

Complete and reliable solar fusible circuit protection

Powering Business Worldwide

Eaton has more than 100 years of proven technical innovation to help make your operation more productive while protecting your equipment.

Solar Photovoltaic (PV) systems have evolved into a mature, sustainable and adaptive technology. The growth in installations and demand for PV systems necessitate effective electrical protection. PV systems, as with all electrical power systems, must have appropriate overcurrent and overvoltage protection.

Eaton has worked closely with solar system manufacturers, and through coordinated research and development, has produced revolutionary photovoltaic fuse links which work in combination with solar array combiner systems to offer a complete protection for PV applications.

Eaton's Bussmann series solar technology solution

1
PVM, 10 x 38, 10 x 85,
14 x 51, 14 x 65, 22 x 65 mm
photovoltaic fuse links.
Rated voltage: from 600 V d.c.
to 1500 V d.c.

1
CHPV fuse holder,
Rated voltage:
up to 1500 V d.c.

1
BM series
fuse block

2 3
PV Flush end fuse
links. Rated voltage:
1000 V d.c.

2
NH Style
photovoltaic fuse
links and fuse holders.
Rated voltage: 1000 V d.c.

2
XL Style
photovoltaic fuse
links and fuse bases.
Rated voltage: 1000 and
1500 V d.c.

3
Square body,
BS and UL High
speed fuse links.
Rated voltage: Up to
4000 V d.c.

4
NH Low voltage
fuse links and fuse
holders. Rated voltage:
400, 500 and 690 V a.c.

String protection

Introduction

The global transition from fossil fuels to renewable sources is well under way. Photovoltaic (PV) have proven to offer an environmentally sustainable solution to our ever increasing energy demands while also being cost competitive. This has led to the increase of installed capacity of PV systems from 574 GW in 2019 growing to 1064 GW expected by 2023. This rapid growth size and output capacity of these installations has challenged system designers, manufacturers and standards organisations due to the specific demands associated with PV installation in terms of current, voltage, and ambient temperature. These requirements have also been considered in the development of international protection standards for PV installations, which Eaton, the leading name in electrical protection, has used to develop PV specific protection devices.

Global annual photovoltaic installations (Megawatt). Source: EPIA

IEC 60269-6 gPV standard

Unlike typical grid connected AC systems, the available short-circuit current within PV systems is limited and the overcurrent protective devices need to operate effectively on low levels of fault current. For this reason Eaton has conducted extensive research and development of fuse links that are specifically designed and tested to safely protect PV systems with high DC voltages and low fault currents.

The International Electrotechnical Commissions (IEC) recognise the protection of PV systems is different to standard electrical installations. This is reflected in IEC 60269-6 which defines specific characteristics that a fuse link is required to meet for protecting PV systems, utilisation class gPV. Eaton's Bussmann series string and branch PV fuse links have been specifically designed to meet this standard. However, Eaton's Bussmann series PV fuse links exceed the requirements of IEC 60269-6 as they operate at $1.35 \times I_n$ (1.35 times the nominal current). They also meet the requirements of UL 2579 and are thus suitable for protecting PV modules in reverse current situations.

Whilst the standard does not recognise a specific symbol, the combination of the symbols for fuse link and strings are often used to indicate a fuse link is suitable for protecting strings in PV systems, see Figure 1.

Figure 1

Photovoltaic module construction

- A photovoltaic (PV) cell is usually between 4" and 6" square.
- A number of individual cells are combined in a module (often called a panel).
- A number of PV modules in series is referred to as a string.
- A number of strings in parallel is referred to as an array.

Figure 2

Photovoltaic module output

The voltage output of a PV module is defined by the number of cells in series that form the module.

The current output of a PV module is dependent on the area of a cell.

The most widely used solar modules are made with 4", 5" and 6" poly-crystalline silicon cells. This type of module using 6" cells, can achieve approximately 8 Amps maximum power point (MPP) current per module with a typical voltage output of around 30 Volts.

With thin film technology typical output is 2.5 Amps and 40 Volts.

The maximum power point current of the modules vary between manufacturers of equal solar cell dimensions. When selecting the appropriate fuse links, the specified Short Circuit Current (I_{SC}) and reverse current characteristics specified by the manufacturers should be used.

The specifications provided by the module manufacturer should be consulted to confirm the output currents and voltages of the modules under the range of conditions expected for the proposed installation. These conditions are influenced by the ambient temperature, the incident angle of sunlight and the amount of solar energy reaching the module. These are usually mentioned as coefficients on the manufacturer's specifications.

Manufacturers also suggest the maximum series fuse rating or a reverse current rating. Both of these are based on modules surviving 1.35 times this rating for two hours.

Overview of string protection

Depending on the desired capacity of the Photovoltaic (PV) system, there may be several PV strings connected in parallel to achieve higher currents and subsequently more power.

PV systems that have three or more strings connected in parallel need to have each string protected. Systems that have less than three strings will not generate enough current to damage the modules in the event of a fault. Therefore they do not present a safety hazard, provided the conductor is sized correctly, based on local codes and installations requirements.

Where three or more strings are connected in parallel, a fuse link in each string will protect the cables and modules from overcurrent faults and help minimise any safety hazards. It will also isolate the faulted string so that the rest of the PV system can continue to generate electricity.

It should be remembered that PV modules current output changes with the module temperature as well as the amount of sun they are exposed to. The exposure is dependant on irradiance level, incline as well as shading effect from trees, buildings or clouds. In operation, fuse links, as thermal devices, are influenced by ambient temperature. The current capability of Eaton's Bussmann series PV string fuse links should be derated according to the curves below.

PVM, 10 x 38, 10 x 85, 14 x 51, 14 x 65, 22 x 65 mm photovoltaic fuse links.
Rated voltage: from 600 V d.c. to 1500 V d.c.

CHPV fuse holder, Rated voltage: up to 1500 V d.c.

BM series fuse block

String protection

How to select fuse links for string protection

Whilst a full study of all the parameters is recommended, the following factors should be used: 1.56 for current and 1.2 for voltage when selecting the fuse link. These cover most variations due to installation. The same method should be adopted for crystalline and thin film modules.

If your PV installation is subject to extremes of high altitude, high irradiance, or low temperature, please consult Eaton's Field Application Engineers: bulehighspeedtechnical@eaton.com.

Define the specifications of the PV module

Criteria

I_{sc} : Short-circuit current of the module at Standard Test Conditions (STC) - Data provided by the PV Manufacturer

V_{oc} : Open circuit voltage of one module at STC - Data provided by the PV Manufacturer

N_s : Number of modules in series per string

N_p : Number of strings in parallel per array

$I_{mod_max_OCPR}$: The PV module maximum overcurrent protection rating specified by IEC 61730-2 (this is often specified by module manufacturers as the maximum series fuse rating)

If $N_p \leq 3$ and the cable is rated at $1.56 \times I_{sc}$

For PV installations with three or less parallel strings and string cables adequately sized, fusing might be needed if local installation regulations or codes require them.

However Eaton recommends fuse links protection in all PV systems as unpredicted fault currents may occur in the event of inverter failure where batteries are connected to the strings.

If $N_p > 3$

The fuse link's rating should be selected as follows:

- Voltage rating $\geq 1.20 \times V_{oc} \times N_s$
- Current rating $\geq 1.56 \times I_{sc}$
- Check the current carrying capability of the selected fuse after derating at the ambient temperature of the fuse still satisfies the above criteria
- Current rating $\leq I_{mod_max_OCPR}$
- Current rating $\leq I_z$ = string cable rating

For PV application with fuse links installed at high altitudes, there is reduced cooling effect on the fuse as the density of the atmosphere reduces. For above 2000 metre sea level, every 100 metre increase will have 0.5% de-rate on the fuse current. Please consult Eaton's Fuse Application Engineers for further information: bulehighspeedtechnical@eaton.com

Cable protection

Fuse links are required to protect cables and PV modules to prevent fires and ensure the fuse could open a fault circuit safely during an overcurrent fault.

For $N_p \leq 3$, a fuse might not be required as stated above, but cable should be rated at $1.56 \times I_{sc}$ or higher.

For $N_p > 3$, a fuse is needed to protect both the PV modules and the cables. The cable should be rated big enough to carry the load current. If cable rating is too small, there is a risk of nuisance tripping. Also it is important to ensure the fuse link current rating $<$ string cable rating for fuse to protect the cables.

String protection — worked example

Once it has been determined that the maximum short-circuit current exceeds the cable's continuous current rating, the recommendations for selecting the correct PV string fuse link are as follows:

Manufacturer's PV Module specifications

PV Module description

- Maximum system voltage: 1000 V d.c.

Electrical data

- Open circuit voltage (V_{oc}): 43.1 V
- Short-circuit current (I_{sc}): 5.37 A
- Maximum series fuse rating: ($I_{mod_max_OCPR}$): 15 A

PV Installation set-up

- 18 modules in series per string ($N_s = 18$)
- Maximum 60°C module
- Minimum -30°C module
- Maximum 45°C ambient fuse link
- 4 strings in parallel ($N_p = 4$)
- Cable size: 2.5 mm² ≥ cable rating $I_z = 11.5$ A at 60°C (manufacturer's data)

Calculation

- Cable rating ≥ $1.56 \times I_{sc} = 1.56 \times 5.37 = 8.38$ A. Selected cable $I_z = 11.5$ A → The selected cable is suitable

- String max short-circuit current $I_{sc_string} = (N_p - 1) \times 1.25^* \times I_{sc}$
 $= (4 - 1) \times 1.25^* \times 5.37$
 $= 20.1$ A

I_{sc_string} (20.1 A > I_z (11.5 A), therefore string fuse links are needed.

* NEC states the maximum circuit current for PV circuit is defined as 1.25 multiplied by PV model rated short-circuit current I_{sc} or the sum of parallel PV module rated short-circuit.

- Minimum fuse current rating $I_n \geq 1.56 \times I_{sc}$
 $= 1.56 \times 5.37 = 8.38$ A

- Maximum fuse current rating $I_n \leq I_{mod_max_OCPR} = 15$ A

$$I_n \leq I_z \text{ cable rating} = 11.5 \text{ A}$$

- Minimum fuse voltage rating $U_n \geq 1.2 \times V_{oc} \times N_s$
 $= 1.2 \times 43.1 \times 18 = 931$ V

The selected fuse link needs to be rated at 10 A and 1000 V d.c.

Eaton's Bussmann series catalogue is PV-10A10F

The selected fuse link has current carrying capability of 9.3 A at 45°C ambient temperature, which is greater than the minimum fuse current rating (8.38 A). Therefore the fuse link selected will protect the cables and the modules against reverse current faults.

Overview of array protection

Depending on the desired capacity of the Photovoltaic (PV) system, there may be several PV strings connected in parallel to achieve higher currents and subsequently more power.

A fuse link on each array will protect the cables from fault current and help minimise any safety hazards. It will also isolate the faulted array so that the rest of the PV system can continue to generate electricity.

A fuse link positioned in the cable that carries the combined output of a number of strings should be protected by array fuse links. If a number of arrays are subsequently combined then a further fuse link should be incorporated.

It should be remembered that the characteristics of PV modules vary with module temperature as well as irradiance level. In operation fuse links are influenced by ambient temperature.

How to select fuse links for array protection

Whilst a full study of all the parameters is recommended, in general the following factors should be used: 1.56 for current and 1.2 for voltage when selecting the fuse link. These cover most variations due to installation. If you have concerns that your PV installation may be subject to extremes of high altitude, high irradiance, high or low temperature, please consult Eaton's technical team (bulehighspeedtechnical@eaton.com).

Define the specifications of the PV module

Criteria

I_{sc} : Short-circuit current of the module at Standard Test Conditions (STC) - Data provided by the PV Manufacturer

V_{oc} : Open circuit voltage of one module at STC - Data provided by the PV Manufacturer

N_s : Number of modules in series per string

N_p : Number of strings in parallel per array

N_A : Number of arrays in parallel

According to IEC 62548, 6.5.5.2 PV sub-array overcurrent protection. The nominal rated current (I_n) of overcurrent protection devices for PV sub-arrays shall be determined with following formula:

$$I_n > 1.25 \times I_{sc_Array} \text{ and } I_n \leq 2.4 \times I_{sc_Array}$$

In accordance with the National Electrical Code (NEC) fuses are selected using $1.56 \times I_{sc}$. As fuse manufacturer, Eaton's recommends the array fuse selection method below in order to satisfy both IEC and NEC requirements.

The fuse link's ratings should be selected as follows:

- Voltage rating $\geq 1.20 \times V_{oc} \times N_s$
- Current rating $\geq 1.56 \times I_{sc} \times N_p$
- Check the current carrying capability of the selected fuse link, after derating at the ambient temperature of the fuse still satisfies the above criteria
- Current rating $\leq I_z$ = array cable rating

Eaton recommends using Eaton's Bussmann series fuse links in both positive and negative cables, each with adequate voltage rating (as above). Selectivity with string fuse links may not be achieved under some fault conditions.

Array protection — worked example

Manufacturer's PV Module specifications

- $I_{sc} = 5.37 \text{ A}$
- $V_{oc} = 43.1 \text{ V}$
- Temperature coefficient of short-circuit current $\alpha = 0.053 \% / ^\circ\text{C}$

PV Installation set-up

- Maximum irradiance level $1000\text{W/m}^2 \geq \text{Irradiance factor } F2 = 1$
- 18 modules in series per string ($N_s = 18$)
- Maximum 60°C module Temperature factor $F1 = 1 + \alpha \times (T - 25^\circ\text{C}) = 1.02$
- Minimum -30°C module
- Maximum 45°C ambient fuse link. Derating factor for array fuses current carrying capability is 0.95 at 45°C ambient temperature
- Array cable size: $25 \text{ mm}^2 \geq \text{cable rating } I_z = 98 \text{ A}$ at 60°C (Manufacturer's data)
- 8 strings in parallel ($N_p = 8$)
- 4 arrays in parallel ($N_A = 4$)

Calculation

- Cable rating $\geq 1.56 \times I_{sc} \times N_p$
 $= 1.56 \times 5.37 \times 8 = 67 \text{ A}$

Selected cable $I_z = 98 \text{ A} \rightarrow$ The selected cable is suitable

- Array max short-circuit current $I_{sc_Array} = (N_A - 1) \times N_p \times I_{sc} \times F1 \times F2$
 $= (4 - 1) \times 8 \times 5.37 \times 1.02 \times 1 = 131 \text{ A}$

- $I_{sc_Array} (131 \text{ A}) > I_z = 98 \text{ A}$ (therefore array fuse links are required)

- Minimum fuse current rating $I_n \geq 1.56 \times I_{sc} \times N_p$
 $= 1.56 \times 5.37 \times 8 = 67 \text{ A}$

For PV application with fuse links installed at high altitudes, there is reduced cooling effect on the fuse as the density of the atmosphere reduces. For above 2000 metre sea level, every 100 metre increase will have 0.5% de-rate on the fuse current. Please consult Eaton's Fuse Application Engineers for further information: bulehighspeedtechnical@eaton.com

- Maximum fuse current rating: $I_n \leq I_z = 98 \text{ A}$
- Minimum fuse voltage rating: $U_n = 1.2 \times V_{oc} \times N_s$
 $= 1.2 \times 43.1 \times 18 = 931 \text{ V}$

The selected fuse link needs to be rated at 80 A and 1000 V d.c. Eaton's Bussmann series part number would be PV-80ANH1 or PV-80-A-01XL. The selected fuse link has current carrying capability of $80 \times 0.95 = 76 \text{ A}$ at 45°C ambient temperature, which is greater than the minimum fuse current rating (67 A).

600 V DC

10 x 38 mm, 4 to 30 A, PVM

Description

A range of UL 2579 fast-acting 600 V d.c. Midget fuses specifically designed to protect solar power systems in extreme ambient temperature, high cycling and low level fault current conditions (reverse current, multi-array fault).

Catalogue number

PVM-(amp rating)

Technical data

Fuse size: 10 x 38 mm
Rated voltage: 600 V d.c. to UL 2579
Rated current: 4 A to 30 A
Interrupting rating: 50 kA DC

Standard/Approvals

UL Listed 2579, Guide JFGA, File E335324
CSA Component Certified C22.2

Packaging

10

Recommended fuse blocks / fuse holders

1000 V DC

10 x 38 mm, 1 to 20 A, PV-A10

Description

A range of fuse links in a 10 x 38 mm package specifically designed for the protection and isolation of photovoltaic strings. The fuse links are capable of interrupting low overcurrents associated with faulted PV (reverse current, multi-array fault) strings.

Catalogue number

Cylindrical: PV-(amp rating)A10F

Bolt fixing: PV-(amp rating)A10-T

PCB fixing 1 pin: PV-(amp rating)A10-1P

PCB fixing 2 pin: PV-(amp rating)A10-2P

PCB fixing double pin sliver cap: PV-(amp rating)A10-2PS

In-line with crimp terminal: PV-(amp rating)A10F-CT

Technical data

Fuse size: 10 x 38 mm

Rated voltage: 1000 V d.c.

Rated current: 1 A to 20 A

Breaking capacity: 50 kA

Operating class: gPV and UL PV Fuse links

Min interrupting rating: $1.3 \times I_n$ for 1 to 15 A, $1.5 \times I_n$ for 20 A

Time constant: 1 - 3 ms

PV Fuse coordination with thin film cells and 4", 5" and 6" crystal-line silicon cells

Standards/Approvals

IEC 60269-6

UL 2579 (File number E335324)

CCC (1 to 15A), RoHS compliant

Packaging

MOQ: 10

Packaging 100% recyclable

Recommended fuse holders and clips

1500 V DC

Fuse holder, CHPV15H85, 32 A (IEC/UL)

Description

Eaton's Bussmann series 10 x 85 mm fuse holders are suitable for use with 10 x 85 mm and 14 x 85 mm cylindrical gPV fuse links. The unique design offers high degree of safety. There is no possibility of any accidental contact with live parts during replacement of the fuse links. When the fuse carrier is extracted, a spring loaded cover moves out covering the live parts hence protecting against accidental damage.

800 V AC

NH fuse links, 170M, 32 A to 400 A

Description

Eaton's Bussmann series NH size 800 V a.c. fuse links are specifically designed to meet the needs of branch circuit and transformer protection in photovoltaic inverter systems. The fuse links are capable of interrupting low overcurrents associated with faulted PV systems (reverse current, multi-array fault).

Technical data

- Rated voltage: 800 V a.c.
- Rated current: 32 A to 400 A
- Breaking capacity: 65 kA
- Operating class: gR

Standards / Agency information

- UL 248-13 (file number E125085)
- IEC 60269-4 (see details below)

Description

Eaton's Bussmann Series NH gG fuse links are designed to ensure cable protection up to 800 V a.c. They are also ideally suited for the cable protection on the AC side of solar string inverters with outputs up to 800 V a.c.

Technical data

Rated voltage: 800 V a.c.
Rated current: 32 A to 400 A
Breaking capacity: 80 kA
Operating class: gG

Fuse size

DIN Style NH 1 and 2

Standards / Agency information

Microswitches

Description

Eaton's microswitches are used for remote electrical indication of fuse link operations. All microswitches have one normally open and one normally closed contact.

170H0236 and 170H0238 - Type T Indicator

The indicator is situated on one cover plate with a cover plate tag to accommodate an auxiliary switch. The minimum rated voltage for operating the indicator is 20 V. A special low rated voltage indicator (1.5V) is available on request).

170H0069 - Type K Indicator

The indicator is situated on the fuse link body. It is covered by an adaptor for snap-on mounting of an auxiliary switch. The operating Rated voltage of the indicator is 1.5V. As a matter of safety, the factory mounted adaptor must not be removed from the fuse link.

Contact details

Customer Satisfaction team

Eaton's Customer Satisfaction team is available to answer questions regarding Bussmann series products.

Calls can be made between:

Monday - Friday: 7.30 a.m. - 5.00 p.m. GMT

The Customer Satisfaction team can be reached via:

Phone: 00 44 (0) 1509 882 600

Email: GBBURsales@eaton.com

Application engineering

Application Engineering assistance is available to all customers. The Application Engineering team is staffed by university-qualified electrical engineers who are available with technical and application support.

Calls can be made between:

Monday - Thursday: 8.30 a.m. - 4.30 p.m. GMT

Friday: 8.30 a.m. - 4.00 p.m. GMT

Application Engineering can be reached via:

Phone: 00 44 (0) 1509 882 699

Eaton is an intelligent power management company dedicated to protecting the environment and improving the quality of life for people everywhere. We make products for the data center, utility, industrial, commercial, machine building, residential, aerospace and mobility markets. We are guided by our commitment to do business right, to operate sustainably and to help our customers manage power today and well into the future. By capitalizing on the global growth trends of electrification and digitalization, we're helping to solve the world's most urgent power management challenges and building a more sustainable society for people today and generations to come.

Founded in 1911, Eaton has continuously evolved to meet the changing and expanding needs of our stakeholders. With revenues of nearly \$25 billion in 2024, the company serves customers in more than 160 countries. For more information, visit www.eaton.com. Follow us on [LinkedIn](#).
