1. Introduction

The Innodisk Industrial CompactFlash[®] 1ME Memory Card (iCF 1ME) products provide high capacity solid-state flash memory that electrically complies with the True IDE Mode that is electrically compatible with an IDE disk drive. The original CF form factor card can be used in any system that has a CF slot. Designed to replace traditional rotating disk drives, Innodisk Industrial CompactFlash[®] 1ME Memory Cards are embedded solid-state data storage systems for mobile computing and the industrial work place. The Industrial CompactFlash[®] 1ME (iCF 1ME) support advanced PIO (0-6), Multiword DMA (0-4), Ultra DMA (0-7) transfer mode, multi-sector transfers, and LBA addressing.

2. Features

The Industrial ATA products provide the following system features:

- Capacities:
 - with A19nm MLC: 4GB/8GB/16GB/32GB/64GB/128GB
 - with 15nm MLC: 8GB/16GB/32GB/64GB/128GB/256GB
- Fully compatible with CompactFlash[®] specification version 6.0
- Fully compatible with PC Card Standard.
- Fully compatible with the IDE standard interface, ATA Standard
- Three access modes
 - True IDE Mode
 - PC Card Memory Mode
 - PC Card I/O Mode
- ECC (Error Correction Code) function: 72 bits/ per 1 Kbyte
- +3.3V/+5V single power supply operation
- Support Auto Stand-by and Sleep Mode.
- Power Consumption

```
- Active mode
```

```
- 5V:
```

```
Read: 148mA(typ)
```

```
Write : 155mA(typ)
```

```
Idle : 4mA(typ)
```

- 3.3V:

9

```
Read : 130mA(typ)
```

```
Write: 145mA(typ)
```

```
Idle: 4mA(typ)
```

• Support transfer modes: PIO(0-6), Multiword DMA (0-4) and Ultra DMA(0-7)

• R/W performance:

Flash type	Capacity	Max. Read (MB/s)	Max. Write (MB/s)	
A19nm MLC	4GB	75	10	
	8GB	85	20	
	16GB	110	40	
	32GB	110	65	
	64GB	110	65	
	128GB	110	75	

Table 1: A19nm MLC Performance

Table 2: 15nm MLC Performance

Flash type	Capacity	Max. Read (MB/s)	Max. Write (MB/s)	
15nm MLC	8GB	75	25	
	16GB	80	25	
	32GB	110	45	
	64GB	110	75	
	128GB	110	75	
	256GB	110	110	

- Operating temperature range:
 - Standard Grade: 0°C ~ +70°C
 - Industrial Grade: -40°C ~ +85°C
- Storage temperature range: -55°C ~ +95°C

3. Pin Assignment

See Table 1 for iCF 1ME pin assignments.

Note:

1) These signals are required only for 16 bit accesses and not required when installed in 8 bit systems. Devices should allow for 3-state signals not to consume current.

2) The signal should be grounded by the host.

3) The signal should be tied to VCC by the host.

4) The mode is optional for CF+ Cards, but required for CompactFlash Storage Cards.

5) The -CSEL signal is ignored by the card in PC Card modes. However, because it is not pulled up on the card in these modes, it should not be left floating by the host in PC Card modes. In these modes, the pin should be connected by the host to PC Card A25 or grounded by the host.

6) If DMA operations are not used, the signal should be held high or tied to VCC by the host. For proper operation in older hosts: while DMA operations are not active, the card shall ignore this signal, including a floating condition

TPS, DEC. 2016

- 7) Signal usage in True IDE Mode except when Ultra DMA mode protocol is active.
- 8) Signal usage in True IDE Mode when Ultra DMA mode protocol DMA Write is active.
- 9) Signal usage in True IDE Mode when Ultra DMA mode protocol DMA Read is active.
- 10) Signal usage in PC Card I/O and Memory Mode when Ultra DMA mode protocol DMA Write is active.
- 11) Signal usage in PC Card I/O and Memory Mode when Ultra DMA mode protocol DMA Read is active.
- 12) Signal usage in PC Card I/O and Memory Mode when Ultra DMA protocol is active.
- 13) Signal is a totem-pole output during Ultra DMA data bursts in True IDE mode.

4.Pin Description

Table 2 describes the pin descriptions for iCF 1ME

	Table 4: iCF 1ME Pin Description						
Pin Name	Pin No.	I/ 0	Description

			This signal is not used in this mode.
			The Input Acknowledge signal is asserted by the CompactFlash
			Storage Card or CF+ Card when the card is selected and responding to
-INPACK (PC Card			an I/O read cycle at the address that is on the address bus. This signal
Memory Mode except			is used by the host to control the enable of any input data buffers
Ultra DMA Protocol			between the CompactFlash Storage Card or CF+ Card and the CPU.
Active)			Hosts that support a single socket per interface logic, such as for
INDACK (DC Card I/O			Advanced Timing Modes and Ultra DMA operation may ignore the –
-INPACK (PC Card I/O			INPACK signal from the device and manage their input buffers based
Mode except Ultra DMA			solely on Card Enable signals.
Protocol Active) Input	43		This signal is a DMA Request that is used for DMA data transfers
Acknowledge			between host and device. It shall be asserted by the device when it is
		0	ready to transfer data to or from the host. For Multiword DMA
	45		transfers, the direction of data transfer is controlled by -IORD and
			-IOWR. This signal is used in a handshake manner with (-)DMACK,
			i.e., the device shall wait until the host asserts (-)DMACK before
-DMARQ (PC Card			negating (-)DMARQ, and re-asserting (-)DMARQ if there is more data
Memory Mode - Ultra			to transfer.
DMA Protocol Active)			In PCMCIA I/O Mode, the -DMARQ shall be ignored by the host while
-DMARQ (PC Card I/O			the host is performing an I/O Read cycle to the device. The host shall
Mode - Ultra DMA			not initiate an I/O Read cycle while -DMARQ is asserted by the device.
Protocol Active) DMARQ			In True IDE Mode, DMARQ shall not be driven when the device is not
(True IDE Mode)			selected in the Drive-Head register.
(While a DMA operation is in progress, -CS0 (-CE1) and -CS1 (-CE2)
			shall be held negated and the width of the transfers shall be 16 bits.
			If there is no hardware support for True IDE DMA mode in the host,
			this output signal is not used and should not be connected at the host.
			In this case, the BIOS must report that DMA mode is not supported by
			the host so that device drivers will not attempt DMA mode operation.
			A host that does not support DMA mode and implements both PC Card

		1	
			and True IDE modes of operation need not alter the PC Card mode
			connections while in True IDE mode as long as this does not prevent
			proper operation in any mode.
-IORD (PC Card Memory			This signal is not used in this mode.
Mode except Ultra DMA			
Protocol Active)			
-IORD (PC Card I/O			This is an I/O Read strobe generated by the host. This signal gates I/O
Mode except Ultra DMA			data onto the bus from the CompactFlash Storage Card or CF+ Card
Protocol Active)			when the card is configured to use the I/O interface.
-IORD (True IDE Mode -			In True IDE Mode, while Ultra DMA mode is not active, this signal has
Except Ultra DMA			the same function as in PC Card I/O Mode.
Protocol Active)	34	I	
-HDMARDY (All Modes -	J 1		In all modes when Ultra DMA mode DMA Read is active, this signal is
Ultra DMA Protocol DMA			asserted by the host to indicate that the host is ready to receive Ultra
Read)			DMA data-in bursts. The host may negate -HDMARDY to pause an
			Ultra DMA transfer.
HSTROBE (All Modes -			In all modes when Ultra DMA mode DMA Write is active, this signal is
Ultra DMA Protocol DMA			the data out strobe generated by the host. Both the rising and falling
Write)			edge of HSTROBE cause data to be latched by the device. The host
			may stop generating HSTROBE edges to pause an Ultra DMA data-out
			burst.
-IOWR (PC Card Memory			This signal is not used in this mode.
Mode – Except Ultra DMA			
Protocol Active)			
-IOWR (PC Card I/O			The I/O Write strobe pulse is used to clock I/O data on the Card Data
Mode – Except Ultra DMA			bus into the CompactFlash Storage Card or CF+ Card controller
Protocol Active)			registers when the CompactFlash Storage Card or CF+ Card is
			configured to use the I/O interface.
	35	Ι	The clocking shall occur on the negative to positive edge of the signal
			(trailing edge).
-IOWR (True IDE Mode -			In True IDE Mode, while Ultra DMA mode protocol is not active, this
Except Ultra DMA			signal has the same function as in PC Card I/O Mode. When Ultra DMA
Protocol Active)			mode protocol is supported, this signal must be negated before
			entering Ultra DMA mode protocol.
STOP (All Modes – Ultra			In All Modes, while Ultra DMA mode protocol is active, the assertion of
DMA Protocol Active)			this signal causes the termination of the Ultra DMA data burst.
-OE (PC Card Memory	0	<u>,</u>	This is an Output Enable strobe generated by the host interface. It is
Mode)	9	I	used to read data from the CompactFlash Storage Card or CF+ Card in
		1	

			Memory Mode and to read the CIS and configuration registers.
-OE (PC Card I/O Mode)			In PC Card I/O Mode, this signal is used to read the CIS and
			configuration registers.
-ATA SEL (True IDE			To enable True IDE Mode this input should be grounded by the host.
Mode)			
READY (PC Card Memory			In Memory Mode, this signal is set high when the CompactFlash
Mode)			Storage Card or CF+ Card is ready to accept a new data transfer
			operation and is held low when the card is busy.
			At power up and at Reset, the READY signal is held low (busy) until
			the CompactFlash Storage Card or CF+ Card has completed its power
			up or reset function. No access of any type should be made to the
			CompactFlash Storage Card or CF+ Card during this time.
			Note, however, that when a card is powered up and used with RESET
	37	0	continuously disconnected or asserted, the Reset function of the
	57	0	RESET pin is disabled. Consequently, the continuous assertion of
			RESET from the application of power shall not cause the READY signal
			to remain continuously in the busy state.
-IREQ (PC Card I/O			I/O Operation – After the CompactFlash Storage Card or CF+ Card
Mode)			has been configured for I/O operation, this signal is used as -Interrupt
			Request. This line is strobed low to generate a pulse mode interrupt or
			held low for a level mode interrupt.
INTRQ (True IDE Mode)			In True IDE Mode signal is the active high Interrupt Request to the
			host.
-REG (PC Card Memory			This is a DMA Acknowledge signal that is asserted by the host in
Mode – Except Ultra DMA			response to DMARQ to initiate DMA transfers. While DMA operations
Protocol Active) Attribute			are not active, the card shall ignore the -DMACK signal, including a
Memory Select			floating condition. If DMA operation is not supported by a True IDE
			Mode only host, this signal should be driven high or connected to VCC
			by the host.
-REG (PC Card I/O Mode			The signal shall also be active (low) during I/O Cycles when the I/O
– Except Ultra DMA	44	Ι	address is on the Bus.
Protocol Active)			In PC Card I/O Mode, when Ultra DMA Protocol is supported by the
			host and the host has enabled Ultra DMA protocol on the card the,
			host shall keep the -REG signal asserted during the execution of any
			DMA Command by the device.
-DMACK (PC Card			This is a DMA Acknowledge signal that is asserted by the host in
Memory Mode when			response to (-)DMARQ to initiate DMA transfers.
Ultra DMA Protocol			In True IDE Mode, while DMA operations are not active, the card shall

Active) DMACK (PC Card			ignore the (-)DMACK signal, including a floating condition.		
I/O Mode when Ultra			If DMA operation is not supported by a True IDE Mode only host, this		
DMA Protocol Active)			signal should be driven high or connected to VCC by the host.		
-DMACK (True IDE Mode)			A host that does not support DMA mode and implements both PC Card		
			and True-IDE modes of operation need not alter the PC Card mode		
			connections while in True-IDE mode as long as this does not prevent		
			proper operation all modes.		
RESET (PC Card Memory			The CompactFlash Storage Card or CF+ Card is Reset when the RESET		
Mode)			pin is high with the following important exception:		
			The host may leave the RESET pin open or keep it continually high		
			from the application of power without causing a continuous Reset of		
			the card. Under either of these conditions, the card shall emerge from		
	44	Ţ	power-up having completed an initial Reset.		
	41	Ι	The CompactFlash Storage Card or CF+ Card is also Reset when the		
			Soft Reset bit in the Card Configuration Option Register is set.		
RESET (PC Card I/O			This signal is the same as the PC Card Memory Mode signal.		
Mode)					
-RESET (True IDE Mode)			In the True IDE Mode, this input pin is the active low hardware reset		
			from the host.		
VCC (PC Card Memory			+5 V, +3.3 V power.		
Mode)	13, 38				
VCC (PC Card I/O Mode)	15, 56	_	This signal is the same for all modes.		
VCC (True IDE Mode)			This signal is the same for all modes.		
-VS1 -VS2 (PC Card			Voltage Sense SignalsVS1 is grounded on the Card and sensed by		
Memory Mode)			the Host so that the CompactFlash Storage Card or CF+ Card CIS can		
			be read at 3.3 volts and -VS2 is reserved by PCMCIA for a secondary		
	33, 40	0	voltage and is not connected on the Card.		
-VS1 -VS2 (PC Card I/O	55, 40	0	This signal is the same for all modes.		
Mode)					
-VS1 -VS2 (True IDE			This signal is the same for all modes.		
Mode)					

			ICF IME			
-WAIT (PC Card Memory			The -WAIT signal is driven low by the CompactFlash Storage Card or			
Mode – Except Ultra DMA			CF+ Card to signal the host to delay completion of a memory or I/O			
Protocol Active)			cycle that is in progress.			
-WAIT (PC Card I/O			This signal is the same as the PC Card Memory Mode signal.			
Mode – Except Ultra DMA						
Protocol Active)						
IORDY (True IDE Mode -			In True IDE Mode, except in Ultra DMA modes, this output signal may			
Except Ultra DMA			be used as IORDY.			
Protocol Active)						
-DDMARDY (All Modes -	42	0	In all modes, when Ultra DMA mode DMA Write is active, this signal is			
Ultra DMA Write Protocol			asserted by the device during a data burst to indicate that the device			
Active)			is ready to receive Ultra DMA data out bursts. The device may negate			
			-DDMARDY to pause an Ultra DMA transfer.			
DSTROBE (All Modes -			In all modes, when Ultra DMA mode DMA Read is active, this signal is			
Ultra DMA Read Protocol			the data in strobe generated by the device. Both the rising and falling			
Active)			edge of DSTROBE cause data to be latched by the host. The device			
			may stop generating DSTROBE edges to pause an Ultra DMA data in			
			burst.			
-WE (PC Card Memory			This is a signal driven by the host and used for strobing memory write			
Mode)			data to the registers of the CompactFlash Storage Card or CF+ Card			
			when the card is configured in the memory interface mode. It is also			
	26	-	used for writing the configuration registers.			
-WE (PC Card I/O Mode)	36	Ι	In PC Card I/O Mode, this signal is used for writing the configuration			
			registers.			
-WE (True IDE Mode)			In True IDE Mode, this input signal is not used and should be			
			connected to VCC by the host.			
WP (PC Card Memory			Memory Mode – The CompactFlash Storage Card or CF+ Card does			
Mode) Write Protect			not have a write protect switch. This signal is held low after the			
			completion of the reset initialization sequence.			
-IOIS16 (PC Card I/O			I/O Operation – When the CompactFlash Storage Card or CF+ Card is			
Mode)	24	0	configured for I/O Operation Pin 24 is used for the -I/O Selected is 16			
			Bit Port (-IOIS16) function. A Low signal indicates that a 16 bit or odd			
			byte only operation can be performed at the addressed port.			
-IOCS16 (True IDE			In True IDE Mode this output signal is asserted low when this device is			
Mode)			expecting a word data transfer cycle.			

5. Specifications

5.1 CE and FCC Compatibility

iCF 1ME conforms to CE and FCC requirements.

5.2 RoHS Compliance

iCF 1ME is fully compliant with RoHS directive.

5.3 Environmental Specifications

5.3.1 Temperature Ranges

Operating Temperature Range:

- Standard Grade: 0°C to +70°C
- Industrial Grade: -40°C to +85°C

Storage Temperature Range: -55°C to +95°C

5.3.2 Humidity

Relative Humidity: 10-95%, non-condensing

5.3.3 Shock and Vibration

Table 5: Shock/Vibration Test for iCF 1ME

Reliability	Test Conditions	Reference Standards		
Vibration	7 Hz to 2 KHz, 20G, 3 axes	IEC 68-2-6		
Mechanical Shock	Duration: 0.5ms, 1500G, 3	IEC 68-2-27		
	axes	IEC 00-2-27		

5.3.4 Mean Time between Failures (MTBF)

Table 4 summarizes the MTBF prediction results for various iCF 1ME configurations. The analysis was performed using a RAM Commander[™] failure rate prediction.

- **Failure Rate**: The total number of failures within an item population, divided by the total number of life units expended by that population, during a particular measurement interval under stated condition.
- **Mean Time between Failures (MTBF):** A basic measure of reliability for repairable items: The mean number of life units during which all parts of the item perform within their specified limits, during a particular measurement interval under stated conditions.

Table 6: iCF 1ME MTBF

Product	Condition	MTBF (Hours)
iCF 1ME	Telcordia SR-332 GB, 25°C	>3,000,000

5.3.5 Write Protect Function Support

Innodisk CF card within the write-protect function could prevent the CF card from modification and deletion. Write-protected data in CF card could only be read, that is, users could not write to it, edit it, append data to it, or delete it.

When users would like to make sure that neither themselves nor others could modify or destroy the file, users could switch on write-protection. Thus Innodisk CF card would process write-protect mechanism and disable flash memory to be written-in any data. Only while the system power-off, users could switch on write-protection. Write-protection could not be switched-on, after OS booting.

5.3.6 Wear-Leveling

Flash memory can be erased a limited number of times. This number is called the erase cycle limit or write endurance limit and is defined by the flash array vendor. The erase cycle limit applies to each individual erase block in the flash device. iCF 1ME uses a wear-leveling algorithm to ensure that consecutive writes of a specific sector are not written physically to the same page in the flash. This spreads flash media usage evenly across all pages, thereby maximizing flash lifetime.

5.3.7 TBW

Parameter	Value			
Read Cycles	Unlimited Read Cycles			
Wear-Leveling Algorithm	Support			
Bad Blocks Management	Support			
Error Correct Code	Support			
Thermal Sensor	Support			
TBW*(Total Bytes Written)	Unit: TB			
8GB	2.34			
16GB	4.68			
32GB	9.37			
64GB	18.75			
128GB	37.5			
256GB	75			
*Total bytes written is based on JEDEC	218. (Solid-State Drive Requirements and			
Endurance Test Method)				
**Lifespan is calculated by device writ	ten per day.			

5.3.8 Mechanical Dimensions

Mechanical Dimension: 42.80±0.1/36.40±0.1/3.30±0.05mm (W/T/H)

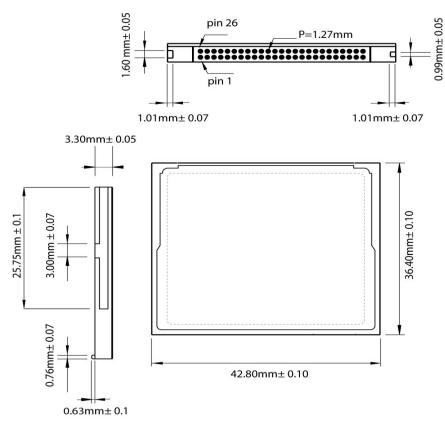

Figure 1: Mechanical Dimension of iCF 1ME

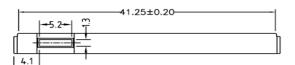

Figure 2: Write Protect(Optional)

5.4 Electrical Specifications

5.4.1 DC Characteristic

Power supply requirement: 5V±0.5V DC or 3.3±0.3V

5.4.2 Timing Specifications

5.4.2.1 True IDE PIO Mode Read/Write Timing Specification

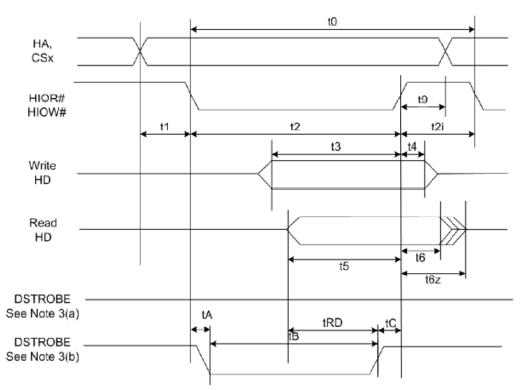

Figure 2: Read/Write Timing Diagram, PIO Mode

Note:

1. Device address comprises CS1#, CS0#, and HA[2:0].

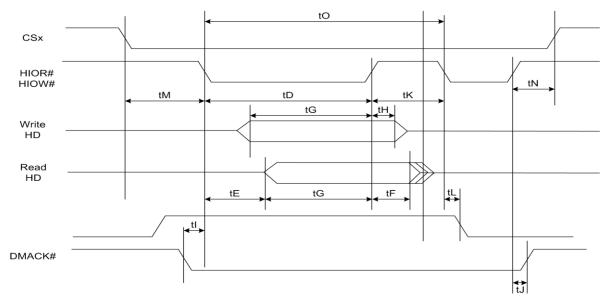

2. Data comprises HD[15:0] (16-bit) or HD[7:0] (8-bit).

3. The negation of DSTROBE by the device is used to lengthen the PIO cycle. Whether the cycle is to be extended is determined by the host after Ta from the assertion of HIOR# or HIOW#. The assertion and negation of DSTROBE is described in the following three cases. (a) The device never negates DSTROBE: No wait is generated. (b) Device drives DSTROBE low before Ta: a wait is generated. The cycle is completed after DSTROBE is reasserted. For cycles in which a wait is generated and HIOR# is asserted, the device places read data on D15-D00 for Trd before DSTROBE is asserted.

	Table 7: True IDE PIO Mode Read/ write Timing								
PIC) timing parameters	Mode 0	Mode 1	Mode 2	Mode 3	Mode 4			
t ₀	Cycle time (min.)	600	383	240	180	120			
t1	Address valid to HIOR-/HIOW- setup (min.)	70	50	30	30	25

5.5 Transfer Function

5.5.1 True IDE Mode I/O Transfer Function

The iCF 1ME can be configured in a True IDE Mode of operation. The iCF 1ME is configured in this mode only when –OE input signal is grounded by the host during the power off to power on cycle.

		l.		IDE Mode	-

Table 10: True IDE Mode I/O Function

Note1: In Ultra DMA Data Register Write mode the signals –IORD, -IOWR and IORDY are

redefined and used as follows: -IORD as HSTROBE, -IOWR as STOP and IORDY as - DDMARDY. Data transfers with each edge of HSTROBE.

Note2: In Ultra DMA Data Register Read mode the signals –IORD, -IOWR and IORDY are redefined and used as follows: -IORD as –HDMARDY H, -IOWR as STOP and IORDY as DSTROBE. Data transfer with each edge of DSTROBE.

5.6 Configuration Register

5.6.1 Configuration Option Register (200h in Attribute Memory)

The Configuration Option Register is used to configure the cards interface, address decoding and interrupt and to issue a soft reset to the iCF 1ME.

			j .		_ _			
Operation	D7	D6	D5	D4	D3	D2	D1	D0
R/W	SRESET	LevelREQ	Conf5	Conf4	Conf3	Conf2	Conf1	Conf0

Table 11: Configuration Option Register

Name	Description
SRSET	Soft Reset: Setting this bit to one (1), waiting the minimum reset time and
	returning to zero(0) places the iCF 1ME in the reset state. Setting this bit to
	one (1) is equivalent to assertion of the +RESET signal except that the
	SRESET bit is not cleared. Returning this bit to zero (0) leaves the iCF 1ME in
	the same un-configured, Reset state as following power-up and hardware
	reset. Contrast with Soft Reset in the Device Control Register.
LevelREQ	This bit is set to one (1) then Level Mode Interrupt is selected, and zero (0)
	then Pulse Mode is selected. Set to zero (0) by Reset.
Conf5-0	Configuration Index: Set to zero (0) by reset. It is used to select operation
	mode of the iCF 1ME as shown below

Table 12: Information for Configuration Option Register

Note: Conf5 and Conf4 are reserved for CompactFlash Storage cards and shall be written as zero(0).

5.6.2 Pin Replacement register (204h in Attribute Memory)

Operation	D7	D6	D5	D4	D3	D2	D1	D0
Read	0	0	Cready	0	1	1	Rready	0
Write	0	0	Cready	0	0	0	Mready	0

Table 13: Pin Replacement Register

Name	Description
Cready	This bit is set to one (1) when the bit Rready changes state. This bit
	can also be written by the host.
Rready	This bit is used to determine the internal state of the READY signal.
	This bit may be used to determine the state of the READY signal as
	this pin has been reallocated for use as Interrupt Request on an I/O
	card. When written, this bit acts as a mask (Mready) for writing the
	corresponding bit Cready.
Mready	This bit acts as a mask for writing corresponding bit Cready.

 Table 14: Information for Pin Replacement Register

5.6.3 Socket and Copy Register (206h in Attribute Memory)

This register contains additional configuration information. This register is always written by the system before writing the card's Configuration Index Register. This register is used for identification of the card from the other card.

Operation	D7	D6	D5	D4	D3	D2	D1	D0
Read	0	0	0	Obsolete	0	0	0	0
				(Drive #)				
Write	0	0	0	Obsolete	х	Х	Х	Х
				(Drive #)				

Table 15: Socket and Copy Register

Name	Description
Obsolete(Drive #)	This bit is obsolete and should be written as 0.

5.7 Software Interface

5.7.1 True IDE Mode Addressing

When the iCF 1ME is configured in the True IDE mode, the I/O decoding is as follows:

-CS1	-CS0	A2	A1	A0	-DMACK	-IORD=0	-IOWR=0	Note						
1	0	0	0	0	1	PIO RD Data	PIO WR Data	8 or						
								16 bit						
1	1	Х	Х	Х	0	DMA RD Data	DMA WR Data	16 bit						
1	0	0	0	1	1	Error Register	Features	8 bit						
1	0	0	1	0	1	Sector Count	Sector Count	8 bit						
1	0	0	1	1	1	Sector No.	Sector No.	8 bit						
1	0	1	0	0	1	Cylinder Low	Cylinder Low	8 bit						
1	0	1	0	1	1	Cylinder High	Cylinder High	8 bit						
1	0	1	1	0	1	Select Card/Head	Select Card/Head	8 bit						
1	1	1	1	1	1	Status	Command	8 bit						
0	1	1	1	0	1	Alt Status	Device Control	8 bit						

Table 17: True IDE Mode I/O Decoding

5.7.2 CF-ATA Register

The following section describes the hardware registers used by the host software to issue commands to the iCF 1ME.

Note:

In True IDE Mode of operation, the size of the transfer is based solely on the register being addressed. All registers are 8 bit only except for the Data Register, which is normally 16 bits, but can be programmed to use 8 bit transfers for Non-DMA operations through the use of the Set Features command. The data register is also 8 bits during a portion of the Read Long and Write Long commands, which exist solely for historical reasons and should not be used.

5.7.2.1 Data Register

The Data Register is a 16 bit register, and it is used to transfer data blocks between the card and the host. This register overlaps the Error Register. This register can be accessed in word and byte mode.

Data	Data Register														
D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0

Table 18: Data Register

5.7.2.2 Error Register

This register contains additional information about the source of an error when an error is indicated in bit 0 of the Status register. The bits are defined as follows.

				-			
BBK	UNC	0	IDNF	0	ABRT	0	AMNF
D7	D6	D5	D4	D3	D2	D1	D0

Table 19: Error Register

5.7.2.3 Feature Register

This register provides information regarding features of the card that the host can utilize. This register is also accessed in PC Card modes on data D15-D8 during a write operation to Offset 0 with -CE2 low and -CE1 high.

Table 20: Feature Register

Feature Re	Feature Register									
D7	D6	D5	D4	D3	D2	D1	D0			

5.7.2.4 Sector Count Register

This registers the number of sectors of data requested to be transferred on a read or write operation between the host and the card. If the value in this register is zero, a count of 256 sectors is specified. If the command was successful, this register is zero at command completion. If not successfully completed, the register contains the number of sectors that need to be transferred in order to complete the request.

Table 21: Sector Count Register

Sector Co	Sector Count Register									
D7	D6	D5	D4	D3	D2	D1	D0			

5.7.2.5 Sector Number Register

This register contains the starting sector number or bits 7-0 of the Logical Block Address (LBA) for iCF 1ME data access for the subsequent command.

 Table 22: Sector Number Register

Sector Number Register									
D7	D6	D5	D4	D3	D2	D1	D0		

5.7.2.6 Cylinder Low Register

This Register contains the low order 8 bits of the starting cylinder address or bits 15-8 of the Logical Block Address.

 Table 23: Cylinder Low Register

Cylinder Low Register									
D7	D6	D5	D4	D3	D2	D1	D0		

5.7.2.7 Cylinder High Register

This Register contains the high order 8 bits of the starting cylinder address or bits 23-16 of the Logical Block Address.

Table 24: Cylinde	r High Register
-------------------	-----------------

Cylinder High Register									
D7	D6	D5	D4	D3	D2	D1	D0		

5.7.2.8 Device/Head Register

The Drive/Head register is used to select the drive and head. It is also used to select LBA addressing instead of cylinder/head/sector addressing.

Table 25: Device/Head Register

1	LBA	1	DRV	HS3	HS2	HS1	HS0
D7	D6	D5	D4	D3	D2	D1	D0

Bit7: this bit is set 1.

Bit6: LBA is a flag to select either Cylinder/Head/Sector or Logical Block Address mode. When LBA=0, Cylinder/Head/Sector mode is selected. When LBA=1, Logical Block Address is selected.

Bit5: this bit is set 1.

Bit4: DRV is the drive number. When DRV=0, drive (card) 0 is selected. When DRV=1, drive (card) 1 is selected.

Bit3: When operation in the Cylinder/Head/Sector mode, this is bit 3 of the head number. It is bit 27 in the Logical Block Address mode.

Bit2: When operation in the Cylinder/Head/Sector mode, this is bit 2 of the head number. It is bit 26 in the Logical Block Address mode.

Bit1: When operation in the Cylinder/Head/Sector mode, this is bit 1 of the head number. It is bit 25 in the Logical Block Address mode.

Bit0: When operation in the Cylinder/Head/Sector mode, this is bit 0 of the head number. It is bit 24 in the Logical Block Address mode.

5.7.2.9 Status Register

These registers return the iCF 1ME status when read by the host. Reading the Status register does clear a pending interrupt while reading the Auxiliary Status register does not.

BUSY	RDY	DWF	DSC	DRQ	CORR	0	ERR
D7	D6	D5	D4	D3	D2	D1	D0

Table 26: Status Register

Bit7: the busy bit is set when the iCF 1ME has access to the command buffer and registers and the host is locked out from accessing the command register and buffer. No other bits in this register are valid when this bit set to a 1.

Bit6: RDY indicates whether the device is capable of performing iCF 1ME operations. This bit is cleared at power up and remains cleared until the card is ready to accept a command. **Bit5**: This bit, if set, indicates a write fault has occurred.

Bit4: This bit is set when the iCF 1ME is ready.

Bit3: The Data Request is set when the iCF 1ME requires that information be transferred either to or from the host through the Data register.

During the data transfer of DMA commands, the card shall not asserted DMARD unless either the BUST bit, the DRQ, or both are set to one.

Bit2: This bit is set when a Correctable data error has been encountered and the data has been corrected. This condition does not terminate a multi-sector read operation.

Bit1: This bit is always to 0.

Bit0: This bit is set when the previous command has ended in some type of error. The bits in the Error register contain additional information description the error.

5.7.2.10 Device Control Register

This register is used to control the iCF 1ME interrupt request and to issue an ATA soft reset to the card. This register can be written even if the device is BUSY.

	5							
Х	Х	Х	Х	Х	SW Rst	-Ien	0	
D7	D6	D5	D4	D3	D2	D1	D0	

Table 27: Device Control Register

Bit7-3: These bits are ignored.

Bit2: This bit is set to 1 in order to force the iCF 1ME to perform a Soft Reset operation. The Card remains in Reset until this bit is reset to `0'.

Bit1: the Interrupt Enable bit enables interrupts when the bit is 0. When the bit is 1, interrupt from the iCF 1ME are disabled. This bit also controls the Int bit in the Configuration and Status Register. This bit is set to 0 at power on and Reset.

Bit0: This bit is ignored.

5.7.2.11 Drive Address Register

This register is provide for compatibility with the AT disk drive interface.

Table 28: Drive Address Register

Х	-WTG	-HS3	-HS2	-HS1	-HS0	-Nds1	-Nds0
D7	D6	D5	D4	D3	D2	D1	D0

Bit7: this bit is unknown.

Bit6: this bit is – when a write operation is in progress; otherwise, it is 1.

Bit5: this bit is the negation of bit 3 in the Drive/Head register.

Bit4: this bit is the negation of bit 2 in the Drive/Head register.

Bit3: this bit is the negation of bit 1 in the Drive/Head register.

Bit2: this bit is the negation of bit 0 in the Drive/Head register.

Bit1: this bit is 0 when drive 1 is active and selected.

Bit0: this bit is 0 when the drive 0 is active and selected.

5.8 Hardware Reset

Power on Reset Timing

5.10 Support IDE Commands

iCF 1ME supports the commands listed in Table 29.

Table 31: IDE Commands

Command	Code	FR	SC	SN	СҮ	DH	LBA
Check Power Mode	E5H	-	-	-	-	D	-
Execute Device	90H	-	-	-	-	D	-
Diagnostic	9011						
Flush Cache	E7H	-	-	-	-	Y	-
Identify Device	ECH	-	-	-	-	D	-
Idle	E3H	-	Y	-	-	D	-
Idle immediate	E1H	-	-	-	-	D	-
Read Buffer	E4H	-	-	-	-	D	-
Read DMA	C8H	-	Y	Y	Y	Y	Y
Read Sector(s)	20H	-	Y	Y	Y	Y	Y
Read Verify Sector(s)	40H	-	Y	Y	Y	Y	Y
Set Features	EFH	Y	-	-	-	D	-
Set Multiple Mode	C6H	-	Y	-	-	D	-
Set Sleep Mode	E6H	-	-	-	-	D	-
SMART	B0h	Y	-	-	Y	Y	-
Standby	E2H	-	-	-	-	D	-
Standby Immediate	E0H	-	-	-	-	D	-
Write Buffer	E8H	-	-	-	-	D	-
Write DMA	CAH	-	Y	Y	Y	Y	Y
Write Multiple	C5h	-	Y	Y	Y	Y	Y
Write Sector(s)	30H	-	Y	Y	Y	Y	Y

Defines:

- FR: Feature Register
- SC: Sector Count Register
- SN: Sector Number Register
- CY: Cylinder Registers
- DH: Card/Device/Head Register
- LBA: LBA Block Address Mode Supported

Y: The register contains a valid parameter for this command. For Card/Device/Head Register Y means both the CompactFlash Storage Card and head parameter are used; D – only the CompactFlash Storage Card parameter is valid and not the head parameter; C – The register contains command specific data (see command description for use).

5.10.1 Check power mode -E5h

Table 32: Check power mode information

			- -					
Register	7	6	5	4	3	2	1	0
Command(7)	E5h							
C/D/H(6)	Х			Drive	Х			
Cylinder	Х							
High(5)								
Cylinder Low(4)	Х							
Sector	Х							
Number(3)								
Sector Count(2)	Х							
Feature(1)	Х							

This command checks the power mode. If the CompactFlash Storage is in, going to, or recovering from the sleep mode, the CompactFlash Storage Card sets BSY, sets the Sector Count Register to 00h, clears BSY and generates an interrupt. If the 37ompactFlash Storage Card is in idle mode, the CompactFlash Storage Card sets BSY, sets the Sector Count Register to FFh, clears BSY and generates an interrupt.

5.10.2 Execute Device Diagnostic - 90h

 Table 33: Execute device diagnostic information

Register	7	6	5	4	3	2	1	0
Command(7)	90h							
C/D/H(6)	Х			Drive	Х			
Cylinder	Х							
High(5)								
Cylinder Low(4)	Х							
Sector	Х							
Number(3)								
Sector Count(2)	Х							
Feature(1)	Х							

This command performs the internal diagnostic tests implemented by the CompactFlash Storage Card. When the diagnostic command is issued in the True IDE Mode, the Drive bit is ignored and the diagnostic command is executed by both the Master and the Slave with the Master responding with status for both devices. The Diagnostic codes are shown in Table 34. Diagnostic Codes are returned in the Error Register at the end of the command.

	Table 541 Blaghostic
Code	Error Type
01h	No Error Detected
02h	Formatter Device Error
03h	Sector Buffer Error
04h	ECC Circuitry Error
05h	Controller Microprocessor Error
8Xh	Slave Error in True IDE Mode

Status	BSY	DRDY	DF	Na	DRQ	Na	Na	ERR

Device register-

DEV shall specify the selected device.

Status register-

BSY will be cleared to zero indicating command completion

DRDY will be set to one.

DF (Device Fault) will be cleared to zero.

DRQ will be cleared to zero

ERR will be cleared to zero.

5.10.3.5 Error Outputs

Table 37: Flush cache command for error output information

Register	7	6	5	4	3	2	1	0
Error	Na	Na	Na	Na	Na	ABRT	Na	Na
Sector Count	Na							
LBA Low	LBA(7:	LBA(7:0)						
LBA Mid	LBA(1	5:8)						
LBA High	LBA(23	3:16)						
Device	Obs	Na	obs	DEV	LBA(27:24)			
Status	BSY	DRDY	DF	Na	DRQ	Na	Na	ERR

Error register-

ABRT may be set to one if the device is not able to complete the action requested by the command.

5.10.3.6 LBA Low, LBA Mid, and LBA High, Device

Shall be written with the address of first unrecoverable error.

Status register-

BSY will be cleared to zero indicating command completion

DRDY will be set to one.

DF (Device Fault) will be cleared to one if a device fault has occurred.

DRQ will be cleared to zero

ERR will be set to one if an Error register bit is set to one.

5.10.3.7 Prerequisites

DRDY will be set to one.

5.10.3.8 Description

This command is used by the host to request the device to flush the write cache. If there is data in write cache, that data shall be written to the SSD. The BSY bit shall remain set to one until all data has been successfully written or an error occurs.

5.10.4 Identify Device- Ech

Table 38: Identify device information

			,,	•••••

Feature(1)	Х							

The Identify Device command enables the host to receive parameter information from the CompactFlash Storage Card. This command has the same protocol as the Read Sector(s) command. The parameter words in the buffer have the arrangement and meanings defined in Table 35. All reserved bits or words are zero. Hosts should not depend in Obsolete words in Identify Device containing 0. Table 35 specifies each filed in the data returned by the Identify Device Command. In Table 35, X indicates a numeric nibble vale specific to the card and aaaa indicates an ASCII string specific to the particular drive.

5.10.5 Idle -97H or E3H

 Table 40: Idle information

7	6	5	4	3	2	1	0
97h or	E3h						
Х			Drive	Х			
Х							
Х	X						
Х	X						
Timer	Timer Count (5 msec increments)						
Х							
	97h or X X X X X Timer	97h or E3h X X X X X Timer Count (S	97h or E3h X X X X X Timer Count (5 msec	97h or E3h X Drive X X X X Timer Count (5 msec increme	97h or E3h X Drive X X X X X Timer Count (5 msec increments)	97h or E3h X Drive X X X X X Timer Count (5 msec increments)	97h or E3h X Drive X X X X X Timer Count (5 msec increments)

This command causes the CompactFlash Storage Card to set BSY, enter the IDLE mode, clear BSY and generate an interrupt. If the sector count is non-zero, it is interpreted as a timer count with each count being 5 milliseconds and the automatic power down mode is enabled. If the sector count is zero, the automatic power down mode is disabled. Note that this time base (5 msec) is different from the ATA specification.

5.10.6 Idle immediate - 95H or E1H

 Table 41: Idle immediate information

Cylinder Low(4)	Cylinde	Cylinder Low (LBA 15-8								
Sector	Sector	Numbe	(LBA 7-	0						
Number(3)										
Sector Count(2)	Sector	Sector Count								
Feature(1)	Х									

This command uses DMA mode to read from 1 to 256 sectors as specified in the Sector Count register. A sector count of 0 request 256 sectors. The transfer begins at he sector specified in the Sector Number Register. When this command is issued the CompactFlash Storage Card sets BSY, puts all or part of the sector of data in the buffer. The Card is then permitted, although not required, to set DRQ, cleat BSY. The Card asserts DMAREQ while data is available to be transferred. The Card asserts DMAREQ while data is available to be transferred. The Card asserts DMAREQ while data from the Card using DMA. While DMAREQ is asserted by the Card, the Host asserts –DMACK while it is ready to transfer data by DMA and asserts –IORD once for each 16 bit word to be

transferred to the Host.

Interrupts are not generated on every sector, but upon completion of the transfer of the entire number of sectors to be transferred or upon the occurrence of an unrecoverable error. At command completion, the Command Block Registers contain the cylinder, head and sector number of the last sector read. If an error occurs, the read terminates at the sector where the error occurred. The command Block Registers contain the cylinder, head, and sector number of the sector where the occurred. The amount of data transferred is indeterminate. When a Read DMA command is received by the Card and 8 bit transfer mode has been enabled by the Set Features command, the Card shall return the Aborted error.

Number(3)										
Sector Count(2)	Sector	Sector Count								
Feature(1)	Х									

5.10.9 Read Sector(s) - 20h

 Table 44: Read sector information

This command reads from 1 to 256 sectors as specified in the Sector Count Register. A sector count of 0 requests 256 sectors. The transfer begins at the sector specified in the Sector Number Register. When this command is issued and after each sector of data (except the last one) has buffer, sets DRQ, cleats BSY, and generates an interrupt. The host then reads the 512 bytes of data from the buffer.

At command completion, the Command Block Registers contain the cylinder, head and sector number of the last sector read. If an error occurs, the read terminates at the sector where the error occurred. The command Block Registers contain the cylinder head, and sector number of the sector 2where the error occurred. The flawed data is pending in the sector buffer.

5.10.10 Read Verify Sector(s) - 40h

 Table 45: Read verify sector information

			,						
Register	7	6	5	4	3	2	1	0	
Command(7)	40h	40h							
C/D/H(6)	1	LBA	1	Drive	Head (LBA 27-	·24)

Cylinder Low(4)	Cylinde	Cylinder Low (LBA 15-8)							
Sector	Sector	Numbe	r (LBA 7	7-0)					
Number(3)									
Sector Count(2)	Sector	Sector Count							
Feature(1)	Х								

This command is identical to the Read Sectors command, except that DRQ is never set and no data is transferred to the host. When the command is accepted, the CompactFlash Storage Card sets BSY. When the requested sectors have been verified, the CompactFlash Storage Card clears BSY and generates an interrupt. Upon command completion, the Command Block Registers contain the cylinder, head, and sector number of the last sector verified. If an error occurs, the Read Verify Command terminates at the sector where the error occurs. The Command Block Registers contain the cylinder, head and sector number of the sector where the error occurred. The Sector Count Register contains the number of sectors not yet verified.

5.10.11 Set Features - Efh

7 6 5 4 3 2 1 0 Register Command(7) C6h C/D/H(6) Х Drive Х Х Cylinder High(5) Cylinder Low(4) Х Х Sector Number(3) Sector Count(2) Sector Count Х Feature(1)

Table 48: Set multiple mode information

This command enables the CompactFlash Storage Card to perform Read and Write Multiple operations and establishes the block count for these commands. The Sector Count Register is loaded with the number of sectors per block. Upon receipt of the command, the CompactFlash Storage Card sets BSY to 1 and checks the Sector Count Register. If the Sector Count Register contains a valid value and the block count is supported, the value is loaded and execution is enabled for all subsequent Read Multiple and Write Multiple commands. If the Sector Count Register contains 0 when the command is issued, Read and Write Multiple commands are disabled. At power on, or after a hardware or (unless disabled by a Set Feature command) software reset, the default mode is Read and Write multiple disabled.

5.10.13 Set Sleep Mode -E6h

Table 49: Set sleep mode information

Register	7	6	5	4	3	2	1	0
Command(7)	E6h							
C/D/H(6)	Х			Drive	Х			
Cylinder	Х							
High(5)								
Cylinder Low(4)	Х							
Sector	Х							
Number(3)								
Sector Count(2)	Х							
Feature(1)	Х							

This command causes the CompactFlash Storage Card to set BSY, enter the Sleep mode, clear BSY and generate an interrupt. Recovery from sleep mode is accomplished by simply issuing another command (a reset is permitted but not required). Sleep mode is also entered when internal timers expire so the host does not need to issue this command except when it wishes to enter Sleep mode immediately. The default value for the timer is 5 milliseconds.

5.10.14 Standby -E2h

	Ia	Die 30.	Stanut	<i>y</i> 11101	mation

Cylinder	Х							
High(5)								
Cylinder Low(4)	Х							
Sector	Х							
Number(3)								
Sector Count(2)	Х							
Feature(1)	Х							

This command causes the CompactFlash Storage Card to set BSY, enter the Sleep mode, clear BSY and return the interrupt immediately. Recovery from sleep mode is accomplished by simply issuing another command (a reset is not required).

5.10.16 Write Buffer – E8h

 Table 52: Write buffer information

Register	7	6	5	4	3	2	1	0
Command(7)	E8h							
C/D/H(6)	Х			Drive	Х			
Cylinder	Х							
High(5)								
Cylinder Low(4)	Х							
Sector	Х							
Number(3)								
Sector Count(2)	Х							
Feature(1)	Х							

The Write Buffer command enables the host to overwrite contents of the CompactFlash Storage Card's sector buffer with any data pattern desired. This command has the same protocol as the Write Sector(s) command and transfer 512 bytes.

5.10.17 Write DMA – Cah

Table 53: Write DMA information

Register	7	6	5	4	3	2	1	0
Command(7)	Cah	Cah						
C/D/H(6)	1	LBA	1	Drive	Head (LBA 27-	·24)	
Cylinder	Cylinde	er High	(LBA 23	-16)

Cylinder Low(4)	Cylinde	er Low(l	_BA 15-8	3)				
Sector	Sector	Numbe	r (LBA 7	'-0)				
Number(3)								
Sector Count(2)	Sector	Sector Count						
Feature(1)	Х							

This command uses DMA mode to write from 1 to 256 sectors as specified in the Sector Count register. A sector count of 0 requests 256 sectors. The transfer begins at the sector specified in the Sector Number Register. When this command is issued the CompactFlash Storage Card sets BSY, puts all or part of the sector of data in the buffer. The Card is then permitted, although not required, to set DRQ, clear BSY. The Card asserts DMAREQ while data is available to be transferred. The host then writes the (512*sector count) bytes of data to the Card using DMA. While DMAREQ is asserted by the Card, the host asserts – DMACK while it is ready to transfer data by DMA and asserts –IOWR once for each 16 bit word to be transferred from the Host.

Interrupts are not generated on every sector, but upon completion of the transfer of the entire number of sectors to be transferred or upon the occurrence of an unrecovertable error. At command completion, the Command Block Registers contain the cylinder, head and sector number of the last sector read. If an error occurs, the read terminates at the sector where the error occurred. The Command Block Registers contain the cylinder, head and sector number of the sector where the error occurred. The amount of data transferred is indeterminate. When a write DMA command is received by the Card and 8 bit transfer mode has been enabled by the Set Features command, the Card shall return the Aborted error.

5.10.18 Write Multiple- C5h

5.10.18.1 Command Code C5h **5.10.18.2 Protocol** PIO data-out

5.10.18.3 Inputs

The LBA mid, LBA High, Device, and LBA Low specify the starting sector address to be written. The Sector Count register specifies the number of sectors to be transferred.

 Table 56: Write multiple command for normal output information

Error register-

IDNF shall be set to one if a user-accessible address could not be found. IDNF shall be set to one if an address outside of the range user-accessible address is requested if command aborted is not returned.

ABRT shall be set to one if an error, include an ICRC error, has occurred during an Ultra DMA data transfer. ABRT shall be set to one if an address outside of the range of user-accessible address is requested if IDNF is not set to one.

LBA Low, LBA Mid, and LBA High, Device -

Shall be written with the address of first unrecoverable error.

Status register-

BSY will be cleared to zero indicating command completion

DRDY will be set to one.

DF (Device Fault) will be set to one if a device fault has occurred.

DRQ will be cleared to zero

ERR will be set to one if an Error register bit is set to one.

iCF 1ME

5.10.18.6 Prerequisites

DRDY set to one. If bit 8 of IDENTIFY DEVICE word 59 is cleared to zero, a successful SET MULTIPLE MODE command shall proceed a WRITE MULTIPLE command.

5.10.18.7 Description

This command writes the number of sectors specified in the Sector Count register.

The number of sectors per block is defined by the content of word 59 of the IDENTIFY DEVICE response.

When the WRITE MULTIPLE command is issued, the SECTOR Count register contains the number of sectors (not the number of blocks) requested. The device shall interrupt for each DRQ block transferred.

IF the number of requested sectors is not evenly divisible by the block count, as many full blocks as possible are transferred, followed by a final, partial block transfer. The partial block transfer is for n sectors, where:

N = Remainder (sector count / block count).

If the WRITE MULTIPLE command is received when WRITE MULTIPLE commands are disabled, the Write Multiple operation shall be rejected with command aborted.

Device errors encountered during WRITE MULTIPLE commands are posted after the attempted device write of the block or partial block transferred. The command ends with the sector in error, even if the error was in the middle of a block. Subsequent blocks are not transferred in the event of an error.

The contents of the Command Block Registers following the transfer of a data block that had a sector in error are undefined. The host should retry the transfer as individual requests to obtain valid error information. Interrupt pending is set when the DRQ bit is set to one at the beginning of each block or partial block.

Register	7	6	5	4	3	2	1	0

Number(3)									
Sector Count(2)	Sector	Sector Count							
Feature(1)	Х								

5.10.19 Write Sector(s) – 30h

Table 57: Write sector information

This command writes from 1 to 256 sectors as specified in the Sector Count Register. A60Rev 1.6TPS,DEC. 2016

iCF 1ME

sector count of zero requests 256 sectors. The transfer begins at the sector specified in the Sector Number Register. When this command is accepted, the CompactFlash Storage Card sets BST, then sets DRQ and clears BSDY, then waits for the host to fill the sector buffer with the data to be written. No interrupt is generated to start the first host transfer operation. No data should be transferred by the host until BSY has been cleared by the host.

For multiple sectors, after the first sector of data is in the buffer, BSY shall be set and DRQ shall be cleared. After the next buffer is ready for data, BSY is cleared, DRQ is set and an interrupt is generated. When the final sector of data is transferred, BSY is set and DRQ is cleared. It shall remain in this state until the command is completed at which time BSY is cleared and an interrupt is generated. If an error occurs during a write of more than one sector, writing terminates at the sector where the error occurs. The Command Block Registers contain the cylinder, head and sector number of the sector where the error occurred. The host may then read the command block to determine what error has occurred, and on which sector.

5.10.20.7 Description

This command transfer 512 byte of data from the host. Table 10 defines the content of this information. The data transferred controls the function of this command. Table 11 defines the interaction of the identifier and security level bits.

The revision code field shall be returned in the IDENTIFY DEVICE word 92. The valid revision codes are 0001h through FFFEh. A value of 0000h or FFFFh indicates that the Master Password Revision Code is not supported.

5.10.21.6 Prerequisites

DRDY set to one.

5.10.21.7 Description

This command transfers 512 bytes of data from the host. Table13 defines the content of this information. If the Identifier bit is set to Master and the device is in high security level, then the password supplied shall be compared with the stored Master password. If the device is in maximum security level then the unlock shall be rejected.

If the Identifier bit is set to user then the device shall compare the supplied password with the stored User password. If the password compare fails then the device shall return command aborted to the host and decrements the unlock counter. This counter shall be initially set to five and shall decremented for each password mismatch when SECURITY

UNLOCK and SECURITY ERASE UNIT commands shall be command aborted until a power-on reset or a hardware reset. SECURITY UNLOCK commands issued when the device is unlocked have no effect on the unlock counter.

DRQ will be cleared to zero

ERR will be set to one if an Error register bit is set to one.

5.10.23.6 Prerequisites

DRDY set to one. This command shall be immediately preceded by a SECURITY ERASE PREPARE command.

5.10.23.7 Description

This command transfer 512 bytes of data from the host. Table12 defines the content of this information. If the password does not match the password previously saved by the device, the device shall reject the command with command aborted.

The SECURITY ERASE PREPARE command shall be completed immediately prior to the SECURITY ERASE UNIT command. If the device receives a SECURITY ERASE UNIT command without an immediately prior SECURITY ERASE PREPARE command, the device shall command abort the SECURITY ERASE UNIT command.

When Normal Erase mode is specified, the SECURITY ERASE UNIT command shall write binary zeroes to all user data areas. The Enhanced Erase mode is optional. When Enhanced Erase Mode is specified, the device shall write predetermined data patterns to all user areas. In Enhanced Erase mode, all previously written user data shall be overwritten, including sectors that are no longer in use due to reallocation.

This command shall disable the device Lock mode, however, the Master password shall still

be stored internally within the device and may be reactivated later a new User password is set.

Status	BSY	DRDY	DF	Na	DRQ	Na	Na	ERR		

Device Register-

DEV shall indicate the selected device.

Status register-

BSY will be cleared to zero indicating command completion.

DRDY will be set to one.

DF (Device Fault) will be cleared to zero.

DRQ shall be cleared to zero.

ERR shall be cleared to zero.

5.10.29.6 Prerequisites

DRDY set to one. SMART enabled.

5.10.29.7 Description

This command disables all SMART capabilities within device.

6. Device Parameters

iCF 1ME device parameters are listed in Table 86.

Capacity	Cylinders	Heads	Sectors	LBA	Capacity(MB)
4GB	7,785	16	63	7,847,280	3,831.68
8GB	15,538	16	63	15,662,304	7,647.61
16GB	31,045	16	63	31,293,360	15,279.96
32GB	62,041	16	63	62,537,328	30,535.80
64GB	16,383	15	63	125,059,072	61,064.00
128GB	16,383	15	63	250,085,376	122,112.00

8. Appendix

Issue Date: May 26, 2014 Ref. Report No. ISL-14LE208FB

Product Name Model(s) Brand Applicant Address

: DECFC-XXXD53* # % % & : Innodisk : Innodisk Corporation : 5F.No.237, Sec. 1, Datong Rd., Xizhi Dist., New Taipei City 221, Taiwan (R.O.C.)

We, International Standards Laboratory, hereby certify that:

: iCF 1ME

The device bearing the trade name and model specified above has been shown to comply with the applicable technical standards as indicated in the measurement report and was tested in accordance with the measurement procedures specified. (refer to Test Report if any modifications were made for compliance).

Standards:

FCC CFR Title 47 Part 15 Subpart B: 2012- Section 15.107 and 15.109 ANSI C63.4-2009 Industry Canada Interference-Causing Equipment Standard ICES-003 Issue 5: 2012

Class B

I attest to the accuracy of data and all measurements reported herein were performed by me or were made under my supervision and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements and vouch for the qualifications of all persons taking them.
