronous channels by the bits SYNCx in the PWM_SCM register.
3. Define the update period by the field UPR in the PWM_SCUP register.
4. Enable the synchronous channels by writing CHID0 in the PWM_ENA register.
5. If an update of the period value and/or of the dead-time values is required, write registers that need to be updated (PWM_CPRDUPDx, PWM_DTUPDx), else go to Step 8.
6. Set UPDULOCK to ‘1’ in PWM_SCUC.
7. The update of these registers will occur at the beginning of the next PWM period. At this moment the bit UPDULOCK is reset, go to Step 5. for new values.
8. If an update of the duty-cycle values and/or the update period is required, check first that write of new update values is possible by polling the flag WRDY (or by waiting for the corresponding interrupt) in PWM_ISR2.
9. Write registers that need to be updated (PWM_CDTYUPDx, PWM_SCUPUPD).
10. The update of these registers will occur at the next PWM period of the synchronous channels when the Update Period is elapsed. Go to Step 8. for new values.

Figure 79.20. Method 2 (UPDM = 1)



79.6.2.9.3.Method 3: Automatic write of duty-cycle values and automatic trigger of the update

In this mode, the update of the duty cycle values is made automatically by the DMA Controller. The update of the period value, the dead-time values and the update period value must be done by writing in their respective update registers with the processor (respectively PWM_CPRDUPDx, PWM_DTUPDx and PWM_SCUPUPD).

To trigger the update of the period value and the dead-time values, the user must use the bit UPDULOCK which allows to update synchronously (at the same PWM period) the synchronous channels:

© 2025 Microchip Technology Inc. and its subsidiaries

- If the bit UPDULOCK is set to '1', the update is done at the next PWM period of the synchronous channels.
- If the UPDULOCK bit is not set to '1', the update is locked and cannot be performed.

After writing the UPDULOCK bit to '1', it is held at this value until the update occurs, then it is read 0.

The update of the duty-cycle values and the update period value is triggered automatically after an update period.

To configure the automatic update, the user must define a value for the Update Period by the field UPR in the PWM_SCUP register. The PWM controller waits UPR+1 periods of synchronous channels before updating automatically the duty values and the update period value.

Using the DMA Controller removes processor overhead by reducing its intervention during the transfer. This significantly reduces the number of clock cycles required for a data transfer, which improves microcontroller performance.

The DMA Controller must write the duty-cycle values in the synchronous channels index order. For example if the channels 0, 1 and 3 are synchronous channels, the DMA Controller must write the duty-cycle of the channel 0 first, then the duty-cycle of the channel 1, and finally the duty-cycle of the channel 3.

The status of the DMA Controller transfer is reported in PWM_ISR2 by the following flags:

- WRDY: this flag is set to '1' when the PWM Controller is ready to receive new duty-cycle values and a new update period value. It is reset to '0' when PWM_ISR2 is read. The user can choose to synchronize the WRDY flag and the DMA Controller transfer request with a comparison match (see PWM Comparison Units), by the fields PTRM and PTRCS in the PWM_SCM register.
- UNRE: this flag is set to '1' when the update period defined by the UPR field has elapsed while the whole data has not been written by the Peripheral DMA Controller. It is reset to '0' when PWM_ISR2 is read.

Depending on the interrupt mask in PWM_IMR2, an interrupt can be generated by these flags.

Sequence for Method 3:

1. Select the automatic write of duty-cycle values and automatic update by setting the field UPDM to 2 in the PWM_SCM register.
2. Define the synchronous channels by the bits SYNCx in the PWM_SCM register.
3. Define the update period by the field UPR in the PWM_SCUP register.
4. Define when the WRDY flag and the corresponding DMA Controller transfer request must be set in the update period by the PTRM bit and the PTRCS field in the PWM_SCM register (at the end of the update period or when a comparison matches).
5. Define the DMA Controller transfer settings for the duty-cycle values and enable it in the DMA Controller registers
6. Enable the synchronous channels by writing CHID0 in the PWM_ENA register.
7. If an update of the period value and/or of the dead-time values is required, write registers that need to be updated (PWM_CPRDUPDx, PWM_DTUPDx), else go to Step 10.
8. Set UPDULOCK to '1' in PWM_SCUC.
9. The update of these registers will occur at the beginning of the next PWM period. At this moment the bit UPDULOCK is reset, go to Step 7. for new values.
10. If an update of the update period value is required, check first that write of a new update value is possible by polling the flag WRDY (or by waiting for the corresponding interrupt) in PWM_ISR2, else go to Step 14.
11. Write the register that needs to be updated (PWM_SCUPUPD).

© 2025 Microchip Technology Inc. and its subsidiaries

12. The update of this register will occur at the next PWM period of the synchronous channels when the Update Period is elapsed. Go to Step 10 for new values.
13. Wait for the DMA status flag indicating that the buffer transfer is complete. If the transfer has ended, define a new DMA transfer for new duty-cycle values. Go to Step 5.

Figure 79.21. Method 3 (UPDM = 2 and PTRM = 0)

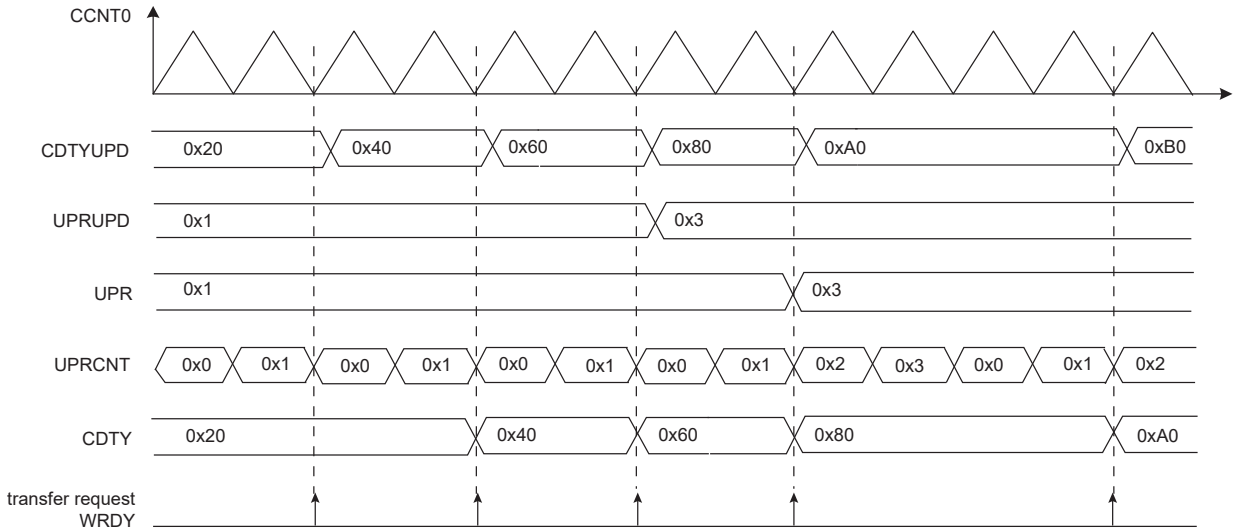


Figure 79.22. Method 3 (UPDM = 2 and PTRM = 1 and PTRCS = 0)

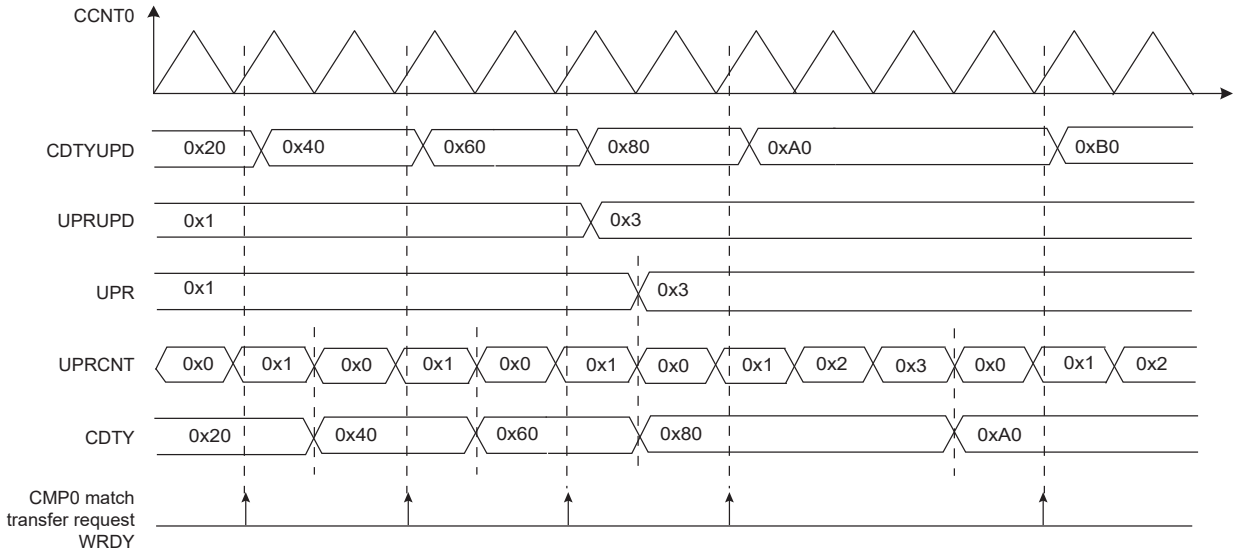


79.6.2.10. Update Time for Double-Buffering Registers

All channels integrate a double-buffering system in order to prevent an unexpected output waveform while modifying the period, the spread spectrum value, the polarity, the duty-cycle, the dead-times, the output override, and the synchronous channels update period.

This double-buffering system comprises the following update registers:

- PWM Sync Channels Update Period Update Register
- PWM Output Selection Set Update Register
- PWM Output Selection Clear Update Register

© 2025 Microchip Technology Inc. and its subsidiaries

- PWM Spread Spectrum Update Register
- PWM Channel Duty Cycle Update Register
- PWM Channel Period Update Register
- PWM Channel Dead Time Update Register
- PWM Channel Mode Update Register

When one of these update registers is written to, the write is stored, but the values are updated only at the next PWM period border. In Left-aligned mode (CALG = 0), the update occurs when the channel counter reaches the period value CPRD. In Center-aligned mode, the update occurs when the channel counter value is decremented and reaches the 0 value.

In Center-aligned mode, it is possible to trigger the update of the polarity and the duty-cycle at the next half period border. This mode concerns the following update registers:

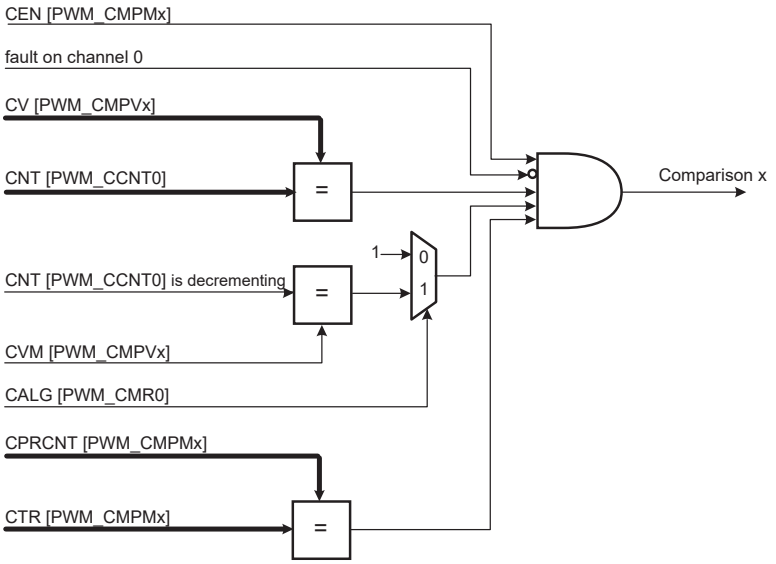
- PWM Channel Duty Cycle Update Register
- PWM Channel Mode Update Register

The update occurs at the first half period following the write of the update register (either when the channel counter value is incrementing and reaches the period value CPRD, or when the channel counter value is decrementing and reaches the 0 value). To activate this mode, the user must write a one to the bit UPDS in the PWM Channel Mode Register.

79.6.3. PWM Comparison Units

The PWM provides 8 independent comparison units able to compare a programmed value with the current value of the channel 0 counter (which is the channel counter of all synchronous channels, "Synchronous Channels"). These comparisons are intended to generate pulses on the event lines (used to synchronize ADC, see PWM Event Lines), to generate software interrupts and to trigger DMA Controller transfer requests for the synchronous channels (see Method 3: Automatic write of duty-cycle values and automatic trigger of the update).

Figure 79.23. Comparison Unit Block Diagram



The comparison x matches when it is enabled by the bit CEN in the PWM Comparison x Mode Register (PWM_CMPMx for the comparison x) and when the counter of the channel 0 reaches the comparison value defined by the field CV in PWM Comparison x Value Register (PWM_CMPVx for the comparison x). If the counter of the channel 0 is center-aligned (CALG = 1 in PWM Channel

© 2025 Microchip Technology Inc. and its subsidiaries

Mode Register), the bit CVM in PWM_CMPVx defines if the comparison is made when the counter is counting up or counting down (in Left-alignment mode CALG = 0, this bit is useless).

If a fault is active on the channel 0, the comparison is disabled and cannot match (see Fault Protection).

The user can define the periodicity of the comparison x by the fields CTR and CPR in PWM_CMPMx. The comparison is performed periodically once every CPR+1 periods of the counter of the channel 0, when the value of the comparison period counter CPRCNT in PWM_CMPMx reaches the value defined by CTR. CPR is the maximum value of the comparison period counter CPRCNT. If CPR = CTR = 0, the comparison is performed at each period of the counter of the channel 0.

The comparison x configuration can be modified while the channel 0 is enabled by using the PWM Comparison x Mode Update Register (PWM_CMPMUPDx registers for the comparison x). In the same way, the comparison x value can be modified while the channel 0 is enabled by using the PWM Comparison x Value Update Register (PWM_CMPVUPDx registers for the comparison x).

The update of the comparison x configuration and the comparison x value is triggered periodically after the comparison x update period. It is defined by the field CUPR in PWM_CMPMx. The comparison unit has an update period counter independent from the period counter to trigger this update. When the value of the comparison update period counter CUPRCNT (in PWM_CMPMx) reaches the value defined by CUPR, the update is triggered. The comparison x update period CUPR itself can be updated while the channel 0 is enabled by using the PWM_CMPMUPDx register.

⚠ CAUTION The write of PWM_CMPVUPDx must be followed by a write of PWM_CMPMUPDx.

The comparison match and the comparison update can be source of an interrupt, but only if it is enabled and not masked. These interrupts can be enabled by the PWM Interrupt Enable Register 2 and disabled by the PWM Interrupt Disable Register 2. The comparison match interrupt and the comparison update interrupt are reset by reading the PWM Interrupt Status Register 2.

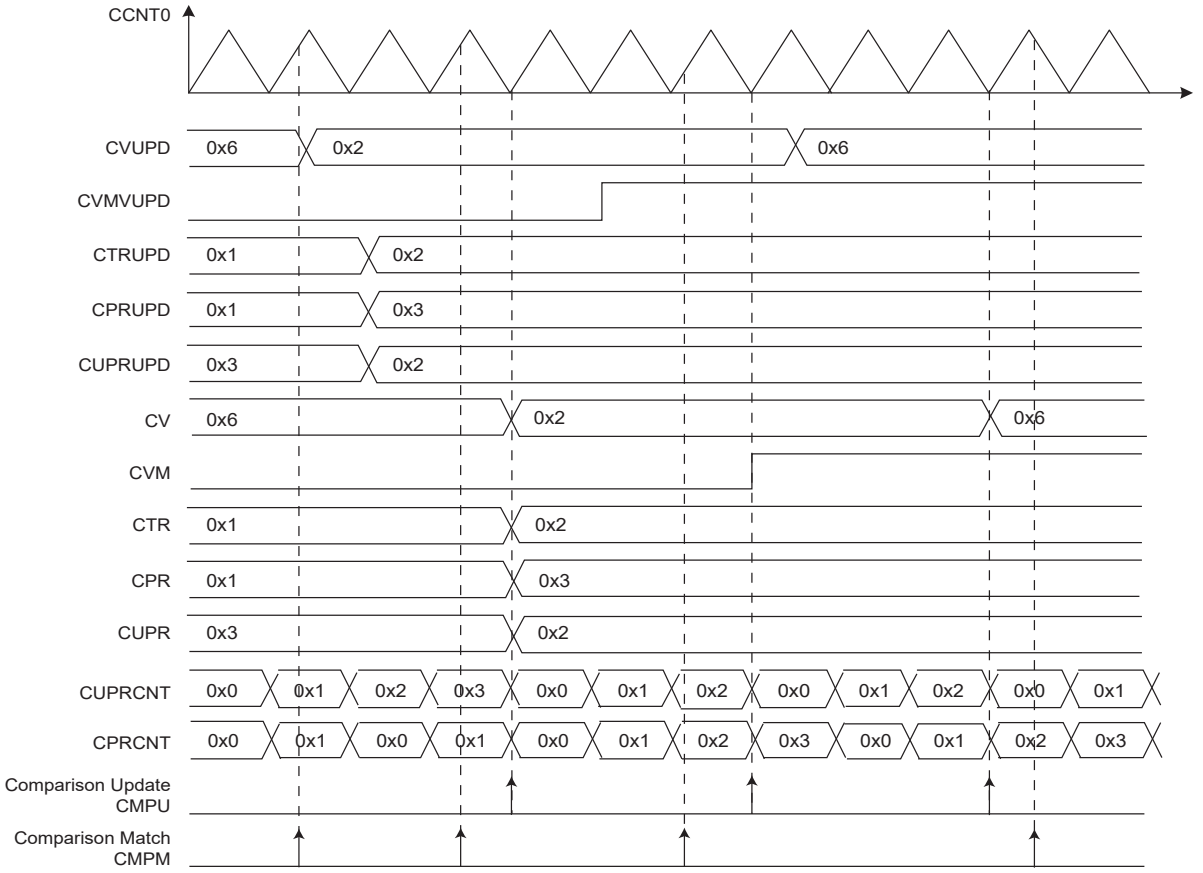
Figure 79.24. Comparison Waveform



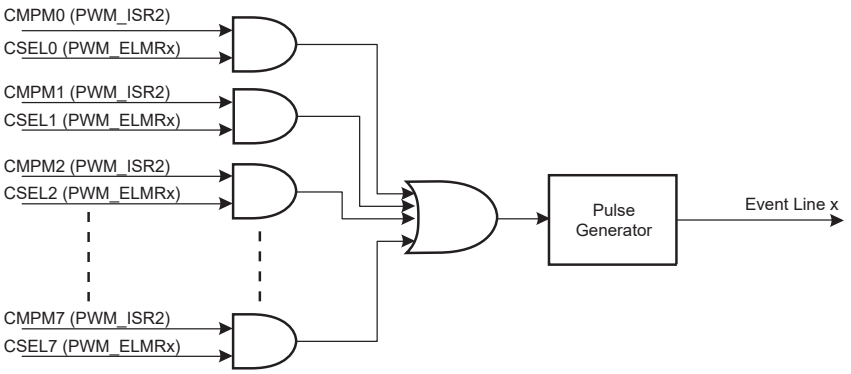
79.6.4. PWM Event Lines

The PWM provides 2 independent event lines intended to trigger actions in other peripherals (e.g., for the Analog-to-Digital Converter (ADC)).

A pulse (one cycle of the peripheral clock) is generated on an event line, when at least one of the selected comparisons is matching. The comparisons can be selected or unselected independently by the CSEL bits in the PWM Event Line x Register (PWM_ELMRx for the Event Line x).

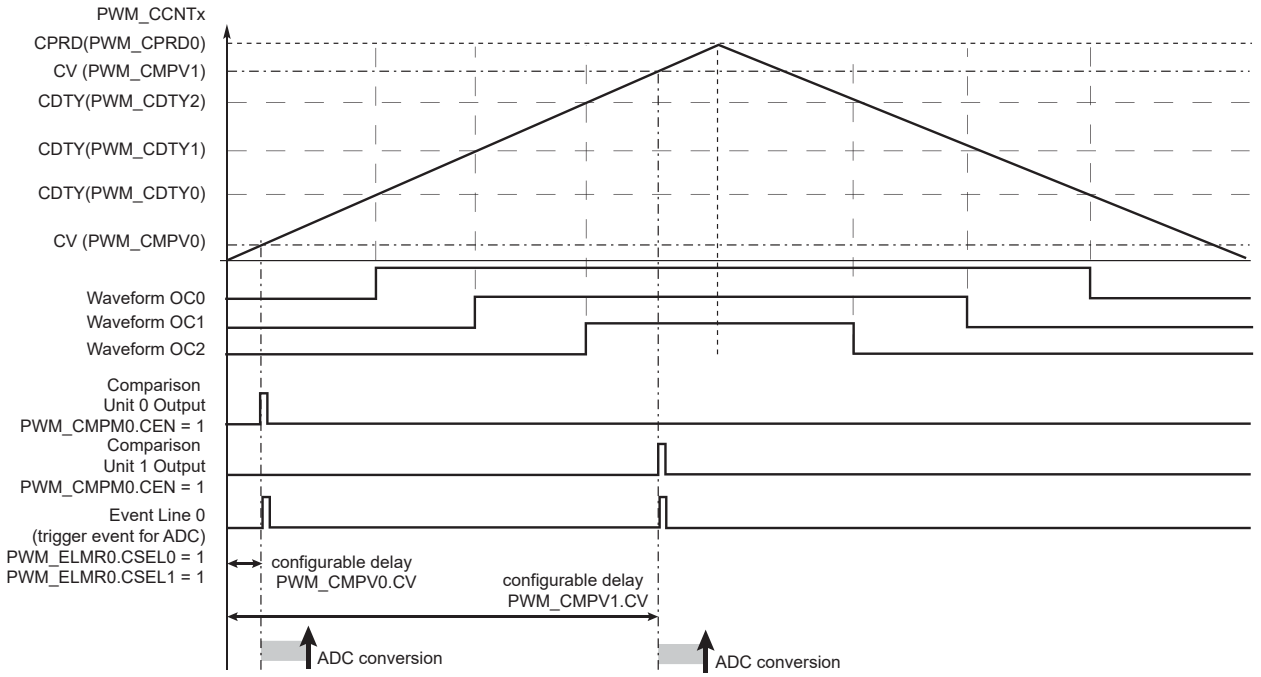
An example of event generation is provided in the figure Event Line Generation Waveform (Example).

Figure 79.25. Event Line Block Diagram



© 2025 Microchip Technology Inc. and its subsidiaries

Figure 79.26. Event Line Generation Waveform (Example)



79.6.5. Debug Mode

When debugging an application using breakpoints, the core is stopped in Debug mode when the breakpoint is hit. PWM registers are no longer updated by the application and thus PWML and/or PWMH outputs maintain the states or waveforms provided just before entering Debug mode. Depending on the application target, this state may not be valid for an undetermined period, or may have an undesired effect on devices driven by the PWM while the system is in Debug mode.

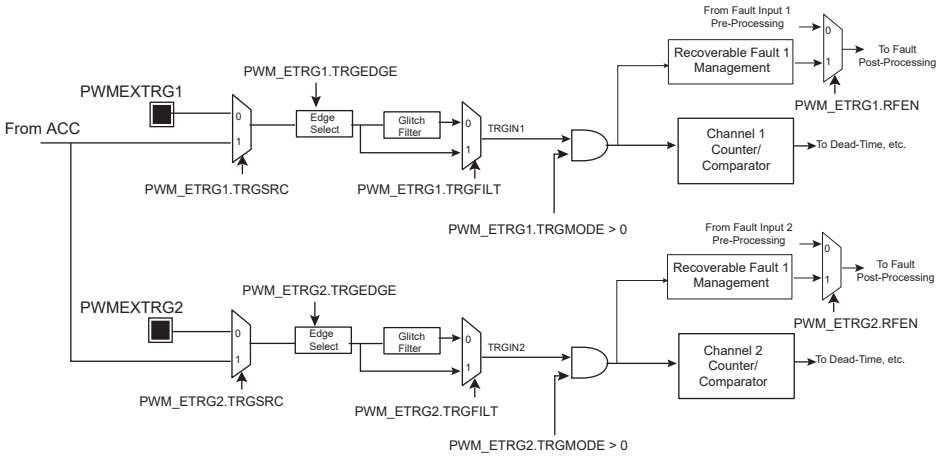
When entering Debug mode, the PWM outputs can be automatically and immediately forced to a predefined state if the bit OUTMODE=1 in the Debug register (PWM_DEBUG) (see PWM_DEBUG). The predefined state is defined in the Fault Protection Value registers (PWM_FPVx) (see PWM_FPV1 and PWM_FPV2).

79.6.6. PWM External Trigger Mode

The PWM channels 1 and 2 can be configured to use an external trigger for generating specific PWM signals to provide functions such as DC/DC converters, etc.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 79.27. External Trigger Mode Block Diagram



The external trigger source can be selected through the bit TRGSRC of the PWM External Trigger Register (see the table below).

Table 79.5. External Event Source Selection

Channel	Trigger Source Selection	Trigger Source
1	PWM_ETRG1.TRGSRC = 0	From PWMEXTRG1 input
	PWM_ETRG1.TRGSRC = 1	From Analog Comparator Controller
2	PWM_ETRG2.TRGSRC = 0	From PWMEXTRG2 input
	PWM_ETRG2.TRGSRC = 1	From Analog Comparator Controller

Each external trigger source can be filtered by writing a one to PWM_ETRGx.TRGFILT.

When the external trigger event is detected, the internal counter of the PWM channel can be modified when conditions are met, depending on the value of the PWM_ETRGx.TRGMODE field.

Each time an external trigger event is detected, the corresponding PWM channel counter value is stored in PWM_ETRGx.MAXCNT if it is greater than the previously stored value. Reading PWM_ETRGx clears the MAXCNT value.

To adapt to different use cases, three different external trigger mode modes (ETM) are available for channels 1 and 2 depending on the value of the PWM_ETRGx.TRGMODE field:

- TRGMODE = 1: External PWM Reset Mode (see External PWM Reset Mode)
- TRGMODE = 2: External PWM Start Mode (see External PWM Start Mode)
- TRGMODE = 3: Cycle-By-Cycle Duty Mode (see Cycle-By-Cycle Duty Mode)

The ETM feature is disabled when PWM_ETRGx.TRGMODE = 0.

The ETM mode can be associated with the recoverable fault mode (PWM_ETRGx.RFEN=1) to manage specific use case (see Cycle-By-Cycle Duty Mode: LED String Control).

The use cases described in the figures External PWM Start Mode: Buck DC/DC Converter and Cycle-By-Cycle Duty Mode are managed by PWM_ETRGx.RFEN=0.

The ETM must be enabled only if the corresponding channel is left-aligned (CALG = 0 in PWM Channel Mode Register of channel 1 or 2) and not managed as a synchronous channel (SYNCx = 0 in PWM Sync Channels Mode Register where x = 1 or 2). Programming the channel to be center-aligned or synchronous while TRGMODE is not 0 is forbidden.

79.6.6.1.External PWM Reset Mode

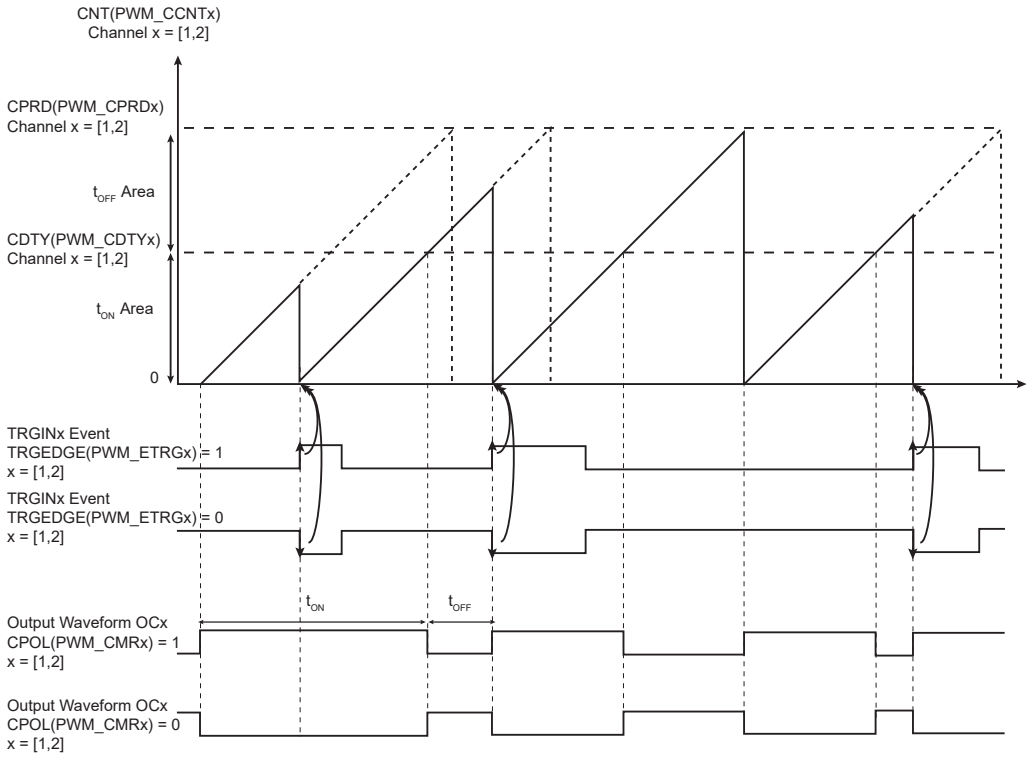
External PWM Reset mode is selected by programming TRGMODE = 1 in the PWM_ETRGx register.

© 2025 Microchip Technology Inc. and its subsidiaries

In this mode, when an edge is detected on the PWMEXTRGx input, the internal PWM counter is cleared and a new PWM cycle is restarted. The edge polarity can be selected by programming the TRGEDGE bit in the PWM_ETRGx register. If no trigger event is detected when the internal channel counter has reached the CPRD value in the PWM Channel Period Register, the internal counter is cleared and a new PWM cycle starts.

Note that this mode does not ensure a constant t_{ON} or t_{OFF} time.

Figure 79.28. External PWM Reset Mode



79.6.6.1.1.Application Example

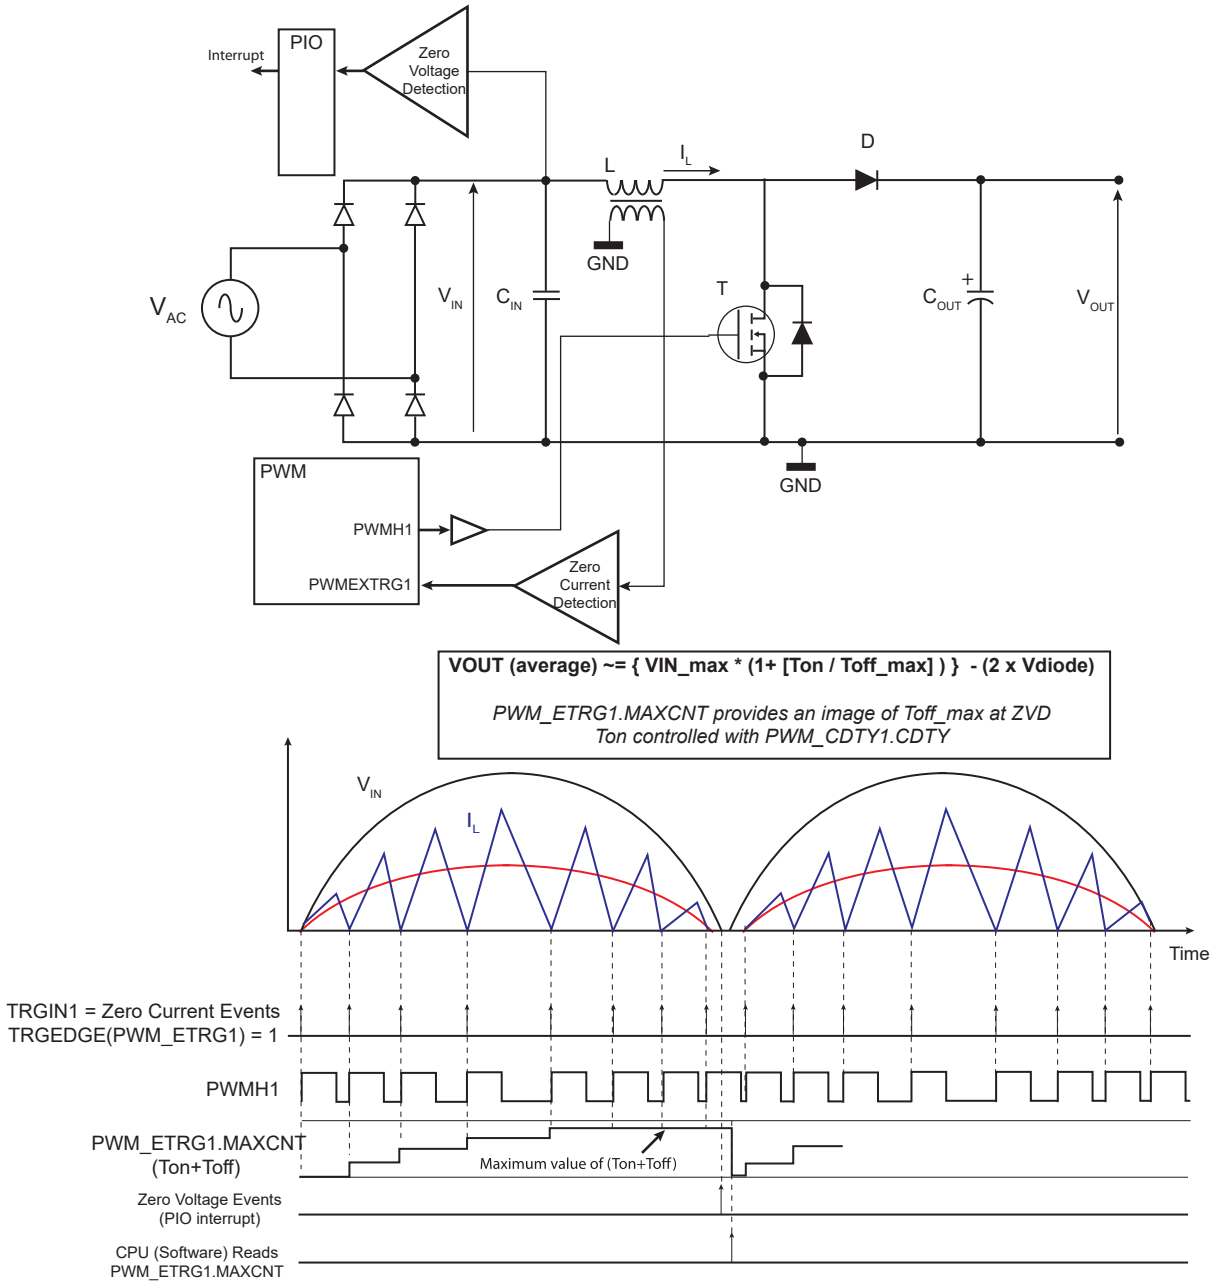
The external PWM Reset mode can be used in power factor correction applications.

In the example below, the external trigger input is the PWMEXTRG1 (therefore the PWM channel used for regulation is the channel 1). The PWM channel 1 period (CPRD in the PWM Channel Period Register of the channel 1) must be programmed so that the TRGIN1 event always triggers before the PWM channel 1 period elapses.

In the figure below, an external circuit (not shown) is required to sense the inductor current I_L. The internal PWM counter of the channel 1 is cleared when the inductor current falls below a specific threshold (I_{REF}). This starts a new PWM period and increases the inductor current.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 79.29. External PWM Reset Mode: Power Factor Correction Application



79.6.6.2. External PWM Start Mode

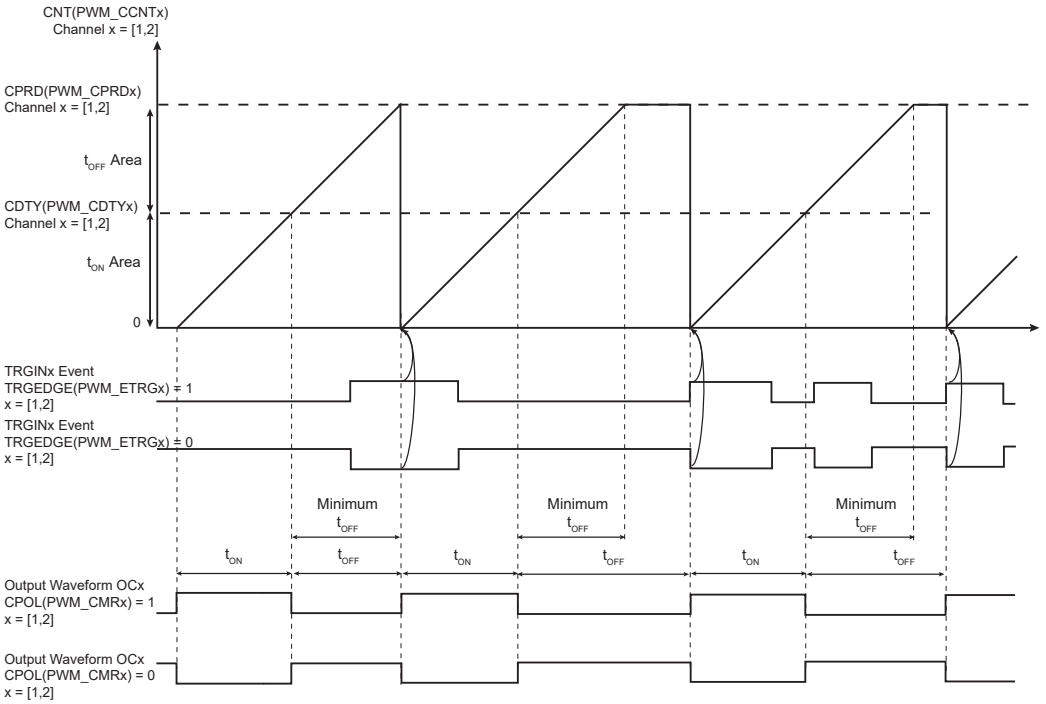
External PWM Start mode is selected by programming TRGMODE = 2 in the PWM_ETRGx register.

In this mode, the internal PWM counter can only be reset once it has reached the CPRD value in the PWM Channel Period Register and when the correct level is detected on the corresponding external trigger input. Both conditions have to be met to start a new PWM period. The active detection level is defined by the bit TRGEDGE of the PWM_ETRGx register.

Note that this mode ensures a constant t_{ON} time and a minimum t_{OFF} time.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 79.30. External PWM Start Mode



79.6.6.2.1.Application Example

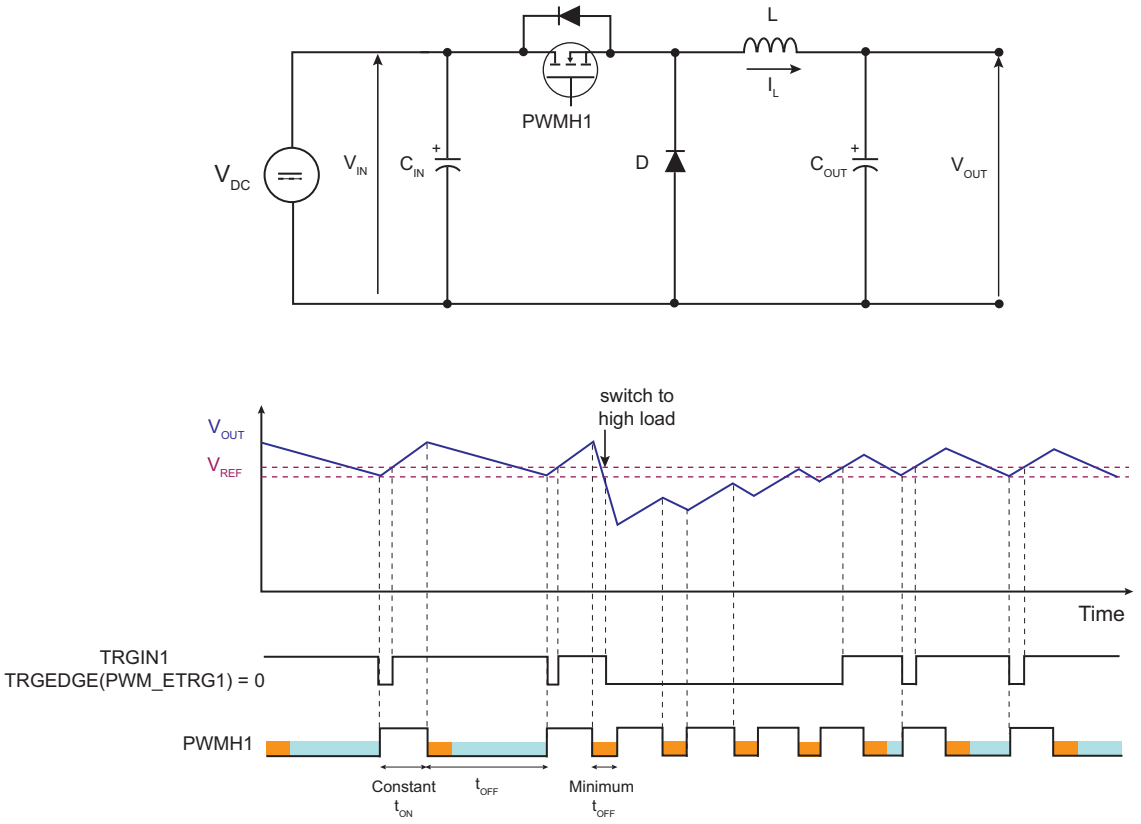
The external PWM Start mode generates a modulated frequency PWM signal with a constant active level duration (t_{ON}) and a minimum inactive level duration (minimum t_{OFF}).

The t_{ON} time is defined by the CDTY value in the PWM Channel Duty Cycle Register. The minimum t_{OFF} time is defined by CDTY - CPRD (PWM Channel Period Register). This mode can be useful in Buck DC/DC Converter applications.

When the output voltage V_{OUT} is above a specific threshold (Vref), the PWM inactive level is maintained as long as V_{OUT} remains above this threshold. If V_{OUT} is below this specific threshold, this mode ensures a minimum t_{OFF} time required for MOSFET driving (see the figure below).

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 79.31. External PWM Start Mode: Buck DC/DC Converter



79.6.6.3.Cycle-By-Cycle Duty Mode

Cycle-by-cycle duty mode is selected by programming TRGMODE = 3 in PWM_ETRGx.

In this mode, the PWM frequency is constant and is defined by the CPRD value in the PWM Channel Period Register.

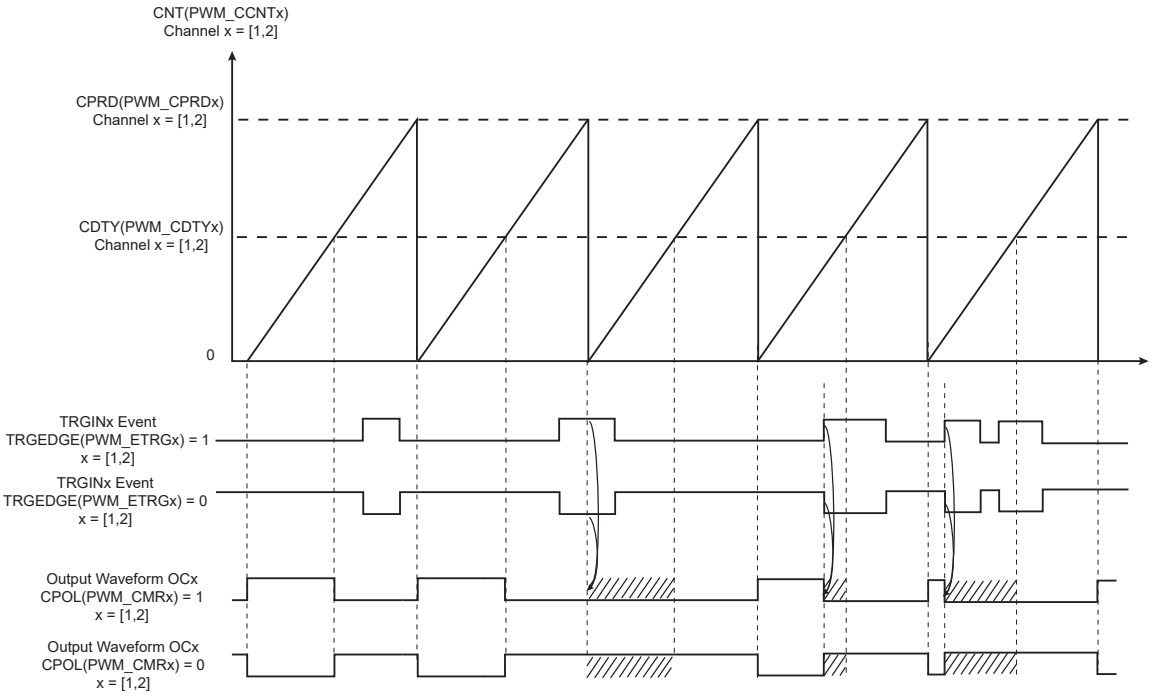
An external trigger event has no effect on the PWM output if it occurs while the internal PWM counter value is above the CDTY value of the PWM Channel Duty Cycle Register.

If the internal PWM counter value is below the value of CDTY of the PWM Channel Duty Cycle Register, an external trigger event makes the PWM output inactive.

The external trigger event can be detected on rising or falling edge according to the TRGEDGE bit in PWM_ETRGx.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 79.32. Cycle-By-Cycle Duty Mode



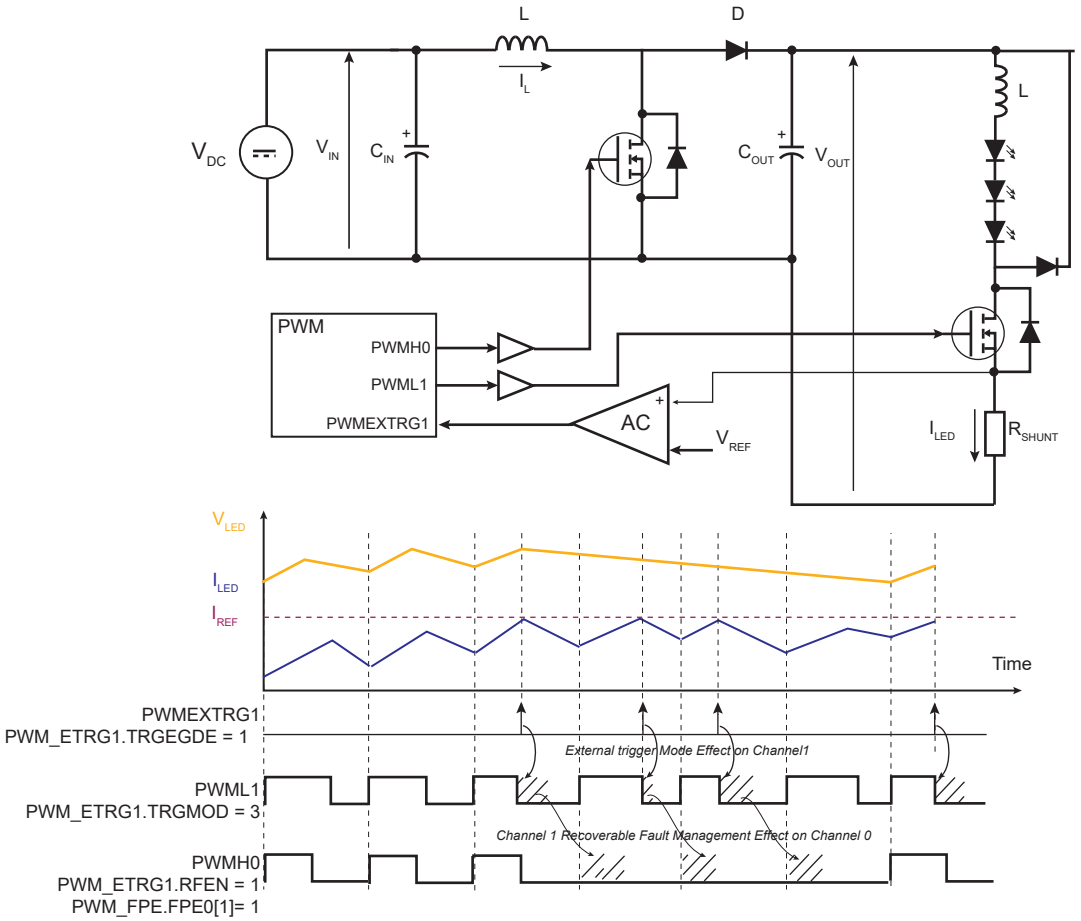
79.6.6.3.1.Application Example

The figure below illustrates an application example of the Cycle-by-cycle Duty mode.

In an LED string control circuit, Cycle-by-cycle Duty mode can be used to automatically limit the current in the LED string. This use case requires the recoverable fault mode to be enabled on channel 1 and associated fault signal must be enabled on channel 0.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 79.33. Cycle-By-Cycle Duty Mode: LED String Control



79.6.6.4.Leading-Edge Blanking (LEB)

PWM channels 1 and 2 support leading-edge blanking. Leading-edge blanking masks the external trigger input when a transient occurs on the corresponding PWM output. It masks potential spurious external events due to power transistor switching.

The blanking delay on each external trigger input is configured by programming the LEBDELAYx in the PWM Leading-Edge Blanking Register.

The LEB can be enabled on both the rising and the falling edges for the PWMH and PWML outputs through the bits PWMLFEN, PWMLREN, PWMHFEN, PWMHREN.

Any event on the PWMEXTRGx input which occurs during the blanking time is ignored.

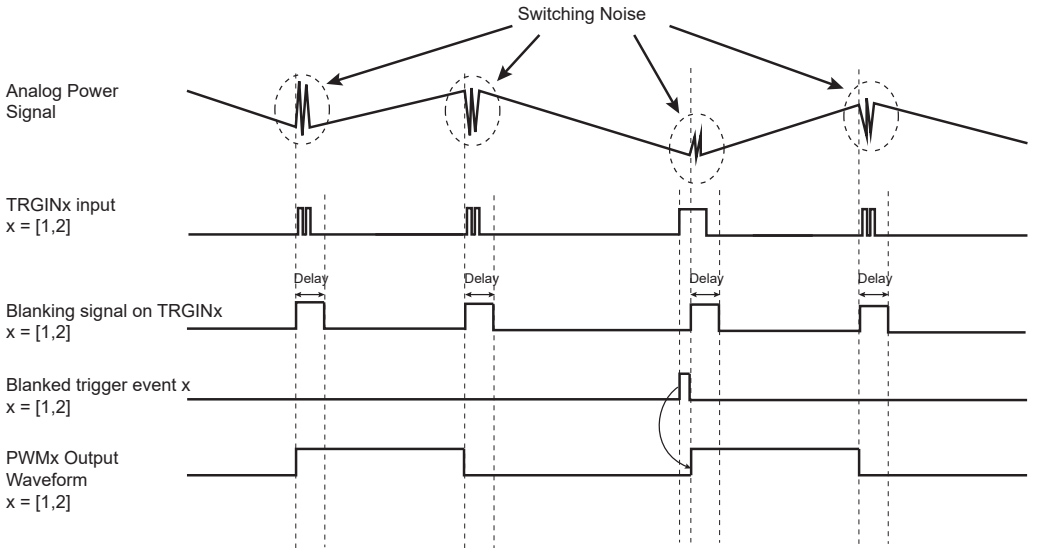
Figure 79.34. Leading-Edge Blanking



79.6.7. PWM Controller Operations

79.6.7.1. Initialization

Before enabling the channels, they must be configured by the software application as described below:

- Unlock User Interface by writing the WPCMD field in PWM_WPCR.
- Configuration of the clock generator (DIVA, PREA, DIVB, PREB in the PWM_CLK register if required).
- Selection of the clock for each channel (CPRE field in PWM_CMRx)
- Configuration of the waveform alignment for each channel (CALG field in PWM_CMRx)
- Selection of the counter event selection (if CALG = 1) for each channel (CES field in PWM_CMRx)
- Configuration of the output waveform polarity for each channel (CPOL bit in PWM_CMRx)
- Configuration of the period for each channel (CPRD in the PWM_CPRDx register). Writing in PWM_CPRDx register is possible while the channel is disabled. After validation of the channel, the user must use PWM_CPRDUPDx register to update PWM_CPRDx as explained below.
- Configuration of the duty-cycle for each channel (CDTY in the PWM_CDTYx register). Writing in PWM_CDTYx register is possible while the channel is disabled. After validation of the channel, the user must use PWM_CDTYUPDx register to update PWM_CDTYx as explained below.
- Configuration of the dead-time generator for each channel (DTH and DTL in PWM_DTx) if enabled (DTE bit in PWM_CMRx). Writing in the PWM_DTx register is possible while the channel is disabled. After validation of the channel, the user must use PWM_DTUPDx register to update PWM_DTx
- Selection of the synchronous channels (SYNCx in the PWM_SCM register)
- Selection of the moment when the WRDY flag and the corresponding DMA Controller transfer request are set (PTRM and PTRCS in the PWM_SCM register)
- Configuration of the Update mode (UPDM in PWM_SCM register)
- Configuration of the update period (UPR in PWM_SCUP register) if needed
- Configuration of the comparisons (PWM_CMPVx and PWM_CMPMx)
- Configuration of the event lines (PWM_ELMRx)

© 2025 Microchip Technology Inc. and its subsidiaries

- Configuration of the fault inputs polarity (FPOL in PWM_FMR)
- Configuration of the fault protection (FMOD and FFIL in PWM_FMR, PWM_FPV and PWM_FPE1)
- Enable of the interrupts (writing CHIDx and FCHIDx in PWM_IER1, and writing WRDY, UNRE, CMPMx and CMPUx in PWM_IER2)
- Enable of the PWM channels (writing CHIDx in the PWM_ENA register)

79.6.7.2. Source Clock Selection Criteria

The large number of source clocks can make selection difficult. The relationship between the value in the PWM Channel Period Register (PWM_CPRDx) and the PWM Channel Duty Cycle Register (PWM_CDTYx) helps the user select the appropriate clock. The event number written in the Period Register gives the PWM accuracy. The Duty-Cycle quantum cannot be lower than 1/CPRDx value. The higher the value of PWM_CPRDx, the greater the PWM accuracy.

For example, if the user sets 15 (in decimal) in PWM_CPRDx, the user is able to set a value from between 1 up to 14 in PWM_CDTYx. The resulting duty-cycle quantum cannot be lower than 1/15 of the PWM period.

79.6.7.3. Changing the Duty-Cycle, the Period and the Dead-Times

It is possible to modulate the output waveform duty-cycle, period and dead-times.

To prevent unexpected output waveform, the user must use the PWM Channel Duty Cycle Update Register (PWM_CDTYUPDx), the PWM Channel Period Update Register (PWM_CPRDUPDx) and the PWM Channel Dead Time Update Register (PWM_DTUPDx) to change waveform parameters while the channel is still enabled.

- If the channel is an asynchronous channel (SYNCx = 0 in PWM Sync Channels Mode Register (PWM_SCM)), these registers hold the new period, duty-cycle and dead-times values until the end of the current PWM period and update the values for the next period.
- If the channel is a synchronous channel and update method 0 is selected (SYNCx = 1 and UPDM = 0 in PWM_SCM register), these registers hold the new period, duty-cycle and dead-times values until the bit UPDULOCK is written at ‘1’ (in PWM Sync Channels Update Control Register (PWM_SCUC)) and the end of the current PWM period, then update the values for the next period.
- If the channel is a synchronous channel and update method 1 or 2 is selected (SYNCx = 1 and UPDM = 1 or 2 in PWM_SCM register):
  - registers PWM_CPRDUPDx and PWM_DTUPDx hold the new period and dead-times values until the bit UPDULOCK is written at ‘1’ (in PWM_SCUC) and the end of the current PWM period, then update the values for the next period.
  - register PWM_CDTYUPDx holds the new duty-cycle value until the end of the update period of synchronous channels (when UPRCNT is equal to UPR in PWM Sync Channels Update Period Register (PWM_SCUP)) and the end of the current PWM period, then updates the value for the next period.
    Note: If the update registers PWM_CDTYUPDx, PWM_CPRDUPDx and PWM_DTUPDx are written several times between two updates, only the last written value is taken into account.

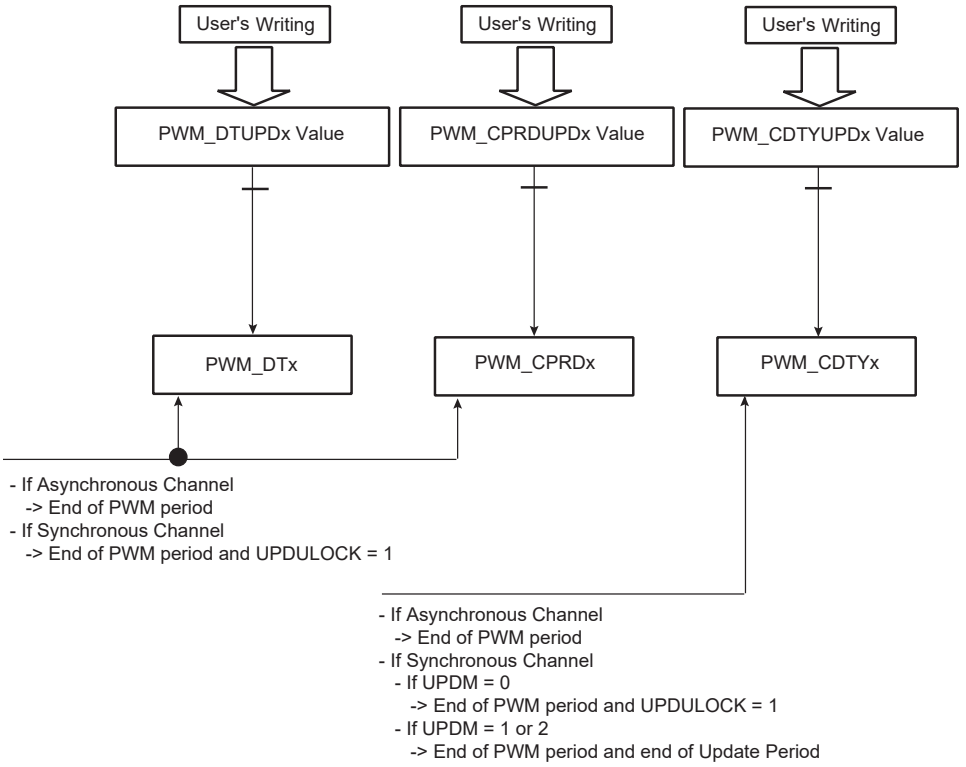
Figure 79.35. Synchronized Period, Duty-Cycle and Dead-Time Update



79.6.7.4.Changing the Update Period of Synchronous Channels

It is possible to change the update period of synchronous channels while they are enabled. See Method 2: Manual write of duty-cycle values and automatic trigger of the update and Method 3: Automatic write of duty-cycle values and automatic trigger of the update .

To prevent an unexpected update of the synchronous channels registers, the user must use the PWM Sync Channels Update Period Update Register (PWM_SCUPUPD) to change the update period of synchronous channels while they are still enabled. This register holds the new value until the end of the update period of synchronous channels (when UPRCNT is equal to UPR in PWM_SCUP) and the end of the current PWM period, then updates the value for the next period.

Notes:

1. If the update register PWM_SCUPUPD is written several times between two updates, only the last written value is taken into account.
2. Changing the update period does make sense only if there is one or more synchronous channels and if the update method 1 or 2 is selected (UPDM = 1 or 2 in PWM Sync Channels Mode Register).

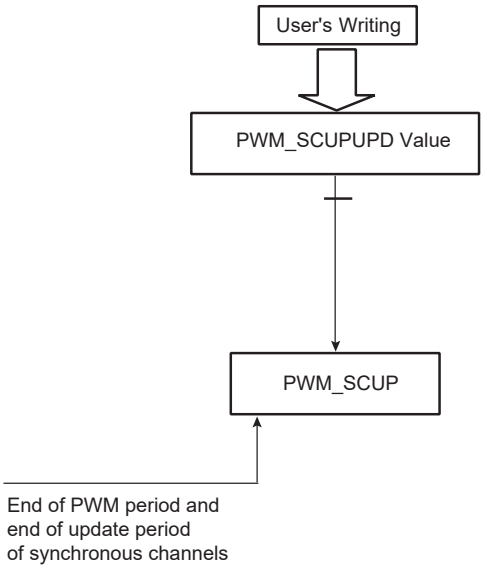
Figure 79.36. Synchronized Update of Update Period Value of Synchronous Channels



79.6.7.5. Changing the Comparison Value and the Comparison Configuration

It is possible to change the comparison values and the comparison configurations while the channel 0 is enabled (see PWM Comparison Units).

To prevent unexpected comparison match, the user must use the PWM Comparison x Value Update Register (PWM_CMPVUPDx) and the PWM Comparison x Mode Update Register (PWM_CMPMUPDx) to change, respectively, the comparison values and the comparison configurations while the channel 0 is still enabled. These registers hold the new values until the end of the comparison update period (when CUPRCNT is equal to CUPR in PWM Comparison x Mode Register (PWM_CMPMx) and the end of the current PWM period, then update the values for the next period.

CAUTION The write of the register PWM_CMPVUPDx must be followed by a write of the register PWM_CMPMUPDx.

Note: If the update registers PWM_CMPVUPDx and PWM_CMPMUPDx are written several times between two updates, only the last written value are taken into account.

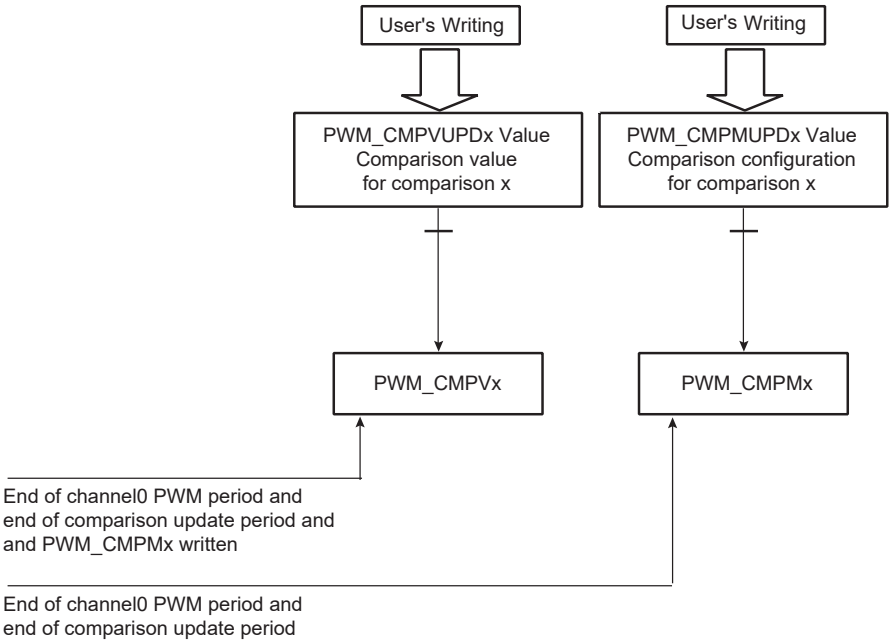
Figure 79.37. Synchronized Update of Comparison Values and Configurations



79.6.7.6. Interrupt Sources

Depending on the interrupt mask in PWM_IMR1 and PWM_IMR2, an interrupt can be generated at the end of the corresponding channel period (CHIDx in the PWM Interrupt Status Register 1 (PWM_ISR1)), after a fault event (FCHIDx in PWM_ISR1), after a comparison match (CMPMx in PWM_ISR2), after a comparison update (CMPUx in PWM_ISR2) or according to the Transfer mode of the synchronous channels (WRDY and UNRE in PWM_ISR2).

If the interrupt is generated by the flags CHIDx or FCHIDx, the interrupt remains active until a read operation in PWM_ISR1 occurs.

If the interrupt is generated by the flags WRDY or UNRE or CMPMx or CMPUx, the interrupt remains active until a read operation in PWM_ISR2 occurs.

A channel interrupt is enabled by setting the corresponding bit in PWM_IER1 and PWM_IER2. A channel interrupt is disabled by setting the corresponding bit in PWM_IDR1 and PWM_IDR2.

79.6.8. Register Write Protection

To prevent any single software error that may corrupt PWM behavior, the registers listed below can be write-protected by writing the field WPCMD in the PWM Write Protection Control Register (PWM_WPCR). They are divided into six groups:

- Register group 0:
  - PWM Clock Register
- Register group 1:
  - PWM Disable Register
  - PWM Interrupt Enable Register 1
  - PWM Interrupt Disable Register 1
  - PWM Interrupt Enable Register 2
  - PWM Interrupt Disable Register 2
- Register group 2:
  - PWM Sync Channels Mode Register

© 2025 Microchip Technology Inc. and its subsidiaries

  - PWM Channel Mode Register
  - PWM Stepper Motor Mode Register
  - PWM Fault Protection Value Register 2
  - PWM Leading-Edge Blanking Register
  - PWM Channel Mode Update Register
- Register group 3:
  - PWM Spread Spectrum Register
  - PWM Spread Spectrum Update Register
  - PWM Channel Period Register
  - PWM Channel Period Update Register
- Register group 4:
  - PWM Channel Dead Time Register
  - PWM Channel Dead Time Update Register
- Register group 5:
  - PWM Fault Mode Register
  - PWM Fault Protection Value Register 1

There are two types of write protection:

- SW write protection—can be enabled or disabled by software
- HW write protection—can be enabled by software but only disabled by a hardware reset of the PWM controller

Both types of write protection can be applied independently to a particular register group by means of the WPCMD and WPRGx fields in PWM_WPCR. If at least one type of write protection is active, the register group is write-protected. The value of field WPCMD defines the action to be performed:

- 0: Disables SW write protection of the register groups of which the bit WPRGx is at ‘1’
- 1: Enables SW write protection of the register groups of which the bit WPRGx is at ‘1’
- 2: Enables HW write protection of the register groups of which the bit WPRGx is at ‘1’

At any time, the user can determine whether SW or HW write protection is active in a particular register group by the fields WPSWS and WPHWS in the PWM Write Protection Status Register (PWM_WPSR).

If a write access to a write-protected register is detected, the WPVS flag in PWM_WPSR is set and the field WPVSRC indicates the register in which the write access has been attempted.

The WPVS and WPVSRC fields are automatically cleared after reading PWM_WPSR.

79.7.1. PWM Clock Register

Name: PWM_CLK
Offset: 0x00
Reset: 0x00000000
Property: Read/Write

This register can only be written if bits WPSWS0 and WPHWS0 are cleared in the PWM Write Protection Status Register.

Bit	31	30	29	28	27	26	25	24
					PREB[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit	23	22	21	20	19	18	17	16
	DIVB[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
					PREA[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit	7	6	5	4	3	2	1	0
	DIVA[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 27:24 – PREB[3:0] CLKB Source Clock Selection

Value	Name	Description
0	CLK	Peripheral clock
1	CLK_DIV2	Peripheral clock/2
2	CLK_DIV4	Peripheral clock/4
3	CLK_DIV8	Peripheral clock/8
4	CLK_DIV16	Peripheral clock/16
5	CLK_DIV32	Peripheral clock/32
6	CLK_DIV64	Peripheral clock/64
7	CLK_DIV128	Peripheral clock/128
8	CLK_DIV256	Peripheral clock/256
9	CLK_DIV512	Peripheral clock/512
10	CLK_DIV1024	Peripheral clock/1024
Other	–	Reserved

Bits 23:16 – DIVB[7:0] CLKB Divide Factor

Value	Name	Description
0	CLKB_POFF	CLKB clock is turned off
1	PREB	CLKB clock is clock selected by PREB
2–255	PREB_DIV	CLKB clock is clock selected by PREB divided by DIVB factor

Bits 11:8 – PREA[3:0] CLKA Source Clock Selection

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
0	CLK	Peripheral clock
1	CLK_DIV2	Peripheral clock/2
2	CLK_DIV4	Peripheral clock/4
3	CLK_DIV8	Peripheral clock/8
4	CLK_DIV16	Peripheral clock/16
5	CLK_DIV32	Peripheral clock/32
6	CLK_DIV64	Peripheral clock/64
7	CLK_DIV128	Peripheral clock/128
8	CLK_DIV256	Peripheral clock/256
9	CLK_DIV512	Peripheral clock/512
10	CLK_DIV1024	Peripheral clock/1024
Other	–	Reserved

Bits 7:0 – DIVA[7:0] CLKA Divide Factor

Value	Name	Description
0	CLKA_POFF	CLKA clock is turned off
1	PREA	CLKA clock is clock selected by PREA
2–255	PREA_DIV	CLKA clock is clock selected by PREA divided by DIVA factor

79.7.2. PWM Enable Register

Name: PWM_ENA
Offset: 0x04
Reset: –
Property: Write-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
					CHID3	CHID2	CHID1	CHID0
Access					W	W	W	W
Reset					–	–	–	–

Bits 0, 1, 2, 3 – CHIDx Channel ID

Value	Description
0	No effect.
1	Enable PWM output for channel x.

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.3. PWM Disable Register

Name: PWM_DIS
Offset: 0x08
Reset: –
Property: Write-only

This register can only be written if bits WPSWS1 and WPHWS1 are cleared in the PWM Write Protection Status Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
					CHID3	CHID2	CHID1	CHID0
Access					W	W	W	W
Reset					–	–	–	–

Bits 0, 1, 2, 3 – CHIDx Channel ID

Value	Description
0	No effect.
1	Disable PWM output for channel x.

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.4. PWM Status Register

Name: PWM_SR
Offset: 0x0C
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
					CHID3	CHID2	CHID1	CHID0
Access					R	R	R	R
Reset					0	0	0	0

Bits 0, 1, 2, 3 – CHIDx Channel ID

Value	Description
0	PWM output for channel x is disabled.
1	PWM output for channel x is enabled.

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.5. PWM Interrupt Enable Register 1

Name: PWM_IER1
Offset: 0x10
Reset: –
Property: Write-only

This register can only be written if bits WPSWS1 and WPHWS1 are cleared in the PWM Write Protection Status Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
					FCHID3	FCHID2	FCHID1	FCHID0
Access					W	W	W	W
Reset					–	–	–	–

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
					CHID3	CHID2	CHID1	CHID0
Access					W	W	W	W
Reset					–	–	–	–

Bits 16, 17, 18, 19 – FCHIDx Fault Protection Trigger on Channel x Interrupt Enable

Bits 0, 1, 2, 3 – CHIDx Counter Event on Channel x Interrupt Enable

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.6. PWM Interrupt Disable Register 1

Name: PWM_IDR1
Offset: 0x14
Reset: –
Property: Write-only

This register can only be written if bits WPSWS1 and WPHWS1 are cleared in the PWM Write Protection Status Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
					FCHID3	FCHID2	FCHID1	FCHID0
Access					W	W	W	W
Reset					–	–	–	–

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
					CHID3	CHID2	CHID1	CHID0
Access					W	W	W	W
Reset					–	–	–	–

Bits 16, 17, 18, 19 – FCHIDx Fault Protection Trigger on Channel x Interrupt Disable

Bits 0, 1, 2, 3 – CHIDx Counter Event on Channel x Interrupt Disable

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.7. PWM Interrupt Mask Register 1

Name: PWM_IMR1
Offset: 0x18
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
					FCHID3	FCHID2	FCHID1	FCHID0
Access					R	R	R	R
Reset					0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
					CHID3	CHID2	CHID1	CHID0
Access					R	R	R	R
Reset					0	0	0	0

Bits 16, 17, 18, 19 – FCHIDx Fault Protection Trigger on Channel x Interrupt Mask

Bits 0, 1, 2, 3 – CHIDx Counter Event on Channel x Interrupt Mask

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.8. PWM Interrupt Status Register 1

Name: PWM_ISR1
Offset: 0x1C
Reset: 0x00000000
Property: Read-only

Note: Reading PWM_ISR1 automatically clears CHIDx and FCHIDx flags.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
					FCHID3	FCHID2	FCHID1	FCHID0
Access					R	R	R	R
Reset					0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
					CHID3	CHID2	CHID1	CHID0
Access					R	R	R	R
Reset					0	0	0	0

Bits 16, 17, 18, 19 – FCHIDx Fault Protection Trigger on Channel x

Value	Description
0	No new trigger of the fault protection since the last read of PWM_ISR1.
1	At least one trigger of the fault protection since the last read of PWM_ISR1.

Bits 0, 1, 2, 3 – CHIDx Counter Event on Channel x

Value	Description
0	No new counter event has occurred since the last read of PWM_ISR1.
1	At least one counter event has occurred since the last read of PWM_ISR1.

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.9. PWM Sync Channels Mode Register

Name: PWM_SCM
Offset: 0x20
Reset: 0x00000000
Property: Read/Write

This register can only be written if bits WPSWS2 and WPHWS2 are cleared in the PWM Write Protection Status Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	PTRCS[2:0]			PTRM			UPDM[1:0]	
Access	R/W	R/W	R/W	R/W			R/W	R/W
Reset	0	0	0	0			0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
					SYNC3	SYNC2	SYNC1	SYNC0
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bits 23:21 – PTRCS[2:0] DMA Controller Transfer Request Comparison Selection
Selection of the comparison used to set the flag WRDY and the corresponding DMA Controller transfer request.

Bit 20 – PTRM DMA Controller Transfer Request Mode

UPDM	PTRM	WRDY Flag and DMA Controller Transfer Request
0	x	The WRDY flag in PWM Interrupt Status Register 2 and the DMA transfer request are never set to '1'.
1	x	The WRDY flag in PWM Interrupt Status Register 2 is set to '1' as soon as the update period is elapsed, the DMA Controller transfer request is never set to '1'.
2	0	The WRDY flag in PWM Interrupt Status Register 2 and the DMA transfer request are set to '1' as soon as the update period is elapsed.
	1	The WRDY flag in PWM Interrupt Status Register 2 and the DMA transfer request are set to '1' as soon as the selected comparison matches.

Bits 17:16 – UPDM[1:0] Synchronous Channels Update Mode

Value	Name	Description
0	MODE0	Manual write of double buffer registers and manual update of synchronous channels 1[(1)].
1	MODE1	Manual write of double buffer registers and automatic update of synchronous channels 2[(2)].
2	MODE2	The WRDY flag in PWM Interrupt Status Register 2 and the DMA transfer request are set to '1' as soon as the update period is elapsed.

© 2025 Microchip Technology Inc. and its subsidiaries

Notes:

1. The update occurs at the beginning of the next PWM period, when the UPDULOCK bit in PWM Sync Channels Update Control Register is set.
2. The update occurs when the Update Period is elapsed.

Bits 0, 1, 2, 3 – SYNCx Synchronous Channel x

Value	Description
0	Channel x is not a synchronous channel.
1	Channel x is a synchronous channel.

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.10. PWM DMA Register

Name: PWM_DMAR
Offset: 0x24
Reset: –
Property: Write-only

Only the first 16 bits (channel counter size) are significant.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	DMADUTY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	15	14	13	12	11	10	9	8

	DMADUTY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bits 23:0 – DMADUTY[23:0] Duty-Cycle Holding Register for DMA Access
Each write access to PWM_DMAR sequentially updates PWM_CDTYUPDx.CDTYUPD with DMADUTY (only for channel configured as synchronous). See “Method 3: Automatic write of duty-cycle values and automatic trigger of the update” .

79.7.11. PWM Sync Channels Update Control Register

Name: PWM_SCUC
Offset: 0x28
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
								UPDULOCK
Access								R/W
Reset								0

Bit 0 – UPDULOCK Synchronous Channels Update Unlock
This bit is automatically reset when the update is done.

Value	Description
0	No effect
1	If the UPDM field is set to '0' in PWM Sync Channels Mode Register, writing the UPDULOCK bit to '1' triggers the update of the period value, the duty-cycle and the dead-time values of synchronous channels at the beginning of the next PWM period. If the field UPDM is set to '1' or '2', writing the UPDULOCK bit to '1' triggers only the update of the period value and of the dead-time values of synchronous channels.

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 7:4 – UPRCNT[3:0] Update Period Counter
Reports the value of the update period counter.

Bits 3:0 – UPR[3:0] Update Period
Defines the time between each update of the synchronous channels if automatic trigger of the update is activated (UPDM = 1 or UPDM = 2 in PWM Sync Channels Mode Register). This time is equal to UPR+1 periods of the synchronous channels.

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.13. PWM Sync Channels Update Period Update Register

Name: PWM_SCUPUPD
Offset: 0x30
Reset: –
Property: Write-only

This register acts as a double buffer for the UPR value. This prevents an unexpected automatic trigger of the update of synchronous channels.

Bit	31	30	29	28	27	26	25	24
Access								
Reset

					UNRE			WRDY
Access					R			R
Reset					0			0

Bits 16, 17, 18, 19, 20, 21, 22, 23 – CMPUx Comparison x Update

Value	Description
0	The comparison x has not been updated since the last read of the PWM_ISR2 register.
1	The comparison x has been updated at least one time since the last read of the PWM_ISR2 register.

Bits 8, 9, 10, 11, 12, 13, 14, 15 – CMPMx Comparison x Match

Value	Description
0	The comparison x has not matched since the last read of the PWM_ISR2 register.
1	The comparison x has matched at least one time since the last read of the PWM_ISR2 register.

Bit 3 – UNRE Synchronous Channels Update Underrun Error

Value	Description
0	No Synchronous Channels Update Underrun has occurred since the last read of the PWM_ISR2 register.
1	At least one Synchronous Channels Update Underrun has occurred since the last read of the PWM_ISR2 register.

Bit 0 – WRDY Write Ready for Synchronous Channels Update

Value	Description
0	New duty-cycle and dead-time values for the synchronous channels cannot be written.
1	New duty-cycle and dead-time values for the synchronous channels can be written.

79.7.24. PWM Fault Mode Register

Name: PWM_FMR
Offset: 0x5C
Reset: 0x00000000
Property: Read/Write

This register can only be written if bits WPSWS5 and WPHWS5 are cleared in the PWM Write Protection Status Register.

See Fault Inputs for details on fault generation.

> **CAUTION** To prevent an unexpected activation of the status flag FSy in the PWM Fault Status Register, the bit FMODy can be set to '1' only if the FPOLy bit has been previously configured to its final value.

Bit	31	30	29	28	27	26	25	24
Access								
Reset

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 23:16 – FFIL[7:0] Fault Filtering
For each bit y of FFIL, where y is the fault input number:
0: The fault input y is not filtered.
1: The fault input y is filtered.

Bits 15:8 – FMOD[7:0] Fault Activation Mode
For each bit y of FMOD, where y is the fault input number:
0: The fault y is active until the fault condition is removed at the peripheral(1) level.
1: The fault y stays active until the fault condition is removed at the peripheral level(1)AND until it is cleared in the PWM Fault Clear Register.
Note:
1. The peripheral generating the fault.

Bits 7:0 – FPOL[7:0] Fault Polarity
For each bit y of FPOL, where y is the fault input number:
0: The fault y becomes active when the fault input y is at 0.
1: The fault y becomes active when the fault input y is at 1.

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.25. PWM Fault Status Register

Name: PWM_FSR
Offset: 0x60
Reset: 0x00000000
Property: Read-only

Refer to Fault Inputs for details on fault generation.

	FCLR[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bits 7:0 – FCLR[7:0] Fault Clear
For each bit y of FCLR, where y is the fault input number:
0: No effect.
1: If bit y of FMOD field is set to ‘1’ and if the fault input y is not at the level defined by the bit y of FPOL field, the fault y is cleared and becomes inactive (FMOD and FPOL fields belong to PWM Fault Mode Register), else writing this bit to ‘1’ has no effect.

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.27. PWM Fault Protection Value Register 1

Name: PWM_FPV1
Offset: 0x68
Reset: 0x00000000
Property: Read/Write

This register can only be written if bits WPSWS5 and WPHWS5 are cleared in the PWM Write Protection Status Register.

See Fault Inputs for details on fault generation.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
					FPVL3	FPVL2	FPVL1	FPVL0

Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bits 16, 17, 18, 19 – FPVLx Fault Protection Value for PWML output on channel x
This bit is taken into account only if the bit FPZLx is set to '0' in PWM Fault Protection Value Register 2.

Value	Description
0	PWML output of channel x is forced to '0' when fault occurs.
1	PWML output of channel x is forced to '1' when fault occurs.

Bits 0, 1, 2, 3 – FPVHx Fault Protection Value for PWMH output on channel x
This bit is taken into account only if the bit FPZHx is set to '0' in PWM Fault Protection Value Register 2.

Value	Description
0	PWMH output of channel x is forced to '0' when fault occurs.
1	PWMH output of channel x is forced to '1' when fault occurs.

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.28. PWM Fault Protection Enable Register

Name: PWM_FPE
Offset: 0x6C
Reset: 0x00000000
Property: Read/Write

This register can only be written if bits WPSWS5 and WPHWS5 are cleared in the PWM Write Protection Status Register.

Only the first 5 bits (number of fault input pins) of fields FPEx are significant.

Refer to Fault Inputs for details on fault generation.

Bits 0:7, 8:15, 16:23, 24:31 – FPEx Fault Protection Enable for channel x
For each bit y of FPEx, where y is the fault input number:
0: Fault y is not used for the fault protection of channel x.
1: Fault y is used for the fault protection of channel x.

CAUTION To prevent an unexpected activation of the fault protection, the bit y of FPEx field can be set to '1' only if the corresponding FPOL field has been previously configured to its final value in PWM Fault Mode Register.

79.7.30. PWM Spread Spectrum Register

Name: PWM_SSPR
Offset: 0xA0
Reset: 0x00000000
Property: Read/Write

This register can only be written if bits WPSWS3 and WPHWS3 are cleared in the PWM Write Protection Status Register.

Only the first 16 bits (channel counter size) are significant.

Bit	31	30	29	28	27	26	25	24
								SPRDM
Access								R/W
Reset								0

Bit	23	22	21	20	19	18	17	16

Bit 24 – SPRDM Spread Spectrum Counter Mode

Value	Description
0	Triangular mode. The spread spectrum counter starts to count from -SPRD when the channel 0 is enabled and counts upwards at each PWM period. When it reaches +SPRD, it restarts to count from -SPRD again.
1	Random mode. The spread spectrum counter is loaded with a new random value at each PWM period. This random value is uniformly distributed and is between -SPRD and +SPRD.

Bits 23:0 – SPRD[23:0] Spread Spectrum Limit Value
The spread spectrum limit value defines the range for the spread spectrum counter. It is introduced in order to achieve constant varying PWM period for the output waveform.

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.31. PWM Spread Spectrum Update Register

Name: PWM_SSPUP
Offset: 0xA4
Reset: –
Property: Write-only

This register can only be written if bits WPSWS3 and WPHWS3 are cleared in the PWM Write Protection Status Register.

This register acts as a double buffer for the SPRD value. This prevents an unexpected waveform when modifying the spread spectrum limit value.

Only the first 16 bits (channel counter size) are significant.

Bit 0 – OUTMODE PWM Output Mode when System is in Debug Mode
0 (NO_EFFECT): Keeps the PWM outputs running when the processor reports a debug operating mode.
1 (STUCK_AT): Forces the PWM outputs with the values configured in PWM_FPVx as soon as the processor reports a debug operating mode. See PWM_FPV1 and PWM_FPV2.

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.33. PWM Stepper Motor Mode Register

Name: PWM_SMMR
Offset: 0xB0
Reset: 0x00000000
Property: Read/Write

This register can only be written if bits WPSWS2 and WPHWS2 are cleared in the PWM Write Protection Status Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

Reset							0	0

Bits 16, 17 – DOWNx Down Count

Value	Description
0	Up counter.
1	Down counter.

Bits 0, 1 – GCENx Gray Count Enable

Value	Description
0	Disable Gray count generation on PWML[2*x], PWMH[2*x], PWML[2*x +1], PWMH[2*x +1]
1	Enable Gray count generation on PWML[2*x], PWMH[2*x], PWML[2*x +1], PWMH[2*x +1].

Bits 16, 17, 18, 19 – FPZLx Fault Protection to Hi-Z for PWML output on channel x

Value	Description
0	When fault occurs, PWML output of channel x is forced to value defined by the bit FPVLx in PWM Fault Protection Value Register 1.
1	When fault occurs, PWML output of channel x is forced to high-impedance state.

Bits 0, 1, 2, 3 – FPZHx Fault Protection to Hi-Z for PWMH output on channel x

Value	Description
0	When fault occurs, PWMH output of channel x is forced to value defined by the bit FPVHx in PWM Fault Protection Value Register 1.
1	When fault occurs, PWMH output of channel x is forced to high-impedance state.

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.35. PWM Write Protection Control Register

Name: PWM_WPCR
Offset: 0xE4
Reset: –
Property: Write-only

See Register Write Protection for the list of registers that can be write-protected.

Bit	31	30	29	28	27	26	25	24
	WPKEY[23:16]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	23	22	21	20	19	18	17	16

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	15	14	13	12	11	10	9	8
	WPKEY[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	WPRG5	WPRG4	WPRG3	WPRG2	WPRG1	WPRG0	WPCMD[1:0]	
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x50574D	PASSWD	Writing any other value in this field aborts the write operation of the WPCMD field. Always reads as 0

Bits 2, 3, 4, 5, 6, 7 – WPRGx Write Protection Register Group x

Value	Description
0	The WPCMD command has no effect on the register group x.
1	The WPCMD command is applied to the register group x.

Bits 1:0 – WPCMD[1:0] Write Protection Command
This command is performed only if the WPKEY corresponds to 0x50574D (“PWM” in ASCII).

Value	Name	Description
0	DISABLE_SW_PROT	Disables the software write protection of the register groups of which the bit WPRGx is at ‘1’.
1	ENABLE_SW_PROT	Enables the software write protection of the register groups of which the bit WPRGx is at ‘1’.
2	ENABLE_HW_PROT	Enables the hardware write protection of the register groups of which the bit WPRGx is at ‘1’. Only a hardware reset of the PWM controller can disable the hardware write protection. Moreover, to meet security requirements, the PIO lines associated with the PWM can not be configured through the PIO interface.

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.36. PWM Write Protection Status Register

Name: PWM_WPSR
Offset: 0xE8
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	WPVSRC[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	WPVSRC[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
			WPHWS5	WPHWS4	WPHWS3	WPHWS2	WPHWS1	WPHWS0
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	WPVS		WPSWS5	WPSWS4	WPSWS3	WPSWS2	WPSWS1	WPSWS0
Access	R		R	R	R	R	R	R
Reset	0		0	0	0	0	0	0

Bits 31:16 – WPVSRC[15:0] Write Protect Violation Source
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

Bits 8, 9, 10, 11, 12, 13 – WPHWSx Write Protect HW Status

Value	Description
0	The HW write protection x of the register group x is disabled.
1	The HW write protection x of the register group x is enabled.

Bit 7 – WPVS Write Protect Violation Status

Value	Description
0	No write protection violation has occurred since the last read of PWM_WPSR.
1	At least one write protection violation has occurred since the last read of PWM_WPSR. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

Bits 0, 1, 2, 3, 4, 5 – WPSWSx Write Protect SW Status

Value	Description
0	The SW write protection x of the register group x is disabled.
1	The SW write protection x of the register group x is enabled.

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.37. PWM Comparison x Value Register

Name: PWM_CMPVx
Offset: 0x0130 + x*0x10 [x=0..7]
Reset: 0x00000000
Property: Read/Write

Only the first 16 bits (channel counter size) of field CV are significant.

Bit	31	30	29	28	27	26	25	24
								CVM
Access								R/W
Reset								0

Bit	23	22	21	20	19	18	17	16

	CV[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 24 – CVM Comparison x Value Mode

Value	Description
0	The comparison x between the counter of the channel 0 and the comparison x value is performed when this counter is incrementing.
1	The comparison x between the counter of the channel 0 and the comparison x value is performed when this counter is decrementing. Note: This bit is not relevant if the counter of the channel 0 is left-aligned (CALG = 0 in PWM Channel Mode Register)

Bits 23:0 – CV[23:0] Comparison x Value
Define the comparison x value to be compared with the counter of the channel 0.

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.38. PWM Comparison x Value Update Register

Name: PWM_CMPVUPDx
Offset: 0x0134 + x*0x10 [x=0..7]
Reset: –
Property: Write-only

This register acts as a double buffer for the CV and CVM values. This prevents an unexpected comparison x match.

Only the first 16 bits (channel counter size) of field CVUPD are significant.

CAUTION The write of the register PWM_CMPVUPDx must be followed by a write of the register PWM_CMPMUPDx.

Bit	31	30	29	28	27	26	25	24
								CVMUPD
Access								W
Reset								–

Bit	23	22	21	20	19	18	17	16

	CVUPD[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit 24 – CVMUPD Comparison x Value Mode Update
Note: This bit is not relevant if the counter of the channel 0 is left-aligned (CALG = 0 in PWM Channel Mode Register)

Value	Description
0	The comparison x between the counter of the channel 0 and the comparison x value is performed when this counter is incrementing.
1	The comparison x between the counter of the channel 0 and the comparison x value is performed when this counter is decrementing.

Bits 23:0 – CVUPD[23:0] Comparison x Value Update
Defines the comparison x value to be compared with the counter of the channel 0.

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.39. PWM Comparison x Mode Register

Name: PWM_CMPMx
Offset: 0x0138 + x*0x10 [x=0..7]
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	CUPRCNT[3:0]				CUPR[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	CPRCNT[3:0]				CPR[3:0]			
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	CTR[3:0]							CEN
Access	R/W	R/W	R/W	R/W				R/W
Reset	0	0	0	0				0

Bits 23:20 – CUPRCNT[3:0] Comparison x Update Period Counter
Reports the value of the comparison x update period counter.
Note: The field CUPRCNT is read-only

Bits 19:16 – CUPR[3:0] Comparison x Update Period
Defines the time between each update of the comparison x mode and the comparison x value. This time is equal to CUPR+1 periods of the channel 0 counter.

Bits 15:12 – CPRCNT[3:0] Comparison x Period Counter
Reports the value of the comparison x period counter.
Note: The field CPRCNT is read-only

Bits 11:8 – CPR[3:0] Comparison x Period
CPR defines the maximum value of the comparison x period counter (CPRCNT). The comparison x value is performed periodically once every CPR+1 periods of the channel 0 counter.

Bits 7:4 – CTR[3:0] Comparison x Trigger
The comparison x is performed when the value of the comparison x period counter (CPRCNT) reaches the value defined by CTR.

Bit 0 – CEN Comparison x Enable

Value	Description
0	The comparison x is disabled and can not match.
1	The comparison x is enabled and can match.

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.40. PWM Comparison x Mode Update Register

Name: PWM_CMPMUPDx
Offset: 0x013C + x*0x10 [x=0..7]
Reset: –
Property: Write-only

This register acts as a double buffer for the CEN, CTR, CPR and CUPR values. This prevents an unexpected comparison x match.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
					CUPRUPD[3:0]			
Access					W	W	W	W
Reset					–	–	–	–

					CPRUPD[3:0]			
Access					W	W	W	W
Reset					–	–	–	–

Bit	7	6	5	4	3	2	1	0
	CTRUPD[3:0]							CENUPD
Access	W	W	W	W				W
Reset	–	–	–	–				–

Bits 19:16 – CUPRUPD[3:0] Comparison x Update Period Update
Defines the time between each update of the comparison x mode and the comparison x value. This time is equal to CUPR+1 periods of the channel 0 counter.

Bits 11:8 – CPRUPD[3:0] Comparison x Period Update
CPR defines the maximum value of the comparison x period counter (CPRCNT). The comparison x value is performed periodically once every CPR+1 periods of the channel 0 counter.

Bits 7:4 – CTRUPD[3:0] Comparison x Trigger Update
The comparison x is performed when the value of the comparison x period counter (CPRCNT) reaches the value defined by CTR.

Bit 0 – CENUPD Comparison x Enable Update

Value	Description
0	The comparison x is disabled and can not match.
1	The comparison x is enabled and can match.

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.41. PWM Channel Mode Register

Name: PWM_CMRx
Offset: 0x0200 + x*0x20 [x=0..3]
Reset: 0x00000000
Property: Read/Write

This register can only be written if bits WPSWS2 and WPHWS2 are cleared in the PWM Write Protection Status Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
					PPM	DTLI	DTHI	DTE
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit	15	14	13	12	11	10	9	8
			TCTS	DPOLI	UPDS	CES	CPOL	CALG
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
					CPRE[3:0]			
Access					R/W	R/W	R/W	R/W
Reset					0	0	0	0

Bit 19 – PPM Push-Pull Mode
The Push-Pull mode is enabled for channel x.

Value	Description
0	The Push-Pull mode is disabled for channel x.
1	The Push-Pull mode is enabled for channel x.

Bit 18 – DTLI Dead-Time PWMLx Output Inverted

Value	Description
0	The dead-time PWMLx output is not inverted.
1	The dead-time PWMLx output is inverted.

Bit 17 – DTHI Dead-Time PWMHx Output Inverted

Value	Description
0	The dead-time PWMHx output is not inverted.
1	The dead-time PWMHx output is inverted.

Bit 16 – DTE Dead-Time Generator Enable

Value	Description
0	The dead-time generator is disabled.
1	The dead-time generator is enabled.

Bit 13 – TCTS Timer Counter Trigger Selection

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	The comparator of the channel x (OCx) is used as the trigger source for the Timer Counter (TC).
1	The counter events of the channel x is used as the trigger source for the Timer Counter (TC).

Bit 12 – DPOLI Disabled Polarity Inverted

Value	Description
0	When the PWM channel x is disabled (CHIDx(PWM_SR) = 0), the OCx output waveform is the same as the one defined by the CPOL bit.
1	When the PWM channel x is disabled (CHIDx(PWM_SR) = 0), the OCx output waveform is inverted compared to the one defined by the CPOL bit.

Bit 11 – UPDS Update Selection

If the PWM period is center-aligned (CALG=1):
0: The update occurs at the next end of the PWM period after writing the update register(s).
1: The update occurs at the next end of the PWM half period after writing the update register(s).
If the PWM period is left-aligned (CALG=0), the update always occurs at the end of the PWM period after writing the update register(s).

Bit 10 – CES Counter Event Selection

If the PWM period is center-aligned (CALG=1):
0: The channel counter event occurs at the end of the PWM period.
1: The channel counter event occurs at the end of the PWM period and at half the PWM period.
If the PWM period is left-aligned (CALG=0), the channel counter event occurs at the end of the period and the CES bit has no effect.

Bit 9 – CPOL Channel Polarity

Value	Description
0	The OCx output waveform (output from the comparator) starts at a low level.
1	The OCx output waveform (output from the comparator) starts at a high level.

Bit 8 – CALG Channel Alignment

Value	Description
0	The period is left-aligned.
1	The period is center-aligned.

Bits 3:0 – CPRE[3:0] Channel Prescaler

Value	Name	Description
0	MCK	Peripheral clock
1	MCK_DIV_2	Peripheral clock/2
2	MCK_DIV_4	Peripheral clock/4
3	MCK_DIV_8	Peripheral clock/8
4	MCK_DIV_16	Peripheral clock/16
5	MCK_DIV_32	Peripheral clock/32
6	MCK_DIV_64	Peripheral clock/64
7	MCK_DIV_128	Peripheral clock/128
8	MCK_DIV_256	Peripheral clock/256
9	MCK_DIV_512	Peripheral clock/512
10	MCK_DIV_1024	Peripheral clock/1024
11	CLKA	Clock A
12	CLKB	Clock B

79.7.42. PWM Channel Duty Cycle Register

Name: PWM_CDTYx
Offset: 0x0204 + x*0x20 [x=0..3]
Reset: 0x00000000
Property: Read/Write

Only the first 16 bits (channel counter size) are significant.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	CDTY[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 23:0 – CDTY[23:0] Channel Duty-Cycle
Defines the waveform duty-cycle. This value must be defined between 0 and CPRD (PWM_CPRDx).

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.43. PWM Channel Duty Cycle Update Register

Name: PWM_CDTYUPDx
Offset: 0x0208 + x*0x20 [x=0..3]
Reset: –
Property: Write-only

This register acts as a double buffer for the CDTY value. This prevents an unexpected waveform when modifying the waveform duty-cycle.

Only the first 16 bits (channel counter size) are significant.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

79.7.44. PWM Channel Period Register

Name: PWM_CPRDx
Offset: 0x020C + x*0x20 [x=0..3]
Reset: 0x00000000
Property: Read/Write

This register can only be written if bits WPSWS3 and WPHWS3 are cleared in the PWM Write Protection Status Register.

Only the first 16 bits (channel counter size) are significant.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	CPRD[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	CPRD[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	CPRD[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 23:0 – CPRD[23:0] Channel Period

If the waveform is left-aligned, then the output waveform period depends on the channel counter source clock and can be calculated:
– By using the PWM peripheral clock divided by a given prescaler value “X” (where X = 2^{PREA} is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(X \times \mathrm{CPRD})}{f_{\mathrm{peripheral\ clock}}}$$

– By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

$$\frac{(X \times \mathrm{CPRD} \times \mathrm{DIVA})}{f_{\mathrm{peripheral\ clock}}} \text{ or } \frac{(X \times \mathrm{CPRD} \times \mathrm{DIVB})}{f_{\mathrm{peripheral\ clock}}}$$

If the waveform is center-aligned, then the output waveform period depends on the channel counter source clock and can be calculated:
– By using the PWM peripheral clock divided by a given prescaler value “X” (where X = 2^{PREA} is 1, 2, 4, 8, 16, 32, 64, 128, 256, 512, or 1024). The resulting period formula is:

$$\frac{(2 \times X \times \mathrm{CPRD})}{f_{\mathrm{peripheral\ clock}}}$$

– By using the PWM peripheral clock divided by a given prescaler value “X” (see above) and by either the DIVA or the DIVB divider. The formula becomes, respectively:

79.7.47. PWM Channel Dead Time Register

Name: PWM_DTx
Offset: 0x0218 + x*0x20 [x=0..3]
Reset: 0x00000000
Property: Read/Write

This register can only be written if bits WPSWS4 and WPHWS4 are cleared in the PWM Write Protection Status Register.

Only the first 12 bits (dead-time counter size) of fields DTH and DTL are significant.

Bit	31	30	29	28	27	26	25	24
	DTL[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:16 – DTL[15:0] Dead-Time Value for PWMLx Output
Defines the dead-time value for PWMLx output. This value must be defined between 0 and CDTY (PWM_CDTYx).

Bits 15:0 – DTH[15:0] Dead-Time Value for PWMHx Output
Defines the dead-time value for PWMHx output. This value must be defined between 0 and the value (CPRD – CDTY) (PWM_CPRDx and PWM_CDTYx).

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.48. PWM Channel Dead Time Update Register

Name: PWM_DTUPDx
Offset: 0x021C + x*0x20 [x=0..3]
Reset: –
Property: Write-only

This register can only be written if bits WPSWS4 and WPHWS4 are cleared in the PWM Write Protection Status Register.

This register acts as a double buffer for the DTH and DTL values. This prevents an unexpected waveform when modifying the dead-time values.

Only the first 12 bits (dead-time counter size) of fields DTHUPD and DTLUPD are significant.

Bit	31	30	29	28	27	26	25	24
	DTLUPD[15:8]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	23	22	21	20	19	18	17	16
	DTLUPD[7:0]

	DTHUPD[7:0]							
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bits 31:16 – DTLUPD[15:0] Dead-Time Value Update for PWMLx Output
Defines the dead-time value for PWMLx output. This value must be defined between 0 and CDTY (PWM_CDTYx). This value is applied only at the beginning of the next channel x PWM period.

Bits 15:0 – DTHUPD[15:0] Dead-Time Value Update for PWMHx Output
Defines the dead-time value for PWMHx output. This value must be defined between 0 and the value (CPRD – CDTY) (PWM_CPRDx and PWM_CDTYx). This value is applied only at the beginning of the next channel x PWM period.

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.49. PWM Channel Mode Update Register

Name: PWM_CMUPDx
Offset: 0x0400 + x*0x20 [x=0..3]
Reset: –
Property: Write-only

This register can only be written if bits WPSWS2 and WPHWS2 are cleared in the PWM Write Protection Status Register.

This register acts as a double buffer for the CPOL value. This prevents an unexpected waveform when modifying the polarity value.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
			CPOLINVUP				CPOLUP	
Access			W				W	
Reset			–				–	

Bit	7	6	5	4	3	2	1	0
Access								
Reset								

Bit 13 – CPOLINVUP Channel Polarity Inversion Update
If this bit is written at ‘1’, the write of the bit CPOLUP is not taken into account.

Value	Description
0	No effect.
1	The OCx output waveform (output from the comparator) is inverted.

Bit 9 – CPOLUP Channel Polarity Update
The write of this bit is taken into account only if the bit CPOLINVUP is written at ‘0’ at the same time.

Value	Description
0	The OCx output waveform (output from the comparator) starts at a low level.
1	The OCx output waveform (output from the comparator) starts at a high level.

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.50. PWM External Trigger Register

Name: PWM_ETRGx
Offset: 0x042C + (x-1)*0x20 [x=1..2]
Reset: 0x00000000
Property: Read/Write

This register can only be written if bits WPSWS2 and WPHWS2 are cleared in the PWM Write Protection Status Register.

Bit	31	30	29	28	27	26	25	24
	RFEN	TRGSRC	TRGFILT	TRGEDGE			TRGMODE[1:0]	
Access	R/W	R/W	R/W	R/W			R/W	R/W
Reset	0	0	0	0			0	0

Bit	23	22	21	20	19	18	17	16
	MAXCNT[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	MAXCNT[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	MAXCNT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 31 – RFEN Recoverable Fault Enable

Value	Description
0	The TRGINx signal does not generate a recoverable fault.
1	The TRGINx signal generate a recoverable fault in place of the fault x input.

Bit 30 – TRGSRC Trigger Source

Value	Description
0	The TRGINx signal is driven by the PWMEXTRGx input.
1	

Bit 29 – TRGFILT Filtered input

Value	Description
0	The external trigger input x is not filtered.
1	The external trigger input x is filtered.

Bit 28 – TRGEDGE Edge Selection

Value	Name	Description
0	FALLING_ZERO	TRGMODE = 1: TRGINx event detection on falling edge. TRGMODE = 2, 3: TRGINx active level is 0
1	RISING_ONE	TRGMODE = 1: TRGINx event detection on rising edge. TRGMODE = 2, 3: TRGINx active level is 1

© 2025 Microchip Technology Inc. and its subsidiaries

Bits 25:24 – TRGMODE[1:0] External Trigger Mode

Value	Name	Description
0	OFF	External trigger is not enabled.
1	MODE1	External PWM Reset Mode
2	MODE2	External PWM Start Mode
3	MODE3	Cycle-by-cycle Duty Mode

Bits 23:0 – MAXCNT[23:0] Maximum Counter value

Maximum channel x counter value measured at the TRGINx event since the last read of the register. At the TRGINx event, if the channel x counter value is greater than the stored MAXCNT value, then MAXCNT is updated by the channel x counter value.

© 2025 Microchip Technology Inc. and its subsidiaries

79.7.51. PWM Leading-Edge Blanking Register

Name: PWM_LEBRx
Offset: 0x0430 + (x-1)*0x20 [x=1..2]
Reset: 0x00000000
Property: Read/Write

This register can only be written if bits WPSWS2 and WPHWS2 are cleared in the PWM Write Protection Status Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

Bit	7	6	5	4	3	2	1	0
		LEBDELAY[6:0]						
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	0	0	0	0

Bit 19 – PWMHREN PWMH Rising Edge Enable

Value	Description
0	Leading-edge blanking is disabled on PWMHx output rising edge.
1	Leading-edge blanking is enabled on PWMHx output rising edge.

Bit 18 – PWMHFEN PWMH Falling Edge Enable

Value	Description
0	Leading-edge blanking is disabled on PWMHx output falling edge.
1	Leading-edge blanking is enabled on PWMHx output falling edge.

Bit 17 – PWMLREN PWML Rising Edge Enable

Value	Description
0	Leading-edge blanking is disabled on PWMLx output rising edge.
1	Leading-edge blanking is enabled on PWMLx output rising edge.

Bit 16 – PWMLFEN PWML Falling Edge Enable

Value	Description
0	Leading-edge blanking is disabled on PWMLx output falling edge.
1	Leading-edge blanking is enabled on PWMLx output falling edge.

© 2025 Microchip Technology Inc. and its subsidiaries

Bits 6:0 – LEBDELAY[6:0] Leading-Edge Blanking Delay for TRGINx

Leading-edge blanking duration for external trigger x input. The delay is calculated according to the following formula:

LEBDELAY = ($f_{peripheral\ clock}$ × Delay) + 1

© 2025 Microchip Technology Inc. and its subsidiaries

80. Timer Counter (TC)

80.1. Description

A Timer Counter (TC) module includes three identical TC channels. The number of implemented TC modules is device-specific.

Each TC channel can be independently programmed to perform a wide range of functions including frequency measurement, event counting, interval measurement, pulse generation, delay timing and pulse width modulation.

Each channel has three external clock inputs, five internal clock inputs and two multipurpose input/output signals which can be configured by the user. Each channel drives an internal interrupt signal which can be programmed to generate processor interrupts.

The TC embeds a quadrature decoder (QDEC) connected in front of the timers and driven by TIOA0, TIOB0 and TIOB1 inputs. When enabled, the QDEC performs the input lines filtering, decoding of quadrature signals and connects to the timers/counters in order to read the position and speed of the motor through the user interface.

The TC block has two global registers which act upon all TC channels:

- Block Control register (TC_BCR)—allows channels to be started simultaneously with the same instruction
- Block Mode register (TC_BMR)—defines the external clock inputs for each channel, allowing them to be chained

80.2. Embedded Characteristics

- Total of six Channels
- 32-bit Channel Size
- Wide Range of Functions Including:
  - Frequency measurement
  - Event counting
  - Interval measurement
  - Pulse generation
  - Delay timing
  - Pulse width modulation
  - Up/down capabilities
  - Quadrature decoder with real time filtering reports
  - 2-bit Gray up/down count for stepper motor
- Each Channel is User-Configurable and Contains:
  - Three external clock inputs
  - Five internal clock inputs
  - Two multipurpose input/output signals acting as trigger event
  - Trigger/capture events can be directly synchronized by PWM signals
- Interrupt Line
- Read of the Capture Registers by the DMAC
- Compare and Input Edge Trigger Events for DMA
- Compare Event Fault Generation for PWM

80.3. Block Diagram

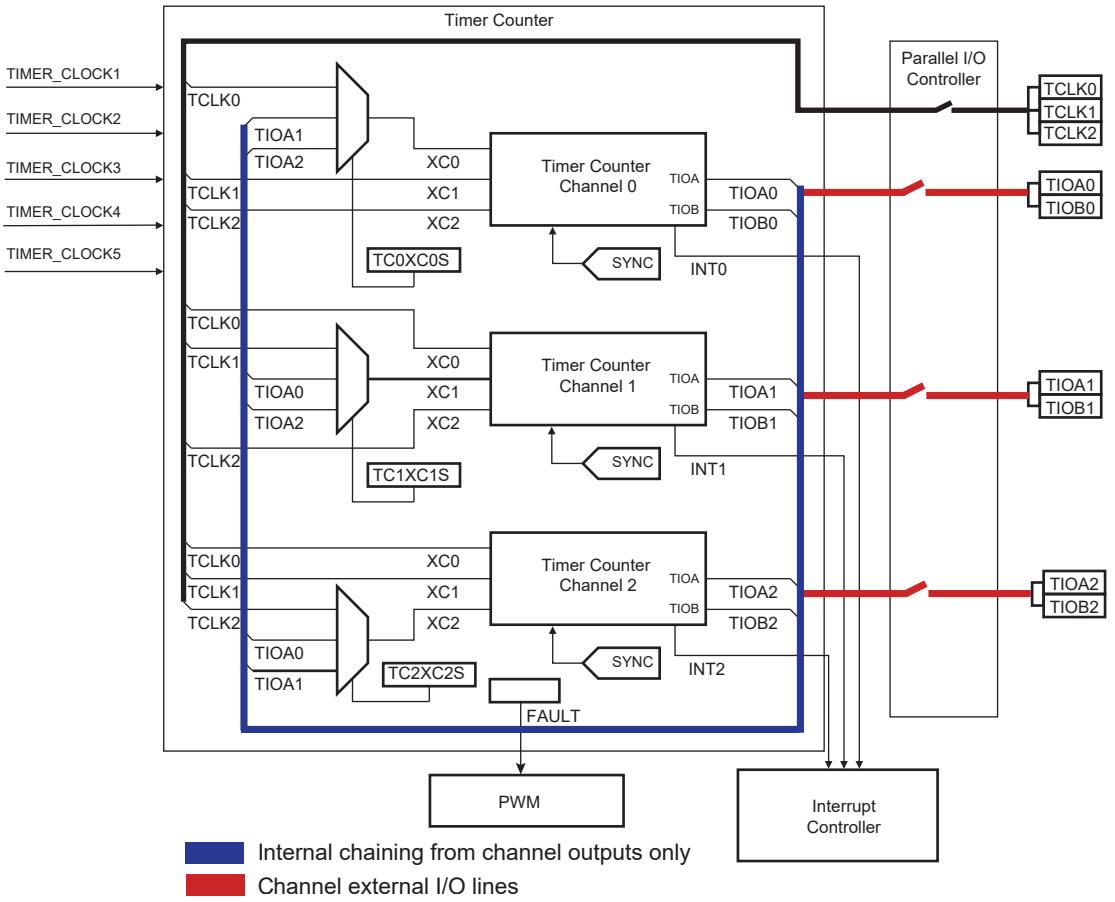
Table 80.1. Timer Counter Clock Assignment

Name	Definition
TIMER_CLOCK1	GCLK [TC_ID]
TIMER_CLOCK2	MCK0/8
TIMER_CLOCK3	MCK0/32
TIMER_CLOCK4	MCK0/128
TIMER_CLOCK5 (1)	TD_SLCK

Note:

1. The GCLK [TC_ID] frequency must be at least three times lower than peripheral clock frequency.

Figure 80.1. TC Block Diagram



Notes:

1. The above figure provides pin names of a first instance of a Timer Counter module (i.e., instance TC0). For any subsequent instances, the signal numbering increments. For example, “TCLK3-TCLK5”, "TIOA3-TIOA5” and "TIOB3-TIOB5” are the external I/O pins of a second Timer Counter module (i.e., instance TC1).
2. QDEC connections are detailed in Figure 80.18.

© 2025 Microchip Technology Inc. and its subsidiaries

Table 80.2. Channel Signal Description

Signal Name	Description
XC0, XC1, XC2	Channel clock source that can be connected to TIOAx, TIOBx, TCLKx
TIMER_CLOCK1-5	Channel clock source from system clocks
TIOAx	Capture mode: Timer Counter input Waveform mode: Timer Counter output
TIOBx	Capture mode: Timer Counter input Waveform mode: Timer Counter input/output
INT	Interrupt signal output (internal signal)
SYNC	Synchronization input signal (from Configuration register)

80.4. Pin List

Table 80.3. Pin List

Pin Name	Description	Type
TCLK0–TCLK2	External clock input	Input
TIOA0–TIOA2	I/O line A	I/O
TIOB0–TIOB2	I/O line B	I/O

Note: This table provides pin names of a first instance of a Timer Counter block (i.e., instance TC0). For any subsequent instances, the signal numbering increments. For example, “TCLK3-TCLK5”, "TIOA3-TIOA5” and "TIOB3-TIOB5” are the external I/O pins of a second Timer Counter block (i.e., instance TC1).

80.5. Product Dependencies

80.5.1. I/O Lines

The pins used for interfacing the compliant external devices may be multiplexed with PIO lines. The programmer must first program the PIO controllers to assign the TC pins to their peripheral functions.

80.5.2. Power Management

The TC is clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the Timer Counter clock of each channel.

80.5.3. Interrupt Sources

The TC has an interrupt line per channel connected to the interrupt controller. Handling the TC interrupt requires programming the interrupt controller before configuring the TC.

80.5.4. Synchronization Inputs from PWM

The TC has trigger/capture inputs internally connected to the PWM. See Synchronization with PWM and refer to the implementation of the Pulse Width Modulation (PWM) in this product.

80.5.5. Fault Output

The TC has the FAULT output internally connected to the fault input of PWM. See Fault Mode and refer to the implementation of the Pulse Width Modulation (PWM) in this product.

80.6. Functional Description

80.6.1. Description

All channels of the Timer Counter are independent and identical in operation except when the QDEC is enabled. The registers for channel programming are listed in Register Summary.

© 2025 Microchip Technology Inc. and its subsidiaries

80.6.2. 32-bit Counter

Each 32-bit channel is organized around a 32-bit counter. The value of the counter is incremented at each positive edge of the selected clock. When the counter has reached the value 2^{32}-1 and passes to zero, an overflow occurs and the COVFS bit in the Interrupt Status register (TC_SR) is set.

The current value of the counter is accessible in real time by reading the Counter Value register (TC_CV). The counter can be reset by a trigger. In this case, the counter value passes to zero on the next valid edge of the selected clock.

80.6.3. Clock Selection

Input clock signals of each channel can be connected either to the external inputs TCLKx, or to the internal I/O signals TIOAx for chaining[(1)] by programming the Block Mode register (TC_BMR). See the figure Clock Chaining Selection.

Each channel can independently select a source for its counter[(2)]:

- Signals from other channels: XC0, XC1 or XC2
- Signals from the system: GCLK [TC_ID], MCK0/8, MCK0/32, MCK0/128, TD_SLCK

This selection is made by the TCCLKS bits in the Channel Mode register (TC_CMRx).

The selected clock can be inverted with TC_CMRx.CLKI. This allows counting on the opposite edges of the clock.

The burst function allows the clock to be validated when an external signal is high. The BURST parameter in the TC_CMRx defines this signal (none, XC0, XC1, XC2). See the figure Clock Selection.

Notes:

1. In Waveform mode, to chain two timers, it is mandatory to initialize some parameters:
   - Configure TIOx outputs to 1 or 0 by writing the required value to TC_CMRx.ASWTRG.
   - Bit TC_BCR.SYNC must be written to 1 to start the channels at the same time.
2. In all cases, if an external clock or asynchronous internal clock GCLK [TC_ID] is used, the duration of each of its levels must be longer than the peripheral clock period, so the clock frequency will be at least 2.5 times lower than the peripheral clock.

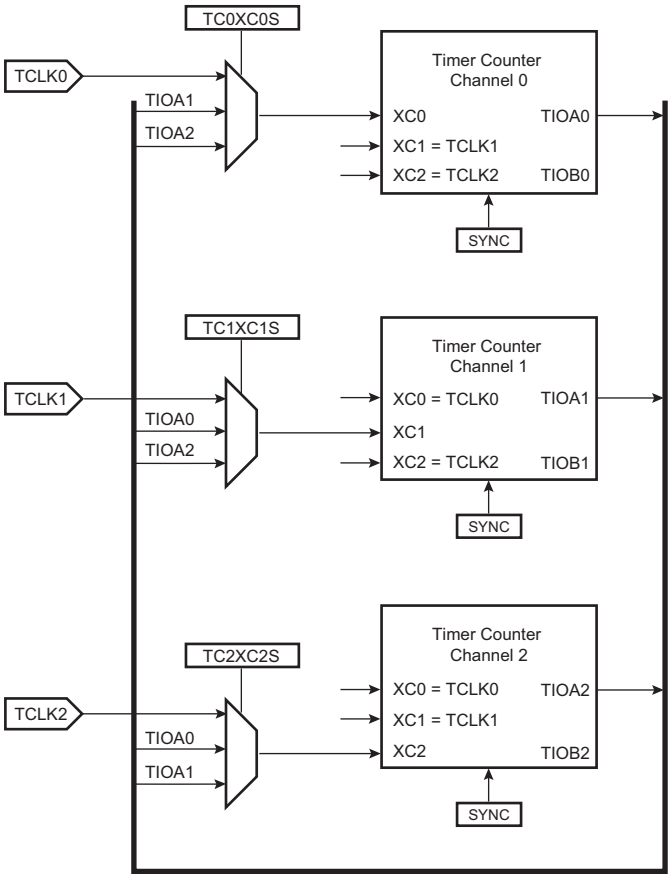
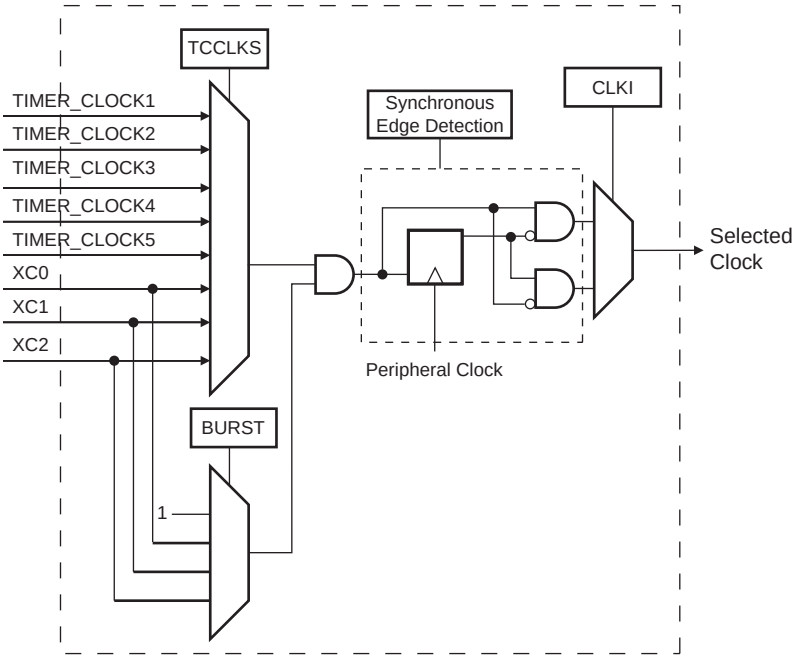
Figure 80.2. Clock Chaining Selection



Note: The above figure provides pin names of a first instance of a Timer Counter block (i.e., instance TC0). For any subsequent instances, the signal numbering increments. For example, “TCLK3-TCLK5”, "TIOA3-TIOA5” and "TIOB3-TIOB5” are the external I/O pins of a second Timer Counter block (i.e., instance TC1).

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 80.3. Clock Selection



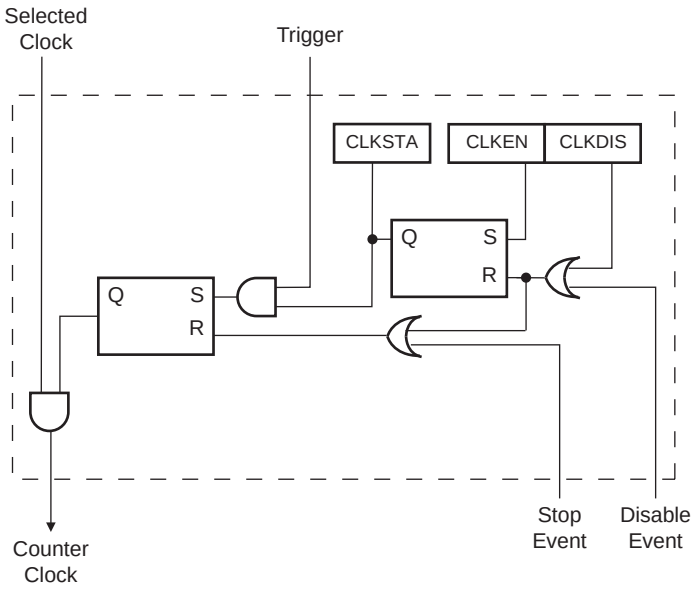
80.6.4. Clock Control

The clock of each counter can be controlled in two different ways: it can be enabled/disabled and started/stopped, as shown in the following figure.

- The clock can be enabled or disabled by the user with the CLKEN and the CLKDIS commands in the Channel Control register (TC_CCR). In Capture mode it can be disabled by an RB load event if TC_CMRx.LDBDIS is set to ‘1’. In Waveform mode, it can be disabled by an RC Compare event if TC_CMRx.CPCDIS is set to ‘1’. When disabled, the start or the stop actions have no effect: only a CLKEN command in the TC_CCR can reenable the clock. When the clock is enabled, TC_SR.CLKSTA is set.
- The clock can also be started or stopped: a trigger (software, synchro, external or compare) always starts the clock. The clock can be stopped by an RB load event in Capture mode (TC_CMRx.LDBSTOP = 1) or an RC compare event in Waveform mode (TC_CMRx.CPCSTOP = 1). The start and the stop commands are effective only if the clock is enabled.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 80.4. Clock Control



80.6.5. Operating Modes

Each channel can operate independently in two different modes:

- Capture mode provides measurement on signals.
- Waveform mode provides wave generation.

The TC operating mode is programmed with TC_CMRx.WAVE.

In Capture mode, TIOAx and TIOBx are configured as inputs.

In Waveform mode, TIOAx is always configured to be an output and TIOBx is an output if it is not selected to be the external trigger.

80.6.6. Trigger Events

Input Events

An input trigger event resets the internal counter value and starts the counter clock. Three types of trigger are common to both modes, and an external trigger is available to each mode (Capture or Waveform).

Regardless of the input trigger event used, it will be taken into account at the following active edge of the selected clock. This means that the counter value can be read differently from zero just after a trigger event, especially when a low frequency signal is selected as the clock.

The following input trigger events are common to both modes:

- Software trigger: Each channel has a software trigger, available by setting TC_CCR.SWTRG.
- SYNC: Each channel has a synchronization signal SYNC. When asserted, this signal has the same effect as a software trigger. The SYNC signals of all channels are asserted simultaneously by writing TC_BCR with SYNC set.
- Compare RC trigger: RC is implemented in each channel and can provide a trigger when the counter value matches the RC value if TC_CMRx.CPCTRG is set.

The timer channel can also be configured to be triggered by an external event.

In Capture mode, the external trigger signal can be selected between TIOAx and TIOBx.

© 2025 Microchip Technology Inc. and its subsidiaries

In Waveform mode, an external event can be programmed on one of the following signals: TIOBx, XC0, XC1 or XC2. This external event can then be programmed to perform a trigger by setting TC_CMRx.ENETRG.

If an external trigger event is used, the duration of the pulses must be longer than the peripheral clock period to be detected.

Output Events

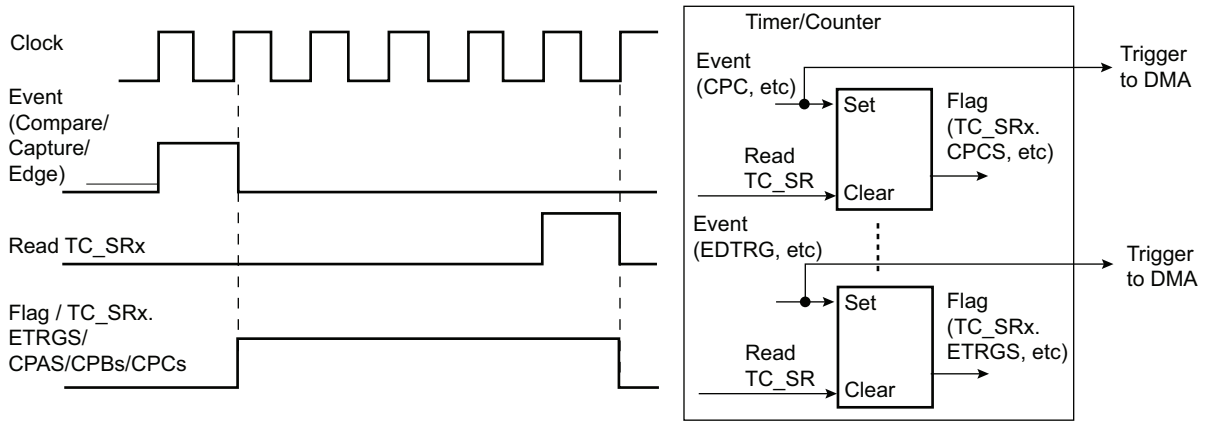
The internal counter and associated comparators provide generic trigger events for DMA transfers. These trigger events are selected in the DMA peripheral (refer to the section “DMA Controller”).

Three events correspond to the capture and compare events for which status flags CPAS, CPBS and CPCS are provided in TC_SRx.

One event corresponds to the detection of an edge on either the TIOA, TIOB or TCLK0/1/2 input depending on operating mode and configuration, for which the ETRGS status flag is provided in TC_SRx.

The status flags are cleared by software whereas the compare events setting the corresponding flags are pulses of one clock period only.

Figure 80.5. TC Output Trigger Events for DMA



When triggered by the TC output events, the DMA can perform any access allowed in the system memory, including accesses to TC when configured in Capture mode (see Transferring Timer Values with DMAC in Capture Mode).

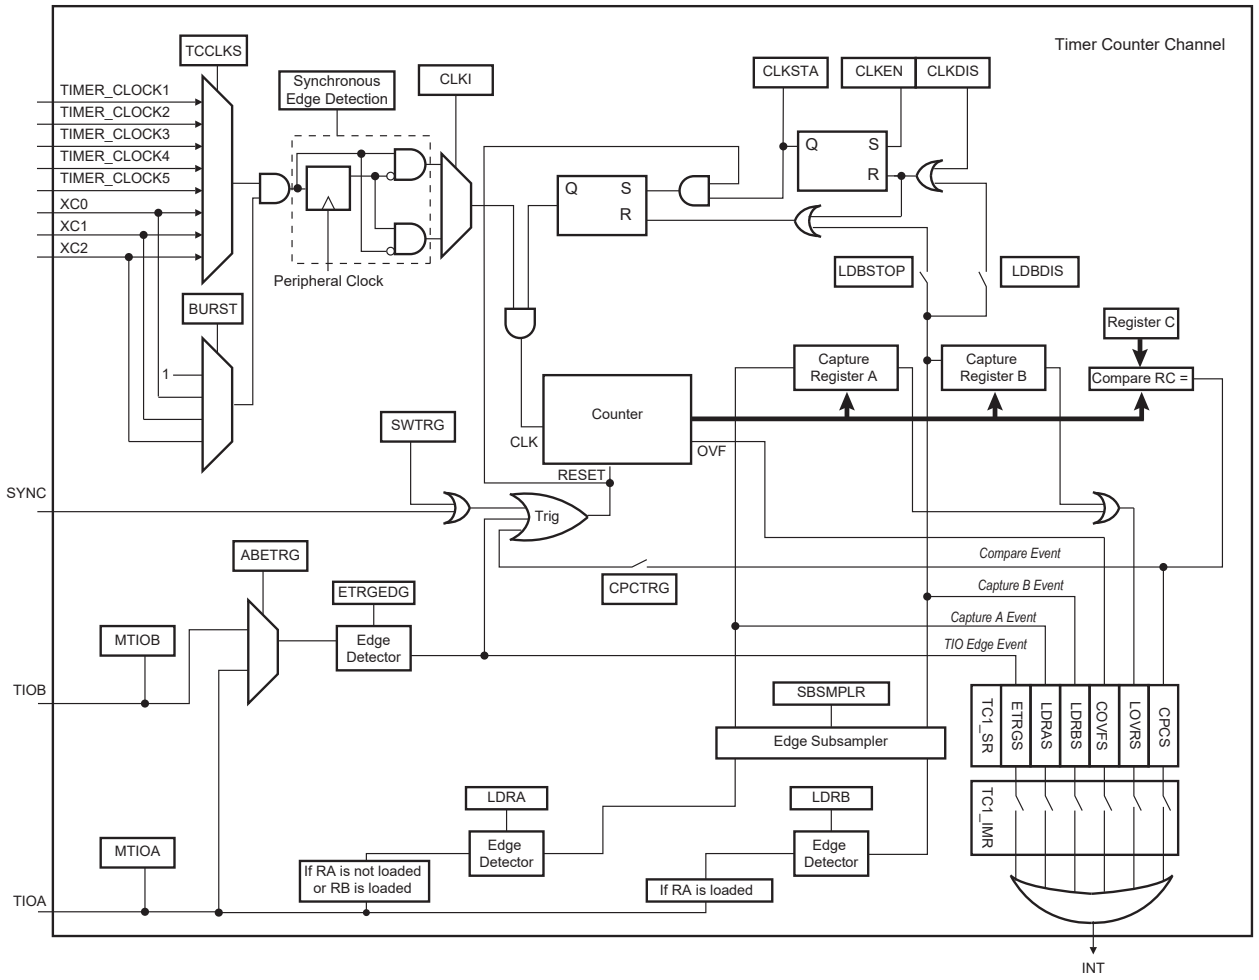
80.6.7. Trigger Conditions

In addition to the SYNC signal, the software trigger and the RC compare trigger, an external trigger can be defined.

The ABETRG bit in the TC_CMR selects TIOAx or TIOBx input signal as an external trigger or the trigger signal from the output comparator of the PWM module. The External Trigger Edge Selection parameter (ETRGEDG field in TC_CMR) defines the edge (rising, falling, or both) detected to generate an external trigger. If ETRGEDG = 0 (none), the external trigger is disabled.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 80.6. Capture Mode



80.6.8. Capture Mode

Capture mode is entered by clearing TC_CMRx.WAVE.

Capture mode allows the TC channel to perform measurements such as pulse timing, frequency, period, duty cycle and phase on TIOAx and TIOBx signals which are considered as inputs.

The figure Capture Mode shows the configuration of the TC channel when programmed in Capture mode.

80.6.9. Capture Registers A and B

Registers A and B (TC_RA and TC_RB) are used as capture registers. They can be loaded with the counter value when a programmable event occurs on the signal TIOAx.

TC_CMRx.LDRA defines the TIOAx selected edge for the loading of TC_RA, and TC_CMRx.LDRB defines the TIOAx selected edge for the loading of TC_RB.

The subsampling ratio defined by TC_CMRx.SBSMPLR is applied to these selected edges, so that the loading of Register A and Register B occurs once every 1, 2, 4, 8 or 16 selected edges.

TC_RA is loaded only if it has not been loaded since the last trigger or if TC_RB has been loaded since the last loading of TC_RA.

TC_RB is loaded only if TC_RA has been loaded since the last trigger or the last loading of TC_RB.

© 2025 Microchip Technology Inc. and its subsidiaries

Loading TC_RA or TC_RB before the read of the last value loaded sets TC_SR.LOVRS. In this case, the old value is overwritten.

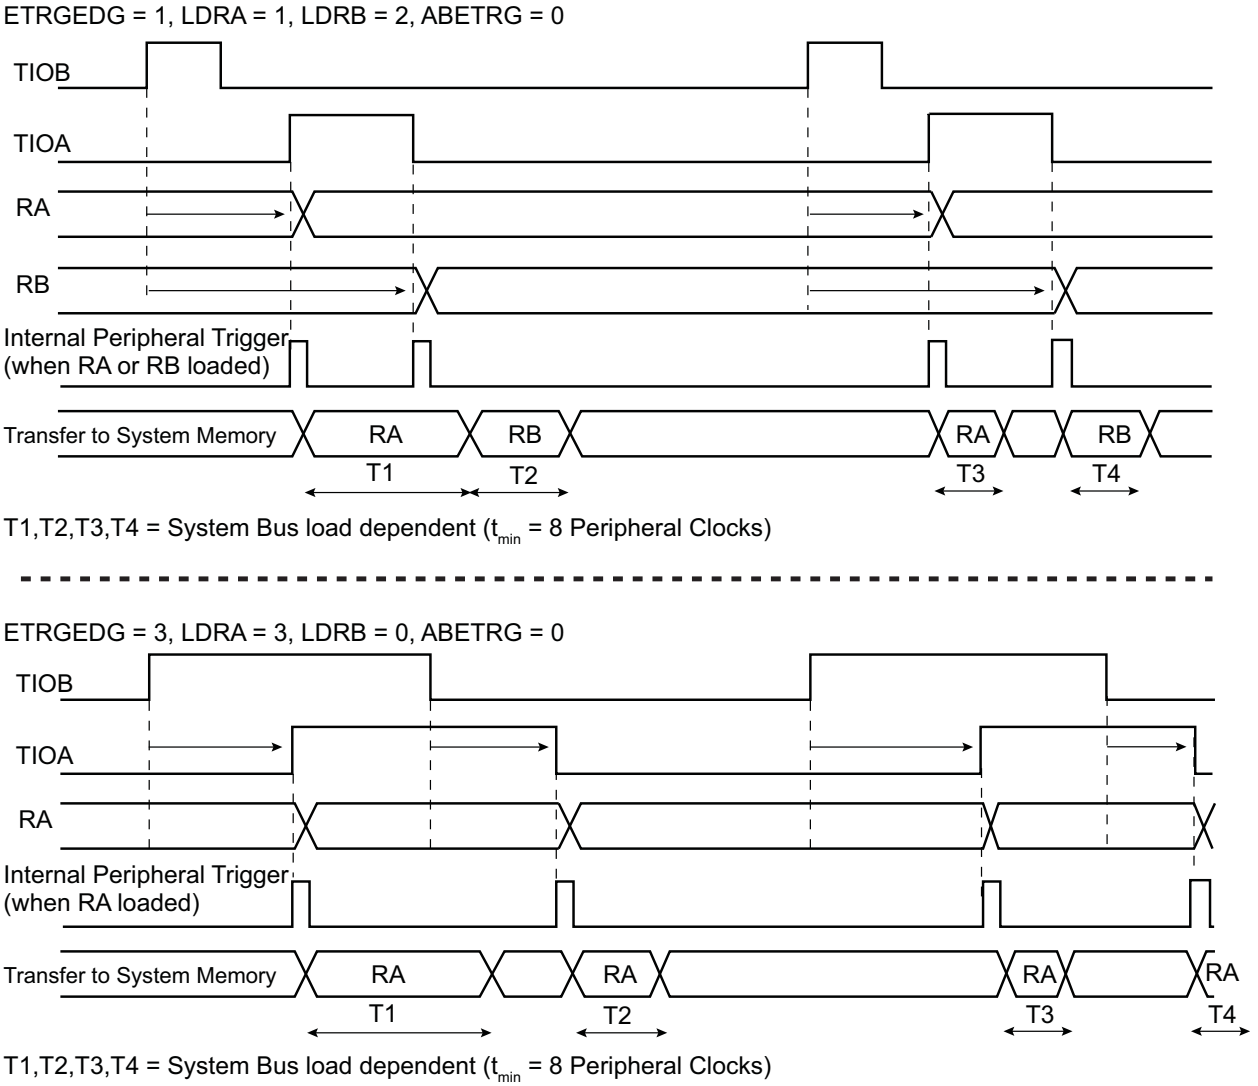
When DMA is used, the Register AB (TC_RAB) address must be configured as source address of the transfer. TC_RAB provides the next unread value from TC_RA and TC_RB. It may be read by the DMA after a request has been triggered upon loading TC_RA or TC_RB.

80.6.10. Transferring Timer Values with DMAC in Capture Mode

The DMAC can perform access from the TC to system memory in Capture mode only.

The following figure illustrates how TC_RA and TC_RB can be loaded in the system memory without processor intervention.

Figure 80.7. Example of Transfer with DMAC in Capture Mode



80.6.11. Waveform Mode

Waveform mode is entered by setting the TC_CMRx.WAVE bit.

In Waveform mode, the TC channel generates one or two PWM signals with the same frequency and independently programmable duty cycles, or generates different types of one-shot or repetitive pulses.

© 2025 Microchip Technology Inc. and its subsidiaries

In this mode, TIOAx is configured as an output and TIOBx is defined as an output if it is not used as an external event (EEVT parameter in TC_CMR).

The figure Waveform Mode shows the configuration of the TC channel when programmed in Waveform operating mode.

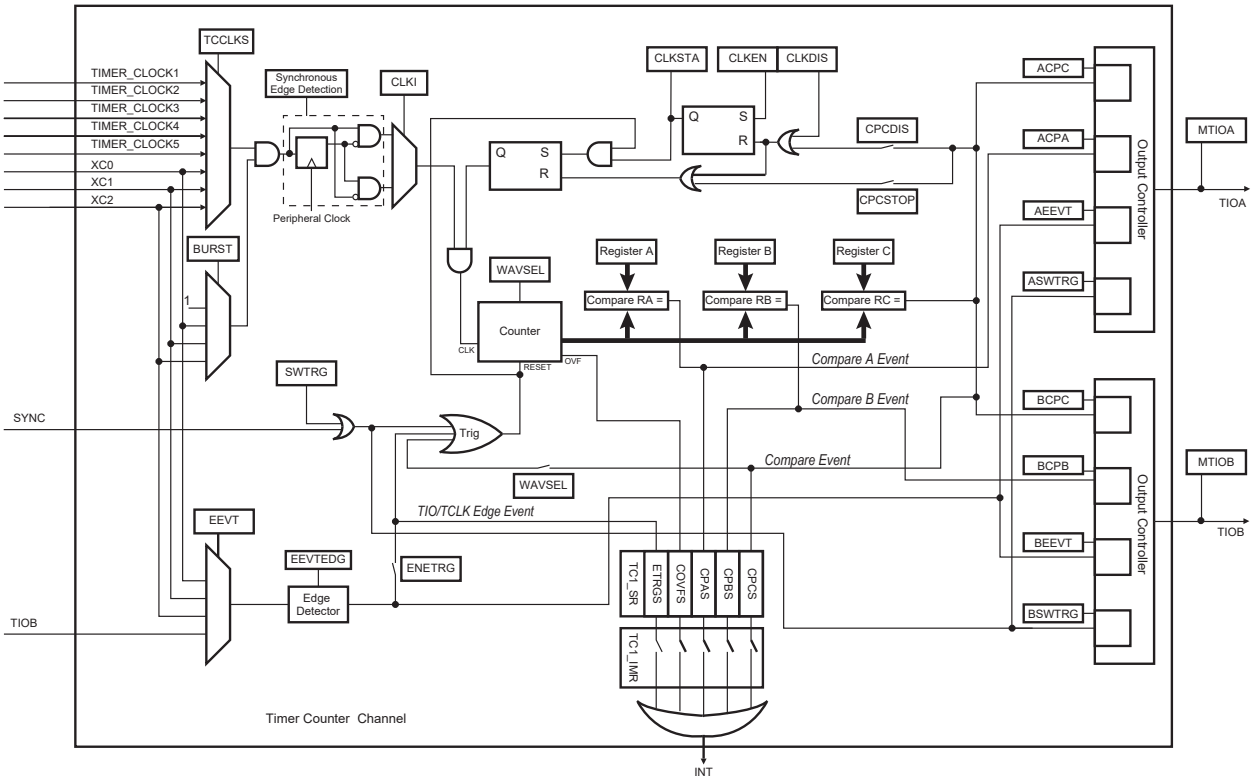
80.6.12. Waveform Selection

Depending on the WAVSEL parameter in TC_CMR, the behavior of TC_CV varies.

With any selection, TC_RA, TC_RB and TC_RC can all be used as compare registers.

RA Compare is used to control the TIOAx output, RB Compare is used to control the TIOBx output (if correctly configured) and RC Compare is used to control TIOAx and/or TIOBx outputs.

Figure 80.8. Waveform Mode



80.6.12.1.WAVSEL = 00

When WAVSEL = 00, the value of TC_CV is incremented from 0 to 2^{32}-1. Once 2^{32}-1 has been reached, the value of TC_CV is reset. Incrementation of TC_CV starts again and the cycle continues.

An external event trigger or a software trigger can reset the value of TC_CV. It is important to note that the trigger may occur at any time.

See the following figures.

RC Compare cannot be programmed to generate a trigger in this configuration. At the same time, RC Compare can stop the counter clock (CPCSTOP = 1 in TC_CMR) and/or disable the counter clock (CPCDIS = 1 in TC_CMR).

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 80.9. WAVSEL = 00 without Trigger

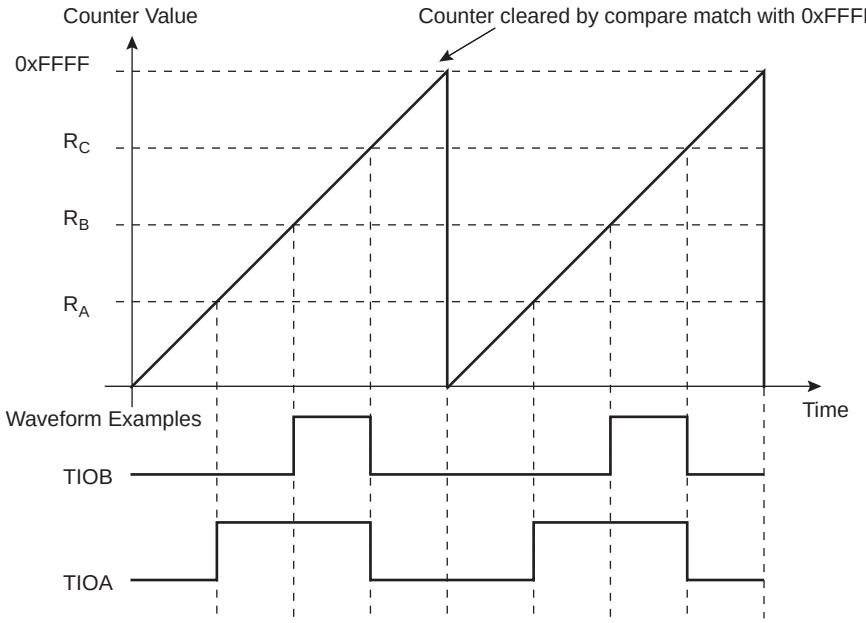


Figure 80.10. WAVSEL = 00 with Trigger

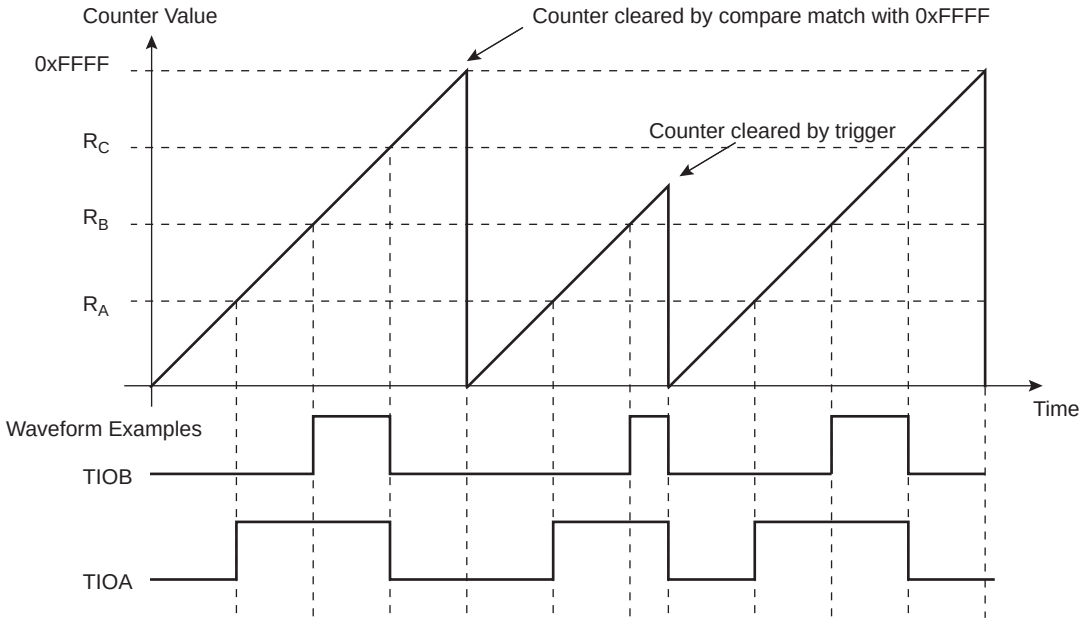

80.6.12.2.WAVSEL = 10

When WAVSEL = 10, the value of TC_CV is incremented from 0 to the value of RC, then automatically reset on a RC Compare. Once the value of TC_CV has been reset, it is then incremented and so on.

It is important to note that TC_CV can be reset at any time by an external event or a software trigger if both are programmed correctly.

See the following figures.

In addition, RC Compare can stop the counter clock (CPCSTOP = 1 in TC_CMR) and/or disable the counter clock (CPCDIS = 1 in TC_CMR).

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 80.11. WAVSEL = 10 without Trigger

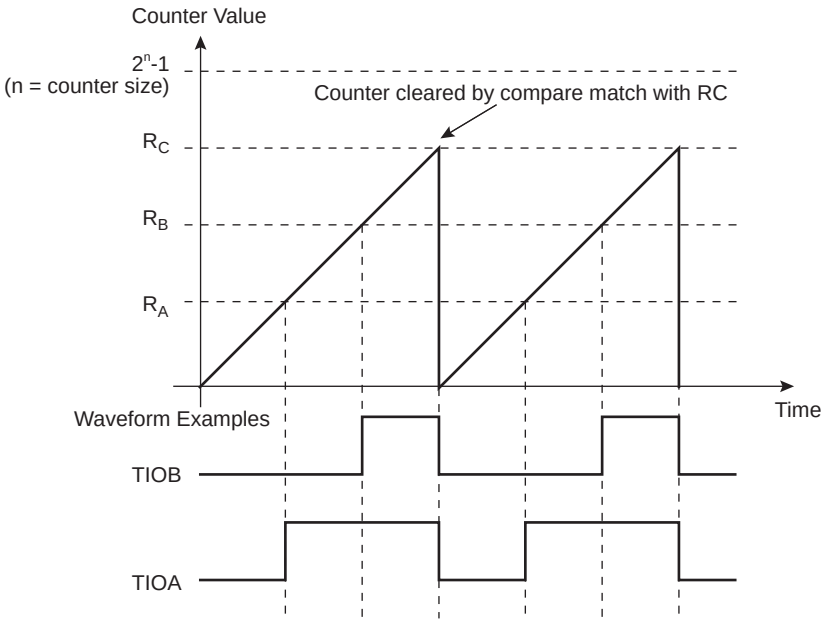

Figure 80.12. WAVSEL = 10 with Trigger

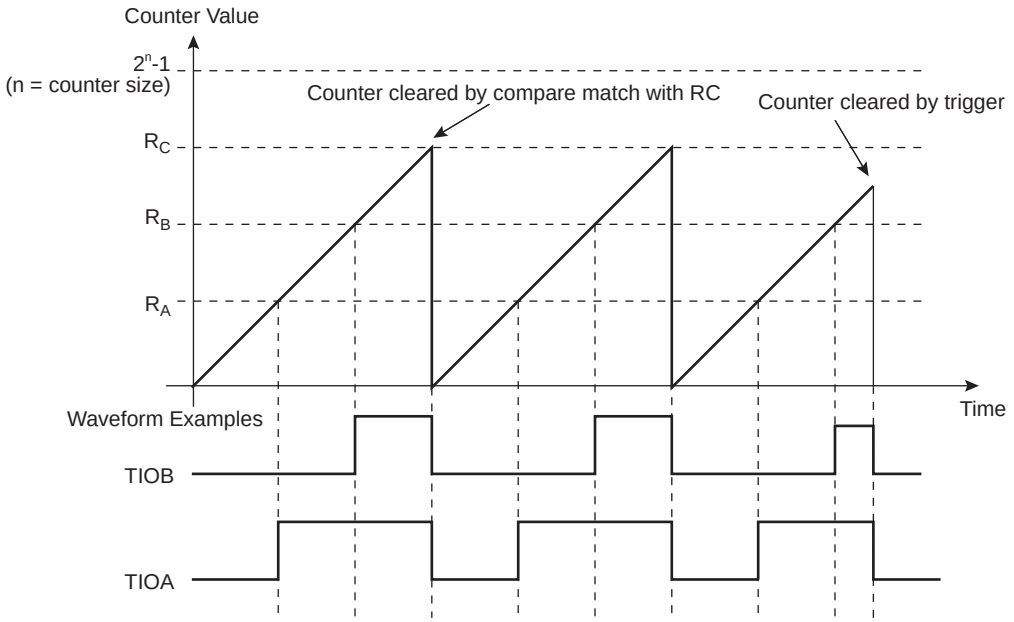

80.6.12.3.WAVSEL = 01

When WAVSEL = 01, the value of TC_CV is incremented from 0 to 2^{32}-1 . Once 2^{32}-1 is reached, the value of TC_CV is decremented to 0, then reincremented to 2^{32}-1 and so on.

A trigger such as an external event or a software trigger can modify TC_CV at any time. If a trigger occurs while TC_CV is incrementing, TC_CV then decrements. If a trigger is received while TC_CV is decrementing, TC_CV then increments.

See the following figures.

RC Compare cannot be programmed to generate a trigger in this configuration.

© 2025 Microchip Technology Inc. and its subsidiaries

At the same time, RC Compare can stop the counter clock (CPCSTOP = 1) and/or disable the counter clock (CPCDIS = 1).

Figure 80.13. WAVSEL = 01 without Trigger

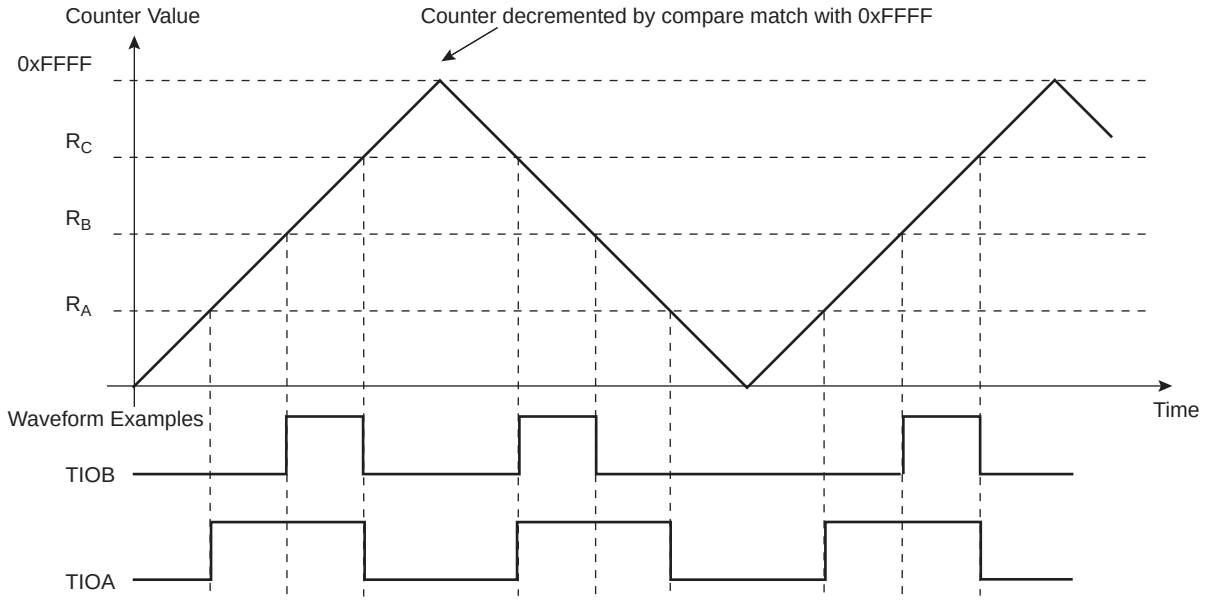

Figure 80.14. WAVSEL = 01 with Trigger

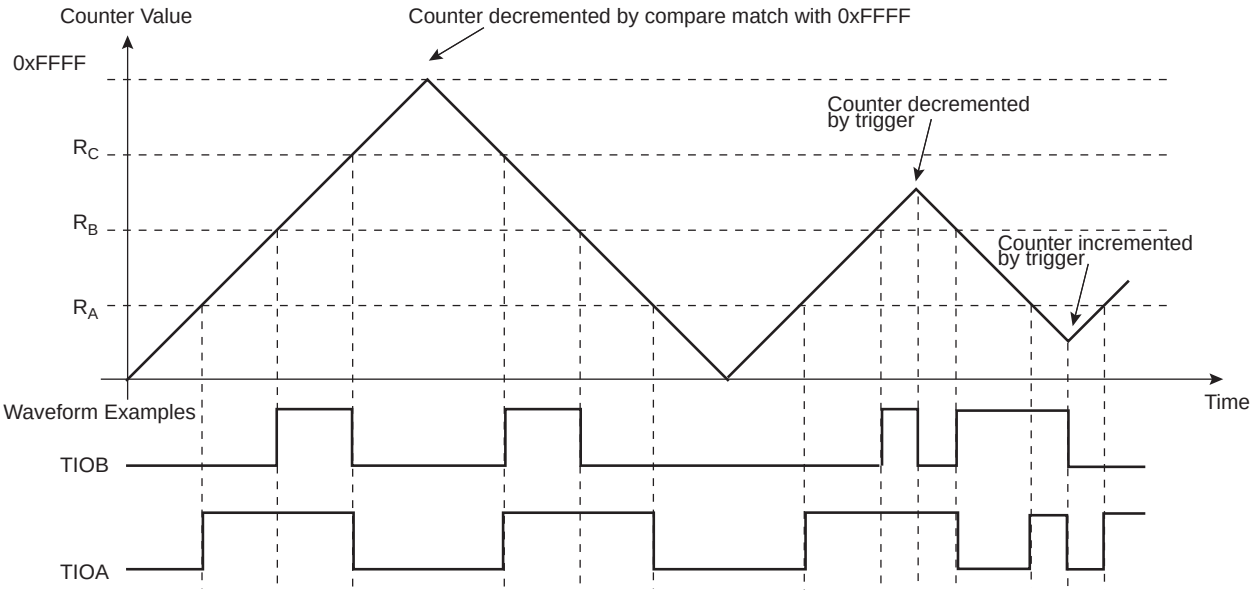

80.6.12.4.WAVSEL = 11

When WAVSEL = 11, the value of TC_CV is incremented from 0 to RC. Once RC is reached, the value of TC_CV is decremented to 0, then reincremented to RC and so on.

A trigger such as an external event or a software trigger can modify TC_CV at any time. If a trigger occurs while TC_CV is incrementing, TC_CV then decrements. If a trigger is received while TC_CV is decrementing, TC_CV then increments.

See the following figures.

RC Compare can stop the counter clock (CPCSTOP = 1) and/or disable the counter clock (CPCDIS = 1).

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 80.15. WAVSEL = 11 without Trigger

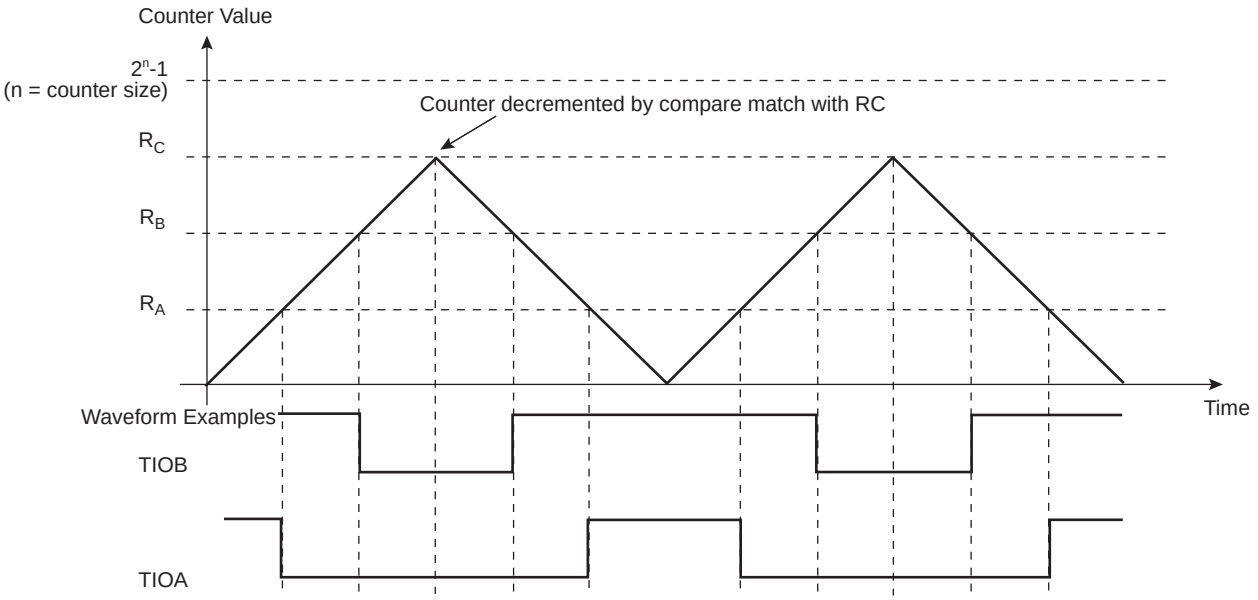

Figure 80.16. WAVSEL = 11 with Trigger

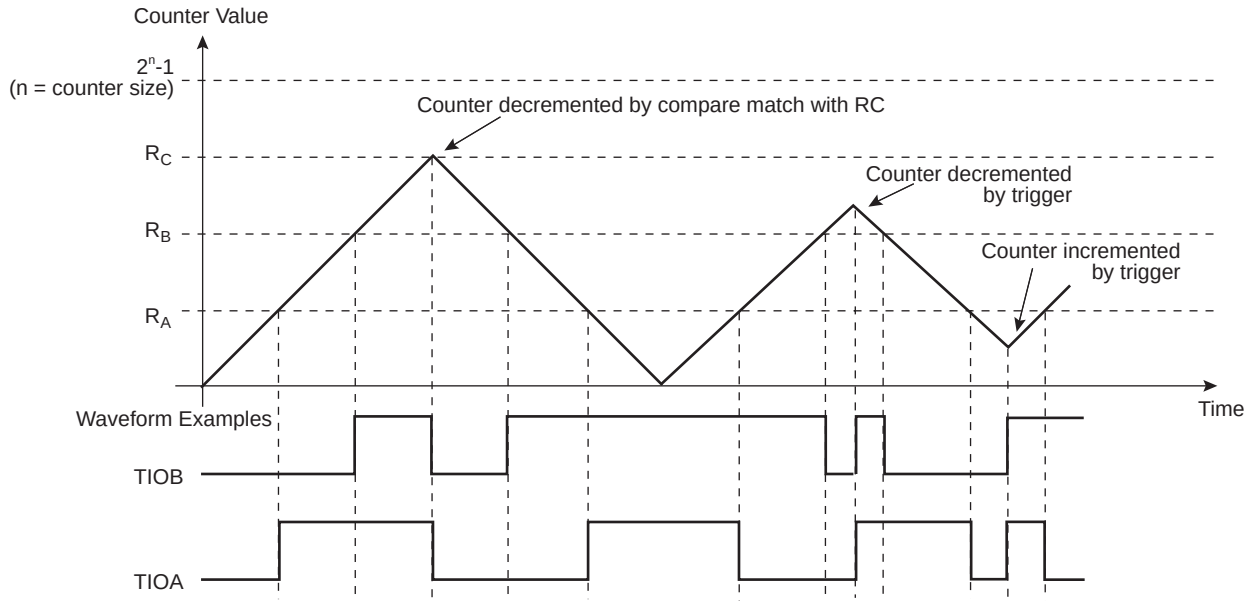


80.6.13. External Event/Trigger Conditions

An external event can be programmed to be detected on one of the clock sources (XC0, XC1, XC2) or TIOBx. The external event selected can then be used as a trigger.

The event trigger is selected using TC_CMR.EEVT. The trigger edge (rising, falling or both) for each of the possible external triggers is defined in TC_CMR.EEVTEDG. If EEVTEDG is cleared (none), no external event is defined.

If TIOBx is defined as an external event signal (EEVT = 0), TIOBx is no longer used as an output and the compare register B is not used to generate waveforms and subsequently no IRQs. In this case, the TC channel can only generate a waveform on TIOAx.

When an external event is defined, it can be used as a trigger by setting TC_CMR.ENETRG.

© 2025 Microchip Technology Inc. and its subsidiaries

As in Capture mode, the SYNC signal and the software trigger are also available as triggers. RC Compare can also be used as a trigger depending on the parameter WAVSEL.

80.6.14. Synchronization with PWM

The inputs TIOAx/TIOBx can be bypassed, and thus channel trigger/capture events can be directly driven by the independent PWM module.

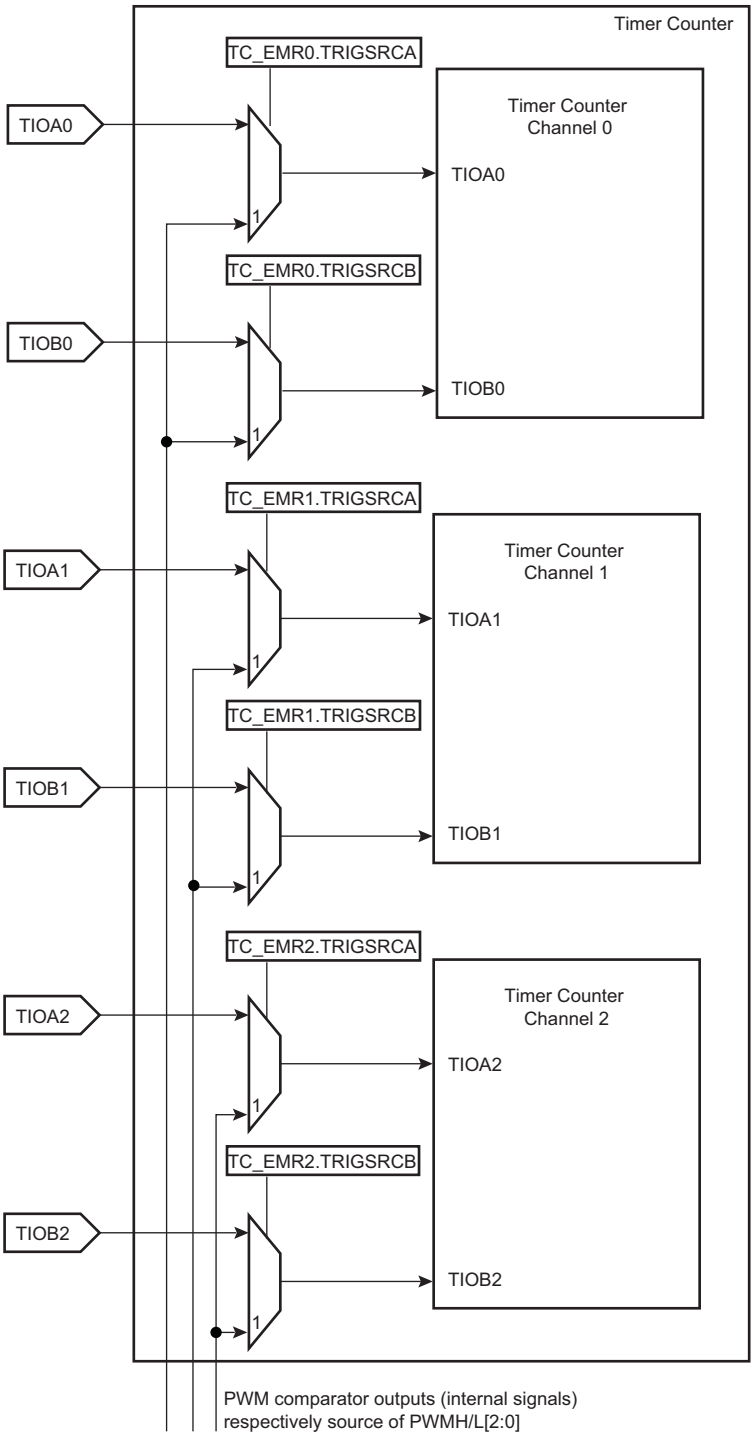
PWM comparator outputs (internal signals without dead-time insertion - OCx), respectively source of the PWMH/L[2:0] outputs, are routed to the internal TC inputs. These specific TC inputs are multiplexed with TIOA/B input signal to drive the internal trigger/capture events.

The selection is made in the Extended Mode register (TC_EMR) fields TRIGSRCA and TRIGSRCB (see TC_EMRx).

Each channel of the TC module can be synchronized by a different PWM channel as described in the following figure.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 80.17. Synchronization with PWM



Note: This figure provides pin names of the first instance of a Timer Counter block (i.e., instance TC0). For any subsequent instances, the signal numbering increments. For example, "TIOA3-TIOA5" and "TIOB3-TIOB5" are the external IO pins of a second Timer Counter block (i.e., instance TC1).

80.6.15. Output Controller

The output controller defines the output level changes on TIOAx and TIOBx following an event. TIOBx control is used only if TIOBx is defined as output (not as an external event).

© 2025 Microchip Technology Inc. and its subsidiaries

The following events control TIOAx and TIOBx:

- Software trigger
- External event
- RC compare

RA Compare controls TIOAx, and RB Compare controls TIOBx. Each of these events can be programmed to set, clear or toggle the output as defined in the corresponding parameter in TC_CMR.

80.6.16. Quadrature Decoder

80.6.16.1.Description

The quadrature decoder (QDEC) is driven by TIOA0, TIOB0 and TIOB1 input pins and drives the timer counter of channel 0 and 1. Channel 2 can be used as a time base in case of speed measurement requirements (see the following figure).

When writing a '0' to TC_BMR.QDEN, the QDEC is bypassed and the IO pins are directly routed to the timer counter function.

TIOA0 and TIOB0 are to be driven by the two dedicated quadrature signals from a rotary sensor mounted on the shaft of the off-chip motor.

A third signal from the rotary sensor can be processed through pin TIOB1 and is typically dedicated to be driven by an index signal if it is provided by the sensor. This signal is not required to decode the quadrature signals PHA, PHB.

TC_CMRx.TCCLKS must be configured to select XC0 input (i.e., 0x101). Field TC0XC0S has no effect as soon as the QDEC is enabled.

Either speed or position/revolution can be measured. Position channel 0 accumulates the edges of PHA, PHB input signals giving a high accuracy on motor position whereas channel 1 accumulates the index pulses of the sensor, therefore the number of rotations. Concatenation of both values provides a high level of precision on motion system position.

In Speed mode, position cannot be measured but revolution can be measured.

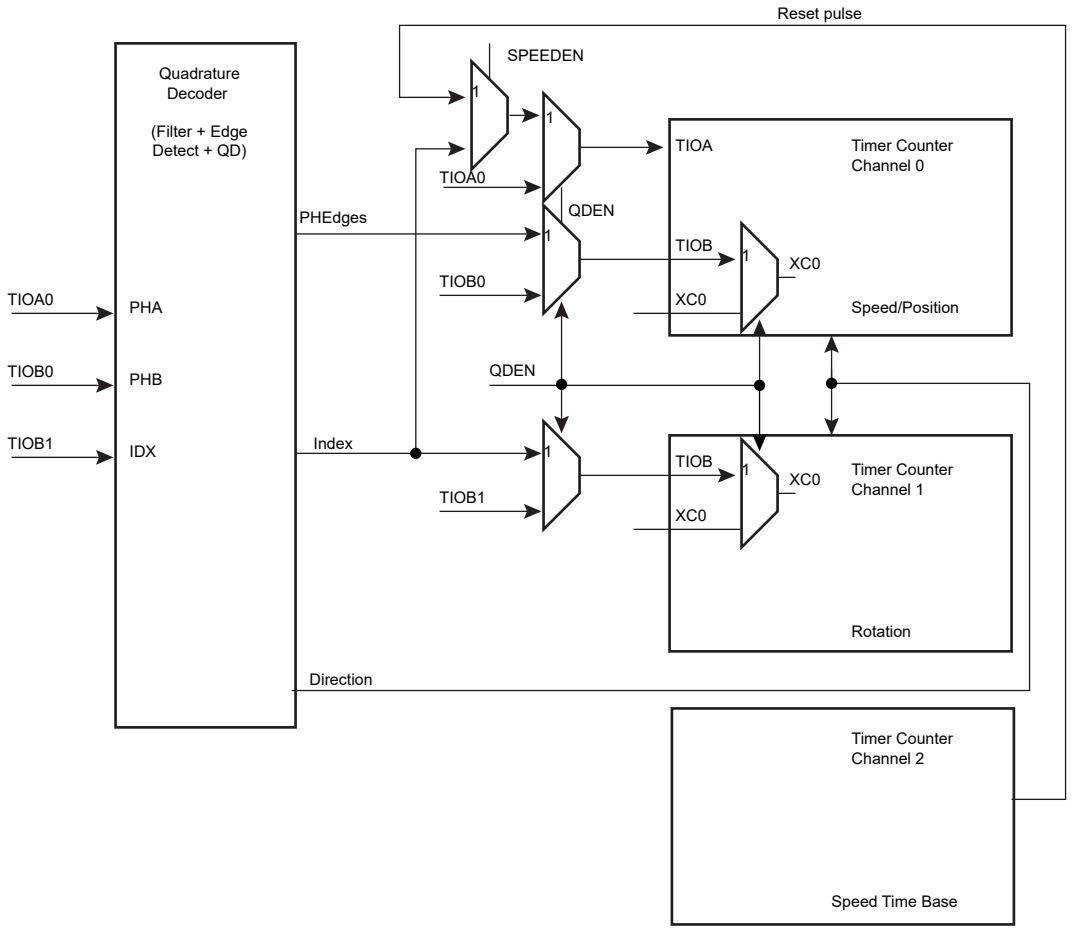
Inputs from the rotary sensor can be filtered prior to downstream processing. Accommodation of input polarity, phase definition and other factors are configurable.

Interruptions can be generated on different events.

A compare function (using TC_RC) is available on channel 0 (speed/position) or channel 1 (rotation) and can generate an interrupt by means of TC_SRx.CPCS.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 80.18. Predefined Connection of the Quadrature Decoder with Timer Counters



Note: This figure provides pin names of the first instance of a Timer Counter block (i.e., instance TC0). For any subsequent instances, the signal numbering increments. For example, "TIOA3-TIOA5" and "TIOB3-TIOB5" are the external IO pins of a second Timer Counter block (i.e., instance TC1).

80.6.16.2.Input Preprocessing

Input preprocessing consists of capabilities to take into account rotary sensor factors such as polarities and phase definition followed by configurable digital filtering.

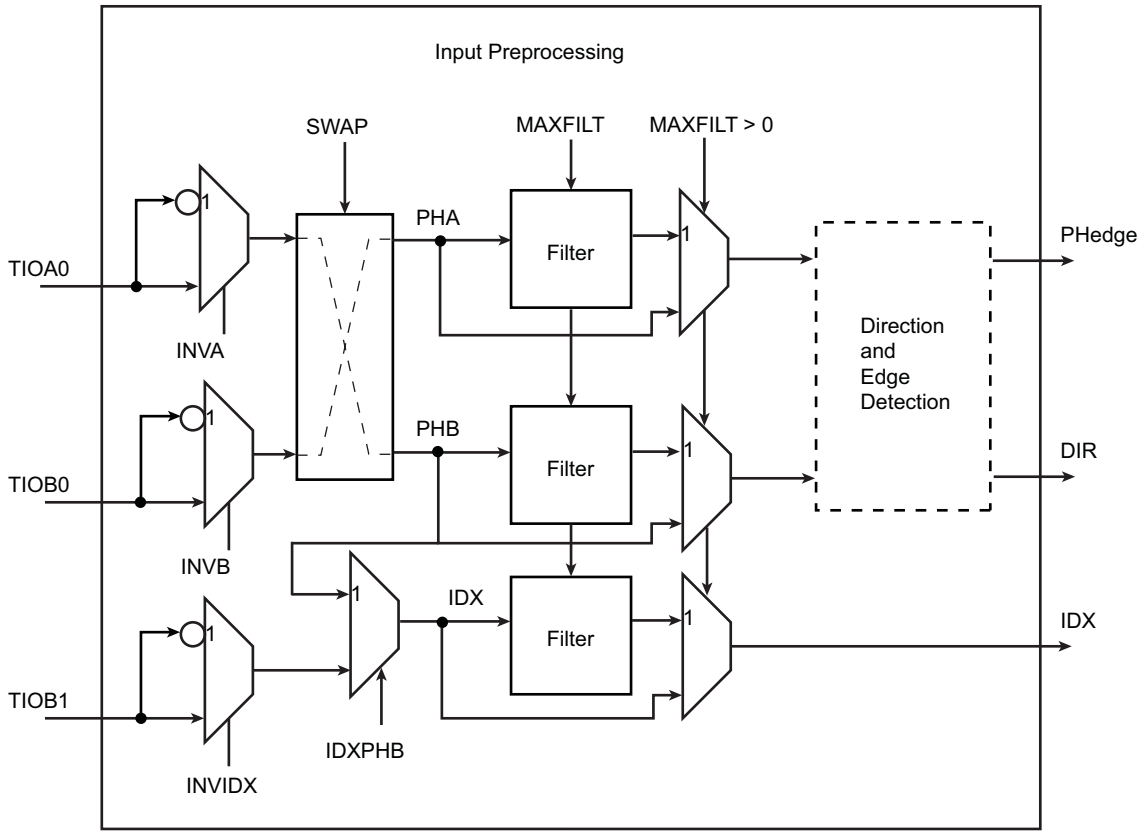
Each input can be negated and swapping PHA, PHB is also configurable.

TC_BMR. MAXFILT is used to configure a minimum duration for which the pulse is stated as valid. When the filter is active, pulses with a duration lower than (MAXFILT +1) × $t_{peripheral\ clock}$ are not passed to downstream logic.

The value of (MAXFILT +1) × $t_{peripheral\ clock}$ must not be greater than 10% of the minimum pulse on PHA, PHB or index when the rotary encoder speed is at its maximum. This speed depends on the application.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 80.19. Input Stage

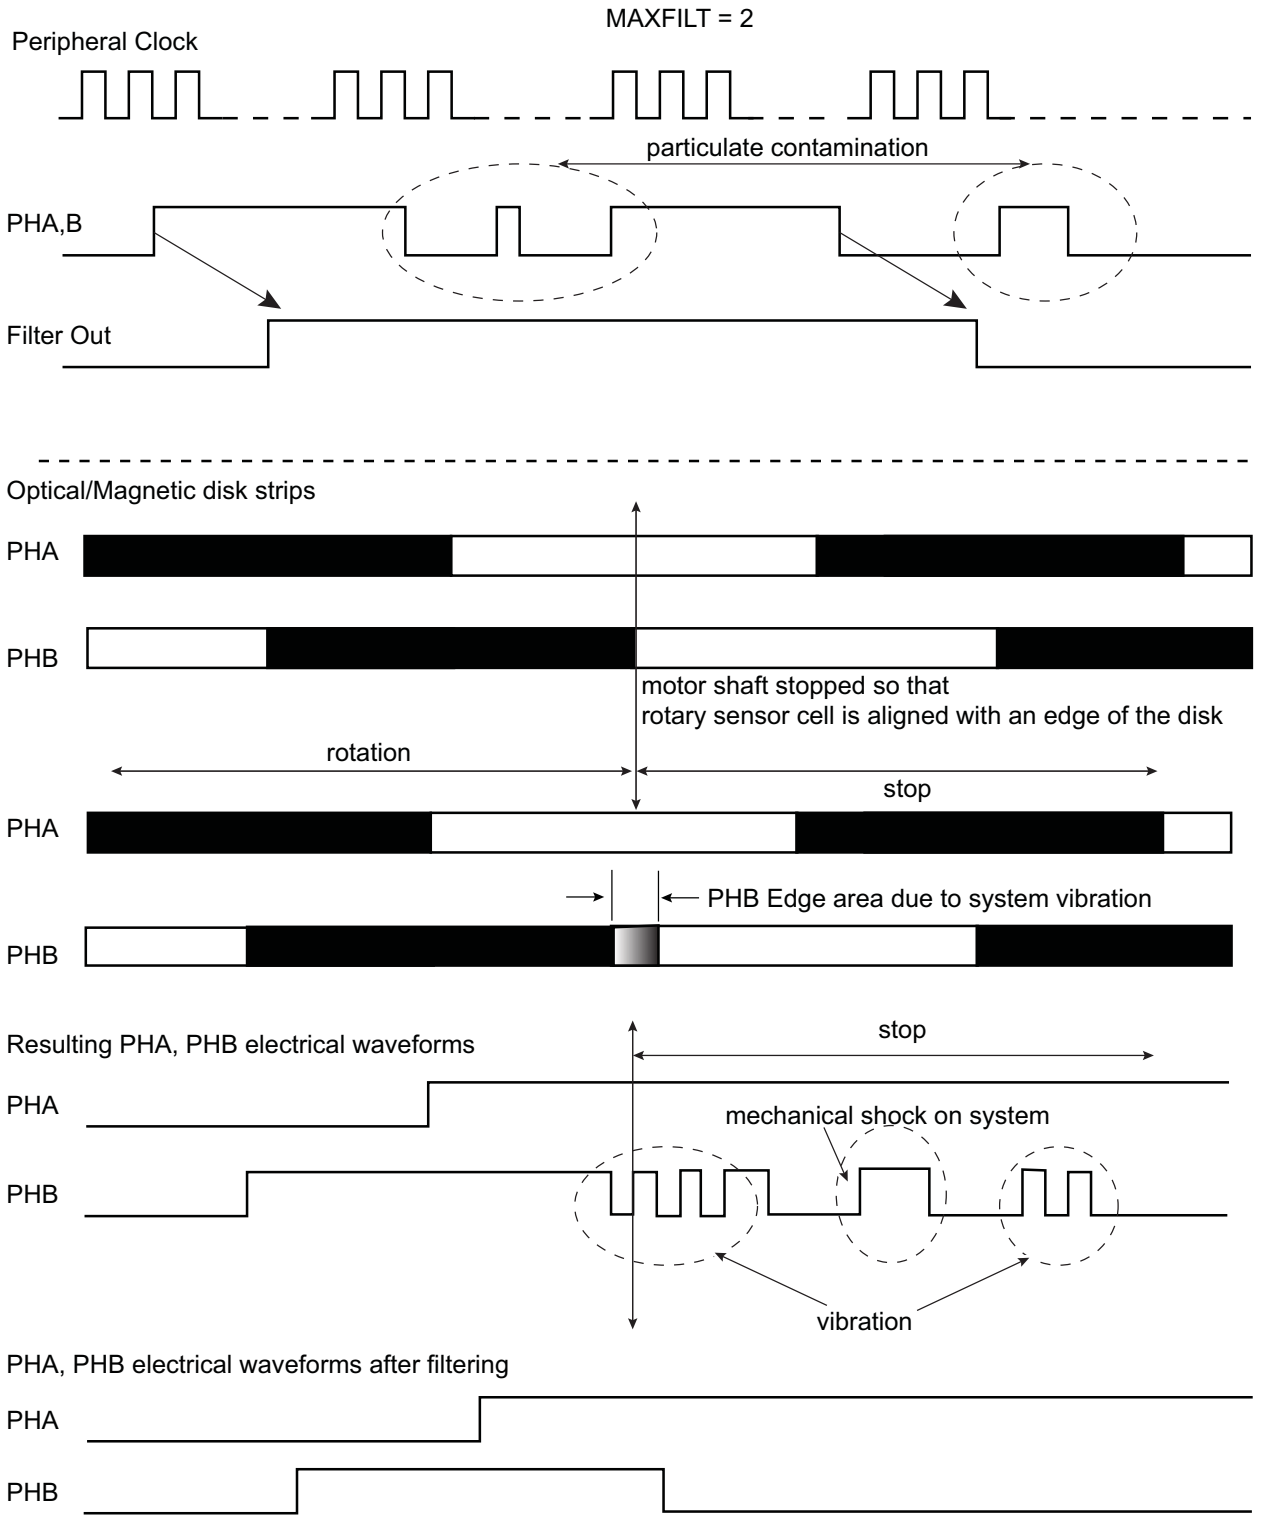


Input filtering can efficiently remove spurious pulses that might be generated by the presence of particulate contamination on the optical or magnetic disk of the rotary sensor.

Spurious pulses can also occur in environments with high levels of electromagnetic interference. Or, simply if vibration occurs even when rotation is fully stopped and the shaft of the motor is in such a position that the beginning of one of the reflective or magnetic bars on the rotary sensor disk is aligned with the light or magnetic (Hall) receiver cell of the rotary sensor. Any vibration can make the PHA, PHB signals toggle for a short duration.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 80.20. Filtering Examples



80.6.16.3.Direction Status and Change Detection

After filtering, the quadrature signals are analyzed to extract the rotation direction and edges of the two quadrature signals detected in order to be counted by TC logic downstream.

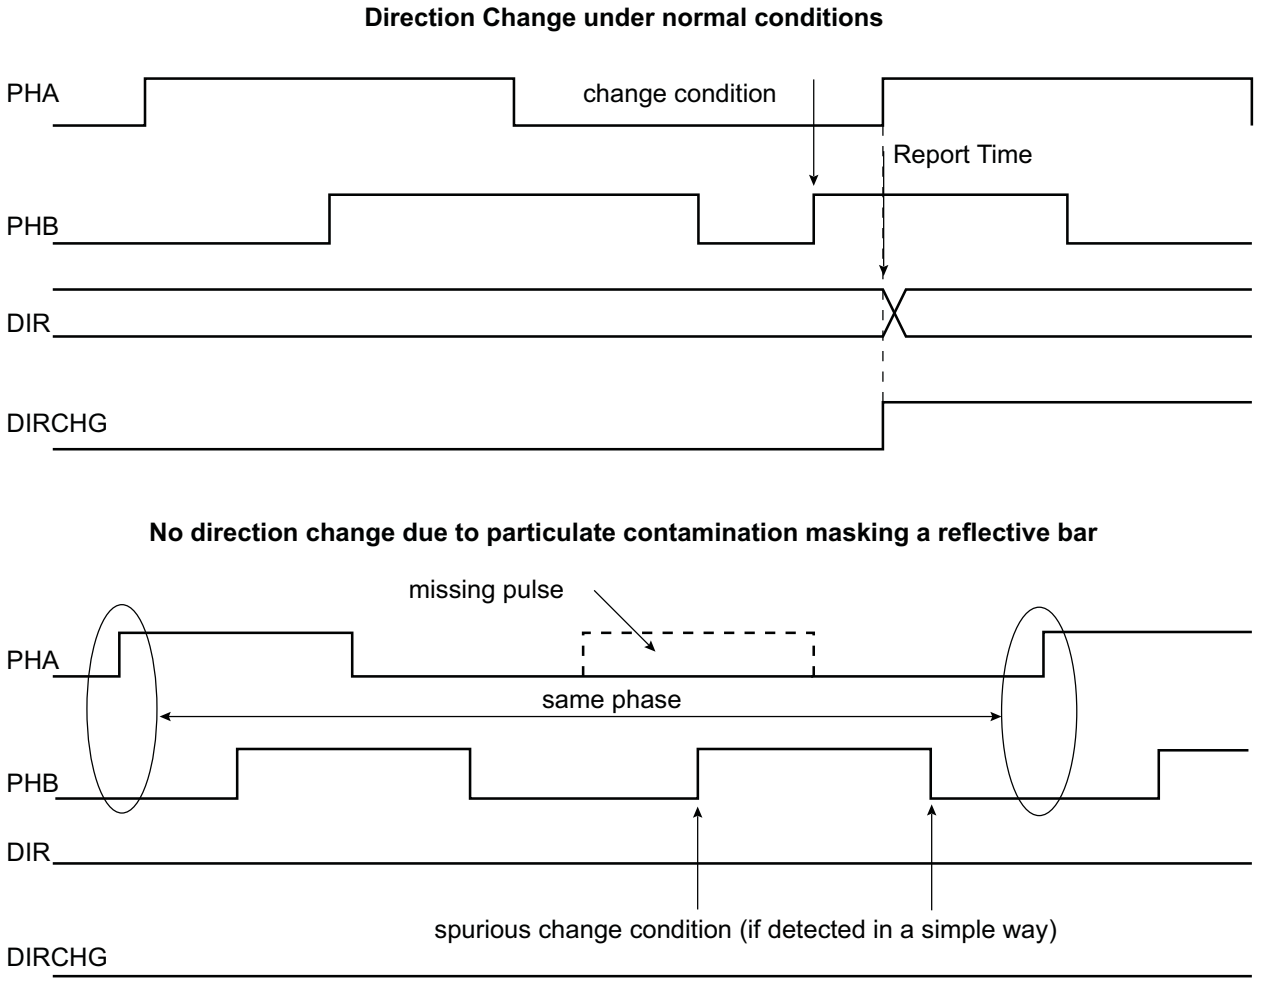
© 2025 Microchip Technology Inc. and its subsidiaries

The direction status can be directly read at anytime in the TC_QISR. The polarity of the direction flag status depends on the configuration written in TC_BMR. INVA, INVB, INVIDX, SWAP modify the polarity of DIR flag.

Any change in rotation direction is reported in the TC_QISR and can generate an interrupt.

The direction change condition is reported as soon as two consecutive edges on a phase signal have sampled the same value on the other phase signal and there is an edge on the other signal. The two consecutive edges of one phase signal sampling the same value on other phase signal is not sufficient to declare a direction change, as particulate contamination may mask one or more reflective bars on the optical or magnetic disk of the sensor. See the following figure for waveforms.

Figure 80.21. Rotation Change Detection

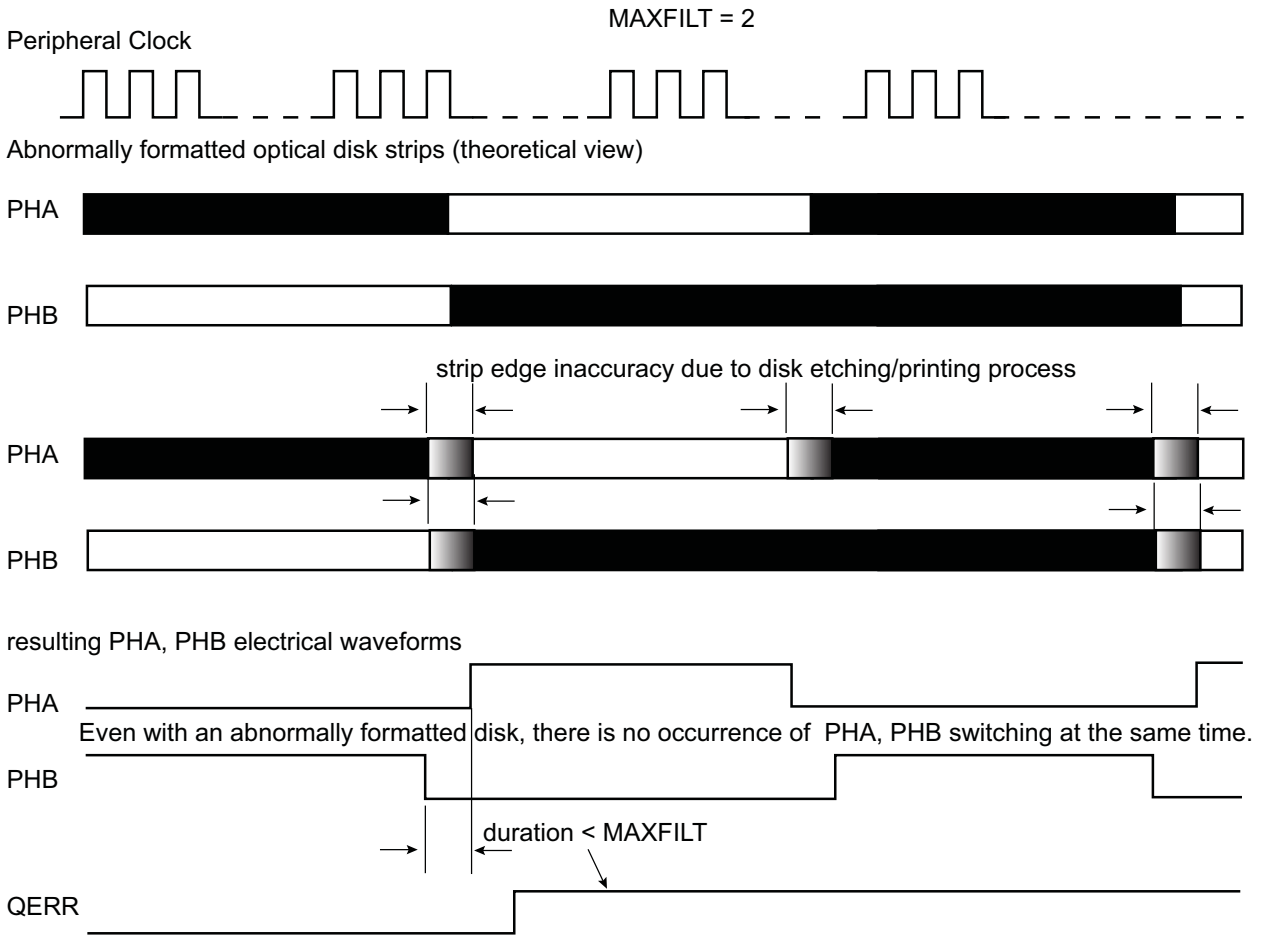


The direction change detection is disabled when TC_BMR.QDTRANS is set. In this case, the DIR flag report must not be used.

A quadrature error is also reported by the QDEC via TC_QISR.QERR. This error is reported if the time difference between two edges on PHA, PHB is lower than a predefined value. This predefined value is configurable and corresponds to (TC_BMR.MAXFILT + 1) × $t_{peripheral\ clock}$ ns. After being filtered, there is no reason to have two edges closer than (TC_BMR.MAXFILT + 1) × $t_{peripheral\ clock}$ ns under normal mode of operation.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 80.22. Quadrature Error Detection



MAXFILT must be tuned according to several factors such as the peripheral clock frequency, type of rotary sensor and rotation speed to be achieved.

80.6.16.4.Position and Rotation Measurement

When TC_BMR.POSEN is set, the motor axis position is processed on channel 0 (by means of the PHA, PHB edge detections) and the number of motor revolutions are recorded on channel 1 if the IDX signal is provided on the TIOB1 input. If no IDX signal is available, the internal counter can be cleared for each revolution if the number of counts per revolution is configured in TC_RC0.RC and the TC_CMR.CPCTRG bit is written to '1'. The position measurement can be read in the TC_CV0 register and the rotation measurement can be read in the TC_CV1 register.

Channel 0 and 1 must be configured in Capture mode (TC_CMR0.WAVE = 0). 'Rising edge' must be selected as the External Trigger Edge (TC_CMR.ETRGEDG = 0x01) and 'TIOAx' must be selected as the External Trigger (TC_CMR.ABETRG = 0x1). The process must be started by configuring TC_CCR.CLKEN and TC_CCR.SWTRG.

In parallel, the number of edges are accumulated on TC channel 0 and can be read on the TC_CV0 register.

Therefore, the accurate position can be read on both TC_CV registers and concatenated to form a 32-bit word.

The TC channel 0 is cleared for each increment of IDX count value.

Depending on the quadrature signals, the direction is decoded and allows to count up or down in TC channels 0 and 1. The direction status is reported on TC_QISR.

© 2025 Microchip Technology Inc. and its subsidiaries

80.6.16.5.Speed Measurement

When TC_BMR.SPEEDEN is set, the speed measure is enabled on channel 0.

A time base must be defined on channel 2 by writing the TC_RC2 period register. Channel 2 must be configured in Waveform mode (WAVE bit set) in TC_CMR2. The WAVSEL field must be defined with 0x10 to clear the counter by comparison and matching with TC_RC value. Field ACPC must be defined at 0x11 to toggle TIOAx output.

This time base is automatically fed back to TIOAx of channel 0 when QDEN and SPEEDEN are set.

Channel 0 must be configured in Capture mode (WAVE = 0 in TC_CMR0). TC_CMR0.ABETRG must be configured at 1 to select TIOAx as a trigger for this channel.

EDGTRG must be set to 0x01, to clear the counter on a rising edge of the TIOAx signal and field LDRA must be set accordingly to 0x01, to load TC_RA0 at the same time as the counter is cleared (LDRB must be set to 0x01). As a consequence, at the end of each time base period the differentiation required for the speed calculation is performed.

The process must be started by configuring bits CLKEN and SWTRG in the TC_CCR.

The speed can be read on field RA in TC_RA0.

Channel 1 can still be used to count the number of revolutions of the motor.

80.6.16.6.Detecting a Missing Index Pulse

To detect a missing index pulse due contamination, dust, etc., the TC_SR0.CPCS flag can be used. It is also possible to assert the interrupt line if the TC_SR0.CPCS flag is enabled as a source of the interrupt by writing a '1' to TC_IER0.CPCS.

The TC_RC0.RC field must be written with the nominal number of counts per revolution provided by the rotary encoder, plus a margin to eliminate potential noise (ex: if the nominal count per revolution is 1024, then TC_RC0.RC=1026).

If the index pulse is missing, the timer value is not cleared and the nominal value is exceeded, then the comparator on the RC triggers an event, TC_SR0.CPCS=1, and the interrupt line is asserted if TC_IER0.CPCS=1.

The missing index pulse detection is only valid if the bit TC_QISR.DIRCHG=0.

80.6.16.7.Detecting a Badly Located Index

The digital filter reduces effects of dust, scratches or contamination on the index line. If the contamination creates a pulse surpassing the filter capacity (in particular at low speed), this can be interpreted as an index pulse, even if it is badly placed.

An on-the-fly detection of a badly-placed index is enabled when TC_BMR.BIDXCE=1. TC_RC0.RC must be written with the nominal number of counts per revolution provided by the rotary encoder + 2. For example, if the nominal count per revolution is 1024, then TC_RC0.RC=1026. This margin of 2 eliminates potential noise.

If the pulse is processed while the current value of the counter (TC_CV0) is outside the value programmed in TC_RC0.RC ±2, the TC_SR0.LDRAS flag is written to '1' and the location of the pulse is written in TC_RA0.

This detection circuitry does not prevent a rotary encoder integrity check before use.

80.6.16.8.Detecting Contamination/Dust at Rotary Encoder Low Speed

The contamination/dust that can be filtered when the rotary encoder speed is high may not be filtered at low speed, thus creating unsollicited direction change, etc.

At low speed, even a minor contamination may appear as a long pulse, and thus not filtered and processed as a standard quadrature encoder pulse.

This contamination can be detected by using the similar method as the missing index detection.

© 2025 Microchip Technology Inc. and its subsidiaries

A contamination exists on a phase line if TC_SR.CPCS = 1 and TC_QISR.DIRCHG = 1 when there is no sollicited change of direction.

80.6.16.9.Missing Pulse Detection and Autocorrection

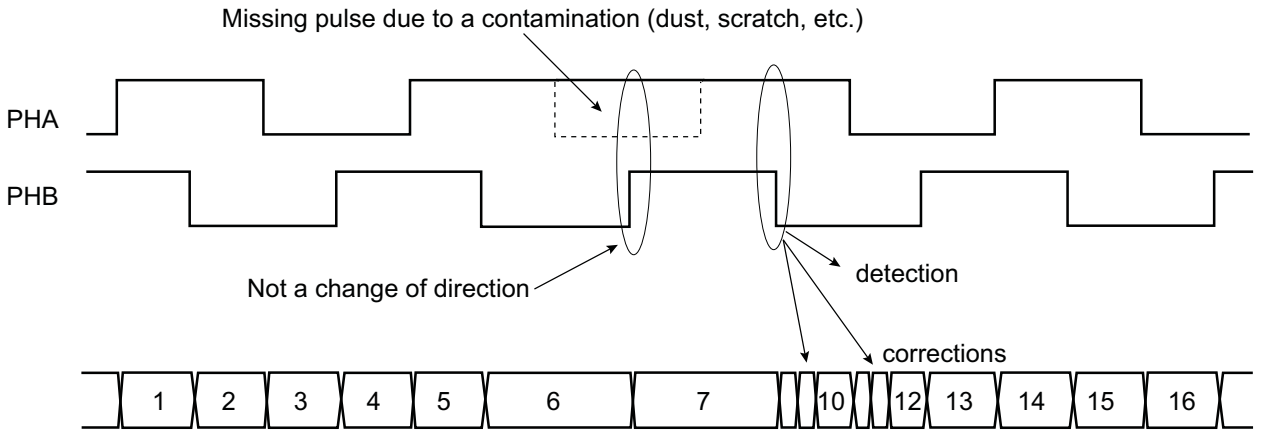
The QDEC is equipped with a circuitry which detects and corrects some errors that may result from contamination on optical disks or other materials producing the quadrature phase signals.

The detection and autocorrection only works if the Count mode is configured for both phases (EDGPHA = 1 in TC_BMR) and is enabled (AUTOC = 1 in TC_BMR).

If a pulse is missing on a phase signal, it is automatically detected and the pulse count reported in the CV field of the TC_CV0/1 is automatically corrected.

There is no detection if both phase signals are affected at the same location on the device providing the quadrature signals because the detection requires a valid phase signal to detect the contamination on the other phase signal.

Figure 80.23. Detection and Autocorrection of Missing Pulses



If a quadrature device is undamaged, the number of pulses counted for a predefined period of time must be the same with or without detection and autocorrection feature.

Therefore, if the measurement results differ, a contamination exists on the device producing the quadrature signals.

This does not substitute the measurements of the number of pulses between two index pulses (if available) but provides a complementary method to detect damaged quadrature devices.

When the device providing quadrature signals is severely damaged, potentially leading to a number of consecutive missing pulses greater than 1, the downstream processing may be affected. It is possible to define the maximum admissible number of consecutive missing pulses before issuing a Missing Pulse Error flag (MPE in TC_QISR). The threshold triggering an MPE flag report can be configured in TC_BMR.MAXCMP. If the field MAXCMP is cleared, MPE never rises. The flag MAXCMP can trigger an interrupt while the QDEC is operating, thus providing a real time report of a potential problem on the quadrature device.

80.6.16.10.Report of Filtered Pulses due to Contamination/Dust

When the digital filter removes pulses created by contamination/dust, a report is provided in the TC QDEC Interrupt Status Register. A separate flag is provided for each line (PHA, PHB, Index) and one flag is provided when a missing pulse is corrected (a ‘1’ must be written to TC_BMR.AUTOC). If TC_QISR.FPHA=1, a pulse has been filtered on PHA line. If TC_QISR.FPHB=1, a pulse has been filtered on PHB line. If TC_QISR.FIDX=1, a pulse has been filtered on Index line. If TC_QISR.FMP=1, a missing pulse has been corrected by the missing pulse detection logic.

© 2025 Microchip Technology Inc. and its subsidiaries

The on-the-fly detection and associated flags can be used to anticipate further effects of contamination/dust, in particular if the flag is written to '1' when the rotary encoder speed is high. This may cause abnormal behavior when the rotary encoder slows down if the abnormal pulse is no longer filtered (surpassing digital filter capabilities).

This detection circuitry does not prevent rotary encoder integrity check before use.

80.6.17. 2-bit Gray Up/Down Counter for Stepper Motor

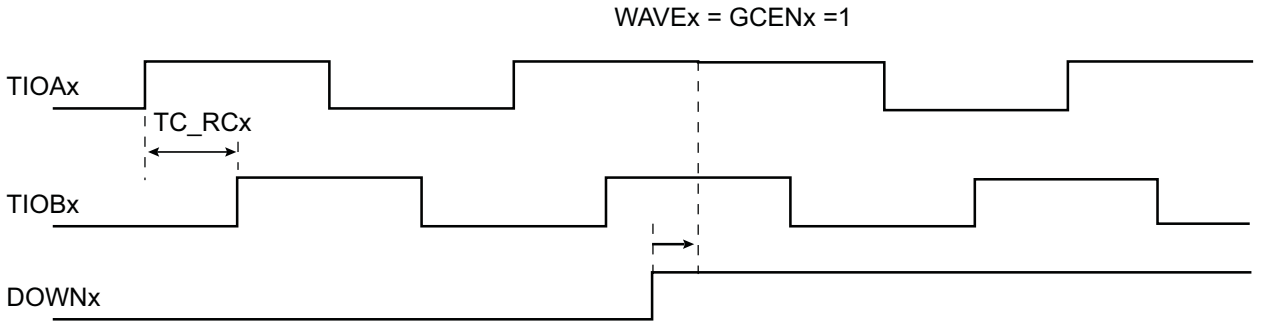
Each channel can be independently configured to generate a 2-bit Gray count waveform on corresponding TIOAx, TIOBx outputs by means of TC_SMMRx.GCEN.

Up or Down count can be defined by writing TC_SMMRx.DOWN.

It is mandatory to configure the channel in Waveform mode in the TC_CMR.

The period of the counters can be programmed in TC_RCx.

Figure 80.24. 2-bit Gray Up/Down Counter



80.6.18. Fault Mode

At any time, the TC_RCx registers can be used to perform a comparison on the respective current channel counter value (TC_CVx) with the value of TC_RCx register.

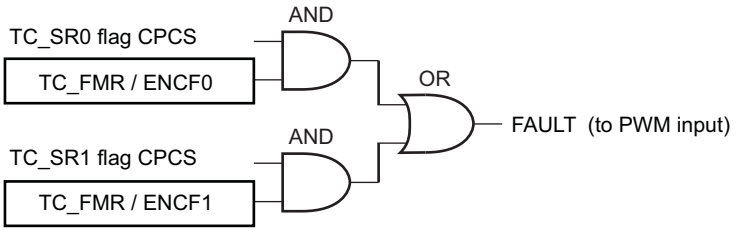
The CPCSx flags can be set accordingly and an interrupt can be generated.

This interrupt is processed but requires an unpredictable amount of time to be achieve the required action.

It is possible to trigger the FAULT output of the TIMER1 with CPCS from TC_SR0 and/or CPCS from TC_SR1. Each source can be independently enabled/disabled in the TC_FMR.

This can be useful to detect an overflow on speed and/or position when QDEC is processed and to act immediately by using the FAULT output.

Figure 80.25. Fault Output Generation



80.6.19. Register Write Protection

To prevent any single software error from corrupting TC behavior, certain registers in the address space can be write-protected by setting the WPEN bit , WPITEN (Write Protection Interrupt Enable),

© 2025 Microchip Technology Inc. and its subsidiaries

and/or WPCREN (Write Protection Control Enable) in the TC Write Protection Mode Register (TC_WPMR).

If a write access to the protected registers is detected, the WPVS flag in the "TC Safety Status Register" (TC_SSRx) is set and the field WPVSRC indicates the register in which the write access has been attempted.

The Timer Counter clock of the first channel must be enabled to access TC_WPMR.

The following registers can be write-protected when WPEN is set:

- TC Block Mode Register
- TC Channel Mode Register Capture Mode
- TC Channel Mode Register Waveform Mode
- TC Fault Mode Register
- TC Stepper Motor Mode Register
- TC Register A
- TC Register B
- TC Register C
- TC Extended Mode Register

The following registers can be write-protected when WPITEN is set:

- TC Interrupt Enable Register
- TC Interrupt Disable Register
- TC QDEC Interrupt Enable Register
- TC QDEC Interrupt Disable Register

The following register can be write-protected when WPCREN is set:

- TC Channel Control Register
- TC Block Control Register

80.6.20. Security and Safety Analysis and Reports

Several type of checks are performed when a TC channel is enabled.

The peripheral clock of the TC is monitored by a specific circuitry to detect abnormal waveforms on the internal clock net that may affect the behavior of the TDES. Corruption on the triggering edge of the clock or a pulse with a minimum duration may be identified. If the flag TC_SSRx.CGD is set, an abnormal condition occurred on the internal clock net. This flag is not set under normal operating conditions.

The internal counter of a TC channel is also monitored and if an abnormal state is detected, the flag TC_SSRx.SEQE is set. This flag cannot be set under normal operating conditions.

The software accesses to the TC are monitored and if an incorrect access is performed, the flag TC_SSRx.SWE is set. The type of incorrect/abnormal software access is reported in TC_SSRx.SWETYP (see TC_CSRx for details). As an example, when the TC channel is configured in Capture mode, reading TC_RAx when TC_SRx.LDRAS=0 asserts the SWE flags. TC_SSR.ECLASS is an indicator reporting the criticality of the SWETYP report.

The flags CGD, SEQE, SWE, WPVS are automatically cleared when TC_SSRx is read.

If one of these flags is set, the flag TC_SRx.SECE is set and triggers an interrupt if the TC_IMRx.SECE bit is ‘1’. SECE is cleared by reading TC_SRx.

Bit	7	6	5	4	3	2	1	0
						SWTRG	CLKDIS	CLKEN
Access						W	W	W
Reset						–	–	–

Bit 2 – SWTRG Software Trigger Command

Value	Description
0	No effect.
1	A software trigger is performed: the counter is reset and the clock is started.

Bit 1 – CLKDIS Counter Clock Disable Command

Value	Description
0	No effect.
1	Disables the clock.

Bit 0 – CLKEN Counter Clock Enable Command

Value	Description
0	No effect.
1	Enables the clock if CLKDIS is not 1.

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 22:20 – SBSMPLR[2:0] Loading Edge Subsampling Ratio

Value	Name	Description
0	ONE	Load a Capture register each selected edge.
1	HALF	Load a Capture register every 2 selected edges.
2	FOURTH	Load a Capture register every 4 selected edges.
3	EIGHTH	Load a Capture register every 8 selected edges.
4	SIXTEENTH	Load a Capture register every 16 selected edges.

Bits 19:18 – LDRB[1:0] RB Loading Edge Selection

Value	Name	Description
0	NONE	None
1	RISING	Rising edge of TIOAx
2	FALLING	Falling edge of TIOAx
3	EDGE	Each edge of TIOAx

Bits 17:16 – LDRA[1:0] RA Loading Edge Selection

Value	Name	Description
0	NONE	None
1	RISING	Rising edge of TIOAx
2	FALLING	Falling edge of TIOAx
3	EDGE	Each edge of TIOAx

Bit 15 – WAVE Waveform Mode

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Capture mode is enabled.
1	Capture mode is disabled (Waveform mode is enabled).

Bit 14 – CPCTRG RC Compare Trigger Enable

Value	Description
0	RC Compare has no effect on the counter and its clock.
1	RC Compare resets the counter and starts the counter clock.

Bit 10 – ABETRG TIOAx or TIOBx External Trigger Selection

Value	Description
0	TIOBx is used as an external trigger.
1	TIOAx is used as an external trigger.

Bits 9:8 – ETRGEDG[1:0] External Trigger Edge Selection

Value	Name	Description
0	NONE	The clock is not gated by an external signal.
1	RISING	Rising edge
2	FALLING	Falling edge
3	EDGE	Each edge

Bit 7 – LDBDIS Counter Clock Disable with RB Loading

Value	Description
0	Counter clock is not disabled when RB loading occurs.
1	Counter clock is disabled when RB loading occurs.

Bit 6 – LDBSTOP Counter Clock Stopped with RB Loading

Value	Description
0	Counter clock is not stopped when RB loading occurs.
1	Counter clock is stopped when RB loading occurs.

Bits 5:4 – BURST[1:0] Burst Signal Selection

Value	Name	Description
0	NONE	The clock is not gated by an external signal.
1	XC0	XC0 is ANDed with the selected clock.
2	XC1	XC1 is ANDed with the selected clock.
3	XC2	XC2 is ANDed with the selected clock.

Bit 3 – CLKI Clock Invert

Value	Description
0	Counter is incremented on rising edge of the clock.
1	Counter is incremented on falling edge of the clock.

Bits 2:0 – TCCLKS[2:0] Clock Selection
To operate at maximum peripheral clock frequency, see TC_EMRx.

Value	Name	Description
0	TIMER_CLOCK1	Clock selected: internal GCLK [TC_ID] clock signal (from PMC)
1	TIMER_CLOCK2	Clock selected: internal MCK0/8 clock signal (from PMC)
2	TIMER_CLOCK3	Clock selected: internal MCK0/32 clock signal (from PMC)
3	TIMER_CLOCK4	Clock selected: internal MCK0/128 clock signal (from PMC)

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
4	TIMER_CLOCK5	Clock selected: internal TD_SLCK clock signal (from PMC)
5	XC0	Clock selected: XC0
6	XC1	Clock selected: XC1
7	XC2	Clock selected: XC2

0	NONE	None
1	SET	Set
2	CLEAR	Clear
3	TOGGLE	Toggle

Bit 15 – WAVE Waveform Mode

Value	Description
0	Waveform mode is disabled (Capture mode is enabled).
1	Waveform mode is enabled.

Bits 14:13 – WAVSEL[1:0] Waveform Selection

Value	Name	Description
0	UP	UP mode without automatic trigger on RC Compare
1	UPDOWN	UPDOWN mode without automatic trigger on RC Compare
2	UP_RC	UP mode with automatic trigger on RC Compare
3	UPDOWN_RC	UPDOWN mode with automatic trigger on RC Compare

Bit 12 – ENETRG External Event Trigger Enable

Whatever the value programmed in ENETRG, the selected external event only controls the TIOAx output and TIOBx if not used as input (trigger event input or other input used).

Value	Description
0	The external event has no effect on the counter and its clock.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
1	The external event resets the counter and starts the counter clock.

Bits 11:10 – EEVT[1:0] External Event Selection
Signal selected as external event.

Value	Name	Description	TIOB Direction
0	TIOB	TIOB	Input
1	XC0	XC0	Output
2	XC1	XC1	Output
3	XC2	XC2	Output

Note: If TIOB is chosen as the external event signal, it is configured as an input and no longer generates waveforms and subsequently no IRQs.

Bits 9:8 – EEVTEDG[1:0] External Event Edge Selection

Value	Name	Description
0	NONE	None
1	RISING	Rising edge
2	FALLING	Falling edge
3	EDGE	Each edge

Bit 7 – CPCDIS Counter Clock Disable with RC Compare

Value	Description
0	Counter clock is not disabled when counter reaches RC.
1	Counter clock is disabled when counter reaches RC.

Bit 6 – CPCSTOP Counter Clock Stopped with RC Compare

Value	Description
0	Counter clock is not stopped when counter reaches RC.
1	Counter clock is stopped when counter reaches RC.

Bits 5:4 – BURST[1:0] Burst Signal Selection

Value	Name	Description
0	NONE	The clock is not gated by an external signal.
1	XC0	XC0 is ANDed with the selected clock.
2	XC1	XC1 is ANDed with the selected clock.
3	XC2	XC2 is ANDed with the selected clock.

Bit 3 – CLKI Clock Invert

Value	Description
0	Counter is incremented on rising edge of the clock.
1	Counter is incremented on falling edge of the clock.

Bits 2:0 – TCCLKS[2:0] Clock Selection
To operate at maximum peripheral clock frequency, see TC_EMRx.

Value	Name	Description
0	TIMER_CLOCK1	Clock selected: internal GCLK [TC_ID] clock signal (from PMC)
1	TIMER_CLOCK2	Clock selected: internal MCK0/8 clock signal (from PMC)
2	TIMER_CLOCK3	Clock selected: internal MCK0/32 clock signal (from PMC)
3	TIMER_CLOCK4	Clock selected: internal MCK0/128 clock signal (from PMC)
4	TIMER_CLOCK5	Clock selected: internal TD_SLCK clock signal (from PMC)

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
5	XC0	Clock selected: XC0
6	XC1	Clock selected: XC1
7	XC2	Clock selected: XC2

© 2025 Microchip Technology Inc. and its subsidiaries

80.7.4. TC Stepper Motor Mode Register

Name: TC_SMMRx
Offset: 0x08 + x*0x40 [x=0..2]
Reset: 0x00000000
Property: R/W

This register can only be written if the WPEN bit is cleared in the TC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
							DOWN	GCEN
Access							R/W	R/W
Reset							0	0

Bit 1 – DOWN Down Count

Value	Description
0	Up counter.
1	Down counter.

Bit 0 – GCEN Gray Count Enable

Value	Description
0	TIOAx [x=0..2] and TIOBx [x=0..2] are driven by internal counter of channel x.
1	TIOAx [x=0..2] and TIOBx [x=0..2] are driven by a 2-bit Gray counter.

© 2025 Microchip Technology Inc. and its subsidiaries

80.7.5. TC Register AB

Name: TC_RABx
Offset: 0x0C + x*0x40 [x=0..2]
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	RAB[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	RAB[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	RAB[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	RAB[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – RAB[31:0] Register A or Register B
RAB contains the next unread capture Register A or Register B value in real time. It is usually read by the DMA after a request due to a valid load edge on TIOAx.
When DMA is used, the RAB register address must be configured as source address of the transfer.

© 2025 Microchip Technology Inc. and its subsidiaries

80.7.6. TC Counter Value Register

Name: TC_CVx
Offset: 0x10 + x*0x40 [x=0..2]
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	CV[31:24]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	CV[23:16]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	CV[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	CV[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – CV[31:0] Counter Value
CV contains the counter value in real time.

Important:
For 16-bit channels, the CV field size is limited to register bits 15:0.

© 2025 Microchip Technology Inc. and its subsidiaries

80.7.7. TC Register A

Name: TC_RAx
Offset: 0x14 + x*0x40 [x=0..2]
Reset: 0x00000000
Property: Read/Write

This register has access Read-only if TC_CMRx.WAVE = 0, Read/Write if TC_CMRx.WAVE = 1.
This register can only be written if the WPEN bit is cleared in the TC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	RA[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	RA[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	RA[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	RA[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – RA[31:0] Register A
RA contains the Register A value in real time.

© 2025 Microchip Technology Inc. and its subsidiaries

80.7.8. TC Register B

Name: TC_RBx
Offset: 0x18 + x*0x40 [x=0..2]
Reset: 0x00000000
Property: Read/Write

This register has access Read-only if TC_CMRx.WAVE = 0, Read/Write if TC_CMRx.WAVE = 1.
This register can only be written if the WPEN bit is cleared in the TC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	RB[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	RB[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	RB[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	RB[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – RB[31:0] Register B
RB contains the Register B value in real time.

© 2025 Microchip Technology Inc. and its subsidiaries

80.7.9. TC Register C

Name: TC_RCx
Offset: 0x1C + x*0x40 [x=0..2]
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the TC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
	RC[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	RC[23:16]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	RC[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	RC[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – RC[31:0] Register C
RC contains the Register C value in real time.

© 2025 Microchip Technology Inc. and its subsidiaries

80.7.10. TC Interrupt Status Register

Name: TC_SRx
Offset: 0x20 + x*0x40 [x=0..2]
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
						MTIOB	MTIOA	CLKSTA
Access						R	R	R
Reset						0	0	0

Bit	15	14	13	12	11	10	9	8
								SECE
Access								R
Reset								0

Bit	7	6	5	4	3	2	1	0
	ETRGS	LDRBS	LDRAS	CPCS	CPBS	CPAS	LOVRS	COVFS
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit 18 – MTIOB TIOBx Mirror

Value	Description
0	TIOBx is low. If TC_CMRx.WAVE = 0, TIOBx pin is low. If TC_CMRx.WAVE = 1, TIOBx is driven low.
1	TIOBx is high. If TC_CMRx.WAVE = 0, TIOBx pin is high. If TC_CMRx.WAVE = 1, TIOBx is driven high.

Bit 17 – MTIOA TIOAx Mirror

Value	Description
0	TIOAx is low. If TC_CMRx.WAVE = 0, TIOAx pin is low. If TC_CMRx.WAVE = 1, TIOAx is driven low.
1	TIOAx is high. If TC_CMRx.WAVE = 0, TIOAx pin is high. If TC_CMRx.WAVE = 1, TIOAx is driven high.

Bit 16 – CLKSTA Clock Enabling Status

Value	Description
0	The clock is disabled.
1	The clock is enabled.

Bit 8 – SECE Security and/or Safety Event (cleared on read)

Value	Description
0	No security or safety event occurred.
1	One or more safety or security event occurred since the last read of TC_SRx. For details on the event, see TC_SSRx.

Bit 7 – ETRGS External Trigger Status (cleared on read)

Value	Description
0	External trigger has not occurred since the last read of the Status register.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
1	External trigger has occurred since the last read of the Status register.

Bit 6 – LDRBS RB Loading Status (cleared on read)

Value	Description
0	RB Load has not occurred since the last read of the Status register or TC_CMRx.WAVE = 1.
1	RB Load has occurred since the last read of the Status register, if TC_CMRx.WAVE = 0.

Bit 5 – LDRAS RA Loading Status (cleared on read)

Value	Description
0	RA Load has not occurred since the last read of the Status register or TC_CMRx.WAVE = 1.
1	RA Load has occurred since the last read of the Status register, if TC_CMRx.WAVE = 0.

Bit 4 – CPCS RC Compare Status (cleared on read)

Value	Description
0	RC Compare has not occurred since the last read of the Status register.
1	RC Compare has occurred since the last read of the Status register.

Bit 3 – CPBS RB Compare Status (cleared on read)

Value	Description
0	RB Compare has not occurred since the last read of the Status register or TC_CMRx.WAVE = 0.
1	RB Compare has occurred since the last read of the Status register, if TC_CMRx.WAVE = 1.

Bit 2 – CPAS RA Compare Status (cleared on read)

Value	Description
0	RA Compare has not occurred since the last read of the Status register or TC_CMRx.WAVE = 0.
1	RA Compare has occurred since the last read of the Status register, if TC_CMRx.WAVE = 1.

Bit 1 – LOVRS Load Overrun Status (cleared on read)

Value	Description
0	Load overrun has not occurred since the last read of the Status register or TC_CMRx.WAVE = 1.
1	RA or RB have been loaded at least twice without any read of the corresponding register since the last read of the Status register, if TC_CMRx.WAVE = 0.

Bit 0 – COVFS Counter Overflow Status (cleared on read)

Value	Description
0	No counter overflow has occurred since the last read of the Status register.
1	A counter overflow has occurred since the last read of the Status register.

© 2025 Microchip Technology Inc. and its subsidiaries

80.7.11. TC Interrupt Enable Register

Name: TC_IERx
Offset: 0x24 + x*0x40 [x=0..2]
Reset: –
Property: Write-only

This register can only be written if the WPITEN bit is cleared in the TC Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Enables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16

80.7.12. TC Interrupt Disable Register

Name: TC_IDRx
Offset: 0x28 + x*0x40 [x=0..2]
Reset: –
Property: Write-only

This register can only be written if the WPITEN bit is cleared in the TC Write Protection Mode Register.

The following configuration values are valid for all listed bit names of this register:

0: No effect.

1: Disables the corresponding interrupt.

Bit	31	30	29	28	27	26	25	24

Bit 7 – ETRGS External Trigger

Bit 6 – LDRBS RB Loading

Bit 5 – LDRAS RA Loading

Bit 4 – CPCS RC Compare

Bit 3 – CPBS RB Compare

Bit 2 – CPAS RA Compare

Bit 1 – LOVRS Load Overrun

Bit 0 – COVFS Counter Overflow

© 2025 Microchip Technology Inc. and its subsidiaries

80.7.14. TC Extended Mode Register

Name: TC_EMRx
Offset: 0x30 + x*0x40 [x=0..2]
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the TC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Bit	15	14	13	12	11	10	9	8
Access								R/W
Reset								0

Bit	7	6	5	4	3	2	1	0
Access			R/W	R/W			R/W	R/W
Reset			0	0			0	0

Bit 8 – NODIVCLK No Divided Clock

Value	Description
0	The selected clock is defined by field TCCLKS in TC_CMRx.
1	The selected clock is peripheral clock and TCCLKS field (TC_CMRx) has no effect.

Bits 5:4 – TRIGSRCB[1:0] Trigger Source for Input B

Value	Name	Description
0	EXTERNAL_TIOBx	The trigger/capture input B is driven by external pin TIOBx
1	PWMx	For TC0: The trigger/capture input B is driven internally by the comparator output (see Synchronization with PWM) of the PWMx.

Bits 1:0 – TRIGSRCA[1:0] Trigger Source for Input A

Value	Name	Description
0	EXTERNAL_TIOAx	The trigger/capture input A is driven by external pin TIOAx
1	PWMx	For TC0: The trigger/capture input A is driven internally by PWMx. For TC1.TIOA1, TC1.TIOA2: The trigger/capture input A is driven internally by the GTSUCOMP signal of the Ethernet MAC (GMAC).

© 2025 Microchip Technology Inc. and its subsidiaries

80.7.15. TC Channel Status Register

Name: TC_CSRx
Offset: 0x34 + x*0x40 [x=0..2]
Reset: 0x00000000
Property: Read-only

Note: The flags in this register are a copy of the similar flags in the TC_SRx register. Reading the TC_CSRx does not perform a clear-on-read of TC_SRx flags.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
						MTIOB	MTIOA	CLKSTA
Access						R	R	R
Reset						0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
Access								
Reset								

Bit 18 – MTIOB TIOBx Mirror

Value	Description
0	TIOBx is low. If TC_CMRx.WAVE = 0, TIOBx is low. If TC_CMRx.WAVE = 1, TIOBx is driven low.
1	TIOBx is high. If TC_CMRx.WAVE = 0, TIOBx is high. If TC_CMRx.WAVE = 1, TIOBx is driven high.

Bit 17 – MTIOA TIOAx Mirror

Value	Description
0	TIOAx is low. If TC_CMRx.WAVE = 0, TIOAx is low. If TC_CMRx.WAVE = 1, TIOAx is driven low.
1	TIOAx is high. If TC_CMRx.WAVE = 0, TIOAx is high. If TC_CMRx.WAVE = 1, TIOAx is driven high.

Bit 16 – CLKSTA Clock Enabling Status

Value	Description
0	Clock is disabled.
1	Clock is enabled.

© 2025 Microchip Technology Inc. and its subsidiaries

80.7.16. TC Safety Status Register

Name: TC_SSRx
Offset: 0x38 + x*0x40 [x=0..2]
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	ECLASS				SWETYP[3:0]			
Access	R				R	R	R	R
Reset	0				0	0	0	0

Bit	23	22	21	20	19	18	17	16
	WPVSRC[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	WPVSRC[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
					SWE	SEQE	CGD	WPVS
Access					R	R	R	R
Reset					0	0	0	0

Bit 31 – ECLASS Software Error Class

Value	Name	Description
0	WARNING	An abnormal access that does not have any impact.
1	ERROR	An abnormal access that may have an impact.

Bits 27:24 – SWETYP[3:0] Software Error Type (cleared on read)

Value	Name	Description
0	READ_WO	TC Channel x is enabled and a write-only register has been read (Warning).
1	WRITE_RO	TC Channel x is enabled and a write access has been performed on a read-only register (Warning).
2	UNDEF_RW	Access to an undefined address of the TC (Warning).
3	W_RARB_CAPT	TC_RAx or TC_RBx are written while channel is enabled and configured in capture mode (Error).

Bits 23:8 – WPVSRC[15:0] Write Protection Violation Source (cleared on read)
When WPVS = 1, WPVSRC indicates the register address offset at which a write access has been attempted.

Bit 3 – SWE Software Control Error (cleared on read)

Value	Description
0	No software error has occurred since the last read of TC_SSRx.
1	A software error has occurred since the last read of TC_SSRx. The field SWETYP details the type of software error encountered.

Bit 2 – SEQE Internal Sequencer Error (cleared on read)

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No internal counter error has occurred since the last read of TC_SSRx. In normal operating conditions, SEQE is cleared.
1	An internal counter error has occurred since the last read of TC_SSRx. This flag can be set only under abnormal operating conditions resulting in clock glitch, etc. The detection is enabled if TC_CSRx.CLKSTA=1, TC_CMRx.WAVE=1, TC_CMRx.CPCTRG=1 and flag is set if TC_CVx > TC_RCx.

Bit 1 – CGD Clock Glitch Detected (cleared on read)

Value	Description
0	The clock monitoring has not been corrupted since the last read of TC_SSRx.
1	The clock monitoring has been corrupted since the last read of TC_SSRx. This flag can be set under abnormal operating conditions.

Bit 0 – WPVS Write Protection Violation Status (cleared on read)

Value	Description
0	No write protection violation has occurred since the last read of TC_SSRx.
1	A write protection violation has occurred since the last read of TC_SSRx. If this violation is an unauthorized attempt to write a protected register, the associated violation is reported into field WPVSRC.

80.7.17. TC Block Control Register

Name: TC_BCR
Offset: 0xC0
Reset: –
Property: Write-only

This register can only be written if the WPCREN bit is cleared in the TC Write Protection Mode Register.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
								SYNC
Access								W
Reset								–

Bit 0 – SYNC Synchro Command

Value	Description
0	No effect.
1	Asserts the SYNC signal which generates a software trigger simultaneously for each of the channels.

© 2025 Microchip Technology Inc. and its subsidiaries

80.7.18. TC Block Mode Register

Name: TC_BMR
Offset: 0xC4
Reset: 0x00000000
Property: Read/Write

This register can only be written if the WPEN bit is cleared in the TC Write Protection Mode Register.

The External Clock Signal x Selection (TCxXCxS) bit field mentions pin names of the first Timer Counter module (TC0). For any subsequent instances, the signal numbering increments. For example, "TCLK3-TCLK5", "TIOA3-TIOA5" and "TIOB3-TIOB5" are the external I/O pins of the second Timer Counter module (TC1).

Bit	31	30	29	28	27	26	25	24
			MAXCMP[3:0]				MAXFILT[5:4]	
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bits 29:26 – MAXCMP[3:0] Maximum Consecutive Missing Pulses

Value	Description
0	The flag MPE in TC_QISR never rises.
1–15	Defines the number of consecutive missing pulses before a flag report.

Bits 25:20 – MAXFILT[5:0] Maximum Filter

Pulses with a period shorter than MAXFILT+1 peripheral clock cycles are discarded. For more details on MAXFILT constraints, see Input Preprocessing.

Value	Description
1–63	Defines the filtering capabilities.

Bit 18 – AUTOC AutoCorrection of Missing Pulses

Value	Name	Description
0	DISABLED	The detection and autocorrection function is disabled.
1	ENABLED	The detection and autocorrection function is enabled.

Bit 17 – IDXPHB Index Pin is PHB Pin

Value	Description
0	IDX pin of the rotary sensor must drive TIOA1.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
1	IDX pin of the rotary sensor must drive TIOB0.

Bit 16 – SWAP Swap PHA and PHB

Value	Description
0	No swap between PHA and PHB.
1	Swap PHA and PHB internally, prior to driving the QDEC.

Bit 15 – INVIDX Inverted Index

Value	Description
0	IDX (TIOA1) is directly driving the QDEC.
1	IDX is inverted before driving the QDEC.

Bit 14 – INVB Inverted PHB

Value	Description
0	PHB (TIOB0) is directly driving the QDEC.
1	PHB is inverted before driving the QDEC.

Bit 13 – INVA Inverted PHA

Value	Description
0	PHA (TIOA0) is directly driving the QDEC.
1	PHA is inverted before driving the QDEC.

Bit 12 – EDGPHA Edge on PHA Count Mode

Value	Description
0	Edges are detected on PHA only.
1	Edges are detected on both PHA and PHB.

Bit 11 – QDTRANS Quadrature Decoding Transparent

Value	Description
0	Full quadrature decoding logic is active (direction change detected).
1	Quadrature decoding logic is inactive (direction change inactive) but input filtering and edge detection are performed.

Bit 10 – SPEEDEN Speed Enabled

Value	Description
0	Disabled.
1	Enables the speed measure on channel 0, the time base being provided by channel 2.

Bit 9 – POSEN Position Enabled

Value	Description
0	Disable position.
1	Enables the position measure on channel 0 and 1.

Bit 8 – QDEN Quadrature Decoder Enabled

Quadrature decoding (direction change) can be disabled using QDTRANS bit.
One of the POSEN or SPEEDEN bits must be also enabled.

Value	Description
0	Disabled.
1	Enables the QDEC (filter, edge detection and quadrature decoding).

© 2025 Microchip Technology Inc. and its subsidiaries

Bits 5:4 – TC2XC2S[1:0] External Clock Signal 2 (XC2) Selection
See Clock Selection for more details.

Value	Name	Description
0	TCLK2	Signal connected to XC2: TCLK2
1	–	Reserved
2	TIOA0	Signal connected to XC2: internal TIOA0 for chaining
3	TIOA1	Signal connected to XC2: internal TIOA1 for chaining

Bits 3:2 – TC1XC1S[1:0] External Clock Signal 1 (XC1) Selection
See Clock Selection for more details.

Value	Name	Description
0	TCLK1	Signal connected to XC1: TCLK1
1	–	Reserved
2	TIOA0	Signal connected to XC1: internal TIOA0 for chaining
3	TIOA2	Signal connected to XC1: internal TIOA2 for chaining

Bits 1:0 – TC0XC0S[1:0] External Clock Signal 0 (XC0) Selection
See Clock Selection for more details.

Value	Name	Description
0	TCLK0	Signal connected to XC0: TCLK0
1	–	Reserved
2	TIOA1	Signal connected to XC0: internal TIOA1 for chaining
3	TIOA2	Signal connected to XC0: internal TIOA2 for chaining

Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit 7 – FMP Filtered Missing Pulse

Value	Description
0	No effect.
1	Enables the interrupt when phase A or phase B has a corrected missing pulse.

Bit 6 – FIDX Filtered Index Line

Value	Description
0	No effect.
1	Enables the interrupt when index line has a filtered contamination.

Bit 5 – FPHB Filtered Phase B Line

Value	Description
0	No effect.
1	Enables the interrupt when phase B line has a filtered contamination.

Bit 4 – FPHA Filtered Phase A Line

Value	Description
0	No effect.
1	Enables the interrupt when phase A line has a filtered contamination.

Bit 3 – MPE Consecutive Missing Pulse Error

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	Enables the interrupt when an occurrence of MAXCMP consecutive missing pulses is detected.

Bit 2 – QERR Quadrature Error

Value	Description
0	No effect.
1	Enables the interrupt when a quadrature error occurs on PHA, PHB.

Bit 1 – DIRCHG Direction Change

Value	Description
0	No effect.
1	Enables the interrupt when a change on rotation direction is detected.

Bit 0 – IDX Index

Value	Description
0	No effect.
1	Enables the interrupt when a rising edge occurs on IDX input.

Reset	–	–	–	–	–	–	–	–

Bit 7 – FMP Filtered Missing Pulse

Value	Description
0	No effect.
1	Disables the interrupt when phase A or phase B has a corrected missing pulse.

Bit 6 – FIDX Filtered Index Line

Value	Description
0	No effect.
1	Disables the interrupt when index line has a filtered contamination.

Bit 5 – FPHB Filtered Phase B Line

Value	Description
0	No effect.
1	Disables the interrupt when phase B line has a filtered contamination.

Bit 4 – FPHA Filtered Phase A Line

Value	Description
0	No effect.
1	Disables the interrupt when phase A line has a filtered contamination.

Bit 3 – MPE Consecutive Missing Pulse Error

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	Disables the interrupt when an occurrence of MAXCMP consecutive missing pulses has been detected.

Bit 2 – QERR Quadrature Error

Value	Description
0	No effect.
1	Disables the interrupt when a quadrature error occurs on PHA, PHB.

Bit 1 – DIRCHG Direction Change

Value	Description
0	No effect.
1	Disables the interrupt when a change on rotation direction is detected.

Bit 0 – IDX Index

Value	Description
0	No effect.
1	Disables the interrupt when a rising edge occurs on IDX input.

Reset	0	0	0	0	0	0	0	0

Bit 7 – FMP Filtered Missing Pulse

Value	Description
0	The interrupt on auto-corrected missing pulse is disabled.
1	The interrupt on auto-corrected missing pulse is enabled.

Bit 6 – FIDX Filtered Index Line

Value	Description
0	The interrupt on index line filtered contamination is disabled.
1	The interrupt on index line filtered contamination is enabled.

Bit 5 – FPHB Filtered Phase B Line

Value	Description
0	The interrupt on phase B line filtered contamination is disabled.
1	The interrupt on phase B line filtered contamination is enabled.

Bit 4 – FPHA Filtered Phase A Line

Value	Description
0	The interrupt on phase A line filtered contamination is disabled.
1	The interrupt on phase A line filtered contamination is enabled.

Bit 3 – MPE Consecutive Missing Pulse Error

Value	Description
0	The interrupt on the maximum number of consecutive missing pulses specified in MAXCMP is disabled.
1	The interrupt on the maximum number of consecutive missing pulses specified in MAXCMP is enabled.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 2 – QERR Quadrature Error

Value	Description
0	The interrupt on quadrature error is disabled.
1	The interrupt on quadrature error is enabled.

Bit 1 – DIRCHG Direction Change

Value	Description
0	The interrupt on rotation direction change is disabled.
1	The interrupt on rotation direction change is enabled.

Bit 0 – IDX Index

Value	Description
0	The interrupt on IDX input is disabled.
1	The interrupt on IDX input is enabled.

Reset	0	0	0	0	0	0	0	0

Bit 8 – DIR Direction
Returns an image of the current rotation direction.

Bit 7 – FMP Filtered Missing Pulse

Value	Description
0	No correction of missing pulse on phase A or B lines occurred since the last read of TC_QISR.
1	A correction of missing pulse on phase A or B lines occurred since the last read of TC_QISR.

Bit 6 – FIDX Filtered Index Line

Value	Description
0	No filtered contamination on index line since the last read of TC_QISR.
1	A contamination has been successfully on index line since the last read of TC_QISR.

Bit 5 – FPHB Filtered Phase B Line

Value	Description
0	No filtered contamination on phase B line since the last read of TC_QISR.
1	A contamination has been successfully on phase B line since the last read of TC_QISR.

Bit 4 – FPHA Filtered Phase A Line

Value	Description
0	No filtered contamination on phase A line since the last read of TC_QISR.
1	A contamination has been successfully on phase A line since the last read of TC_QISR.

Bit 3 – MPE Consecutive Missing Pulse Error

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	The number of consecutive missing pulses has not reached the maximum value specified in MAXCMP since the last read of TC_QISR.
1	An occurrence of MAXCMP consecutive missing pulses has been detected since the last read of TC_QISR.

Bit 2 – QERR Quadrature Error

Value	Description
0	No quadrature error since the last read of TC_QISR.
1	A quadrature error occurred since the last read of TC_QISR.

Bit 1 – DIRCHG Direction Change

Value	Description
0	No change on rotation direction since the last read of TC_QISR.
1	The rotation direction changed since the last read of TC_QISR.

Bit 0 – IDX Index

Value	Description
0	No Index input change since the last read of TC_QISR.
1	The IDX input has changed since the last read of TC_QISR.

				FIRSTE		WPCREN	WPITEN	WPEN
Access				R/W		R/W	R/W	R/W
Reset				0		0	0	0

Bits 31:8 – WPKEY[23:0] Write Protection Key

Value	Name	Description
0x54494D	PASSWD	Writing any other value in this field aborts the write operation of the WPEN bit. Always reads as 0.

Bit 4 – FIRSTE First Error Report Enable

Value	Description
0	The last write protection violation source is reported in TC_SSRx.WPVSRC and the last software control error type is reported in TC_SSRx.SWETYP. The TC_SRx.SECE flag is set at the first error occurrence within a series.
1	Only the first write protection violation source is reported in TC_SSRx.WPVSRC and only the first software control error type is reported in TC_SSRx.SWETYP. The TC_SRx.SECE flag is set at the first error occurrence within a series.

Bit 2 – WPCREN Write Protection Control Enable

Value	Description
0	Disables the write protection on control register if WPKEY corresponds to 0x54494D (“TIM” in ASCII).
1	Enables the write protection on control register if WPKEY corresponds to 0x54494D (“TIM” in ASCII).

Bit 1 – WPITEN Write Protection Interrupt Enable

Value	Description
0	Disables the write protection on interrupt registers if WPKEY corresponds to 0x54494D (“TIM” in ASCII).
1	Enables the write protection on interrupt registers if WPKEY corresponds to 0x54494D (“TIM” in ASCII).

Bit 0 – WPEN Write Protection Enable
The Timer Counter clock of the first channel must be enabled to access this register.

© 2025 Microchip Technology Inc. and its subsidiaries

See Register Write Protection for a list of registers that can be write-protected and Timer Counter clock conditions.

Value	Description
0	Disables the write protection if WPKEY corresponds to 0x54494D (“TIM” in ASCII).
1	Enables the write protection if WPKEY corresponds to 0x54494D (“TIM” in ASCII).

USB Subsystem

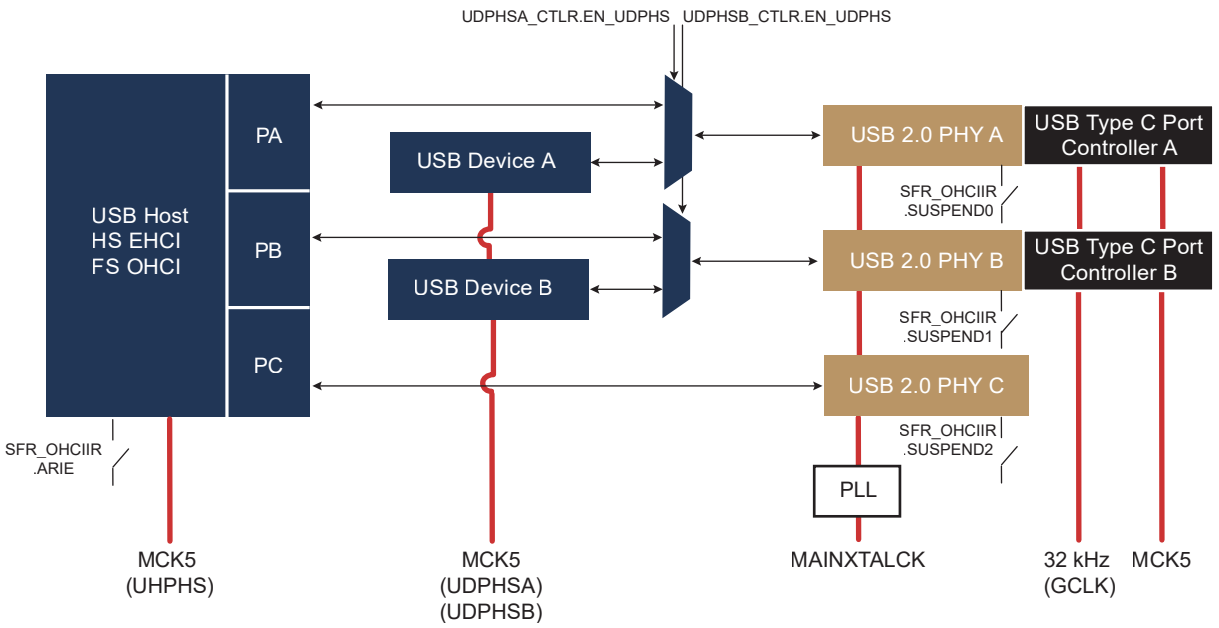
81. Overview

81.1. Components

- 1x high-speed host (EHCI) and one full-speed host (OHCI) with three ports (PA, PB and PC) (UHPHS)
- 2x high-speed devices (Device A and Device B) shared with PA and PB (UDPHS)
- 3x USB 2.0 PHYs
- 2x USB Type-C Port Controller (TCPC)

81.2. Block Diagram

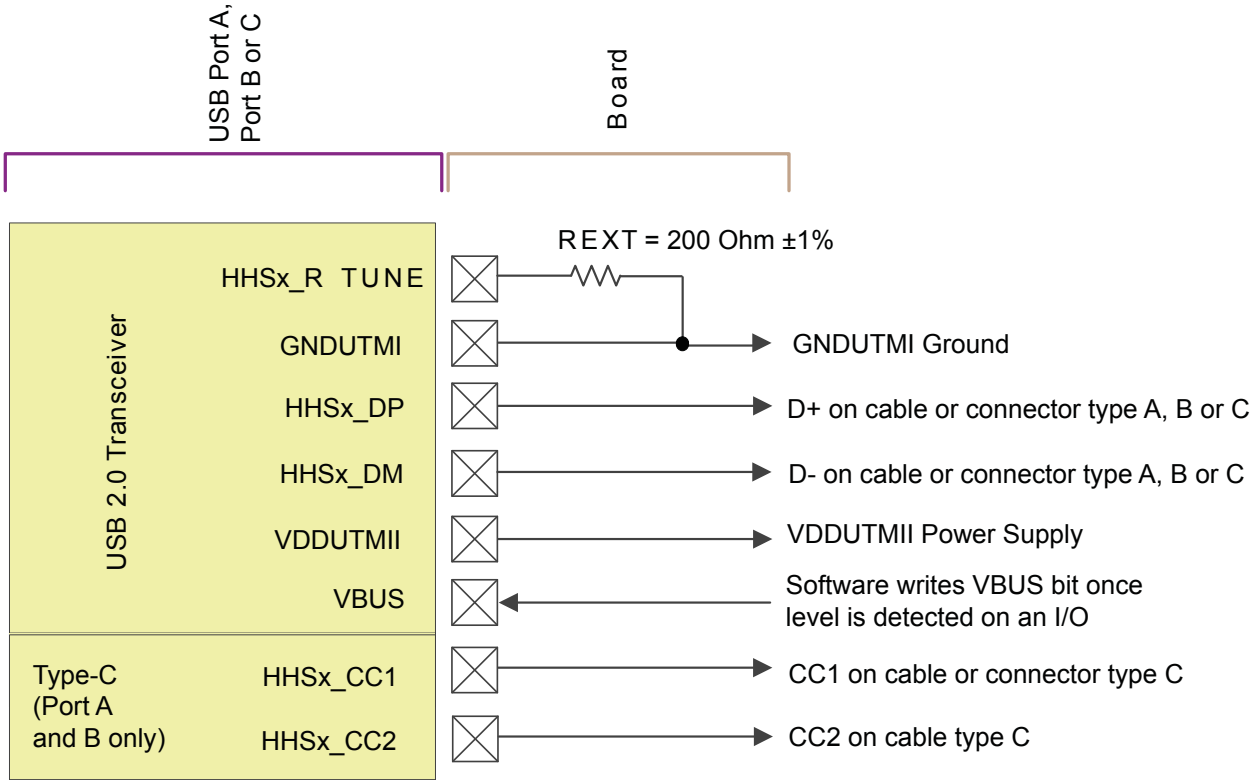
Figure 81.1. USB Subsystem Block Diagram



© 2025 Microchip Technology Inc. and its subsidiaries

81.3. Typical Connection

Figure 81.2. USB Typical Connection



81.4. Product Dependencies

81.4.1. Clocks

To generate USB frequencies with high accuracy, the device embeds a dedicated USB PLL.

81.4.2. Interrupts

Refer to the table Peripheral Identifiers.

81.4.3. Reset

USB peripherals are connected to the processor and peripherals reset line.

81.4.4. I/Os

USB I/Os are dedicated I/Os powered by VDDIN33/GND.

81.5. Special Functions in SFR/SFRBU

- SFR_OHCIICR.SUSPENDx to control suspend for each port. These bits must be set to reduce power consumption on VDDUTMII in Low-power mode.
- SFR_OHCIICR.ARIE to enable OHCI asynchronous resume interrupt
- SFR_OHCIISR.RISx for Port Resume status of each port

© 2025 Microchip Technology Inc. and its subsidiaries

82. USB Type-C™ Port Controller (TCPC)

82.1. Reference Documents

Table 82.1. Reference Documents

Owner - Reference	Title
USB Implementers Forum, Inc.	Battery Charging Specification Revision 1.2 December 7, 2010
USB 3.0 Promoter Group	Universal Serial Bus Type-C™ Port Controller Interface Specification Revision 1.0, Version 1.2 November 2016
USB 3.0 Promoter Group	Universal Serial Bus Type-C Cable and Connector Specification Revision 1.2 March 25, 2016

82.2. Description

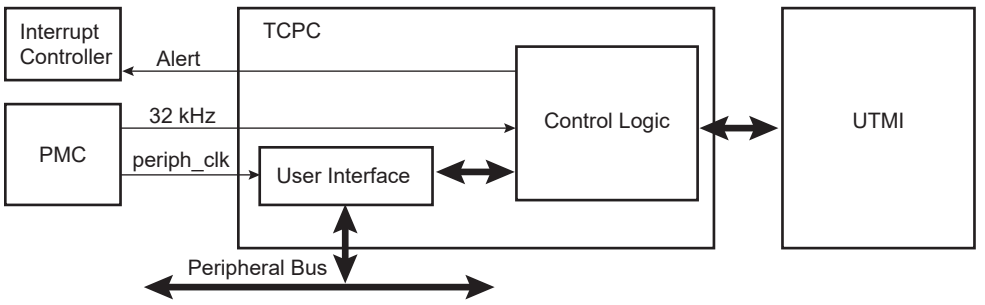
The USB Type-C™ Port Controller (TCPC) provides a low-level interface to the USB Battery Charging and USB Type-C PHY. It also features a register set compliant with the Universal Serial Bus Type-C™ Port Controller Interface Specification, with an access to these registers that enables a software implementation of the Universal Serial Bus Type-C™ Port Controller Interface Specification. See Reference Documents.

82.3. Embedded Characteristics

- Battery Charging Source Type Detection
- Accessory Charger Adaptor Detection
- Type-C Cable Connection Detection
- Type-C Power Source Advertising 5V, 500 mA/1.5A/3.0A
- Type-C Power Capability Detection 5V, 500 mA/1.5A/3.0A
- Enables USB.org Compliant Software Implementation of USB2.0 TCPC

82.4. Block Diagram

Figure 82.1. TCPC Block Diagram



© 2025 Microchip Technology Inc. and its subsidiaries

82.5. Product Dependencies

82.5.1. Power Management

The TCPC may be clocked through the Power Management Controller (PMC), thus the programmer must first configure the PMC to enable the TCPC peripheral clock (periph_clk) and the TCPC 32 kHz generic clock (GCLK).

82.5.2. Interrupt Sources

The TCPC has an interrupt line connected to the interrupt controller. Handling the TCPC interrupt requires programming the interrupt controller before configuring the TCPC.

82.6. Functional Description

The TCPC provides access to the USB PHY for the software implementation of the Universal Serial Bus Type-C™ Port Controller Interface Specification and the Battery Charging Specification.

82.6.1. Battery Charging

The Battery Charging Specification defines the charger detection hardware to be controlled.

The features defined in the Battery Charging Specification can be controlled using TCPC_UPC and the resulting outputs can be observed in TCPC_UPS as shown in the table and figure that follow.

Table 82.2. Battery Charging Specification to USB PHY Mapping

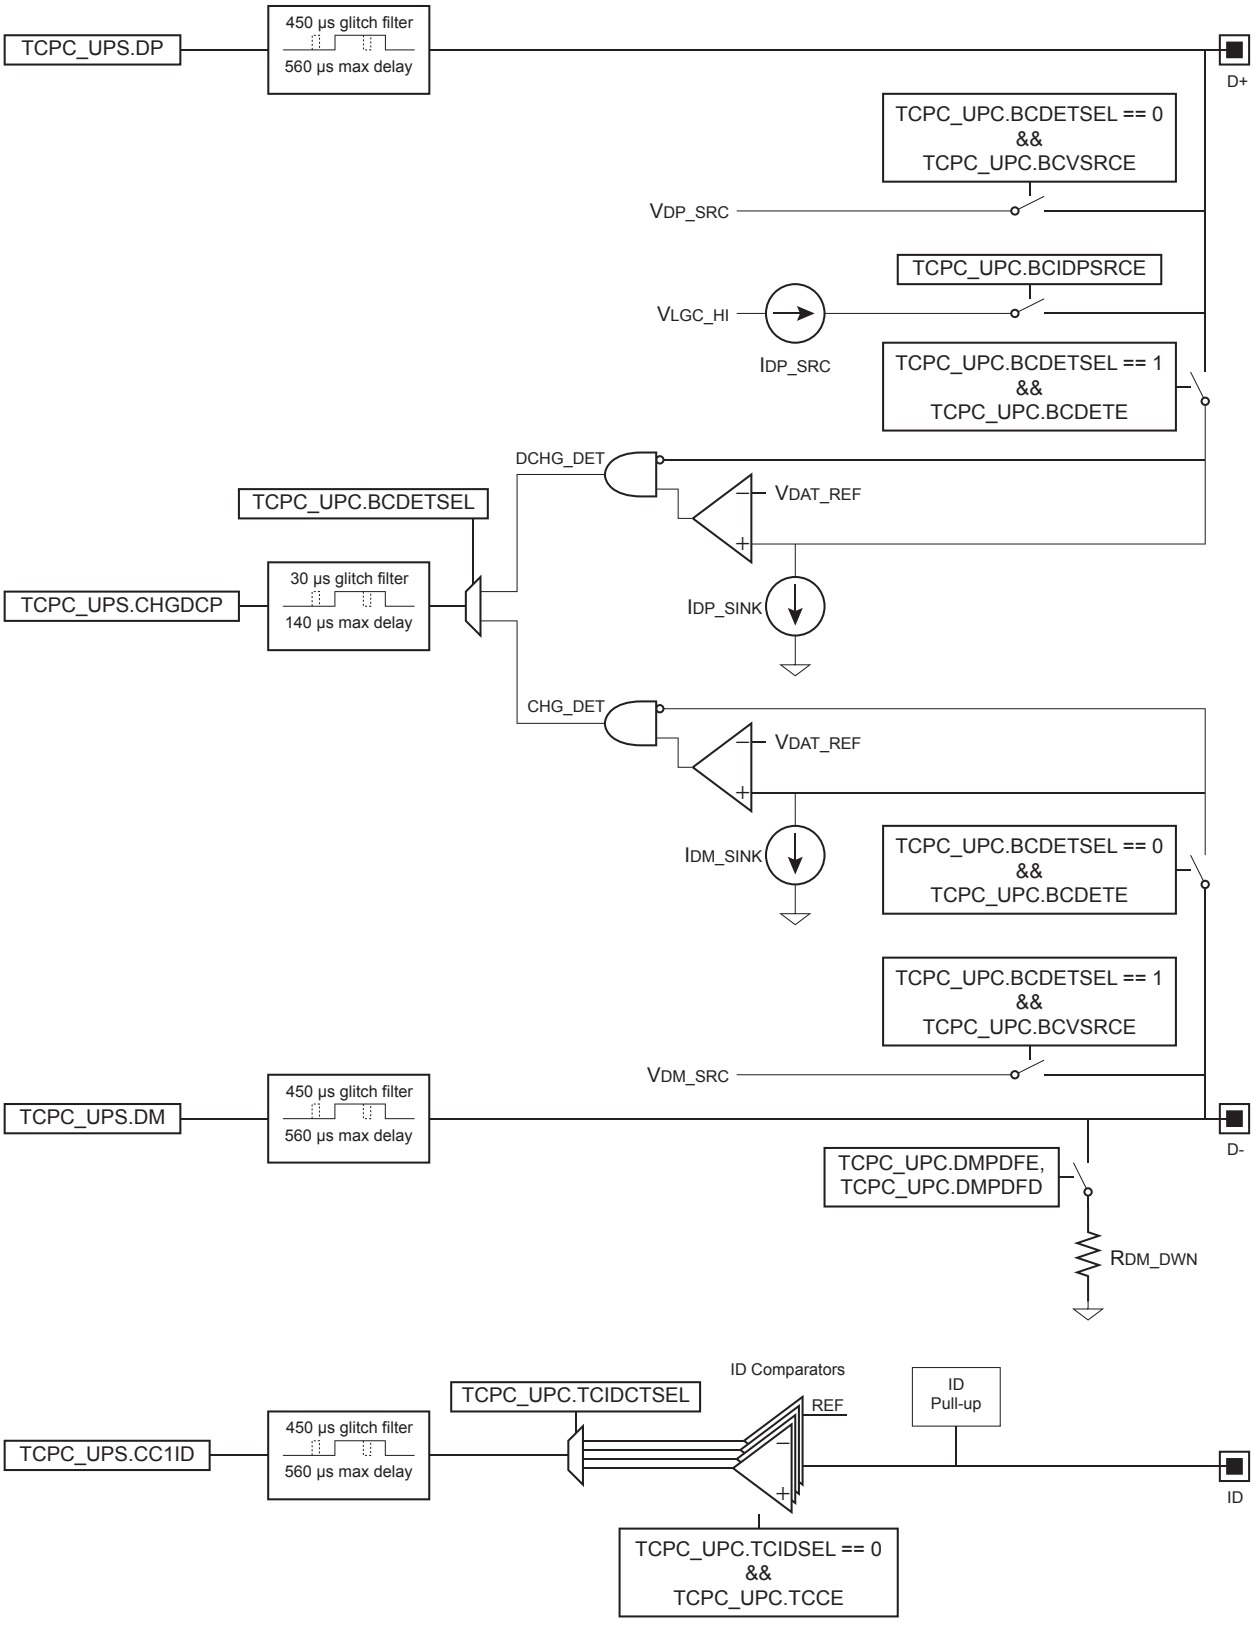
Battery Charging Specification Reference	TCPC Register Field
Data Contact Detect I_{DP_SRC} Current Source Enable	TCPC_UPC.BCIDPSRCE
Data Contact Detect R_{DM_DWN} Pull-Down Control	Force activation: TCPC_UPC.DMPDFE Force deactivation: TCPC_UPC.DMPDFD
Primary Detection or Secondary Detection	Select detection type: TCPC_UPC.BCDETSEL
Primary / Secondary Detection V_{DP_SRC} / V_{DM_SRC} Voltage Source Enable	TCPC_UPC.BCVSRCE
Primary / Secondary Detection CHG_DET / DCHG_DET(1) Comparator Enable	TCPC_UPC.BCDETE
Primary / Secondary Detection CHG_DET / DCHG_DET(1) Comparator Output	TCPC_UPS.CHGDCP
ACA Detection Enable	TCPC_UPC.TCCE, TCPC_UPC.TCIDSEL
ACA Detection ID Comparators Selection	TCPC_UPC.TCIDCTSEL
ACA Detection ID Comparators Output	TCPC_UPS.CC1ID
Data Contact Detect/ACA-Dock Primary Detection D+ line state	TCPC_UPS.DP
ACA-A FS B-device/LS B-device Determining D- line State	TCPC_UPS.DM

Note:

1. In the Battery Charging Specification, DCHG_DET indicates DCP_DET comparator output in a Portable Device (PD) and indicates PRTBL_DET comparator output in a Charging Downstream Port (CDP).

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 82.2. Charger Detection Hardware



© 2025 Microchip Technology Inc. and its subsidiaries

After any software change in the Control register (TCPC_UPC) or after any change on the USB ID, D+ or D- lines state, the charger detection outputs in the Status register (TCPC_UPS) may not be valid before an update delay, as shown in the Max Delay Update column of the table below.

These update delays must be respected after any TCPC_UPC software change when implementing the Data Contact Detect, Primary / Secondary Detection and ACA Detection of the “Charger Detection Algorithms” specified in the Battery Charging Specification.

Changes to TCPC_UPS register bits are filtered to avoid USB ID, D+ or D- lines state glitches propagation. The maximum glitch duration that is always filtered is shown in the Min Glitch Filtering column in the table below.

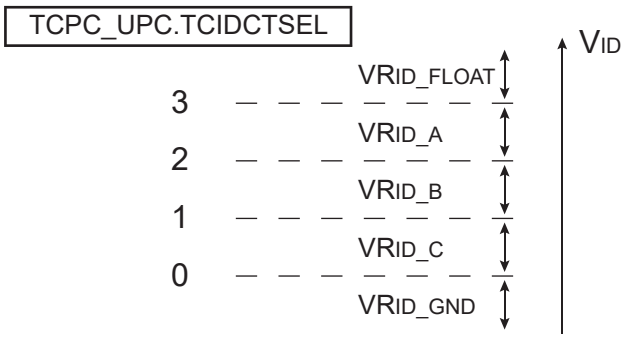
Any longer filtering or debouncing, such as during the t_{DCD_DBNC} time for the D+ or ID lines as specified in the Battery Charging Specification (see Reference Documents), must be performed by periodically sampling TCPC_UPS.

Table 82.3. TCPC_UPS Glitch Filtering Times

TCPC_UPS Bit	Max Delay Update	Min Glitch Filtering
TCPC_UPS.DP	560 µs	450 µs
TCPC_UPS.DM	560 µs	450 µs
TCPC_UPS.CC1ID	560 µs	450 µs
TCPC_UPS.CHGDCP	140 µs	30 µs

Each of the five possible values of R_{ID} specified in the Battery Charging Specification corresponds to one of the respective VR_{ID} voltage values shown in the figure below.

Figure 82.3. TCPC_UPC.TCIDCTSEL Values of ID Voltage Thresholds to Identify R_{ID}



For the purpose of ACA detection, the R_{ID} value can be determined by the following example procedure:

1. Set TCPC_UPC.TCCE to 1, TCPC_UPC.TCIDSEL to 0 and TCPC_UPC.TCIDCTSEL to 2.
2. Wait for 560 µs.
   a. If the TCPC_UPS.CC1ID comparator output is read at 1, set TCPC_UPC.TCIDCTSEL to 3 and proceed to step 3.
   b. If the TCPC_UPS.CC1ID comparator output is read at 0, set TCPC_UPC.TCIDCTSEL to 1 and proceed to step 4.
3. Wait for 560 µs.
   a. If the TCPC_UPS.CC1ID comparator output is read at 1, R_{ID} value is R_{ID_FLOAT}.
   b. If the TCPC_UPS.CC1ID comparator output is read at 0, R_{ID} value is R_{ID_A}.
4. Wait for 560 µs.
   a. If the TCPC_UPS.CC1ID comparator output is read at 1, R_{ID} value is R_{ID_B}.

© 2025 Microchip Technology Inc. and its subsidiaries

b. If the TCPC_UPS.CC1ID comparator output is read at 0, R_{ID} value is R_{ID_C}.

Note: Only one TCPC_UPC write is required at each of the two first steps.

Any other sequence to determine R_{ID} among the five possible values is permitted at any time as long as the following conditions are fulfilled:

- TCP_UPS.CC1ID delay update is respected.
- TCPC_UPC.TCCE is set to 1.
- TCPC_UPC.TCIDSEL is set to 0.

82.6.2. USB Type-C

The TCPC enables a software implementation of the USB Type-C CC Control and sensing and of the USB Type-C Power Control for V_{BUS} as defined in the Universal Serial Bus Type-C™ Port Controller Interface Specification. The TCPC provides both a user interface compatible with the programmer model of the USB Type-C Port Controller and a direct access to the Configuration Channel (CC) hardware. V_{BUS} detection and control hardware is available through the PIO controller externally to the TCPC.

The Configuration Channel (CC) used in the discovery and configuration of connections across a USB Type-C cable is further defined in the Universal Serial Bus Type-C™ Port Controller Interface Specification.

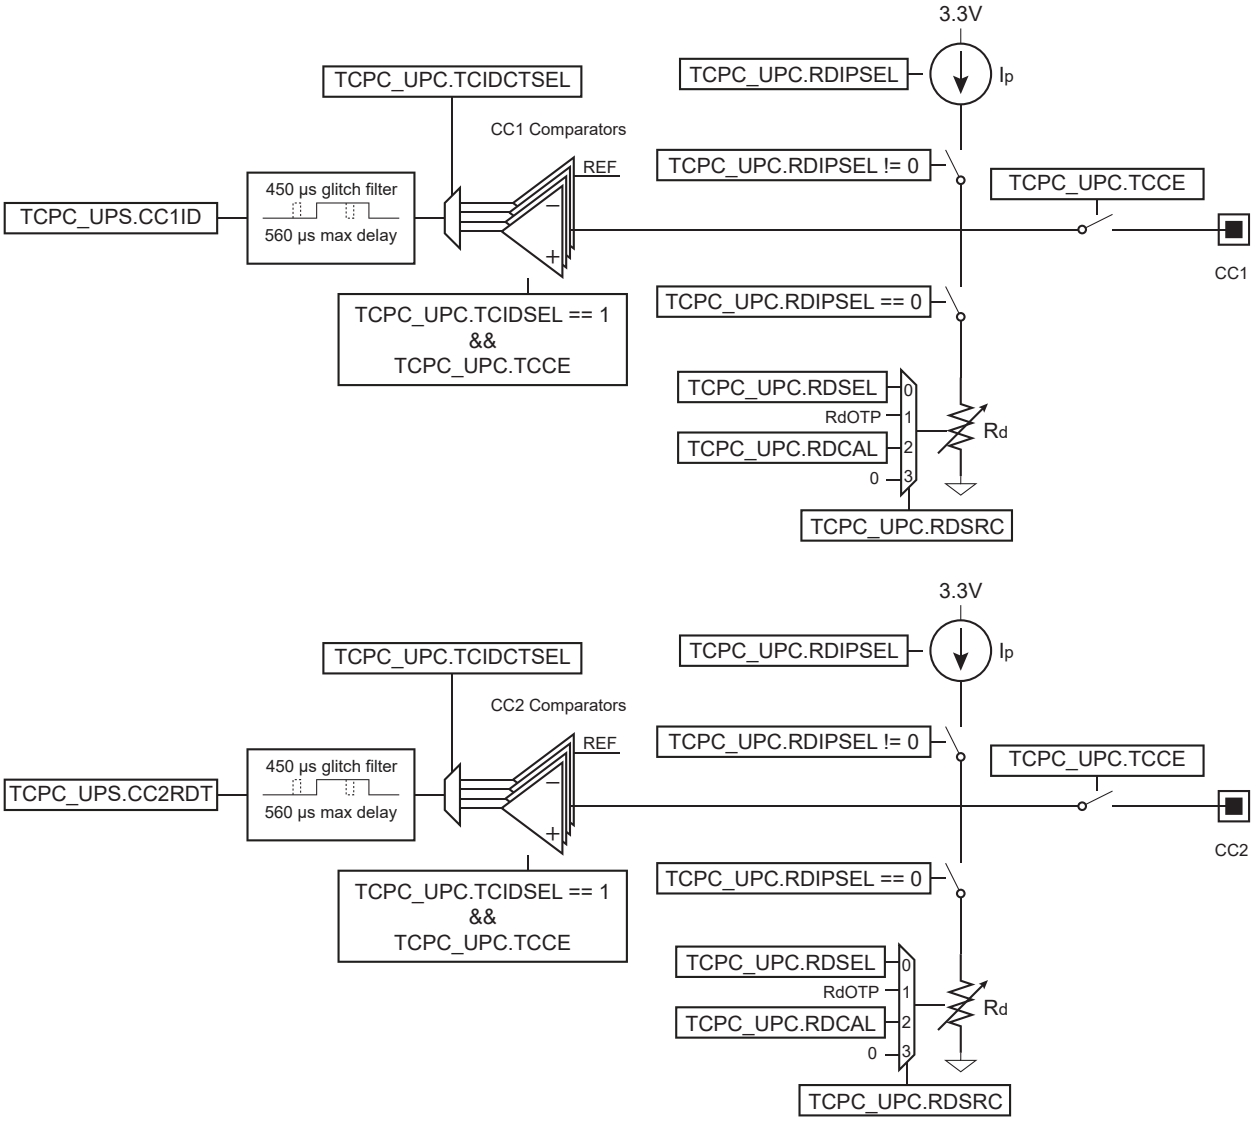
The Configuration Channel (CC) hardware can be controlled by TCPC_UPC, and the resulting outputs can be observed in TCPC_UPS, as shown in the table and figure that follow.

Table 82.4. Configuration Channel (CC) Hardware to USB PHY Mapping

Configuration Channel Hardware	TCPC Register Field
CC Pull-Up Rp	TCPC_UPC.RDIPSEL
CC Pull-Down Rd	TCPC_UPC.RDIPSEL, TCPC_UPC.RDSRC, TCPC_UPC.RDSEL, TCPC_UPC.RDTRME
CC Status Comparator And Phy Enable	TCPC_UPC.TCCE, TCPC_UPC.TCIDSEL
CC Status Comparator Threshold	TCPC_UPC.TCIDCTSEL
CC Status Comparator Outputs	TCPC_UPS.CC2RDT

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 82.4. Configuration Channel (CC) Hardware



The Rd pull-down resistor value can be set from three alternate sources selected via the TCPC_UPC.RDSRC field:

- Software configuration in TCPC_UPC.RDSEL
- OTP controller hardware configuration outputs
- Live comparison of the USB PHY calibration outputs to the programmed calibration voltages references in TCPC_CALVREF

If the software configuration in TCPC_UPC.RDSEL is selected, then prior to operating the TCPC, a two- or three-step procedure is needed to trim the Rd pull-down:

1. Set TCPC_UPC.TCCE to 1, TCPC_UPC.TCIDSEL to 1, TCPC_UPC.TCIDCTSEL to 2, TCPC_UPC.RDTRME to 1 and TCPC_UPC.RDSEL to 2.
2. Wait for 560 µs.
   a. If the TCPC_UPS.CC2RDT comparator output is read at 1, set TCPC_UPC.RDSEL to 1, reset TCPC_UPC.RDTRME to 0 and exit the trimming sequence.

© 2025 Microchip Technology Inc. and its subsidiaries

b. If the TCPC_UPS.CC2RDT comparator output is read at 0, set TCPC_UPC.TCIDCTSEL to 0 while keeping TCPC_UPC.RDSEL at 2 and proceed to step 3.

3. Wait for 560 µs.
   a. If the TCPC_UPS.CC2RDT comparator output is read at 1, keep TCPC_UPC.RDSEL at 2 and reset TCPC_UPC.RDTRME to 0.
   b. If the TCPC_UPS.CC2RDT comparator output is read at 0, set TCPC_UPC.RDSEL to 3 and reset TCPC_UPC.RDTRME to 0.

   Note: Only one TCPC_UPC write is required at each of the three above steps.

After any software change in TCPC_UPC or after any change on the CC1 or CC2 pins, the CC comparator outputs in TCPC_UPS.CC1ID and TCPC_UPS.CC2RDT are not valid before some update delay as shown in the Max Delay Update column of the table below.

These update delays must be respected after any TCPC_UPC software change when implementing the CC control and sensing as specified by the Universal Serial Bus Type-C™ Port Controller Interface Specification.

The CC comparator outputs in TCPC_UPS.CC1ID and TCPC_UPS.CC2RDT are debounced by a glitch filter rejecting any pulse of $t_{TCPCfilter}$ = 450 µs or less as shown in the Min Glitch Filtering column of the table below.

Any longer filtering or debouncing, such as during the $t_{CCDebounce}$ time as specified in the Universal Serial Bus Type-C Cable and Connector Specification, must be performed by periodically sampling TCPC_UPS.

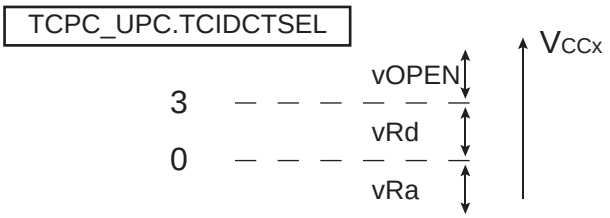
Table 82.5. TCPC_UPS Debouncing Times

TCPC_UPS Bit	Max Delay Update	Min Glitch Filtering
TCPC_UPS.CC1ID	560 µs	450 µs
TCPC_UPS.CC2RDT	560 µs	450 µs

82.6.2.1. Sink Detection at Power Source

Each of the possible values—Ra, Rd or zOPEN—for the pull-down resistor on CC1 and CC2 of the sink specified in the Universal Serial Bus Type-C Cable and Connector Specification (see Reference Documents) corresponds to one of the respective VRa, VRd or VOPEN voltage detection values at the source as shown in the figure below.

Figure 82.5. TCPC_UPC.TCIDCTSEL Values of CCx Voltage Thresholds at Source



For the purpose of connect detection at the source, the CC1 and CC2 voltage values can be determined by the following example procedure:

1. Set TCPC_UPC.RDIPSEL to the appropriate power advertising a non-zero value. Set TCPC_UPC.TCCE to 1, TCPC_UPC.TCIDSEL to 1 and TCPC_UPC.TCIDCTSEL to 3.
2. Wait for 560 µs or more.
   a. If the TCPC_UPS.CC1ID and TCPC_UPS.CC2RDT comparator outputs are equal to 11b indicating VOPEN voltage value on the CC pins, loop on step 2.
3. Wait for 450 µs.

© 2025 Microchip Technology Inc. and its subsidiaries

a. If TCPC_UPS.CC1ID and TCPC_UPS.CC2RDT are equal to the previous sampled values, loop on step 3 until $t_{CCDebounce}$ time has elapsed.

b. If TCPC_UPS.CC1ID and TCPC_UPS.CC2RDT have changed, go back to step 2.

4. Set TCPC_UPC.TCIDCTSEL to 0.
5. Wait for 560 µs.
6. For each TCPC_UPS.CC1ID and TCPC_UPS.CC2RDT that was 0 in step 3, if TCPC_UPS.CC1ID and TCPC_UPS.CC2RDT is now 1, the corresponding CCx voltage is VRd, else it is VRa..

Note: Only one TCPC_UPC write is required at steps 1 and 4.

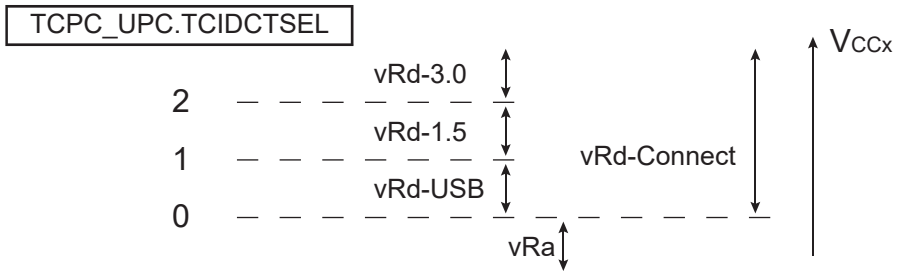
Any other sequence to determine the CC1ID and CC2RDT voltage values is permitted at any time as long as TCPC_UPS.CC1ID and TCPC_UPS.CC2RDT delay update is respected, TCPC_UPC.TCCE is set to 1 and TCPC_UPC.TCIDSEL is set to 1.

If interfacing to a Type-C Port Manager (TCPM), the software has to update the CC Status register (TCPC_CCS) using the Set Status (TCPC_SSR) and Clear Status (TCPC_CSR) registers.

82.6.2.2. Power Source Detection at Sink

As defined in the in the Universal Serial Bus Type-C Cable and Connector Specification (see Reference Documents) , four voltage ranges may be present on CC1 and CC2 when connecting a Type-C cable. These voltage ranges are shown in the figure below.

Figure 82.6. TCPC_UPC.TCIDCTSEL Values of CCx Voltage Thresholds at Sink



Once V_{BUS} has been detected with the PIO controller, the sink may require the power delivery capability of the source. For that purpose, the CC1 and CC2 voltage values can be determined by the following example procedure:

1. Set TCPC_UPC.RDIPSEL to 0, TCPC_UPC.TCCE to 1, TCPC_UPC.TCIDSEL to 1 and TCPC_UPC.TCIDCTSEL to 0.
2. Wait for 560 µs or more.
   a. If the TCPC_UPS.CC1ID and TCPC_UPS.CC2RDT comparator outputs are equal to 00b indicating VRa voltage value on the CC pins, loop on step 2.
3. Wait for 450 µs.
   a. If the TCPC_UPS.CC1ID and TCPC_UPS.CC2RDT are equal to the previous sampled values, loop on step 3 until $t_{CCDebounce}$ time has elapsed.
   b. If the TCPC_UPS.CC1ID and TCPC_UPS.CC2RDT have changed, go back to step 2.
4. set TCPC_UPC.TCIDCTSEL to 1
5. Wait for 560 µs.
   a. If the TCPC_UPS.CC1ID and TCPC_UPS.CC2RDT that was 1 at step 3 is now 0, the CCx voltage is VRd-USB. Exit the sequence.
   b. Otherwise, set TCPC_UPC.TCIDCTSEL to 2 and go to step 6.

© 2025 Microchip Technology Inc. and its subsidiaries

6. Wait for 560 µs.
   a. If the TCPC_UPS.CC1ID and TCPC_UPS.CC2RDT that was 1 at step 6 is now 0, the CCx voltage is VRd-1.5, else it is VRd-3.0.

   Note: Only one TCPC_UPC write is required at each of steps 1, 4 and 5.

Any other sequence to determine the CC1ID and CC2RDT voltage values is permitted at any time as long as TCPC_UPS.CC1ID and TCPC_UPS.CC2RDT delay update is respected, TCPC_UPC.TCCE is set to 1 and TCPC_UPC.TCIDSEL is set to 1.

If interfacing to a TCPM, the software has to update TCPC_CCS using TCPC_SSR and TCPC_CSR.

82.6.2.3. USB-Type C Port Controller Status Register Management

The TCPC software regularly polls TCPC_UPS to meet the Universal Serial Bus Type-C™ Port Controller Interface Specification CC debouncing requirements, in particular after V_{BUS} detection or driving.

TCPC_SSR and TCPC_CSR are then used for the software to change the state of the CC Status (TCPC_CCS), Power Status (TCPC_PS), Fault Status (TCPC_FS) and Alert (TCPC_AL) registers.

The TCPC Role Control (TCPC_RCTL), Fault Control (TCPC_FCTL) and Command (TCPC_CMD) registers are to be read by the software to control the USB-Type C hardware through TCPC_UPC and external controls such as V_{BUS}.

The bits in registers TCPC_CCS, TCPC_PS and TCPC_FS are set from the Set Status (TCPC_SSR) register.

The bits in registers TCPC_CCS and TCPC_PS are cleared from the Clear Status (TCPC_CSR) register.

TCPC_AL is set from the Set Alert (TCPC_SAR) register.

The bits in TCPC_FS and TCPC_AL are cleared by writing each bit in these registers to '1'. Refer to the Universal Serial Bus Type-C™ Port Controller Interface Specification (see Reference Documents).

Note that any unmasked change in TCPC_FS or TCPC_PS, or any change in TCPC_CCS also automatically sets, respectively, FLT, PWRS and CCS bits in TCPC_AL.

Setting an unmasked bit in TCPC_AL triggers the Alert interrupt to the Interrupt Controller to signal status changes to the TCPM software.

Refer to the Universal Serial Bus Type-C™ Port Controller Interface Specification and Universal Serial Bus Type-C Cable and Connector Specification (see Reference Documents) for a detailed description of the algorithms to be implemented to support the various USB Type-C features.

82.7. Register Summary

Notes:

1. Refer to the Universal Serial Bus Type-C™ Port Controller Interface Specification (see Reference Documents) for a detailed description of the registers from offsets 0x00 to 0x29.
2. 8-bit or 16-bit subaccess to the TCPC registers is permitted within 32-bit address boundaries.
3. Simultaneous multiple register access with a single 32-bit or 16-bit transfer to contiguous 16-bit or 8-bit TCPC registers is permitted within 32-bit address boundaries.

Offset	Name	Bit Pos.	7	6	5	4	3	2	1	0

82.7.7. TCPC Alert Register

Name: TCPC_AL
Offset: 0x10
Reset: 0x0000
Property: Read/Write

Bit	15	14	13	12	11	10	9	8
	VDA				VBUSSNKDS		FLT	VBUSLO
Access	R/W				R/W		R/W	R/W
Reset	0				0		0	0

Bit	7	6	5	4	3	2	1	0
	VBUSHI						PWRS	CCS
Access	R/W						R/W	R/W
Reset	0						0	0

Bit 15 – VDA Vendor Defined Alert
This bit can be cleared, regardless of the current status of the alert source.

Value	Description
0	No vendor defined alert has been detected.
1	A vendor defined alert has been detected.

Bit 11 – VBUSSNKDS VBUS Sink Disconnect Detected

Value	Description
0	No V_{BUS} sink disconnect threshold crossing has been detected.
1	A V_{BUS} sink disconnect threshold crossing has been detected.

Bit 9 – FLT Fault

Value	Description
0	No fault has occurred.
1	A fault has occurred. Read TCPC_FS.

Bit 8 – VBUSLO VBUS Voltage Alarm Low

Value	Description
0	A low-voltage alarm has not occurred.
1	A low-voltage alarm has occurred.

Bit 7 – VBUSHI VBUS Voltage Alarm High

Value	Description
0	A high-voltage alarm has not occurred.
1	A high-voltage alarm has occurred.

Bit 1 – PWRS Power Status

Value	Description
0	Power status not changed.
1	Power status changed.

Bit 0 – CCS CC Status

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	CC status not changed.
1	CC status changed.

82.7.11. TCPC Config Standard Output Register

Name: TCPC_CSO
Offset: 0x18
Reset: 0x60
Property: Read/Write

Bit	7	6	5	4	3	2	1	0
							CNX	COR
Access							R/W	R/W
Reset							0	0

Bit 1 – CNX Connection Present

Value	Description
0	No connection (default).
1	Connection.

Bit 0 – COR Connector Orientation

Value	Description
0	Normal (CC1=A5, CC2=B5, TX1=A2/A3, RX1=B10/B11) default.
1	Flipped (CC2=A5, CC1=B5, TX1=B2/B3, RX1=A10/A11).

© 2025 Microchip Technology Inc. and its subsidiaries

82.7.12. TCPC Role Control Register

Name: TCPC_RCTL
Offset: 0x1A
Reset: 0x0F
Property: Read/Write

Bit	7	6	5	4	3	2	1	0
		DRP	RP[1:0]		CC2[1:0]		CC1[1:0]	
Access		R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset		0	0	0	1	1	1	1

Bit 6 – DRP Dual Role Play

The TCPC must use the Rp value defined in the field RP when a connection is resolved, i.e., upon entry to Potential_Connect_as_Src (figure "TCPC State Diagram" in Universal Serial Bus Type-C™ Port Controller Interface Specification, see Reference Documents) before a connection.
The TCPC toggles CC1 and CC2 after receiving TCPC_CMD.Look4Connection and until a connection is detected. Upon connection, the TCPC must resolve to either an Rp or Rd and report the CC1/CC2 State in TCPC_CCS. The CC pins must stay in Potential_Connect_as_Src or Potential_Connect_as_Sink until directed otherwise.

Value	Description
0	No DRP. CC1, CC2 fields determine Rp/Rd/Ra or open settings.
1	DRP

Bits 5:4 – RP[1:0] Resistor for Power Advertising

Value	Name	Description
0	RP_DEFAULT	Rp default
1	RP_1P5A	Rp 1.5A
2	RP_3A	Rp 3.0A
3	RP_RESERVED	Reserved

Bits 3:2 – CC2[1:0] Configuration Channel 2

Value	Name	Description
0	CC2_RA	Ra
1	CC2_RP	Rp defined as in RP field
2	CC2_RD	Rd
3	CC2_OPEN	Open (Disconnect or don't care)

Bits 1:0 – CC1[1:0] Configuration Channel 1

Value	Name	Description
0	CC1_RA	Ra
1	CC1_RP	Rp defined as in RP field
2	CC1_RD	Rd
3	CC1_OPEN	Open (Disconnect or don't care)

© 2025 Microchip Technology Inc. and its subsidiaries

82.7.13. TCPC Fault Control Register

Name: TCPC_FCTL
Offset: 0x1B
Reset: 0x00
Property: Read/Write

Bit	7	6	5	4	3	2	1	0
				FRCOFVBUS		VBUSOCPF	VBUSOVPF	
Access				R/W		R/W	R/W	
Reset				0		0	0	

Bit 4 – FRCOFVBUS Force Off VBUS (Source or Sink)
This enables or disables the standard input signal Force Off V_{BUS} functionality for debug purposes.

Value	Description
0	Allows standard input signal Force Off V_{BUS} control (default).
1	Blocks standard input signal Force Off V_{BUS} control. .

Bit 2 – VBUSOCPF Internal or External OCP VBUS Over Current Protection Fault

Value	Description
0	Internal and external OCP circuit enabled.
1	Internal and external OCP circuit disabled.

Bit 1 – VBUSOVPF Internal or External OVP VBUS Over Voltage Protection Fault

Value	Description
0	Internal and external OVP circuit enabled.
1	Internal and external OVP circuit disabled.

© 2025 Microchip Technology Inc. and its subsidiaries

82.7.14. TCPC CC Status Register

Name: TCPC_CCS
Offset: 0x1D
Reset: 0x00
Property: Read-only

Bit	7	6	5	4	3	2	1	0
			LK4CNX	CONRES	CC2[1:0]		CC1[1:0]	
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bit 5 – LK4CNX Looking4Connection

Value	Description
0	TCPC is not actively looking for a connection. A transition from '1' to '0' indicates a potential connection has been found.
1	TCPC is looking for a connection (toggling as a DRP or looking for a connection as sink/source only condition).

Bit 4 – CONRES Connect Result

Value	Description
0	TCPC is presenting Rp.
1	TCPC is presenting Rd.

Bits 3:2 – CC2[1:0] CC2 State
If (TCPC_RCTL.CC2=Rp) or (ConnectResult=0):

Value	Name	Description
0	CC2_SRC_OPEN	SRC.Open (Open, Rp)
1	CC2_SRC_RA	SRC.Ra (below maximum VRa)
2	CC2_SRC_RD	SRC.Rd (within the VRd range)
3	CC2_SRC_RESERVED	Reserved

If (TCPC_RCTL.CC2 = Rd) or (ConnectResult=1):

Value	Name	Description
0	CC2_SNK_OPEN	SNK.Open (Open, below maximum VRa)
1	CC2_SNK_DEFAULT	SRC.Default (above minimum VRd-Connect)
2	CC2_SNK_1P5A	SRC.Power1.5 (above minimum VRd-Connect) Detects Rp-1.5A
3	CC2_SNK_3A	SNK.Power3.0 (above minimum VRd-Connect) Detects Rp-3.0A

If TCPC_RCTL.CC2=Ra, this field is set to 0.
If TCPC_RCTL.CC2=Open, this field is set to 0.
This field always returns 0 if (LK4CNX=1).
Otherwise, the returned value depends on TCPC_RCTL.CC2.

Bits 1:0 – CC1[1:0] CC1 State
If (TCPC_RCTL.CC1=Rp) or (ConnectResult=0):

Value	Name	Description
0	CC1_SRC_OPEN	SRC.Open (Open, Rp)
1	CC1_SRC_RA	SRC.Ra (below maximum VRa)
2	CC1_SRC_RD	SRC.Rd (within the VRd range)

© 2025 Microchip Technology Inc. and its subsidiaries

CC1 (continued)		
Value	**Name**	**Description**
3	CC1_SRC_RESERVED	Reserved

If (TCPC_RCTL.CC1 = Rd) or (ConnectResult=1):

Value	Name	Description
0	CC1_SNK_OPEN	SNK.Open (Open, below maximum VRa)
1	CC1_SNK_DEFAULT	SRC.Default (above minimum VRd-Connect)
2	CC1_SNK_1P5A	SRC.Power1.5 (above minimum VRd-Connect) Detects Rp-1.5A
3	CC1_SNK_3A	SNK.Power3.0 (above minimum VRd-Connect) Detects Rp-3.0A

If TCPC_RCTL.CC1=Ra, this field is set to 0.
If TCPC_RCTL.CC1=Open, this field is set to 0.
This field always returns 0 if (LK4CNX=1).
Otherwise, the returned value depends on TCPC_RCTL.CC1.

© 2025 Microchip Technology Inc. and its subsidiaries

82.7.15. TCPC Power Status Register

Name: TCPC_PS
Offset: 0x1E
Reset: 0x00
Property: Read-only

Bit	7	6	5	4	3	2	1	0
	DBG	INIT	SRCHIV	SRCVBUS	VBUSDETE	VBUS	VCONN	SNKVBUS
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit 7 – DBG Debug Accessory Connected
Reflects the state of the DebugAccessoryConnected# output if supported

Value	Description
0	No debug accessory connected (default).

Bit 6 – INIT TCPC Initialization

Value	Description
0	TCPC has completed initialization and all registers are valid.
1	TCPC is still performing internal initialization and the only registers ensuring return of correct values are 00h..0Fh.

Bit 5 – SRCHIV Sourcing High Voltage

Value	Description
0	vSafe5V.

Bit 4 – SRCVBUS Sourcing VBUS
This does not control the path. It provides a monitor of the status.

Value	Description
0	Sourcing V_{BUS} is disabled.
1	Sourcing V_{BUS} is enabled.

Bit 3 – VBUSDETE VBUS Present Detection Enabled
Indicates if the TCPC is monitoring for V_{BUS} present or if the circuit has been powered off.

Value	Description
0	V_{BUS} present detection disabled.
1	V_{BUS} present detection enabled (default).

Bit 2 – VBUS VBUS Present

Value	Description
0	V_{BUS} disconnected.
1	V_{BUS} connected.

Bit 1 – VCONN VCONN Present

Value	Description
0	VCONN is not present.

Bit 0 – SNKVBUS Sinking VBUS

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Sink is disconnected. (Default and if not supported)
1	TCPC is sinking V_{BUS} to the system load.

© 2025 Microchip Technology Inc. and its subsidiaries

82.7.16. TCPC Fault Status Register

Name: TCPC_FS
Offset: 0x1F
Reset: 0x80
Property: Read/Write

Bit	7	6	5	4	3	2	1	0
	ALLREGRES	FRCOFVBUS			VBUSOCPF	VBUSOVPF		
Access	R/W	R/W			R/W	R/W		
Reset	1	0			0	0		

Bit 7 – ALLREGRES All Registers Reset To Default

Value	Description
0	The registers have not been reset since the last clear of this bit.
1	The TCPC has reset all registers to their default value. This happens at initial powerup or if an unexpected power reset occurs.

Bit 6 – FRCOFVBUS Force Off VBUS
The TCPC has disconnected V_{BUS} due to TCPC_SIC.FOFVBUS.

Value	Description
0	No fault detected, no action (default and not supported).
1	V_{BUS} source/sink has been forced off due to external fault.

Bit 3 – VBUSOCPF Internal or External OCP VBUS Over-Current Protection Fault

Value	Description
0	Not in an over-current protection state.
1	Over-current fault latched.

Bit 2 – VBUSOVPF Internal or External OVP VBUS Over-Voltage Protection Fault

Value	Description
0	Not in an over-voltage protection state.
1	Over-voltage fault latched.

© 2025 Microchip Technology Inc. and its subsidiaries

82.7.17. TCPC Command Register

Name: TCPC_CMD
Offset: 0x23
Reset: 0x00
Property: Read/Write

Bit	7	6	5	4	3	2	1	0
	COMMAND[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 7:0 – COMMAND[7:0] Command
All values not given here are reserved; must be ignored by the receiver.

Value	Name	Description
34	DISABLEVBUSDETECT	Disables Vbus present detection.
51	ENABLEVBUSDETECT	Enables Vbus present detection.
68	DISABLESINKVBUS	Disables sinking power over V_{BUS}. This COMMAND does not disable TCPC_PS.VBUS detection. The TCPC must clear TCPC_FS.VBUSOCPF and TCPC_FS.VBUSOVPF.
85	SINKVBUS	Enables sinking power over V_{BUS} and enable V_{BUS} present detection.
102	DISABLESOURCEVBUS	Disables sourcing power over V_{BUS}. The TCPC shall stop reporting TCPC_FS. Internal or External OCP or OVP Faults. This COMMAND does not disable TCPC_PS.VBUS detection.
119	SOURCEVBUSDEFAULTVOLTAGE	Enables sourcing vSafe5V over V_{BUS} and enable V_{BUS} present detection. Source must transition to vSafe5V if at a high voltage.
153	LOOK4CONNECTION	Starts DRP toggling if TCPC_RCTL.DRP=1. If TCPC_RCTL.CC1/CC2= 1 start with Rp, if TCPC_RCTL.CC1/CC2 =2 start with Rd. If TCPC_RCTL.CC1/CC2 are not both 1 or 2, then do not start toggling. The TCPM must issue TCPC_CMD.Look4Connection to enable the TCPC to restart connection detection in cases where TCPC_RCTL contents will not change. An example of this is when a potential connection as a source occurred but was further debounced by the TCPM to find the sink disconnected. In this case, a source only or DRP should go back to its Unattached.Src state. This would result in TCPC_RCTL staying the same.

	ROLES[2:0]			SOPDBG	SRCVCN	SNKVBUS	SRCHVBUS	SRCVBUS
Access								
Reset	0	0	0	0	0	0	0	0

Bit 14 – VBUSOCPR VBUS OCP Reporting
Support for both TCPC_FS.VBUSOCPF and TCPC_FCTL.VBUSOCPF implemented.

Value	Description
0	V_{BUS} OCP is not reported by the TCPC.
1	V_{BUS} OCP is reported by the TCPC.

Bit 13 – VBUSOVPR VBUS OVP Reporting
Support for both TCPC_FS.VBUSOVPF and TCPC_FCTL.VBUSOVPF implemented.

Value	Description
0	V_{BUS} OVP is not reported by the TCPC.
1	V_{BUS} OVP is reported by the TCPC.

Bit 12 – BLDDCH Bleed Discharge

Value	Description
0	No bleed discharge implemented in the TCPC.
1	Bleed discharge is implemented in the TCPC.

Bit 11 – FRCDCH Force Discharge

Value	Description
0	No force discharge is implemented in the TCPC.
1	Force discharge is implemented in the TCPC.

Bit 10 – VBUSMSRAL VBUS Measurement and Alarm Capable
Support for VBUS_VOLTAGE, VBUS_VOLTAGE_ALARM_HI_CFG, VBUS_VOLTAGE_ALARM_LO_CFG implemented.

Value	Description
0	No V_{BUS} voltage measurement nor V_{BUS} alarms.
1	V_{BUS} voltage measurement and V_{BUS} alarms.

Bits 9:8 – SRCRES[1:0] Source Resistor Supported
Rp values which may be configured by the TCPM via TCPC_RCTL:

Value	Name	Description
0	RES_RPDEF	Rp default only

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
1	RES_RP1P5	Rp 1.5A and default
2	RES_RP3	Rp 3.0A, 1.5A, and default
3	RES_RESERVED	Reserved

Bits 7:5 – ROLES[2:0] Roles Supported

Value	Name	Description
0	ROLE_SRCSNK	USB Type-C Port Manager can configure the Port as Source only or Sink only (not DRP)
1	ROLE_SRC	Source only
2	ROLE_SNK	Sink only
3	ROLE_SNK_ACC	Sink with accessory support
4	ROLE_DRP	DRP only
5	ROLE_ALL	Source, Sink, DRP, Adapter/Cable all supported
6	ROLE_SRCSNKDRP	Source, Sink, DRP
7	ROLE_INVALID	Not valid

Bit 4 – SOPDBG SOP'_DBG/SOP"_DBG Support

This function is not supported.

Bit 3 – SRCVCN Source VCONN

Value	Description
0	TCPC is not capable of switching VCONN.
1	TCPC is capable of switching VCONN.

Bit 2 – SNKVBUS Sink VBUS

Support for TCPC_PS.SNKVBUS, TCPC_CMD.SinkVbus, and TCPC_CMD.DisableSinkVbus implemented.

Value	Description
0	TCPC is not capable of controlling the sink path to the system load.
1	TCPC is capable of controlling the sink path to the system load.

Bit 1 – SRCHVBUS Source High Voltage VBUS

Support for VBUS_VOLTAGE, TCPC_PS.SRCHIV, and TCPC_CMD.SourceVbusHighVoltage implemented.
DEVICE_CAPABILITIES_1.VBUS Measurement and Alarm Capable must be set to 1b if Source High Voltage VBUS is enabled.

Value	Description
0	TCPC is not capable of controlling the source high voltage path to V_{BUS}.
1	TCPC is capable of controlling the source high voltage path to V_{BUS}.

Bit 0 – SRCVBUS Source VBUS

Support for TCPC_PS.SRCVBUS, TCPC_CMD.SourceVbusDefaultVoltage, TCPC_CMD.DisableSourceVbus, TCPC_CMD.EnableVbusDetect and TCPC_CMD.DisableVbusDetect implemented.

Value	Description
0	TCPC is not capable of controlling the source path to V_{BUS}.
1	TCPC is capable of controlling the source path to V_{BUS}.

Bit 29 – BCDETE Battery Charging Detection Enable

Value	Description
0	Battery charging detection is disabled.
1	Battery charging detection is enabled. • If BCDETSEL is set to 0, DM VDAT comparator and IDM_SINK current source are enabled, and CHG_DET output can be read in TCPC_UPS.CHGDCP. • If BCDETSEL is set to 1, DP VDAT comparator and IDP_SINK current source are enabled, and DCP_DET output can be read in TCPC_UPS.CHGDCP.

Bit 28 – BCVSRCE Battery Charging Voltage Source Enable

Value	Description
0	Battery charging VDP_SRC and VDM_SRC voltage sources are disabled.
1	Battery charging voltage source enable: • If BCDETSEL is set to 0, VDP_SRC voltage source is enabled. • If BCDETSEL is set to 1, VDM_SRC voltage source is enabled.

Bit 27 – BCDETSEL Battery Charging Detection Selection

Value	Description
0	Battery charging primary detection is selected.
1	Battery charging secondary detection is selected.

Bit 26 – BCIDPSRCE Battery Charging IDP Source Enable

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Battery charging IDP current source is disabled.
1	Battery charging IDP current source is enabled for data contact detection.

Bit 25 – DMPDFE DM Pull-Down Force Enable

Value	Description
0	DM pull-down is not forced to the active state by the TCPC.
1	DM pull-down is forced to the active state by the TCPC for battery charging data contact detection.

Bit 24 – DMPDFD DM Pull-Down Force Disable

Value	Description
0	DM pull-down is not forced to the inactive state by the TCPC.
1	DM pull-down is forced to the inactive state by the TCPC.

Bits 21:20 – RDSRC[1:0] Type-C Rd Resistor Value Source

Value	Name	Description
0	RDSRC_CFG	Software configuration value RDSEL is selected for Rd pull-down resistor.
1	RDSRC_OTP	OTP value is selected for Rd pull-down resistor.
2	RDSRC_CAL	Calibration value TCPC_CALST.RDCAL is selected for Rd pull-down resistor.
3	RDSRC_DIS	Rd pull-down is disabled.

Bit 18 – RDTRME Type-C Rd Resistor Trim Enable

Value	Description
0	Rd resistor trim is disabled. The Rd value selected in RDSEL can be used for Type-C attach detection.
1	Rd resistor trim is enabled. CC2 is disconnected. RDSEL is enforced for Rd resistor value.

Bits 17:16 – RDSEL[1:0] Type-C Rd Resistor Trim Selection

Value	Name	Description
0	RDSEL_OFF	Rd pull-down is disabled
1	RDSEL_MINUS_10P	Rd pull-down value decreased by 10% is selected
2	RDSEL_DEFAULT	Rd pull-down default value is selected
3	RDSEL_PLUS_10P	Rd pull-down value increased by 10% is selected

Bits 13:12 – RDIPSEL[1:0] Type-C Rd or Ip Pull-up Current Selection

Value	Name	Description
0	IP_OFF	Type-C pull-up current source Ip is off, Rd pull-down is selected
1	IP_0P5	Type-C pull-up current source Ip is advertising 0.5A as V_{BUS} sourcing capability
2	IP_1P5	Type-C pull-up current source Ip is advertising 1.5A as V_{BUS} sourcing capability
3	IP_3P0	Type-C pull-up current source Ip is advertising 3.0A as V_{BUS} sourcing capability

Bits 10:8 – TCIDCTSEL[2:0] Type-C or ID Comparator Threshold Selection

Value	Name	Description
0	THRESHOLD_0	Threshold above VRid_gnd for ID determination or Type-C VRa
1	THRESHOLD_1	Threshold above VRid_c for ID determination or Type-C VRd-USB
2	THRESHOLD_2	Threshold above VRid_b for ID determination or Type-C VRd-1.5
3	THRESHOLD_3	Threshold above VRid_a for ID determination or Type-C VRd
4	THRESHOLD_4	Reserved
5	THRESHOLD_5	Reserved
6	THRESHOLD_6	Reserved
7	THRESHOLD_7	Reserved

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 1 – TCIDSEL Type-C or ID Selection

Value	Description
0	CC1 comparator is used for ID detection for OTG or for battery charging. CC1 is connected and CC2 is disconnected.
1	CC1 and CC2 comparators are used to determine the power capability advertised by the facing source.

Bit 0 – TCCE Type-C Cell Enable

Value	Description
0	USB Type-C cell is disabled; CC1 and CC2 are disconnected.
1	USB Type-C cell is enabled.

Bit	7	6	5	4	3	2	1	0
				CC2RDT	CC1ID	CHGDCP	DM	DP
Access				R	R	R	R	R
Reset				0	0	0	0	0

Bit 4 – CC2RDT Type-C CC2 Comparator or Rd Trim comparator
Comparator output for Type-C CC2 voltage detection or for Rd trimming as selected via TCPC_UPC.RDSEL.

Value	Description
0	CC2 or Rd Trim comparator output is low for Power Source Detection at Sink and is high for Sink Detection at Power Source. Voltage is below the selected TCUPC.TCIDCTSEL threshold.
1	CC2 or Rd Trim comparator output is high for Power Source Detection at Sink and is low for Sink Detection at Power Source. Voltage is above the selected TCUPC.TCIDCTSEL threshold.

Bit 3 – CC1ID Type-C CC1 Comparator or ID comparator
Comparator output for Type-C CC1 voltage detection or for ID determination as selected via TCPC_UPC.TCIDSEL.

Value	Description
0	CC1 or ID comparator output is low for Power Source Detection at Sink and is high for Sink Detection at Power Source. Voltage is below the selected TCPC_UPC.TCIDCTSEL threshold.
1	CC1 or ID comparator output is high for Power Source Detection at Sink and is low for Sink Detection at Power Source. Voltage is above the selected TCPC_UPC.TCIDCTSEL threshold.

Bit 2 – CHGDCP Charging Port Detection, Dedicated Charging Port Detection
Comparator output of the primary or secondary detection as selected via TCPC_UPC.BCDETSEL, valid if TCPC_UPC.BCDETE has been set.

Value	Description
0	No charging port detected • If TCPC_UPC.BCDETSEL is set to 0, the primary detection CHG_DET output is low. • If TCPC_UPC.BCDETSEL is set to 1, the secondary detection DCP_DET output is low.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Charging port detected • If TCPC_UPC.BCDETSEL is set to 0, the primary detection CHG_DET output is high. • If TCPC_UPC.BCDETSEL is set to 1, the secondary detection DCP_DET output is high.

Bit 1 – DM USB Differential line Minus

USB DM line state, used in the battery charger type determination to distinguish ACA with FS B-device from ACA with LS B-device.

Value	Description
0	DM is low.
1	DM is high.

Bit 0 – DP USB Differential line Plus

USB DP line state, used for the battery charging data contact detect and ACA-Dock type determination.

Value	Description
0	DP is low.
1	DP is high.

				CALNST[4:0]				
Access				R	R	R	R	R
Reset				–	–	–	–	–

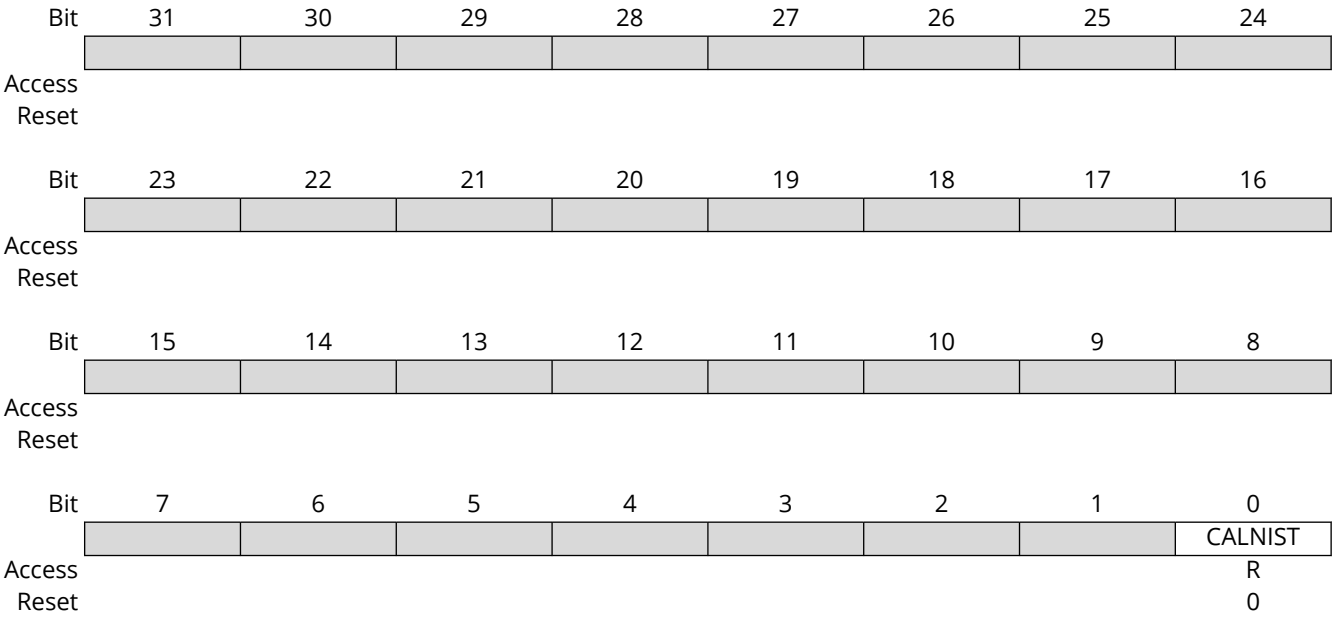
Bits 9:8 – RDCAL[1:0] Rd From Calibration
Rd pull-down resistor control value as computed from the live calibration input value CALNST. This computed value is actually applied to Rd only if TCPC_UPC.RDSRC is set to 2.

Bits 4:0 – CALNST[4:0] Calibration Input Status
Mirrors the TCPC calibration input used to adjust the Rd pull-down resistor control RDCAL.

© 2025 Microchip Technology Inc. and its subsidiaries

82.7.30. TCPC Calibration Interrupt Status Register

Name: TCPC_CALIST
Offset: 0xB0
Reset: 0x00000000
Property: Read-only



Bit 0 – CALNIST Calibration Interrupt Status

Value	Description
0	No TCPC calibration input change has occurred in TCPC_CALST since the last read of the TCPC_CALIST register.
1	At least one TCPC calibration input change has occurred in TCPC_CALST since the last read of the TCPC_CALIST register.

© 2025 Microchip Technology Inc. and its subsidiaries

82.7.31. TCPC Calibration Calibration Interrupt Mask Register

Name: TCPC_CALIM
Offset: 0xB4
Reset: 0x00000000
Property: Read/Write

83. USB Device High Speed Port (UDPHS)

83.1. Description

The USB Device High Speed Port (UDPHS) is compliant with the Universal Serial Bus (USB), rev 2.0 High Speed device specification.

Each endpoint can be configured in one of several USB transfer types. It can be associated with one, two or three banks of a Dual-port RAM used to store the current data payload. If two or three banks are used, one DPR bank is read or written by the processor, while the other is read or written by the USB device peripheral. This feature is mandatory for isochronous endpoints.

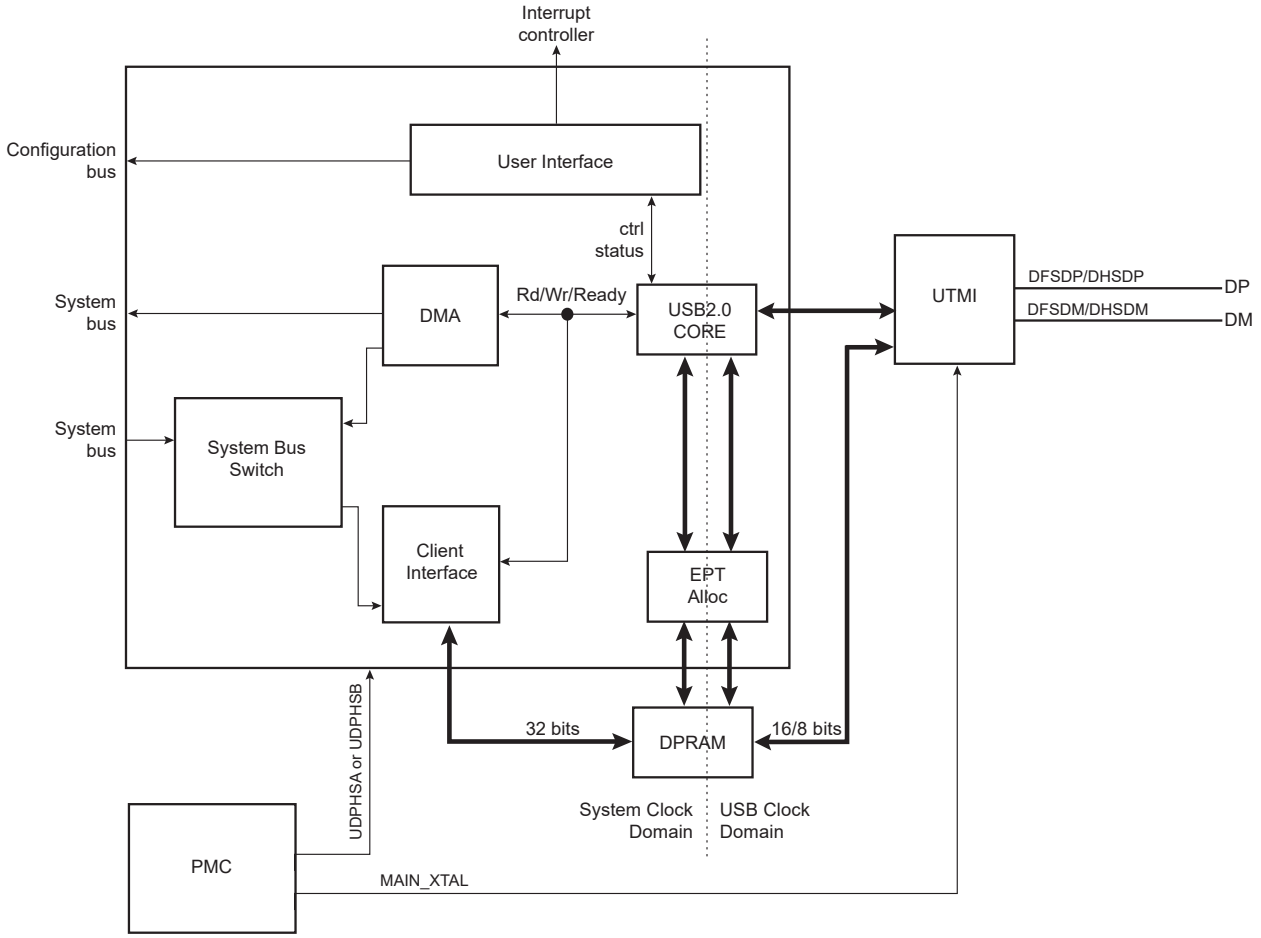
83.2. Embedded Characteristics

- 1 High-Speed Device
- 1 UTMI Transceiver Shared Between Host and Device for Each UDPHS Instance
- USB v2.0 High Speed (480 Mbits/s) Compliant
- 16 Endpoints up to 1024 Bytes
- Embedded Dual-port RAM for Endpoints
- Suspend/Resume Logic (Command of UTMI)
- Up to Three Memory Banks for Endpoints (Not for Control Endpoint)
- 16448 bytes of DPRAM

© 2025 Microchip Technology Inc. and its subsidiaries

83.3. Block Diagram

Figure 83.1. UDPHS Block Diagram



83.4. Product Dependencies

83.4.1. Power Management

The UDPHS is not continuously clocked.

To use the UDPHS, assuming the UTMI USB PLL is off and the UDPHS is disabled:

1. Enable the UDPHS clock in the Power Management Controller (PMC).
2. Enable the UDPHS in the UDPHS_CTRL register (EN_UDPHS bit).
3. Enable the UTMI (PLL and transceiver) by enabling the bandgap and then the voltage regulator in the PMC (UTMIBG and UTMIVR bits in the PMC_PLL_ACR register).

Note: If the application does not require UDPHS operations, the UDPHS clock can be stopped when not needed and restarted later.

83.4.2. Interrupt Sources

The UDPHS interrupt line is connected on one of the internal sources of the interrupt controller. Using the UDPHS interrupt requires the interrupt controller to be programmed first.

© 2025 Microchip Technology Inc. and its subsidiaries

83.5. Functional Description

83.5.1. USB V2.0 High Speed Device Port Introduction

The USB V2.0 High Speed Device Port provides communication services between host and attached USB devices. Each device is offered with a collection of communication flows (pipes) associated with each endpoint. Software on the host communicates with a USB Device through a set of communication flows.

83.5.2. USB V2.0 High Speed Transfer Types

A communication flow is carried over one of four transfer types defined by the USB device.

A device provides several logical communication pipes with the host. To each logical pipe is associated an endpoint. Transfer through a pipe belongs to one of the four transfer types:

- Control Transfers: Used to configure a device at attach time and can be used for other device-specific purposes, including control of other pipes on the device.
- Bulk Data Transfers: Generated or consumed in relatively large burst quantities and have wide dynamic latitude in transmission constraints.
- Interrupt Data Transfers: Used for timely but reliable delivery of data, for example, characters or coordinates with human-perceptible echo or feedback response characteristics.
- Isochronous Data Transfers: Occupy a prenegotiated amount of USB bandwidth with a prenegotiated delivery latency. (Also called streaming real time transfers.)

As indicated below, transfers are sequential events carried out on the USB bus.

Endpoints must be configured according to the transfer type they handle.

Table 83.1. USB Communication Flow

Transfer	Direction	Bandwidth	Endpoint Size	Error Detection	Retrying
Control	Bidirectional	Not ensured	8, 16, 32, 64	Yes	Automatic
Isochronous	Unidirectional	Ensured	8–1024	Yes	No
Interrupt	Unidirectional	Not ensured	8–1024	Yes	Yes
Bulk	Unidirectional	Not ensured	8–512	Yes	Yes

83.5.3. USB Transfer Event Definitions

A transfer is composed of one or several transactions as shown in the table below.

Table 83.2. USB Transfer Events

Transfer		Transaction
Direction	Type	
CONTROL (bidirectional)	Control Transfer (1)	• Setup transaction → Data IN transactions → Status OUT transaction • Setup transaction → Data OUT transactions → Status IN transaction • Setup transaction → Status IN transaction
IN (device toward host)	Bulk IN Transfer	• Data IN transaction → Data IN transaction
	Interrupt IN Transfer	• Data IN transaction → Data IN transaction
	Isochronous IN Transfer (2)	• Data IN transaction → Data IN transaction

© 2025 Microchip Technology Inc. and its subsidiaries

Table 83.2. USB Transfer Events (continued)

Transfer		Transaction
Direction	Type	
OUT (host toward device)	Bulk OUT Transfer	• Data OUT transaction → Data OUT transaction
	Interrupt OUT Transfer	• Data OUT transaction → Data OUT transaction
	Isochronous OUT Transfer [2]	• Data OUT transaction → Data OUT transaction

Notes:

1. Control transfer must use endpoints with one bank and can be aborted using a stall handshake.
2. Isochronous transfers must use endpoints configured with two or three banks.

An endpoint handles all transactions related to the type of transfer for which it has been configured.

Table 83.3. UDPHS Endpoint Description

Endpoint #	Mnemonic	Nb Banks	DMA	High Bandwidth	Max. Endpoint Size	Endpoint Type
0	EPT_0	1	N	N	64	Control
1	EPT_1	3	Y	Y	1024	Ctrl/Bulk/Iso[1]/Interrupt
2	EPT_2	3	Y	Y	1024	Ctrl/Bulk/Iso[1]/Interrupt
3	EPT_3	2	Y	N	1024	Ctrl/Bulk/Iso[1]/Interrupt
4	EPT_4	2	Y	N	512	Ctrl/Bulk/Iso[1]/Interrupt
5	EPT_5	2	Y	N	512	Ctrl/Bulk/Iso[1]/Interrupt
6	EPT_6	2	Y	N	512	Ctrl/Bulk/Iso[1]/Interrupt
7	EPT_7	2	Y	N	512	Ctrl/Bulk/Iso[1]/Interrupt
8	EPT_8	1	N	N	512	Ctrl/Bulk/Iso[1]/Interrupt
9	EPT_9	1	N	N	512	Ctrl/Bulk/Iso[1]/Interrupt
10	EPT_10	1	N	N	512	Ctrl/Bulk/Iso[1]/Interrupt
11	EPT_11	1	N	N	512	Ctrl/Bulk/Iso[1]/Interrupt
12	EPT_12	1	N	N	512	Ctrl/Bulk/Iso[1]/Interrupt
13	EPT_13	1	N	N	512	Ctrl/Bulk/Iso[1]/Interrupt
14	EPT_14	1	N	N	512	Ctrl/Bulk/Iso[1]/Interrupt
15	EPT_15	1	N	N	512	Ctrl/Bulk/Iso[1]/Interrupt

Note:

1. In Isochronous (Iso) mode, it is preferable that the high bandwidth capability is available.

The size of the internal DPRAM is 16448 bytes, covering the memory need for the endpoints, hence enabling static allocation of the memory for all endpoints.

Suspend and resume are automatically detected by the UDPHS device, which notifies the processor by raising an interrupt.

83.5.4. USB V2.0 High Speed BUS Transactions

Each transfer results in one or more transactions over the USB bus.

Five types of transaction flow across the bus in packets:

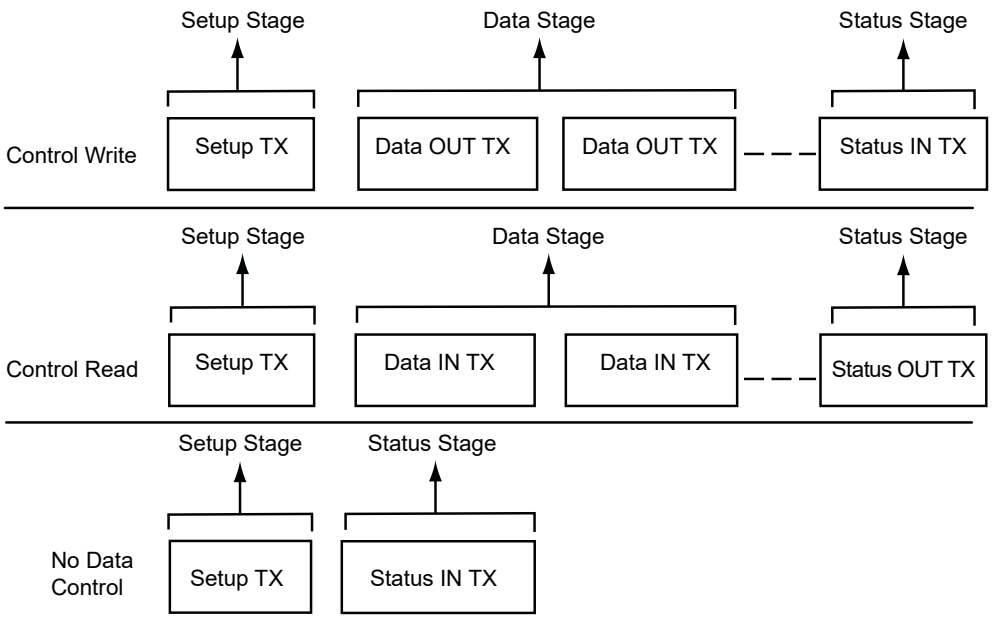
1. Setup Transaction
2. Data IN Transaction
3. Data OUT Transaction
4. Status IN Transaction

© 2025 Microchip Technology Inc. and its subsidiaries

5. Status OUT Transaction

A status IN or OUT transaction is identical to a data IN or OUT transaction.

Figure 83.2. Control Read and Write Sequences



83.5.5. Endpoint Configuration

The endpoint 0 is always a control endpoint, it must be programmed and active in order to be enabled when the End Of Reset interrupt occurs.

To configure the endpoints:

- Fill the configuration register (UDPHS_EPTCFG) with the endpoint size, direction (IN or OUT), type (CTRL, Bulk, IT, ISO) and the number of banks.
- Fill the number of transactions (NB_TRANS) for isochronous endpoints.

Note: For control endpoints the direction has no effect.

- Verify that the EPT_MAPD flag is set. This flag is set if the endpoint size and the number of banks are correct for this endpoint.
- Configure the endpoint control flags and enable them in UDPHS_EPTCTLENBx as described in UDPHS_EPTCTLDISx.

Control endpoints can generate interrupts and use only 1 bank.

All endpoints (except endpoint 0) can be configured either as Bulk, Interrupt or Isochronous. See the table USB Transfer Events.

The maximum packet size they can accept corresponds to the maximum endpoint size.

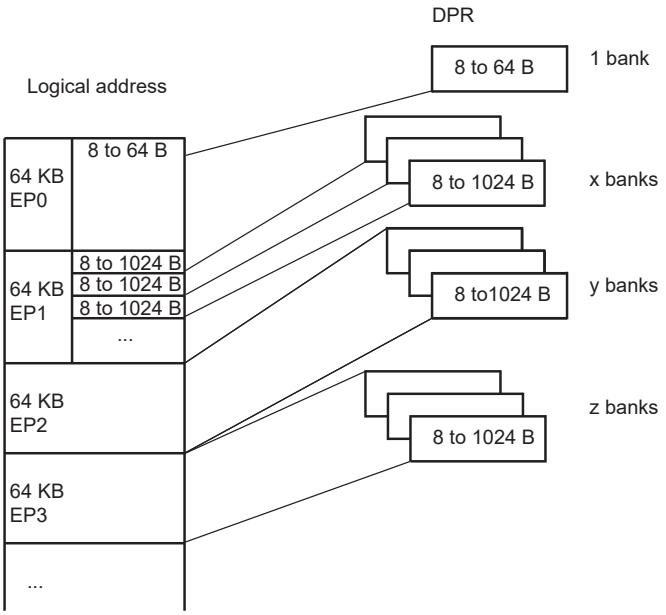
Note: The endpoint size of 1024 is reserved for isochronous endpoints.

The application has access to the physical block of DPR reserved for the endpoint through a 64-Kbyte logical address space.

The physical block of DPR reserved for the endpoint is remapped all along the 64-Kbyte logical address space. The application can write a 64-Kbyte buffer linearly.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 83.3. Logical Address Space for DPR Access



Configuration examples of UDPHS_EPTCTLDISx for Bulk IN endpoint type follow below.

- With DMA
  - AUTO_VALID: Automatically validate the packet and switch to the next bank.
  - EPT_ENABL: Enable endpoint.
- Without DMA:
  - TXRDY: An interrupt is generated after each transmission.
  - EPT_ENABL: Enable endpoint.

Configuration examples of Bulk OUT endpoint type follow below.

- With DMA
  - AUTO_VALID: Automatically validate the packet and switch to the next bank.
  - EPT_ENABL: Enable endpoint.
- Without DMA
  - RXRDY_TXKL: An interrupt is sent after a new packet has been stored in the endpoint FIFO.
  - EPT_ENABL: Enable endpoint.

83.5.6. DPRAM Management

Endpoints can be configured in any order.

Disabling an endpoint, by writing a one to the Endpoint Disable bit in the UDPHS Endpoint Control Disable Register (UDPHS_EPTCTLDISx.EPT_DISABL), does not reset its configuration:

- Endpoint Banks (UDPHS_EPTCFGx.BK_NUMBER)
- Endpoint Size (UDPHS_EPTCFGx.EPT_SIZE)
- Endpoint Direction (UDPHS_EPTCFGx.EPT_DIR)
- Endpoint Type (UDPHS_EPTCFGx.EPT_TYPE)

© 2025 Microchip Technology Inc. and its subsidiaries

Notes:

1. There is no way the data of the endpoint 0 can be lost (except if it is de-allocated) as the memory allocation and de-allocation may affect only higher endpoints.
2. Deactivating then reactivating the same endpoint with the same configuration only modifies temporarily the controller DPRAM pointer and size for this endpoint. Nothing changes in the DPRAM, higher endpoints seem not to have been moved and their data is preserved as far as nothing has been written or received into them while changing the allocation state of the first endpoint.
3. When the user writes a value different from zero to the UDPHS_EPTCFGx.BK_NUMBER field, the Endpoint Mapped bit (UDPHS_EPTCFGx.EPT_MAPD) is set only if the configured size and number of banks are correct as compared to the endpoint maximal allowed values and to the maximal FIFO size (i.e., the DPRAM size). The UDPHS_EPTCFGx.EPT_MAPD value does not consider memory allocation conflicts.

83.5.7. Transfer With DMA

USB packets of any length may be transferred when required by the UDPHS device. These transfers always feature sequential addressing.

Packet data system bus bursts may be locked on a DMA buffer basis for drastic overall system bus bandwidth performance boost with paged memories. These clock-cycle consuming memory row (or bank) changes will then likely not occur, or occur only once instead of several times, during a single big USB packet DMA transfer in case another system bus host addresses the memory. The locked bursts result in up to 128-word single-cycle unbroken system bus bursts for bulk endpoints and 256-word single-cycle unbroken bursts for isochronous endpoints.

This maximum burst length is then controlled by the lowest programmed USB endpoint size (EPT_SIZE field in the UDPHS_EPTCFGx register) and DMA Size (BUFF_LENGTH field in the UDPHS_DMACONTROLx register).

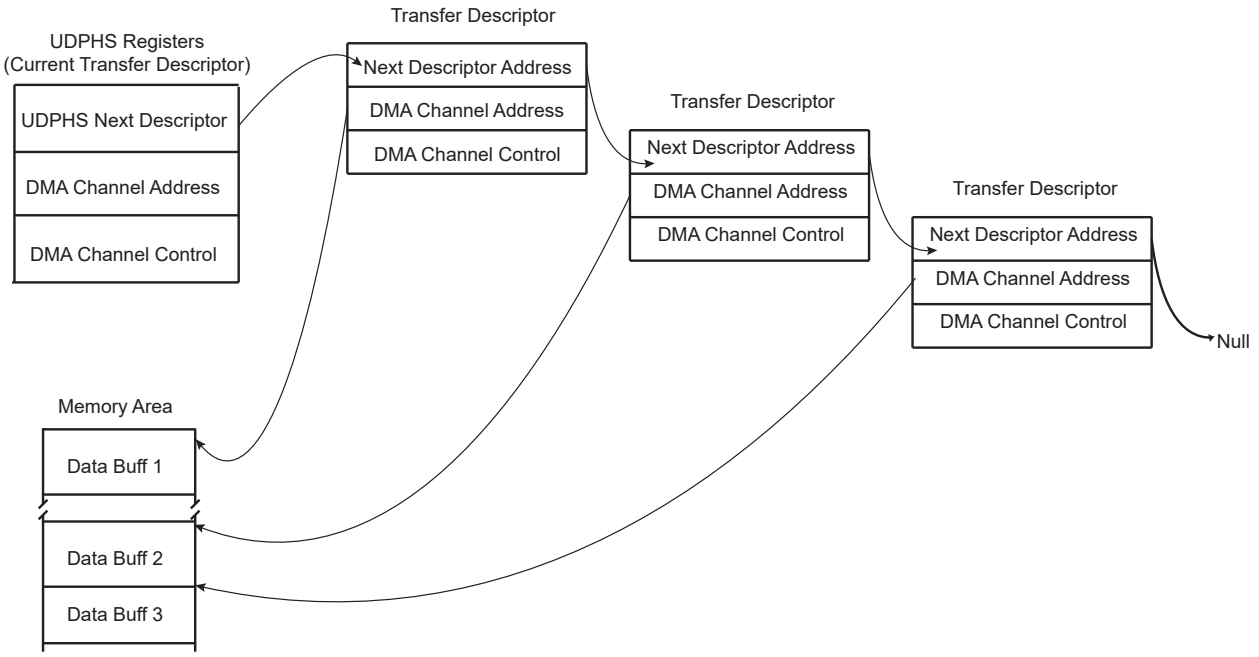
The USB 2.0 device average throughput may be up to nearly 60 Mbyte/s. Its internal client average access latency decreases as burst length increases due to the 0 wait-state side effect of unchanged endpoints. If at least 0 wait-state word burst capability is also provided by the external DMA system bus clients, each of both DMA system busses need less than 50% bandwidth allocation for full USB 2.0 bandwidth usage at 30 MHz, and less than 25% at 60 MHz.

The UDPHS DMA Channel Transfer Descriptor is described in the section UDPHS DMA Channel Transfer Descriptor.

Note: When debugging, make sure to address the DMA to an SRAM address even if a remap is done.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 83.4. Example of DMA Chained List



83.5.8. Transfer Without DMA

Important: When not used, the DMA should be disabled to make sure it cannot be left enabled by a previous USB transfer session. If this occurred, the DMA could process data before an interrupt without the user's knowledge.

The recommended procedure to disable the DMA is as follows:

```
// Reset IP UDPHS
  BASE_UDPHS->UDPHS_CTRL &= ~UDPHS_EN_UDPHS;
  BASE_UDPHS->UDPHS_CTRL |= UDPHS_EN_UDPHS;//
With OR without DMA !!!
  for( i=1; i<=DMA_CHANNEL_NBR); i++ )
// RESET endpoint canal DMA:
    // DMA stop channel command
   BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMACONTROL = 0; // STOP
command
// Disable endpoint
  BASE_UDPHS->UDPHS_EPT[i].UDPHS_EPTCTLDIS |= 0XFFFFFFFF;
// Reset endpoint config
  BASE_UDPHS->UDPHS_EPT[i].UDPHS_EPTCTLCFG = 0;
// Reset DMA channel (Buff count and Control field)
  BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMACONTROL = 0x02; // NON
STOP command
// Reset DMA channel 0 (STOP)
  BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMACONTROL = 0; // STOP
command
// Clear DMA channel status (read the register for clear it)
  BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMASTATUS =
  BASE_UDPHS->UDPHS_DMA[i].UDPHS_DMASTATUS;
}
```

83.5.9. Handling Transactions with USB V2.0 Device Peripheral

83.5.9.1. Setup Transaction

The setup packet is valid in the DPR while RX_SETUP is set. Once RX_SETUP is cleared by the application, the UDPHS accepts the next packets sent over the device endpoint.

© 2025 Microchip Technology Inc. and its subsidiaries

When a valid setup packet is accepted by the UDPHS:

- The UDPHS device automatically acknowledges the setup packet (sends an ACK response)
- Payload data is written in the endpoint
- Sets the RX_SETUP interrupt
- The BYTE_COUNT field in the UDPHS_EPTSTAx register is updated

An endpoint interrupt is generated while RX_SETUP in the UDPHS_EPTSTAx register is not cleared. This interrupt is carried out to the microcontroller if interrupts are enabled for this endpoint.

Thus, firmware must detect RX_SETUP polling UDPHS_EPTSTAx or catching an interrupt, read the setup packet in the FIFO, then clear the RX_SETUP bit in the UDPHS_EPTCLRSTA register to acknowledge the setup stage.

If STALL_SNT was set to 1, then this bit is automatically reset when a setup token is detected by the device. Then, the device still accepts the setup stage (see STALL).

83.5.9.2.NYET

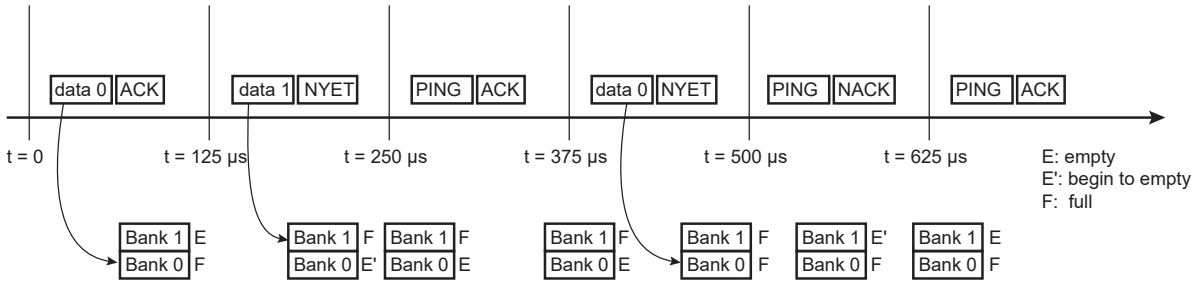
NYET is a High Speed only handshake. It is returned by a High Speed endpoint as part of the PING protocol.

High Speed devices must support an improved NAK mechanism for Bulk OUT and control endpoints (except setup stage). This mechanism allows the device to tell the host whether it has sufficient endpoint space for the next OUT transfer (refer to USB 2.0 spec 8.5.1 NAK Limiting via Ping Flow Control).

The NYET/ACK response to a High Speed Bulk OUT transfer and the PING response are automatically handled by hardware in the UDPHS_EPTCTLx register (except when the user wants to force a NAK response by using the NYET_DIS bit).

If the endpoint responds instead to the OUT/DATA transaction with an NYET handshake, this means that the endpoint accepted the data but does not have room for another data payload. The host controller must return to using a PING token until the endpoint indicates it has space available.

Figure 83.5. NYET Example with Two Endpoint Banks



83.5.9.3.Data IN

- Bulk IN or Interrupt IN
  Data IN packets are sent by the device during the data or the status stage of a control transfer or during an (interrupt/bulk/isochronous) IN transfer. Data buffers are sent packet by packet under the control of the application or under the control of the DMA channel.
  There are three ways for an application to transfer a buffer in several packets over the USB:
  - packet by packet (see Bulk IN or Interrupt IN: Sending a Packet Under Application Control (Device to Host) below)
  - 64 Kbytes (see Bulk IN or Interrupt IN: Sending a Packet Under Application Control (Device to Host) below)
  - DMA (see Bulk IN or Interrupt IN: Sending a Buffer Using DMA (Device to Host) below)

© 2025 Microchip Technology Inc. and its subsidiaries

- Bulk IN or Interrupt IN: Sending a Packet Under Application Control (Device to Host)
  The application can write one or several banks.

  A simple algorithm can be used by the application to send packets regardless of the number of banks associated to the endpoint.

  Algorithm description for each packet:

  - The application waits for the TXRDY flag to be cleared in the UDPHS_EPTSTAx register before it can perform a write access to the DPR.
  - The application writes one USB packet of data in the DPR through the 64 Kbytes endpoint logical memory window.
  - The application sets TXRDY flag in the UDPHS_EPTSETSTAx register.

  The application is notified that it is possible to write a new packet to the DPR by the TXRDY interrupt. This interrupt can be enabled or masked by setting the TXRDY bit in the UDPHS_EPTCTLENB/UDPHS_EPTCTLDIS register.

  Algorithm description to fill several packets:

  Using the previous algorithm, the application is interrupted for each packet. It is possible to reduce the application overhead by writing linearly several banks at the same time. The AUTO_VALID bit in the UDPHS_EPTCTLx must be set by writing the AUTO_VALID bit in the UDPHS_EPTCTLENBx register.

  The auto-valid-bank mechanism allows the transfer of data (IN and OUT) without the intervention of the CPU. This means that bank validation (set TXRDY or clear the RXRDY_TXKL bit) is done by hardware.

  - The application checks the BUSY_BANK_STA field in the UDPHS_EPTSTAx register. The application must wait that at least one bank is free.
  - The application writes a number of bytes inferior to the number of free DPR banks for the endpoint. Each time the application writes the last byte of a bank, the TXRDY signal is automatically set by the UDPHS.
  - If the last packet is incomplete (i.e., the last byte of the bank has not been written) the application must set the TXRDY bit in the UDPHS_EPTSETSTAx register.

  The application is notified that all banks are free, so that it is possible to write another burst of packets by the BUSY_BANK interrupt. This interrupt can be enabled or masked by setting the BUSY_BANK flag in the UDPHS_EPTCTLENB and UDPHS_EPTCTLDIS registers.

  This algorithm must not be used for isochronous transfer. In this case, the ping-pong mechanism does not operate.

  A Zero Length Packet can be sent by setting just the TXRDY flag in the UDPHS_EPTSETSTAx register.

- Bulk IN or Interrupt IN: Sending a Buffer Using DMA (Device to Host)
  The UDPHS integrates a DMA host controller. This DMA controller can be used to transfer a buffer from the memory to the DPR or from the DPR to the processor memory under the UDPHS control. The DMA can be used for all transfer types except control transfer.

  Example DMA configuration:

  - 1. Program UDPHS_DMAADDRESS x with the address of the buffer that should be transferred.
  - 2. Enable the interrupt of the DMA in UDPHS_IEN.
  - 3. Program UDPHS_ DMACONTROLx:
    - Size of buffer to send: size of the buffer to be sent to the host.
    - END_B_EN: the endpoint can validate the packet (according to the values programmed in the AUTO_VALID and SHRT_PCKT fields of UDPHS_EPTCTLx) (see UDPHS_EPTCTLDISx and the figure Autovalid with DMA).

© 2025 Microchip Technology Inc. and its subsidiaries

- END_BUFFIT: generate an interrupt when the BUFF_COUNT field in the UDPHS DMA Channel Status register (UDPHS_DMASTATUSx) reaches 0.
- CHANN_ENB: run and stop at end of buffer.

The auto-valid-bank mechanism allows the transfer of data (IN & OUT) without the intervention of the CPU. This means that bank validation (set TXRDY or clear RXRDY_TXKL) is done by hardware.

A transfer descriptor can be used. Instead of programming the register directly, a descriptor should be programmed and the address of this descriptor is then given to UDPHS_DMANXTDSC to be processed after setting the LDNXT_DSC field (Load Next Descriptor Now) in UDPHS_DMACONTROLx register.

The structure that defines this transfer descriptor must be aligned.

Each buffer to be transferred must be described by a DMA Transfer descriptor (see UDPHS DMA Channel Transfer Descriptor). Transfer descriptors are chained. Before executing transfer of the buffer, the UDPHS may fetch a new transfer descriptor from the memory address pointed by the UDPHS_DMANXTDSCx register. Once the transfer is complete, the transfer status is updated in the UDPHS_DMASTATUSx register.

To chain a new transfer descriptor with the current DMA transfer, the DMA channel must be stopped. To do so, INTDIS_DMA and TXRDY may be set in the UDPHS_EPTCTLENBx register. It is also possible for the application to wait for the completion of all transfers. In this case the LDNXT_DSC bit in the last transfer descriptor UDPHS_DMACONTROLx register must be set to 0 and the CHANN_ENB bit set to 1.

Then the application can chain a new transfer descriptor.

The INTDIS_DMA can be used to stop the current DMA transfer if an enabled interrupt is triggered. This can be used to stop DMA transfers in case of errors.

The application can be notified at the end of any buffer transfer (via UDPHS_DMACONTROLx.ENB_BUFFIT).

Figure 83.7. Data IN Transfer for Endpoint with Two Banks

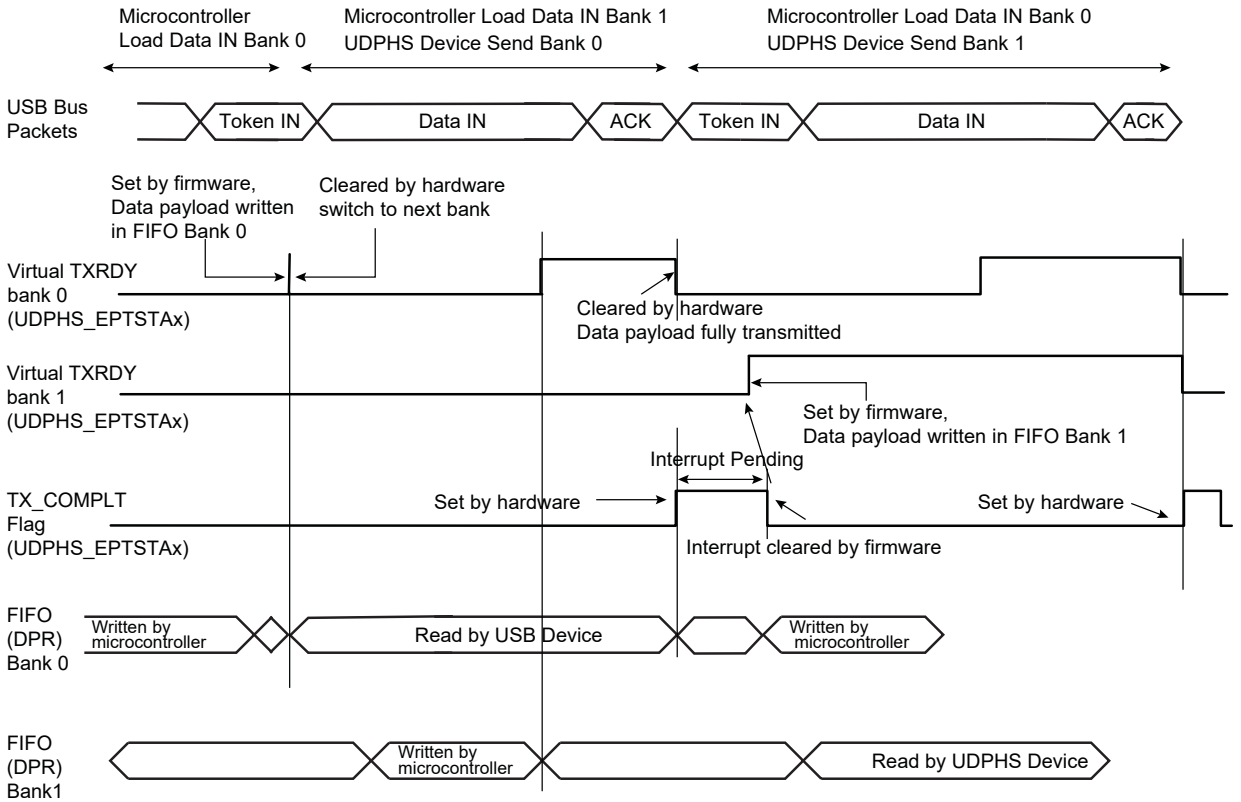

Figure 83.8. Data IN Followed By Status OUT Transfer at the End of a Control Transfer

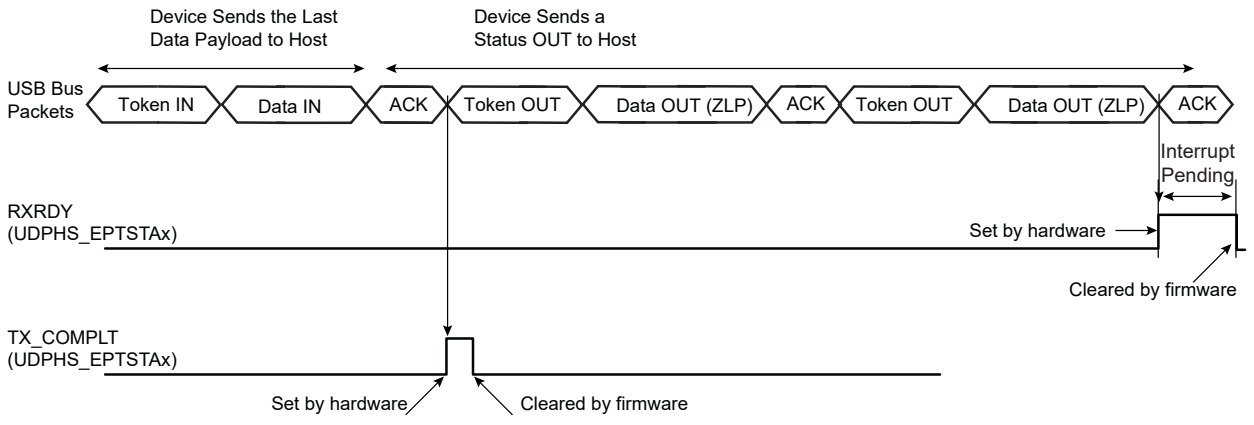
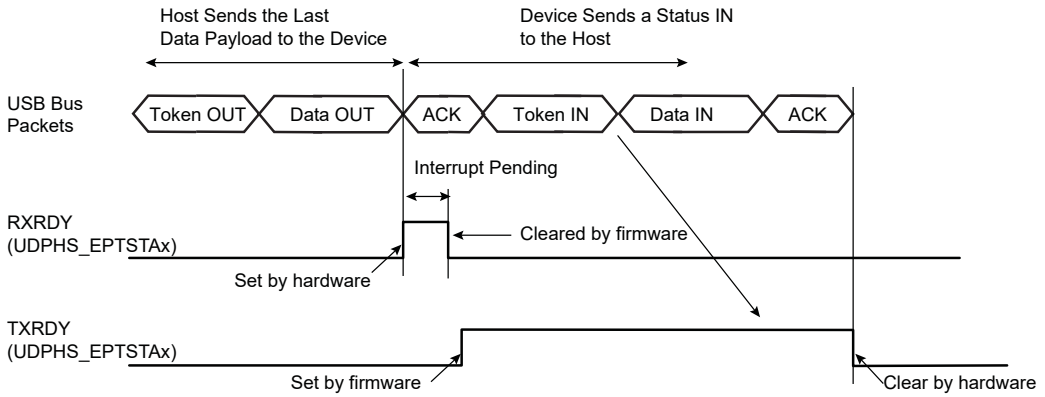


Note: A NAK handshake is always generated at the first status stage token.

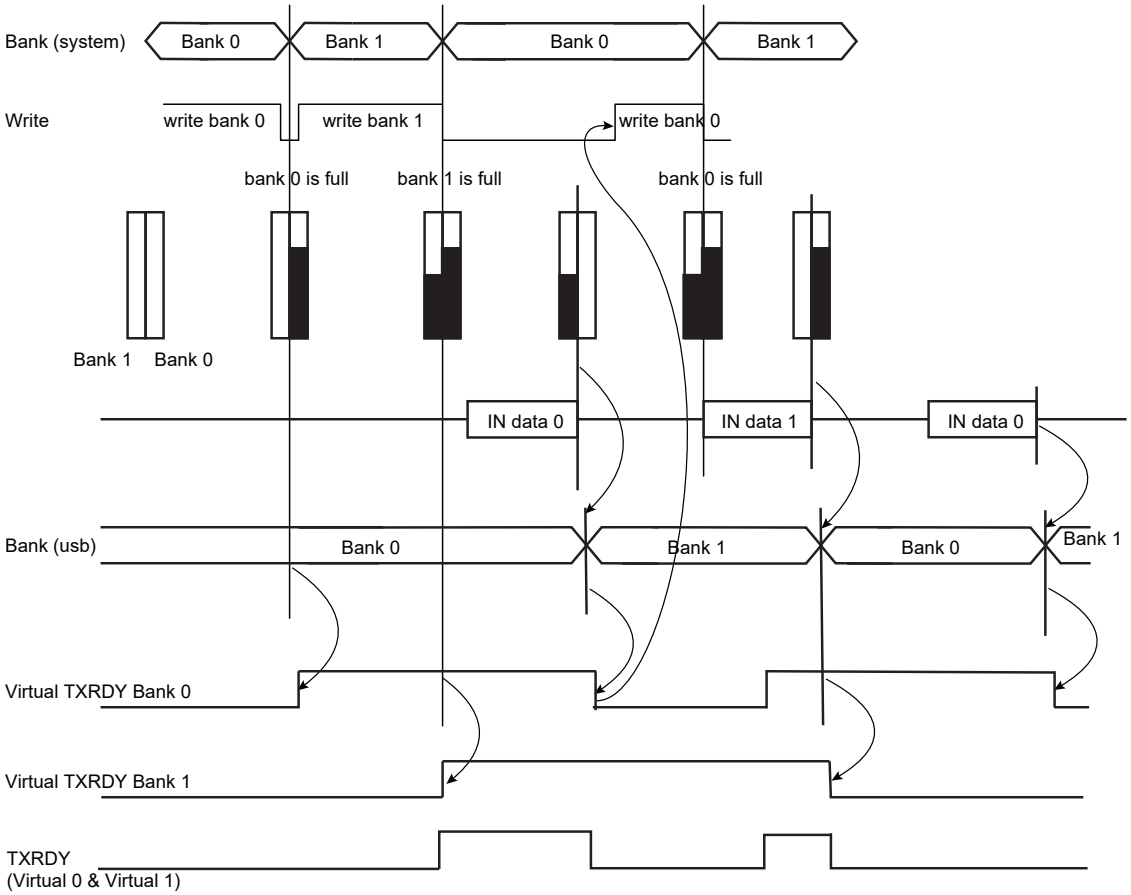
© 2025 Microchip Technology Inc. and its subsidiaries

Figure 83.9. Data OUT Followed by Status IN Transfer



Note: Before proceeding to the status stage, the software should determine that there is no risk of extra data from the host (data stage). If not certain (non-predictable data stage length), then the software should wait for a NAK-IN interrupt before proceeding to the status stage. This precaution should be taken to avoid collision in the FIFO.

Figure 83.10. Autovalid with DMA



Note: In the illustration above, Autovalid validates a bank as full, although this might not be the case, in order to continue processing data and to send to DMA.

- Isochronous IN

© 2025 Microchip Technology Inc. and its subsidiaries

Isochronous-IN is used to transmit a stream of data whose timing is implied by the delivery rate. Isochronous transfer provides periodic, continuous communication between host and device.

It ensures bandwidth and low latencies appropriate for telephony, audio, video, etc.

If the endpoint is not available (TXRDY_TRER = 0), then the device does not answer the host. An ERR_FL_ISO interrupt is generated in the UDPHS_EPTSTAx register and, once enabled, sent to the CPU.

The STALL_SNT command bit is not used for an ISO-IN endpoint.

- High Bandwidth Isochronous Endpoint Handling: IN Example
  For high bandwidth isochronous endpoints, the DMA can be programmed with the number of transactions (UDPHS_DMACONTROLx.BUFF_LENGTH) and the system should provide the required number of packets per microframe, otherwise, the host will notice a sequencing problem.

  A response should be made to the first token IN recognized inside a microframe under the following conditions:
  - If at least one bank has been validated, the correct DATAx corresponding to the programmed Number Of Transactions per Microframe (NB_TRANS) should be answered. In case of a subsequent missed or corrupted token IN inside the microframe, the USB 2.0 Core available data bank(s) that should normally have been transmitted during that microframe shall be flushed at its end. If this flush occurs, an error condition is flagged (UDPHS_EPTSTAx.ERR_FLUSH is set).
  - If no bank is validated yet, the default DATA0 ZLP is answered and underflow is flagged (UDPHS_EPTSTAx.ERR_FL_ISO is set). Then, no data bank is flushed at the microframe end.
  - If no data bank has been validated at the time when a response should be made for the second transaction of NB_TRANS = 3 transactions microframe, a DATA1 ZLP is answered and underflow is flagged (UDPHS_EPTSTAx.ERR_FL_ISO is set). If and only if remaining untransmitted banks for that microframe are available at its end, they are flushed and an error condition is flagged (UDPHS_EPTSTAx.ERR_FLUSH is set).
  - If no data bank has been validated at the time when a response should be made for the last programmed transaction of a microframe, a DATA0 ZLP is answered and underflow is flagged (UDPHS_EPTSTAx.ERR_FL_ISO is set). If and only if the remaining untransmitted data bank for that microframe is available at its end, it is flushed and an error condition is flagged (UDPHS_EPTSTAx.ERR_FLUSH is set).

If at the end of a microframe no valid token IN has been recognized, no data bank is flushed and no error condition is reported.

At the end of a microframe in which at least one data bank has been transmitted, if less than NB_TRANS banks have been validated for that microframe, an error condition is flagged (UDPHS_EPTSTAx.ERR_TRANS is set).

Error cases (in UDPHS_EPTSTAx):

- ERR_FL_ISO: There was no data to transmit inside a microframe, so a ZLP is answered by default.
- ERR_FLUSH: At least one packet has been sent inside the microframe, but the number of token INs received is less than the number of transactions actually validated (TXRDY_TRER) and likewise with the NB_TRANS programmed.
- ERR_TRANS: At least one packet has been sent inside the microframe, but the number of token INs received is less than the number of programmed NB_TRANS transactions and the packets not requested were not validated.
- ERR_FL_ISO + ERR_FLUSH: At least one packet has been sent inside the microframe, but the data has not been validated in time to answer one of the following token INs.

© 2025 Microchip Technology Inc. and its subsidiaries

- ERR_FL_ISO + ERR_TRANS: At least one packet has been sent inside the microframe, but the data has not been validated in time to answer one of the following token INs and the data can be discarded at the microframe end.
- ERR_FLUSH + ERR_TRANS: The first token IN has been answered and it was the only one received, a second bank has been validated but not the third, whereas NB_TRANS was waiting for three transactions.
- ERR_FL_ISO + ERR_FLUSH + ERR_TRANS: The first token IN has been treated, the data for the second Token IN was not available in time, but the second bank has been validated before the end of the microframe. The third bank has not been validated, but three transactions have been set in NB_TRANS.

83.5.9.4.Data OUT

- Bulk OUT or Interrupt OUT
  Like data IN, data OUT packets are sent by the host during the data or the status stage of control transfer or during an interrupt/bulk/isochronous OUT transfer. Data buffers are sent packet by packet under the control of the application or under the control of the DMA channel.
- Bulk OUT or Interrupt OUT: Receiving a Packet Under Application Control (Host to Device)
  Algorithm Description for Each Packet:
  - The application enables an interrupt on RXRDY_TXKL.
  - When an interrupt on RXRDY_TXKL is received, the application knows that UDPHS_EPTSTAx register BYTE_COUNT bytes have been received.
  - The application reads the BYTE_COUNT bytes from the endpoint.
  - The application clears RXRDY_TXKL.
    Note: If the application does not know the size of the transfer, it may not be a good option to use AUTO_VALID. Because if a zero-length-packet is received, the RXRDY_TXKL is automatically cleared by the AUTO_VALID hardware and if the endpoint interrupt is triggered, the software will not find its originating flag when reading the UDPHS_EPTSTAx register.

  Algorithm to Fill Several Packets
  - The application enables the interrupts of BUSY_BANK and AUTO_VALID.
  - When a BUSY_BANK interrupt is received, the application knows that all banks available for the endpoint have been filled. Thus, the application can read all banks available.

  If the application does not know the size of the receive buffer, instead of using the BUSY_BANK interrupt, the application must use RXRDY_TXKL.
- Bulk OUT or Interrupt OUT: Sending a Buffer Using DMA (Host To Device)

To use the DMA setting, the AUTO_VALID field is mandatory.

See Bulk IN or Interrupt IN: Sending a Buffer Using DMA (Device to Host) for more information.

DMA Configuration Example:

1. First program UDPHS_DMAADDRESSx with the address of the buffer that should be transferred.
2. Enable the interrupt of the DMA in the Interrupt Enable register (UDPHS_IEN).
3. Program the DMA Channelx Control Register:
   - Size of buffer to be sent.
   - END_B_EN: Can be used for OUT packet truncation (discarding of unbuffered packet data) at the end of DMA buffer.
   - END_BUFFIT: Generate an interrupt when UDPHS_DMASTATUSx.BUFF_COUNT reaches 0.
   - END_TR_EN: End of transfer enable, the UDPHS device can put an end to the current DMA transfer, in case of a short packet.

© 2025 Microchip Technology Inc. and its subsidiaries

- END_TR_IT: End of transfer interrupt enable, an interrupt is sent after the last USB packet has been transferred by the DMA, if the USB transfer ended with a short packet. (Beneficial when the receive size is unknown.)
- CHANN_ENB: Run and stop at end of buffer.

For OUT transfer, the bank will be automatically cleared by hardware when the application has read all the bytes in the bank (the bank is empty).

Notes:

1. When a zero-length-packet is received, UDPHS_EPTSTAx.RXRDY_TXKL is cleared automatically by AUTO_VALID, and the application knows of the end of buffer by the presence of the END_TR_IT.
2. If the host sends a zero-length packet, and the endpoint is free, then the device sends an ACK. No data is written in the endpoint, the RXRDY_TXKL interrupt is generated, and the UDPHS_EPTSTAx.BYTE_COUNT field is null.

Figure 83.11. Data OUT Transfer for Endpoint with One Bank

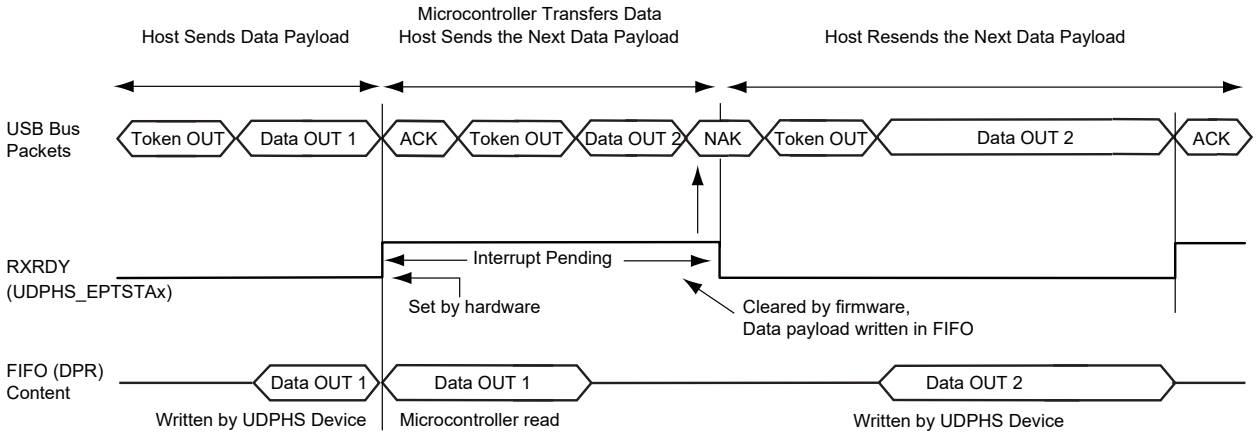


Figure 83.12. Data OUT Transfer for an Endpoint with Two Banks

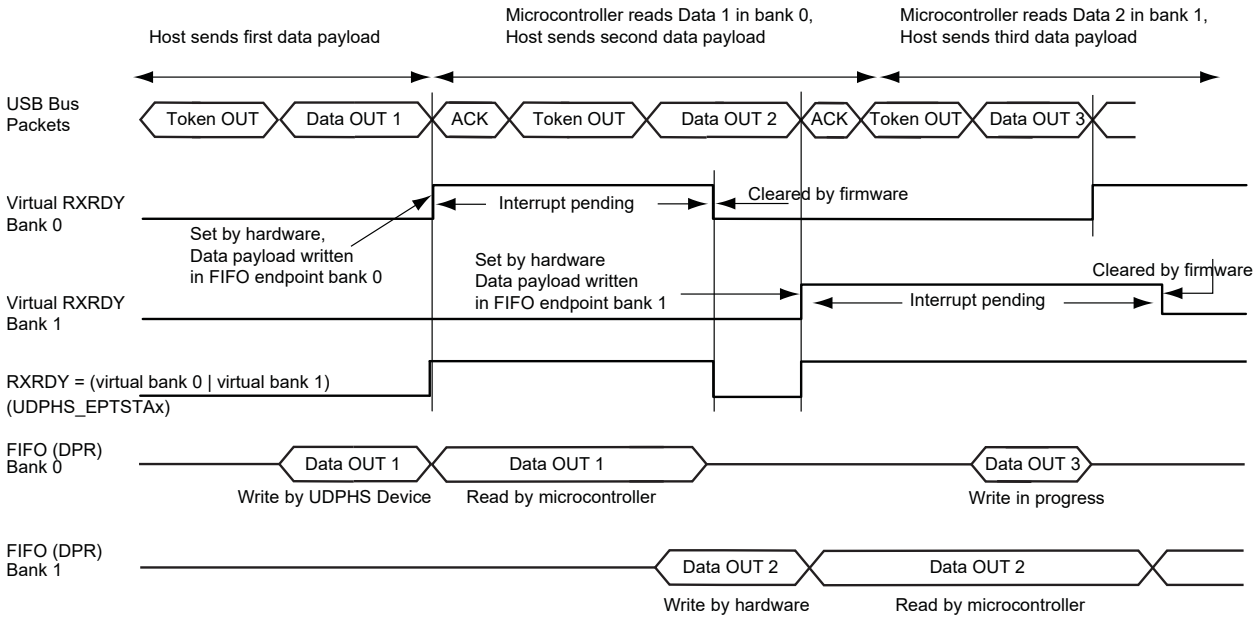


- High Bandwidth Isochronous Endpoint OUT

© 2025 Microchip Technology Inc. and its subsidiaries

USB 2.0 supports individual High Speed isochronous endpoints that require data rates up to 192 Mb/s (24 MB/s): 3x1024 data bytes per microframe.

To support such a rate, two or three banks may be used to buffer the three consecutive data packets. The microcontroller (or the DMA) should be able to empty the banks very rapidly (at least 24 MB/s on average).

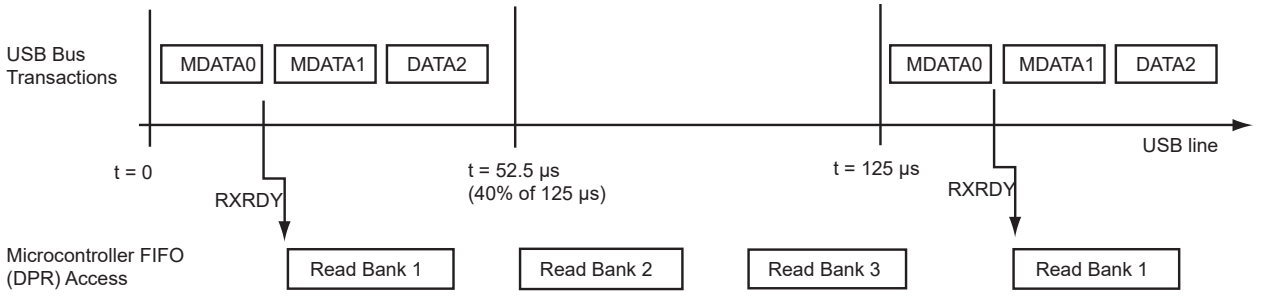
NB_TRANS field in UDPHS_EPTCFGx register = Number Of Transactions per Microframe.

If NB_TRANS > 1 then it is High Bandwidth.

Example:

- If NB_TRANS = 3, the sequence should be either one of the following:
  - MData0
  - MData0/Data1
  - MData0/Data1/Data2
- If NB_TRANS = 2, the sequence should be either one of the following:
  - MData0
  - MData0/Data1
- If NB_TRANS = 1, the sequence should be:
  - Data0

Figure 83.13. Bank Management, Example of Three Transactions per Microframe



- Isochronous Endpoint Handling: OUT Example
  The user can ascertain the bank status (free or busy), and the toggle sequencing of the data packet for each bank with the UDPHS_EPTSTAx register in the three fields as follows:
  - TOGGLESQ_STA: PID of the data stored in the current bank.
  - CURBK: Number of the bank currently being accessed by the microcontroller.
  - BUSY_BANK_STA: Number of busy bank.

  This is particularly useful in case of a missing data packet.

  If the inter-packet delay between the OUT token and the Data is greater than the USB standard, then the ISO-OUT transaction is ignored. (Payload data is not written, no interrupt is generated to the CPU.)

  If there is a data CRC (Cyclic Redundancy Check) error, the payload is, none the less, written in the endpoint. The UDPHS_EPTSTAx.ERR_CRC_NTR flag is set.

  If the endpoint is already full, the packet is not written in the DPRAM. The UDPHS_EPTSTAx.ERR_FL_ISO flag is set.

  If the payload data is greater than the maximum size of the endpoint, then the ERR_OVFLW flag is set. It is the task of the CPU to manage this error. The data packet is written in the endpoint (except the extra data).

© 2025 Microchip Technology Inc. and its subsidiaries

If the host sends a Zero Length Packet, and the endpoint is free, no data is written in the endpoint, the RXRDY_TXKL flag is set, and the UDPHS_EPTSTAx.BYTE_COUNT field is null.

The FRCESTALL command bit is unused for an isochronous endpoint.

Otherwise, payload data is written in the endpoint, the RXRDY_TXKL interrupt is generated and BYTE_COUNT is updated.

83.5.9.5.STALL

STALL is returned by a function in response to an IN token or after the data phase of an OUT or in response to a PING transaction. STALL indicates that a function is unable to transmit or receive data, or that a control pipe request is not supported.

- OUT

To stall an endpoint, set the FRCESTALL bit in UDPHS_EPTSETSTAx register and after the STALL_SNT flag has been set, set the TOGGLE_SEG bit in the UDPHS_EPTCLRSTAx register.

- IN

Set the FRCESTALL bit in UDPHS_EPTSETSTAx register.

Figure 83.14. Stall Handshake Data OUT Transfer

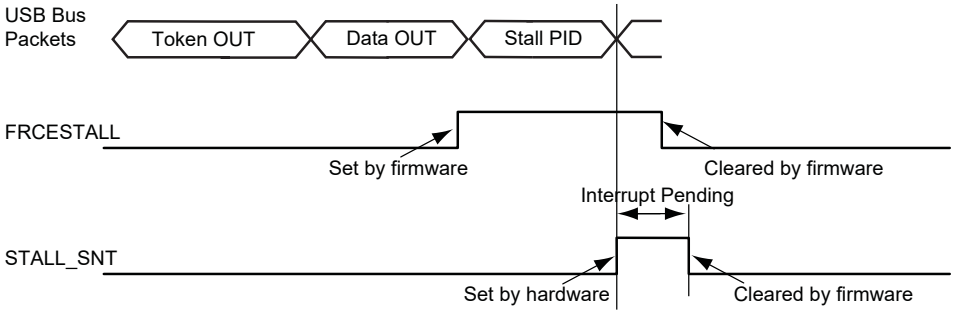


Figure 83.15. Stall Handshake Data IN Transfer

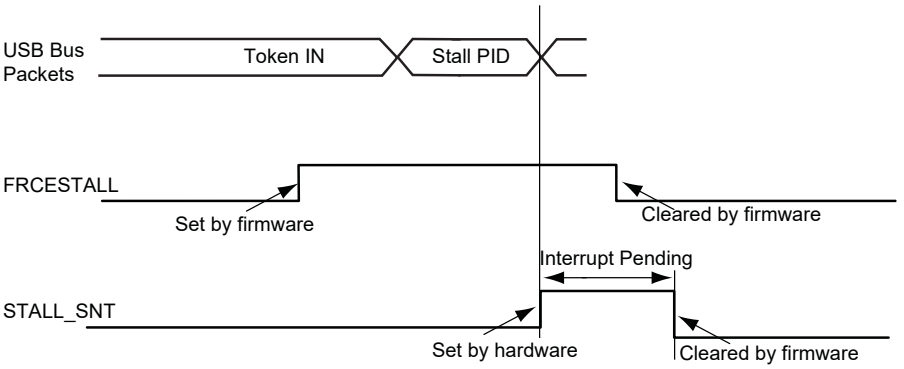

83.5.10. Speed Identification

The high speed reset is managed by hardware.

At the connection, the host makes a reset which could be a classic reset (full speed) or a high speed reset.

At the end of the reset process (full or high), the ENDRESET interrupt is generated.

Then the CPU should read the SPEED bit in UDPHS_INTSTAx to ascertain the speed mode of the device.

© 2025 Microchip Technology Inc. and its subsidiaries

83.5.11. USB V2.0 High Speed Global Interrupt

Interrupts are defined in UDPHS_IEN and in UDPHS_INTSTA (Interrupt Status register).

83.5.12. Endpoint Interrupts

Interrupts are enabled in UDPHS_IEN and individually masked in UDPHS_EPTCTLENBx.

Table 83.4. Endpoint Interrupt Source Masks

Acronym	Description
SHRT_PCKT	Short packet interrupt
BUSY_BANK	Busy bank interrupt
NAK_OUT	NAKOUT interrupt
NAK_IN/ERR_FLUSH	NAKIN/error flush interrupt
STALL_SNT/ERR_CRC_NTR	Stall sent/CRC error/number of transaction error interrupt
RX_SETUP/ERR_FL_ISO	Received SETUP/error flow interrupt
TXRDY_TRER	TX packet read/transaction error interrupt
TX_COMPLT	Transmitted IN data complete interrupt
RXRDY_TXKL	Received OUT data interrupt
ERR_OVFLW	Overflow error interrupt
MDATA_RX	MDATA interrupt
DATAX_RX	DATAx interrupt

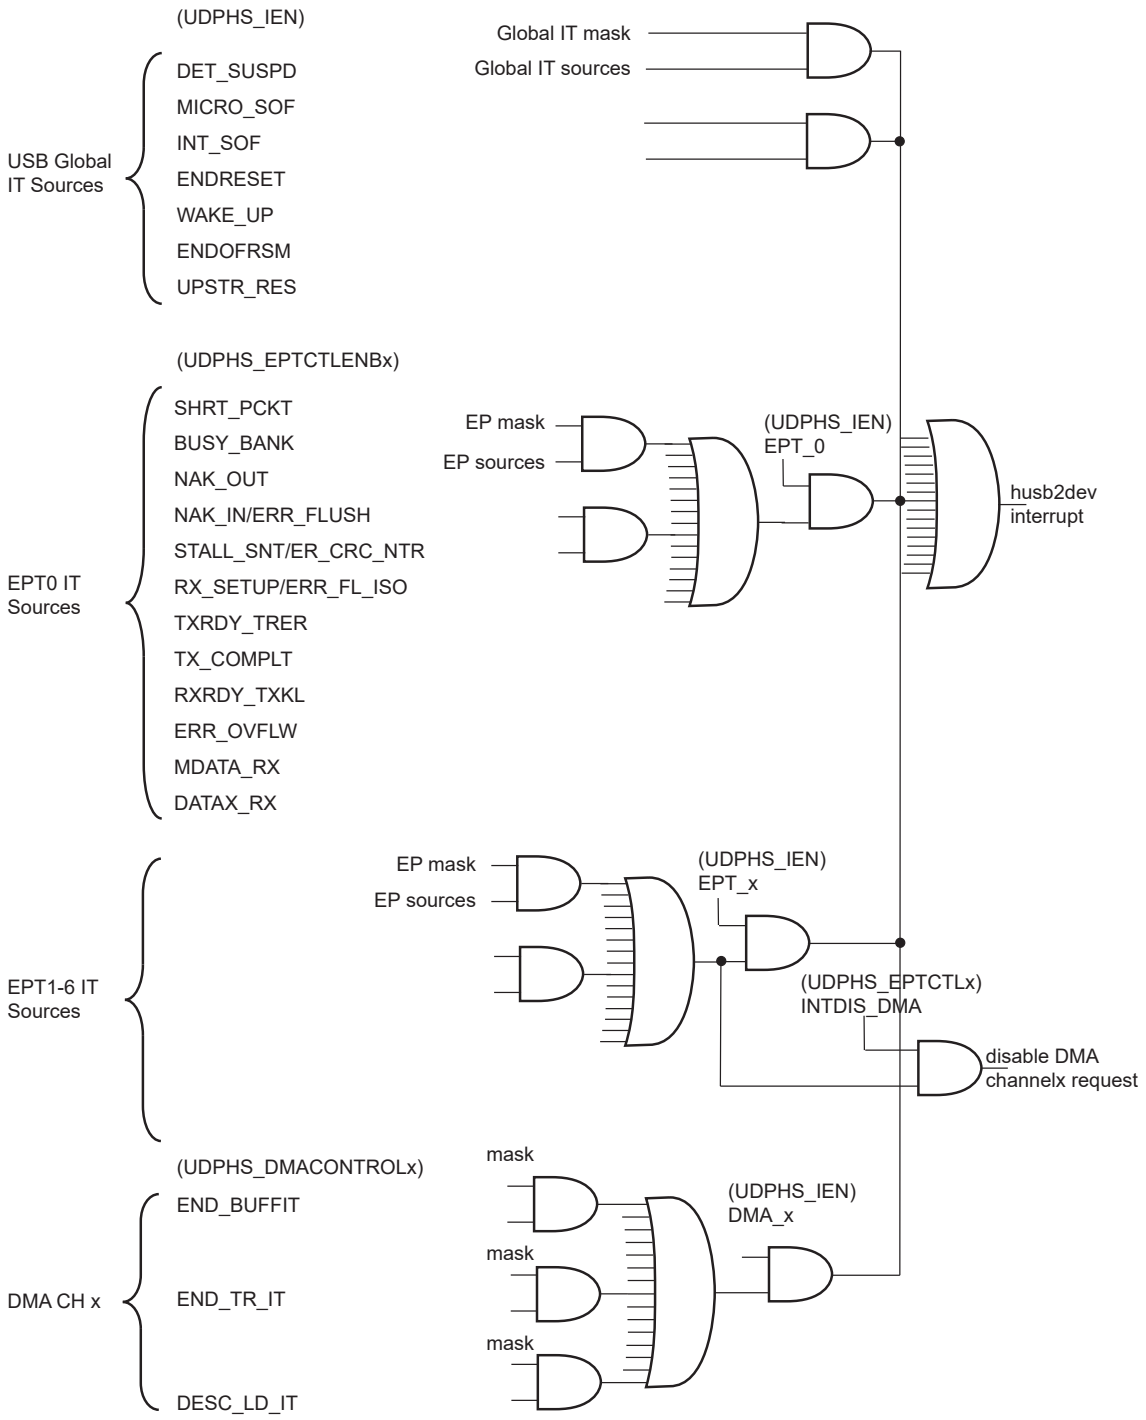
Figure 83.16. UDPHS Interrupt Control Interface



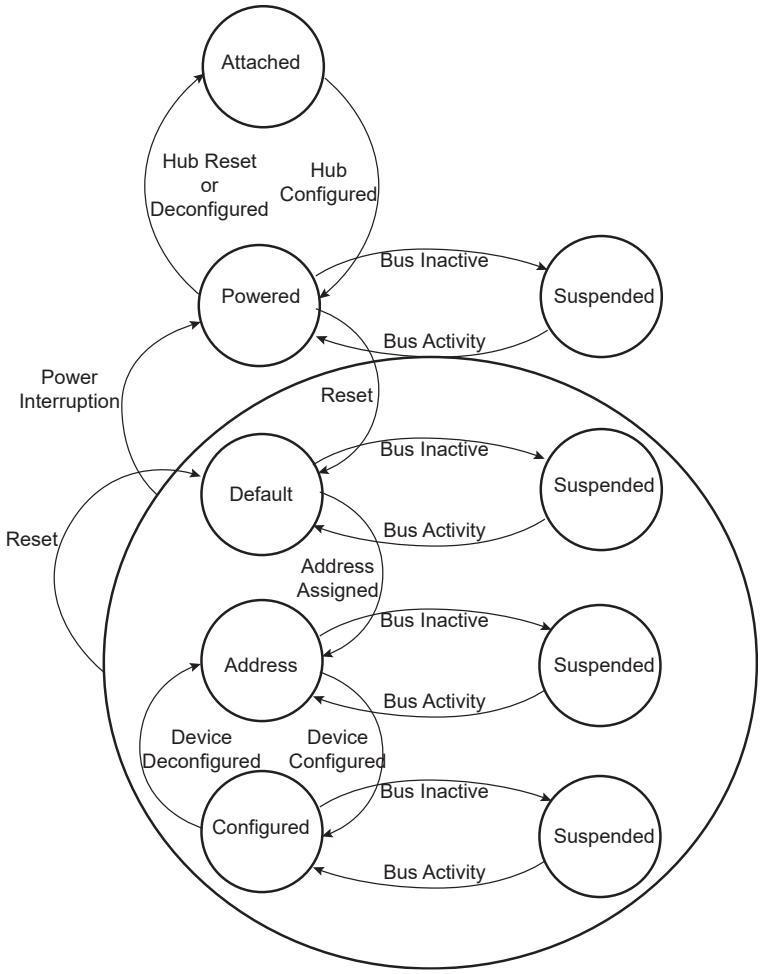
83.5.13. Power Modes

83.5.13.1.Controlling Device States

A USB device has several possible states. Refer to Chapter 9 (USB Device Framework) of the Universal Serial Bus Specification, Rev 2.0.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 83.17. UDPHS Device State Diagram



Movement from one state to another depends on the USB bus state or on standard requests sent through control transactions via the default endpoint (endpoint 0).

After a period of bus inactivity, the USB device enters Suspend mode. Accepting Suspend/Resume requests from the USB host is mandatory. Constraints in Suspend mode are very strict for bus-powered applications; devices may not consume more than 500 µA on the USB bus.

While in Suspend mode, the host may wake up a device by sending a resume signal (bus activity) or a USB device may send a wake-up request to the host (waking up a PC by moving a USB mouse, for example).

The wake-up feature is not mandatory for all devices and must be negotiated with the host.

83.5.13.2.Not Powered State

Self powered devices can detect 5V VBUS using a PIO. When the device is not connected to a host, device power consumption can be reduced by the DETACH bit in UDPHS_CTRL. Disabling the transceiver is automatically done. HSDM, HSDP, FSDP and FSDP lines are tied to GND pulldowns integrated in the hub downstream ports.

83.5.13.3.Entering Attached State

When no device is connected, the USB FSDP and FSDM signals are tied to GND by 15 KΩ pulldowns integrated in the hub downstream ports. When a device is attached to an hub downstream port, the device connects a 1.5 KΩ pullup on FSDP. The USB bus line goes into IDLE state, FSDP is pulled up by the device 1.5 KΩ resistor to 3.3V and FSDM is pulled down by the 15 KΩ resistor to GND of the host.

© 2025 Microchip Technology Inc. and its subsidiaries

After pullup connection, the device enters the powered state. The transceiver remains disabled until bus activity is detected.

In case of low power consumption need, the device can be stopped. When the device detects the VBUS, the software must enable the USB transceiver by enabling the EN_UDPHS bit in UDPHS_CTRL register.

The software can detach the pullup by setting DETACH bit in UDPHS_CTRL register.

83.5.13.4.From Powered State to Default State (Reset)

After its connection to a USB host, the USB device waits for an end-of-bus reset. The unmasked flag ENDRESET is set in the UDPHS_IEN register and an interrupt is triggered.

Once the ENDRESET interrupt has been triggered, the device enters Default State. In this state, the UDPHS software must:

- Enable the default endpoint, setting the EPT_ENABL flag in the UDPHS_EPTCTLENB[0] register and, optionally, enabling the interrupt for endpoint 0 by writing 1 in EPT_0 of the UDPHS_IEN register. The enumeration then begins by a control transfer.
- Configure the Interrupt Mask Register which has been reset by the USB reset detection
- Enable the transceiver.

In this state, the EN_UDPHS bit in UDPHS_CTRL register must be enabled.

83.5.13.5.From Default State to Address State (Address Assigned)

After a Set Address standard device request, the USB host peripheral enters the address state.

WARNING Before the device enters address state, it must achieve the Status IN transaction of the control transfer, i.e., the UDPHS device sets its new address once the TX_COMPLT flag in the UDPHS_EPTCTL[0] register has been received and cleared.

To move to address state, the driver software sets the DEV_ADDR field and the FADDR_EN flag in the UDPHS_CTRL register.

83.5.13.6.From Address State to Configured State (Device Configured)

Once a valid Set Configuration standard request has been received and acknowledged, the device enables endpoints corresponding to the current configuration. This is done by setting the BK_NUMBER, EPT_TYPE, EPT_DIR and EPT_SIZE fields in the UDPHS_EPTCFGx registers and enabling them by setting the EPT_ENABL flag in the UDPHS_EPTCTLENBx registers, and, optionally, enabling corresponding interrupts in the UDPHS_IEN register.

83.5.13.7.Entering Suspend State (Bus Activity)

When a Suspend (no bus activity on the USB bus) is detected, the DET_SUSPD signal in the UDPHS_STA register is set. This triggers an interrupt if the corresponding bit is set in the UDPHS_IEN register. This flag is cleared by writing to the UDPHS_CLRINT register. Then the device enters Suspend mode.

In this state bus powered devices must drain less than 500 µA from the 5V VBUS. As an example, the microcontroller switches to slow clock, disables the PLL and main oscillator, and goes into Idle mode. It may also switch off other devices on the board.

The UDPHS device peripheral clocks can be switched off. Resume event is asynchronously detected.

83.5.13.8.Receiving a Host Resume

In Suspend mode, a resume event on the USB bus line is detected asynchronously, transceiver and clocks disabled (however, the pullup should not be removed).

© 2025 Microchip Technology Inc. and its subsidiaries

Once the resume is detected on the bus, the signal WAKE_UP in the UDPHS_INTSTA is set. It may generate an interrupt if the corresponding bit in the UDPHS_IEN register is set. This interrupt may be used to wake up the core, enable PLL and main oscillators and configure clocks.

83.5.13.9.Sending an External Resume

In Suspend State it is possible to wake up the host by sending an external resume.

The device waits at least 5 ms after being entered in Suspend State before sending an external resume.

The device must force a K state from 1 to 15 ms to resume the host.

83.5.14. Test Mode

A device must support the TEST_MODE feature when in the Default, Address or Configured High Speed device states.

TEST_MODE can be:

- Test_J
- Test_K
- Test_Packet
- Test_SEO_NAK

(See UDPHS Test Register for definitions of each test mode.)

```
const char test_packet_buffer[] = {
0x00,0x00,0x00,0x00,0x00,0x00,0x00,0x00,0x00,                 // JKJKJKJK * 9
0xAA,0xAA,0xAA,0xAA,0xAA,0xAA,0xAA,0xAA,                      // JJKKJJKK * 8
0xEE,0xEE,0xEE,0xEE,0xEE,0xEE,0xEE,0xEE,                      // JJKKJJKK * 8
0xFE,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF,0xFF, // JJJJJJJKKKKKKK * 8
0x7F,0xBF,0xDF,0xEF,0xF7,0xFB,0xFD,                           // JJJJJJJK * 8
0xFC,0x7E,0xBF,0xDF,0xEF,0xF7,0xFB,0xFD,0x7E                  // {JKKKKKKK * 10}, JK
};
```

83.6. Register Summary

Notes: The registers below have two modes: Control, Bulk, Interrupt Endpoints mode and Isochronous Endpoints mode. In this register summary, both modes are displayed at the same offset.

- UDPHS_EPTCTLENB
- UDPHS_EPTCTLDIS
- UDPHS_EPTCTL
- UDPHS_EPTSETSTA
- UDPHS_EPTCLRSTA
- UDPHS_EPTSTA

83.6.1. UDPHS Control Register

Name: UDPHS_CTRL
Offset: 0x00
Reset: 0x00000200
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
					PULLD_DIS	REWAKEUP	DETACH	EN_UDPHS
Access					R/W	R/W	R/W	R/W
Reset					0	0	1	0

Bit	7	6	5	4	3	2	1	0
	FADDR_EN	DEV_ADDR[6:0]						
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 11 – PULLD_DIS Pulldown Disable (cleared upon USB reset)
When set, there is no pulldown on DP & DM. (DM Pulldown = DP Pulldown = 0).
Note: If the DETACH bit is also set, device DP & DM are left in High Impedance state.

See description of bit “DETACH”.

DETACH	PULLD_DIS	DP	DM	Condition
0	0	Pullup	Pulldown	Not recommended
0	1	Pullup	High impedance state	VBUS present
1	0	Pulldown	Pulldown	No VBUS
1	1	High Impedance state	High Impedance state	VBUS present & software disconnect

Bit 10 – REWAKEUP Send Remote Wake-Up (cleared upon USB reset)
An Upstream Resume is sent only after the UDPHS bus has been in Suspend state for at least 5 ms.
This bit is automatically cleared by hardware at the end of the Upstream Resume.

Value	Description
0	Remote Wake-Up is disabled (read), or this bit has no effect (write).
1	Remote Wake-Up is enabled (read), or this bit forces an external interrupt on the UDPHS controller for Remote Wake-Up purposes.

Bit 9 – DETACH Detach Command
See description of bit “PULL_DIS”.

Value	Description
0	UDPHS is attached (read), or this bit pulls up the DP line (attach command) (write).
1	UDPHS is detached, UTMI transceiver is suspended (read), or this bit simulates a detach on the UDPHS line and forces the UTMI transceiver into Suspend state (Suspend M = 0) (write).

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 8 – EN_UDPHS UDPHS Enable

Value	Description
0	UDPHS is disabled (read), or this bit disables and resets the UDPHS controller (write). Switch the UHPHS to UTMI.
1	UDPHS is enabled (read), or this bit enables the UDPHS controller (write). Switch the UDPHS to UTMI.

Bit 7 – FADDR_EN Function Address Enable (cleared upon USB reset)

Value	Description
0	The device is not in Address state (read), or only the default function address is used (write).
1	The device is in Address state (read), or this bit is set by the device firmware after a successful status phase of a SET_ADDRESS transaction (write). When set, the only address accepted by the UDPHS controller is the one stored in the UDPHS Address field. It will not be cleared afterwards by the device firmware. It is cleared by hardware on hardware reset, or when UDPHS bus reset is received.

Bits 6:0 – DEV_ADDR[6:0] UDPHS Address (cleared upon USB reset)

This field contains the default address (0) after power-up or UDPHS bus reset (read), or it is written with the value set by a SET_ADDRESS request received by the device firmware (write).

© 2025 Microchip Technology Inc. and its subsidiaries

83.6.2. UDPHS Frame Number Register

Name: UDPHS_FNUM
Offset: 0x04
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	FNUM_ERR							
Access	R							
Reset	0							

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
			FRAME_NUMBER[10:5]					
Access			R	R	R	R	R	R
Reset			0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	FRAME_NUMBER[4:0]					MICRO_FRAME_NUM[2:0]		
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit 31 – FNUM_ERR Frame Number CRC Error (cleared upon USB reset)
This bit is set by hardware when a corrupted Frame Number in Start of Frame packet (or Micro SOF) is received.
This bit and the INT_SOF (or MICRO_SOF) interrupt are updated at the same time.

Bits 13:3 – FRAME_NUMBER[10:0] Frame Number as defined in the Packet Field Formats (cleared upon USB reset)
This field is provided in the last received SOF packet (see UDPHS_IEN.INT_SOF).

Bits 2:0 – MICRO_FRAME_NUM[2:0] Microframe Number (cleared upon USB reset)
Number of the received microframe (0 to 7) in one frame.This field is reset at the beginning of each new frame (1 ms).
One microframe is received each 125 microseconds (1 ms/8).

© 2025 Microchip Technology Inc. and its subsidiaries

83.6.3. UDPHS Interrupt Enable Register

Name: UDPHS_IEN
Offset: 0x10
Reset: 0x00000010
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
	DMA_7	DMA_6	DMA_5	DMA_4	DMA_3	DMA_2	DMA_1	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	0	0	0	0

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	UPSTR_RES	ENDOFRSM	WAKE_UP	ENDRESET	INT_SOF	MICRO_SOF	DET_SUSPD	
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	
Reset	0	0	0	1	0	0	0	

Bits 25, 26, 27, 28, 29, 30, 31 – DMA_x DMA Channel x Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable the interrupts for this channel.
1	Enable the interrupts for this channel.

Bits 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23 – EPT_x Endpoint x Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable the interrupts for this endpoint.
1	Enable the interrupts for this endpoint.

Bit 7 – UPSTR_RES Upstream Resume Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable Upstream Resume Interrupt.
1	Enable Upstream Resume Interrupt.

Bit 6 – ENDOFRSM End Of Resume Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable Resume Interrupt.
1	Enable Resume Interrupt.

Bit 5 – WAKE_UP Wake Up CPU Interrupt Enable (cleared upon USB reset)

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Disable Wake-up CPU Interrupt.
1	Enable Wake-up CPU Interrupt.

Bit 4 – ENDRESET End Of Reset Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable End Of Reset Interrupt.
1	Enable End Of Reset Interrupt. Automatically enabled after USB reset.

Bit 3 – INT_SOF SOF Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable SOF Interrupt.
1	Enable SOF Interrupt.

Bit 2 – MICRO_SOF Micro-SOF Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable Micro-SOF Interrupt.
1	Enable Micro-SOF Interrupt.

Bit 1 – DET_SUSPD Suspend Interrupt Enable (cleared upon USB reset)

Value	Description
0	Disable Suspend Interrupt.
1	Enable Suspend Interrupt.

© 2025 Microchip Technology Inc. and its subsidiaries

83.6.4. UDPHS Interrupt Status Register

Name: UDPHS_INTSTA
Offset: 0x14
Reset: 0x00000000
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	DMA_7	DMA_6	DMA_5	DMA_4	DMA_3	DMA_2	DMA_1	
Access	R	R	R	R	R	R	R	
Reset	0	0	0	0	0	0	0	

Bit	23	22	21	20	19	18	17	16

Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
	EPT_7	EPT_6	EPT_5	EPT_4	EPT_3	EPT_2	EPT_1	EPT_0
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	UPSTR_RES	ENDOFRSM	WAKE_UP	ENDRESET	INT_SOF	MICRO_SOF	DET_SUSPD	SPEED
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bits 25, 26, 27, 28, 29, 30, 31 – DMA_x DMA Channel x Interrupt

Value	Description
0	Reset when the UDPHS_DMASTATUSx interrupt source is cleared.
1	Set by hardware when an interrupt is triggered by the DMA Channelx and this endpoint interrupt is enabled by the DMA_x bit in UDPHS_IEN.

Bits 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23 – EPT_x Endpoint x Interrupt (cleared upon USB reset)

Value	Description
0	Reset when the UDPHS_EPTSTAx interrupt source is cleared.
1	Set by hardware when an interrupt is triggered by the UDPHS_EPTSTAx register and this endpoint interrupt is enabled by the EPT_x bit in UDPHS_IEN.

Bit 7 – UPSTR_RES Upstream Resume Interrupt

Value	Description
0	Cleared by setting the UPSTR_RES bit in UDPHS_CLRINT.
1	Set by hardware when the UDPHS controller is sending a resume signal called “upstream resume”. This triggers a UDPHS interrupt when the UPSTR_RES bit is set in UDPHS_IEN.

Bit 6 – ENDOFRSM End Of Resume Interrupt

Value	Description
0	Cleared by setting the ENDOFRSM bit in UDPHS_CLRINT.
1	Set by hardware when the UDPHS controller detects a good end of resume signal initiated by the host. This triggers a UDPHS interrupt when the ENDOFRSM bit is set in UDPHS_IEN.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 5 – WAKE_UP Wake Up CPU Interrupt

Value	Description
0	Cleared by setting the WAKE_UP bit in UDPHS_CLRINT.
1	Set by hardware when the UDPHS controller is in SUSPEND state and is re-activated by a filtered non-idle signal from the UDPHS line (not by an upstream resume). This triggers a UDPHS interrupt when the WAKE_UP bit is set in UDPHS_IEN register. When receiving this interrupt, the user has to enable the device controller clock prior to operation. **Note:** this interrupt is generated even if the device controller clock is disabled.

Bit 4 – ENDRESET End Of Reset Interrupt

Value	Description
0	Cleared by setting the ENDRESET bit in UDPHS_CLRINT.
1	Set by hardware when an End Of Reset has been detected by the UDPHS controller. This triggers a UDPHS interrupt when the ENDRESET bit is set in UDPHS_IEN.

Bit 3 – INT_SOF Start Of Frame Interrupt

Note: The Micro Start Of Frame Interrupt (MICRO_SOF), and the Start Of Frame Interrupt (INT_SOF) are not generated at the same time.

Value	Description
0	Cleared by setting the INT_SOF bit in UDPHS_CLRINT.
1	Set by hardware when an UDPHS Start Of Frame PID (SOF) has been detected (every 1 ms) or synthesized by UDPHS. This triggers a UDPHS interrupt when the INT_SOF bit is set in UDPHS_IEN register. In case of detected SOF, in High Speed mode, the MICRO_FRAME_NUMBER field is cleared in UDPHS_FNUM register and the FRAME_NUMBER field is updated.

Bit 2 – MICRO_SOF Micro Start Of Frame Interrupt

Note: The Micro Start Of Frame Interrupt (MICRO_SOF), and the Start Of Frame Interrupt (INT_SOF) are not generated at the same time.

Value	Description
0	Cleared by setting the MICRO_SOF bit in UDPHS_CLRINT register.
1	Set by hardware when an UDPHS micro start of frame PID (SOF) has been detected (every 125 us) or synthesized by UDPHS. This triggers a UDPHS interrupt when the MICRO_SOF bit is set in UDPHS_IEN. In case of detected SOF, the MICRO_FRAME_NUM field in UDPHS_FNUM register is incremented and the FRAME_NUMBER field does not change.

Bit 1 – DET_SUSPD Suspend Interrupt

Value	Description
0	Cleared by setting the DET_SUSPD bit in UDPHS_CLRINT register.
1	Set by hardware when a UDPHS Suspend (Idle bus for three frame periods, a J state for 3 ms) is detected. This triggers a UDPHS interrupt when the DET_SUSPD bit is set in UDPHS_IEN register.

Bit 0 – SPEED Speed Status

Value	Description
0	Reset by hardware when the hardware is in Full Speed mode.
1	Set by hardware when the hardware is in High Speed mode.

Access	W	W	W	W	W	W	W	
Reset	–	–	–	–	–	–	–	

Bit 7 – UPSTR_RES Upstream Resume Interrupt Clear

Value	Description
0	No effect.
1	Clear the UPSTR_RES bit in UDPHS_INTSTA.

Bit 6 – ENDOFRSM End Of Resume Interrupt Clear

Value	Description
0	No effect.
1	Clear the ENDOFRSM bit in UDPHS_INTSTA.

Bit 5 – WAKE_UP Wake Up CPU Interrupt Clear

Value	Description
0	No effect.
1	Clear the WAKE_UP bit in UDPHS_INTSTA.

Bit 4 – ENDRESET End Of Reset Interrupt Clear

Value	Description
0	No effect.
1	Clear the ENDRESET bit in UDPHS_INTSTA.

Bit 3 – INT_SOF Start Of Frame Interrupt Clear

Value	Description
0	No effect.
1	Clear the INT_SOF bit in UDPHS_INTSTA.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 2 – MICRO_SOF Micro Start Of Frame Interrupt Clear

Value	Description
0	No effect.
1	Clear the MICRO_SOF bit in UDPHS_INTSTA.

Bit 1 – DET_SUSPD Suspend Interrupt Clear

Value	Description
0	No effect.
1	Clear the DET_SUSPD bit in UDPHS_INTSTA.

Bit	15	14	13	12	11	10	9	8
	EPT_15	EPT_14	EPT_13	EPT_12	EPT_11	EPT_10	EPT_9	EPT_8
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
	EPT_7	EPT_6	EPT_5	EPT_4	EPT_3	EPT_2	EPT_1	EPT_0
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bits 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15 – EPT_x Endpoint x Reset
Setting this bit clears all bits in Endpoint Status register (UDPHS_EPTSTAx), except the TOGGLESQ_STA field.

Value	Description
0	No effect.
1	Reset the Endpointx state.

© 2025 Microchip Technology Inc. and its subsidiaries

83.6.7. UDPHS Test Register

Name: UDPHS_TST
Offset: 0xE0
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
			OPMODE2	TST_PKT	TST_K	TST_J	SPEED_CFG[1:0]	
Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit 5 – OPMODE2 OpMode2

Note: For the Test mode, Test_SE0_NAK (refer to Universal Serial Bus Specification, Revision 2.0: 7.1.20, Test Mode Support). Force the device in High Speed mode, and configure a bulk-type endpoint. Do not fill this endpoint for sending NAK to the host.
Upon command, a port's transceiver must enter the High Speed Receive mode and remain in that mode until the exit action is taken. This enables the testing of output impedance, low level output voltage and loading characteristics. In addition, while in this mode, upstream facing ports (and only upstream facing ports) must respond to any IN token packet with a NAK handshake (only if the packet CRC is determined to be correct) within the normal allowed device response time. This enables testing of the device squelch level circuitry and, additionally, provides a general purpose stimulus/response test for basic functional testing.

Value	Description
0	No effect.
1	Set to force the OpMode signal (UTMI interface) to "10", to disable the bit-stuffing and the NRZI encoding.

Bit 4 – TST_PKT Test Packet Mode

Value	Description
0	No effect.
1	Set to repetitively transmit the packet stored in the current bank. This enables the testing of rise and fall times, eye patterns, jitter, and any other dynamic waveform specifications.

Bit 3 – TST_K Test K Mode

Value	Description
0	No effect.
1	Set to send the K state on the UDPHS line. This enables the testing of the high output drive level on the D- line.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 2 – TST_J Test J Mode

Value	Description
0	No effect.
1	Set to send the J state on the UDPHS line. This enables the testing of the high output drive level on the D+ line.

Bits 1:0 – SPEED_CFG[1:0] Speed Configuration

Value	Name	Description
0	NORMAL	Normal mode: The macro is in Full Speed mode, ready to make a High Speed identification, if the host supports it and then to automatically switch to High Speed mode.
1	–	Reserved
2	HIGH_SPEED	Force High Speed: Set this value to force the hardware to work in High Speed mode. Only for debug or test purpose.
3	FULL_SPEED	Force Full Speed: Set this value to force the hardware to work only in Full Speed mode. In this configuration, the macro will not respond to a High Speed reset handshake.

© 2025 Microchip Technology Inc. and its subsidiaries

83.6.8. UDPHS Endpoint Configuration Register

Name: UDPHS_EPTCFG
Offset: 0x0100 + n*0x20 [n=0..15]
Reset: 0x00000000
Property: Read/Write

Bit	31	30	29	28	27	26	25	24
	EPT_MAPD							
Access	R/W							
Reset	0							

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
							NB_TRANS[1:0]	
Access							R/W	R/W
Reset							0	0

Bit	7	6	5	4	3	2	1	0
	BK_NUMBER[1:0]		EPT_TYPE[1:0]		EPT_DIR	EPT_SIZE[2:0]		
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit 31 – EPT_MAPD Endpoint Mapped (cleared upon USB reset)

Value	Description
0	The user should reprogram the register with correct values.
1	Set by hardware when the endpoint size (EPT_SIZE) and the number of banks (BK_NUMBER) are correct regarding: – The max endpoint size for this endpoint – The number of allowed banks for this endpoint

Bits 9:8 – NB_TRANS[1:0] Number Of Transactions per Microframe (cleared upon USB reset)
The number of transactions per microframe is set by software.
Note: Meaningful for high bandwidth isochronous endpoint only.

Bits 7:6 – BK_NUMBER[1:0] Number of Banks (cleared upon USB reset)
Set this field according to the endpoint's number of banks (see Endpoint Configuration).

Value	Name	Description
0	0	Zero bank, the endpoint is not mapped in memory
1	1	One bank (bank 0)
2	2	Double bank (Ping-Pong: bank0/bank1)
3	3	Triple bank (bank0/bank1/bank2)

Bits 5:4 – EPT_TYPE[1:0] Endpoint Type (cleared upon USB reset)
Set this field according to the endpoint type (see Endpoint Configuration).
(Endpoint 0 should always be configured as control).

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
0	CTRL8	Control endpoint
1	ISO	Isochronous endpoint
2	BULK	Bulk endpoint
3	INT	Interrupt endpoint

Bit 3 – EPT_DIR Endpoint Direction (cleared upon USB reset)
For Control endpoints this bit has no effect and should be left at zero.

Value	Description
0	Clear this bit to configure OUT direction for Bulk, Interrupt and Isochronous endpoints.
1	Set this bit to configure IN direction for Bulk, Interrupt and Isochronous endpoints.

Bits 2:0 – EPT_SIZE[2:0] Endpoint Size (cleared upon USB reset)
Set this field according to the endpoint size in bytes (see Endpoint Configuration). Note that 1024 bytes is only for isochronous endpoints.

Value	Name	Description
0	8	8 bytes
1	16	16 bytes
2	32	32 bytes
3	64	64 bytes
4	128	128 bytes
5	256	256 bytes
6	512	512 bytes
7	1024	1024 bytes

© 2025 Microchip Technology Inc. and its subsidiaries

83.6.9. UDPHS Endpoint Control Enable Register (Control, Bulk, Interrupt Endpoints) (Default Mode)

Name: UDPHS_EPTCTLENB (DEFAULT_MODE)
Offset: 0x0104 + n*0x20 [n=0..15]
Reset: –
Property: Write-only

This register view is relevant only if UDPHS_EPTCFGx.EPT_TYPE = 0x0, 0x2 or 0x3.

For additional information, see UDPHS_EPTCTLx.

Bit	31	30	29	28	27	26	25	24
	SHRT_PCKT							
Access	W							
Reset	–							

Bit	23	22	21	20	19	18	17	16
						BUSY_BANK		
Access						W		
Reset						–		

Bit	15	14	13	12	11	10	9	8
	NAK_OUT	NAK_IN	STALL_SNT	RX_SETUP	TXRDY	TX_COMPLT	RXRDY_TXKL	ERR_OVFLW
Access	W	W	W	W	W	W	W	W
Reset	–	–	–	–	–	–	–	–

Bit	7	6	5	4	3	2	1	0
				NYET_DIS	INTDIS_DMA		AUTO_VALID	EPT_ENABL
Access				W	W		W	W
Reset				–	–		–	–

Bit 31 – SHRT_PCKT Short Packet Send/Short Packet Interrupt Enable
For IN endpoints: Ensures short packet at end of DMA Transfer if the UDPHS_DMACONTROLx register END_B_EN and UDPHS_EPTCTLx register AUTOVALID bits are also set.
For OUT endpoints:

Value	Description
0	No effect.
1	Enable Short Packet Interrupt.

Bit 18 – BUSY_BANK Busy Bank Interrupt Enable

Value	Description
0	No effect.
1	Enable Busy Bank Interrupt.

Bit 15 – NAK_OUT NAKOUT Interrupt Enable

Value	Description
0	No effect.
1	Enable NAKOUT Interrupt.

Bit 14 – NAK_IN NAKIN Interrupt Enable

Value	Description
0	No effect.
1	Enable NAKIN Interrupt.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 13 – STALL_SNT Stall Sent Interrupt Enable

Value	Description
0	No effect.
1	Enable Stall Sent Interrupt.

Bit 12 – RX_SETUP Received SETUP

Value	Description
0	No effect.
1	Enable RX_SETUP Interrupt.

Bit 11 – TXRDY TX Packet Ready Interrupt Enable

Value	Description
0	No effect.
1	Enable TX Packet Ready/Transaction Error Interrupt.

Bit 10 – TX_COMPLT Transmitted IN Data Complete Interrupt Enable

Value	Description
0	No effect.
1	Enable Transmitted IN Data Complete Interrupt.

Bit 9 – RXRDY_TXKL Received OUT Data Interrupt Enable

Value	Description
0	No effect.
1	Enable Received OUT Data Interrupt.

Bit 8 – ERR_OVFLW Overflow Error Interrupt Enable

Value	Description
0	No effect.
1	Enable Overflow Error Interrupt.

Bit 4 – NYET_DIS NYET Disable (Only for High Speed Bulk OUT endpoints)

Value	Description
0	No effect.
1	Forces an ACK response to the next High Speed Bulk OUT transfer instead of a NYET response.

Bit 3 – INTDIS_DMA Interrupts Disable DMA

Value	Description
0	No effect.
1	If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled.

Bit 1 – AUTO_VALID Packet Auto-Valid Enable

Value	Description
0	No effect.
1	Enable this bit to automatically validate the current packet and switch to the next bank for both IN and OUT transfers.

Bit 0 – EPT_ENABL Endpoint Enable

Value	Description
0	No effect.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Enable endpoint according to the device configuration.

© 2025 Microchip Technology Inc. and its subsidiaries

83.6.10. UDPHS Endpoint Control Enable Register (Isochronous Endpoints)

Name: UDPHS_EPTCTLENB (ISOENDPT)
Offset: 0x0104 + n*0x20 [n=0..15]
Reset: –
Property: Write-only

This register view is relevant only if UDPHS_EPTCFGx.EPT_TYPE = 0x1.

For additional information, see UDPHS_EPTCTLx.

Bit	31	30	29	28	27	26	25	24
	SHRT_PCKT							
Access	W							
Reset	–							

Bit	23	22	21	20	19	18	17	16

Access	W	W			W		W	W
Reset	–	–			–		–	–

Bit 31 – SHRT_PCKT Short Packet Send/Short Packet Interrupt Enable
For IN endpoints: Ensures short packet at end of DMA Transfer if the UDPHS_DMACONTROLx register END_B_EN and UDPHS_EPTCTLx register AUTOVALID bits are also set.
For OUT endpoints:

Value	Description
0	No effect.
1	Enable Short Packet Interrupt.

Bit 18 – BUSY_BANK Busy Bank Interrupt Enable

Value	Description
0	No effect.
1	Enable Busy Bank Interrupt.

Bit 14 – ERR_FLUSH Bank Flush Error Interrupt Enable

Value	Description
0	No effect.
1	Enable Bank Flush Error Interrupt.

Bit 13 – ERR_CRC_NTR ISO CRC Error/Number of Transaction Error Interrupt Enable

Value	Description
0	No effect.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Enable Error CRC ISO/Error Number of Transaction Interrupt.

Bit 12 – ERR_FL_ISO Error Flow Interrupt Enable

Value	Description
0	No effect.
1	Enable Error Flow ISO Interrupt.

Bit 11 – TXRDY_TRER TX Packet Ready/Transaction Error Interrupt Enable

Value	Description
0	No effect.
1	Enable TX Packet Ready/Transaction Error Interrupt.

Bit 10 – TX_COMPLT Transmitted IN Data Complete Interrupt Enable

Value	Description
0	No effect.
1	Enable Transmitted IN Data Complete Interrupt.

Bit 9 – RXRDY_TXKL Received OUT Data Interrupt Enable

Value	Description
0	No effect.
1	Enable Received OUT Data Interrupt.

Bit 8 – ERR_OVFLW Overflow Error Interrupt Enable

Value	Description
0	No effect.
1	Enable Overflow Error Interrupt.

Bit 7 – MDATA_RX MDATA Interrupt Enable (Only for high bandwidth Isochronous OUT endpoints)

Value	Description
0	No effect.
1	Enable MDATA Interrupt.

Bit 6 – DATAX_RX DATAx Interrupt Enable (Only for high bandwidth Isochronous OUT endpoints)

Value	Description
0	No effect.
1	Enable DATAx Interrupt.

Bit 3 – INTDIS_DMA Interrupts Disable DMA

Value	Description
0	No effect.
1	If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled.

Bit 1 – AUTO_VALID Packet Auto-Valid Enable

Value	Description
0	No effect.
1	Enable this bit to automatically validate the current packet and switch to the next bank for both IN and OUT transfers.

Bit 0 – EPT_ENABL Endpoint Enable

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	Enable endpoint according to the device configuration.

© 2025 Microchip Technology Inc. and its subsidiaries

83.6.11. UDPHS Endpoint Control Disable Register (Control, Bulk, Interrupt Endpoints) (Default Mode)

Name: UDPHS_EPTCTLDIS (DEFAULT_MODE)
Offset: 0x0108 + n*0x20 [n=0..15]
Reset: –
Property: Write-only

This register view is relevant only if UDPHS_EPTCFGx.EPT_TYPE = 0x0, 0x2 or 0x3.

For additional information, see UDPHS_EPTCTLx.

Bit	31	30	29	28	27	26	25	24

Bit 31 – SHRT_PCKT Short Packet Interrupt Disable
For IN endpoints: Never automatically add a zero length packet at end of DMA transfer.
For OUT endpoints, the configuration is:

Value	Description
0	No effect.
1	Disable Short Packet Interrupt.

Bit 18 – BUSY_BANK Busy Bank Interrupt Disable

Value	Description
0	No effect.
1	Disable Busy Bank Interrupt.

Bit 15 – NAK_OUT NAKOUT Interrupt Disable

Value	Description
0	No effect.
1	Disable NAKOUT Interrupt.

Bit 14 – NAK_IN NAKIN Interrupt Disable

Value	Description
0	No effect.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Disable NAKIN Interrupt.

Bit 13 – STALL_SNT Stall Sent Interrupt Disable

Value	Description
0	No effect.
1	Disable Stall Sent Interrupt.

Bit 12 – RX_SETUP Received SETUP Interrupt Disable

Value	Description
0	No effect.
1	Disable RX_SETUP Interrupt.

Bit 11 – TXRDY TX Packet Ready Interrupt Disable

Value	Description
0	No effect.
1	Disable TX Packet Ready/Transaction Error Interrupt.

Bit 10 – TX_COMPLT Transmitted IN Data Complete Interrupt Disable

Value	Description
0	No effect.
1	Disable Transmitted IN Data Complete Interrupt.

Bit 9 – RXRDY_TXKL Received OUT Data Interrupt Disable

Value	Description
0	No effect.
1	Disable Received OUT Data Interrupt.

Bit 8 – ERR_OVFLW Overflow Error Interrupt Disable

Value	Description
0	No effect.
1	Disable Overflow Error Interrupt.

Bit 4 – NYET_DIS NYET Enable (Only for High Speed Bulk OUT endpoints)

Value	Description
0	No effect.
1	Let the hardware handle the handshake response for the High Speed Bulk OUT transfer.

Bit 3 – INTDIS_DMA Interrupts Disable DMA

Value	Description
0	No effect.
1	Disable the “Interrupts Disable DMA”.

Bit 1 – AUTO_VALID Packet Auto-Valid Disable

Value	Description
0	No effect.
1	Disable this bit to not automatically validate the current packet.

Bit 0 – EPT_DISABL Endpoint Disable

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	Disable endpoint.

© 2025 Microchip Technology Inc. and its subsidiaries

83.6.12. UDPHS Endpoint Control Disable Register (Isochronous Endpoint)

Name: UDPHS_EPTCTLDIS (ISOENDPT)
Offset: 0x0108 + n*0x20 [n=0..15]
Reset: –
Property: Write-only

This register view is relevant only if UDPHS_EPTCFGx.EPT_TYPE = 0x1.

Bit 12 – ERR_FL_ISO Error Flow Interrupt Disable

Value	Description
0	No effect.
1	Disable Error Flow ISO Interrupt.

Bit 11 – TXRDY_TRER TX Packet Ready/Transaction Error Interrupt Disable

Value	Description
0	No effect.
1	Disable TX Packet Ready/Transaction Error Interrupt.

Bit 10 – TX_COMPLT Transmitted IN Data Complete Interrupt Disable

Value	Description
0	No effect.
1	Disable Transmitted IN Data Complete Interrupt.

Bit 9 – RXRDY_TXKL Received OUT Data Interrupt Disable

Value	Description
0	No effect.
1	Disable Received OUT Data Interrupt.

Bit 8 – ERR_OVFLW Overflow Error Interrupt Disable

Value	Description
0	No effect.
1	Disable Overflow Error Interrupt.

Bit 7 – MDATA_RX MDATA Interrupt Disable (Only for High Bandwidth Isochronous OUT endpoints)

Value	Description
0	No effect.
1	Disable MDATA Interrupt.

Bit 6 – DATAX_RX DATAx Interrupt Disable (Only for High Bandwidth Isochronous OUT endpoints)

Value	Description
0	No effect.
1	Disable DATAx Interrupt.

Bit 3 – INTDIS_DMA Interrupts Disable DMA

Value	Description
0	No effect.
1	Disable the “Interrupts Disable DMA”.

Bit 1 – AUTO_VALID Packet Auto-Valid Disable

Value	Description
0	No effect.
1	Disable this bit to not automatically validate the current packet.

Bit 0 – EPT_DISABL Endpoint Disable

Value	Description
0	No effect.
1	Disable endpoint.

Access				R	R		R	R
Reset				0	0		0	0

Bit 31 – SHRT_PCKT Short Packet Interrupt Enabled (cleared upon USB reset)
For OUT endpoints: sends an Interrupt when a Short Packet has been received.
For IN endpoints: a Short Packet transmission is ensured upon end of the DMA Transfer, thus signaling a BULK or INTERRUPT end of transfer, but only if the UDPHS_DMACONTROLx register END_B_EN and UDPHS_EPTCTLx register AUTO_VALID bits are also set.

Value	Description
0	Short Packet Interrupt is masked.
1	Short Packet Interrupt is enabled.

Bit 18 – BUSY_BANK Busy Bank Interrupt Enabled (cleared upon USB reset)
For OUT endpoints: an interrupt is sent when all banks are busy.
For IN endpoints: an interrupt is sent when all banks are free.

Value	Description
0	BUSY_BANK Interrupt is masked.
1	BUSY_BANK Interrupt is enabled.

Bit 15 – NAK_OUT NAKOUT Interrupt Enabled (cleared upon USB reset)

Value	Description
0	NAKOUT Interrupt is masked.
1	NAKOUT Interrupt is enabled.

Bit 14 – NAK_IN NAKIN Interrupt Enabled (cleared upon USB reset)

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	NAKIN Interrupt is masked.
1	NAKIN Interrupt is enabled.

Bit 13 – STALL_SNT Stall Sent Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Stall Sent Interrupt is masked.
1	Stall Sent Interrupt is enabled.

Bit 12 – RX_SETUP Received SETUP Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Received SETUP is masked.
1	Received SETUP is enabled.

Bit 11 – TXRDY TX Packet Ready Interrupt Enabled (cleared upon USB reset)

CAUTION Interrupt source is active as long as the corresponding UDPHS_EPTSTAx register TXRDY flag remains low. If there are no more banks available for transmitting after the software has set UDPHS_EPTSTAx/TXRDY for the last transmit packet, then the interrupt source remains inactive until the first bank becomes free again to transmit at UDPHS_EPTSTAx/TXRDY hardware clear.

Value	Description
0	TX Packet Ready Interrupt is masked.
1	TX Packet Ready Interrupt is enabled.

Bit 10 – TX_COMPLT Transmitted IN Data Complete Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Transmitted IN Data Complete Interrupt is masked.
1	Transmitted IN Data Complete Interrupt is enabled.

Bit 9 – RXRDY_TXKL Received OUT Data Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Received OUT Data Interrupt is masked.
1	Received OUT Data Interrupt is enabled.

Bit 8 – ERR_OVFLW Overflow Error Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Overflow Error Interrupt is masked.
1	Overflow Error Interrupt is enabled.

Bit 4 – NYET_DIS NYET Disable (Only for High Speed Bulk OUT Endpoints) (cleared upon USB reset)

Note: According to the Universal Serial Bus Specification, Rev 2.0 (8.5.1.1 NAK Responses to OUT/DATA During PING Protocol), a NAK response to an HS Bulk OUT transfer is expected to be an unusual occurrence.

Value	Description
0	Lets the hardware handle the handshake response for the High Speed Bulk OUT transfer.
1	Forces an ACK response to the next High Speed Bulk OUT transfer instead of a NYET response.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 3 – INTDIS_DMA Interrupt Disables DMA (cleared upon USB reset)

If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled regardless of the UDPHS_IEN register EPT_x bit for this endpoint. Then, the firmware will have to clear or disable the interrupt source or clear this bit if transfer completion is needed.
If the exception raised is associated with the new system bank packet, then the previous DMA packet transfer is normally completed, but the new DMA packet transfer is not started (not requested).
If the exception raised is not associated to a new system bank packet (NAK_IN, NAK_OUT, etc.), then the request cancellation may happen at any time and may immediately stop the current DMA transfer.
This may be used, for example, to identify or prevent an erroneous packet to be transferred into a buffer or to complete a DMA buffer by software after reception of a short packet.

Bit 1 – AUTO_VALID Packet Auto-Valid Enabled (Not for CONTROL Endpoints) (cleared upon USB reset)

Set this bit to automatically validate the current packet and switch to the next bank for both IN and OUT endpoints.
For IN Transfer:
If this bit is set, the UDPHS_EPTSTAx register TXRDY bit is set automatically when the current bank is full and at the end of DMA buffer if the UDPHS_DMACONTROLx register END_B_EN bit is set.
The user may still set the UDPHS_EPTSTAx register TXRDY bit if the current bank is not full, unless the user needs to send a Zero Length Packet by software.
For OUT Transfer:
If this bit is set, the UDPHS_EPTSTAx register RXRDY_TXKL bit is automatically reset for the current bank when the last packet byte has been read from the bank FIFO or at the end of DMA buffer if the UDPHS_DMACONTROLx register END_B_EN bit is set, for example to truncate a padded data packet when the actual data transfer size is reached.
The user may still clear the UDPHS_EPTSTAx register RXRDY_TXKL bit, for example, after completing a DMA buffer by software if UDPHS_DMACONTROLx register END_B_EN bit was disabled or in order to cancel the read of the remaining data bank(s).

Bit 0 – EPT_ENABL Endpoint Enable (cleared upon USB reset)

Value	Description
0	The endpoint is disabled according to the device configuration. Endpoint 0 should always be enabled after a hardware or UDPHS bus reset and participate in the device configuration.
1	The endpoint is enabled according to the device configuration.

Access	R	R			R		R	R
Reset	0	0			0		0	0

Bit 31 – SHRT_PCKT Short Packet Interrupt Enabled (cleared upon USB reset)
For OUT endpoints: Send an Interrupt when a Short Packet has been received.
For IN endpoints: A Short Packet transmission is ensured upon end of the DMA Transfer, thus signaling an end of isochronous (micro-)frame data, but only if the UDPHS_DMACONTROLx register END_B_EN and UDPHS_EPTCTLx register AUTO_VALID bits are also set.

Value	Description
0	Short Packet Interrupt is masked.
1	Short Packet Interrupt is enabled.

Bit 18 – BUSY_BANK Busy Bank Interrupt Enabled (cleared upon USB reset)
For OUT endpoints: An interrupt is sent when all banks are busy.
For IN endpoints: An interrupt is sent when all banks are free.

Value	Description
0	BUSY_BANK Interrupt is masked.
1	BUSY_BANK Interrupt is enabled.

Bit 14 – ERR_FLUSH Bank Flush Error Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Bank Flush Error Interrupt is masked.
1	Bank Flush Error Interrupt is enabled.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 13 – ERR_CRC_NTR ISO CRC Error/Number of Transaction Error Interrupt Enabled (cleared upon USB reset)

Value	Description
0	ISO CRC error/number of Transaction Error Interrupt is masked.
1	ISO CRC error/number of Transaction Error Interrupt is enabled.

Bit 12 – ERR_FL_ISO Error Flow Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Error Flow Interrupt is masked.
1	Error Flow Interrupt is enabled.

Bit 11 – TXRDY_TRER TX Packet Ready/Transaction Error Interrupt Enabled (cleared upon USB reset)

⚠ CAUTION Interrupt source is active as long as the corresponding UDPHS_EPTSTAx register TXRDY_TRER flag remains low. If there are no more banks available for transmitting after the software has set UDPHS_EPTSTAx/TXRDY_TRER for the last transmit packet, then the interrupt source remains inactive until the first bank becomes free again to transmit at UDPHS_EPTSTAx/TXRDY_TRER hardware clear.

Value	Description
0	TX Packet Ready/Transaction Error Interrupt is masked.
1	TX Packet Ready/Transaction Error Interrupt is enabled.

Bit 10 – TX_COMPLT Transmitted IN Data Complete Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Transmitted IN Data Complete Interrupt is masked.
1	Transmitted IN Data Complete Interrupt is enabled.

Bit 9 – RXRDY_TXKL Received OUT Data Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Received OUT Data Interrupt is masked.
1	Received OUT Data Interrupt is enabled.

Bit 8 – ERR_OVFLW Overflow Error Interrupt Enabled (cleared upon USB reset)

Value	Description
0	Overflow Error Interrupt is masked.
1	Overflow Error Interrupt is enabled.

Bit 7 – MDATA_RX MDATA Interrupt Enabled (Only for High Bandwidth Isochronous OUT endpoints) (cleared upon USB reset)

Value	Description
0	No effect.
1	Send an interrupt when an MDATA packet has been received and so at least one packet of the microframe data payload has been received.

Bit 6 – DATAX_RX DATAx Interrupt Enabled (Only for High Bandwidth Isochronous OUT endpoints) (cleared upon USB reset)

Value	Description
0	No effect.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Send an interrupt when a DATA2, DATA1 or DATA0 packet has been received meaning the whole microframe data payload has been received.

Bit 3 – INTDIS_DMA Interrupt Disables DMA (cleared upon USB reset)

If set, when an enabled endpoint-originated interrupt is triggered, the DMA request is disabled regardless of the UDPHS_IEN register EPT_x bit for this endpoint. Then, the firmware will have to clear or disable the interrupt source or clear this bit if transfer completion is needed.
If the exception raised is associated with the new system bank packet, then the previous DMA packet transfer is normally completed, but the new DMA packet transfer is not started (not requested).
If the exception raised is not associated to a new system bank packet (ex: ERR_FL_ISO), then the request cancellation may happen at any time and may immediately stop the current DMA transfer. This may be used, for example, to identify or prevent an erroneous packet to be transferred into a buffer or to complete a DMA buffer by software after reception of a short packet, or to perform buffer truncation on ERR_FL_ISO interrupt for adaptive rate.

Bit 1 – AUTO_VALID Packet Auto-Valid Enabled (cleared upon USB reset)

Set this bit to automatically validate the current packet and switch to the next bank for both IN and OUT endpoints.
For IN Transfer:
If this bit is set, the UDPHS_EPTSTAx register TXRDY_TRER bit is set automatically when the current bank is full and at the end of DMA buffer if the UDPHS_DMACONTROLx register END_B_EN bit is set. The user may still set the UDPHS_EPTSTAx register TXRDY_TRER bit if the current bank is not full, unless the user needs to send a Zero Length Packet by software.
For OUT Transfer:
If this bit is set, the UDPHS_EPTSTAx register RXRDY_TXKL bit is automatically reset for the current bank when the last packet byte has been read from the bank FIFO or at the end of DMA buffer if the UDPHS_DMACONTROLx register END_B_EN bit is set. For example, to truncate a padded data packet when the actual data transfer size is reached.
The user may still clear the UDPHS_EPTSTAx register RXRDY_TXKL bit, for example, after completing a DMA buffer by software if UDPHS_DMACONTROLx register END_B_EN bit was disabled or in order to cancel the read of the remaining data bank(s).

Bit 0 – EPT_ENABL Endpoint Enable (cleared upon USB reset)

Value	Description
0	The endpoint is disabled according to the device configuration. Endpoint 0 should always be enabled after a hardware or UDPHS bus reset and participate in the device configuration.
1	The endpoint is enabled according to the device configuration.

Bit 11 – TXRDY TX Packet Ready Set

Value	Description
0	No effect.
1	Set this bit after a packet has been written into the endpoint FIFO for IN data transfers – This flag is used to generate a Data IN transaction (device to host). – Device firmware checks that it can write a data payload in the FIFO, checking that TXRDY is cleared. – Transfer to the FIFO is done by writing in the “Buffer Address” register. – Once the data payload has been transferred to the FIFO, the firmware notifies the UDPHS device setting TXRDY to one. – UDPHS bus transactions can start. – TXCOMP is set once the data payload has been received by the host. – Data should be written into the endpoint FIFO only after this bit has been cleared. – Set this bit without writing data to the endpoint FIFO to send a Zero Length Packet.

Bit 9 – RXRDY_TXKL KILL Bank Set (for IN Endpoint)

Value	Description
0	No effect.
1	Kill the last written bank.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 5 – FRCESTALL Stall Handshake Request Set

Refer to chapters 8.4.5 (Handshake Packets) and 9.4.5 (Get Status) of the Universal Serial Bus Specification, Rev 2.0 for more information on the STALL handshake.

Value	Description
0	No effect.
1	Set this bit to request a STALL answer to the host for the next handshake

© 2025 Microchip Technology Inc. and its subsidiaries

83.6.16. UDPHS Endpoint Set Status Register (Isochronous Endpoint)

Name: UDPHS_EPTSETSTA (ISOENDPT)
Offset: 0x0114 + n*0x20 [n=0..15]
Reset: –
Property: Write-only

This register view is relevant only if UDPHS_EPTCFGx.EPT_TYPE = 0x1.

1	Clear the STALL_SNT flags of UDPHS_EPTSTAx.

Bit 12 – RX_SETUP Received SETUP Clear

Value	Description
0	No effect.
1	Clear the RX_SETUP flags of UDPHS_EPTSTAx.

Bit 10 – TX_COMPLT Transmitted IN Data Complete Clear

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	No effect.
1	Clear the TX_COMPLT flag of UDPHS_EPTSTAx.

Bit 9 – RXRDY_TXKL Received OUT Data Clear

Value	Description
0	No effect.
1	Clear the RXRDY_TXKL flag of UDPHS_EPTSTAx.

Bit 6 – TOGGLESQ Data Toggle Clear

For OUT endpoints, the next received packet should be a DATA0.
For IN endpoints, the next packet will be sent with a DATA0 PID.

Value	Description
0	No effect.
1	Clear the PID data of the current bank

Bit 5 – FRCESTALL Stall Handshake Request Clear

Value	Description
0	No effect.
1	Clear the STALL request. The next packets from host will not be STALLed.

© 2025 Microchip Technology Inc. and its subsidiaries

Reset	0	1	0					

Bit 31 – SHRT_PCKT Short Packet (cleared upon USB reset)
An OUT Short Packet is detected when the receive byte count is less than the configured UDPHS_EPTCFGx register EPT_Size.
This bit is updated at the same time as the BYTE_COUNT field.
It is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

Bits 30:20 – BYTE_COUNT[10:0] UDPHS Byte Count (cleared upon USB reset)
Byte count of a received data packet.
This field is incremented after each write into the endpoint (to prepare an IN transfer). It is decremented after each reading into the endpoint (OUT transfer).
This field is also updated at RXRDY_TXKL flag clear with the next bank, and at TXRDY flag set with the next bank.
This field is reset by UDPHS_EPTRST.EPT_x.

Bits 19:18 – BUSY_BANK_STA[1:0] Busy Bank Number (cleared upon USB reset)
These bits are set by hardware to indicate the number of busy banks.
IN endpoint: Indicates the number of busy banks filled by the user, ready for IN transfer.
OUT endpoint: Indicates the number of busy banks filled by OUT transaction from the Host.

Value	Name	Description
0	0BUSYBANK	All banks are free
1	1BUSYBANK	1 busy bank
2	2BUSYBANKS	2 busy banks
3	3BUSYBANKS	3 busy banks

© 2025 Microchip Technology Inc. and its subsidiaries

Bits 17:16 – CURBK_CTLDIR[1:0] Current Bank/Control Direction (cleared upon USB reset)

Control Direction (for Control endpoint only):

0: A Control Write is requested by the Host.
1: A Control Read is requested by the Host.

Notes:

1. Corresponds to the the 7th bit of the bmRequestType (Byte 0 of the Setup Data).
2. Updated after receiving new setup data.

Current Bank (not relevant for Control endpoint):

- Set by hardware to indicate the number of the current bank.
- Reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).
- The current bank is updated each time the user:
  - Sets the TX Packet Ready bit to prepare the next IN transfer and to switch to the next bank.
  - Clears the received OUT data bit to access the next bank.

Value	Name	Description
0	BANK0	Bank 0 (or single bank)
1	BANK1	Bank 1
2	BANK2	Bank 2

Bit 15 – NAK_OUT NAK OUT (cleared upon USB reset)

This bit is set by hardware when a NAK handshake has been sent in response to an OUT or PING request from the Host.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by EPT_CTL_DISx (disable endpoint).

Bit 14 – NAK_IN NAK IN (cleared upon USB reset)

This bit is set by hardware when a NAK handshake has been sent in response to an IN request from the Host.
This bit is cleared by software.

Bit 13 – STALL_SNT Stall Sent (cleared upon USB reset)

For Control, Bulk and Interrupt endpoints.
This bit is set by hardware after a STALL handshake has been sent as requested by the UDPHS_EPTSTAx register FRCESTALL bit.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

Bit 12 – RX_SETUP Received SETUP (cleared upon USB reset)

For Control endpoint only.
This bit is set by hardware when a valid SETUP packet has been received from the host.
It is cleared by the device firmware after reading the SETUP data from the endpoint FIFO.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint), and by UDPHS_EPTCTLDISx (disable endpoint).

Bit 11 – TXRDY TX Packet Ready (cleared upon USB reset)

This bit is cleared by hardware after the host has acknowledged the packet.
For Multi-bank endpoints, this bit may remain clear even after software is set if another bank is available to transmit.
Hardware clear of this bit may generate an interrupt if enabled by the UDPHS_EPTCTLx register TXRDY bit.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint), and by UDPHS_EPTCTLDISx (disable endpoint).

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 10 – TX_COMPLT Transmitted IN Data Complete (cleared upon USB reset)
This bit is set by hardware after an IN packet has been accepted (ACK'ed) by the host.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint), and by UDPHS_EPTCTLDISx (disable endpoint).

Bit 9 – RXRDY_TXKL Received OUT Data/KILL Bank (cleared upon USB reset)
Received OUT Data (for OUT endpoint or Control endpoint):

- This bit is set by hardware after a new packet has been stored in the endpoint FIFO.
- This bit is cleared by the device firmware after reading the OUT data from the endpoint.
- For multi-bank endpoints, this bit may remain active even when cleared by the device firmware, this if an other packet has been received meanwhile.
- Hardware assertion of this bit may generate an interrupt if enabled by the UDPHS_EPTCTLx register RXRDY_TXKL bit.
- This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

KILL Bank (for IN endpoint):

- The bank is really cleared or the bank is sent, BUSY_BANK_STA is decremented.
- The bank is not cleared but sent on the IN transfer, TX_COMPLT
- The bank is not cleared because it was empty. The user should wait that this bit is cleared before trying to clear another packet.
  Note: "Kill a packet" may be refused if at the same time, an IN token is coming and the current packet is sent on the UDPHS line. In this case, the TX_COMPLT bit is set. Take notice however, that if at least two banks are ready to be sent, there is no problem to kill a packet even if an IN token is coming. In fact, in that case, the current bank is sent (IN transfer) and the last bank is killed.

Bit 8 – ERR_OVFLW Overflow Error (cleared upon USB reset)
This bit is set by hardware when a new too-long packet is received.
Example: If the user programs an endpoint 64 bytes wide and the host sends 128 bytes in an OUT transfer, then the Overflow Error bit is set.
This bit is updated at the same time as the BYTE_COUNT field.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

Bits 7:6 – TOGGLESQ_STA[1:0] Toggle Sequencing (cleared upon USB reset)
In OUT transfer, the Toggle information is meaningful only when the current bank is busy (Received OUT Data = 1).
This field is updated for OUT transfer:

- A new data has been written into the current bank.
- The user has just cleared the Received OUT Data bit to switch to the next bank.

This field is reset to DATA1 by the UDPHS_EPTCLRSTAx register TOGGLESQ bit, and by UDPHS_EPTCTLDISx (disable endpoint).
Toggle Sequencing:

- IN endpoint: Indicates the PID Data Toggle that will be used for the next packet sent. This is not relative to the current bank.
- CONTROL and OUT endpoints: Set by hardware to indicate the PID data of the current bank.

Value	Name	Description
0	DATA0	DATA0
1	DATA1	DATA1
2	DATA2	Reserved for High Bandwidth Isochronous Endpoint

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Name	Description
3	MDATA	Reserved for High Bandwidth Isochronous Endpoint

Bit 5 – FRCESTALL Stall Handshake Request (cleared upon USB reset)
This bit is reset by hardware upon received SETUP.

Value	Description
0	No effect.
1	If set a STALL answer will be done to the host for the next handshake.

© 2025 Microchip Technology Inc. and its subsidiaries

83.6.20. UDPHS Endpoint Status Register (Isochronous Endpoint)

Name: UDPHS_EPTSTA (ISOENDPT)
Offset: 0x011C + n*0x20 [n=0..15]
Reset: 0x00000040
Property: Read-only

This register view is relevant only if UDPHS_EPTCFGx.EPT_TYPE = 0x1.

Bit	31	30	29	28	27	26	25	24
	SHRT_PCKT	BYTE_COUNT[10:4]						
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	BYTE_COUNT[3:0]				BUSY_BANK_STA[1:0]		CURBK[1:0]	
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
		ERR_FLUSH	ERR_CRC_NT	ERR_FL_ISO	TXRDY_TRER	TX_COMPLT	RXRDY_TXKL	ERR_OVFLW
Access		R	R	R	R	R	R	R
Reset		0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	TOGGLESQ_STA[1:0]							
Access	R	R						
Reset	0	1						

Bit 31 – SHRT_PCKT Short Packet (cleared upon USB reset)
An OUT Short Packet is detected when the receive byte count is less than the configured UDPHS_EPTCFGx register EPT_Size.
This bit is updated at the same time as the BYTE_COUNT field.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

Bits 30:20 – BYTE_COUNT[10:0] UDPHS Byte Count (cleared upon USB reset)
Byte count of a received data packet.
This field is incremented after each write into the endpoint (to prepare an IN transfer).
This field is decremented after each reading into the endpoint (OUT transfer).
This field is also updated at RXRDY_TXKL flag clear with the next bank.
This field is also updated at TXRDY_TRER flag set with the next bank.
This field is reset by EPT_x of UDPHS_EPTRST register.

Bits 19:18 – BUSY_BANK_STA[1:0] Busy Bank Number (cleared upon USB reset)
These bits are set by hardware to indicate the number of busy banks.
IN endpoint: It indicates the number of busy banks filled by the user, ready for IN transfer.
OUT endpoint: It indicates the number of busy banks filled by OUT transaction from the Host.

Value	Name	Description
0	0BUSYBANK	All banks are free
1	1BUSYBANK	1 busy bank
2	2BUSYBANKS	2 busy banks
3	3BUSYBANKS	3 busy banks

© 2025 Microchip Technology Inc. and its subsidiaries

Bits 17:16 – CURBK[1:0] Current Bank (cleared upon USB reset)

These bits are set by hardware to indicate the number of the current bank.
The current bank is updated each time the user:

- Sets the TX Packet Ready bit to prepare the next IN transfer and to switch to the next bank.
- Clears the received OUT data bit to access the next bank.

This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

Value	Name	Description
0	BANK0	Bank 0 (or single bank)
1	BANK1	Bank 1
2	BANK2	Bank 2

Bit 14 – ERR_FLUSH Bank Flush Error (cleared upon USB reset)

For High Bandwidth Isochronous IN endpoints.
This bit is set when flushing unsent banks at the end of a microframe.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by EPT_CTL_DISx (disable endpoint).

Bit 13 – ERR_CRC_NTR CRC ISO Error/Number of Transaction Error (cleared upon USB reset)

CRC ISO Error (for Isochronous OUT endpoints) (Read-only):
This bit is set by hardware if the last received data is corrupted (CRC error on data).
This bit is updated by hardware when new data is received (Received OUT Data bit).
Number of Transaction Error (for High Bandwidth Isochronous IN endpoints):
This bit is set at the end of a microframe in which at least one data bank has been transmitted, if less than the number of transactions per micro-frame banks (UDPHS_EPTCFGx register NB_TRANS) have been validated for transmission inside this microframe.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

Bit 12 – ERR_FL_ISO Error Flow (cleared upon USB reset)

This bit is set by hardware when a transaction error occurs.

- Isochronous IN transaction is missed, the micro has no time to fill the endpoint (underflow).
- Isochronous OUT data is dropped because the bank is busy (overflow).

This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

Bit 11 – TXRDY_TRER TX Packet Ready/Transaction Error (cleared upon USB reset)

TX Packet Ready
This bit is cleared by hardware, as soon as the packet has been sent.
For Multi-bank endpoints, this bit may remain clear even after software is set if another bank is available to transmit.
Hardware clear of this bit may generate an interrupt if enabled by the UDPHS_EPTCTLx register TXRDY_TRER bit.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint), and by UDPHS_EPTCTLDISx (disable endpoint).
Transaction Error (for high bandwidth isochronous OUT endpoints) (Read-Only):
This bit is set by hardware when a transaction error occurs inside one microframe.
If one toggle sequencing problem occurs among the n-transactions (n = 1, 2 or 3) inside a microframe, then this bit is still set as long as the current bank contains one “bad” n-transaction (see CURBK field description). As soon as the current bank is relative to a new “good” n-transactions, then this bit is reset.

© 2025 Microchip Technology Inc. and its subsidiaries

Notes:

1. A transaction error occurs when the toggle sequencing does not comply with the Universal Serial Bus Specification, Rev 2.0 (5.9.2 High Bandwidth Isochronous endpoints) (Bad PID, missing data, etc.)
2. When a transaction error occurs, the user may empty all the "bad" transactions by clearing the Received OUT Data flag (RXRDY_TXKL).

If this bit is reset, then the user should consider that a new n-transaction is coming.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint), and by UDPHS_EPTCTLDISx (disable endpoint).

Bit 10 – TX_COMPLT Transmitted IN Data Complete (cleared upon USB reset)
This bit is set by hardware after an IN packet has been sent.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint), and by UDPHS_EPTCTLDISx (disable endpoint).

Bit 9 – RXRDY_TXKL Received OUT Data/KILL Bank (cleared upon USB reset)

Received OUT Data (for OUT endpoint or Control endpoint):

- This bit is set by hardware after a new packet has been stored in the endpoint FIFO.
- This bit is cleared by the device firmware after reading the OUT data from the endpoint.
- For multi-bank endpoints, this bit may remain active even when cleared by the device firmware, this if an other packet has been received meanwhile.
- Hardware assertion of this bit may generate an interrupt if enabled by the UDPHS_EPTCTLx register RXRDY_TXKL bit.
- This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

KILL Bank (for IN endpoint):

- The bank is really cleared or the bank is sent, BUSY_BANK_STA is decremented.
- The bank is not cleared but sent on the IN transfer, TX_COMPLT
- The bank is not cleared because it was empty. The user should wait that this bit is cleared before trying to clear another packet.
  Note: "Kill a packet" may be refused if at the same time, an IN token is coming and the current packet is sent on the UDPHS line. In this case, the TX_COMPLT bit is set. Take notice however, that if at least two banks are ready to be sent, there is no problem to kill a packet even if an IN token is coming. In fact, in that case, the current bank is sent (IN transfer) and the last bank is killed.

Bit 8 – ERR_OVFLW Overflow Error (cleared upon USB reset)
This bit is set by hardware when a new too-long packet is received.
Example: If the user programs an endpoint 64 bytes wide and the host sends 128 bytes in an OUT transfer, then the Overflow Error bit is set.
This bit is updated at the same time as the BYTE_COUNT field.
This bit is reset by UDPHS_EPTRST register EPT_x (reset endpoint) and by UDPHS_EPTCTLDISx (disable endpoint).

Bits 7:6 – TOGGLESQ_STA[1:0] Toggle Sequencing (cleared upon USB reset)
In OUT transfer, the Toggle information is meaningful only when the current bank is busy (Received OUT Data = 1).
This field is updated for OUT transfer:

- A new data has been written into the current bank.
- The user has just cleared the Received OUT Data bit to switch to the next bank.

© 2025 Microchip Technology Inc. and its subsidiaries

For High Bandwidth Isochronous Out endpoint, it is recommended to check the UDPHS_EPTSTAx/TXRDY_TRER bit to know if the toggle sequencing is correct or not.
This field is reset to DATA1 by the UDPHS_EPTCLRSTAx register TOGGLESQ bit, and by UDPHS_EPTCTLDISx (disable endpoint).
Toggle Sequencing:

- IN endpoint: Indicates the PID Data Toggle that will be used for the next packet sent. This is not relative to the current bank.
- OUT endpoint: Set by hardware to indicate the PID data of the current bank:

Value	Name	Description
0	DATA0	DATA0
1	DATA1	DATA1
2	DATA2	Data2 (only for High Bandwidth Isochronous Endpoint)
3	MDATA	MData (only for High Bandwidth Isochronous Endpoint)

83.6.21. UDPHS DMA Channel Transfer Descriptor

The DMA channel transfer descriptor is loaded from the memory. Be careful with the alignment of this buffer. The structure of the DMA channel transfer descriptor is defined by three parameters as described below:

- Offset 0:
  - The address must be aligned: 0xXXXX0
  - Next Descriptor Address Register: UDPHS_DMANXTDSCx
- Offset 4:
  - The address must be aligned: 0xXXXX4
  - DMA Channelx Address Register: UDPHS_DMAADDRESSx
- Offset 8:
  - The address must be aligned: 0xXXXX8
  - DMA Channelx Control Register: UDPHS_DMACONTROLx

To use the DMA channel transfer descriptor, fill the structures with the correct value (as described in the following pages). Then write directly in UDPHS_DMANXTDSCx the address of the descriptor to be used first. Then write '1' in the LDNXT_DSC bit of UDPHS_DMACONTROLx (load next channel transfer descriptor). The descriptor is automatically loaded upon Endpointx request for packet transfer.

© 2025 Microchip Technology Inc. and its subsidiaries

83.6.22. UDPHS DMA Next Descriptor Address Register

Name: UDPHS_DMANXTDSC
Offset: 0x0310 + (n-1)*0x10 [n=1..7]
Reset: 0x00000000
Property: Read/Write

Channel 0 is not used.

Bit	31	30	29	28	27	26	25	24
	NXT_DSC_ADD[31:24]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reset	0	0	0	0	0	0	0	0

Bits 31:0 – NXT_DSC_ADD[31:0] Next Descriptor Address
This field points to the next channel descriptor to be processed. This channel descriptor must be aligned, so bits 0 to 3 of the address must be equal to zero.

© 2025 Microchip Technology Inc. and its subsidiaries

83.6.23. UDPHS DMA Channel Address Register

Name: UDPHS_DMAADDRESS
Offset: 0x0314 + (n-1)*0x10 [n=1..7]
Reset: 0x00000000
Property: Read/Write

Channel 0 is not used.

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:0 – BUFF_ADD[31:0] Buffer Address

This field determines the system bus starting address of a DMA channel transfer.
Channel start and end addresses may be aligned on any byte boundary.
The firmware may write this field only when the UDPHS_DMASTATUS.CHANN_ENB bit is clear.
This field is updated at the end of the address phase of the current access to the system bus. It is incrementing of the access byte width. The access width is 4 bytes (or less) at packet start or end, if the start or end address is not aligned on a word boundary.
The packet start address is either the channel start address or the next channel address to be accessed in the channel buffer.
The packet end address is either the channel end address or the latest channel address accessed in the channel buffer.
The channel start address is written by software or loaded from the descriptor, whereas the channel end address is either determined by the end of buffer or the UDPHS device, USB end of transfer if the UDPHS_DMACONTROL.END_TR_EN bit is set.

© 2025 Microchip Technology Inc. and its subsidiaries

83.6.24. UDPHS DMA Channel Control Register

Name: UDPHS_DMACONTROL
Offset: 0x0318 + (n-1)*0x10 [n=1..7]
Reset: 0x00000000
Property: Read/Write

Channel 0 is not used.

Bits [31:2] are only writable when issuing a channel Control Command other than “Stop Now”.

For reliability it is highly recommended to wait for both UDPHS_DMASTATUS.CHAN_ACT and CHAN_ENB flags at 0, thus ensuring the channel has been stopped before issuing a command other than “Stop Now”.

Bit	31	30	29	28	27	26	25	24
	BUFF_LENGTH[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	BUFF_LENGTH[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	BURST_LCK	DESC_LD_IT	END_BUFFIT	END_TR_IT	END_B_EN	END_TR_EN	LDNXT_DSC	CHANN_ENB
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 31:16 – BUFF_LENGTH[15:0] Buffer Byte Length (Write-only)
This field determines the number of bytes to be transferred until end of buffer. The maximum channel transfer size (64 Kbytes) is reached when this field is 0 (default value). If the transfer size is unknown, this field should be set to 0, but the transfer end may occur earlier under UDPHS device control.
When this field is written, the UDPHS_DMASTATUS.BUFF_COUNT field is updated with the write value.

Bit 7 – BURST_LCK Burst Lock Enable

Value	Description
0	The DMA never locks bus access.
1	USB packets system data bursts are locked for maximum optimization of the bus bandwidth usage and maximization of fly-by system bus burst duration.

Bit 6 – DESC_LD_IT Descriptor Loaded Interrupt Enable

Value	Description
0	UDPHS_DMASTATUS.DESC_LDST rising will not trigger any interrupt.
1	An interrupt is generated when a descriptor has been loaded from the bus.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 5 – END_BUFFIT End of Buffer Interrupt Enable

Value	Description
0	UDPHS_DMASTATUS.END_BF_ST rising will not trigger any interrupt.
1	An interrupt is generated when the UDPHS_DMASTATUS.BUFF_COUNT reaches zero.

Bit 4 – END_TR_IT End of Transfer Interrupt Enable

Value	Description
0	UDPHS device initiated buffer transfer completion will not trigger any interrupt at UDPHS_STATUS.END_TR_ST rising.
1	An interrupt is sent after the buffer transfer is complete, if the UDPHS device has ended the buffer transfer. Use when the receive size is unknown.

Bit 3 – END_B_EN End of Buffer Enable (Control)

Value	Description
0	DMA Buffer End has no impact on USB packet transfer.
1	Endpoint can validate the packet (according to the values programmed in the UDPHS_EPTCTL.AUTO_VALID and SHRT_PCKT fields) at DMA Buffer End, i.e., when the UDPHS_DMASTATUS.BUFF_COUNT reaches 0. This is mainly for short packet IN validation initiated by the DMA reaching end of buffer, but could be used for OUT packet truncation (discarding of unwanted packet data) at the end of DMA buffer.

Bit 2 – END_TR_EN End of Transfer Enable (Control)
Used for OUT transfers only.

Value	Description
0	USB end of transfer is ignored.
1	UDPHS device can put an end to the current buffer transfer. When set, a BULK or INTERRUPT short packet or the last packet of an ISOCHRONOUS (micro) frame (DATAX) will close the current buffer and the UDPHS_DMASTATUS.END_TR_ST flag will be raised. This is intended for UDPHS non-prenegotiated end of transfer (BULK or INTERRUPT) or ISOCHRONOUS microframe data buffer closure.

Bit 1 – LDNXT_DSC Load Next Channel Transfer Descriptor Enable (Command)
If the CHANN_ENB bit is cleared, the next descriptor is immediately loaded upon transfer request.
DMA Channel Control Command Summary:

LDNXT_DSC	CHANN_ENB	Description
0	0	Stop now
0	1	Run and stop at end of buffer
1	0	Load next descriptor now
1	1	Run and link at end of buffer

Value	Description
0	No channel register is loaded after the end of the channel transfer.
1	The channel controller loads the next descriptor after the end of the current transfer, i.e., when the UDPHS_DMASTATUS.CHANN_ENB bit is reset.

Bit 0 – CHANN_ENB (Channel Enable Command)

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	DMA channel is disabled at and no transfer will occur upon request. This bit is also cleared by hardware when the channel source bus is disabled at end of buffer. If the UDPHS_DMACONTROL.LDNXT_DSC bit has been cleared by descriptor loading, the firmware will have to set the corresponding CHANN_ENB bit to start the described transfer, if needed. If the LDNXT_DSC bit is cleared, the channel is frozen and the channel registers may then be read and/or written reliably as soon as both UDPHS_DMASTATUS.CHANN_ENB and CHANN_ACT flags read as 0. If a channel request is currently serviced when this bit is cleared, the DMA FIFO buffer is drained until it is empty, then the UDPHS_DMASTATUS.CHANN_ENB bit is cleared. If the LDNXT_DSC bit is set at or after this bit clearing, then the currently loaded descriptor is skipped (no data transfer occurs) and the next descriptor is immediately loaded.
1	The UDPHS_DMASTATUS.CHANN_ENB bit will be set, thus enabling DMA channel data transfer. Then, any pending request will start the transfer. This may be used to start or resume any requested transfer.

© 2025 Microchip Technology Inc. and its subsidiaries

83.6.25. UDPHS DMA Channel Status Register

Name: UDPHS_DMASTATUS
Offset: 0x031C + (n-1)*0x10 [n=1..7]
Reset: 0x00000000
Property: Read/Write

Channel 0 is not used.

Bit	31	30	29	28	27	26	25	24
	BUFF_COUNT[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	23	22	21	20	19	18	17	16
	BUFF_COUNT[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
		DESC_LDST	END_BF_ST	END_TR_ST			CHANN_ACT	CHANN_ENB
Access		R/W	R/W	R/W			R/W	R/W
Reset		0	0	0			0	0

Bits 31:16 – BUFF_COUNT[15:0] Buffer Byte Count
This field determines the current number of bytes still to be transferred for this buffer. It is decremented from the source system bus access byte width at the end of this bus address phase. The access byte width is 4 by default, or less, at DMA start or end, if the start or end address is not aligned on a word boundary.
At the end of buffer, the DMA accesses the UDPHS device only for the number of bytes needed to complete it.
This field value is reliable (stable) only if the channel has been stopped or frozen (the UDPHS_EPTCTLx.NT_DIS_DMA bit is used to disable the channel request) and the channel is no longer active (CHANN_ACT flag is 0).
Note: For OUT endpoints, if the receive buffer byte length (BUFF_LENGTH) has been defaulted to zero because the USB transfer length is unknown, the actual buffer byte length received is 0x10000-BUFF_COUNT.

Bit 6 – DESC_LDST Descriptor Loaded Status
Valid until the CHANN_ENB flag is cleared at the end of the next buffer transfer.

Value	Description
0	Cleared automatically when read by software.
1	Set by hardware when a descriptor has been loaded from the system bus.

Bit 5 – END_BF_ST End of Channel Buffer Status
Valid until the CHANN_ENB flag is cleared at the end of the next buffer transfer.

Value	Description
0	Cleared automatically when read by software.

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Set by hardware when the BUFF_COUNT countdown reaches zero.

Bit 4 – END_TR_ST End of Channel Transfer Status

Valid until the CHANN_ENB flag is cleared at the end of the next buffer transfer.

Value	Description
0	Cleared automatically when read by software.
1	Set by hardware when the last packet transfer is complete, if the UDPHS device has ended the transfer.

Bit 1 – CHANN_ACT Channel Active Status

When a packet transfer is ended, this bit is automatically reset.
When a packet transfer cannot be completed due to an END_BF_ST, this flag stays set during the next channel descriptor load (if any) and potentially until UDPHS packet transfer completion, if allowed by the new descriptor.

Value	Description
0	The DMA channel is no longer trying to source the packet data.
1	The DMA channel is currently trying to source packet data, i.e., selected as the highest-priority requesting channel.

Bit 0 – CHANN_ENB Channel Enable Status

When any transfer is ended either due to an elapsed byte count or a UDPHS device initiated transfer end, this bit is automatically reset.
This bit is normally set or cleared by writing into the UDPHS_DMACONTROLx.CHANN_ENB bit either by software or descriptor loading.
If a channel request is currently serviced when the CHANN_ENB bit is cleared, the DMA FIFO buffer is drained until it is empty, then this status bit is cleared.

Value	Description
0	The DMA channel no longer transfers data, and may load the next descriptor if the UDPHS_DMACONTROLx.LDNXT_DSC bit is set.
1	The DMA channel is currently enabled and transfers data upon request.

© 2025 Microchip Technology Inc. and its subsidiaries

84. USB Host High Speed Port (UHPHS)

84.1. Description

The USB Host High Speed Port (UHPHS) interfaces the USB with the host application. It handles Open HCI protocol (Open Host Controller Interface) as well as Enhanced HCI protocol (Enhanced Host Controller Interface).

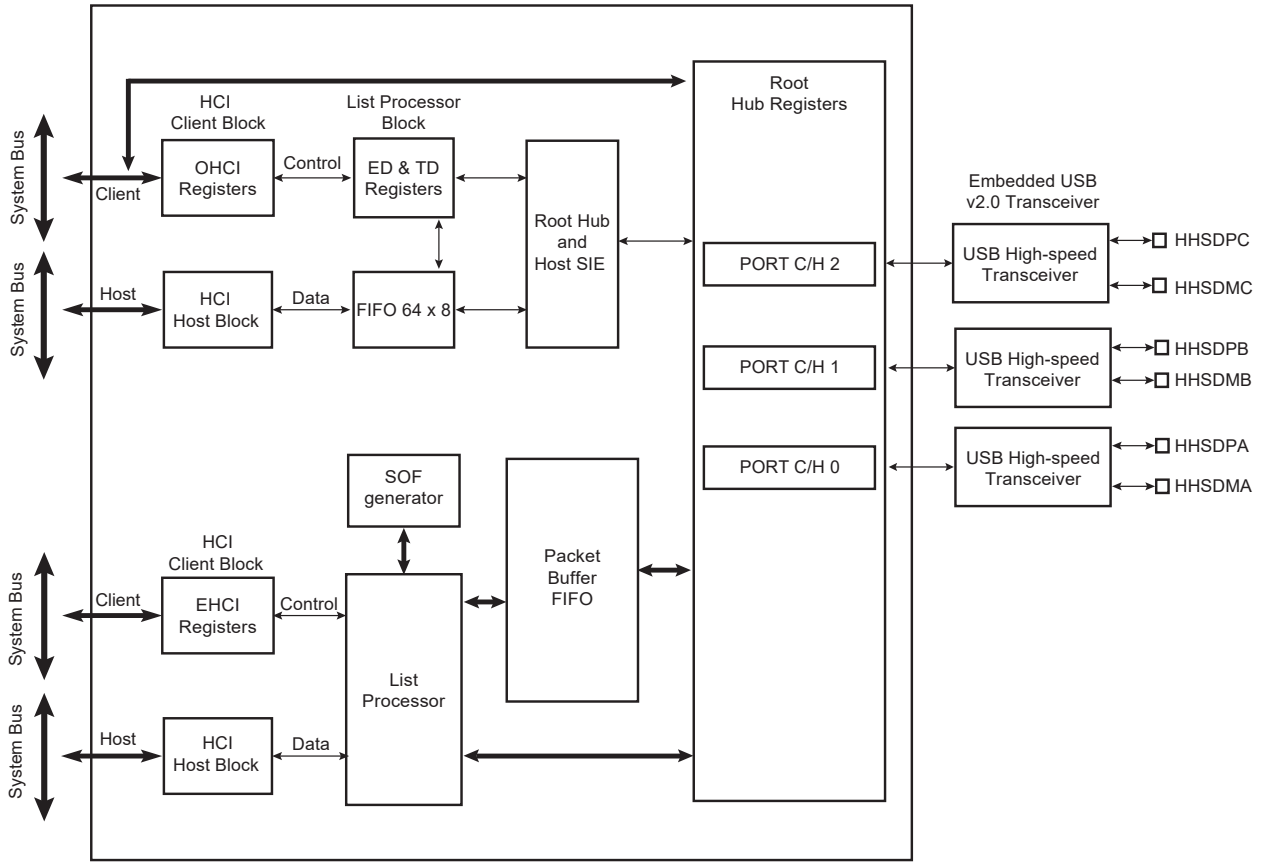
84.2. Embedded Characteristics

- Compliant with Enhanced HCI Rev 1.0 Specification
  - Compliant with USB V2.0 High-speed Specification
  - Supports high-speed 480 Mbps
- Compliant with Open HCI Rev 1.0 Specification
  - Compliant with USB V2.0 Full-speed and Low-speed Specification
  - Supports both low-speed 1.5 Mbps and full-speed 12 Mbps USB devices
- Root Hub Integrated with 2 Downstream USB HS Ports and 1 FS Port
- Embedded USB Transceivers
- Supports Power Management
- 3 Hosts (A, B, and C) High Speed (EHCI), Port A shared with UDPHS

© 2025 Microchip Technology Inc. and its subsidiaries

84.3. Block Diagram

Figure 84.1. UHPHS Block Diagram



Access to the USB host operational registers is achieved through the system bus client interface. The Open HCI host controller and Enhanced HCI host controller initialize host DMA transfers through the system bus host interface as follows:

- Fetches endpoint descriptors and transfer descriptors
- Accesses endpoint data from system memory
- Accesses HC communication area
- Writes status and retires transfer descriptor

Memory access errors (abort, misalignment) lead to an “Unrecoverable Error” indicated by the corresponding flag in the host controller operational registers.

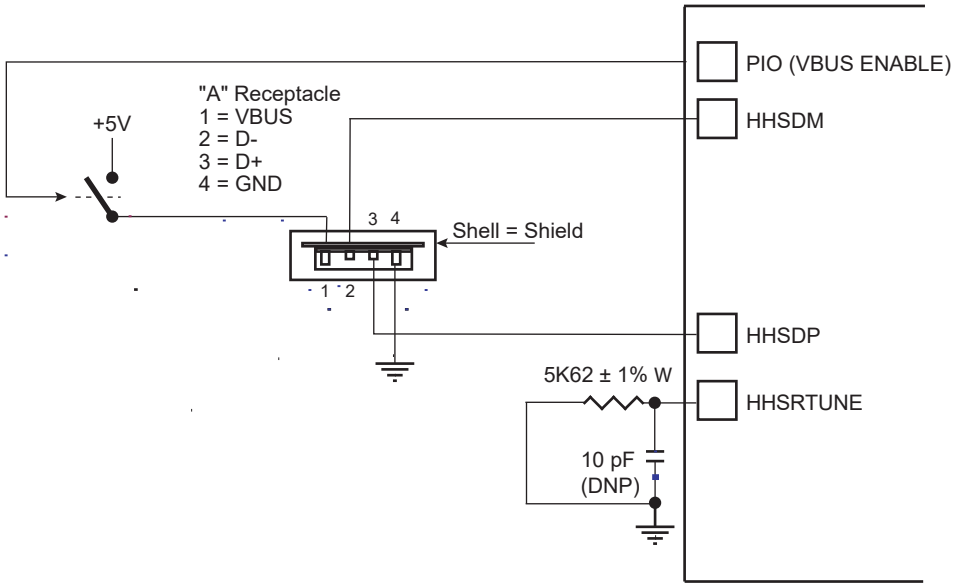
The USB root hub is integrated in the USB host. Several USB downstream ports are available. The number of downstream ports can be determined by the software driver reading the root hub’s operational registers. Device connection is automatically detected by the USB host port logic.

USB physical transceivers are integrated in the product and driven by the root hub’s ports.

© 2025 Microchip Technology Inc. and its subsidiaries

84.4. Typical Connection

Figure 84.2. Board Schematic to Interface UHP High-speed Host Controller



84.5. Product Dependencies

84.5.1. I/O Lines

HHSDPs and HHSDMs are not controlled by any PIO controllers. The embedded USB High Speed physical transceivers are controlled by the USB host controller.

One transceiver is shared with the USB High Speed Device (port A). The selection between Host Port A and USB Device is controlled by the UDPHS enable bit (EN_UDPHS) located in the UDPHS_CTRL register.

In the case the port A is driven by the USB High Speed Device, the output signals are DHSDP and DHSDM. The transceiver is automatically selected for Device operation once the USB High Speed Device is enabled.

In the case the port A is driven by the USB High Speed Host, the output signals are HHSDPA and HHSDMA.

84.5.2. Power Management

The system embeds three transceivers.

The USB Host High Speed requires a 480 MHz clock for the embedded High-speed transceivers. This clock (UPLLCK) is provided by the UTMI PLL.

In case power consumption is saved by stopping the UTMI PLL, high-speed operations are not possible. Nevertheless, OHCI Full-speed operations remain possible by selecting PLLACK as the input clock of OHCI.

The High-speed transceiver returns a 30 MHz clock to the USB Host controller.

The USB Host controller requires 48 MHz and 12 MHz clocks for OHCI full-speed operations. These clocks must be generated by a PLL with a correct accuracy of +/-0.25% using the USBDIV field.

Thus the USB Host peripheral receives three clocks from the Power Management Controller (PMC): the Peripheral Clock (MCK domain), the UHP48M and the UHP12M (built-in UHP48M divided by four) used by the OHCI to interface with the bus USB signals (recovered 12 MHz domain) in Full-speed operations.

© 2025 Microchip Technology Inc. and its subsidiaries

Thus the USB Host peripheral receives three clocks from the Power Management Controller (PMC): the Peripheral Clock (MCK domain), the UHP48M and the UHP12M (built-in UHP48M divided by four) used by the OHCI to interface with the bus USB signals (recovered 12 MHz domain) in Full-speed operations.

For High-speed operations, the user has to perform the following:

- Enable UHPHS peripheral clock in the PMC.
- Start the UPLL with a 480 MHz output frequency following the recommendation provided in section "USB Clock Controller" in chapter "Power Management Controller (PMC)".
- Select UPLLCK as Input clock of OHCI part (USBS bit in PMC_USB register).
- Program OHCI clocks (UHP48M and UHP12M) with USBDIV field in PMC_USB register. USBDIV must be 9 (division by 10) if UPLLCK is selected.
- Enable OHCI clocks with UHP bit in PMC_SCER.

For OHCI Full-speed operations only, the user can use the PLLA, and in this case has to perform the following:

- Enable UHPHS peripheral clock in the PMC.
- Select PLLACK as Input clock of OHCI part (USBS bit in PMC_USB register).
- Program OHCI clocks (UHP48M and UHP12M) with USBDIV field in PMC_USB register. USBDIV value is to be calculated according to the PLLACK value and USB Full-speed accuracy.
- Enable the OHCI clocks with UHP bit in PMC_SCER.

Figure 84.3. UHP Clock Trees

84.5.3. Interrupt Sources

The USB host interface has an interrupt line connected to the interrupt controller.

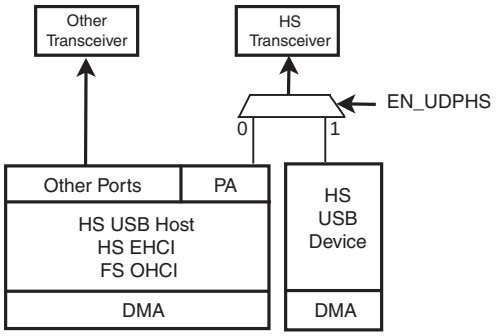
Handling USB host interrupts requires programming the interrupt controller before configuring the UHPHS.

84.6. Functional Description

84.6.1. UTMI Transceivers Sharing

The High Speed USB Host Port A is shared with the High Speed USB Device port and connected to the second UTMI transceiver. The selection between Host Port A and USB device is controlled by the UDPHS enable bit (EN_UDPHS) located in the UDPHS_CTRL register.

Figure 84.4. USB Selection



84.6.2. EHCI

The USB Host Port controller is fully compliant with the Enhanced HCI specification. The USB Host Port User Interface (registers description) can be found in the Enhanced HCI Rev 1.0 Specification available on www.usb.org

84.6.3. OHCI

The USB Host Port integrates a root hub and transceivers on downstream ports. It provides several Full-speed half-duplex serial communication ports at a baud rate of 12 Mbps. Up to 127 USB devices (printer, camera, mouse, keyboard, disk, etc.) and the USB hub can be connected to the USB host in the USB “tiered star” topology.

The USB Host Port controller is fully compliant with the Open HCI specification. The USB Host Port User Interface (registers description) can be found in the Open HCI Rev 1.0 Specification available on www.usb.org.

All standard class devices are automatically detected and available to the user’s application. As an example, integrating an HID (Human Interface Device) class driver provides a plug & play feature for all USB keyboards and mouses.

84.7. Register Summary

The Enhanced USB Host Controller contains two sets of software-accessible hardware registers: memory-mapped Host Controller Registers and optional PCI configuration registers. Note that the PCI configuration registers are only needed for PCI devices that implement the Host Controller.

- Memory-mapped USB Host Controller Registers—This block of registers is memory-mapped into non-cacheable memory. This memory space must begin on a DWord (32-bit) boundary. This register space is divided into two sections: a set of read-only capability registers and a set of read/write operational registers. The table below describes each register space.

© 2025 Microchip Technology Inc. and its subsidiaries

Note: Host controllers are not required to support exclusive-access mechanisms (such as PCI LOCK) for accesses to the memory-mapped register space. Therefore, if software attempts exclusive-access mechanisms to the host controller memory-mapped register space, the results are undefined.

- PCI Configuration Registers (for PCI devices)—In addition to the normal PCI header, power management, and device-specific registers, two registers are needed in the PCI configuration space to support USB. The normal PCI header and device-specific registers are beyond the scope of this document (the UHPHS_CLASSC register is shown in this document). Note that HCD does not interact with the PCI configuration space. This space is used only by the PCI enumerator to identify the USB Host Controller, and assign the appropriate system resources.
  The table below summarizes the enhanced interface register sets.

Offset	Register Set	Explanation
0 to N-1	Capability Registers	The capability registers specify the limits, restrictions, and capabilities of a host controller implementation. These values are used as parameters to the host controller driver.
N to N+M-1	Operational Registers	The operational registers are used by system software to control and monitor the operational state of the host controller.

Note: Software must not modify reserved bits in Read/Write registers.

84.7.1. UHPHS Host Controller Capability Register

Name: UHPHS_HCCAPBASE
Offset: 0x00
Reset: 0x01000010
Property: Read-only

Bit	31	30	29	28	27	26	25	24
	HCIVERSION[15:8]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	1

Bit	23	22	21	20	19	18	17	16
	HCIVERSION[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8
Access								
Reset								

Bit	7	6	5	4	3	2	1	0
	CAPLENGTH[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	1	0	0	0	0

Bits 31:16 – HCIVERSION[15:0] Host Controller Interface Version Number
This is a two-byte field containing a BCD encoding of the EHCI revision number supported by this host controller. The most significant byte of this field represents the major revision and the least significant byte the minor revision.

Bits 7:0 – CAPLENGTH[7:0] Capability Registers Length
This field is used as an offset to add to the register base to find the beginning of the Operational Register Space.

© 2025 Microchip Technology Inc. and its subsidiaries

84.7.2. UHPHS Host Controller Structural Parameters Register

Name: UHPHS_HCSPARAMS
Offset: 0x04
Reset: 0x00001303
Property: Read-only

These fields define structural parameters: number of downstream ports, etc.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	N_DP[3:0]							P_INDICATOR
Access	R	R	R	R				R
Reset	0	0	0	0				0

Bit	15	14	13	12	11	10	9	8
	N_CC[3:0]				N_PCC[3:0]			
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	1	0	0	1	1

Bit	7	6	5	4	3	2	1	0
				PPC	N_PORTS[3:0]			
Access				R	R	R	R	R
Reset				0	0	0	1	1

Bits 23:20 – N_DP[3:0] Debug Port Number
Optional. This register identifies which of the host controller ports is the debug port. The value is the port number (1-based) of the debug port. A non-zero value in this field indicates the presence of a debug port. The value in this register must not be greater than N_PORTS.

Bit 16 – P_INDICATOR Port Indicators
This bit indicates whether the ports support port indicator control. When this bit is a 1, the port status and control registers include a read/writeable field for controlling the state of the port indicator. See UHPHS Port Status and Control Register for a definition of the port indicator control field.

Bits 15:12 – N_CC[3:0] Number of Companion Controllers
This field indicates the number of companion controllers associated with this USB 2.0 host controller.
A zero in this field indicates there are no companion host controllers. Port-ownership hand-off is not supported. Only high-speed devices are supported on the host controller root ports.
A value larger than zero in this field indicates there are companion USB 1.1 host controller(s). Port-ownership hand-offs are supported. High, Full- and Low-speed devices are supported on the host controller root ports.

Bits 11:8 – N_PCC[3:0] Number of Ports per Companion Controller
This field indicates the number of ports supported per companion host controller. It is used to indicate the port routing configuration to system software.
For example, if N_PORTS has a value of 6 and N_CC has a value of 2, then N_PCC could have a value of 3. The convention is that the first N_PCC ports are assumed to be routed to companion controller

© 2025 Microchip Technology Inc. and its subsidiaries

1, the next N_PCC ports to companion controller 2, etc. In the previous example, the N_PCC could have been 4, where the first four are routed to companion controller 1 and the last two are routed to companion controller 2.
The number in this field must be consistent with N_PORTS and N_CC.

Bit 4 – PPC Port Power Control
This field indicates whether the host controller implementation includes port power control. A one in this bit indicates the ports have port power switches. A zero in this bit indicates the ports do not have port power switches. The value of this field affects the functionality of the Port Power field in each port status and control register (see UHPHS Port Status and Control Register).

Bits 3:0 – N_PORTS[3:0] Number of Ports
This field specifies the number of physical downstream ports implemented on this host controller. The value of this field determines how many port registers are addressable in the Operational Register Space. Valid values are in the range of 1 to 15.
A zero in this field is undefined.

© 2025 Microchip Technology Inc. and its subsidiaries

84.7.3. UHPHS Host Controller Capability Parameters Register

Name: UHPHS_HCCPARAMS
Offset: 0x08
Reset: 0x00000026
Property: Read-only

These fields define capability parameters: Multiple Mode control (time-base bit functionality), addressing capability, etc.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access								
Reset								

Bit	15	14	13	12	11	10	9	8
	EECP[7:0]							
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
	IST[3:0]					ASPC	PFLF	AC
Access	R	R	R	R		R	R	R
Reset	0	0	1	0		1	1	0

Bits 15:8 – EECP[7:0] EHCI Extended Capabilities Pointer
Indicates the existence of a capabilities list. A value of 0 indicates no extended capabilities are implemented. A non-zero value in this register indicates the offset in the PCI configuration space of the first EHCI extended capability. The pointer value must be 64 or greater if implemented to maintain the consistency of the PCI header defined for this class of device.

Bits 7:4 – IST[3:0] Isochronous Scheduling Threshold
Indicates, relative to the current position of the executing host controller, where software can reliably update the isochronous schedule. When bit [7] is 0, the value of the least significant three bits indicates the number of microframes a host controller can hold a set of isochronous data structures (one or more) before flushing the state. When bit [7] is set to 1, the host software assumes the host controller may cache an isochronous data structure for an entire frame.

Bit 2 – ASPC Asynchronous Schedule Park Capability
The park capability can be disabled or enabled and set to a specific level by using the Asynchronous Schedule Park Mode Enable and Asynchronous Schedule Park Mode Count fields in the UHPHS_USBCMD register.

Value	Description
0	Host controller does not supports the park feature for high-speed queue.
1	Host controller supports the park feature for high-speed queue heads in the Asynchronous Schedule.

Bit 1 – PFLF Programmable Frame List Flag

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
0	System software must use a frame list length of 1024 elements with this host controller. The UHPHS_USBCMD register Frame List Size field is a read-only register and must be set to 0.
1	System software can specify and use a smaller frame list and configure the host controller via the UHPHS_USBCMD register Frame List Size field. The frame list must always be aligned on a 4-Kbyte page boundary. This requirement ensures that the frame list is always physically contiguous.

Bit 0 – AC 64-bit Addressing Capability

This field documents the addressing range capability of this implementation. The value of this field determines whether software should use 32-bit or 64-bit data structures.
This information is not tightly coupled with the UHPHS_USBBASE address register mapping control. The 64-bit Addressing Capability bit indicates whether the host controller can generate 64-bit addresses as a host. The UHPHS_USBBASE register indicates the host controller only needs to decode 32-bit addresses as a client.

Value	Description
0	Data structures using 32-bit address memory pointers
1	Data structures using 64-bit address memory pointers

© 2025 Microchip Technology Inc. and its subsidiaries

84.7.4. UHPHS USB Command Register

Name: UHPHS_USBCMD
Offset: 0x10
Reset: 0x00080B00
Property: Read/Write

The Command Register indicates the command to be executed by the serial bus host controller. Writing to the register causes a command to be executed.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
	ITC[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	1	0	0	0

Bit	15	14	13	12	11	10	9	8
					ASPME		ASPMC[1:0]	
Access					R-R/W		R-R/W	R-R/W
Reset					1		1	1

Bit	7	6	5	4	3	2	1	0
	LHCR	IAAD	ASE	PSE	FLS[1:0]		HCRESET	RS
Access	R/W	R/W	R/W	R/W	R-R/W	R-R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 23:16 – ITC[7:0] Interrupt Threshold Control
This field is used by system software to select the maximum rate at which the host controller will issue interrupts. The only valid values are defined below. If software writes an invalid value to this register, the results are undefined.

Value	Maximum Interrupt Interval
0	Reserved
1	1 microframe
2	2 microframes
4	4 microframes
8	8 microframes (1 ms)
16	16 microframes (2 ms)
32	32 microframes (4 ms)
64	64 microframes (8 ms)

Any other value in this register yields undefined results.
Software modifications to this field while HCHLT=0 results in undefined behavior.

Bit 11 – ASPME Asynchronous Schedule Park Mode Enable (optional)
If the Asynchronous Park Capability bit in the UHPHS_HCCPARAMS register is set to 1, then this bit is set to 1 and is Read/Write. Otherwise the bit must be 0 and is read-only.

Value	Description
0	Park mode is enabled.
1	Park mode is disabled.

© 2025 Microchip Technology Inc. and its subsidiaries

Bits 9:8 – ASPMC[1:0] Asynchronous Schedule Park Mode Count (optional)
If the Asynchronous Park Capability bit in the UHPHS_HCCPARAMS register is set to 1, then this field defaults to 3 and is read/write. Otherwise it defaults to 0 and is read-only. It contains a count of the number of successive transactions the host controller is allowed to execute from a high-speed queue head on the Asynchronous schedule before continuing traversal of the Asynchronous schedule. Valid values are 1 to 3. Software must not write a 0 to this bit when Park Mode Enable is set to 1 as this will result in undefined behavior.

Bit 7 – LHCR Light Host Controller Reset (optional)
This control bit is not required. If implemented, it allows the driver to reset the EHCI controller without affecting the state of the ports or the relationship to the companion host controllers. For example, the UHPHS_PORTSC registers should not be reset to their default values and the CF bit setting should not go to 0 (retaining port ownership relationships).
A host software read of this bit as 0 indicates the Light Host Controller Reset has completed and it is safe for host software to re-initialize the host controller. A host software read of this bit as 1 indicates the Light Host Controller Reset has not yet completed.
If not implemented, a read of this field will always return a 0.

Bit 6 – IAAD Interrupt on Async Advance Doorbell
This bit is used as a doorbell by software to tell the host controller to issue an interrupt the next time it advances asynchronous schedule. Software must write a 1 to this bit to ring the doorbell. When the host controller has evicted all appropriate cached schedule state, it sets the Interrupt on Async Advance status bit in the UHPHS_USBSTS register. If the Interrupt on Async Advance Enable bit in the UHPHS_USBINTR register is set to 1, then the host controller will assert an interrupt at the next interrupt threshold.
The host controller sets this bit to 0 after it has set the Interrupt on Async Advance status bit in the UHPHS_USBSTS register to 1.
Software should not write a 1 to this bit when the asynchronous schedule is disabled. Doing so will yield undefined results.

Bit 5 – ASE Asynchronous Schedule Enable
This bit controls whether the host controller skips processing the Asynchronous Schedule.

Value	Description
0	Do not process the Asynchronous Schedule.
1	Use the UHPHS_ASYNCLISTADDR register to access the Asynchronous Schedule.

Bit 4 – PSE Periodic Schedule Enable
This bit controls whether the host controller skips processing the Periodic Schedule.

Value	Description
0	Do not process the Periodic Schedule.
1	Use the UHPHS_PERIODICLISTBASE register to access the Periodic Schedule.

Bits 3:2 – FLS[1:0] Frame List Size
This field is read-only with one exception: it is read/write if the Programmable Frame List flag, in the UHPHS_HCCPARAMS register, is set to 1. This field specifies the size of the frame list. The size of the frame list controls which bits in the Frame Index Register should be used for the Frame List Current index.

Value	Description
0	1024 elements (4096 bytes).
1	512 elements (2048 bytes).
2	256 elements (1024 bytes), for resource-constrained environments.
3	Reserved.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 1 – HCRESET Host Controller Reset

This control bit is used by software to reset the host controller. The effects of this on Root Hub registers are similar to a Chip Hardware Reset.
When software writes a 1 to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on USB is immediately terminated. A USB reset is not driven on downstream ports.
PCI Configuration registers are not affected by this reset. All operational registers, including port registers and port state machines, are set to their initial values. Port ownership reverts to the companion host controller(s) with side effects. Software must reinitialize the host controller in order to return the host controller to an operational state.
This bit is set to 0 by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a 0 to this register.
Software must not set this bit to 1 when HCHLT in the UHPHS_USBSTS register is 0. Attempting to reset an actively running host controller results in undefined behavior.

Bit 0 – RS Run/Stop

The Host Controller must halt within 16 microframes after software clears the bit RS. The HCHLT bit in the status register indicates when the Host Controller has finished its pending pipelined transactions and has entered the stopped state. Software must not write 1 to this field unless the host controller is in the halted state (i.e., HCHLT in the UHPHS_USBSTS register is 1). Doing so yields undefined results.

Value	Description
0	Host Controller completes the current and any actively pipelined transactions on the USB and then halts.
1	Host Controller proceeds with execution of the schedule.

© 2025 Microchip Technology Inc. and its subsidiaries

84.7.5. UHPHS USB Status Register

Name: UHPHS_USBSTS
Offset: 0x14
Reset: 0x00001000
Property: Read/Write

This register indicates pending interrupts and various states of the Host Controller. The status resulting from a transaction on the serial bus is not indicated in this register. Software sets a bit to 0 in this register by writing a 1 to it.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Access			R/W	R/W	R/W	R/W	R/W	R/W
Reset			0	0	0	0	0	0

Bit 15 – ASS Asynchronous Schedule Status
The bit reports the current real status of the Asynchronous Schedule.
The Host Controller is not required to immediately disable or enable the Asynchronous Schedule when software transitions the Asynchronous Schedule Enable bit in the UHPHS_USBCMD register. When this bit and the Asynchronous Schedule Enable bit are the same value, the Asynchronous Schedule is either enabled or disabled.

Value	Description
0	Asynchronous Schedule is disabled.
1	Asynchronous Schedule is enabled.

Bit 14 – PSS Periodic Schedule Status
The bit reports the current real status of the Periodic Schedule. If this bit is set to 0, then the status of the Periodic Schedule is disabled. If this bit is set to 1, then the status of the Periodic Schedule is enabled. The Host Controller is not required to immediately disable or enable the Periodic Schedule when software transitions the Periodic Schedule Enable bit in the UHPHS_USBCMD register. When this bit and the Periodic Schedule Enable bit are the same value, the Periodic Schedule is either enabled or disabled.

Bit 13 – RCM Reclamation
This is a read-only status bit used to detect any empty asynchronous schedule.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 12 – HCHLT HCHalted
This bit is 0 whenever the Run/Stop bit is 1. The Host Controller sets this bit to 1 after it has stopped executing as a result of the Run/Stop bit being set to 0, either by software or by the Host Controller hardware (following an internal error, for example).

Bit 5 – IAA Interrupt on Async Advance (Cleared on write)
System software can force the host controller to issue an interrupt the next time the host controller advances the asynchronous schedule by writing 1 to the Interrupt on the Async Advance Doorbell bit in the UHPHS_USBCMD register. This status bit indicates the assertion of that interrupt source.

Bit 4 – HSE Host System Error (Cleared on write)
The Host Controller sets this bit to 1 when a serious error occurs during a host system access involving the Host Controller module. In a PCI system, conditions that set this bit to 1 include PCI Parity error, PCI Host Abort, and PCI Target Abort. When this error occurs, the Host Controller clears the Run/Stop bit in the Command register to prevent further execution of the scheduled TDs.

Bit 3 – FLR Frame List Rollover (Cleared on write)
The Host Controller sets this bit to 1 when the Frame List Index (see UHPHS USB Frame Index Register) rolls over from its maximum value to 0. The exact value at which the rollover occurs depends on the frame list size. For example, if the frame list size (as programmed in the Frame List Size field of the UHPHS_USBCMD register) is 1024, the Frame Index Register rolls over every time FRINDEX[13] toggles. Similarly, if the size is 512, the Host Controller sets this bit to 1 every time FRINDEX[12] toggles.

Bit 2 – PCD Port Change Detect (Cleared on write)
The Host Controller sets this bit to 1 when any port for which the Port Owner bit is set to 0 (see UHPHS Port Status and Control Register) has a change bit transition from 0 to 1 or a Force Port Resume bit transition from 0 to 1 as a result of a J-K transition detected on a suspended port. This bit will also be set as a result of the Connect Status Change being set to 1 after system software has relinquished ownership of a connected port by writing 1 to a port's Port Owner bit.
This bit is allowed to be maintained in the Auxiliary power well. Alternatively, it is also acceptable that on a D3 to D0 transition of the EHCI HC device, this bit is loaded with the OR of all of the PORTSC change bits (including: Force Port Resume, Overcurrent Change, Enable/Disable Change and Connect Status Change).

Bit 1 – USBERRINT USB Error Interrupt (Cleared on write)
The Host Controller sets this bit to 1 when completion of a USB transaction results in an error condition (error counter underflow, for example). If the TD on which the error interrupt occurred also had its IOC bit set, both this bit and USBINT bit are set.

Bit 0 – USBINT USB Interrupt (Cleared on write)
The Host Controller sets this bit to 1 on the completion of a USB transaction, which results in the retirement of a Transfer Descriptor that had its IOC bit set.
The Host Controller also sets this bit to 1 when a short packet is detected (the actual number of bytes received was less than the expected number of bytes).

84.7.6. UHPHS USB Interrupt Enable Register

Name: UHPHS_USBINTR
Offset: 0x18
Reset: 0x00000000
Property: Read/Write

This register enables and disables reporting of the corresponding interrupt to the software. When a bit is set and the corresponding interrupt is active, an interrupt is generated to the host. Interrupt sources that are disabled in this register still appear in the UHPHS_USBSTS to allow the software to poll for events.

For all bits, 1=Enabled, 0=Disabled.

Bit 5 – IAAE Interrupt on Async Advance Enable
The interrupt is acknowledged by software clearing the Interrupt on Async Advance bit UHPHS_USBSTS.

Bit 4 – HSEE Host System Error Enable
The interrupt is acknowledged by software clearing the Host System Error bit in UHPHS_USBSTS.

Bit 3 – FLRE Frame List Rollover Enable
The interrupt is acknowledged by software clearing the Frame List Rollover in UHPHS_USBSTS.

Bit 2 – PCIE Port Change Interrupt Enable
The interrupt is acknowledged by software clearing the Port Change Detect bit in UHPHS_USBSTS.

Bit 1 – USBEIE USB Error Interrupt Enable
The interrupt is acknowledged by software clearing the USBERRINT in UHPHS_USBSTS.

Bit 0 – USBIE USB Interrupt Enable
The interrupt is acknowledged by software clearing the USBINT in UHPHS_USBSTS.

84.7.7. UHPHS USB Frame Index Register

Name: UHPHS_FRINDEX
Offset: 0x1C
Reset: 0x00000000
Property: Read/Write

This register is used by the host controller to index into the periodic frame list. The register updates every 125 µs (once each microframe). Bits [N:3] are used to select a particular entry in the Periodic Frame List during periodic schedule execution. The number of bits used for the index depends on the size of the frame list as set by system software in the Frame List Size field in the UHPHS_USBCMD register).

This register must be written as a DWord. Byte writes produce undefined results. This register cannot be written unless the Host Controller is in the Halted state as indicated by the HCHLT bit (UHPHS_USBSTS register). A write to this register while the Run/Stop bit is set to 1 (UHPHS_USBCMD register) produces undefined results. Writes to this register also affect the SOF value.

Bit	31	30	29	28	27	26	25	24
Access								
Reset								

Bit	23	22	21	20	19	18	17	16
Access

Bit	7	6	5	4	3	2	1	0
	FI[7:0]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 13:0 – FI[13:0] Frame Index
The value in this register increments at the end of each time frame (microframe, for example). Bits [N:3] are used for the Frame List current index. This means that each location of the frame list is accessed eight times (frames or microframes) before moving to the next index. The following illustrates values of N based on the value of FLS (Frame List Size) in the UHPHS_USBCMD register.

UHPHS_USBCMD.FLS	Number Elements	N
0	1024	12
1	512	11
2	256	10
3	Reserved	–

The SOF frame number value for the bus SOF token is derived or alternatively managed from this register. The value of FRINDEX must be 125 µs (1 microframe) ahead of the SOF token value. The SOF value may be implemented as an 11-bit shadow register. For this discussion, this shadow register is 11 bits and is named SOFV. SOFV updates every eight microframes (1 millisecond). An

© 2025 Microchip Technology Inc. and its subsidiaries

example implementation to achieve this behavior is to increment SOFV each time the FRINDEX[2:0] increments from 0 to 1.
Software must use the value of FRINDEX to derive the current microframe number, both for high-speed isochronous scheduling purposes and to provide the “get microframe number” function required for client drivers. Therefore, the value of FRINDEX and the value of SOFV must be kept consistent if chip is reset or software writes to FRINDEX. Writes to FRINDEX must also write-through FRINDEX[13:3] to SOFV[10:0]. In order to keep the update as simple as possible, software should never write a FRINDEX value where the three least significant bits are 7 or 0.

© 2025 Microchip Technology Inc. and its subsidiaries

84.7.8. UHPHS Periodic Frame List Base Address Register

Name: UHPHS_PERIODICLISTBASE
Offset: 0x24
Reset: 0x00000000
Property: Read/Write

This 32-bit register contains the beginning address of the Periodic Frame List in the system memory. The memory structure referenced by this physical memory pointer is assumed to be 4-Kbyte aligned. The contents of this register are combined with the Frame Index Register (UHPHS_FRINDEX) to enable the Host Controller to step through the Periodic Frame List in sequence. This register must be written as a DWord. Byte writes produce undefined results.

84.7.9. UHPHS Asynchronous List Address Register

Name: UHPHS_ASYNCLISTADDR
Offset: 0x28
Reset: 0x00000000
Property: Read/Write

This 32-bit register contains the address of the next asynchronous queue head to be executed. Bits [4:0] of this register cannot be modified by system software and will always return a zero when read. The memory structure referenced by this physical memory pointer is assumed to be 32-byte (cache line) aligned. This register must be written as a DWord. Byte writes produce undefined results.

Bit	31	30	29	28	27	26	25	24

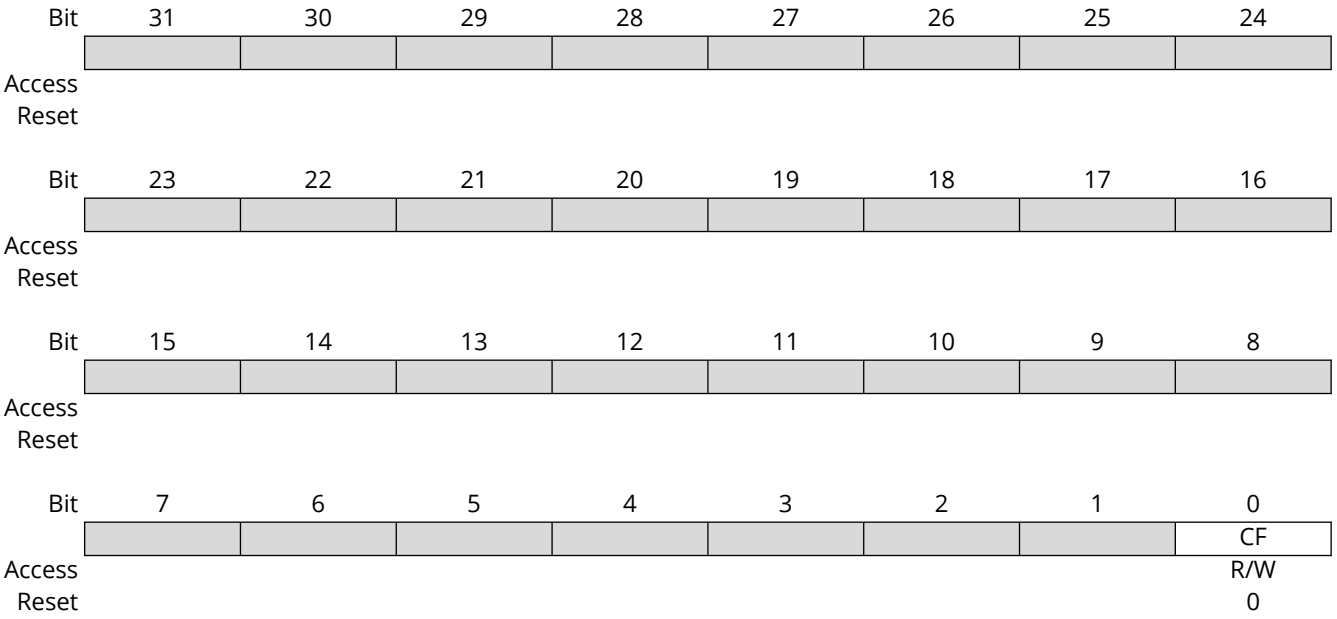
Bits 31:5 – LPL[26:0] Link Pointer Low
These bits correspond to memory address signals [31:5], respectively. This field may only reference a Queue Head (QH).

© 2025 Microchip Technology Inc. and its subsidiaries

84.7.10. UHPHS Configure Flag Register

Name: UHPHS_CONFIGFLAG
Offset: 0x50
Reset: 0x00000000
Property: Read/Write

This register is in the auxiliary power well. It is only reset by hardware when the auxiliary power is initially applied or in response to a host controller reset.



Bit 0 – CF Configure Flag
Host software sets this bit as the last action in its process of configuring the Host Controller. This bit controls the default port-routing control logic. Bit values and side-effects are listed below.

Value	Description
0	Port routing control logic default-routes each port to an implementation-dependent classic host controller (default value).
1	Port routing control logic default-routes all ports to this host controller.

© 2025 Microchip Technology Inc. and its subsidiaries

84.7.11. UHPHS Port Status and Control Register

Name: UHPHS_PORTSCx
Offset: 0x54 + x*0x04 [x=0..2]
Reset: 0x00003000
Property: Read/Write

The number of port registers is documented in the UHPHS_HCSPARAMS register. Software uses this information as an input parameter to determine how many ports need to be serviced. All ports have the structure defined below.

This register is in the auxiliary power well. It is only reset by hardware when the auxiliary power is initially applied or in response to a host controller reset. The initial conditions of a port are:

- No device connected
- Port disabled

If the port has port power control, software cannot change the state of the port until after it applies power to the port by setting port power to a 1. Software must not attempt to change the state of the port until after power is stable on the port. The host is required to have power stable to the port within 20 milliseconds of the 0 to 1 transition.

Notes:

1. When a device is attached, the port state transitions to the connected state and system software will process this as with any status change notification.
2. If a port is being used as the Debug Port, then the port may report device connected and enabled when the Configured Flag is set to 0.

Bit	7	6	5	4	3	2	1	0
	SUS	FPR	OCC	OCA	PEDC	PED	CSC	CCS
Access	R/W	R/W	R/W	R	R/W	R/W	R/W	R
Reset	0	0	0	0	0	0	0	0

Bit 22 – WKOC_E Wake on Overcurrent Enable
This field is 0 if Port Power is 0.

Value	Description
0	Disables the port to be sensitive to overcurrent conditions as wake-up events.
1	Enables the port to be sensitive to overcurrent conditions as wake-up events.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 21 – WKDSCNNT_E Wake on Disconnect Enable
This field is 0 if Port Power is 0.

Value	Description
0	Disables the port to be sensitive to device disconnects as wake-up events.
1	Enables the port to be sensitive to device disconnects as wake-up events.

Bit 20 – WKCNNT_E Wake on Connect Enable
This field is 0 if Port Power is 0.

Value	Description
0	Disables the port to be sensitive to device connects as wake-up events.
1	Enables the port to be sensitive to device connects as wake-up events.

Bits 19:16 – PTC[3:0] Port Test Control
When this field is set to 0, the port is NOT operating in a test mode. A non-zero value indicates that it is operating in test mode and the specific test mode is indicated by the specific value.
Test mode bits are encoded as follows (6 to 15 are reserved):

Value	Test Mode
0	Test mode not enabled
1	Test J_STATE
2	Test K_STATE
3	Test SE0_NAK
4	Test Packet
5	Test FORCE_ENABLE

Refer to the USB Specification Revision 2.0, Chapter 7, for details on each test mode.

Bits 15:14 – PIC[1:0] Port Indicator Control
Writing to these bits has no effect if the P_INDICATOR bit in the UHPHS_HCSPARAMS register is set to 0. If the P_INDICATOR bit is set to 1, then the bits are encoded as follows:

Value	Meaning
0	Port indicators are off
1	Amber
2	Green
3	Undefined

Refer to the USB Specification Revision 2.0 for a description of how these bits are to be used.
This field is 0 if Port Power is 0.

Bit 13 – PO Port Owner
System software uses this field to release ownership of the port to a selected host controller (in the event that the attached device is not a high-speed device). Software writes 1 to this bit when the attached device is not a high-speed device. A 1 in this bit means that a companion host controller owns and controls the port.

Value	Description
0	This bit unconditionally goes to a 0 when the bit UHPHS_CONFIGFLAG.CF makes a 0 to 1 transition.
1	This bit unconditionally goes to 1 whenever the bit UHPHS_CONFIGFLAG.CF=0.

Bit 12 – PP Port Power
The function of this bit depends on the value of the Port Power Control (PPC) field in the UHPHS_HCSPARAMS register. When host controller has port power control switches (PPC=0), PP is in read-only mode:

© 2025 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Each port is hard-wired to power.

When host controller has port power control switches (PPC=1), PP is in read/write mode:

Value	Description
0	Host port power switch is off. When power is not available on a port (i.e., PP at 0), the port is non-functional and does not report attaches, detaches, etc.
1	Host port power switch is on. When power is not available on a port (i.e., PP at 0), the port is non-functional and does not report attaches, detaches, etc.

When an overcurrent condition is detected on a powered port and PPC is set to 1, the PP bit in each affected port may be transitioned by the host controller from 1 to 0 (removing power from the port).

Bits 11:10 – LS[1:0] Line Status

These bits reflect the current logical levels of the D+ (bit 11) and D- (bit 10) signal lines. These bits are used for detection of low-speed USB devices prior to the port reset and enable sequence. This field is valid only when the port enable bit is 0 and the current connect status bit is set to 1.
This value of this field is undefined if Port Power is 0.

Value	Name	Description
0	SE0	Not a low-speed device, perform EHCI reset
1	K_STATE	Low-speed device, release ownership of port
2	J_STATE	Not a low-speed device, perform EHCI reset
3	Undefined	Not a low-speed device, perform EHCI reset

Bit 8 – PR Port Reset

When software writes a 1 to this bit (from 0), the bus reset sequence as defined in the USB Specification Revision 2.0 is started. Software writes a 0 to this bit to terminate the bus reset sequence. Software must keep this bit set to 1 long enough to ensure the reset sequence, as specified in the USB Specification Revision 2.0, completes.
Note: When software writes this bit to 1, it must also write 0 to the Port Enable bit.

When software writes a 0 to this bit, there may be a delay before the bit status changes to 0. The bit status will not read as 0 until after the reset has completed. If the port is in High-Speed mode after reset is complete, the host controller will automatically enable this port (set the Port Enable bit to 1, for example). A host controller must terminate the reset and stabilize the state of the port within 2 milliseconds of software transitioning this bit from 1 to 0. For example: if the port detects that the attached device is high-speed during reset, then the host controller must have the port in the enabled state within 2 ms of software writing this bit to 0.
The HCHLT bit in the UHPHS_USBSTS register should be set to 0 before software attempts to use this bit. The host controller may hold Port Reset asserted to 1 when the HCHLT bit is 1.
This field is 0 if Port Power is 0.

Value	Description
0	Port is not in Reset.
1	Port is in Reset.

Bit 7 – SUS Suspend

Value	Description
0	Port not in Suspend state.
1	Port in Suspend state.

© 2025 Microchip Technology Inc. and its subsidiaries

Note:
Port Enabled Bit and Suspend bit of this register define the port states as follows:

Bits [Port Enabled, Suspend]	Port State
0X	Disable
10	Enable
11	Suspend

When in suspend state, downstream propagation of data is blocked on this port, except for port reset. The blocking occurs at the end of the current transaction, if a transaction was in progress when this bit was written to 1. In the suspend state, the port is sensitive to resume detection. Note that the bit status does not change until the port is suspended and that there may be a delay in suspending a port if there is a transaction currently in progress on the USB.

A write of 0 to this bit is ignored by the host controller. The host controller will unconditionally set this bit to 0 when:

- Software sets the Force Port Resume bit to 0 (from 1).
- Software sets the Port Reset bit to 1 (from 0).

If host software sets this bit to 1 when the port is not enabled (i.e., Port Enabled bit set to 0), the results are undefined.

This field is 0 if Port Power is set to 0.

Bit 6 – FPR Force Port Resume

This functionality defined for manipulating this bit depends on the value of the Suspend bit. For example, if the port is not suspended (Suspend and Enabled bits are set to 1) and software transitions this bit to 1, then the effects on the bus are undefined.
Software sets this bit to a 1 to drive resume signaling. The Host Controller sets this bit to 1 if a J-to-K transition is detected while the port is in the Suspend state. When this bit transitions to 1 because a J-to-K transition is detected, the Port Change Detect bit in the UHPHS_USBSTS register is also set to 1. If software sets this bit to 1, the host controller must not set the Port Change Detect bit.
Note that when the EHCI controller owns the port, the resume sequence follows the defined sequence documented in the USB Specification Revision 2.0. The resume signaling (Full-speed 'K') is driven on the port as long as this bit remains set to 1. Software must appropriately time the Resume and set this bit to 0 when the appropriate amount of time has elapsed. Writing a 0 (from 1) causes the port to return to High-Speed mode (forcing the bus below the port into a high-speed idle). This bit will remain set to 1 until the port has switched to the high-speed idle. The host controller must complete this transition within 2 milliseconds of software setting this bit to 0.
This field is 0 if Port Power is 0.

Value	Description
0	No resume (K-state) detected/driven on port.
1	Resume detected/driven on port.

Bit 5 – OCC Overcurrent Change (Cleared on write)

Software clears this bit by writing 1.

Value	Description
0	No change to Overcurrent Active.
1	Changes to Overcurrent Active.

Bit 4 – OCA Overcurrent Active

This bit will automatically transition from 1 to 0 when the overcurrent condition is removed.

Value	Description
0	This port does not have an overcurrent condition.
1	This port currently has an overcurrent condition.

© 2025 Microchip Technology Inc. and its subsidiaries

Bit 3 – PEDC Port Enable/Disable Change (Cleared on write)

For the root hub, this bit gets set to 1 only when a port is disabled due to the appropriate conditions existing at the EOF2 point (refer to Chapter 11 of the USB Specification for the definition of a Port Error). Software clears this bit by writing a 1 to it.
This field is 0 if Port Power bit is 0.

Value	Description
0	No change in port enabled/disabled status.
1	Port enabled/disabled status has changed.

Bit 2 – PED Port Enabled/Disabled

Ports can only be enabled by the host controller as a part of the reset and enable. Software cannot enable a port by writing a 1 to this field. The host controller will only set this bit to 1 when the reset sequence determines that the attached device is a high-speed device.
Ports can be disabled by either a fault condition (disconnect event or other fault condition) or by host software. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller and bus events.
When the port is disabled (0b), downstream propagation of data is blocked on this port, except for reset.
This field is 0 if Port Power bit is 0.

Value	Description
0	Disable.
1	Enable.

Bit 1 – CSC Connect Status Change (Cleared on write)

Indicates a change has occurred in the port's Current Connect Status. The host controller sets this bit for all changes to the port device connect status, even if system software has not cleared an existing connect status change. For example, the insertion status changes twice before system software has cleared the changed condition, hub hardware will be "setting" an already-set bit (i.e., the bit remains set). Software sets this bit to 0 by writing a 1 to it.
This field is 0 if Port Power bit is 0.

Value	Description
0	No change.
1	Change in Current Connect Status.

Bit 0 – CCS Current Connect Status

This value reflects the current state of the port, and may not correspond directly to the event that caused the CSC bit to be 1.
This bit is 0 if Port Power is 0.

Value	Description
0	No device is present.
1	Device is present on port.

© 2025 Microchip Technology Inc. and its subsidiaries

84.7.12. EHCI: REG06 - AHB Error Status

Name: UHPHS_INSNREG06
Offset: 0xA8
Reset: 0x00000000
Property: Read/Write

Control and Status Register, used to read the UTMI registers from the signals below.

Bit	31	30	29	28	27	26	25	24
	AHB_ERR							
Access	R/W							
Reset	0

	Nb_Burst[3:0]				Nb_Success_Burst[3:0]			
Access	R	R	R	R	R	R	R	R
Reset	0	0	0	0	0	0	0	0

Bit 31 – AHB_ERR AHB Error
System bus error was encountered and erroneous burst characteristics are captured. To clear this field the application must write a 0.
EHCI:

- When no error, 0 is written to INSNREG06[8:4].
- When INCR4 and an error occurs, 4 is written to INSNREG06[8:4].
- When INCR8 and an error occurs, 8 is written to INSNREG06[8:4].
- When INCR16 and an error occurs, 16 is written to INSNREG06[8:4].
- Other values except 4, 8, and 16 are not written to INSNREG06[8:4].

OHCI:

- When no error, 0 is written to INSNREG06[8:4].
- When INCR4 and error occurs, 4 is written to INSNREG06[8:4].
- Other values except 4 are not written to INSNREG06[8:4].

Bits 11:9 – HBURST[2:0] Burst Value
Value of the control phase at which the AHB error occurred.
This field applies to enabled incremental bursts only.

Bits 8:4 – Nb_Burst[4:0] Number of Bursts
Number of beats expected in the burst at which the AHB error occurred. Valid values are 0 to 16.
This field applies to enabled incremental bursts only.

© 2025 Microchip Technology Inc. and its subsidiaries

Bits 3:0 – Nb_Success_Burst[3:0] Number of Successful Bursts
Number of successfully completed beats in the current burst before the AHB error occurred. This field applies to enabled incremental bursts only.

Electrical and Mechanical Characteristics

85. Electrical Characteristics

85.1. Electrical Parameters Usage

Tables in the following sections define the limiting values for several electrical parameters:

- I/O Characteristics
- Embedded Analog Peripherals Characteristics
- Security Module Characteristics
- Power Consumption in Active Mode
- Operation and Power Consumption in Low-Power Modes

- Unless otherwise noted, these values are valid over the junction temperature range defined in Ordering Information. This junction temperature range is referred to as the “applicable T_J range" in the following sections.
- Parameters annotated as "Simulation data" are not production-tested. Their limiting values come from simulations run in corner case conditions and were verified by electrical characterization over a limited number of samples. Additionally, the specifications in Digital Peripheral Timings are simulation data, even though they are not annotated as such.
- These limits may be affected by the board on which the device is mounted. In particular, noisy supply and ground conditions must be avoided and care must be taken to provide:
  - a PCB with a low-impedance ground plane. A single unbroken ground plane is a minimum requirement.
  - low-impedance decoupling of the device power supply inputs. A 10 nF to 220 nF Ceramic X7R (or X5R) capacitor placed very close to each power supply input is a minimum requirement. See specific recommendations regarding analog pins or functions in the corresponding sections. To reduce any potential electromagnetic compatibility (EMC) related issues, it is good practice to double this decoupling capacitor whenever possible with a high frequency one, for example one 100 pF (C0G or NP0) per power supply input.
  - low-impedance power supply decoupling of external components. This recommendation aims at avoiding large current spikes flowing into the PCB ground and power planes.
- In addition, although the device is specified with wide operating supply ranges on most of its supply inputs (for example 1.7V to 3.6V), large and fast supply variations may lead to unpredictable device behavior including, but not limited to, out-of-specification operation. Therefore, in addition to maintaining the power supply inputs within their specified range, it is also mandatory to keep the power supply variations within the limits described in Table 85.1 during the device operation.
- Finally, the device performances and operating junction temperature are strongly dependent on the thermal performances of the board on which the device is mounted. For further details, refer to the application note "SAMA7D6 Series Power Consumption and Thermal Considerations" (AN5821), available on www.microchip.com.

Table 85.1. Maximum Power Supply Variations[1]

Symbol	Parameter	Conditions	Min	Max	Unit
V_N	Peak-to-peak ripple and noise voltage	Applies to VDDCORE, VDDCPU, VDDIOP0, VDDIOP1, VDDQSPI0, VDDIODDR, VDDSDMMC0, VDDSDMMC1, VDDSDMMC2, VDDGMAC0, VDDGMAC1	–	3	% V_{DC}[2]
		Applies to VDDIN33, VBAT, VDDUTMII, VDDLVDS[5]	–	1	% V_{DC}[2]

© 2025 Microchip Technology Inc. and its subsidiaries

Table 85.1. Maximum Power Supply Variations[1] (continued)

Symbol	Parameter	Conditions	Min	Max	Unit
SR	Slewrate of power supply variations	$\Delta V \le 5\%\ V_{DC_MIN}$[3][4]	–	±50	V/ms
		$\Delta V < 10\%\ V_{DC_MIN}$	–	±10	V/ms
		$\Delta V \ge 10\%\ V_{DC_MIN}$	–	±1	V/ms

Notes:

1. VDDANA, VDDIN25 and VDDDPHY are not mentioned in this table, as they must be connected to the VDDOUT25 regulator output that fulfills the electrical requirements of these power inputs.
2. V_{DC} is the DC value of the power supply.
3. V_{DC_MIN} is the minimum operating voltage of the supply input as described in Table 85.4.
4. ΔV is the amplitude of the variation. The slew rate specification applies when the $\Delta V \ge V_{N.}$
5. The peak-to-peak ripple and noise voltage for VDDLVDS can be relaxed to 3% VDC when this segment is not used with the LVDS PHY.

The following examples and figure illustrate this table:

- When working with VDDIOP0 = 3.3V, a maximum power supply ripple and noise voltage of 99 mV peak-to-peak (3% of 3.3V) must be respected.
- When working with VDDIN33 = 3.3V, a maximum power supply ripple and noise voltage of 33 mV peak-to-peak (1% of 3.3V) must be respected.

Figure 85.1. Maximum Power Supply Variation

85.2. Absolute Maximum Ratings

Table 85.2. Absolute Maximum Ratings

Storage Temperature	-60°C to +150°C	**Note:** Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or other conditions beyond those indicated in the operational sections of this specification is not implied. **Exposure to absolute maximum rating conditions for extended periods may affect device reliability.**
Voltage Difference between two ground pins (among GND, GNDANA, GNDIN33, GNDUTMI, GNDDPHY and GNDBAT)	±50 mV	
Power Supply Inputs with respect to ground pins:		
VDDCORE, VDDCPU	-0.3V to 1.4V	
VDDIODDR	-0.3V to 2.0V	
VDDIOPx, VDDQSPI0, VDDSDMMCx, VDDGMAC0, VDDGMAC1	-0.3V to 4.0V	
VDDIN33, VBAT, VDDLVDS	-0.3V to 4.0V	
VDDUTMII	-0.3V to 4.0V	
VDDDPHY, VDDANA, VDDIN25	-0.3V to 3.0V	
Voltage on Digital or Analog Input Pins with respect to ground	-0.3V to 4.0V	
Injected Current into any input pin	± 1 mA	
Total Injected Current in all input pins of a common power supply pair	± 10 mA	
Maximum DC Output Current		
On all I/O lines into one power rail	100 mA	
Per output pin	25 mA	

Note: All I/O pins are internally clamped to their respective VDD and GND rails, as defined in the table Pin Description. Ex: for PA12, this corresponds to VDDSDMMC0 and GND.

85.3. ESD Ratings

Table 85.3. Electrostatic Discharge (ESD) Ratings

Symbol	Description	Conditions	Value	Unit
Electrostatic Discharge, Human Body Model (HBM)				
ESD_HBM	AEC-Q100-002 Rev E stress voltage level	All pins	±2	kV
Electrostatic Discharge, Charged-Device Model (CDM)				
ESD_CDM	AEC-Q100-011 Rev D classification level	All pins	C2a	–
	Corresponding stress voltage level	All pins	±500	V
		Corner pins	±750	V

85.4. Recommended Operating Conditions

Table 85.4. Power Supply Inputs[8]

Power Input	Parameter	Conditions	Min	Max	Unit
VDDCPU[1]	Cortex-A7 and cache memories	f_{CPU_CLK} ≤ 600 MHz	1.03	1.21	V
		f_{CPU_CLK} ≤ 800 MHz	1.12	1.21	V
		f_{CPU_CLK} ≤ 1 GHz[2] (SAMA7D65-V or SAMA7D65-E and T_J ≤ 105°C)	1.22	1.30	V
VDDCORE	Core logic power supply	–	1.03	1.21	V

© 2025 Microchip Technology Inc. and its subsidiaries

Table 85.4. Power Supply Inputs[8] (continued)

Power Input	Parameter	Conditions	Min	Max	Unit
VDDIODDR	SDRAM I/O lines power supply	[LPDDR2 / LPDDR3]-SDRAM	1.14	1.30	V
		DDR3-SDRAM	1.425	1.575	V
		DDR3L-SDRAM	1.283	1.45	V
		DDR2-SDRAM	1.7	1.9	V
VDDIN33[3]	VDDOUT25 regulator and OTP power supplies Backup area power switch input	–	3.0	3.6	V
VDDUTMII[3]	USB device and host UTMI+ interface	–	3.0	3.6	V
VDDDPHY[4]	MIPI D-PHY power supply	–	2.4	2.6	V
VDDANA[4]	ADC, comparator, temperature sensor, PLLs, main crystal oscillator, main RC oscillator power supply	–	2.4	2.6	V
VDDIN25	PLL LVDS power supply	–	2.4	2.6	V
VDDLVDS[5, 6]	LVDS PHY and VDDLVDS I/O lines power supply	–	1.7	3.6	V
VDDIOP[0,1][5]	Peripheral I/O lines	–	1.7	3.6	V
VDDGMAC[0,1]	MAC Interface I/O lines	–	1.7	3.6	V
VDDQSPI[0,1][5]	QSPIx I/O lines	–	1.7	3.6	V
VDDSDMMC[0,1,2][5]	SDMMCx I/O lines	–	1.7	3.6	V
VBAT	Backup area power switch input	–	1.7	3.6	V
t_{R_VDD}	Power supply slope at power-up	Applies to any of the power supply inputs listed above	0.2	20	mV/µs
t_{F_VDD}	Power supply slope at power-down		-20	-1[7]	mV/µs

Notes:

1. For lifetime estimation as a function of operating voltage and junction temperature, refer to the application note "SAMA7G5/D6 Series Product Lifetime Estimation" (AN4532), available on www.microchip.com.
2. VDDCPU related alarms in SECUMOD_SR are always triggered when f_{CPU_CLK} > 800 MHz
3. VDDIN33 and VDDUTMII are powered from one single power source so that ΔV(VDDIN33,VDDUTMII) ≤ 50 mV.
4. VDDANA, VDDIN25 and VDDDPHY must be connected to VDDOUT25.
5. Supply range restrictions apply when using the digital peripheral timing characteristics. See I/O Characteristics.
6. When the LVDS PHY is used, VDDLVDS must be connected to VDDOUT25.
7. For VBAT, this value is 0 mV/µs.
8. Refer to Microchip Recommended Power Management Solutions for a power supply schematic example with typical voltage regulator output values.

Table 85.5. Recommended Operating Conditions on Input Pins[1]

Symbol	Parameter	Conditions	Min	Max	Unit
V_{IN}	Input line voltage range on inputs[2][3]	–	-0.3	V_{DD} + 0.3	V
I_{IN}	DC current injection on inputs[4][5]	–	–	± 0.2	mA
I_{TOT_INJ}	Total current injection per power rail or per ground rail[6]	–	–	± 2	mA

© 2025 Microchip Technology Inc. and its subsidiaries

Notes:

1. In this table, VDD refers to the voltage of the associated power rail of the I/O line, as defined in the table Pin Description. Ex: for PA12, VDD refers to VDDSDMMC0.
2. Input voltages $V_{IN} \leq 0V$ or $V_{IN} \geq VDD$ lead to negative or positive current injection on inputs.
3. For A/D converter analog inputs (PB28, PB29, PC3, PC4, PC5, PC6, PC7, PC10, PC11, PC12, PC13, PC14, PC15, PC16, PC22), input voltages $V_{IN} \geq \min(V_{DDANA}, V_{ADVREFP})$ lead to saturated A/D conversion to 0xFFF.
4. Current injection on A/D converter analog inputs (PB28, PB29, PC3, PC4, PC5, PC6, PC7, PC10, PC11, PC12, PC13, PC14, PC15, PC16, PC22) may degrade the analog performance of the corresponding channel, or the analog performance of other analog channels.
5. High frequency current injection must be limited to avoid propagating high frequency signals to internal sensitive analog circuits (oscillators, regulators, etc.). One common use case of high frequency current injection occurs when a digital input pin suffers overshoots and/or undershoots from a poorly adapted transmission line (PCB trace with signal reflections, for example). These cases should be cured by appropriate source series resistor termination. Special attention must be paid to high-speed interfaces (Gigabit Ethernet MAC I/F, SD Card or e.MMC I/F, QSPI I/F, etc.).
6. Corresponds to the sum of the positive currents into one power rail and, respectively, to the sum of the negative currents into one ground rail, as defined in the table Pin Description.

Table 85.6. Recommended Operating Conditions on Internal Clocks

Symbol	Parameter	Conditions	Min	Max	Unit
f_{CPU_CLK}	Processor clock (CPU_CLK) frequency	$V_{DDCPU} \geq 1.22V$ (SAMA7D65-V or SAMA7D65-E and $T_J \leq 105°C$)	–	1000	MHz
		$V_{DDCPU} \geq 1.12V$	–	800	MHz
		$V_{DDCPU} \geq 1.03V$	–	600	MHz
f_{MCK0}	Main system bus clock (MCK0) frequency	–	–	200	MHz
f_{MCK1}	Main system bus clock (MCK1) frequency	–	–	200	MHz
f_{MCK2}	Main system bus clock (MCK2) frequency	–	–	133	MHz
f_{MCK3}	Main system bus clock (MCK3) frequency	–	–	266	MHz
f_{MCK4}	Main system bus clock (MCK4) frequency	–	–	400	MHz
f_{MCK5}	Main system bus clock (MCK5) frequency	–	–	200	MHz
f_{MCK6}	Main system bus clock (MCK6) frequency	–	–	200	MHz
f_{MCK7}	Main system bus clock (MCK7) frequency	–	–	100	MHz
f_{MCK8}	Main system bus clock (MCK8) frequency	–	–	100	MHz
f_{MCK9}	Main system bus clock (MCK9) frequency	–	–	100	MHz

Table 85.7. Recommended Operating Conditions on SDRAM Interface

Symbol	Parameter	Conditions	Min	Max	Unit
f_{DDR_CLK}	SDRAM clock frequency	[LPDDR2 / LPDDR3]-SDRAM	100	533	MHz
		[DDR3 / DDR3L]-SDRAM	100	533	MHz
		DDR2-SDRAM	125	533	MHz

Table 85.8. Recommended Thermal Operating Conditions(1)

Symbol	Parameter	Conditions	Min	Max	Unit
T_J	Junction temperature range	Ordering Code SAMA7D65-**V**	-40	105	°C
		Ordering Code SAMA7D65-**E**	-40	125	°C

© 2025 Microchip Technology Inc. and its subsidiaries

Note:

1. For lifetime estimation as a function of operating voltage and junction temperature, refer to the application note "SAMA7G5/D6 Series Product Lifetime Estimation" (AN4532) on www.microchip.com.

Table 85.9. BGA343 Package Thermal Characteristics[1][2]

Symbol	Parameter	Typ	Unit
R_{JA}	Junction-to-ambient thermal resistance	25	°C/W
R_{JB}	Junction-to-board thermal resistance	18	°C/W
R_{JC}	Junction-to-case thermal resistance	8	°C/W
Ψ_{JT}	Junction-to-package-top characterization parameter	0.3	°C/W

Notes:

1. According to the JEDEC JESD51-2 standard, with 2s2p board and 0 m/s air flow.
2. The package characteristics in the above table are provided according to the JEDEC JESD51-2 standard with the 2s2p board and 0 m/s air flow. These values are not directly applicable to the final application. As per JEDEC standards, these parameters represent the device mounted on a specific PCB under controlled conditions. In real-world applications, the PCB design and construction, airflow, and other factors may significantly impact thermal characteristics.

Table 85.10. BGA375 Package Thermal Characteristics[1][2]

Symbol	Parameter	Typ	Unit
R_{JA}	Junction-to-ambient thermal resistance	28	°C/W
R_{JB}	Junction-to-board thermal resistance	16	°C/W
R_{JC}	Junction-to-case thermal resistance	13	°C/W
Ψ_{JT}	Junction-to-package-top characterization parameter	0.3	°C/W

Notes:

1. According to the JEDEC JESD51-2 standard, with 2s2p board and 0 m/s air flow.
2. These values are not directly applicable to the board where the device is mounted. As per JEDEC standards, these parameters do not characterize the package itself but rather the package together with the PCB (4-layer or more) and other environmental factors (still air, etc.). For example, in still-air JEDEC-defined R_{JA} measurements, almost 70%–95% of the power generated by the chip is dissipated from the test board, not from the surfaces of the package.

85.5. Recommended Power Supply Sequencing

In the following sections, various recommended power sequences are described. Operating the device outside this scope may lead to unpredictable behavior.

85.5.1. Power-Up and Power-Down

At power-up, from a power supply sequencing perspective, the SAMA7D6 power supply inputs are categorized into three independent groups:

- VDDIN33,
- the core group that contains VDDCPU and VDDCORE, and
- the periphery group that contains all other power supply inputs except VBAT.

The following figure shows the recommended power-up sequence. Note the following:

- VBAT
  - When supplied from a pre-charged storage element (battery or supercapacitor), VBAT is an always-on supply input and is therefore not part of the power supply sequencing.
  - When no storage element is used on VBAT in the application, VBAT must be tied to VDDIN33.

© 2025 Microchip Technology Inc. and its subsidiaries

  - When a supercapacitor is used in the application to power VBAT during Backup mode, this element must be isolated from VBAT during its (slow) charge so that VBAT closely follows VDDIN33. In Table 85.11, the parameter t_0 limits the delay to establish VBAT after VDDIN33.
- VDDOUT25 is the output of the internal VDDOUT25 regulator, therefore, there is no power supply requirement on this pin. VDDOUT25 is mentioned in the following figures for information only. VDDOUT25 is automatically started at VDDIN33 rise when VDDIN33 is above its power-on reset threshold.
- VDDDPHY, VDDIN25 and VDDANA must be connected to VDDOUT25 and are therefore not subject to any supply sequencing requirement.
- VDDLVDS requirements do not apply when VDDLVDS is connected to VDDOUT25.
- NRST must be asserted low during the whole power-up sequence.

Figure 85.2. Recommended Power Sequence at Power-Up

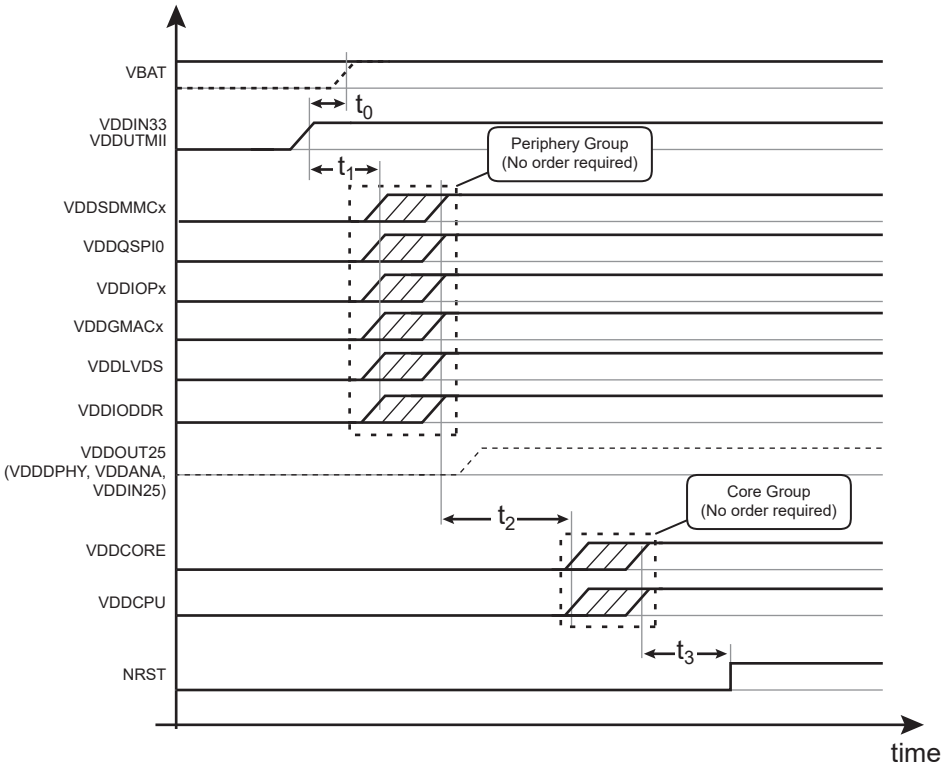

Table 85.11. Power-Up Timing Specification[1]

Symbol	Parameter	Conditions	Min	Max	Unit
t_0	VBAT delay	Delay from established VDDIN33 to established VBAT	–	0.2	ms
t_1	VDDIN33 to periphery group delay	Delay from established VDDIN33 to the first established periphery group supply	-0.3	–	ms
t_2	Periphery group to VDDCORE delay	Delay from the last established periphery group supply to the first core group supply turn-on	0	–	ms
t_3	Reset delay at power-up	Delay from the last established core group supply to NRST high	8	–	ms

Note:

1. The term "established" refers to a power supply established at 90% of its final value.

© 2025 Microchip Technology Inc. and its subsidiaries

The following figure shows the SAMA7D6 power-down sequence that starts by asserting the NRST line to 0. Once NRST is asserted, the supply inputs can be immediately shut down without any specific timing or order. VBAT may not be shut down if the application uses a backup storage element on this supply input. When VDDIN33 falls below the negative-going threshold of the VDDIN33 power-on reset, the VDDOUT25 regulator is automatically shut down and its output is pulled low by an internal discharge resistor.

Figure 85.3. Recommended Power Sequence at Power-Down

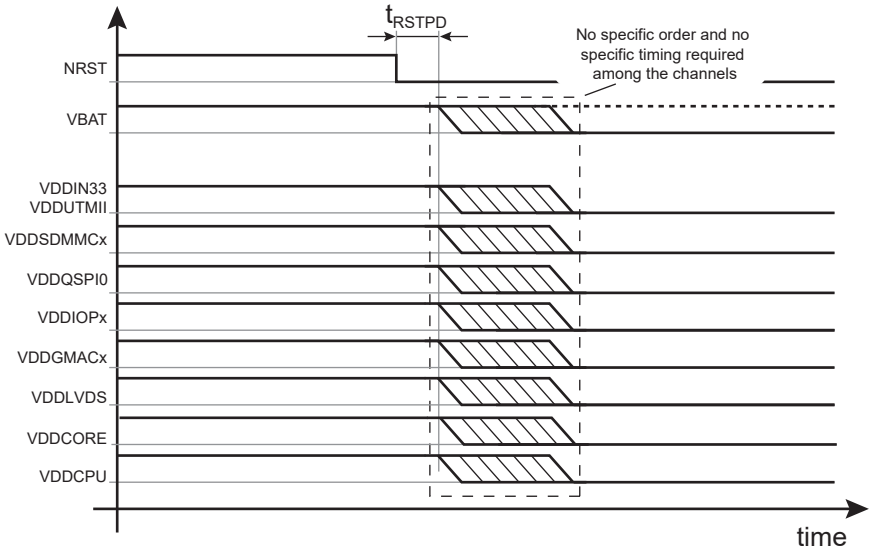

Table 85.12. Power-Down Timing Specification

Symbol	Parameter	Conditions	Min	Max	Unit
t_{RSTPD}	NRST Delay at power-down	Delay from NRST low to the first supply out of its operating range	0	–	ms

85.5.2. Backup Mode Entry and Wake-up

The following figure shows the recommended power-down sequence to place the device in Backup mode. The SHDN signal, output of the Shutdown Controller (SHDWC), signals the shutdown request to the external power supply. This output is supplied by VBAT present in Backup mode. In a similar way to the power-down sequence, the NRST signal must be asserted prior to turning the device power supplies off.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 85.4. Recommended Power Sequence at Backup Mode Entry

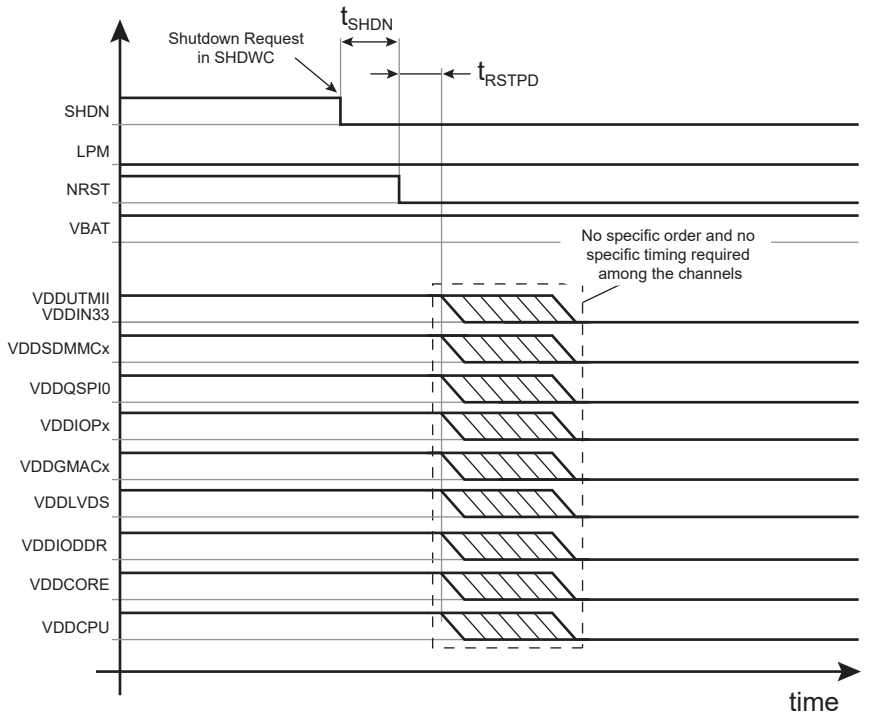

Table 85.13. Backup Mode Entry Timing Requirements

Symbol	Parameter	Conditions	Min	Max	Unit
t_{SHDN}	SHDN delay at backup mode entry	Delay from SHDN low to NRST low	0	–	ms
t_{RSTPD}	NRST delay at power-down	Delay from NRST low to the first supply out of its operating range	0	–	ms

The following figure shows the recommended power-up sequence to wake up the device from Backup mode. Upon a Wake-up event (WKUP pin, RTC alarm, etc.), the Shutdown Controller automatically toggles its SHDN output back to VBAT to request the external power supply to restart. This power-up sequence is the same as the one shown in Figure 85.2. In particular, the supply groups definition is the same.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 85.5. Recommended Power Sequence at Wake-Up from Backup Mode

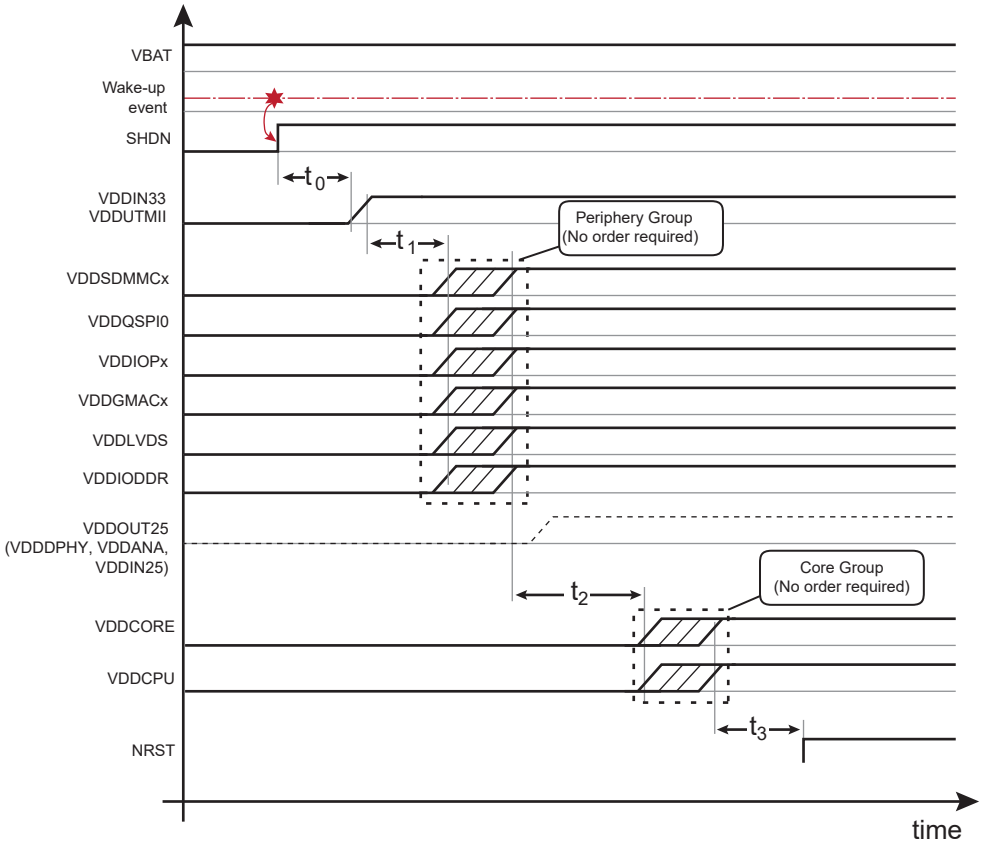

Table 85.14. Wake-Up from Backup Mode Timing Specification[1]

Symbol	Parameter	Conditions	Min	Max	Unit
t_0	VDDIN33 delay	Delay from SHDN high to VDDIN33 turn-on	0	–	ms
t_1	VDDIN33 to periphery group delay	Delay from established VDDIN33 to the first established periphery group supply	-0.3	–	ms
t_2	Periphery group to VDDCORE delay	Delay from the last periphery group established supply to VDDCORE supply turn-on	0	–	ms
t_3	Reset delay at power-up	From established VDDCORE to NRST high	8	–	ms

Note:

1. The term "established" refers to a power supply established at 90% of its final value.

85.5.3. BSR Mode Entry and Wake-up

The following figure shows the recommended power-down sequence to place the device in BSR mode (Backup Mode with SDRAM in Self-refresh mode to save the context). A combination of the LPM and SHDN signals, both outputs of the Shutdown Controller (SHDWC), requests a special powering mode to the external power supply where VDDIODDR is maintained. These outputs are supplied by VBAT present in BSR mode. In a similar way to the power-down sequence, the NRST signal must be asserted prior to turning the SAMA7D6 power supplies off.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 85.6. Recommended Power Sequence at BSR Mode Entry

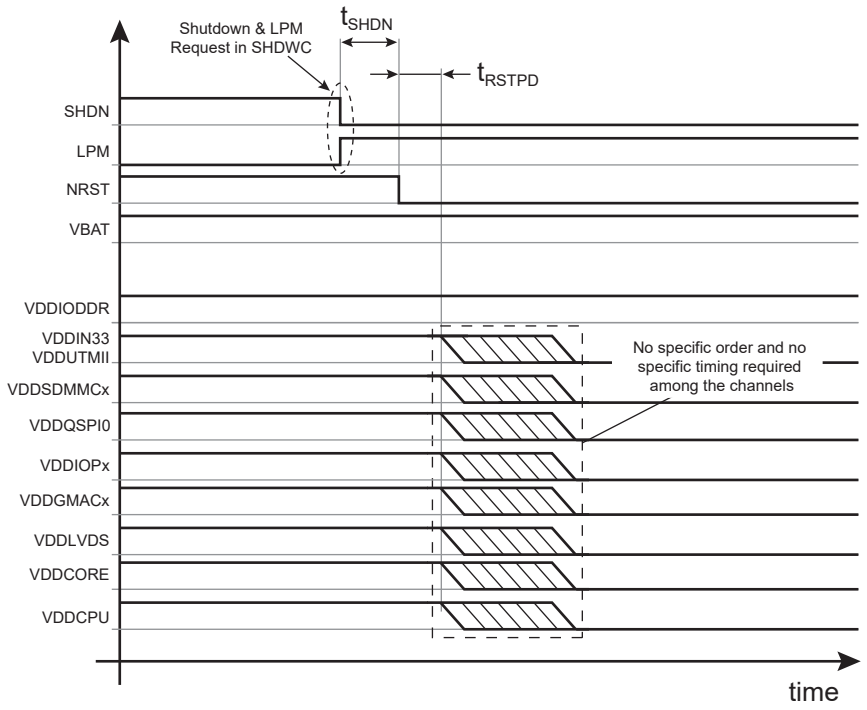

Table 85.15. BSR Mode Entry Timing Specification

Symbol	Parameter	Conditions	Min	Max	Unit
t_{SHDN}	SHDN delay at backup mode entry	Delay from SHDN low to NRST low	0	–	ms
t_{RSTPD}	NRST delay at power-down	Delay from NRST low to the first supply out of its operating range	0	–	ms

The following figure shows the recommended power-up sequence to wake up the device from BSR mode. Upon a Wake-up event (WKUP pin, RTC alarm, etc.), the Shutdown Controller automatically toggles its SHDN output back to VBAT to request the external power supply to restart. This power-up sequence is the same as the one shown in Figure 85.2. In particular, the supply groups definition is the same. The LPM pin is not automatically reset, and therefore the external power supply may enter a power saving state at wake-up. To make the power supply return to normal operation, the LPM pin must be software-reset in the SHDWC as soon as possible in the wake-up process.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 85.7. Recommended Power Sequence at Wake-Up from BSR Mode

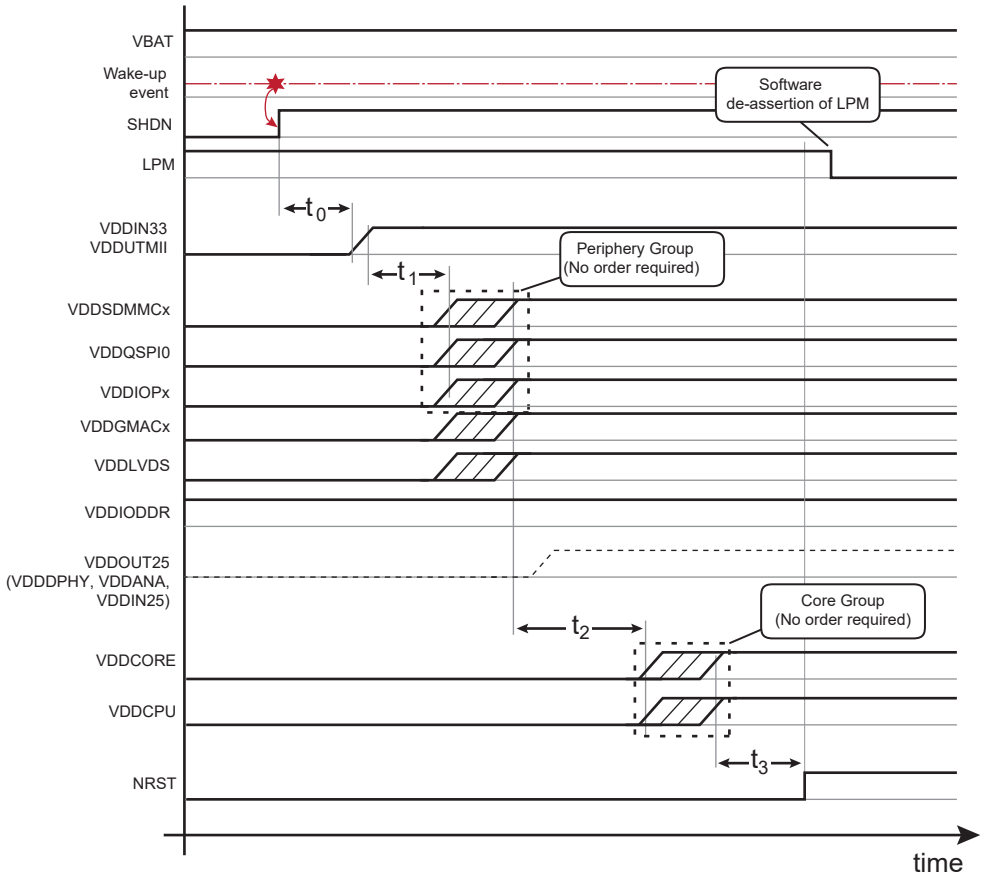

Table 85.16. Wake-Up from BSR Mode Timing Specification[(1)]

Symbol	Parameter	Conditions	Min	Max	Unit
t_0	VDDIN33 delay	Delay from SHDN high to VDDIN33 turn-on	0	–	ms
t_1	VDDIN33 to periphery group delay	Delay from established VDDIN33 to the first periphery group supply established	-0.3	–	ms
t_2	Periphery group to VDDCORE delay	Delay from the last periphery group established supply to VDDCORE supply turn-on	0	–	ms
t_3	Reset delay at power-up	From established VDDCORE to NRST high	8	–	ms

Note:

1. The term "established" refers to a power supply established at 90% of its final value.

85.6. I/O Characteristics

The device features the following types of input/output (I/O) circuits:

- GPIO I/Os with drive and slewrate control.
  - AUDIOCLK is a special case of GPIO type with hardwired DRIVE and SR controls.
    - For AUDIOCLK: DRIVE = 0 and SR = 1
- HSIO I/Os with drive control only for the following lines:
  - SDMMC0: PA0, PA1, PA3, PA4, PA5, PA6, PA7, PA8, PA9, PA10, PA11
  - SDMMC1: PB22, PB23, PB24, PB25, PB26, PB27
  - SDMMC2: PC27, PC28, PC29, PC30, PC31, PD0

© 2025 Microchip Technology Inc. and its subsidiaries

  - QSPI0, QSPI1: PB8, PB9, PB10, PB11, PB12, PB13, PB14, PB15, PB16, PB17, PB18, PB19, PB20
- PIOBU I/Os with no drive and no slewrate control

Unless otherwise specified:

- The following specifications apply to the GPIO, PIOBU and HSIO types.
- V_{DD} refers to the voltage of the associated power rail of the I/O line, as defined in the table Pin Description; for example, for PA12, V_{DD} refers to the voltage applied on VDDSDMMC0.

For SDMMC lines in UHS I mode in the 1.8V range, the drive is controlled in the SDMMC user interface. In this case, drive configurations in PIO registers have no effect.

For any other SDMMC configuration, the GPIO drive configuration is applicable.

DRIVE and SLEWRATE are set in the PIO_CFGR register corresponding to the GPIO, with the DRVSTR and SR bits, respectively.

85.6.1. I/O DC Characteristics

Table 85.17. Input DC Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{IL}	Low level input voltage[1]	–	–	0.3 x V_{DD}	V
V_{IH}	High level input voltage[1]	–	0.7 x V_{DD}	–	V
I_{IH}	Input-high input leakage current[1]	Pull-down resistor disabled V_{IN} = V_{DD} = 3.6V	-150	150	nA
I_{IL}	Input-low input leakage current[1]	Pull-up resistor disabled V_{IN} = 0V, V_{DD} = 3.6V	-150	150	nA
R_{PULL}	Programmable pull-up or pull-down resistor	Digital Input mode	60	140	kΩ
C_{IN}	Input capacitance[1]	–	–	4	pF
V_{hys}	Input hysteresis[1]	–	150	–	mV

Note:

1. Simulation data

Table 85.18. Output DC Characteristics (1.7V < V_{DD} < 1.9V)

Symbol	Parameter	I/O Type	Conditions	Min	Max	Unit
V_{OL}	Low level output voltage	Any	I_{OL_MAX}	–	0.25 x VDD	V
V_{OH}	High level output voltage	Any	I_{OH_MAX}	0.75 x VDD	–	V
I_{OL} or I_{OH}	Low level or high level output current	GPIO	Drive = 0, Slewrate = 0	–	3	mA
			Drive = 1, Slewrate = 0	–	4	mA
			Drive = 0, Slewrate = 1	–	1	mA
			Drive = 1, Slewrate = 1	–	2	mA
		HSIO	–	–	1.5	mA
		PIOBU	–	–	2	mA

Table 85.19. Output DC Characteristics (3.0V < V_{DD} < 3.6V)

Symbol	Parameter	I/O Type	Conditions	Min	Max	Unit
V_{OL}	Low level output voltage	Any	I_{OL_MAX}	–	0.2 x VDD	V
V_{OH}	High level output voltage	Any	I_{OH_MAX}	0.8 x VDD	–	V

© 2025 Microchip Technology Inc. and its subsidiaries

Table 85.19. Output DC Characteristics (3.0V < V_{DD} < 3.6V) (continued)

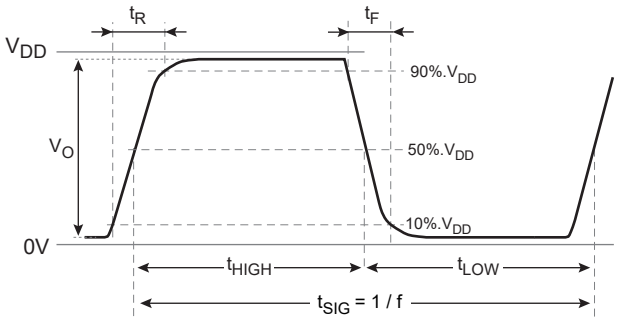
Symbol	Parameter	I/O Type	Conditions	Min	Max	Unit
I_{OL} or I_{OH}	Low level/high level output current	GPIO	Drive = 0, Slewrate = 0	–	9	mA
			Drive = 1, Slewrate = 0	–	10	mA
			Drive = 0, Slewrate = 1	–	3	mA
			Drive = 1, Slewrate = 1	–	6	mA
		HSIO	–	–	2	mA
		PIOBU	–	–	5	mA

85.6.2. I/O AC Characteristics

85.6.2.1. Output Driver AC Characteristics

The timing definitions necessary to specify the maximum operating frequency of an output driver are provided in the following figure.

Figure 85.8. Timing Definitions of a Digital Output Signal



t_{SIG}: Period of the digital output signal

$f = 1 / t_{SIG}$: Frequency of the digital output signal

t_{HIGH}: Time during which the output waveform is greater than $V_{DD} / 2$

$t_{LOW} = t_{SIG} - t_{HIGH}$: Time during which the output waveform is less than $V_{DD} / 2$

$d = t_{HIGH} / t_{SIG}$: Output waveform duty cycle

V_O: Output waveform amplitude

In Table 85.22 and Table 85.23, the maximum operating frequency f_{MAX} ensures that the driver's output waveform fulfills the following characteristics:

- $t_R < 0.75 / f_{MAX}$ and $t_F < 0.75 / f_{MAX}$
- d: the duty cycle of the output waveform is between 45% and 55%
- V_O: the output waveform amplitude is greater than 95% VDD

The f_{MAX} parameter indicates the speed limit of an output driver across various operating conditions: supply voltage range, load capacitance, drive strength programming. The effective maximum output frequency of a specific output line may be limited by the peripheral that drives this line. Conversely, higher output switching speeds may be achieved under different load conditions. Microchip recommends to perform an electrical simulation of the critical interfaces (GMAC, SDMMC, QSPI, etc.) with the provided IBIS models.

Table 85.22 and Table 85.23 provide the AC output characteristics of the output drivers in the following conditions:

© 2025 Microchip Technology Inc. and its subsidiaries

- Output load: 10 pF capacitor to ground
- Two VDD ranges:
  - 1.7V < VDD < 1.9V and
  - 3.0V < VDD < 3.6V
- Two Drive settings: 0 and 1, and
- Two Slewrate settings for the GPIO type: 0 and 1.

For the GPIO drivers, the following table provides the recommended drive and slewrate settings depending on the output switching frequency and the two commonly used VDD ranges (1.8V and 3.3V). Other settings are possible but they may lead to excessively fast rise and fall times (t_R, t_F), with a potentially negative impact on the electromagnetic emissions of the application.

Table 85.20. Recommended GPIO Drive and Slewrate Settings vs IO Use Case

VDD Range	Low Speed $f_{GPIO} \leq$ 50 MHz(1)	High Speed 50 MHz $\leq f_{GPIO} \leq$ 170 MHz(1)
1.7V - 1.9V	Drive = 1, Slewrate = 1	Drive = 1, Slewrate = 0
3.0V - 3.6V	Drive = 0, Slewrate = 1	Drive = 0, Slewrate = 0

Note:

1. This is an indicative value. See Table 85.22 and Table 85.23 for accurate maximum frequency specifications.

For the HSIO drivers (used in SDMMCx and QSPI0 peripherals), the following table provides their nominal output impedance with respect to the Drive settings. These drivers do not have a Slewrate setting but are rather calibrated against an external 1% resistor mounted on the SDMMCx_CAL or QSPI0_CAL pins. Depending on the target signal frequency and the external load, it is possible to adjust their target output impedance.

Table 85.21. HSIO Output Impedance vs Drive Settings

VDD Range	Drive = 00 (Type D)	Drive = 01 (Type A)	Drive = 10 (Type C)	Drive = 11 (Type B)	Unit
1.7V – 1.9V(1)	100	33	66	50	Ω
3.0V – 3.6V(2)	84	28	56	42	Ω

Notes:

1. For SDMMC lines in UHS I mode in 1.8V, the drive is controlled in the SDMMC user interface. In this case, drive configurations in PIO registers have no effect.
2. In the 3.3V range, only the Drive = 00 (Type D) settings are recommended. Other configurations may lead to excessively fast rise and fall times. Microchip provides IBIS models to perform an electrical simulation of these QSPI an SDMMC interfaces.

Table 85.22. Output Driver AC Characteristics (1.7V < V_{DD} < 1.9V, C_L = 10 pF)

Symbol	Parameter	I/O Type	Conditions	Min	Max	Unit
t_R or t_F	Rise or fall time(1)(2)	GPIO	Drive = 0, Slewrate = 0	1.5	5.1	ns
			Drive = 1, Slewrate = 0	1.4	4.8	ns
			Drive = 0, Slewrate = 1	4.1	12.3	ns
			Drive = 1, Slewrate = 1	2.1	7.0	ns
		HSIO	Drive = 11 (Type B)	1.6	1.8	ns
			Drive = 01 (Type A)	1.1	1.25	ns
			Drive = 10 (Type C)	2.2	2.3	ns
			Drive = 00 (Type D)	3.3	3.4	ns
		PIOBU	–	1.0	4.0	ns

© 2025 Microchip Technology Inc. and its subsidiaries

Table 85.22. Output Driver AC Characteristics (1.7V < V_{DD} < 1.9V, C_L = 10 pF) (continued)

Symbol	Parameter	I/O Type	Conditions	Min	Max	Unit
f_{MAX}	Maximum frequency[2][3]	GPIO	Drive = 0, Slewrate = 0	–	95	MHz
			Drive = 1, Slewrate = 0	–	135	MHz
			Drive = 0, Slewrate = 1	–	25	MHz
			Drive = 1, Slewrate = 1	–	50	MHz
		HSIO	Drive = 11 (Type B)	–	125	MHz
			Drive = 01 (Type A)[4]	–	150	MHz
			Drive = 10 (Type C)	–	100	MHz
			Drive = 00 (Type D)	–	70	MHz
		PIOBU	–	25	–	MHz

Notes:

1. Measured between V_O = 10% V_{DD} and V_O= 90% V_{DD}
2. Simulation data
3. f_{MAX} may be limited by the peripheral that drives the I/O line.
4. 200 MHz operation can be achieved with different load conditions. It is recommended to perform an electrical simulation with the provided IBIS models.

Table 85.23. Output Driver AC Characteristics (3.0V < V_{DD} < 3.6V, C_L = 10 pF)

Symbol	Parameter	I/O Type	Conditions	Min	Max	Unit
t_R or t_F	Rise or fall time[1][2]	GPIO	Drive = 0, Slewrate = 0	1.5	2.9	ns
			Drive = 1, Slewrate = 0	1.4	2.7	ns
			Drive = 0, Slewrate = 1	4.0	7.0	ns
			Drive = 1, Slewrate = 1	2.2	4.0	ns
		HSIO	Drive = 11 (Type B)	1.3	1.5	ns
			Drive = 01 (Type A)	0.9	1.0	ns
			Drive = 10 (Type C)	1.7	1.9	ns
			Drive = 00 (Type D)	2.6	2.9	ns
		PIOBU	–	1.0	3.0	ns
f_{MAX}	Maximum frequency[2][3]	GPIO	Drive = 0, Slewrate = 0	–	150	MHz
			Drive = 1, Slewrate = 0	–	170	MHz
			Drive = 0, Slewrate = 1	–	50	MHz
			Drive = 1, Slewrate = 1	–	75	MHz
		HSIO	Drive = 11 (Type B)	–	125	MHz
			Drive = 01 (Type A)	–	150	MHz
			Drive = 10 (Type C)	–	100	MHz
			Drive = 00 (Type D)	–	70	MHz
		PIOBU	–	40	–	MHz

Notes:

1. Measured between V_O = 10% V_{DD} and V_O= 90% V_{DD}
2. Simulation data
3. f_{MAX} may be limited by the peripheral that drives the I/O line.

85.6.2.2. Input AC Characteristics

The following table provides the input characteristics of the I/O lines when configured as a digital input. In particular, these values apply when the XIN input is used as a clock input of the device

© 2025 Microchip Technology Inc. and its subsidiaries

(main crystal oscillator set in Bypass mode). They do not apply for the XIN32 input which is designed for slow signals with frequencies up to 50 kHz. Parameters V_{IL} and V_{IH} defined in Table 85.17 apply.

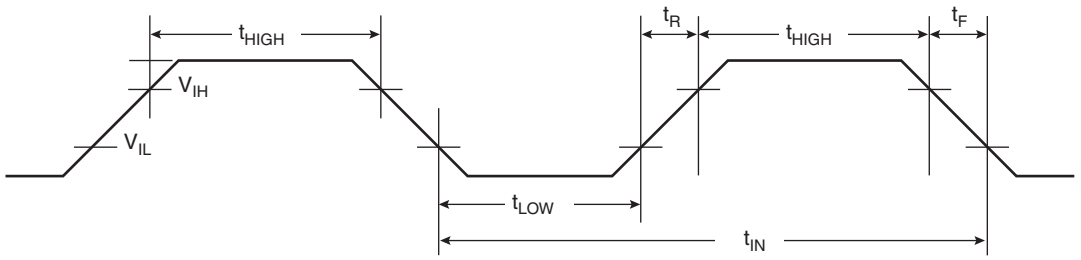
Table 85.24. Input AC Characteristics

Symbol	Parameter	Min	Max	Units
f_{IN}	Input frequency(1)	–	50	MHz
t_{IN}	Input period	20	–	ns
t_{HIGH}	Time at high level	8	–	ns
t_{LOW}	Time at low level	8	–	ns
t_R	Rise time	–	2.2	ns
t_F	Fall time	–	2.2	ns

Note:

1. The maximum input frequency may be limited by the peripheral receiving this signal.

Figure 85.9. Digital Input AC Characteristics



85.6.3. DDR I/O Calibration and DDR Voltage Reference

85.6.3.1. DDR I/O Calibration

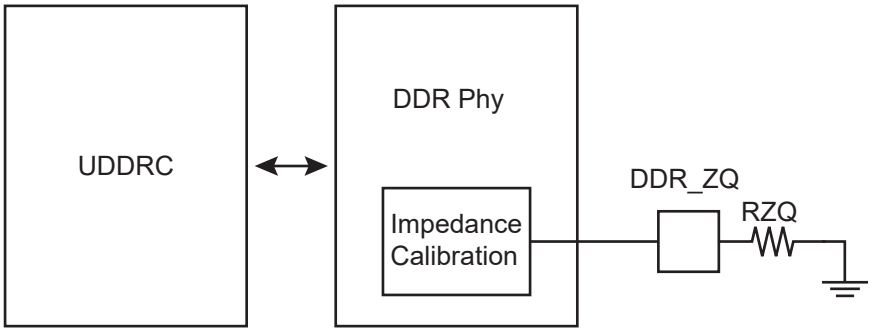
The DDR2/DDR3/LPDDR2/LPDDR3/DDR3L I/Os embed an automatic impedance matching control to avoid overshoots and reach the best performance levels depending on the bus load and external memories. A serial termination connection scheme, where the driver has an output impedance matched to the characteristic impedance of the line, is used to improve signal quality and reduce EMI.

One specific analog input, DDR_ZQ, is used to calibrate all DDR IOs with the external resistor RZQ = 240 Ω ±1%.

The UDDRC supports the ZQ calibration procedure used to calibrate the device DDR I/O drive strength and the commands to setup the external DDR device drive strength (refer to the section Universal DDR Memory Controller (UDDRC)). The calibration cell supports all the memory types listed above.

© 2025 Microchip Technology Inc. and its subsidiaries

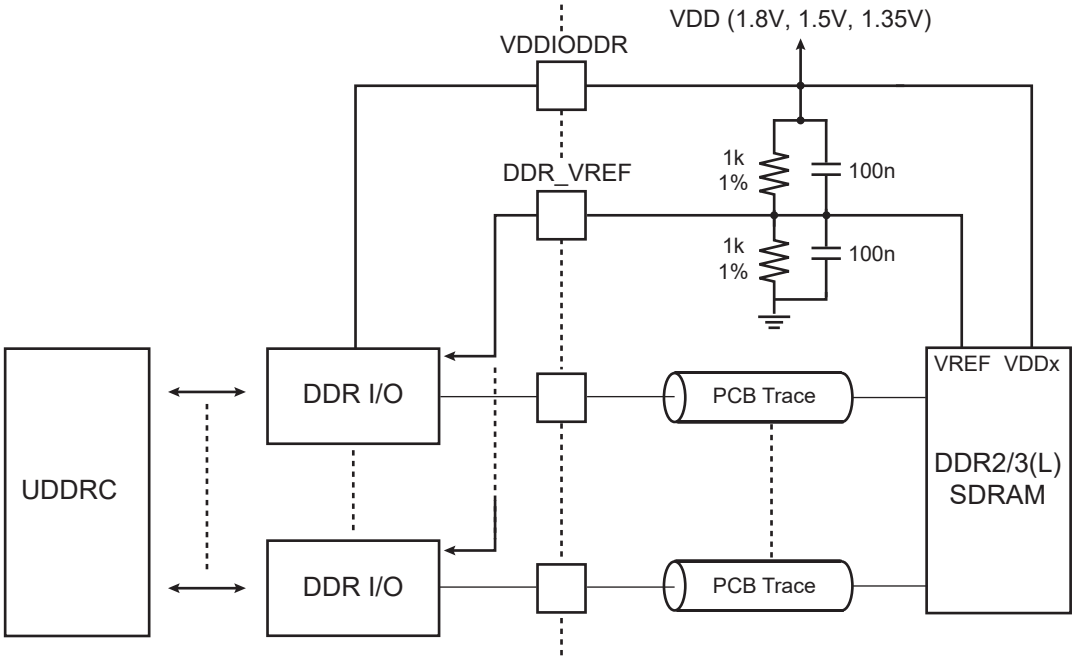
Figure 85.10. DDR Calibration Cell



85.6.3.2.DDR Voltage Reference

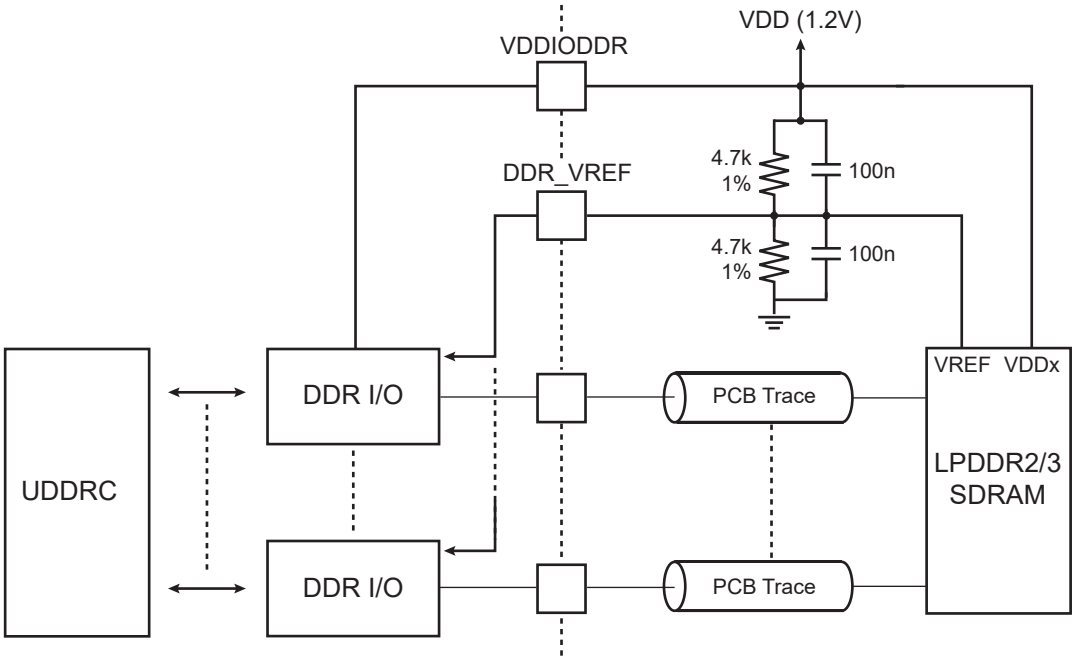
The DDR_VREF input must be driven at all times by a voltage source equal to VDDIODDR/2. See below the recommended schematics to drive DDR_VREF.

Figure 85.11. DDR_VREF Recommended Schematic with DDR2/3(L)-SDRAM



© 2025 Microchip Technology Inc. and its subsidiaries

Figure 85.12. DDR_VREF Recommended Schematic with LPDDR2/3-SDRAM

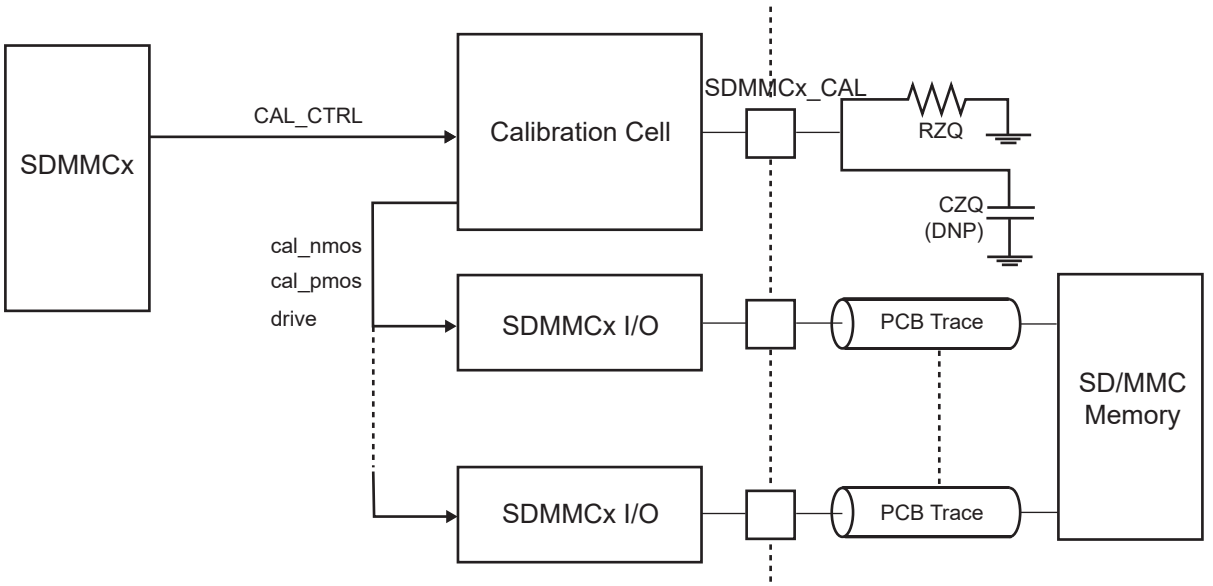


85.6.4. SDMMC and QSPI I/O Calibration

85.6.4.1. SDMMC I/O Calibration

The device embeds I/O calibration cells for SDMMC0, SDMMC1 and SDMMC2. The purpose of this block is to provide to e.MMC/SD I/Os an output impedance reference to limit the impact of process, voltage and temperature on the drivers output impedance. The impedance control is required at high frequency in order to improve signal quality.

Figure 85.13. SDMMCx I/O Calibration Cell



© 2025 Microchip Technology Inc. and its subsidiaries

The calibration cell provides input pin SDMMCx_CAL loaded with a 20 KΩ RZQ resistor for 1.8V memories and a 16.9 KΩ resistor for 3.3V memories. In the above figure, CZQ is not mounted.

- According to the e.MMC specification, the output impedance calibration is required for HS200 and HS400 modes (1.8V) whereas it is not for other modes (3.3V).
- In addition, according to the SD specification, the output impedance calibration is required for 1.8V signaling in SD UHS-I whereas it is not for 3.3V signaling. When the interface needs to operate at both 1.8V and 3.3V, RZQ has the 1.8V value (20 KΩ) .

The following table shows the values to program in the SDMMCx_CALCR.CLKDIV field with respect to MCK1 clock frequency.

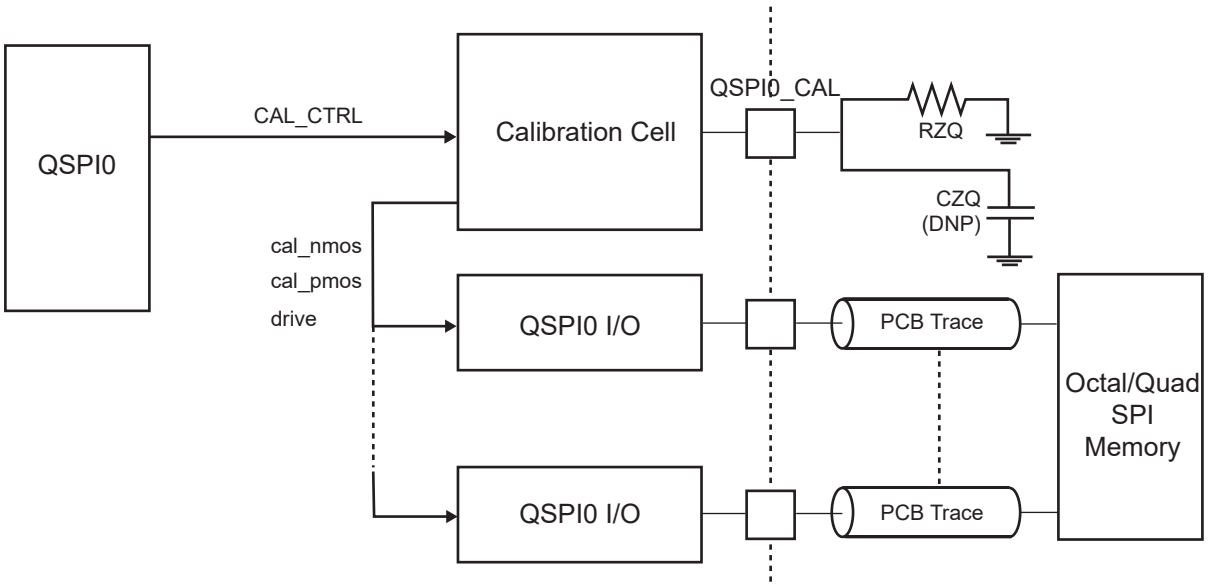
Table 85.25. SDMMCx_CALCR.CLKDIV vs MCK1 Clock Frequency

CLKDIV	Divider	MCK1 (MHz)
0	2	25
1	4	50
2	6	75
3	8	100
4	10	125
5	12	150
6	14	175
7	16	200

85.6.4.2.QSPI0 I/O Calibration

The device embeds a QSPI0 I/O calibration cell. The purpose of this block is to provide to octal/quad SPI I/Os an output impedance reference to limit the impact of process, voltage and temperature on the drivers output impedance. The impedance control is required at high frequency in order to improve signal quality.

Figure 85.14. QSPI0 I/O Calibration Cell



The calibration cell provides an input pin QSPI0_CAL loaded with a 20 KΩ RZQ resistor for 1.8V memories and a 16.9 KΩ resistor for 3.3V memories. In the above figure, CZQ is not mounted.

© 2025 Microchip Technology Inc. and its subsidiaries

According to the QSPI specification, the output impedance calibration is mandatory for QSPI Hyperflash mode (1.8V), whereas it is not for other modes (3.3V).

The following table provides the values to program in the QSPI_PCALCFG.CLKDIV field with respect to MCK5 clock frequency.

Table 85.26. QSPI_PCALCFG.CLKDIV vs MCK5 Clock Frequency

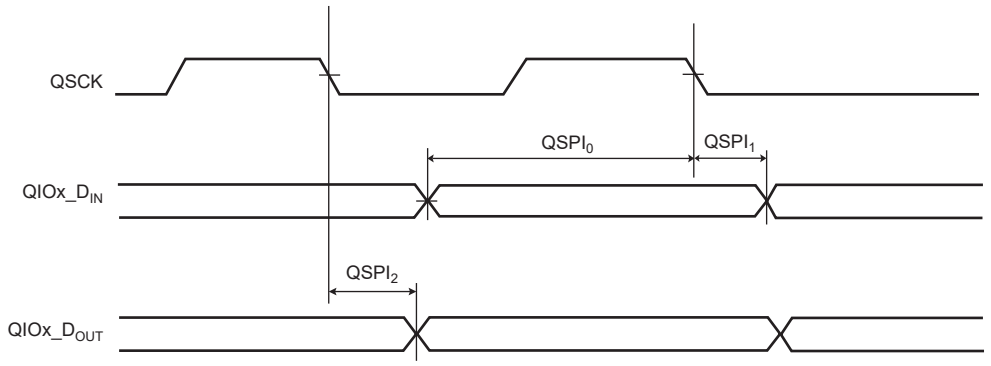
CLKDIV	Divider	MCK5 (MHz)
0	2	25
1	4	50
2	6	75
3	8	100
4	10	125
5	12	150
6	14	175
7	16	200

85.7. Digital Peripheral Timings

85.7.1. Quad Serial Peripheral Interface (QSPI)

The following timings are given for the Serial Memory mode (QSPI_MR.SMM=1). In this mode, only SPI mode 0 is supported. Refer to Quad Serial Peripheral Interface (QSPI) for more details.

Figure 85.15. QSPI Host Mode 0 in Single Data Rate



© 2025 Microchip Technology Inc. and its subsidiaries

Figure 85.16. QSPI Host Mode in Double Data Rate Mode

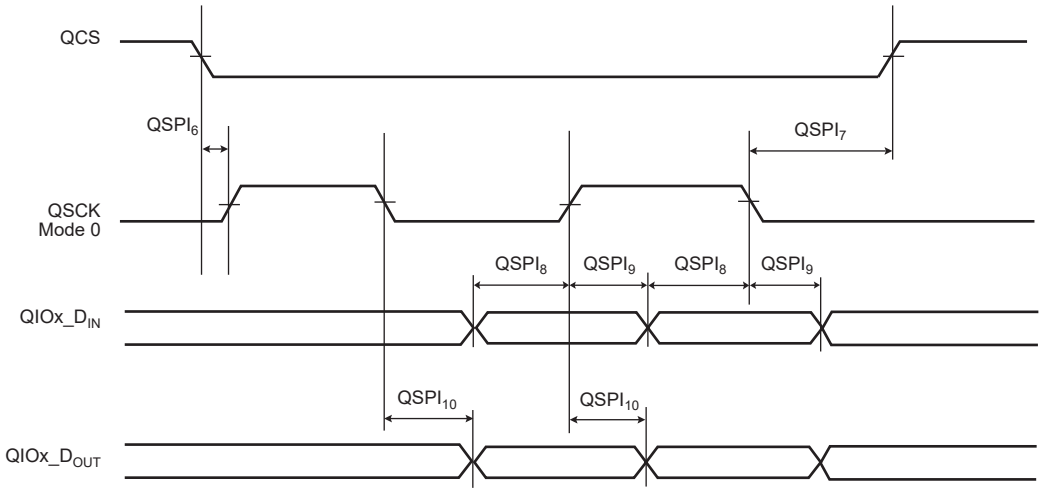


Figure 85.17. QSPI Host Mode in Double Data Rate Mode with DQS

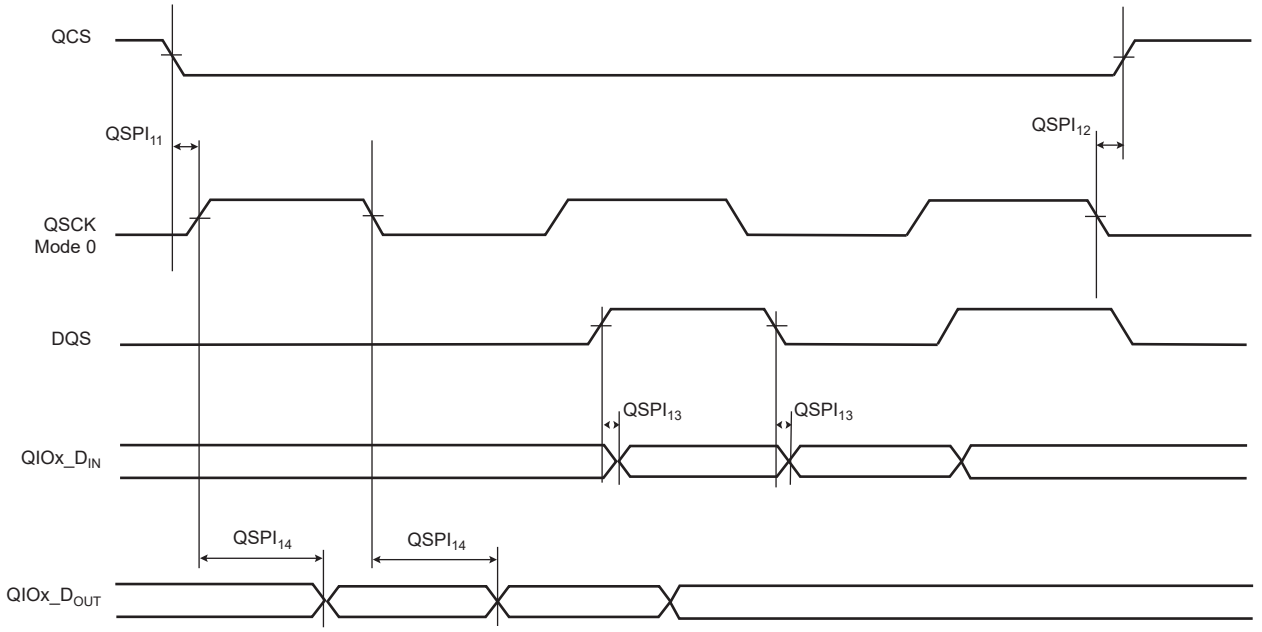

85.7.1.1. Maximum QSPI Frequency

The QSPI GCLK frequency must be set to the target frequency f_{QSCK}. The following formulas provide the achievable QSPI frequency in Host Read and Host Write modes. When the result of these formulas exceeds the f_{QSCK_MAX} parameter provided in the tables in QSPI Timings, f_{QSCK_MAX} applies.

- **Host Write in Single Data Rate Mode**

  $$f_{QSCK} = \frac{1}{(QSPI_2 + t_{SU_CLIENT})}$$

  Where t_{SU_CLIENT} is the input setup time of the client device.

- **Host Read in Single Data Rate Mode**

  $$f_{QSCK} = \frac{1}{QSPI_0 + t_{VALID}}$$

© 2025 Microchip Technology Inc. and its subsidiaries

Where t_{VALID} is the client time response to output data after detecting a QSCK edge.

- For a QSPI client device with t_{VALID} (or t_V) = 12 ns, with $QSPI_0$ = 1.0 ns, f_{QSCK} max = 77 MHz.
- For a QSPI Flash memory device with t_{VALID} (or t_V) = 6 ns, and $QSPI_0$ = 1.0 ns, the formula returns a value of 143 MHz, therefore f_{QSCK} = 133 MHz applies in this case.

- **Host Write in Dual Data Rate Mode**

$$f_{QSCK} = \frac{0.5}{(QSPI_{10} + t_{SU_CLIENT})}$$

Where t_{SU_CLIENT} is the input setup time of the client device.

- **Host Read in Dual Data Rate Mode**

$$f_{QSCK} = \frac{1}{2x(QSPI_8 + t_{VALID})}$$

Where t_{VALID} is the client time response to output data after detecting a QSCK edge.

- For a QSPI Flash memory device with t_{VALID} (or t_V) = 6 ns, and $QSPI_{10}$ = 1.0 ns, the formula returns a value of 71 MHz.

85.7.1.2.QSPI Timings

For the QSPI0 instance, the timings shown in the tables below are provided in the following domains:

- 1.8V domain: VDDQSPI0 from 1.7V to 1.9V, maximum external capacitor: 10 pF, drive: 01 (Type A)
- 3.3V domain: VDDQSPI0 from 3.0V to 3.6V, maximum external capacitor: 10 pF, drive: 01 (Type A)

For the QSPI1 instance, the timings shown in the table below are provided in the following domains:

- 1.8V domain: VDDQSPI0 from 1.7V to 1.9V, maximum external capacitor: 10 pF, DRV: 1, SR: 0
- 3.3V domain: VDDQSPI0 from 3.0V to 3.6V, maximum external capacitor: 10 pF, DRV: 0, SR: 0

Table 85.27. QSPI Timings in Single Data Rate Mode (STR)

Symbol	Parameter	Conditions	Min	Max	Unit
f_{QSCK}	QSCK maximum frequency	–	–	133	MHz
$QSPI_0$	QIOx data in to QSCK falling edge (input setup time)	–	1	–	ns
$QSPI_1$	QIOx data in to QSCK falling edge (input hold time)	–	1	–	ns
$QSPI_2$	QSCK falling edge to QIOx delay	–	0	1	ns

Table 85.28. QSPI Timings in Double Data Rate Mode (DTR)

Symbol	Parameter	Conditions	Min	Max	Unit
f_{QSPI}	QSCK operating frequency	–	–	90	MHz
t_{QSCK_MIN}	Minimum SPCK period	–	11.1	–	ns
$QSPI_6$	CS low before QSCK edge (rising or falling)(1)	–	2	–	ns
$QSPI_7$	QSCK edge (rising or falling) to CS high(2)	–	0	1	ns
$QSPI_8$	QIOx input data setup to QSCK edge (rising or falling)	–	1	–	ns
$QSPI_9$	QIOx input data hold after QSCK edge (rising or falling)	–	1	–	ns
$QSPI_{10}$	QSCK edge (rising or falling) to QIOx delay	–	0	1	ns

Notes:

1. Refer to DLYCS and DLYBS descriptions in Quad Serial Peripheral Interface (QSPI) for more configuration details.
2. Refer to DLYBCT description in Quad Serial Peripheral Interface (QSPI) for more configuration details.

© 2025 Microchip Technology Inc. and its subsidiaries

Table 85.29. QSPI Timings in DTR Mode with Data Strobe (DQS) (QSPI0 Only)

Symbol	Parameter	Conditions	Min	Max	Unit
f_{QSPI}	QSCK operating frequency	–	–	200	MHz
t_{QSCK_MIN}	Minimum SPCK period	–	5	–	ns
$QSPI_{11}$	CS low before QSCK edge (rising or falling)(1)	–	2	–	ns
$QSPI_{12}$	QSCK edge (rising or falling) to CS high(2)	–	0	1	ns
$QSPI_{13}$	QIOx input skew to DQS edge (rising or falling)	–	-0.8	1.4	ns
$QSPI_{14}$	QSCK edge (rising or falling) to QIOx delay	–	0	$t_{QSCK}/4 + 0.6$	ns

Notes:

1. Refer to DLYCS and DLYBS descriptions in Quad Serial Peripheral Interface (QSPI) for more configuration details.
2. Refer to DLYBCT description in Quad Serial Peripheral Interface (QSPI) for more configuration details.

85.7.2. Flexible Serial Communication Controller (FLEXCOM) - SPI

In Figure 85.19 and Figure 85.20, the MOSI line shifting edge is represented with a 0 hold time. However, it is important to note that for this device, the MISO line is sampled prior to the MOSI line shifting edge. As shown in Figure 85.18, the device sampling point extends the propagation delay (t_p) for device and routing delays to more than half the SPI clock period, whereas the common sampling point allows only less than half the SPI clock period.

As an example, an SPI device working in mode 0 can be safely driven if the SPI host is configured in mode 0.

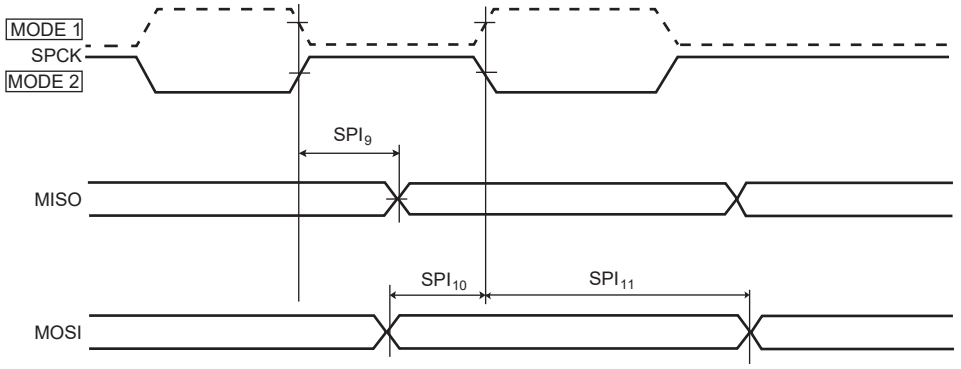

Figure 85.23. FLEXCOM in SPI Client - NPCS Timings

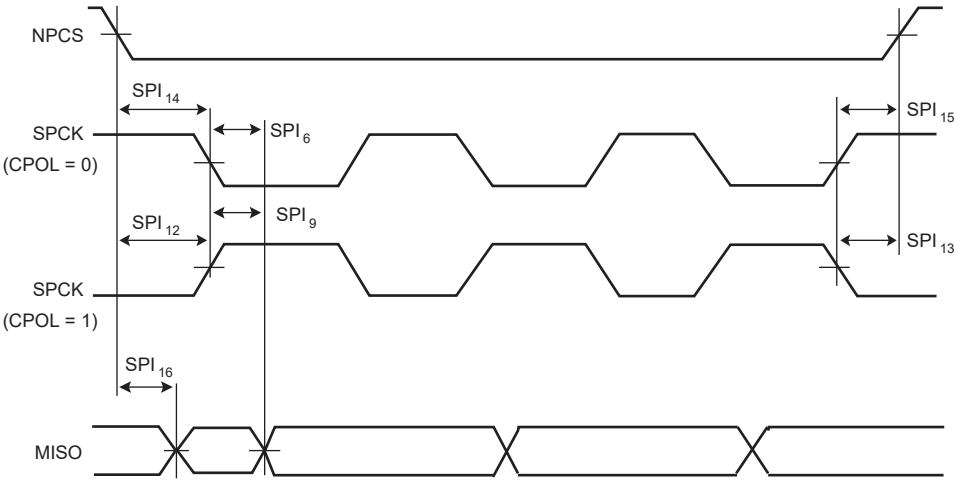


85.7.2.1. FLEXCOM SPI Timings

Timings are provided in the following conditions:

- 1.8V domain: VDDIO from 1.7V to 1.9V, maximum external capacitor = 10 pF, DRV = 1, SR = 0
- 3.3V domain: VDDIO from 3.0V to 3.6V, maximum external capacitor = 10 pF, DRV = 0, SR = 0

Table 85.30. FLEXCOM SPI Timings

Symbol	Parameter	Conditions	Min	Max	Unit
Host Mode					
f_{SPCK}	SPCK operating frequency		–	33	MHz
t_{SPCK}	SPCK period	–	30	–	ns
SPI_0	MISO setup time before SPCK rises/falls	–	24	–	ns
SPI_1	MISO hold time after SPCK rises/falls	–	0	–	ns
SPI_2	SPCK rising to MOSI delay	–	-6	6	ns
SPI_3	MISO setup time before SPCK rises/falls	–	24	–	ns
SPI_4	MISO hold time after SPCK rises/falls	–	0	–	ns
SPI_5	SPCK falling to MOSI delay	–	-6	6	ns
Client Mode					
f_{SPCK}	SPCK operating frequency		–	20	MHz
t_{SPCK}	SPCK period	–	50	–	ns

© 2025 Microchip Technology Inc. and its subsidiaries

Table 85.30. FLEXCOM SPI Timings (continued)

Symbol	Parameter	Conditions	Min	Max	Unit
SPI_6	SPCK falling to MISO delay	–	4	20	ns
SPI_7	MOSI setup time before SPCK rises/falls	–	2.5	–	ns
SPI_8	MOSI hold time after SPCK rises/falls	–	2.5	–	ns
SPI_9	SPCK rising to MISO delay	–	4	20	ns
SPI_{10}	MOSI setup time before SPCK rises/falls	–	2.5	–	ns
SPI_{11}	MOSI hold time after SPCK rises/falls	–	2.5	–	ns
SPI_{12}	NPCS setup to SPCK rising	–	52.5	–	ns
SPI_{13}	NPCS hold after SPCK rises/falls	–	52.5	–	ns
SPI_{14}	NPCS setup to SPCK falling	–	52.5	–	ns
SPI_{15}	NPCS hold after SPCK rises/falls	–	52.5	–	ns
SPI_{16}	NPCS falling to MISO valid	–	52.5	–	ns

85.7.3. Flexible Serial Communication Controller (FLEXCOM) - USART

Table 85.31. FLEXCOM USART Timings

Symbol	Parameter	Conditions	Min	Max	Unit
f_{SCK}	SCK frequency in Synchronous mode (FLEX_US_MR.SYNC=1)	Host or client	–	25	MHz
BR	Baud rate in Asynchronous mode (FLEX_US_MR.SYNC=0)[1][2]	FLEX_US_MR.OVER=1	–	f_{MCKx}/8	Mbps
		FLEX_US_MR.OVER=0	–	f_{MCKx}/16	Mbps

Notes:

1. MCKx stands for MCK7, MCK8 and MCK9.
2. With f_{MCKx}=100 MHz, the maximum baud rate is BR=100/8=12.5 Mbps (OVER=1) or BR=100/16=6.25 Mbps (OVER=0).

85.7.4. Flexible Serial Communication Controller (FLEXCOM) - TWI

The TWI communicates in Standard, Fast, Fast Mode Plus and High-Speed (HS) modes subject to the following:

- When the registers FLEX_TWI_CWGR, FLEX_TWI_HSCWGR and FLEX_TWI_MMR are programmed in the TWI Controller
- When pull-ups (Rp) are computed to achieve the required rise time according to the total Cbus capacitance.

Possible limitations are given in the table and figures below.

Table 85.32. Two-Wire Interface I/O Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{IL}, V_{IH}	Low-level/High-level Input Voltage	All modes	See note (1)		V
V_{OL}, V_{OH}	Low-level/High-level Output Voltage	All modes	See note (2)		V
I_{OL}	Low-level Output Current	Standard Fast Fast-Mode Plus	See notes (2, 3)		mA
		High-speed Mode	See note (2)		

© 2025 Microchip Technology Inc. and its subsidiaries

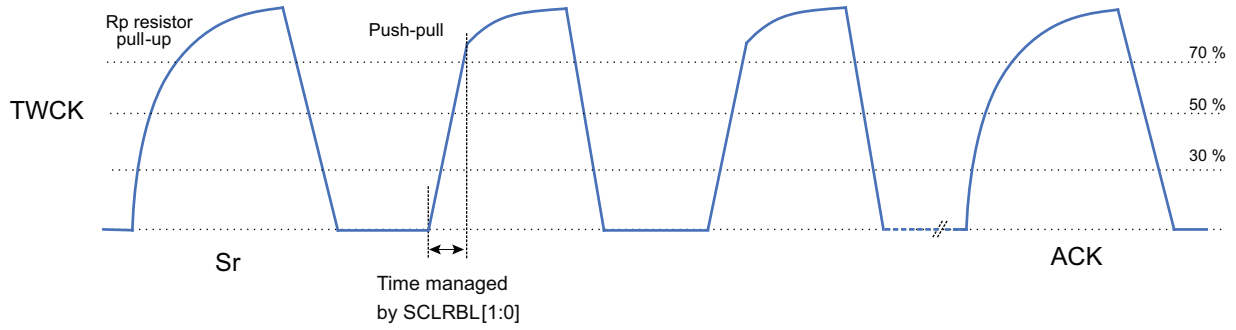
Table 85.32. Two-Wire Interface I/O Characteristics (continued)

Symbol	Parameter	Conditions	Min	Max	Unit
t_f	Output fall time of both TWD and TWCK signals V_{IHmin} to V_{ILmax}	Standard Fast Fast-Mode Plus	See note (4)		ns
t_{fTWCK}, t_{fTWD}	Fall time of both TWD and TWCK signals	High-speed Mode			
t_{rTWCK}	Rise time of TWCK, rise boost mode (push-pull mode)	SCLRBL > 0	See note (5)		ns

Notes:

1. See the table Input DC Characteristics.
2. See the tables Output DC Characteristics (1.7V < VDD < 1.9V) and Output DC Characteristics (3.0V < VDD < 3.6V). If $R_{p(min)}$ as specified in the I2C specification must be overridden (stronger) to meet the timing specification, the IBIS model of the product can be used to extract $V_{OL(max)}$ vs I_{OL}.
3. 20 mA is not supported for Fast Mode Plus.
4. Fall time of FLEXCOM I/O buffers are not I2C-compliant. Fall time can be increased by adding series resistors (see series protection resistors in the I2C specification). Rs < 1 KΩ depending on Cbus and Rp to respect V_{OL}, V_{IL} on the bus. Use Drive disabled (set to 0) and Slew rate enabled (set to 1) on the corresponding I/O. In the I/O AC Characteristics section, see falling times given for a 10 pF load. IBIS models of the product can be used to choose an adequate Rs value by simulating different drive/slew rate combinations with respect to the Cbus load.
5. When in High-speed mode, the TWI Clock signal (TWCK) rise can be boosted to meet a very fast rise time of the parameter t_{rCL} of the I2C specification when the Rp value on TWCK is lower than $R_{p(min)}$.
   Bits in FLEX_TWI_MMR.SCLRBL must be programmed according to t_{MCKx} to respect these timings. This gives the number of peripheral clock periods during which the SCL rise is boosted, i.e. driven in Push-pull mode. Note that the Cbus value and the drive and slew rate settings still influence the rise time. Rise boost usage is more suited with high Cbus values.
   Note: MCKx refers to the MCK associated with the FLEXCOM. Refer to the Domain Clock column in the table “Peripheral Identifiers”.

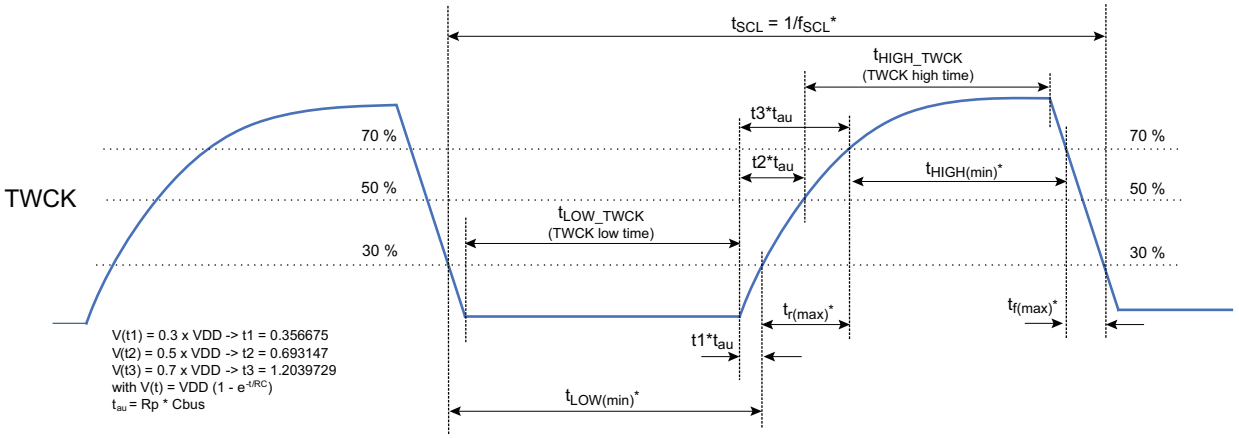
Figure 85.24. TWCK High-Speed Mode with Rise Boost Enabled



The figure below shows programmable register fields (CLDIV/HSCLDIV, CHDIV/HSCHDIV and optional CKDIV/HSCKDIV) in relation to t_{LOW}, t_{HIGH} , t_r, t_f, f_{SCL}, t_{rCL}, t_{rCL1}, t_{fCL} from the I2C specification.

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 85.25. TWCK Timings Characteristics



Note: Symbols with an asterisk (*) are I2C specification symbols: t_{LOW}, t_{HIGH}, t_r , t_f.

Note: For High-speed mode, $t_r = t_{rCL}$ or t_{rCL1} and $t_f = t_{fCL}$ from the I2C specification.

Important: $t_{SCL} \cong t_{LOW(min)} + t_{r(max)} + t_{HIGH(min)} + t_{f(max)}$

85.7.4.1.FLEXCOM TWI Timings

Table 85.33. TWI Interface Host Mode Timings

Symbol	Parameter	Conditions	Min	Max	Unit
t_{LOW_TWCK}	TWCK low time	–	See notes (1, 3, 4)	–	µs
t_{HIGH_TWCK}	TWCK high time	–	See notes (2, 3, 4)	–	µs
f_{TWCK}	TWCK frequency(5)	Standard Fast Fast-Mode Plus High-speed Mode	0	0.1 0.4 1 3.4	MHz
$t_{HD(STA)}$	Hold time (repeated) START condition	Standard Fast Fast-Mode Plus	t_{HIGH_TWCK}	–	ns
		High-speed Mode	FLEX_TWI_CWGR.BRSRCCLK = 1: t_{LOW_TWCK}(6) FLEX_TWI_CWGR.BRSRCCLK = 0: 2 x t_{HIGH_TWCK}	–	ns
$t_{SU(STA)}$	Setup time for a repeated START condition	Standard Fast Fast-Mode Plus	t_{LOW_TWCK}	–	ns
		High-speed Mode	FLEX_TWI_CWGR.BRSRCCLK = 1: t_{LOW_TWCK} FLEX_TWI_CWGR.BRSRCCLK = 0: 2 x t_{LOW_TWCK} (6)	–	ns

© 2025 Microchip Technology Inc. and its subsidiaries

Table 85.33. TWI Interface Host Mode Timings (continued)

Symbol	Parameter	Conditions	Min	Max	Unit
$t_{HD(DAT)}$	Data hold time	Standard Fast Fast-Mode Plus	2 x t_{MCKx}	(HOLD + 3) × t_{MCKx}	ns
		High-speed Mode	0	150 @ f_{TWCK} max = 1.7 MHz 70 @ f_{TWCK} max = 3.4 MHz	ns
$t_{SU(DAT)}$	Data setup time	Standard Fast Fast-Mode Plus	t_{LOW} – (HOLD + 3) × t_{MCKx}	–	ns
		High-speed Mode	t_{LOW_TWCK}	–	ns
$t_{SU(STO)}$	Setup time for STOP condition	Standard Fast Fast-Mode Plus	FLEX_TWI_CWGR.BRSRCCLK = 1: t_{LOW_TWCK} FLEX_TWI_CWGR.BRSRCCLK = 0: t_{HIGH_TWCK}	–	ns
		High-speed Mode	FLEX_TWI_CWGR.BRSRCCLK = 1: t_{HIGH+1} FLEX_TWI_CWGR.BRSRCCLK = 0: t_{HIGH_TWCK}	–	ns
t_{BUF}	Bus free time between a STOP and a START condition	Standard Fast Fast-Mode Plus	t_{LOW_TWCK}	–	ns

Notes:

1. TWCK low time (t_{LOW_TWCK}) ≥ t_{LOWmin} - t1*t_{au} → HSCLDIV/CLDIV = ((t_{LOW_TWCK} / t_{PERIPH})-3) / $2^{CKDIV\ or\ HSCKDIV}$)
2. TWCK high time (t_{HIGH_TWCK}) ≥ $t_{HIGHmin}$ + (t3-t2)*t_{au} → HSCHDIV/CHDIV = ((t_{HIGH_TWCK} / t_{PERIPH})-3) / $2^{CKDIV\ or\ HSCKDIV}$)
3. t_{TWCK} = (t_{LOW_TWCK} + t1*t_{au}) + $t_{r(max}$ + (t_{HIGH_TWCK} + (t3-t2)*t_{au}) + $t_{f(max)}$
4. The TWCK low/high time formulae in notes 1 and 2 are for Bit Rate Source Clock (BRSRCCLK) = 0 for all modes and RX Digital Filter (FILT) = 0 for Standard, Fast and FM+ Modes only. See FLEX_TWI_CWGR, FLEX_TWI_HSCWGR and FLEX_TWI_FILTR registers for more details.
5. 1.7 MHz (Cbus 400 pF max), 3.4 MHz (Cbus 100 pF max). Timings in the above table involving t_{LOW_TWCK} and/or t_{HIGH_TWCK} may limit the TWCK maximum frequency when interfacing with an I2C client requiring strict I2C timings.
6. If computing HSCLDIV and/or HSCHDIV results in 0, $t_{SU(STA)}$ and/or $t_{HD(STA)}$ is equal to 6x t_{LOW_TWCK} and/or 6x t_{HIGH_TWCK}, respectively.
7. MCKx refers to the MCK associated with the FLEXCOM. Refer to column Domain Clock in the table “Peripheral Identifiers”.

Table 85.34. Two-Wire Interface Client High-Speed Mode Timings

Symbol	Parameter	Conditions	Min	Max	Unit
f_{TWCK}	TWCK clock frequency	–	–	3.4	MHz
$t_{HD(DAT)}$	Data hold time	f_{TWCK} = 1.7 MHZ	0	70	ns
		f_{TWCK} = 3.4 MHz	0	150	
$t_{SU(DAT)}$	Data setup time	f_{TWCK} = 1.7 MHZ f_{TWCK} = 3.4 MHz	10	–	ns

85.7.5. I3C Controller (I3CC)

The I3CC interface complies with the standard mentioned in the section I3C Controller (I3CC). Microchip recommends performing an electrical simulation of this interface with the provided IBIS models.

When the I3CC interface is used, the following GPIO configuration is recommended: DRV = 1 and SR = 1.

85.7.6. Secure Digital MultiMedia Card Controller (SDMMC)

The SDMMC0, SDMMC1 and SDMMC2 interfaces comply with the standard mentioned in the section Secure Digital MultiMedia Card Controller (SDMMC). Microchip recommends to perform an electrical simulation of these interfaces with the provided IBIS models.

85.7.7. Universal DDR Memory Controller (UDDRC) and DDR/LPDDR Physical Interface (DDR3PHY)

The UDDRC and DDR3PHY are compliant with the following JEDEC standards:

- DDR2-SDRAM: JESD79-2E with operating frequencies up to 533 MHz
- DDR3-SDRAM: JESD79-3C with operating frequencies up to 533 MHz
- DDR3L-SDRAM: JESD79-3-1A with operating frequencies up to 533 MHz
- LPDDR2-SDRAM: JESD209-2B with operating frequencies up to 533 MHz
- LPDDR3-SDRAM: JESD209-3B with operating frequencies up to 533 MHz

The physical interface (PCB layout) between the processor and its memory has a major impact on signal integrity. Microchip provides IBIS models of the SAMA7D6 device and strongly recommends to verify this processor-memory interface on a PCB simulation tool.

85.7.8. LCD Controller (LCDC)

Timings are provided in the following conditions:

- 1.8V domain: VDDIO from 1.7V to 1.9V, maximum external capacitor = 10 pF, DRV = 1, SR = 1
- 3.3V domain: VDDIO from 3.0V to 3.6V, maximum external capacitor = 10 pF, DRV = 0, SR = 1

Figure 85.26. LCD Timings

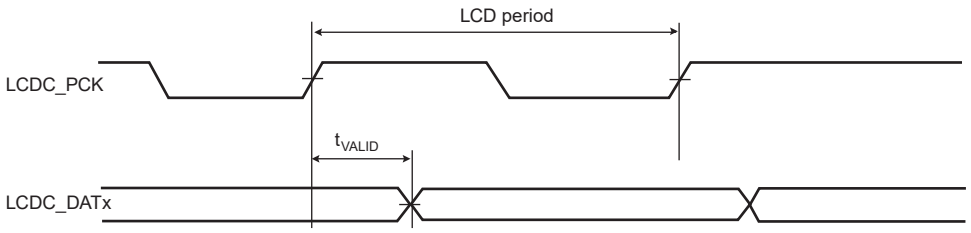

Table 85.35. LCDC Timings

Symbol	Parameter	Conditions	Min	Max	Unit
f_{LCDC_PCK}	Maximum LCDC_PCK clock frequency	–	–	90	MHz
t_{VALID}	Clock to LCDC_DATx valid output	–	–	3.3	ns

85.7.9. Static Memory Controller (SMC)

Timings are provided in the following domains:

- 1.8V domain: VDDIO from 1.7V to 1.9V, maximum external capacitor = 10 pF, DRV= 1, SR = 1
- 3.3V domain: VDDIO from 3.0V to 3.6V, maximum external capacitor = 10 pF, DRV= 0, SR = 1

85.7.9.1.Read Timings

Table 85.36. SMC Read Signals - NRD-Controlled (READ_MODE = 1)

Symbol	Parameter	Min	Max	Unit
NO HOLD SETTINGS (NRD_HOLD = 0)				
SMC_1	Data setup before NRD high	18	–	ns
SMC_2	Data hold after NRD high	0	–	ns
HOLD SETTINGS (NRD_HOLD ≠ 0)				
SMC_3	Data setup before NRD high	18	–	ns
SMC_4	Data hold after NRD high	0	–	ns
HOLD or NO HOLD SETTINGS (NRD_HOLD ≠ 0, NRD_HOLD = 0)				
SMC_5	A[22:0] valid before NRD High	(NRD_SETUP + NRD_PULSE) × t_{MCK1} - 8	–	ns
SMC_6	NCS low before NRD High	(NRD_SETUP + NRD_PULSE - NCS_RD_SETUP) × t_{MCK1} - 8	–	ns
SMC_7	NRD pulse width	NRD_PULSE × t_{MCK1}	–	ns

Table 85.37. SMC Read Signals - NCS-Controlled (READ_MODE= 0)

Symbol	Parameter	Min	Max	Unit
NO HOLD SETTINGS (NCS_RD_HOLD = 0)				
SMC_8	Data setup before NCS high	24	–	ns
SMC_9	Data hold after NCS high	0	–	ns
HOLD SETTINGS (NCS_RD_HOLD ≠ 0)				
SMC_{10}	Data setup before NCS high	24	–	ns
SMC_{11}	Data hold after NCS high	0	–	ns
HOLD or NO HOLD SETTINGS (NCS_RD_HOLD ≠ 0, NCS_RD_HOLD = 0)				
SMC_{12}	A[22:0] valid before NCS High	(NCS_RD_SETUP + NCS_RD_PULSE) × t_{MCK1} - 5	–	ns
SMC_{13}	NRD low before NCS high	(NCS_RD_SETUP + NCS_RD_PULSE - NRD_SETUP) × t_{MCK1}	–	ns
SMC_{14}	NCS pulse width	NCS_RD_PULSE × t_{MCK1}	–	ns

85.7.9.2.Write Timings

Table 85.38. SMC Write Signals - NWE-Controlled (WRITE_MODE = 1)

Symbol	Parameter	Min	Max	Unit
HOLD or NO HOLD SETTINGS (NWE_HOLD ≠ 0, NWE_HOLD = 0)				
SMC_{15}	Data out valid before NWE high	NWE_PULSE × t_{MCK1} - 9	–	ns
SMC_{16}	NWE pulse width	NWE_PULSE × t_{MCK1}	–	ns
SMC_{17}	A[22:0] valid before NWE low	NWE_SETUP × t_{MCK1} - 9	–	ns
SMC_{18}	NCS low before NWE high	(NWE_SETUP - NCS_RD_SETUP + NWE_PULSE) × t_{MCK1} - 9	–	ns
HOLD SETTINGS (NWE_HOLD ≠ 0)				
SMC_{19}	NWE high to data OUT, NBS0/A0 NBS1, A[23:1] change	NWE_HOLD × t_{MCK1}	–	ns
SMC_{20}	NWE high to NCS inactive(1)	(NWE_HOLD - NCS_WR_HOLD) × t_{MCK1}	–	ns
NO HOLD SETTINGS (NWE_HOLD = 0)				
SMC_{21}	NWE high to data OUT, NBS0/A0 NBS1, A[23:1], NCS change(1)	3	–	ns

© 2025 Microchip Technology Inc. and its subsidiaries

Note:

1. Hold length = Total cycle duration - setup duration - pulse duration. “hold length” is for “NCS_WR_HOLD length” or “NWE_HOLD length”.

Table 85.39. SMC Write Signals - NCS-Controlled (WRITE_MODE = 0)

Symbol	Parameter	Min	Max	Unit
SMC_{22}	Data out valid before NCS high	NCS_WR_PULSE × t_{MCK1} - 5	–	ns
SMC_{23}	NCS pulse width	NCS_WR_PULSE × t_{MCK1}	–	ns
SMC_{24}	A[22:0] valid before NCS low	NCS_WR_SETUP × t_{MCK1} - 5	–	ns
SMC_{25}	NWE low before NCS high	(NCS_WR_SETUP - NWE_SETUP + NCS_PULSE) × t_{MCK1}	–	ns
SMC_{26}	NCS high to data OUT, A[25:0] change	NCS_WR_HOLD × t_{MCK1} - 8	–	ns
SMC_{27}	NCS high to NWE inactive	(NCS_WR_HOLD - NWE_HOLD) × t_{MCK1} - 5	–	ns

85.7.10. Synchronous Serial Controller (SSC)

Timings are provided in the following domains:

- 1.8V domain: VDDIO from 1.7V to 1.9V, maximum external capacitor = 10 pF, DRV= 1, SR = 1
- 3.3V domain: VDDIO from 3.0V to 3.6V, maximum external capacitor = 10 pF, DRV= 0, SR = 1

Table 85.40. SSC Timings

Symbol	Parameter	Conditions	Min	Max	Unit
SSC TX Timings - Client Mode (TK Input)					
f_{TK}	TK frequency (TK input)	–	–	15	MHz
t_{TK}	Minimum TK period	–	66.7	–	ns
SSC_1	TK edge to TF/TD	–	5	25.3	ns
SSC_5	TF setup time before TK edge	–	0	–	ns
SSC_6	TF hold time after TK edge	–	t_{MCK}	–	ns
SSC_7	TK edge to TF/TD with STDDLY = 0, START = 4,5,7	3 x t_{MCK} +	5	19	ns
SSC TX Timings - Host Mode (TK Output)					
f_{TK}	TK frequency (TK output)	–	–	25	MHz
t_{TK}	Minimum TK period	–	40.0	–	ns
SSC_0	TK edge to TF/TD	–	0	10.0	ns
SSC_2	TF setup time before TK edge	–	14.0	–	ns
SSC_3	TF hold time after TK edge	–	0	–	ns
SSC_4	TK edge to TF/TD with STDDLY = 0, START = 4,5,7	2 x t_{MCK} +	0.3	8.5	ns
SSC_{14}	TK rise time or fall time (TK input)(1)	–	–	10.0	ns
SSC RX Timings - Client Mode (RK Input)					
f_{RK}	RK frequency (RK input)	–	–	15	MHz
t_{RK}	Minimum RK period	–	66.7	–	ns
SSC_8	RF/RD setup time before RK edge	–	0.0	–	ns
SSC_9	RF/RD hold time after RK edge	–	t_{MCK}(2)	–	ns
SSC_{10}	RK edge to RF	–	4.5	21.5	ns
SSC RX Timings - Host Mode (RK Output)					

© 2025 Microchip Technology Inc. and its subsidiaries

Table 85.40. SSC Timings (continued)

Symbol	Parameter	Conditions	Min	Max	Unit
f_{RK}	RK frequency (RK output)	–	–	25	MHz
t_{RK}	Minimum RK period	–	40.0	–	ns
SSC_{11}	RD/RF setup time before RK edge	–	14.0	–	ns
SSC_{12}	RD/RF hold time after RK edge (RF input)	–	4.1	–	ns
SSC_{13}	RK edge to RF	–	-0.5	10.0	ns

Notes:

1. SSC_{14} applies to RK when RK is selected instead of TK (SSC_TCMR.CKS = RK).
2. In this table, t_{MCK} refers to the period of the Main System Bus clock MCK7 for SSC0 or MCK8 for SSC1.

85.7.11. Inter-IC Sound Multi-Channel Controller (I2SMCC)

Timings are provided in the following domains:

- 1.8V domain: VDDIO from 1.7V to 1.9V, maximum external capacitor = 10 pF, DRV= 1, SR = 1
- 3.3V domain: VDDIO from 3.0V to 3.6V, maximum external capacitor = 10 pF, DRV= 0, SR = 1

Symbol	Parameter		Min	Max	Unit
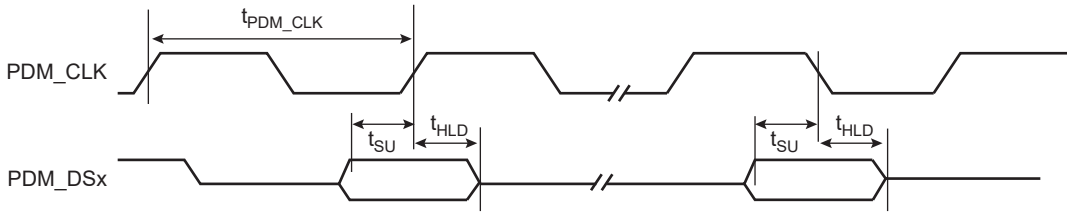
f_{I2SMCC_SCK}	Frequency in Host mode		–	12.5	MHz
$I2S_0$	I2SMCC_DINx setup time before I2SMCC_SCK rises		16.0	–	ns
$I2S_1$	I2SMCC_DINx hold time after I2SMCC_SCK rises		0	–	ns
$I2S_2$	I2SMCC_SCK falling to I2SMCC_DOUTx delay		1	12	ns
$I2S_3$	I2SMCC_SCK falling to I2SMCC_WS delay		1	10	ns
Client Mode					
f_{I2SMCC_SCK}	Frequency in Client mode		–	12.5	MHz
$I2S_4$	I2SMCC_DINx setup time before I2SMCC_SCK rises		3	–	ns
$I2S_5$	I2SMCC_DINx hold time after I2SMCC_SCK rises		2.5	–	ns
$I2S_6$	I2SMCC_WS setup time before I2SMCC_SCK rises		14	–	ns
$I2S_7$	I2SMCC_WS hold time after I2SMCC_SCK rises		0	–	ns
$I2S_8$	I2SMCC_SCK falling to I2SMCC_DOUTx delay		-5	23	ns

85.7.12. Pulse Density Microphone Controller (PDMC)

Timings are provided in the following domains:

- 1.8V domain: VDDIO from 1.7V to 1.9V, maximum external capacitor = 10 pF, DRV= 1, SR = 1
- 3.3V domain: VDDIO from 3.0V to 3.6V, maximum external capacitor = 10 pF, DRV= 0, SR = 1

Figure 85.39. PDMC Timing Diagram



Symbol	Parameter	Conditions	Min	Max	Unit
f_{PDM_CLK}	PDM clock frequency	–		5	MHz
δ_{PDM_CLK}	PDM clock duty cycle	–	48	52	%
t_{SU}	Data input setup time	–	20	–	ns
t_{HLD}	Data input hold time	–	0	–	ns

85.7.13. Ethernet MAC (GMAC)

85.7.13.1.Ethernet MAC MDIO Mode

In MDIO mode, the MDC frequency must be less than or equal to 2.5 MHz to be compatible with the IEEE 802.3 MII specification.

Timings are provided in the following conditions:

- 1.8V domain: VDDIO from 1.7V to 1.9V, maximum external capacitor = 10 pF, DRV= 1, SR = 1
- 3.3V domain: VDDIO from 3.0V to 3.6V, maximum external capacitor = 10 pF, DRV= 0, SR = 1

Table 85.42. Ethernet MAC MDIO Interface Timings

Table 85.45. VDDOUT25 Voltage Regulator Characteristics (continued)

Symbol	Parameter	Conditions	Min	Max	Unit
R_{DIS}	Output discharge resistor value(1)	Regulator off	100	300	Ω

Notes:

1. Simulation data
2. This regulator is designed to supply the device internal circuits (PLLs, MIPI PHY, LVDS PHY, oscillators, etc.). To supply external components, only DC current is permissible (for example, a resistive divider) up to $I_{LOAD_EXT_MAX}$.
3. Input current when charging the external output capacitor C_{OUT}.
4. An X5R or X7R ceramic capacitor connected between VDDIN33 and the device's closest GND pin is a minimum requirement to reduce the inrush current and maximize the regulator performances.
5. To ensure stability, an external X5R or X7R ceramic output capacitor, C_{OUT}, must be connected between the VDDOUT25 and the device's closest GND pin.

85.8.2. VDDCORE Power-On Reset

Table 85.46. Core Power Supply POR Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DDCORE}	Supply voltage range (VDDCORE)	–	0.5	1.21	V
V_{IT-_POR}	Negative-going input threshold voltage (VDDCORE)(1)	Measured with a -10V/s ramp rate	0.68	0.92	V
V_{IT+_POR}	Positive-going input threshold voltage (VDDCORE)(1)	Measured with a +10V/s ramp rate	0.70	0.99	V
V_{hys}	Hysteresis voltage(1)(2)	–	20	60	mV
t_{RES}	Reset time(1)	–	1	5	ms
t_{DET-}	V_{IT-} detection propagation time(1)	100 mV threshold overdrive	–	10	µs

Notes:

1. Simulation data
2. $V_{hys} = V_{IT+} - V_{IT-}$

85.8.3. VDDCPU Power-On Reset

Table 85.47. CPU Power Supply POR Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DDCPU}	Supply voltage range (VDDCPU)	–	0.5	1.30	V
V_{IT-}	Negative-going input threshold voltage (VDDCPU)(1)	Measured with a -10V/s ramp rate	0.68	0.92	V
V_{IT+}	Positive-going input threshold voltage (VDDCPU)(1)	Measured with a +10V/s ramp rate	0.70	0.99	V
V_{hys}	Hysteresis voltage(1)(2)	–	20	60	mV
t_{RES}	Reset time(1)	–	1	5	ms
t_{DET-}	V_{IT-} detection propagation time(1)	100 mV threshold overdrive	–	10	µs

Notes:

85.8.6. Slow RC Oscillator

Table 85.50. Slow RC Oscillator Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{BAT}	Supply voltage range (VBAT)(1)	–	V_{IT-}	3.6	V
f_{SLOWRC}	Frequency accuracy	VBAT = 3.3V, T_J = 0 to +50°C	30.5	33.5	kHz
		VBAT = V_{IT-} to 3.6V, over the applicable T_J range	20	40	kHz

Note:

1. In this table, V_{IT-} refers to the negative-going input threshold voltage of the VBAT POR (see Table 85.49). The operation of the backup section of the device, and in particular of the slow RC oscillator, is granted down to the VBAT POR V_{IT-} threshold.

85.8.7. Main RC Oscillator

Table 85.51. Main RC Oscillator Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DDIN33}	Supply voltage range (VDDIN33) (1)	–	3.0	3.6	V
I_{DDIN33}	Current consumption (VDDIN33)(2)	–	–	200	µA
t_{START}	Start-up time(2)	–	–	15	µs
f_0	Nominal output frequency	–	12		MHz
f_{ACC}	Output frequency accuracy	0°C < T_J < +50°C	–	±2	%
		-20°C < T_J < +70°C(2)	–	±3	%
		Over the applicable T_J range	–	±5	%
df/dV	Output frequency drift with VDDIN33(2)	V_{DDIN33}: 3.0V to 3.6V	–	0.01	% / V
Duty	Output duty cycle	–	45	55	%

Notes:

1. This oscillator is powered by the 2.5V regulated output of the VDDOUT25 regulator, which is supplied from VDDIN33.
2. Simulation data

85.8.8. 32.768 kHz Crystal Oscillator

Table 85.52. 32.768 kHz Crystal Oscillator Characteristics

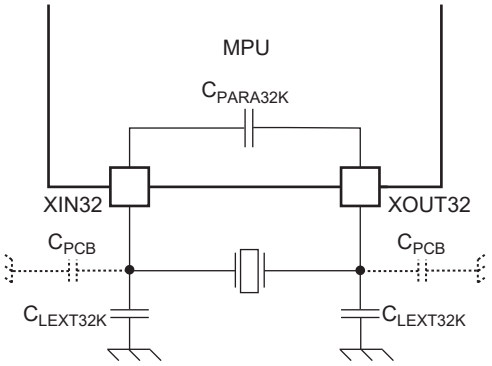
Symbol	Parameter	Conditions		Min	Max	Unit
V_{BAT}	Supply voltage range (VBAT)(1)	–		V_{IT-}	3.6	V
I_{VBAT}	Current consumption (VBAT)(2)	–		–	3.1	µA
t_{START}	Start-up time(2)	R_S(3) < 50 kΩ	C_M = 0.6 fF	–	3.7	s
			C_M = 3 fF	–	0.8	s
		R_S(3) < 90 kΩ	C_M = 0.6 fF	–	5.0	s
			C_M = 3 fF	–	1.0	s
f_{OSC}	Operating frequency	–		32.768		kHz
Duty	Duty cycle(2)	–		40	65	%
R_F	Internal resistor(2)	Between XIN32 and XOUT32		6		MΩ
$C_{PARA32K}$	Internal parasitic capacitance(2)	Between XIN32 and XOUT32		2		pF

© 2025 Microchip Technology Inc. and its subsidiaries

Notes:

1. In this table, V_{IT-} refers to the negative-going input threshold voltage of the VBAT POR (see Table 85.49). Operation of the device backup section is granted down to the VBAT POR V_{IT-} threshold.
2. Simulation data
3. R_S is the crystal's equivalent series resistor.

Figure 85.44. 32.768 kHz Crystal Oscillator



$C_{LEXT32K} = 2x(C_{CRYSTAL} - C_{PARA32K} - C_{PCB} / 2)$

where C_{PCB} is the single-ended (ground-referenced) parasitic capacitance of the printed circuit board (PCB) on XIN32 and XOUT32 tracks. As an example, if the crystal is specified for a 12.5 pF load, with C_{PCB} = 1 pF (on XIN32 and on XOUT32), $C_{LEXT32K}$ = 2 x (12.5 - 2 - 0.5) = 20 pF.

The following table summarizes recommendations for 32.768 kHz crystal selection.

Table 85.53. Recommended 32.768 kHz Crystal Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
$C_{CRYSTAL}$	Crystal load capacitance	As specified by the crystal manufacturer	6	12.5	pF
R_S	Equivalent series resistor	–	–	90	kΩ
C_M	Motional capacitance	–	0.6	3	fF
C_{SHUNT}	Shunt capacitance	–	0.6	2	pF
P_{ON}	Drive level	–	0.2	–	µW

85.8.9. Main Crystal Oscillator

Table 85.54. Main Crystal Oscillator Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DDIN33}	Supply voltage range (VDDIN33)(1)	–	3.0	3.6	V
$I_{VDDIN33}$	Current consumption (VDDIN33)(2)	–	–	2.8	mA
t_{START}	Start-up time(2)	–	–	10	ms
f_{OSC}	Operating frequency range	–	20	50	MHz
Duty	Duty cycle(2)	–	40	60	%
C_{PARA}	Internal parasitic capacitance(2)	Between XIN and XOUT	1		pF

Notes:

1. This oscillator is powered by the 2.5V regulated output of the VDDOUT25 regulator, which is supplied from VDDIN33.
2. Simulation data

Three sets of crystal characteristics are supported with this oscillator corresponding to three operating frequency ranges:

- Set 1: Crystal frequency is between 12 and 20 MHz. See Table 85.55.
- Set 2: Crystal frequency is between 20 and 30 MHz. See Table 85.56.
- Set 3: Crystal frequency is between 30 and 48 MHz. See Table 85.57.

When choosing a crystal, one and only one of these sets must be completely satisfied.

Table 85.55. Recommended Crystal Characteristics (Set 1)

Symbol	Parameter	Conditions	Min	Max	Unit
f_0	Fundamental frequency	–	12	20	MHz
$C_{CRYSTAL}$	Load capacitance	–	6	17.5	pF
C_{SHUNT}	Shunt capacitance	–	–	3	pF
ESR	Equivalent series resistance	–	–	100	Ω
C_M	Motional capacitance	–	1.3	3.2	fF
P_{ON}	Drive level	–	150	–	µW

Table 85.56. Recommended Crystal Characteristics (Set 2)

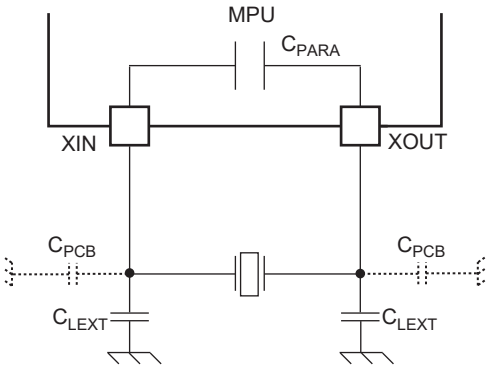
Symbol	Parameter	Conditions	Min	Max	Unit
f_0	Fundamental frequency	–	20	30	MHz
$C_{CRYSTAL}$	Load capacitance	–	6	12.5	pF
C_{SHUNT}	Shunt capacitance	–	–	3	pF
ESR	Equivalent series resistance	–	–	100	Ω
C_M	Motional capacitance	–	1.3	3.2	fF
P_{ON}	Drive level	–	300	–	µW

Table 85.57. Recommended Crystal Characteristics (Set 3)

Symbol	Parameter	Conditions	Min	Max	Unit
f_0	Fundamental frequency	–	30	48	MHz
$C_{CRYSTAL}$	Load capacitance	–	6	10	pF
C_{SHUNT}	Shunt capacitance	With ESR_{MAX} = 60Ω	–	3	pF
		With ESR_{MAX} = 80Ω	–	1	pF
ESR	Equivalent series resistance	With C_{SHUNT_MAX} = 1 pF	–	80	Ω
		With C_{SHUNT_MAX} = 3 pF	–	60	Ω
C_M	Motional capacitance	–	1.3	3.2	fF
P_{ON}	Drive level	–	400	–	µW

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 85.45. Main Crystal Oscillator



C_{LEXT} = 2 x ($C_{CRYSTAL}$ – C_{PARA} – C_{PCB} / 2).

where C_{PCB} is the single-ended (ground referenced) parasitic capacitance of the printed circuit board (PCB) on XIN and XOUT tracks. For example, if the crystal is specified for a 12.5 pF load, with C_{PCB}=1 pF (on XIN and on XOUT), C_{LEXT} = 2 x (12.5 - 1 - 0.5) = 22 pF.

85.8.10. Crystal Oscillator Design Considerations

When choosing a crystal for the 32.768 kHz Crystal Oscillator or for the Main Crystal Oscillator, several parameters must be taken into account. Important parameters are as follows:

- Crystal Load Capacitance: the total capacitance loading the crystal, including the oscillator's internal parasitics and the PCB parasitics, must match the load capacitance for which the crystal's frequency is specified. Any mismatch in the load capacitance with respect to the crystal's specification will lead to inaccurate oscillation frequency.
- Crystal Drive Level: use only crystals with specified drive levels greater than the minimum recommended value. Applications that do not respect this criterion may damage the crystal.
- Crystal Equivalent Series Resistance (ESR): use only crystals with a specified ESR lower than the maximum specified value. In applications where this criterion is not respected, the crystal oscillator may not start.
- Crystal Shunt Capacitance: use only crystals with a specified shunt capacitance lower than the maximum specified value. In applications where this criterion is not respected, the crystal oscillator may not start.
- PCB Layout Considerations: to minimize inductive and capacitive parasitics associated with XIN, XOUT, XIN32, XOUT32 nets, it is recommended to route them as short as possible. It is also of prime importance to keep those nets away from noisy switching signals (clock, data, PWM, etc.). A good practice is to shield them with a quiet ground net to avoid coupling to neighboring signals.

85.8.11. PLL Characteristics

The following characteristics apply to CPUPLL, DDRPLL, IMGPLL, SYSPLL, BAUDPLL, AUDIOPLL, GPUPLL, LVDSPLL and ETHPLL and are provided for register PMC_PLL_ACR programmed to the recommended value 0x00070010. For USBPLL, see note (5).

Table 85.58. PLL Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DDIN33}	Supply voltage range (VDDIN33)(1)	–	3.0	3.6	V
V_{DDCORE}	Supply voltage range (VDDCORE)	–	1.03	1.21	V
$I_{VDDIN33}$	Current consumption (VDDIN33)(2)	$f_{COREPLLCK}$ = 1.0 GHz	–	2.9	mA
$I_{VDDCORE}$	Current consumption (VDDCORE)(2)		–	3.5	mA

© 2025 Microchip Technology Inc. and its subsidiaries

Table 85.58. PLL Characteristics (continued)

Symbol	Parameter	Conditions	Min	Max	Unit
t_{START}	Start-up time[2]	To reach 95% of target frequency	–	50[3]	µs
f_{IN}	Input frequency range	–	10	50	MHz
$f_{COREPLLCK}$	COREPLLCK frequency range	–	600	1200	MHz
$f_{IOPLLCK}$	IOPLLCK[4] frequency range	–	–	100	MHz

Notes:

1. The PLLs are powered by the 2.5V regulated output, which is supplied from VDDIN33.
2. Simulation data
3. For USBPLL, t_{START_MAX} = 150 µs
4. IOPLLCK is available on the AUDIOPLL only and corresponds to the AUDIOCLK pin.
5. For optimal setting of the USBPLL, set PMC_PLL_ACR as follows:
   PMC_PLL_ACR = 0x09023010 for f_{IN} = [12 MHz, 18 MHz]
   PMC_PLL_ACR = 0x12023010 for f_{IN} = [18 MHz, 32 MHz]
   PMC_PLL_ACR = 0x1B023010 for f_{IN} = [32 MHz, 48 MHz]

Table 85.59. PLL Output Clocks Characteristics

Symbol	Parameter[1]	Conditions	Min	Max	Unit
$f_{CPUPLLCK}$	CPUPLLCK frequency range	–	–	1000	MHz
$f_{DDRPLLCK}$	DDRPLLCK frequency range	–	–	533	MHz
$f_{GPUPLLCK}$	GPUPLLCK frequency range	–	–	533	MHz
$f_{SYSPLLCK}$	SYSPLLCK frequency range	–	–	416	MHz
$f_{BAUDPLLCK}$	BAUDPLLCK frequency range	–	–	300	MHz
$f_{AUDIOPLLCK}$	AUDIOPLLCK frequency range	–	–	300	MHz
$f_{ETHPLLCK}$	ETHPLLCK frequency range	–	–	250	MHz
$f_{USBPLLCK}$	USBPLLCK frequency range	–	–	480	MHz
$f_{LVDSPLLCK}$	LVDSPLLCK frequency range	–	–	630	MHz

Note:

85.8.12. Temperature Sensor and Voltage Reference Characteristics

The temperature sensor provides two output voltages that can be converted by the internal 12-bit ADC:

- V_{TEMP}: proportional to the junction temperature (T_J), and
- V_{BG}: temperature-independent voltage.

Both voltages are multiplexed to ADC channel 31. The selection of V_{TEMP} or V_{BG} is done with the ADC_ACR.SRCLCH bit. Calibration data for the temperature sensor are factory-programmed in one OTP controller packet. For a detailed procedure on how to access these data, refer to the application note “SAMA7D6 Series Temperature Sensor Calibration” (AN5812), available on www.microchip.com.

Table 85.60. Temperature Sensor Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DDIN33}	Supply voltage range (VDDIN33)[1]	–	3.0	3.6	V
$I_{VDDIN33}$	Current consumption[2]	–	–	200	µA
t_{START}	Start-up time[2][3]	–	–	20	µs
V_{TEMP}	Temperature output voltage	T_J = 25°C	0.59	0.67	V

© 2025 Microchip Technology Inc. and its subsidiaries

Table 85.60. Temperature Sensor Characteristics (continued)

Symbol	Parameter	Conditions	Min	Max	Unit
dV_{TEMP}/dT	V_{TEMP} sensitivity to temperature(2)	–	2.08		mV/°C
T_{ACC}	Temperature reading accuracy(2)(3)	Over the applicable T_J range	–	±5	°C
V_{BG0}	VBG reference output voltage	T_J = 27°C	1.19	1.21	V
ΔV_{BG}	VBG drift with temperature(2)	$\Delta V_{BG} = V_{BG}(T_J)-V_{BG0}$	-20	20	mV
t_{TH}	V_{TEMP} or V_{BG} track-and-hold time(2)	Required track-and-hold time to ensure 1 LSB accurate settling on internal 12-bit ADC	1	–	µs

Notes:

1. The temperature sensor is powered by the VDDOUT25 regulator, which is supplied from VDDIN33.
2. Simulation data
3. Using the temperature sensor calibration procedure described in the application note “SAMA7D6 Series Temperature Sensor Calibration” (AN5812), available on www.microchip.com.

85.8.13. 12-bit ADC Characteristics

Table 85.61. ADC Power Supply and Voltage Reference Input Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DDIN33}	Supply voltage range (VDDIN33)(1)	–	3.0	3.6	V
$I_{VDDIN33}$	Current consumption on VDDIN33(1)(2)	Low speed ($f_S \le 500$ kS/s, ADC_ACR.IBCTL = 0)	–	1.0	mA
		Full speed ($f_S \le 1$ MS/s, ADC_ACR.IBCTL = 1)	–	1.8	mA
$V_{ADVREFP}$	ADVREFP input voltage range	–	2.4	2.55	V
$R_{ADVREFP}$	ADVREFP input resistance to ground(2)	ADC off	7.2	12	kΩ
		ADC on	1	–	MΩ
$C_{ADVREFP}$	Recommended decoupling capacitor on ADVREFP	–	1	–	µF

Notes:

1. The 12-bit ADC is powered by the VDDOUT25 regulator, which is supplied from VDDIN33.
2. Simulation data

Table 85.62. ADC Timing Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
f_{CKADC}	ADC clock frequency	ADC_ACR.IBCTL = 0	0.1	10	MHz
		ADC_ACR.IBCTL = 1	0.2	20	MHz
t_{CONV}	ADC conversion time(1)	–	20	–	t_{CKADC}
f_S	Sampling rate(2)	ADC_ACR.IBCTL = 0	–	0.5	MS/s
		ADC_ACR.IBCTL = 1	–	1	MS/s
t_{START}	Start-up time(3)	From Off to On	–	5	µs
t_{TRACK}	Track and hold time(3)(4)	–	300	–	ns

© 2025 Microchip Technology Inc. and its subsidiaries

Notes:

1. $t_{CONV} = t_{CH} + t_{TRACK} + 14 \times t_{CKADC}$ with $t_{CKADC} = 1 / f_{CKADC}$. The parameter $t_{CH} = 0$ when the ADC operates in the same input mode (single-ended, pseudo-differential or differential) for the current conversion as for the previous one. $t_{CH} = 2$ when the ADC input mode is changed to perform the current conversion.
2. $f_S = 1 / t_{CONV}$
3. Simulation data
4. See Track and Hold Time versus Source Impedance - Sampling Rate.

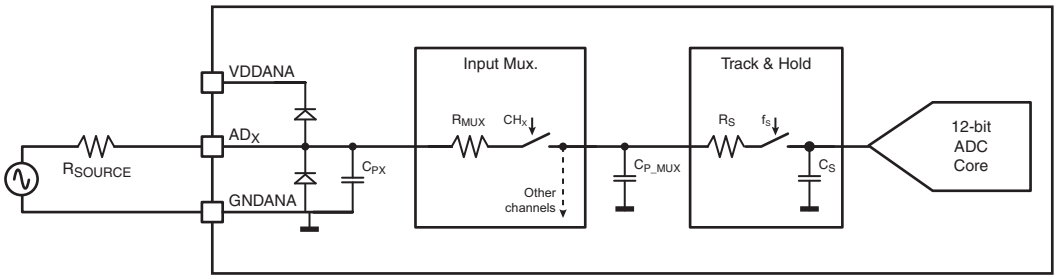
Table 85.63. ADC Analog Input Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{FS}	Analog input full scale range(1)	ADC_CCR.DIFFx = 0	0	$V_{ADVREFP}$	V
		ADC_CCR.DIFFx = 1	$-V_{ADVREFP}$	$V_{ADVREFP}$	V
V_{INCM}	Common mode input range in Differential Input mode(2)	ADC_CCR.DIFFx = 1	0.4 x V_{DDANA}	0.6 x V_{DDANA}	V
C_S	ADC sampling capacitance(3)	–	–	3	pF
C_{P_ADx}	ADx input parasitic capacitance(3)(4)	ADx pin configured as analog input	–	7	pF
R_{ON}	Internal series resistor(3)(4)	–	–	2.9	kΩ
Z_{IN}	Common mode input impedance(3)(5)	On ADx pin	1 / (f_S x C_S)	–	Ω
R_{CH30}	VBAT resistive attenuator impedance(3)	–	100	140	kΩ
G_{CH30}	VBAT channel gain	–	0.594	0.606	–

Notes:

1. $V_{FS} = (V_{ADx} - V_{GNDANA})$ in Single-ended mode and $V_{FS} = (V_{ADx} - V_{ADx+1})$ in Differential mode
2. $V_{INCM} = (V_{ADx} + V_{ADx+1}) / 2$
3. Simulation data
4. With respect to the equivalent model of Figure 85.47.
5. Assuming conversion on one single channel

Figure 85.46. Acquisition Path Block Diagram

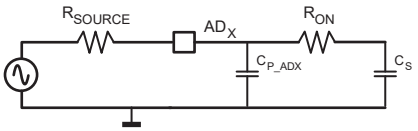


For tracking time calculation, during the sampling phase of the converter, this acquisition path can be reduced to the equivalent model of the following figure, where:

- $R_{ON} = R_{MUX} + R_S$
- $C_{P_ADX} = C_{PX} + C_{P_MUX}$

© 2025 Microchip Technology Inc. and its subsidiaries

Figure 85.47. Equivalent Model of the Acquisition Path



See Track and Hold Time versus Source Impedance - Sampling Rate for further details on the use of this model.

In the following table, unless otherwise specified, the specifications are provided for two speed operating ranges.

- Source resistance = 50Ω
- ADC_EMR.OSR[2:0] = $(000)_2$
- Low-speed
  - f_{CKADC} = 10 MHz, f_S = 500 kS/s
  - ADC_ACR.IBCTL = 0
- High-speed
  - f_{CKADC} = 20 MHz, f_S = 1 MS/s
  - ADC_ACR.IBCTL = 1

Table 85.64. Static Performance Characteristics[1]

Symbol	Parameter	Min	Max	Unit
RES_{ADC}	Native ADC resolution	12		Bit
INL	Integral non-linearity	-3	3	LSB
DNL	Differential non-linearity	-2	2	LSB
OE	Offset error[2]	-7	4	LSB
GE	Gain error[2]	-7	4	LSB
OE_{AT}	Offset error in Auto-test mode (ADC_EMR.ADCMODE!=0)	-10	10	LSB
GE_{AT}	Gain error in Auto-test mode (ADC_EMR.ADCMODE!=0)	-10	10	LSB

Notes:

1. In this table, errors are expressed in LSB where:
   - LSB = V_{VREFP} / 2^{12} in Single-ended mode (ADC_CCR.DIFFx = 0)
   - LSB = V_{VREFP} / 2^{11} in Differential mode
2. Error with respect to the best fit line method.

85.8.13.1. Track and Hold Time versus Source Impedance - Sampling Rate

Referring to Figure 85.47, during its tracking phase, the 12-bit ADC charges its sampling capacitor C_S through various serial resistors modeled as R_{SOURCE} (source output resistor) and R_{ON} (multiplexer series resistor and the sampling switch series resistor). In case of high output source resistance (for example, a low power resistive divider), the tracking time must be increased to ensure full settling of the sampling capacitor voltage. Note that programming a long tracking time may impact the sampling frequency (f_S). The following formula provides the minimum tracking time that ensures a 12-bit accurate settling.

$t_{TRACK} \geq 8 \times (R_{SOURCE} + R_{ON}) \times C_S$

The ADC Controller (ADCC) counts the tracking time in ADC clock cycles (t_{CKADC}). This time can be adjusted between 6 and 54 cycles in the fields ADC_MR.TRACKTIM and ADC_EMR.TRACKX. At maximum ADC clock frequency (20 MHz), the maximum tracking time that can be programmed

© 2025 Microchip Technology Inc. and its subsidiaries

is 2.7 µs. This limits 12-bit accurate sampling to sources having R_{SOURCE} in the 100 kΩ range. To overcome this limitation, the ADC clock frequency can be decreased.

The following examples show typical use cases of tracking time and sampling frequency calculation.

Example 1: Calculated tracking time is lower than the default (minimum) tracking time.

- Assuming f_{CKADC} = 8 MHz (t_{CKADC} = 125 ns), R_{SOURCE} = 10 kΩ
- The minimum required track time is t_{TRACK} = 8 x (10 kΩ + 2 kΩ) x 3pF = 288 ns
- t_{TRACK} is less than the minimum tracking time (6 x t_{CKADC} = 750 ns): set TRACKTIM = 0 and TRACKX = 0
- The real tracking time is 6 x t_{CKADC} (750 ns) and the conversion time is: $t_{CONV} = t_{TRACK} + 14 \times t_{CKADC} = 20 \times t_{CKADC}$
- The sampling rate is f_S = 8 MHz / 20 = 400 kS/s
- The maximum allowable source resistance is $R_{SOURCE_MAX} = (6 \times t_{CKADC}) / (3\ pF \times 8) - 2\ k\Omega$ = 29.25 kΩ

Example 2: Calculated tracking time is greater than the default (minimum) tracking time.

- Assuming f_{CKADC} = 20 MHz (t_{CKADC} = 50 ns), R_{SOURCE} = 20 kΩ
- The minimum required track time is t_{TRACK} = 8 x (20 kΩ + 2 kΩ) x 3 pF= 528 ns
- t_{TRACK} is greater than the minimum tracking time (6 x t_{CKADC} = 300 ns): set TRACKTIM=5 and TRACKX=1
- The real tracking time is (4 x (5 + 1) - 10) = 14 x t_{CK_ADC} = 700 ns
- The conversion time is $t_{CONV} = t_{TRACK} + 14 \times t_{CKADC} = 28 \times t_{CKADC}$
- The sampling rate is f_S = 20 MHz / 28 = 714.3 kS/s
- The maximum allowable source resistance is $R_{SOURCE_MAX} = (14 \times t_{CKADC}) / (3\ pF \times 8) - 2\ k\Omega$ = 27.2 kΩ

Example 3: Maximum sampling rate operation.

- Assuming f_{CKADC} = 20 MHz (t_{CKADC} = 50 ns), R_{SOURCE} = 10 kΩ
- The minimum required track time is t_{TRACK} = 8 x (10 kΩ + 2 kΩ) x 3 pF= 288 ns
- t_{TRACK} is less than the minimum tracking time (6 x t_{CKADC} = 300 ns): set TRACKTIM=0 and TRACKX=0
- The real tracking time is 6 x t_{CK_ADC} (300 ns) and the conversion time is: $t_{CONV} = t_{TRACK} + 14 \times t_{CKADC} = 20 \times t_{CKADC}$
- The sampling rate is f_S = 20 MHz / 20 = 1 MS/s
- The maximum allowable source resistance is $R_{SOURCE_MAX} = (6 \times t_{CKADC}) / (3\ pF \times 8) - 2\ k\Omega$= 10.5 kΩ

85.8.14. Analog Comparator Characteristics

The Analog Comparator features a built-in hysteresis voltage that applies on positive-going differential voltages. The following definitions are used to list the comparator specifications:

- $V_{IND} = (V_{INP} - V_{INN})$ is the differential input voltage
- V_{IT+} is the input threshold for a positive-going differential voltage
- V_{IT-} is the input threshold for a negative-going differential voltage

Table 85.65. Analog Comparator Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
$V_{VDDIN33}$	Supply voltage range (VDDIN33)[1]	–	3.0	3.6	V
I_{DDIN33}	Current consumption (VDDIN33)[2]	–	–	80	µA

© 2025 Microchip Technology Inc. and its subsidiaries

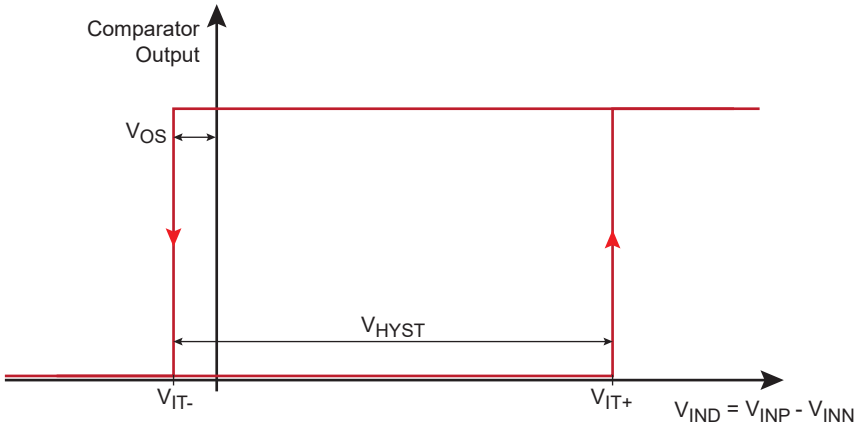
Table 85.65. Analog Comparator Characteristics (continued)

Symbol	Parameter	Conditions	Min	Max	Unit
t_{START}	Start-up time(2)	–	–	5	µs
t_{PD}	Propagation delay(2)(3)	–	–	200	ns
V_{CM}	Common mode input range	On negative and positive inputs	0.25	2.25	V
V_{OS}	Input offset voltage(2)	Applies to positive-going V_{IND}	-10	10	mV
V_{hys}	Hysteresis voltage(2)(4)	–	–	40	mV

Notes:

1. The analog comparator is powered by the VDDOUT25 regulator, which is supplied from VDDIN33.
2. Simulation data
3. Measured with 100 mV threshold overload
4. $V_{hys} = (V_{IT+} - V_{IT-})$

Figure 85.48. Analog Comparator Input/Output Transfer Function



85.8.15. HS USB Transceiver Characteristics

The device complies with all voltage, power, and timing characteristics and specifications as set forth in the USB 2.0 Specification. Refer to the USB 2.0 Specification for more information.

Table 85.66. USB 2.0 Transceiver Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
$V_{DDUTMII}$	Supply voltage range	–	3.0	3.6	V
$I_{DDUTMII}$	HS transceiver current consumption(1)(2)	Bias circuits enabled only	–	15	mA
		HS(3)	–	20	mA
		LS/FS – 0m cable(3)	–	5	mA
		LS/FS – 5m cable(3)	–	30	mA

Notes:

1. Simulation data
2. Including 1 mA due to pull-up/pull-down current
3. Additional current consumption for each port enabled

85.8.16. LVDS PHY Characteristics

The SAMA7D6 complies with the LVDS standard TIA/EIA-644 for protocol and electrical specifications.

Table 85.67. LVDS PHY Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DDLVDS}	Supply voltage range(1)	–	2.25	2.75	V
I_{DDLVDS}	Current consumption (2)(3)	Pre-emphasis disabled	–	30.0	mA
		Pre-emphasis enabled	–	50.0	mA
t_{START}	Start-up time(2)	–	–	50	µs
V_{OD}	Output differential voltage	–	±250	±450	mV
V_{CM}	Output common mode voltage	–	1.06	1.44	V
V_{OHS}	Single-ended output level high	–	1.21	1.64	V
V_{OLS}	Single-ended output level low	–	0.91	1.24	V
f_{LVDSCK}	LVDS_CLK1x output frequency(2)	–	–	90	MHz

Notes:

1. This LVDS PHY must be powered by the 2.5V regulated output of the VDDOUT25 regulator, which is supplied from VDDIN33.
2. Simulation data
3. Four-lane data stream, 0.4 Gbps/lane, 100Ω load

85.8.17. MIPI D-PHY Characteristics

The SAMA7D6 complies with the protocol and electrical specifications of the following standards:

- MIPI Alliance Specification for Display Serial Interface (DSI), Version 1.2
- MIPI Alliance Specification for D-PHY, Version 1.2

Table 85.68. MIPI PHY DSI Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DDDPHY}	Supply voltage range(1)	–	2.4	2.6	V
I_{DDDPHY}	Current consumption(2)	HS mode, 4 lanes	–	30.0	mA
t_{START}	Start-up time(3)	–	–	60	µs
High-Speed Characteristics					
V_{CMTXDC}	Output common mode voltage(2)(3)	–	150	250	mV
V_{OD}	Output differential voltage(2)(3)	–	140	270	mV
V_{OHHS}	Output high voltage(2)(3)	–	–	360	mV
Z_{OS}	Single-ended output impedance(3)	–	40	62.5	Ω
DZ_{OS}	Single-ended output impedance mismatch(3)	–	–	10	%
f_{DSICK}	MIPI_CLKx output frequency(3)	–	40	750	MHz
Low-Power Characteristics					
V_{OH}	Single-ended high-level output(3)	–	1.10	1.30	V
V_{OL}	Single-ended low-level output(3)	–	-50	50	mV
Z_{OLP}	Single-ended output impedance	–	110	–	Ω
t_{RLP} / t_{FLP}	15% to 85% rise time and fall time(3)	C_L < 70 pF	–	25	ns

© 2025 Microchip Technology Inc. and its subsidiaries

Notes:

1. This MIPI D-PHY must be powered by the 2.5V regulated output of the VDDOUT25 regulator, which is supplied from VDDIN33.
2. Lane load impedance is 80 to 125Ω.
3. Simulation data

85.9. Security Module Characteristics

85.9.1. Environmental Sensors

85.9.1.1. Voltage Monitoring

Table 85.69. VDDCORE Voltage Monitor Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DDIN33}	Supply voltage range (VDDIN33)(1)	–	3.00	3.60	V
V_{IT+}	Positive-going input threshold voltage (VDDCORE overvoltage)	–	1.17	1.21	V
V_{IT-}	Negative-going input threshold voltage (VDDCORE undervoltage)	–	0.99	1.03	V
V_{hys}	Hysteresis voltage(2)(3)	–	30		mV
t_{DET}	Detection time(3)(4)	–	–	50	µs

Notes:

1. This voltage monitor is powered by the 2.5V regulated output of the VDDOUT25 regulator, which is supplied from VDDIN33.
2. Hysteresis applies to both VIT+ and VIT- voltage thresholds. VIT+ has a negative hysteresis and VIT- has a positive hysteresis. Refer to Security Module (SECUMOD).
3. Simulation data
4. An additional debouncing time applies to this detection time as programmed in SECUMOD.VDDCORE_DBTV.

Table 85.70. VDDCPU Voltage Monitor Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DDIN33}	Supply voltage range (VDDIN33)(1)	–	3.00	3.60	V
V_{IT+}	Positive-going input threshold voltage (VDDCPU overvoltage)	800 MHz operating frequency (SECUMOD_GPSBR.SMCPURANGE = 1)	1.26	1.30	V
		600 MHz operating frequency (SECUMOD_GPSBR.SMCPURANGE = 0)	1.17	1.21	V
V_{IT-}	Negative-going input threshold voltage (VDDCPU undervoltage)	800 MHz operating frequency (SECUMOD_GPSBR.SMCPURANGE = 1)	1.10	1.14	V
		600 MHz operating frequency (SECUMOD_GPSBR.SMCPURANGE = 0)	0.99	1.03	V
V_{hys}	Hysteresis voltage(2)(3)	–	30		mV
t_{DET}	Detection time(3)(4)	–	–	50	µs

Notes:

1. This voltage monitor is powered by the 2.5V regulated output of the VDDOUT25 regulator, which is supplied from VDDIN33.
2. Hysteresis applies to both VIT+ and VIT- voltage thresholds. VIT+ has a negative hysteresis and VIT- has a positive hysteresis. Refer to Security Module (SECUMOD).
3. Simulation data
4. An additional debouncing time applies to this detection time as programmed in SECUMOD_VCPUFR.VDDCPU_DBTV.

Table 85.71. VBAT Voltage Monitor Characteristics[1]

Symbol	Parameter	Conditions	Min	Max	Unit
V_{BAT}	Supply voltage range (VBAT)[2]	–	V_{IT-_POR}	3.60	V
I_{BAT}	Current consumption on VBAT[3][4]	–	–	200	nA
V_{IT+}	Positive-going input threshold voltage (VBAT overvoltage)	Scheduled operation every 20 ms	3.48	3.62	V
V_{IT-}	Negative-going input threshold voltage (VBAT undervoltage)	Scheduled operation every 20 ms	1.58	1.66	V
t_{DET}	Detection time[4][5]	–	–	10	µs

Notes:

1. Due to temperature monitor alarm rising, do not use the supply monitor above 105°C.
2. V_{IT-_POR} refers to the negative-going input threshold of the VBAT power-on reset (see Table 85.49). Operation of the device backup section, and in particular of this monitor, is granted down to the VBAT power-on reset V_{IT-} threshold.
3. Average current consumption. Refer to Security Module (SECUMOD).
4. Simulation data
5. Measured with 100 mV threshold overload

Table 85.72. VDDANA Voltage Monitor Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{DDIN33}	Supply voltage range (VDDIN33)	–	3.00	3.60	V
V_{IT+}	Positive-going input threshold voltage (VDDANA overvoltage)[1]	–	2.575	2.675	V
V_{IT-}	Negative-going input threshold voltage (VDDANA undervoltage)[1]	–	2.325	2.425	V
t_{DET}	Detection time[1]	–	–	50	µs

Note:

1. Simulation data

85.9.2. Temperature Monitoring

Table 85.73. Temperature Monitor Characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
V_{BAT}	Supply voltage range (VBAT)[1]	–	V_{IT-_POR}	3.60	V
I_{BAT}	Current consumption on VBAT[2][3]	–	–	200	nA
T_{JT+}	Positive-going junction temperature threshold[3]	High threshold (SECUMOD_GPSBR.TSRANGE = 1 or set by OTP)	110	125	°C
		Low threshold (SECUMOD_GPSBR.TSRANGE = 0 or set by OTP)	95	110	°C
T_{JT-}	Negative-going junction temperature threshold[3]	–	-40	-30	°C

Notes:

1. V_{IT-_POR} refers to the negative-going input threshold of the VBAT Power-On Reset (see Table 85.49). Operation of the device backup section, and in particular of this monitor, is granted down to the VBAT Power-On-Reset V_{IT-} threshold.
2. Average current consumption
3. Simulation data

85.10. Power Consumption in Active Mode

Table 85.74 and Table 85.75 report active power consumption data measured on a few SAMA7D6 typical process samples. These data do not provide maximum power consumption specifications.

© 2025 Microchip Technology Inc. and its subsidiaries

85.10.1. Processor Power Consumption in Active Mode

The following table provides the processor power consumption in the following conditions:

- f_{CPU_CLK} = from 400 MHz to 1000 MHz
- f_{MCK1} = 200 MHz
- f_{MCK2} = 133 MHz
- f_{MCK3} = 266 MHz
- f_{MCK4} = 400 MHz
- f_{MCK5} = 200 MHz
- f_{MCK6} = 200 MHz
- $f_{MCK7, MCK8, MCK9}$ = 100 MHz
- L1 caches enabled
- L2 cache enabled
- The Cortex-A7 core executes a CoreMark benchmark from the (internal) SRAM
- Code compiled with speed optimization
- Peripheral clocks disabled
- Current measured according to the following figure

Figure 85.49. Current Measurement on VDDCORE and VDDCPU

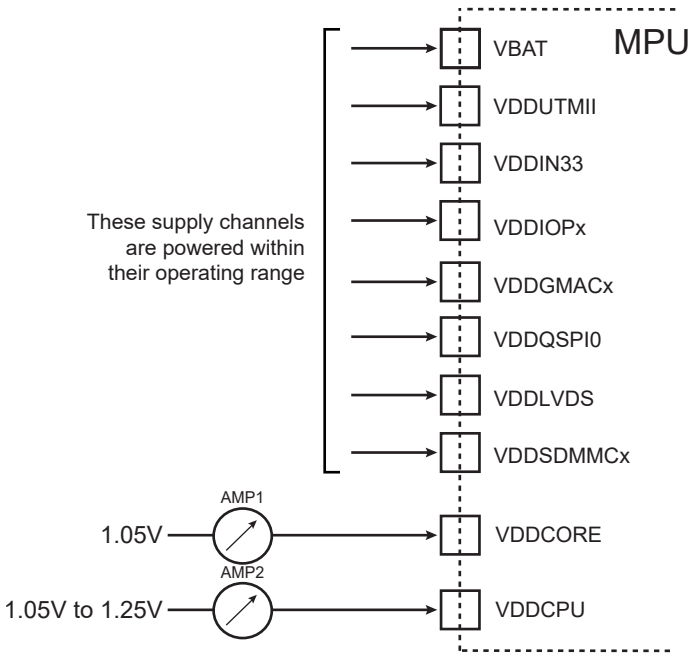

Table 85.74. Processor Current Consumption running a CoreMark Benchmark from SRAM on AMP1+AMP2

f_{CPU} (MHz)	VDDCORE (V)	VDDCPU (V)	Power (mW)	T_J (°C)						
				-40	25	50	70	85	105	125
400	1.05	1.05	$P_{VDDCORE}$	86	90	94	100	109	124	147
			P_{VDDCPU}	60	64	68	76	84	99	120
600	1.05	1.05	$P_{VDDCORE}$	89	94	98	106	114	130	152
			P_{VDDCPU}	85	90	95	102	111	126	147

© 2025 Microchip Technology Inc. and its subsidiaries

Table 85.74. Processor Current Consumption running a CoreMark Benchmark from SRAM on AMP1+AMP2 (continued)

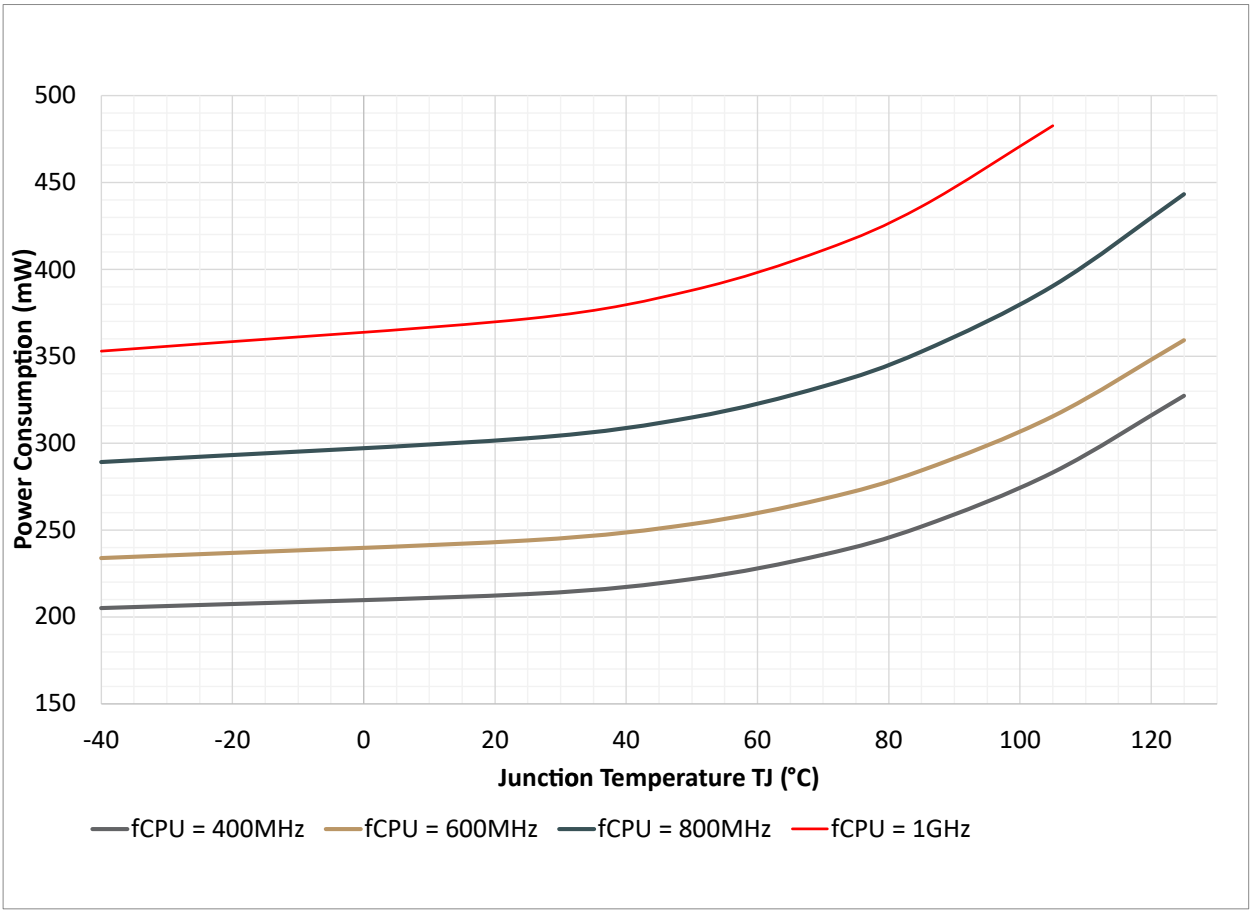
f_{CPU} (MHz)	VDDCORE (V)	VDDCPU (V)	Power (mW)	T_J (°C)						
				-40	25	50	70	85	105	125
800	1.05	1.15	$P_{VDDCORE}$	93	98	103	110	118	135	158
			P_{VDDCPU}	136	145	152	163	174	196	225
1000	1.05	1.25	$P_{VDDCORE}$	92	97	102	110	119	136	160
			P_{VDDCPU}	201	215	226	241	258	287	327

The figure below plots the total power consumption of the device running a CoreMark benchmark versus Temperature. It is based on the following formula :

Power (mW) = P_{VDDCPU} + $P_{VDDCORE}$ + $P_{VDDIN33}$ + $P_{VDDIODDR}$

with P_{VDDCPU} and $P_{VDDCORE}$ as measured in the above table. $P_{VDDIN33}$ contribution is 40 mW, and $P_{VDDIODDR}$ is 20 mW.

Figure 85.50. Typical Device Power Consumption when Running a CoreMark Benchmark



85.10.2. System Power Consumption in Applicative Use Cases

Table 85.76 provides the processor's power consumption under the following conditions:

- f_{CPU_CLK} = 800 MHz
- f_{MCK1} = 200 MHz
- f_{MCK2} = 133 MHz

© 2025 Microchip Technology Inc. and its subsidiaries

- f_{MCK3} = 266 MHz
- f_{MCK4} = 400 MHz
- f_{MCK5} = 200 MHz
- f_{MCK6} = 200 MHz
- $f_{MCK7, MCK8, MCK9}$ = 100 MHz
- I & D caches are enabled.
- The external SDRAM memory is DDR3L.
- Use cases are run on Linux®.
- Current consumptions are measured according to the figure below. Note that the current consumptions of external components (DDR3L, Gigabit Ethernet PHY, etc.) are counted.
- The ambient temperature is 25°C.

Table 85.75. Use Case Definition

Use Case	Description
1	Audio MP3 decoding and playback on I^2S; MP3 file on USB mass storage
2	SAMA7D6 running as iPerf server
3	Running Bonnie++ on USB mass storage
4	SAMA7D6 downloads a file from GMAC0 and copies this file to USB mass storage
5	Test pattern display using mode test (720x1280 DSI panel @ 60 Hz)
6	Linux idle

Main RC Oscillator		✓	✓	✓	✓	✓
Main Clock (MAINCK)	Source (MOSCSEL)	–	–	Main RC osc.	User-defined	User-defined
	Status	–	–	✗	User-defined	✓
Main System Bus Clock (MCK1)	Source (CSS)	–	–	MAINCK	User-defined (MD_SLCK MAINCK, etc.)	User-defined (PLLs, etc.)
	Status	–	–	✗	✓	✓
CPU Clock (CPU_CLK)		–	–	✗	✓	✓
Cortex-A7 State		Not powered	Not powered	Clocks stopped	WFI	WFI
Mode Entry		Use SHDWC to shut down all power supplies except VBAT.	Context saved in SDRAM. SDRAM in Self-refresh. Use SHDWC to shut down all power supplies except VDDIODDR and VBAT.	Context saved in SDRAM. SDRAM in Self-refresh. ULP1 bit	Context saved in SDRAM. SDRAM in Self-refresh. WFI.	WFI
Wake-up	Sources	RTC/RTT alarm. WKUP0, SECUMOD events through WKUP1 and PIOBU[3:0].	RTC/RTT alarm. WKUP0, SECUMOD events through WKUP1 and PIOBU[3:0].	Any PIO line. RTC/RTT alarm. USB resume.	Any unmasked interrupt	Any unmasked interrupt
	Event Sampling Clock	MD_SLCK	MD_SLCK	Asynchronous	User-defined (MD_SLCK, MAINCK division, etc.)	User-defined (MCKx, periph_clk, etc.)
Main System Bus Clock (MCK1) at Wake-up		MAINCK (defaults to Main RC osc.)	MAINCK (defaults to Main RC osc.)	MAINCK (configured to Main RC osc.)	MD_SLCK	User-defined
Wake-up Time (time to fetch first instruction)		-	-	See Table 85.80		

Note:

1. ✓ / ✗ means either powered/un-powered for a power source, on/off for an oscillator, active/inactive for a clock signal, or enter/exit Self-Refresh mode for the external SDRAM.

85.11.1. Backup Mode

85.11.1.1.Operation

Backup mode is designed to serve prolonged power-down periods of the processor. In this mode, only the backup area of the device powered by VBAT is maintained (RTC, GPBR, SHDWC, BSC_CR, SECUMOD, etc.). This mode is entered by shutting down all the power rails of the device except VBAT. It is good practice to use the SHDN output of the Shutdown Controller (SHDWC) for this purpose.

The device exits Backup mode when an active wake-up event is triggered by the SHDWC. Upon this wake-up event, the SHDWC automatically toggles its SHDN output back to VBAT and this signal typically helps to restart all the power supply channels at board level.

The wake-up events to exit Backup mode are:

- PIOBU[3:0]

© 2025 Microchip Technology Inc. and its subsidiaries

- WKUP0 pin
- SECUMOD events
- RTT alarm
- RTC alarm

85.11.1.2.Power Consumption

Backup mode configuration and measurements are defined as follows:

- RTC is running.
- Current measurement is as shown in the following figure.

Figure 85.52. Measurement on VBAT

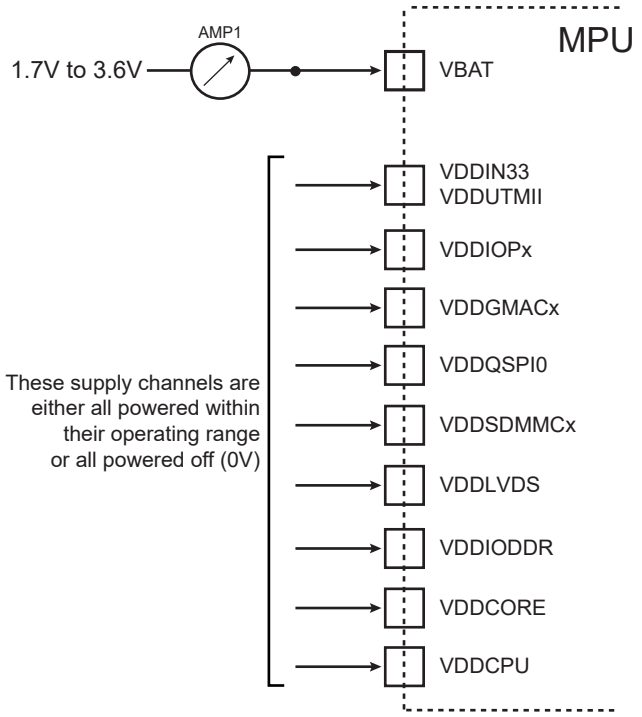

Table 85.78. Current Consumption on VBAT

Symbol	Parameter	Conditions	Min	Max	Unit
I_{VBAT}	Current consumption on VBAT	T_J = 105°C VBAT = 3.6V - Backup mode(1)	–	600	µA
		T_J = 125°C VBAT = 3.6V - Backup mode(1)	–	1	mA
		VBAT = 3.6V - Normal mode(2)(3)	–	5	µA

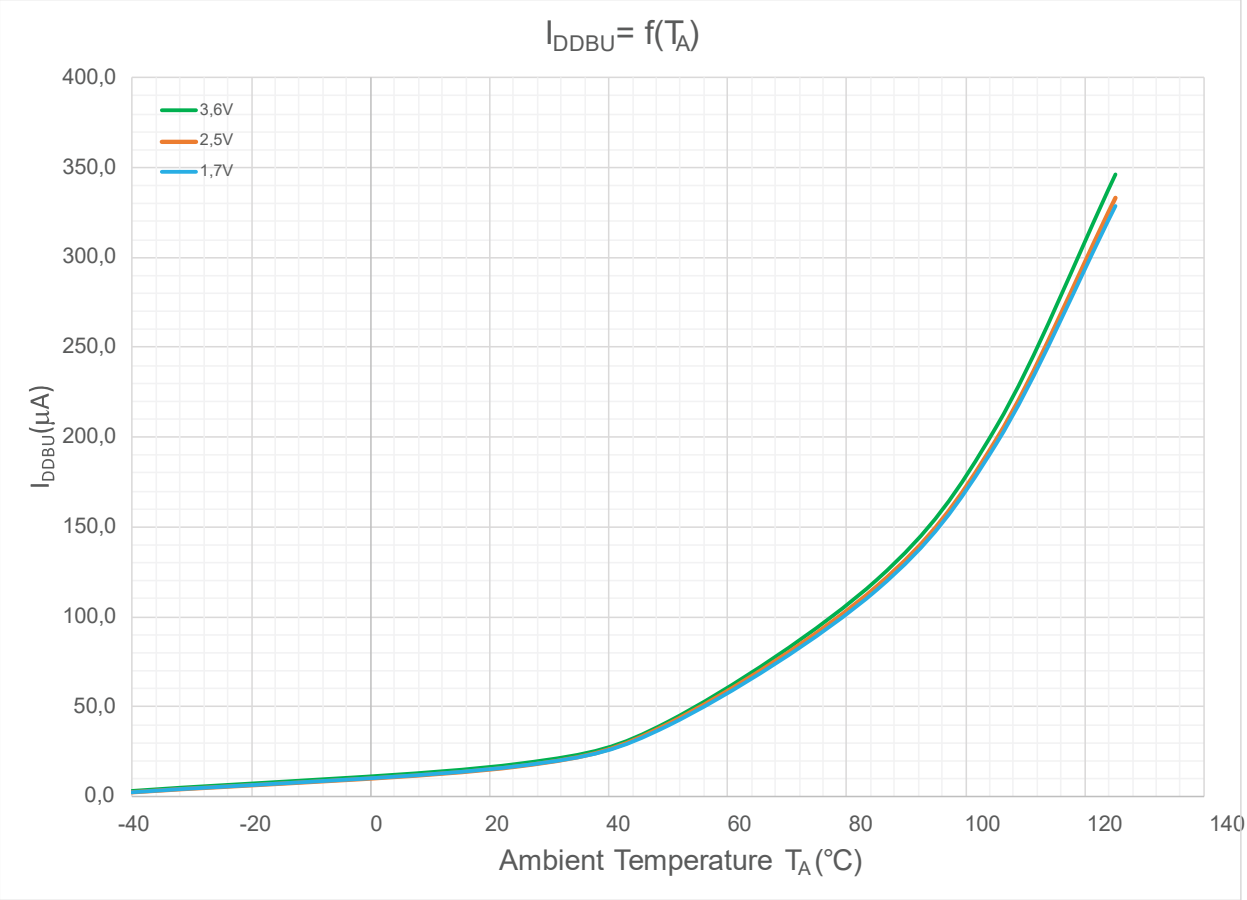
© 2025 Microchip Technology Inc. and its subsidiaries

Notes:

1. When operating the device in Backup mode at a lower junction temperature (70°C, for example), this current consumption specification can be derated using the VBAT current consumption characteristic shown in the following figure.
2. The backup area embeds a VBAT-powered power switch which allows the VBAT section to be powered by VBAT (Backup mode) or by VDDIN33 when available (Normal mode). This power switch is controlled by bits CTRL and SOFTSWITCH in the SFRBU_PSWBU register. Refer to SFRBU_PSWBU in the section Special Function Registers Backup (SFRBU) for more details.
3. Simulation data

The following figure shows the average Backup mode current consumption measured on a few typical devices.

Figure 85.53. Typical Current Consumption in Backup Mode



85.11.2. Backup with SDRAM in Self-Refresh (BSR) Mode

Backup with SDRAM in Self-Refresh (BSR) mode is an extension of Backup mode with the application context saved in the external DDR memory operating in Self-refresh mode, in the perspective to restart the application faster. In this mode, VBAT and VDDIODDR power inputs must be maintained, as well as the DDR component power inputs. It is good practice to use a combination of LPM and SHDN outputs from the Shutdown Controller (SHDWC) to signal the power management circuit to enter this special powering mode. See BSR Mode Entry and Wake-up for detailed waveforms.

The device exits BSR mode when an active wake-up event is triggered by the SHDWC. Upon this wake-up event, the SHDWC automatically toggles its SHDN output back to VBAT and this signal typically helps to restart all the power supply channels at board level. The LPM pin is not

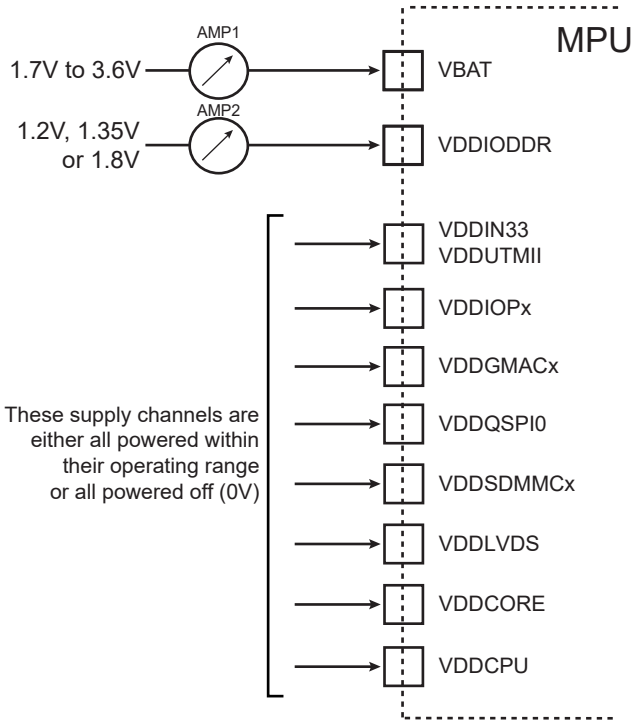
© 2025 Microchip Technology Inc. and its subsidiaries

automatically reset by the SHDWC. It must be reset by software in the early steps of the wake-up process.

The system power consumption in BSR mode is mainly that of the DDR, therefore the type of DDR selected is of prime importance. In a similar way, the selection of the regulator(s) that maintain(s) DDR supplies in BSR mode should optimize efficiency at low current.

85.11.2.1.Power Consumption in BSR Mode

Figure 85.54. Measurement on VBAT and VDDIODDR



Power consumption on AMP1 is provided in section Backup Mode. Only AMP2 measures are relevant in this section. The following table shows the result of average current measurements performed on a few typical devices.

Table 85.79. Typical Current Consumption in BSR Mode on VDDIODDR

VDDIODDR (V)	T_J=-40°C	T_J= 25°C	T_J= 50°C	T_J= 70°C	T_J=85°C	T_J=105°C	T_J=125°C	Unit
1.35V	<1	2	5	15	30	75	140	µA

The following operations, based on procedures described in SDRAM Self-Refresh Mode, must be performed in this order. A code example is provided in the software deliverables.

Entering Backup with SDRAM in Self-Refresh Mode

1. Enter Self-refresh mode with I/O power-down as described in the "Entering Self-Refresh Mode with I/O Power-down" procedure (see SDRAM Self-Refresh Mode).
2. Enter Backup mode:
   - Write a special code (0x12345678, for example) in a backup register to identify the BSR state.
   - Disable SYSC write protection.
   - Clear the SHDWC Control register.
   - Configure the wake-up source.

© 2025 Microchip Technology Inc. and its subsidiaries

- Send Shutdown and LPM Enable commands to the SHDWC Control register.

Note: After wake-up, the device performs a system reset.

3. Re-initialize SDRAM and exit Self-refresh mode: refer to High-Level SDRAM Initialization Procedure in the section Universal DDR Memory Controller (UDDRC).

85.11.2.2.SDRAM Self-Refresh Mode

SDRAM devices require paced refreshes to maintain data consistency. These refreshes are paced by the DDR_CLK signal. To reduce system frequency or disable DDR_CLK, the SDRAM device must be put in Self-refresh mode.

Self-refresh deactivates the SDRAM clock and automatically executes a refresh operation using the SDRAM device internal refresh counter. Self-refresh mode is effective when the device is not accessed for a long time and the data must be kept for a future use (for context saving or peripheral configurations to recover current system state for example).

As the SDRAM device is not accessed, SDRAM I/Os are configured in Retention state:

- DDR_CLK tied to 0
- DDR_CLKN tied to 0
- DDR_CSN tied to 1

This is the case in some SAMA7D6 low-power modes such as Backup Self-refresh and ULP1. These modes use the following routines. Code example is provided in software deliverables.

Entering SDRAM Self-Refresh Mode

1. Save the first eight 32-bit SDRAM words in the backup SRAM.
2. Save the calibration result in the backup SRAM.
3. Set the static values for DDR_CLK and DDR_CLKN to 0,0 when the pair is disabled.
4. Perform a Data Synchronization Barrier (DSB).
5. Disable all UDDRC ports.
   - Wait for port disable to complete.
6. Move system to Self-refresh state.
   - Wait until Self-refresh is entered.
7. Put the DDR3PHY DLLs in Bypass mode.
8. Disable MCK2.
9. Power down the DDR3PHY data receivers.
10. Power down the Address Control, Clock, Chip Select and ODT pin output drivers.

Entering Self-Refresh Mode with I/O Power-down

1. Save the first eight 32-bit SDRAM words in the backup SRAM.
2. Save the calibration result in the backup SRAM.
3. Set the static values for DDR_CLK and DDR_CLKN to 0,0 when the pair is disabled.
4. Perform a Data Synchronization Barrier (DSB).
5. Disable all UDDRC ports.
   - Wait for port disable to complete.
6. Move system to Self-refresh state.
   - Wait until Self-refresh is entered.
7. Power down the DDR3PHY data receivers.
8. Power down the Clock and Chip Select pin output drivers.

© 2025 Microchip Technology Inc. and its subsidiaries

9. Power down the Address Control and ODT pin output drivers.
10. Set the SDRAM I/Os to Retention state by setting SFRBU_DDRPWR.RETENTION.

Exiting SDRAM Self-Refresh Mode

1. Power down the CK and CS pin output drivers.
2. Power down the ODT[3:0] pin I/Os output drivers in the UDDRC DFI Low Power Configuration register 0 (UDDRC_DFILPCFG0).
3. Power down the data input receiver I/Os.
4. Enable MCK2.
5. Move the DDR3PHY DLLs out of Bypass mode.
6. In the UDDRC Software Register Programming Control Enable (UDDRC_SWCTL) register, enable quasi-dynamic register programming.
7. Clear the UDDRC_DFIMISC.DFI_INIT_COMPLETE_EN bit.
8. Set UDDRC_SWCTL.SW_DONE to indicate that UDDRC programming is completed.
   - Poll the UDDRC_SWSTAT.SW_DONE_ACK bit until it changes to 1, acknowledging that programming is complete.
9. Perform a DDR3PHY DLL soft reset , and DLL Lock and ITM soft reset commands.
   - Wait for completion.
10. In the UDDRC_SWCTL register, enable quasi-dynamic register programming.
11. Set the DDRC_DFIMISC.DFI_INIT_COMPLETE_EN bit.
12. Set UDDRC_SWCTL.SW_DONE to indicate that UDDRC programming is completed.
    - Poll the UDDRC_SWSTAT.SW_DONE_ACK bit until it changes to 1, acknowledging that programming is complete.
13. Trigger self-refresh exit.
    - Wait until Self-refresh state is exited.
14. Enable the five AXI ports with the UDDRC_PCTRL_x.PORT_EN bits.
15. Recover the first eight 32-bit SDRAM words from the backup SRAM.
16. Recover the calibration result from the backup SRAM.

85.11.3. Ultra Low-Power (ULP0, ULP1) and Idle Modes

85.11.3.1. ULP0, ULP1 and Idle Modes

In ULP0, ULP1 and Idle low-power modes, all device power supplies are applied within their operating range. The power reduction is achieved by reducing the frequency or stopping the clock signals of the processor and/or its peripherals.

In Idle mode, only the processor clock is stopped and all peripherals continue to operate at the same frequency. When exiting this mode, the processor operates back to full speed. Typically, a few processor clock cycles are needed to enter and exit this mode. In a Linux environment, this corresponds to Suspend-to-Idle.

In ULP0 mode, the processor is stopped and its peripherals operate at a very low frequency (from a few kHz to a few MHz). At wake-up from this mode, the processor restarts at this very low frequency. Power consumption can be optimized by reducing the frequency at the expense of a longer wake-up time. In this mode, the processor is placed in Wait-For-Interrupt (WFI) state, therefore any interrupt source can trigger a return to normal operation.

In ULP1 mode, the processor clock and the peripheral clocks are stopped. Prior to entering this mode and to stop the clocks, the source of every clock is switched to the Main RC oscillator running at a typical 12 MHz. The Power Management Controller (PMC) then stops this oscillator at ULP1

© 2025 Microchip Technology Inc. and its subsidiaries

entry. Upon a wake-up event, the PMC automatically restarts this oscillator, thus clocking back the device to 12 MHz. Unlike ULP0, only the few events listed below can wake up the device. This mode achieves both a very low current consumption and a fast wake-up time of a few microseconds.

A detailed description of each mode is provided in the following sections and is followed by a power consumption section dedicated to the modes.

85.11.3.1.1.Idle Mode Operation

In Idle mode, the device power consumption is optimized versus response time. In this mode, only the processor clock is stopped. The peripheral clocks, including the DDR controller clock, can be enabled. The current consumption in this mode is application-dependent.

This mode is entered via the WFI instruction and CPU_CLK disabling.

The processor can be awakened from an interrupt. The system resumes where it was before entering WFI mode.

85.11.3.1.2.ULP0 Mode Operation

ULP0 mode maintains very low frequency clocks (MCK1, CPU_CLK) in the system to wake up on any interrupt. Selection of the clock frequency depends on the current consumption target versus the required wake-up time. The higher the frequency, the higher the power consumption and the faster the wake-up time.

The sequence to enter ULP0 mode is detailed below. The code used to enter this mode must be executed out of the internal SRAM. Steps 1 to 6 are meant to bypass the DDR delay lines so as to avoid their power consumption.

Entering ULP0 Mode

1. Enter SDRAM Self-refresh mode (if used).
2. Turn on DDR PLL (if DDR was not used).
3. Reset the DDR Controller using RSTC_GRSTR.
4. Wait until the status bit is asserted.
5. Program the lane and control delay lines bypass using the DDLDIS bit in DDR3PHY_ACDLLCR, DDR3PHY_DX0DLLCR and DDR3PHY_DX1DLLCR registers.
6. Turn off DDRPLL in PMC.
7. Set the interrupts to wake up the system.
8. Disable all peripheral clocks.
9. Set the I/Os to an appropriate state and suspend the USB transceivers.
10. Switch the system clock to MD_SLCK.
11. Disable the PLLs, the Main Crystal Oscillator and the Main RC Oscillator.
12. Enter the Wait for Interrupt (WFI) mode.

Exiting ULP0 Mode

Wake-up from ULP0 mode is triggered by any enabled interrupt. When resuming, the software reconfigures the system (oscillator, PLL, etc.) to the same state as before WFI. The Analog LDO must be set back to normal mode.

85.11.3.1.3.ULP1 Mode Operation

In ULP1 mode, all device power supplies are applied within their operating range. Power reduction is achieved by stopping the clock signals of the processor and/or its peripherals. The device is able to resume on wake-up events.

The following operations, based on procedures described in SDRAM Self-Refresh Mode, must be performed in this order. Code example is provided in software deliverables.

Entering ULP1 Mode

© 2025 Microchip Technology Inc. and its subsidiaries

In ULP1 mode (unlike ULP0 mode) all clocks are off and the number of wake-up sources is limited to:

- Any PIO line configured as a wake source in PMC_WCR
- RTC alarm, RTT alarm
- USB Resume from Suspend mode

To enter ULP1 mode:

1. Enter SDRAM Self-refresh mode.
2. Clear all pending events.
3. Configure the wake-up source. RTT example:
   - Disable the interrupt for RTT.
   - Enable the RTT wake-up in the PMC Fast Start-Up Mode register (PMC_FSMR).
   - Set the RTT Alarm register (RTT_AR) to approximately 1 minute.
   - Perform an RTT Restart and enable the alarm interrupt.
4. Suspend USB ports 0, 1 and 2.
5. Disable all GCLK peripheral clocks.
6. Disable PMC protection.
7. Switch MCK0 to MAINCK.
8. Set MDIV to 1 for MCK0.
9. Switch the MCK source to MAINCK for all MCKs (1 to 9).
10. Set MDIV to 1 for all MCKs (1 to 9).
11. Turn off all eight PLLs.
12. Turn on the Main RC.
13. Switch MAINCK to Main RC.
14. Turn off the Main Crystal Oscillator.
15. Disable SYSC and SHDW write protections.
16. Configure the expected event (RTT alarm, for example).
17. Set the CKGR_MOR.ULP1 bit in the PMC (all peripheral clocks are disabled).

The system is now in ULP1 mode, waiting for the programmed event (such as RTT alarm).

Exiting ULP1 Mode

When the event occurs, recover pre-ULP1 state as follows:

1. Start up the Main Crystal Oscillator.
2. Switch MAINCK to Main Crystal Oscillator.
3. Switch MCK0 to MAINCK.
4. Set MDIV to 1 for MCK0.
5. Start up CPUPLL.
6. Switch MCK0 to CPUPLL with MDIV set to 3.
7. Start up SYSPLL (400 MHz).
8. Switch MCK1 to SYSPLL with MDIV set to 2.
9. Switch MCK4 to SYSPLL with MDIV set to 1.
10. Start up DDRPLL (533 MHz).
11. Set Analog LDO out of Low-power mode.

© 2025 Microchip Technology Inc. and its subsidiaries

12. Re-initialize SDRAM and exit Self-refresh mode.
13. Recover data from SDRAM.

85.11.3.2. Power Consumption in Idle and Ultra Low-Power Modes

- Table 85.80, Figure 85.56 and Figure 85.57 provide the SAMA7D6 average power consumption in Idle, ULP0 and ULP1 modes versus temperature measured on a few typical devices. They do not provide maximum power consumption specifications.
- All power supply inputs are powered within their operating range and in particular VDDCORE = 1.05V, VDDCPU = 1.05V.
- There is no consumption on the device I/Os. To reach the best possible power consumption figures, it is important to set each I/O of the device to an appropriate state (pull-up/pull-down, etc.) with respect to the external components connected to these I/Os.
- In ULP1, the embedded memories are automatically switched to Deep Sleep mode (default operation, see Embedded Memories Low-Power Management). In ULP0, this is not the case.
- USB transceivers are disabled.
- All peripheral clocks are disabled.
- Current measurement is as shown in the following figure.

Figure 85.55. Current Measurement in ULP0, ULP1 and Idle Modes

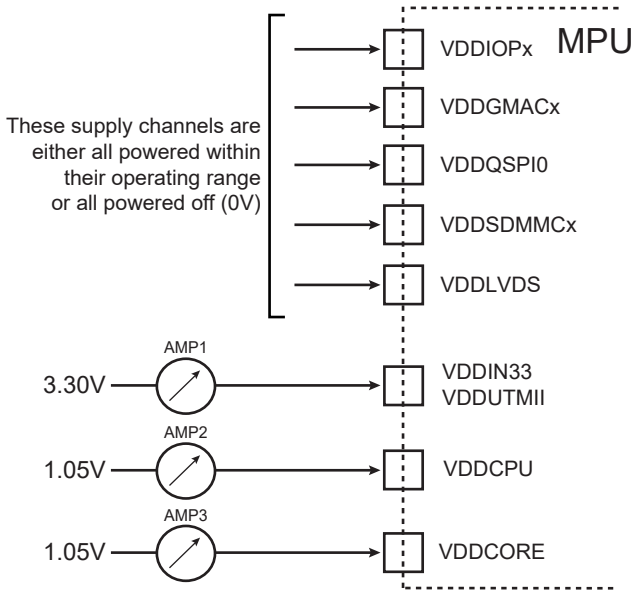


Table 85.80. Typical Power Consumptions and Wake-Up Times in Idle, ULP0, ULP1 Modes

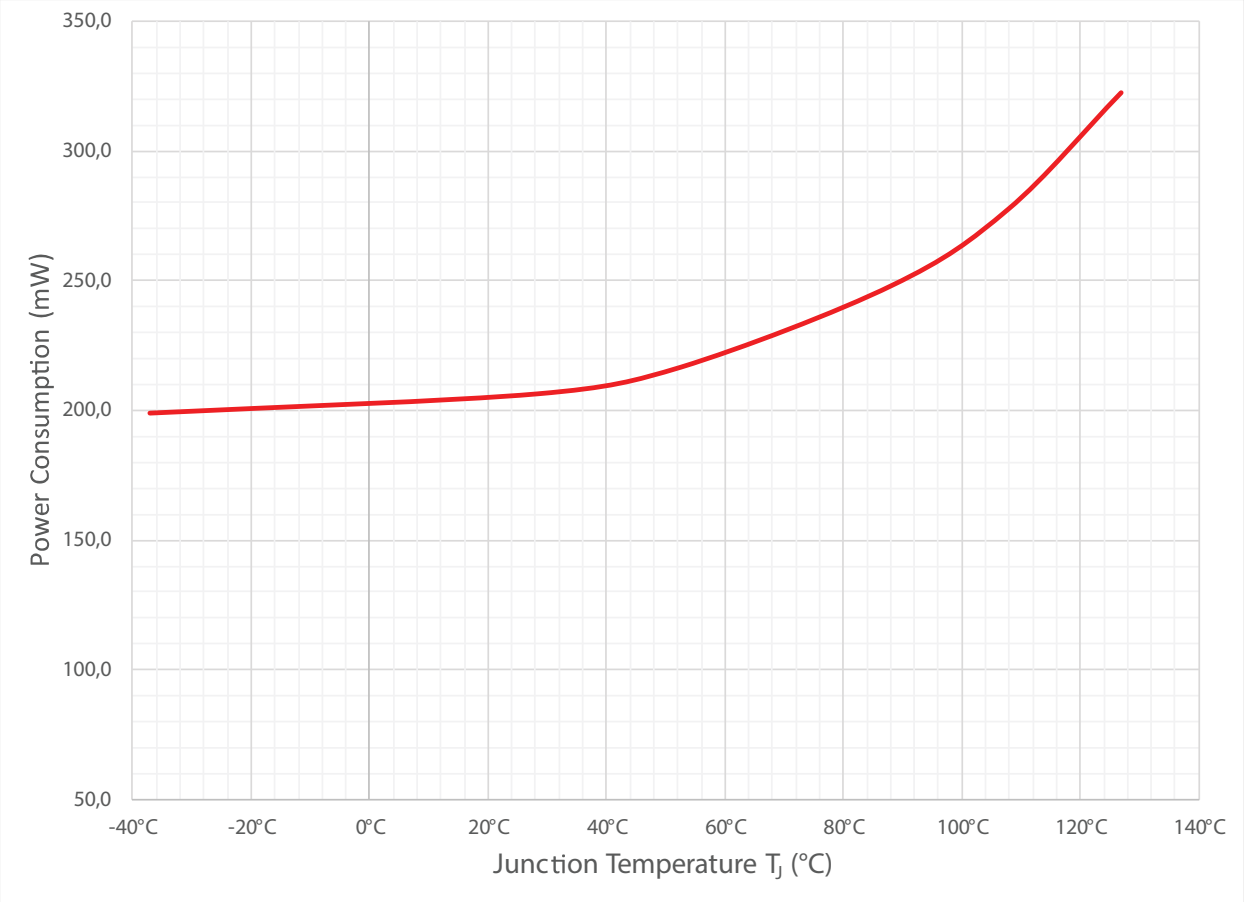
Low-Power Mode	P_{CORE}/P_{CPU} (mW)												
	T_J=-40°C		T_J= 25°C		T_J=50°C		T_J=85°C		T_J=105°C		T_J=125°C		Wake-Up Time (µs)
Idle@200 MHz	128.6	29.7	133.1	34.2	137.9	39.9	152.6	56.4	165.7	72.7	186.9	96.0	10 x t_{CPU_CLK}
ULP1	0.3	0.2	3.0	2.4	7.1	5.5	20.3	15.4	34.9	25.9	56.4	40.8	15
ULP0@12 MHz	2.9	0.8	5.9	4.4	10.3	9.6	25.0	25.6	41.3	42.4	65.2	66.4	15
ULP0@32 kHz	2.3	0.4	5.3	4.0	9.7	9.2	24.5	25.3	40.7	42.1	64.9	66.4	5600

The figures below plot the power consumption of the device in ULP0, ULP1 and Idle modes. They show the current consumption in VDDCPU, VDDCORE and VDDIN33:

© 2025 Microchip Technology Inc. and its subsidiaries

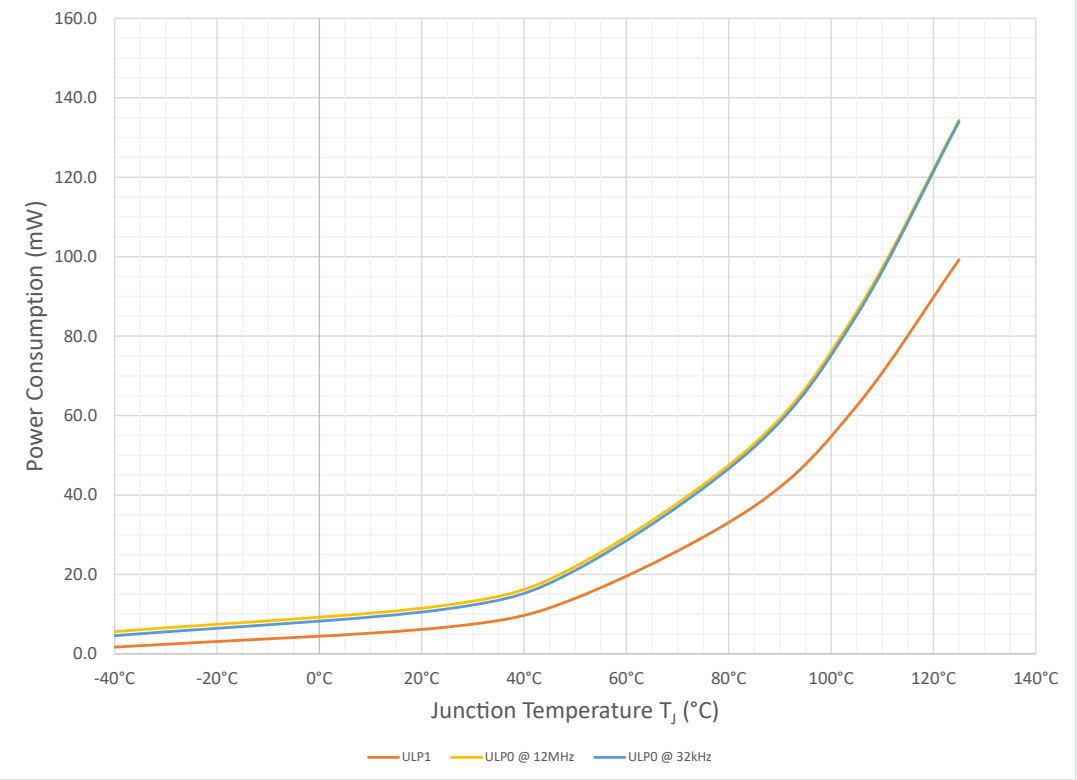
Power (mW) = I_{DDCPU} x 1.05V + I_{DDCORE} x 1.05V + P_{IN33} with I_{DDCPU} and I_{DDCORE} as measured in the above table. P_{IN33} contribution is 2.2 mW in ULP0 and ULP1 modes and 40 mW in Idle mode (application-dependent).

Figure 85.56. Typical Power Consumption in Idle Mode vs. Junction Temperature



© 2025 Microchip Technology Inc. and its subsidiaries

Figure 85.57. Typical Power Consumption in ULP0 and ULP1 Modes vs. Junction Temperature



The following table provides the specifications for ULP1 mode current consumption on VDDCORE, VDDCPU and VDDIN33.

Table 85.81. Power Consumption in ULP1 Mode

Symbol	Parameter	Conditions	Min	Max	Unit
P_{CORE_CPU}	Power consumption on VDDCORE and VDDCPU	VDDCORE = 1.05V VDDCPU = 1.05V T_J = 105°C	–	120	mW
		VDDCORE = 1.05V VDDCPU = 1.05V T_J = 125°C	–	194	mW
P_{IN33}	Power consumption on VDDIN33	VDDIN33 = 3.3V	–	2.2	mW

85.11.4. Embedded Memories Low-Power Management

85.11.4.1.Introduction

To optimize the device power consumption in Low-Power modes ULP0 and ULP1, the embedded memories of the following peripherals can be switched to a Low-Power state:

- I3CC
- DSI

© 2025 Microchip Technology Inc. and its subsidiaries

- EHCI
- UDPHSB
- UDPHSA
- SDMMC2
- SDMMC1
- SDMMC0
- LCDC
- GMAC1
- GMAC0
- GPU2DC
- UDDRC
- ASRC
- NFC

The embedded Low-Power state is controlled independently for each peripheral by enabling/disabling the associated peripheral clock. The same behavior applies when the system switches to ULP1. The Special Function Registers SFR_MEMPOWER, SFR_CLEAR_ONLY_SD_CFG and SFR_DISABLE_SD_CFG define the automatic switching policy.

Four memory power states are supported:

- Normal
- Light Sleep
- Deep Sleep
- Shutdown

These four states allow a tradeoff between data retention, power consumption and wake-up delay. See the following table.

Table 85.82. Memory Power States Characteristics

Memory Power State	Data Retention	Power Consumption	Wake-Up Delay
Normal (Running)	Yes	–	N/A
Light Sleep	Yes	+	+++
Deep Sleep	Yes	++	++
Shutdown	No	+++	+

The control of the memories Low-Power states offers the following options:

- The Low-Power state entry can be totally disabled for all memories.
- The Low-Power state entry and exit can be automatically performed when a peripheral clock is enabled or disabled, or when a Low-Power mode is entered or exited.
- The Low-Power state level (Light Sleep, Deep Sleep or Shutdown) can be configured.

85.11.4.2.Operations

85.11.4.2.1.Memory Automatic Low-Power Control in Active State

Two SFR registers are available to configure the behavior of the automatic memory power state switch:

- **SFR_DISABLE_SD_CFG**: enables/disables the automatic power state control for each peripheral. When disabled, the memory remains in its Normal state regardless of the peripheral clock status (on or off). Enabled by default at reset.

© 2025 Microchip Technology Inc. and its subsidiaries

- **SFR_CLEAR_ONLY_SD_CFG**: for each peripheral, use this register to choose between the following low-power memory policies:
  - The memory Low-Power state is always controlled by the peripheral clock status (default behavior at reset).
  - The memory remains in the Normal state after the first peripheral clock activation.

For all peripherals, SFR_DISABLE_SD_CFG has priority over SFR_CLEAR_ONLY_SD_CFG. If SFR_DISABLE_SD_CFG=1, the memory remains in Normal state, whatever the value of SFR_CLEAR_ONLY_SD_CFG or the peripheral clock status (on or off). See the following table.

Table 85.83. Peripheral Configuration Summary

		SFR_CLEAR_ONLY_SD_CFGx	
		0	1
SFR_DISABLE_SD_CFG	**0**	Memories in Normal state when peripheral clock enabled Memories shut down when peripheral clock disabled	Memories remain in Normal state after first peripheral clock enable
	1	Memories always ON	

In Active state, when a peripheral is clock gated, its embedded memories enter Shutdown state.

85.11.4.2.2.Memory Automatic Low-Power Control in ULP1 Low-Power State

The SFR_MEMPOWER register is used to configure the embedded memories policy when switching to ULP1 Low-Power state. The POWG_DIS field (default reset value=1) activates automatic switching to memory Low-Power state.

When enabled (POWG_DIS=0), the DEEPSLEEP field is available to select the Light Sleep or Deep Sleep Low-Power state, so that the best tradeoff can be found between power consumption and wake-up time.

Revision History

88. Revision History

88.1. Rev. E - 10/2025

Section	Changes
General	Added content related to the SAMA7D65(T)-V/7EW(-SLx) device
Debug and Test	JTAG Debug Port (JTAG-DP), Serial Wire Debug Port (SW-DP): updated VERSION and DESIGNER descriptions
Boot Strategies	Updated Description, Secure Boot Configuration Packet
Static Memory Controller (SMC)	HSMC_SETUPx, HSMC_PULSEx: corrected register access to “Read/Write”
DDR/LPDDR Physical Interface (DDR3PHY)	Updated DDR3PHY_MRx register names
Real-Time Clock (RTC)	Updated UTC Mode RTC_MR: updated the UTC and HRMODE descriptions RTC_TIMALR (DEFAULT_MODE): updated the AMPM bit description
Advanced Encryption Standard (AES)	Updated Start Modes, Encrypted Tweak Generation, Data Processing XEX-based Tweaked-codebook Mode (XTS): updated auto-padding information
Flexible Serial Communication Controller (FLEXCOM)	Modified content regarding multiple data reading in SPI Multiple Data Access, FLEX_SPI_RDR (FIFO_MULTI_DATA_8), FLEX_SPI_RDR (FIFO_MULTI_DATA_16) FLEX_SPI_RDR (FIFO_MULTI_DATA_8), FLEX_SPI_RDR (FIFO_MULTI_DATA_16), FLEX_SPI_TDR (FIFO_MULTI_DATA): “FIFO” removed from register name (but kept in register acronym)
Secure Digital MultiMedia Card Controller (SDMMC)	SDMMC_CALCR: updated CLKDIV description SDMMC SDMA System Address/Argument 2 Register split into SDMMC_SSAR (DEFAULT_MODE) and SDMMC_SSAR (CMD23)
Electrical Characteristics	Table 85.4: updated VDDCPU conditions Table 85.6: updated f_{CPU_CLK} conditions Table 85.76: updated Use Case 6 values Reworked Flexible Serial Communication Controller (FLEXCOM) - USART

88.2. Rev. D - 05/2025

Section	Changes
General	Added content related to Extended Industrial and Automotive devices SAMA7D65(T)-E/4HB(-SLx)(VAO)
Cortex-A7 Processor (Arm)	Updated Reference Documents Renamed and reworked section System Counter and Generic Timer
System Interconnect and Security (SIS)	Updated AHB, Table 14.1, Table 14.10
Debug and Test	Updated Figure 17.1
External Interrupt Controller (EIC)	EIC_SCFGxR: updated reset value
Boot Strategies	Reworked NVM Boot Sequence, Booting with OTP Emulation Mode, SAM-BA Monitor Serial Connection Updated Using a Boot Configuration Packet, Boot Configuration Packet, Software Considerations, Device Specific Data for User Application

Microchip Devices Code Protection Feature

Note the following details of the code protection feature on Microchip products:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
- Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip products are strictly prohibited and may violate the Digital Millennium Copyright Act.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is “unbreakable”. Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.
