Safety Information

Important Information

NOTICE
Read these instructions carefully, and look at the equipment to become familiar with the device before trying to install, operate, or maintain it. The following special messages may appear throughout this documentation or on the equipment to warn of potential hazards or to call attention to information that clarifies or simplifies a procedure.

The addition of this symbol to a Danger or Warning safety label indicates that an electrical hazard exists, which will result in personal injury if the instructions are not followed.

This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

DANGER indicates an imminently hazardous situation, which, if not avoided, will result in death, serious injury, or equipment damage.

WARNING indicates a potentially hazardous situation, which, if not avoided, can result in death, serious injury, or equipment damage.

CAUTION indicates a potentially hazardous situation, which, if not avoided, can result in injury or equipment damage.
PLEASE NOTE  Electrical equipment should be serviced only by qualified personnel. No responsibility is assumed by Schneider Electric for any consequences arising out of the use of this material. This document is not intended as an instruction manual for untrained persons.

About the Book

At a Glance

Document Scope
This manual describes the use of functions accessible from the front panel of the smart relay.

This document is divided into 5 parts and addresses the following topics:

- Part I: Powering up and Discovering the Smart Relay.
  - General presentation of the smart relay.
- Part II: Functions Accessible from the Front Panel.
  - Description of the interface and the menus of the smart relay.
- Part III: LD Language.
  - Description of automation functions available for programming in LADDER.
- Part IV: Creating, Debugging and Saving an Application.
  - Example of programming
  - Presentation of tools for debugging and saving an application.
- Part V: Diagnostics.
  - Help for finding solutions to operating problems.

Validity Note
The information in this manual applies only to smart relays of the Zelio 2 series.

Safety

Preliminary Advice

Preliminary advice and general safety precautions relating to installing smart relays:

- Remember that only qualified personnel are authorized to implement the smart relay.
- Read this instruction sheet and the User Guide to learn the procedures prior to installing, wiring, operating, maintaining of controlling the smart relay.
- The end user should keep this User Guide and the product instructions sheet.
- Install the smart relay by following the instructions in the instruction bulletin and the User Guide. Improper installation may result in failure or malfunction of the smart relay.
- Make the necessary ground and short circuit the connections.
- Check the operating conditions, as described in the User Guide. If you are unsure of the technical characteristics, contact Schneider Electric.
- Fluctuations or variations in the power supply voltage should not exceed the tolerance thresholds stated in the technical characteristics, as they may lead to operating failures and potentially dangerous situations.
- Take any steps necessary to ensure that an application interrupted by a power failure continues to operate correctly after restoring power and make sure also that no dangerous situation whatsoever arises.
- Take any steps necessary to prevent involuntary activation of the relay.
- Automation and control devices must be installed in areas where they are protected against any risk of involuntary activation.
- Ensure that all connections to the control system meet applicable safety standards.
- Ensure that you comply with all applicable standards for emergency stop systems in order to avoid potentially dangerous situations. Ensure that releasing the emergency stop system does not cause the automated system to suddenly restart.
- Install the smart relay only in environments described in the User Guide. Do not use the smart relay in environments subject to excessive temperatures, elevated relative humidity, condensation, corrosive gases, or excessive shocks.
- The smart relay should be used in “Pollution level 2” environments. This level defines the effect of pollution on the insulation.
- Definition of level 2 Pollution: Only non-conductive pollution arises, except for occasional temporary conductivity caused by condensation. Do not use smart relays in environments lower than those specified in IEC Standard 60664-1.
- Use appropriate wires according to current and voltage requirements. Tighten the screws of the terminal according to the specified torque.
- Use an IEC 60127 approved fuse, in conformity with the requirements for current and voltage, to protect the power line and output circuits. This is not required when a device including a smart relay is intended for Europe.
- Use an EU-approved switch. This is not required when a device including a smart relay is intended for Europe.
**DANGER**

**HAZARD OF ELECTRIC SHOCK, EXPLOSION, OR ARC FLASH**

Turn power off before installing, removing, wiring or maintaining.

*Failure to follow this instruction will result in death, serious injury, or equipment damage.*

---

**WARNING**

**RISK OF EXPLOSION**

**Precautions:**
- Compliant with standard CSA C22.2 No 213: This equipment is designed for use in Class 1, Division 2, Groups A, B, C, D or in non-dangerous locations only.
  
  Replacement of components may compromise the suitability to this specified environment.

- Ensure that the power voltage and its tolerances are compatible with those of the smart relay.

- Do not disconnect the equipment as long as the power supply has not been cut off or the zone is not safe.

- This product contains a battery. Do not place the smart relay in fire.

*Failure to follow this instruction can result in death, serious injury, or equipment damage.*

---

**WARNING**

**RISK OF ELECTRIC SHOCK OR FIRE**

**Precautions:**
- The smart relay is solely intended for installation in an enclosure. Do not install the smart relay outside of an enclosure.

- Ensure that no metal fragment or wiring material falls into the enclosure of the smart relay. Foreign bodies may lead to fire, material damage or malfunction.

*Failure to follow this instruction can result in death, serious injury, or equipment damage.*
WARNING

IN Voluntary OPERATION OF EQUIPMENT

Precautions:
- Power off the smart relay prior to installation, deinstallation, wiring, maintenance or operation of the unit.
- The emergency stop and the locking circuits should be configured in the software program of the smart relay.
- In the event of failure of the relays or transistors in the output modules of the smart relay, the outputs should remain activated or deactivated. For output signals that might lead to serious accidents, install a control circuit external to the smart relay.
- Install the modules according to the environmental operation conditions specified in the instruction bulletin.
- Do not attempt to dismantle, repair or modify the smart modules.
- Use an IEC 60127 approved fuse, in conformity with the requirements for current and voltage, to protect the power line and output circuits.

Failure to follow this instruction can result in death, serious injury, or equipment damage.

DANGER

RISK OF UNEXPECTED EQUIPMENT OPERATION

Special case of the use of the SR2COM01 modem communication extension. Sending commands may lead to modification of the status of smart relay outputs or accidental enabling of controlled equipment.

It is important to:
- Know how the commands will affect the process or the controlled equipment,
- Take any preventive measures necessary to ensure safety when making modifications.

Failure to follow this instruction will result in death, serious injury, or equipment damage.
Presentation of the Smart Relay Front Panel

Introduction

Smart relays are designed to simplify the electrical wiring of intelligent solutions. A smart relay is very simple to implement. Its flexibility and its high performance allow users to save significant amounts of time and money.

This User's Guide is intended for people who do not have an in-depth knowledge of automation systems and who would like to be able to implement smart relays.
Description of the Smart Relay Front Panel

The illustration below presents the elements of the front panel of the smart relay:

Prompt | Element
---|---
1 | Retractable mounting feet.
2 | Screw terminal block for the power supply.
3 | LCD display, 4 lines, 18 characters.
4 | Screw terminal block for discrete inputs.
5 | Screw terminal block for analog inputs. 0-10 Volts, usable in discrete input mode depending on model.
6 | Slot for backup memory or PC connection cable.
7 | Shift key (white).
8 | Menu/OK key (green) for selection and confirmation.
9 | Relay output screw terminal block.
10 | Navigation keys (gray) or after configuring Z pushbuttons.
Description of the LCD

The illustration below presents an example of LCD display elements when displaying the INPUT-OUTPUT screen:

<table>
<thead>
<tr>
<th>Prompt</th>
<th>Element</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Input status* display (B...E represent the analog inputs, also may be used as DISCR).</td>
</tr>
<tr>
<td>2</td>
<td>Display of the operating mode (RUN/STOP) and programming mode (LD/FBD).</td>
</tr>
<tr>
<td>3</td>
<td>Display of the date (day and time for products with clock).</td>
</tr>
<tr>
<td>4</td>
<td>Output status display.</td>
</tr>
<tr>
<td>5</td>
<td>Contextual menus / pushbuttons / icons indicating the operating modes.</td>
</tr>
</tbody>
</table>

* An ACTIVE input or output is displayed in reverse video.
Characteristics and Connections

Introduction
Here is detailed information on the characteristics of DC smart relay connections.

Recommended connection
It is recommended to connect the smart relay to a regulated DC power supply:

Possible Connection
It is possible to connect the smart relay to a rectified filtered regulated power supply:

Provided that it verify the following characteristics, according to the type of smart relay:

<table>
<thead>
<tr>
<th>SR2 ... BD</th>
<th>SR2 ... JD</th>
</tr>
</thead>
<tbody>
<tr>
<td>U max &lt; 30 V</td>
<td>U max &lt; 14.4 V</td>
</tr>
<tr>
<td>U min &gt; 19.2 V</td>
<td>U min &gt; 10.4 V</td>
</tr>
</tbody>
</table>

Prohibited Connection
It is prohibited to connect the smart relay to a rectified non-filtered power supply:
Control Keys on the Front Panel of the Smart Relay

Description
The keys located on the front panel of the smart relay are used to configure, program and control the application and monitor the application’s progress.

Illustration:

![Diagram of key functions]

Note: The LCD screen is lit for 30 seconds when the user presses any of the buttons on the front panel.

Shift Key
The Shift key is the white key located on the right side of the LCD screen. When the Shift key is pressed, a contextual menu is displayed above the Z keys (Ins, Del, Param, etc.).

Menu/OK Key
The Menu/OK key is the green key located below the LCD screen on the right side. This key is used for all confirmations: Menu, sub-menu, program, parameter, etc.

Zx Keys
The Zx keys are the gray keys aligned from left (Z1) to right (Z4) and located under the LCD. The arrows indicating the movement direction associated with navigation are marked above the keys.

The navigation keys are used to move left or right, down or up.

The position on the screen appears as a flashing zone:
- Square for a position that corresponds to a contact (only in programming mode),
- Round for a link (only in programming mode).

Note: When the keys may be used for other actions apart from navigation, a contextual menu bar is displayed (e.g.: 1, 2, 3 and 4 as Zx-type keys).
When the cursor is placed on a modifiable parameter, if the Shift key is pressed, a contextual menu appears.

Illustration:

Using the contextual menu functions:

- + / -: Used to scroll through the various possible values of the selected field (types of inputs, outputs, automation functions, numbers, numerical values, etc),
- Ins.: Inserts a line,
- Del.: Deletes the selected element, or the entire line if it is empty,
- Param.: Displays the specific parameter screen for the automation function (visible only if the automation function contains a parameter),
- ← ↑ ↓ →: Direction of the connection (visible only if the cursor is placed over a link box),
- 1 2 3 4: This line appears when the keys are used as Zx key-type inputs in a program.

Illustration:

The key indicates that the program is password-protected.

Illustration:

1: Indicates the state of the smart relay. In RUN it is in motion, in STOP it is immobile.
2: Indicates that faults have appeared (see FAULT menu).
3: The smart relay is physically connected to the programming software.
Examples

Introduction

We will now see two examples of how to use the smart relay’s keys.

Language Selection

Example 1: Here are details on how to select the language of the smart relay:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Powering up  
On initial powering-up, the INPUT-OUTPUT screen is displayed (See: INPUTS-OUTPUTS Screen, p. 34). By default, the selected language is English. View: |
|      | ![View](image1) |
| 2    | From the INPUT-OUTPUT screen, enter the MAIN menu, then go to the CONFIGURATION menu LANGUAGE, by pressing 7 times on the down navigation key View: |
|      | ![View](image2) |

Note: the selected command flashes.
### Initial Power up and Discovering

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>Enter in the language selection menu.</td>
</tr>
</tbody>
</table>

**View:**

<table>
<thead>
<tr>
<th>Language</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENGLISH</td>
</tr>
<tr>
<td>FRANÇAIS</td>
</tr>
<tr>
<td>DEUTSCH</td>
</tr>
<tr>
<td>ITALIANO</td>
</tr>
</tbody>
</table>

**Note:** The activated option flashes and it is also indicated by a black diamond.

| 4    | Select and confirm the language (the selection is shown in flashing text). |

The **Menu/OK** button is used to confirm the selection of the new language. The display returns to the MAIN menu when the smart relay is in STOP mode.

**View:**

<table>
<thead>
<tr>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEAR PROG</td>
</tr>
<tr>
<td>TRANSFER</td>
</tr>
<tr>
<td>VERSION</td>
</tr>
<tr>
<td>LANGUAGE</td>
</tr>
</tbody>
</table>
Example 2: Here are details on procedure to follow to modify the date and time of the initial power up or following a long lasting power failure.

### Modification of Date and Hour

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>From the INPUT-OUTPUT screen, enter the <strong>MAIN</strong> menu, then go to the <strong>CHANGE D/H</strong> menu:</td>
</tr>

STOP LD
FRI 25 NOV 16:40
1234
```
Initial Power up and Discovering

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Enter the date and hour configuration menu:</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Menu / OK" /></td>
</tr>
<tr>
<td></td>
<td><strong>View:</strong></td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="CHANGE D/H" /></td>
</tr>
<tr>
<td></td>
<td><strong>THU 07 JUL 2003</strong></td>
</tr>
<tr>
<td></td>
<td><strong>16:27 30 s</strong></td>
</tr>
<tr>
<td></td>
<td><strong>CAL ± 02 secs/WK</strong></td>
</tr>
<tr>
<td>3</td>
<td>Select the parameter to modify using the arrows (the selection is highlighted by the blinking of the parameter):</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Arrows" /> or <img src="image" alt="Arrows" /></td>
</tr>
<tr>
<td></td>
<td><strong>Modify the parameter using the navigation keys:</strong></td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Navigation Keys" /> or <img src="image" alt="Navigation Keys" /></td>
</tr>
<tr>
<td></td>
<td><strong>Then confirm with the Menu/OK key:</strong></td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Menu / OK" /></td>
</tr>
<tr>
<td></td>
<td><strong>The Menu/OK button is used to confirm the modifications. The display returns to the MAIN menu when the smart relay is in STOP mode.</strong></td>
</tr>
<tr>
<td></td>
<td><strong>View:</strong></td>

<td>● Monitor the performance of the application.</td>
</tr>
</tbody>
</table>

Illustration:

The line flashes to indicate where you are positioned.
The up triangle ▲ on the right side of the LCD screen indicates that possible up options exist. The down triangle ▼ indicates that possible down options exist.
To return to the previous menu, press left navigation key.

**Note:** The LCD screen is lit for 30 seconds when the user presses any of the buttons on the front panel.
Managing Menus

The **INPUTS-OUTPUTS** screen is displayed by default whether the mode is LD or FBD. Pressing the **Menu/OK** key switches the display from the **INPUTS-OUTPUTS** screen to the MAIN menu.

The menu on the first row which is selected by default (flashing). The ⤑ and ⤒ navigation keys can be used to place the cursor over the other menus.

Press the green **Menu/OK** key to display the screen corresponding to the selected menu or to move onto the first sub-menu.

### Differences Between LD and FBD Modes

Certain menus are specific to either LD or FBD mode.

Configuring Extensions

Extensions added to the smart relay may only be configured from the programming software. See on-line help of the programming software for more information.
INPUTS-OUTPUTS Screen

At a Glance

Subject of this Chapter
This chapter describes the characteristics of the INPUTS-OUTPUTS screen.

What's in this Chapter?
This chapter contains the following topics:

<table>
<thead>
<tr>
<th>Topic</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>INPUTS-OUTPUTS Screen</td>
<td>34</td>
</tr>
<tr>
<td>TEXT and DISPLAY screen</td>
<td>36</td>
</tr>
</tbody>
</table>
INPUTS-OUTPUTS Screen

Description

This is the highest-level interface. It is displayed by default, when no (TEXT or DISPLAY) display function is active and regardless of:

- The programming type: LD or FBD,
- The mode: STOP or RUN.

Illustration:

The INPUTS-OUTPUTS screen can be used to view:

1. The state of the inputs: 1 to 9, A to P,
2. The mode used: LD/FBD,
3. The Operating mode: RUN / STOP,
4. The date and time for products with a clock,
5. The state of the outputs: 1 to 9, A to G,

In Simulation mode or Monitoring mode when the program is in RUN, the active states of the Inputs/Outputs are indicated in reverse video.
Access to the Main Menu

Pressing the **Menu/OK** key switches the display from the INPUTS-OUTPUTS screen to the main menu:

- PROGRAMMING (**LD** STOP mode),
- MONITORING (**LD** RUN mode),
- PARAMETERS,
- RUN / STOP,
- CONFIGURATION (STOP mode),
- CLEAR PROG. (**LD** STOP mode),
- TRANSFER (STOP mode),
- VERSION,
- LANGUAGE,
- FAULT,
- CHANGE D/T,
- CHANGE SUMM/WINT.

The display automatically returns to the INPUTS-OUTPUTS menu on exiting all other menus and sub-menus.
TEXT and DISPLAY screen

Description

The display functions are used to display text or numerical values (current value, preset value, etc.) on the LCD display instead of the INPUTS-OUTPUTS:

- In LD mode: A TEXT function is active,
- In FBD mode: A DISPLAY function is active.

Illustration:

If several display functions are active simultaneously:

- In LD mode: The highest block number is displayed. There are 16 TEXT-type blocks numbered from 1 to 9 then from A to G,
- In FBD mode: The superposition of all of the FBD DISPLAY screens is displayed, for up to 32 blocks. If more than 32 FBD DISPLAY blocks are active, the screens of the 32 FBD DISPLAY blocks with the lowest numbers are superposed.

Switching Between the Screens

It is however possible to go from the TEXT (LD) or DISPLAY (FBD) screen to the INPUTS-OUTPUTS screen and vice-versa.

To do this, proceed as follows:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Press and hold down the Shift key and press the Menu/OK key.</td>
</tr>
</tbody>
</table>

Note: The display functions are programmable only from the programming software (see the on-line help for the programming software for more information).
In **RUN** mode, when the TEXT / DISPLAY screen is displayed, it is possible to modify, from the front panel, the displayed values whose modification was authorized in the block function parameters window.

To do this, proceed as follows:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Press the **Shift** key (white key) to display the contextual menu.  
**Result:** Param is displayed at the bottom of the screen. |
| 2    | Press the **key (without releasing the Shift key)** to display the contextual menu.  
**Result:** The parameter which can be modified flashes and the following contextual menu is displayed: |
| 3    | Select the parameter to be modified using the navigation keys **and** from the contextual menu (the value which are available for modification flash). |
| 4    | Modify the parameter value with the **+ ( ) and - ( ) keys** from the contextual menu. |
| 5    | Confirm the changes by pressing the **Menu/OK** key.  
**Result:** The display returns to the INPUTS-OUTPUTS screen or the TEXT / DISPLAY screen. |
This chapter describes the characteristics of the PROGRAMMING menu specific to LD mode / smart relay in STOP mode.

This function lets the user enter the ladder diagrams that will work on the smart relay. This program is written only using a ladder diagram LD.

Illustration:

Note: The smart relays to which have been added an Input/Output extension are programmable only in FBD mode from the programming software. See on-line help of the programming software for more information.

Rules for Entering Ladder Diagrams

Description
A smart relay allows you to enter 120 line Ladder diagrams.

The smart relay’s display screen is used to display these lines, 4 at a time, in the following manner:

```
I1  H1  C1  M1  T2   CC1
I2 ------
Z1 ------
Z3 ------
```

Each line comprises 5 fields each with 2 characters reserved for contacts (conditions). The 4 central columns can also accept links. The last three-character column is reserved for coils (actions).

Links must be entered between the contact and coil columns.

A ladder diagram is entered into the smart relay using the front panel keys (see Control Keys on the Front Panel of the Smart Relay, p. 21).
**Data Entry Rules**  Make sure you respect the following rules when you enter a ladder diagram:

<table>
<thead>
<tr>
<th>Rules</th>
<th>Incorrect</th>
<th>Correct</th>
</tr>
</thead>
<tbody>
<tr>
<td>Each coil must only be entered once in the right hand column</td>
<td><img src="image1" alt="Incorrect Diagram" /></td>
<td><img src="image2" alt="Correct Diagram" /></td>
</tr>
<tr>
<td>Elements used as contacts may be entered as many times as necessary in the 5 left hand columns.</td>
<td><img src="image3" alt="Incorrect Diagram" /></td>
<td><img src="image4" alt="Correct Diagram" /></td>
</tr>
<tr>
<td>Links must always run from left to right.</td>
<td><img src="image5" alt="Incorrect Diagram" /></td>
<td><img src="image6" alt="Correct Diagram" /></td>
</tr>
<tr>
<td>If S coils (SET) are used in a diagram, also use an R (Reset) coil.</td>
<td><img src="image7" alt="Incorrect Diagram" /></td>
<td><img src="image8" alt="Correct Diagram" /></td>
</tr>
<tr>
<td>If no R (Reset) coils are used, the corresponding coil will always be set to 1.</td>
<td><img src="image9" alt="Incorrect Diagram" /></td>
<td><img src="image10" alt="Correct Diagram" /></td>
</tr>
<tr>
<td>An R (Reset) coil must be used for reset purposes.</td>
<td><img src="image11" alt="Incorrect Diagram" /></td>
<td><img src="image12" alt="Correct Diagram" /></td>
</tr>
</tbody>
</table>

**Note:** Smart relays run programs from top to bottom and from left to right.
Method for Entering a Contact or Coil

Description

**Note:** Accessible only in **LD mode** / smart relay in **STOP mode**.

This section describes the procedures for performing the following operations:

- Entering an element,
- Modifying an element,
- Deleting an Element.

This is valid for: contact or coil elements, whether the parameters can be set or not.

**Entering an Element**

When entering an element, the following rules must be observed:

- **Contact**: In any column except the last,
- **Coil**: Only in the last column.

The presence of a square, flashing cursor means an element can be inserted.

**Entry procedure:**

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Place the flashing cursor at the required location. The navigation keys can be used move the cursor in the direction of the arrows on the navigation keys. Illustration:</td>
</tr>
<tr>
<td>2</td>
<td>Press the <strong>Shift</strong> key to display the contextual menu. Illustration:</td>
</tr>
<tr>
<td>3</td>
<td>Choose the type of element desired by pressing simultaneously on <strong>Shift</strong> and <strong>+ or -</strong>. This makes the different types of elements scroll down cyclically, in the following order:</td>
</tr>
</tbody>
</table>

- For the contacts: I, i, Z, z, M, m, Q, q, T, t, c, C, K, k, V, v, A, a, H, h, W, w, S, s.
- For the coils: M, Q, T, C, K, X, L, S.

See the chapter **LD Language Elements, p. 87**.
Modifying an element,

To modify an existing control diagram element, simply:
- Position the pointer over the element to modify: Step 1 in the previous table,
- Select the desired new element: Steps 3 to 6.

Initialization

Status of contacts on program initialization:
- A contact in normally-open mode (direct state) is inactive,
- A contact in normally-closed mode (reverse state) is active,

Deleting an Element

To delete an element, simply:
- Place the cursor over the element to delete: Step 1,
- Simultaneously press the Shift and Menu/OK keys.

Two scenarios are possible, depending on the position of the cursor at the time of the deletion:
- Cursor over an element: the element is deleted,
- Cursor over an empty position of the line: the whole line is deleted.

Note: Generally, the deleted element must be replaced by a link.
# Entering a Link

**Description**

**Note:** Accessible only in **LD mode** / smart relay in **STOP mode**.

This section describes the procedures for performing the following operations:
- Entering links between elements,
- Deleting links between elements,
- Replacing a link with a contact.

**Entering a Link**

Links are entered exclusively using the round flashing cursor.

**Entry procedure:**

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Place the flashing cursor at the required location. The navigation keys can be used move the cursor in the direction of the arrows on the navigation keys. Illustration:</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Navigation Keys" /></td>
</tr>
<tr>
<td>2</td>
<td>Press the <strong>Shift</strong> key to display the contextual menu. Illustration:</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Menu/OK and Delete Buttons" /></td>
</tr>
<tr>
<td>3</td>
<td>Trace connections by simultaneously pressing the <strong>Shift</strong> key and the navigation keys: ← ↑ ↓ →. <strong>Shift</strong> and → to trace a connection to the position of the next contact or to the coil at the end of the line. <strong>Shift</strong> and ↑ ↓ to trace perpendicular connections to the previous or next line.</td>
</tr>
<tr>
<td>4</td>
<td>Release the <strong>Shift</strong> key to have access to the navigation keys: ← ↑ ↓ →.</td>
</tr>
<tr>
<td>5</td>
<td>Repeat the operation as many times as necessary to link the elements together according to your requirements.</td>
</tr>
</tbody>
</table>
Modifying a Link
To modify an existing link, simply:

- Place the cursor over the link to modify: step 1
- Modify the link: Steps 2 to 5.

Deleting a Link
To delete a link, simply:

- Place the cursor over the element to delete: step 1.
- Simultaneously press the Shift and Menu/OK keys.

Two scenarios are possible, depending on the position of the cursor at the time of the deletion:

- Cursor over a link: The link is deleted,
- Over an empty position of the line: The whole line is deleted.

Replacing a Link with a Contact
To replace a link with a contact, simply:

- Place the cursor (flashing square) over the link to transform: step 1.
- Follow the element entry (See Method for Entering a Contact or Coil, p. 43) procedure: Steps 3 to 6.
Entry of Function Block Parameters

Description

| Note: Accessible only in LD mode / smart relay in STOP mode. |

When entering a control diagram, the parameters of the configurable automation functions must be completed.

The automation functions with parameters are the following:

- Auxiliary relays (See Auxiliary Relays, p. 93) (latching),
- Discrete Outputs (See Discrete (DISCR) Outputs, p. 98) (latching),
- Clocks (See Clocks, p. 139),
- Analog Comparators (See Analog Comparators, p. 134),
- Timers (See Timers, p. 103),
- Counters (See Counters, p. 114),
- Fast counters (See Fast Counter, p. 121).

Accessibility of parameters

Function block parameter setting can be accessed:

- When entering the command diagram line,
- From the PARAMETERS menu if the block has not been padlocked.
### Entering Parameters on Creation of the Block

Parameters are entered in the same way, whatever the parameters screen:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Enter the desired automation function: Step 1 of the element entry (See Method for Entering a Contact or Coil, p. 43) procedure. When the function has parameters, <strong>Param</strong> appears in the contextual menu (when the <strong>Shift</strong> key is pressed). Illustration:</td>
</tr>
<tr>
<td></td>
<td><img src="image" alt="Parameter Screen" /></td>
</tr>
<tr>
<td>2</td>
<td>Press and hold down the <strong>Shift</strong> key and press on <strong>Param</strong> (key ➤). <strong>Result:</strong> The function's parameter screen appears.</td>
</tr>
<tr>
<td>3</td>
<td>Use the navigation keys to move to the cursor over the modifiable parameters: ➪ ➤.</td>
</tr>
<tr>
<td>4</td>
<td>Modify the value of the parameter using the ➪ and ➤ keys, holding down <strong>Shift</strong>.</td>
</tr>
<tr>
<td>5</td>
<td>Confirm the modifications by pressing <strong>Menu/OK</strong>, which will open the confirmation window. Confirm again by pressing the <strong>Menu/OK</strong> key to save.</td>
</tr>
</tbody>
</table>

### Modifying the Parameters of Existing Blocks

To modify the parameters of an existing element, simply:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Use the navigation keys to move the cursor over the element to modify: step 1 of the element entry (See Method for Entering a Contact or Coil, p. 43) procedure.</td>
</tr>
<tr>
<td>2</td>
<td>At the same time, hold down <strong>Shift</strong> and the <strong>Param</strong> key to open the parameter window.</td>
</tr>
<tr>
<td>3</td>
<td>Carry out steps 3 to 5 above.</td>
</tr>
</tbody>
</table>
# Deletion and Insertion of Diagram Lines

## Deletion

**Note:** Accessible only in LD mode / smart relay in STOP mode.

Diagram lines are deleted line-by-line. The procedure is the following:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Place the cursor over the line to delete.</td>
</tr>
<tr>
<td>2</td>
<td>Delete all the elements in the line (See Method for Entering a Contact or Coil, p. 43): (Links, contacts and coils) to obtain an empty line.</td>
</tr>
<tr>
<td>3</td>
<td>Press the Shift key to display the contextual menu. Illustration: Simultaneously pressing Shift and Del opens the confirmation window.</td>
</tr>
<tr>
<td>4</td>
<td>Confirm by pressing Menu/OK.</td>
</tr>
</tbody>
</table>

**Note:** It is possible to delete all diagram lines contained in the smart relay. In order to do this, select the CLEAR PROG. option from the main menu, and confirm the deletion of all the control diagram lines.

## Insertion

The procedure is the following:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Place the cursor over the line located immediately below the line to create.</td>
</tr>
<tr>
<td>2</td>
<td>Press the Shift key to display the contextual menu.</td>
</tr>
<tr>
<td>3</td>
<td>Press the Ins key (while holding down the Shift key) to create the line.</td>
</tr>
</tbody>
</table>
PARAMETERS Menu

Description
This menu is used to enter and modify the application parameters directly on the screen using the smart relay keys. This function can be accessed in the two modes: LD and FBD, but the contents will be specific to the mode used.

If there are non-locked parameters to display they are listed in the window; otherwise a NO PARAMETER message appears.

LD mode
Functions with parameters in LD mode:
- Auxiliary relays (See Auxiliary Relays, p. 93) (latching),
- Discrete Outputs (See Discrete (DISCR) Outputs, p. 98) (latching),
- Clocks (See Clocks, p. 139),
- Analog Comparators (See Analog Comparators, p. 134),
- Timers (See Timers, p. 103),
- Counters (See Counters, p. 114),
- Fast counter (See Fast Counter, p. 121).

Only those functions used in the program and with parameters are listed in the PARAMETERS menu.
FBD mode

Functions with parameters in FBD mode:
- Numerical Constant-Type Inputs,
- Clocks,
- Gain,
- Timers: TIMER A/C, TIMER B/H, TIMER Li,
- Counters: PRESET COUNT,
- Fast counter,
- CAM block.

To access the parameters of the FBD blocks, you must know end enter the block number. This number appears in the programming software on the wiring sheet at the top right corner of the block.

Only those functions used in the program and with parameters are listed in the PARAMETERS menu.

Parameter Modification

Parameter modification procedure:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Place the cursor over the PARAMETERS menu in the main menu (PARAMETERS flashing) and confirm by pressing the Menu/OK button. 
**Result**: The parameters window opens to the first parameter. |
| 2    | Select the function to modify. 
To access the required function, scroll through the function block numbers (navigation keys ▼ and ▲) until you reach the right one. |
| 3    | Select the parameter to modify. 
The ◀ and ▶ keys are used to place the cursor over the parameter to modify. |
| 4    | Modify the parameter using the + and - keys (▲ and ▼) of the contextual menu. |
| 5    | Confirm the modifications by pressing Menu/OK, which will open the confirmation window. |
| 6    | Confirm again twice by pressing Menu/OK to save. 
**Result**: The display returns to the INPUTS-OUTPUTS screen in RUN mode and to the MAIN menu in STOP mode. |

Parameters in RUN Mode

It is therefore possible to modify parameters in RUN mode dynamically as long as they are not locked.

The modifications can be made:
- From the PARAMETERS (See PARAMETERS Menu, p. 51) menu,
- From the MONITORING (See MONITORING Menu, p. 53) (LD) menu: Move the pointer over the function to be modified using the navigation keys and open the parameters window from the contextual menu (Shift key).
MONITORING Menu

Description

**Note:** Accessible only in **LD mode** / smart relay in **RUN mode**.

**MONITORING** mode can be used to obtain a dynamic view of the state of the smart relay inputs/outputs.

In this mode the wiring diagram appears as it does in the **PROGRAMMING** (See **PROGRAMMING Menu**, p. 39) menu (smart relay in **STOP** mode), but appear in reverse video when inputs or outputs are activated (white on black background).

Illustration:

```
I  -  i2---------[Q]
IB----------TT1
T1----------[Q2]
H1----------[M]
```

This mode is also used to dynamically modify the values of automation function parameters if these are not locked.
To modify the parameters, proceed as follows:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Use the navigation keys to move the cursor over the element to modify: Step 1 of the element entry (See Method for Entering a Contact or Coil, p. 43) procedure.</td>
</tr>
<tr>
<td>2</td>
<td>At the same time, hold down Shift and the Param key to open the parameter window.</td>
</tr>
<tr>
<td>3</td>
<td>Use the navigation keys to move to the cursor over the modifiable parameters: ➡️➡️.</td>
</tr>
<tr>
<td>4</td>
<td>Change the parameter value using the keys + and -.</td>
</tr>
<tr>
<td>5</td>
<td>Confirm the modifications by pressing Menu/OK, which will open the confirmation window. Confirm a second time by pressing Menu/OK to save.</td>
</tr>
<tr>
<td>6</td>
<td>Confirm again with Menu/OK. Result: Return to the parameter screen.</td>
</tr>
<tr>
<td>7</td>
<td>Confirm again with Menu/OK. Result: Return to the LD diagram screen.</td>
</tr>
</tbody>
</table>
RUN/STOP Menu

Description
This function is used to start or stop the program in the smart relay:

- In **STOP** mode: The program is stopped and the outputs disabled,
- In **RUN** mode (with or without initialization of latching parameters): The program is executed.
**Startup**

In STOP mode, when accessing the RUN/STOP menu, the interface proposes the following three choices for starting the program:

- **WITH LATCHING INIT**: All current values (counters, timers, etc.) are reset to zero before the program starts (default selection).
- **WITHOUT LATCHING INIT**: Current values for which the Latching option has been activated are kept.
- **NO**: The program has not been started.

**Illustration:**

The navigation keys ▼ ▲ are used to change the selection.

When the mode has been validated with the Menu/OK key, the display moves to the **INPUT-OUTPUT** screen.
Off

In RUN mode, when accessing the RUN/STOP menu, the interface asks the user to confirm the request to stop the program:
- YES: The program stops (selected by default),
- NO: The program does not stop.

Illustration:

The navigation keys ▼ ▲ are used to change the selection.
When the mode has been confirmed with the Menu/OK key, the display moves to the INPUT-OUTPUT screen.

Smart Relays Without Screen

For smart modules without screen, a green LED located on the front panel of the module is an indicator light:
- If the LED flashes slowly (3 Hz), the module is in RUN mode (even if there is non-blocking fault).
- If the LED flashes rapidly (5 Hz), the module is in STOP mode with fault.
- If the LED stays lit, the module is powered-up and in STOP mode.

Note: On power up, the smart relay is in RUN mode, unless there is a blocking fault.

Note: To release a blocking fault, power off the module, then power it up again.
RUN/STOP Menu
CONFIGURATION Menu

Presentation

Subject of this Chapter

The CONFIGURATION menu provides access to the following 4 functions:
- PASSWORD,
- FILTER,
- Zx KEYS,
- WATCHDOG & CYCLE

This chapter describes the characteristics of these functions.

Note: Use the navigation key to return to the main menu.

Note: If the program is password-protected, (key displayed in the contextual menu), the user must enter the password before any action can take place in the sub-menus.

Note: The CONFIGURATION menu is only available in STOP mode.

What's in this Chapter?

This chapter contains the following topics:

<table>
<thead>
<tr>
<th>Topic</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>PASSWORD Menu</td>
<td>60</td>
</tr>
<tr>
<td>FILTER Menu</td>
<td>63</td>
</tr>
<tr>
<td>Zx KEYS Menu</td>
<td>64</td>
</tr>
<tr>
<td>WATCHDOG CYCLE Menu</td>
<td>65</td>
</tr>
</tbody>
</table>
PASSWORD Menu

Description
If the program is password-protected (key icon appears), the user must enter the password to perform certain operations.

The password protects access to the following menus:

- PROGRAMMING (LD STOP mode),
- MONITORING (LD RUN mode),
- CONFIGURATION (STOP mode),
- CLEAR PROG. (LD STOP mode),
- MODULE TRANSFER > MEM (STOP mode).

Illustration:

Note: If you lose a password, the solution is to overwrite the program from the programming software, see the on-line help of the programming software.

Note: It is possible to quit the screen without entering a password by using a combination of the Shift key (white key) and the Menu/Ok key (green key).

Note: To return to the main menu from the CONFIGURATION menu, use the navigation key ◄.
Entering Password

Initially, the key is not displayed and each digit is set to 0.
The ENTER message appears in the window.

Entry procedure:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Use the navigation keys to select the digit to enter: ← →.</td>
</tr>
<tr>
<td>2</td>
<td>Select the value of the digit using the + and - keys of the contextual menu.</td>
</tr>
<tr>
<td>3</td>
<td>Confirm the password with the Menu/OK key, which opens the confirmation window.</td>
</tr>
<tr>
<td>4</td>
<td>Confirm again with the Menu/OK key.</td>
</tr>
</tbody>
</table>

Result: The display returns to the MAIN menu.

Note: Henceforth the key is displayed in the contextual menu line.

Removing Password

To cancel the password, follow the same procedure used to enter it.

Initially, the key icon is displayed, meaning: Smart relay protected.
The message CLEAR and the number of attempts 1 / 5 appear in the window.
The following scenarios may arise:

- **Password correct**: The password is then inhibited, and the smart relay returns to the PASSWORD menu,
- **Password incorrect**: The CLEAR counter is incremented.

Illustration:

If an incorrect password is entered 5 times consecutively, the security function is locked for 30 minutes.

During this period, if the power supply to the smart relay fails, the downcount will start again on power up.

Illustration:

Modifying Password

To modify the password, simply cancel the old password and enter a new one.
FILTER Menu

Description
This function is used to detect more quickly any changes in states of Discrete inputs.

Two choices are available:
- Fast,
- Slow.

Response time:

<table>
<thead>
<tr>
<th>Filtering</th>
<th>Commutation</th>
<th>Response time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Slow</td>
<td>ON → OFF</td>
<td>5 ms</td>
</tr>
<tr>
<td></td>
<td>OFF → ON</td>
<td>3 ms</td>
</tr>
<tr>
<td>Fast</td>
<td>ON → OFF</td>
<td>0.5 ms</td>
</tr>
<tr>
<td></td>
<td>OFF → ON</td>
<td>0.3 ms</td>
</tr>
</tbody>
</table>

This selection can only be made when the smart relay is in STOP. By default, the smart relays are configured in SLOW.

Note: This function is available on smart relays with a direct voltage power supply.

Note: to return to the main menu from the CONFIGURATION menu, use the navigation key ↓.

Filter-Type Selection
The current type is indicated by the selection symbol (black diamond).

Procedure for selection of filter type:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select the type of filtering using the ▼ ▲ keys (the selection will flash).</td>
</tr>
<tr>
<td>2</td>
<td>Confirm with Menu/OK.</td>
</tr>
</tbody>
</table>

Result: the display returns to the MAIN menu.
Zx KEYS Menu

Description

The Zx KEYS option is used to activate or deactivate the use of the navigation keys as pushbuttons. Different functions can be obtained depending on the state of this option:

- **Inactive**: The keys are only available for setting, configuring and programming the smart relay.
- **Active**: they can also be used in a control diagram.
  
  In this configuration, they operate as pushbuttons: Zx keys (See Zx Keys, p. 91), without the need to use a terminal input contact.

Note: Accessible only in LD mode.

Note: To return to the main menu from the CONFIGURATION menu, use the navigation key ▼.

Zx Keys in RUN Mode

By default, the Zx keys are used as navigation keys.

In RUN mode, when the INPUTS-OUTPUTS screen, TEXT screen or DISPLAY screen is active, the number of the Zx keys used in the program are displayed in the contextual menu line.

To activate the key, simply select the required key ▼▼▼▼.

Illustration:

![Zx Keys in RUN Mode Illustration](image)

Note: The function is inactive in PARAMETERS, MONITORING mode and in all of the function block parameter screens and configuration screens.
WATCHDOG CYCLE Menu

Description
The duration of a program cycle depends on its length and complexity: In particular, the type and number of inputs-outputs and the number of extensions.

The program is executed periodically at regular time intervals. This time interval is called the cycle time.

For the program to have enough time to completely execute, the cycle time should be greater than the program execution time.

The cycle period is configurable in the menu: CONFIGURATION → WATCHDOG CYCLE. This period is adjustable from 6 ms to 90 ms in 2 ms increments.

The default value of the cycle period is 10 milliseconds.

Illustration:

```
CYCLE = 0 5 x 0 2 m S
WATCHDOG INACTIVE
```

Note: Make sure that:
- Input variations that are too rapid are not masked by cycle time that is too slow,
- The speed of output variations is compatible with system commands.

If the duration of the execution cycle of the program and the embedded software functions exceeds the cycle time value selected by the programmer, the WATCHDOG can be used to operate a specific action.

Note: To return to the main menu from the CONFIGURATION menu, use the navigation key ←.
The WATCHDOG can perform the following different actions:

- **INACTIVE**: normal operating mode,
- **ALARM**: a warning state is set and the warning number corresponding to Cycle time overrun is accessible in the **FAULT** menu,
- **ERROR**: the program stops (STOP mode) and the error number corresponding to: Cycle time overrun is accessible in the **FAULT** menu.

This period may be set from 6 to 90 ms in 2 ms steps.

To adjust this period, adjust the step multiplier factor by 2 ms using the + and - keys in the contextual menu. This factor is between 3 and 45.

\[
\text{CYCLE} = 0.5 \times 0.2 \text{ms}
\]

The multiplier factor is adjusted depending on the shortest sampling period of the inputs.

**WATCHDOG Configuration**

Procedure:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Configure the CYCLE parameter using the + and - keys of the contextual menu.</td>
</tr>
</tbody>
</table>
| 2    | Confirm the entry using one of the keys: ‹ or ›.  
**Result**: The CYCLE parameter is confirmed and the WATCHDOG parameter is selected (it flashes). |
| 3    | Configure the WATCHDOG parameter using the + and - keys of the contextual menu. |
| 4    | Confirm your changes by pressing the Menu/OK key.  
**Result**: The display returns to the MAIN menu. |
CLEAR PROGRAM Menu

Description

This function is used to clear the entire program.

Note: Accessible only in LD mode.

Note: If the program is protected (key displayed), the user must enter the password (see PASSWORD Menu, p. 60) before being able to delete the program.

Clearing the Program

On opening, NO is selected by default.

Procedure:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select the YES choice using the navigation keys ▼ and ▲.</td>
</tr>
<tr>
<td>2</td>
<td>Confirm the clear command by pressing the Menu/OK key. Result: the display returns to the MAIN menu.</td>
</tr>
</tbody>
</table>
TRANSFER Menu

Description

This function is used to:

- load the firmware and the application contained in the smart relay into the backup memory,
- load firmware and application from the backup memory to the smart relay.

This backup memory can then be used to load the firmware and the application into another smart relay.

Illustration:

Note: The backup memory is available as an option.

Note: Insertion and extraction of the backup memory may be performed even when the smart relay is powered up.
For smart relays without screens, detection of the memory may only be performed on power up of the smart relay. If the memory is inserted when the smart relay is powered on, it will not be acknowledged.

Note: If the application is protected (key icon displayed), the user must enter the password before being able to save the program.
Procedure for transferring the application, from the smart relay to the backup memory:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Insert the EEPROM cartridge (SR2 MEM01) into the slot provided.</td>
</tr>
<tr>
<td>2</td>
<td>Select the transfer type: MEMORY&gt;ZELO using the navigation keys ▼ ▲.</td>
</tr>
<tr>
<td>3</td>
<td>Confirm the transfer command with the Menu/OK key. (Enter the password if the program is password-protected).</td>
</tr>
<tr>
<td>4</td>
<td>Wait for the transfer to end. Display: &quot;&quot;MEMORY&quot; &quot;TRANSFER. OK&quot; when it is complete.</td>
</tr>
<tr>
<td>5</td>
<td>Confirm again by pressing Menu/OK key to exit the menu.</td>
</tr>
</tbody>
</table>

Result: The display returns to the INPUTS-OUTPUTS screen in RUN mode and to the MAIN menu in STOP mode.
Backup Memory → Module Transfer

Procedure for transferring the application, from the backup memory toward the smart relay, for a smart relay with LCD and keyboard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Insert the EEPROM cartridge (SR2 MEM01) with the program to be transferred into the slot provided.</td>
</tr>
<tr>
<td>2</td>
<td>Select the transfer type: MEMORY→ZELIO using the navigation keys ▼▲.</td>
</tr>
<tr>
<td>3</td>
<td>Confirm the transfer command with the Menu/OK key.</td>
</tr>
</tbody>
</table>
| 4    | Wait for the transfer to end.  
   Display: > > > MODULE then TRANSFER. OK when it is complete. |
| 5    | Confirm again by pressing Menu/OK to exit the menu.  
   Result: the display returns to the INPUTS-OUTPUTS screen in RUN mode and to the MAIN menu in STOP mode. |

Procedure for transferring the application, from the backup memory toward the smart relay, for a smart relay without LCD or keyboard:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>The smart relay not powered on, insert the EEPROM cartridge (SR2 MEM01) into the slot provided.</td>
</tr>
</tbody>
</table>
| 2    | Power up the smart relay.  
   During the transfer, the LED display is off. |
| 3    | Wait for the transfer to end.  
   During the transfer, the LED display is off, then at the end of the transfer the LED flashes. |
| 4    | ● If the flashing is slow (3 Hz), the transfer has been successful, the smart relay is in RUN, remove the EEPROM cartridge (SR2 MEM01).  
   ● If the flashing is rapid (5 Hz), the transfer has failed due to incompatibility between the configuration necessary for the program to be transferred and that of the smart relay. |

Note: When the smart relay is in STOP mode, the LED display is lit and does not flash.
Possible Errors
Below are the possible errors and, for each case, the messages that are displayed:

- **Absence of backup memory**
  Error message:
  TRANSFER ERROR: NO MEMORY

- **Configurations of the hardware and program to transfer incompatible**
  Error message:
  TRANSFER ERROR: CONFIG INCOMPAT (hardware or software reference numbers).

Refer to the DEFAULT Menu, p. 77 chapter to consult the error number and clear it.

**Note:** The transfer of one module program to another via a memory card is only possible between smart relays with the same reference. For example, it is impossible to transfer a program from a module with a clock to a module that does not have one.

Program incompatible with firmware of the module
If the application stored in backup memory was created with a version of the programming software that is incompatible with the firmware of the target smart relay, proceed as follows:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Load the application from the backup memory to a smart relay with compatible firmware.  
**Note:** If no smart relay has firmware that is compatible with the application, use the programming software version that was used to create the application to load compatible firmware into the target smart relay. |
| 2    | Use the version of the programming software that was used to create the application to load it from the smart relay toward the PC. |
| 3    | Save the application uploaded in step 2. |
| 4    | Launch the latest version of the programming software. |
| 5    | Open the application saved in step 3.  
**Result:** The programming software converts the application. |
| 6    | Load the converted application and the associated firmware to the target smart relay. |
VERSION Menu

Description
This function is used to precisely identify the version of each system component:

- Type of hardware,
- Firmware,
- LD functions,
- FBD functions.

Illustration:

This information is available for the smart relay, but also for the connected extensions.

The symbol is present in the bottom right, indicating the existence of extensions connected to the smart module.
To quit, press the **Menu/OK** button, the display returns to the INPUTS-OUTPUTS screen in RUN mode and to the MAIN menu in STOP mode.
LANGUAGE Menu

Description
This function is used to select the language used by the smart relay.

All messages may be viewed in 6 languages:
- English,
- French,
- German,
- Italian,
- Spanish,
- Portuguese.

Illustration:

<table>
<thead>
<tr>
<th>Language</th>
</tr>
</thead>
<tbody>
<tr>
<td>English</td>
</tr>
<tr>
<td>Français</td>
</tr>
<tr>
<td>Deutsch</td>
</tr>
<tr>
<td>Italiano</td>
</tr>
</tbody>
</table>

Language Selection
The current language is indicated by the selection symbol (black diamond).

Language selection procedure:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select the language using the navigation keys: ▼ and ▲ (the selection flashes).</td>
</tr>
<tr>
<td>2</td>
<td>Confirm with the Menu/OK key.</td>
</tr>
</tbody>
</table>

**Result:** The display returns to the INPUTS-OUTPUTS screen in RUN mode and to the MAIN menu in STOP mode.
DEFAULT Menu

FAULT Menu

Description
This function is used to:
- Display on the LCD screen the type of fault detected by the firmware of the smart relay (error or warning: Watchdog overrun, see WATCHDOG CYCLE Menu, p. 65, cycle time too high, etc.).
- Reset the fault counter to zero.

Illustration:

Reset to Zero of the Fault Counter
To reset the fault counter to zero, proceed as follows:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Select the YES choice using the navigation keys ▼ and ▲.</td>
</tr>
<tr>
<td>2</td>
<td>Confirm the clear command by pressing the Menu/OK key.</td>
</tr>
</tbody>
</table>

Result: The display returns to the INPUTS-OUTPUTS screen in RUN mode and to the MAIN menu in STOP mode.
### Fault Types

Below, the description of possible faults:

<table>
<thead>
<tr>
<th>Number</th>
<th>Type of fault</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>No faults</td>
</tr>
<tr>

</tbody>
</table>
CHANGE DATE/TIME Menu

Description
This function is used to configure the date and time of the smart relays that have a clock.

Illustration:

The modifiable parameters are:
- Day / week / month / year,
- Hour, minutes, seconds,
  Values are recorded by pressing the Menu/Ok key; if you wish to specify the time more accurately, you should complete the entry of modifications with minutes and seconds.
- CAL: Calibration of the internal clock of the smart relay in seconds per week.
The quartz that controls the real-time clock of the smart relay has a variable monthly drift depending on the environmental conditions of the smart relay. The maximum value for this drift is approximately one minute per month. To estimate this drift, proceed by observing the drift on the smart relay clock with respect to a standard reference clock for a few weeks or more.

**Example:**
If you wish to compensate this drift, you can for example make a -15 second correction per week to compensate for a +60 second drift per month. This compensation is executed on Sunday at one O'clock in the morning.

**Note:** This correction serves no purpose if the smart relay is subject to long power interruptions or major variations in temperature.

**Clock Configuration Procedure:**

<table>
<thead>
<tr>
<th>Steps</th>
<th>Description</th>
</tr>
</thead>
</table>
| 1     | Select the parameter to modify using the navigation keys ◀ and ▶.  
Result: The selected parameter flashes.  
(When you enter this mode, the day value is selected) |
| 2     | Modify the value of the parameter.  
The + and - keys of the contextual menu can be used to change the current value. |
| 3     | Confirm the changes by pressing the Menu/OK key.  
Result: The display returns to the MAIN menu. |

**Note:** The smart relay contains a software module that determines the day of the week when the user selects the day of the month in the year.

**Note:** You are not allowed to modify the hour by a product between 2:00 and 3:00 AM for the days of the change from summer to winter time (at 3:00 it is 2:00).
CHANGE SUMMER/WINTER Menu

Description
This function is used to change the time range automatically: Summer/winter, for smart relays with a clock.

Illustration:

<table>
<thead>
<tr>
<th></th>
<th>SUM</th>
<th>WINTER</th>
</tr>
</thead>
<tbody>
<tr>
<td>M:</td>
<td>03</td>
<td>10</td>
</tr>
<tr>
<td>D:</td>
<td>5</td>
<td>5</td>
</tr>
</tbody>
</table>

The following operating modes are possible:

- **NO**: no change,
- **Automatic**: The change takes place automatically, the dates are preset according to the geographic zone:
  - EUROPE: Europe,
  - GB: Great Britain,
  - USA,
- **OTHER ZONE**: (MANUAL) the change takes place automatically, but you must specify, for summer and winter:
  - The month: M,
  - The Sunday: D (1, 2, 3, 4 or 5) when the change takes place.
To configure automatic time change, proceed as follows:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 1    | Select the parameter to modify using the navigation keys ⬅ and →.  
|      | **Result:** The selected parameter flashes. |
| 2    | Modify the parameter value.  
|      | The + and - keys of the contextual menu are used to change the current value. |
| 3    | Confirm the changes by pressing the **Menu/OK** key.  
|      | **Result:** The display returns to the MAIN menu. |

Introduction

Description

In LD programming mode, an application can be created from the interface of the front panel of the smart relay.

Here is detailed information on all possible elements of a ladder diagram in LD mode that are recognized and used by smart relays.

To better understand the functions performed by each element, where necessary a directly usable example is included.

Composition of Ladder Diagrams

Smart relays accept 120-line diagrams.

- Each line is comprised of a maximum of 5 contacts.
- Contacts must be attached to one coil, and the coil is not necessarily on the same line.

Note: When an application requires more than five contacts to activate an action, the auxiliary relays may be used.

Sample Ladder Diagram

Below is an example of a ladder diagram, as it appears on the display of the front panel of a smart relay:

```
I1  I2  I3             M3              Z1         SM1
- - - - - RT1         - - - - - Z1- - SM1
                     - - - - - - TT1
```

Menu / OK
Discrete Inputs

Description
Discrete inputs can be used exclusively as contacts in the program. These contacts represent the status of the input for the smart relay connected to a sensor (push button, switch, sensor, etc.).

The contact number corresponds to the number of terminals of the associated input: 1 to 9, then A to R (except for letters I, M and O) according to the smart relay and the possible extension.

Use as a Contact
This contact may use the direct state of the input (normally open mode) or its inverse state (mode normally closed), see below.

**Normally open mode:**
Symbol of a normally open contact:

\[ \text{I} \]

A normally open contact corresponds to the use of the direct state of the input. If the input is supplied, the contact is said to be conducting.

Example: Switching a lamp on and off with a pushbutton.

\[ \text{I1} \rightarrow \text{Q1} \]

If input 1 is supplied, contact I1 is closed, and coil Q1 is activated.

**Normally closed mode:**
Symbol of a normally closed contact:

\[ \text{i} \]

A normally closed contact corresponds to the use of the reverse state (logical complement of the direct state) of the input. If the input is supplied, the contact is said to be non-conducting.

Example: Controlling a lamp using an input in reverse state.

\[ \text{i1} \rightarrow \text{[Q1]} \]

If input 1 is supplied, contact i1 is open, and coil Q1 is non-activated.
Modification of the state of a contact

To modify a contact from the front panel of the smart relay (the programming window displayed on screen), simply:
- Place the cursor over the letter of the contact,
- Proceed as described in the paragraph *Modifying an element*, p. 44, to scroll through the possible contact types (I for a normally open contact, I for a normally closed contact).

Initialization

Status of contacts on program initialization:
- The direct state is inactive,
- The reverse state is active.
Zx Keys

Description
The navigation keys behave exactly like the physical inputs (Discrete inputs). The only difference is that they do not correspond to the smart relay’s connection terminals, but to the four gray buttons on the front panel.

They are used as pushbuttons, and can only be used as contacts.

Use as a Contact
This contact may use the direct state of the key (normally open mode) or its inverse state (mode normally closed), see below.

Normally open mode:
Symbol of the normally open contact, representing a key:

The normally open mode corresponds to the use of the direct state of the key. If the key is pressed, the corresponding input is said to be conducting.

Normally closed mode:
Symbol of the normally closed contact, representing a key:

The normally closed mode corresponds to the use of the reverse state (logical complement of the direct state) of the key. If the key is pressed, the corresponding input is said to be non-conducting.

Example
Creating a switch operated by the Z1 key and the Q1 output:

Each time the Z1 key is pressed, the Q1 output changes state.
Deactivation of Zx Keys

By default the Zx keys are active. They may be deactivated in one of the following ways:

- From the smart relay front panel: Using the menu: CONFIGURATION → Zx KEYS, see Zx KEYS Menu, p. 64,
- From the programming software: See on-line help of the programming software for more information.

**Note:** When the smart relay is in RUN mode, if the Zx keys have been deactivated, they cannot be used for inputs in the program, but can be only used for navigating the menus.

Modification of the state of a contact

To modify a contact from the front panel of the smart relay (the programming window displayed on screen), simply:

- Place the mouse over the letter representing the contact,
- Proceed as described in the paragraph Modifying an element, p. 44, to scroll through the possible contact types (Z for a normally open contact, z for a normally closed contact).

Initialization

Status of contacts on program initialization:

- Normally open mode (direct state) is inactive,
- Normally closed mode (reverse state) is active.
Auxiliary Relays

**Description**

Auxiliary relays marked M behave in exactly the same way as Q Discrete outputs (see Discrete (DISCR) Outputs, p. 98), but do not have an electrical output contact. They can be used as internal variables.

There are 31, numbered from 1 to 9 and from A to Y except for letters I, M, O. Any auxiliary relay may be used, in the program, indifferently as coil or contact. They are used to memorize a state that will be used as the associated contact.
Use as a Coil

To use an auxiliary relay as a coil, four modes are available:
- Contactor mode,
- Impulse relay mode,
- Latch mode,
- Unlatch mode.

**Contactor mode:**
Symbol of an auxiliary relay, used as a coil in contactor mode:

\[
\text{[ M-]}
\]

The relay is energized if the contacts to which it is connected are conducting. Otherwise it is not energized.

**Impulse relay mode:**
Symbol of an auxiliary relay, used as a coil in impulse relay mode:

\[
\text{[M-]}
\]

Pulse energization, the coil changes state on each pulse it receives.

**Latch mode:**
Symbol of an auxiliary relay, used as a coil in latch mode:

\[
\text{SM-}
\]

The **SET** relay, also called the latch relay, is energized as soon as the contacts to which it is connected are conducting, then stays set even if later the contacts are no longer conducting.

This behavior is identical to that of an RS logic flip-flop.

**Unlatch mode:**
Symbol of an auxiliary relay, used as a coil in latch mode:

\[
\text{RM-}
\]

The **RESET** relay, also called the unlatch relay, is deactivated when the contacts to which it is connected are conducting. It remains deactivated even if later the contacts are no longer conducting.

**Note:** For reasons of upward compatibility for the programs operating with Zelio 1, the four types of mode for any given **Q** output coil or **M** auxiliary relay can be used in the same wiring diagram in Zelio 2.
Use as a Contact  Auxiliary relays can be used as contacts as many times as necessary. This contact may use the direct state of the relay (normally open mode) or its inverse state (mode normally closed), see below.

Normally open mode:
Symbol of an auxiliary relay, used as a contact in normally open mode:

![M-]

A relay used as normally open contact corresponds to the use of the direct state of the relay. If it is powered, the contact is said to be conducting.

Normally closed mode:
Symbol of an auxiliary relay, used as a contact in normally closed mode:

![m-]

An auxiliary relay used as a normally closed contact, corresponds to the use of the reverse state (logical complement of the direct state) of the relay. If it is powered, the contact is said to be non-conducting.
Example

In the following example turning on and off a lamp is conditioned by the status of the six following inputs: I1, I2, I3, I4, I5 and IB.

The is lit when:

- The I1, I4, I5 and IB inputs are set to the state 1, and
- The I2, I3 are set to state 0.

Because the smart relay does not allow more than five contacts on a line, auxiliary relays are used to control the lamp.

You choose to memorize the state of inputs I1, I4, I5 and IB using the auxiliary relay M1 and memorize the state of inputs I2 and I3 using the auxiliary relay M2. The lamp is controlled by relays M1 and M2, used respectively as normally open contact and as normally closed contact.

Illustration:

|                |                |                |                |                |
|                |                |                |                |                |
|                |                |                |                |                |
|                |                |                |                |                |
|                |                |                |                |                |
|                |                |                |                |                |
|                |                |                |                |                |
|                |                |                |                |                |
|                |                |                |                |                |
|                |                |                |                |                |
|                |                |                |                |                |
|                |                |                |                |                |
|                |                |                |                |                |
|                |                |                |                |                |
|                |                |                |                |                |
|                |                |                |                |                |
|                |                |                |                |                |
|                |                |                |                |                |
+----------------+----------------+----------------+----------------+----------------+
```

Modifying the Mode of a Coil or a Contact

To modify the use mode of a coil or a contact from the front panel of the smart relay (the programming window displayed on screen), simply:

- Position the cursor on the symbol representing the coil mode or on the letter of the contact,
- Proceed as described in the paragraph Modifying an element, p. 44, to scroll through the possible modes for a coil or contact types possible (M for normally open contact, m for a normally closed contact).

Initialization

Status of contacts on program initialization:

- Normally open mode (direct state) is inactive,
- Normally closed mode (reverse state) is active.
**Latching**

By default, after a power failure, the relay is in the state that corresponds to program initialization.

To restore the state of the output backed up at the time of power loss, it is essential to activate latching:

- From the front panel: From the PARAMETERS (See *PARAMETERS Menu*, p. 51) window,

  or

- In the programming software: Enable the **Latching** option in the parameters window associated with the relay.
Discrete (DISCR) Outputs

Description

Discrete outputs correspond to the output relay coils of the smart relay. These outputs are numbered from 1 to 9, then from A to G, according to the smart relay and any extensions.

Any Discrete output can be used, in the program, indifferently either as a coil or a contact.
Use as a Coil

To use a Discrete output as coil, four modes are available:

- Contactor mode,
- Impulse relay mode,
- Latch mode,
- Unlatch mode.

**Contactor mode:**
Symbol of a Discrete output, used as a coil in contactor mode:

\[
\text{[Q-]}
\]

The coil is energized if the contacts to which it is connected are conducting. Otherwise it is not energized.

**Impulse relay mode:**
Symbol of a Discrete output, used as a coil in impulse relay mode:

\[
\text{[Q-]}
\]

Pulse energization, the coil changes state on each pulse it receives. For example: Switching a lamp on and off with a pushbutton:

\[
i1 \quad [Q1]
\]

A pushbutton is connected to input I1 and a lamp to output Q1. Each time the button is pressed, the lamp will turn on or off.

**Latch mode:**
Symbol of a Discrete output, used as a coil in latch mode:

\[
\text{SQ-}
\]

The Set coil, also called the latch coil, is energized as soon as the contacts to which it is connected are conducting, then stays set even if later the contacts are no longer conducting.

This behavior is identical to that of an RS logic flip-flop. Example: Switching a lamp on and off using two pushbuttons: See Latching Mode below.
Unlatch mode:

Symbol of a Discrete output, used as a coil in unlatch mode:

The **RESET** coil, also called the unlatch coil, is deactivated when the contacts to which it is connected are conducting. It remains inactive even if later the contacts are no longer conducting.

**For example:** Switching a lamp on and off using two pushbuttons: See Unlatch Mode

\[
\begin{array}{c|c}
I1 & SQ1 \\
I2 & RQ1 \\
\end{array}
\]

BPI1 is connected to input I1. BPI2 to input I2. The lamp is controlled by output Q1. The lamp turns on when pushbutton BPI1 is pressed, and it turns off when pushbutton BPI2 is pressed.

**Note:** Rule for using outputs:
- An output must only be used at one single point in the program as a coil.
- If a SET coil is used for a Discrete output, it is advisable to provide a RESET coil for this output. The RESET coil takes priority over the SET coil.
  The use of a Set coil on its own is only justified for activating an alarm signal that can be reset only by an INIT + ON action from the program.

**Note:** For reasons of upward compatibility for programs operating with Zelio 1 smart relays, the four types of modes for any given Q output coil or M auxiliary relay can be used in the same wiring diagram in Zelio 2. In this case, the operating mode is determined by the coil activated first.
Use as a Contact

An output can be used as an auxiliary contact as many times as necessary. This contact may use the direct state of the output (normally open mode) or its inverse state (normally closed mode), see below.

**Normally open mode:**

Symbol of a Discrete output, used as a contact in normally open mode:

![Symbol of a Discrete output, used as a contact in normally open mode](Q-)

An output used as a **normally open** auxiliary contact corresponds to the use of the direct state of the output. If it is **powered**, the contact is said to be **conducting**.

**Normally closed mode:**

Symbol of a Discrete output, used as a contact in normally closed mode:

![Symbol of a Discrete output, used as a contact in normally closed mode](q-)

An output used as a **normally closed** auxiliary contact corresponds to the use of the reverse state (logical complement of the direct state) of the output. If it is **powered**, the contact is said to be **non-conducting**.

Modifying the Mode of a Coil or a Contact

To modify the operating mode of a coil or a contact from the front panel of the smart relay (the programming window displayed on screen), simply:

- Position the mouse on the symbol representing the coil output mode or on the letter of the contact representing the output,
- Proceed as described in the paragraph **Modifying an element**, p. 44, to scroll through the possible modes for a coil or contact types possible (Q for normally open contact, q for a normally closed contact).

Initialization

Status of contacts on program initialization:

- Normally open mode (direct state) is inactive,
- Normally closed mode (reverse state) is active.
Latching

By default, after a power failure, the relay is in the state that corresponds to program initialization.

To restore the state of the output backed up at the time of power loss, it is essential to activate latching:

- from the front panel: from the PARAMETERS (See PARAMETERS Menu, p. 51)
  window,
- or
- in the programming software: Enable the Latching option in the parameters window associated with the output.
Timers

Description

The **Timer** function is used to delay, prolong and control actions over a predetermined time. Durations can be set using one or two preset values, according to the type of timer.

There are 11 types of timers:

- On delay (A),
- On delay, stop by reset (A),
- Off delay (C),
- On pulse one shot: Pulse calibrated on the command input (B) falling edge,
- Timing after pulse: calibrated on falling edge of the command input (W),
- Flasher unit, control held down synchronously (D),
- Flasher unit, Press to start/stop, Synchronous (D),
- Time on addition (T),
- A/C,
- Flasher unit, control held down asynchronously (L),
- Flasher unit, Press to start/stop, Asynchronous (I),

Refer to the Timing Diagrams paragraph for the description of different types of timers.

The smart relay has 16 timer function blocks, numbered from 1 to 9 then from A to G. Each block has a reset input, a command input and an output used to indicate timer time-out.
Use of Coils

Each timer has two associated coils:
- Coil TT: Command Input,
- Coil RC: Reset Input,

The use of these coils is described below.

Command Input:
Symbol of the Command Input coil of a timer:

\[
\text{TT} -
\]

Each type involves a specific operation, which can be used to manage all possible scenarios in an application.

Reset Input:
Symbol of the Command Input coil of a timer:

\[
\text{RT} -
\]

Energization of the coil causes a reset of the current timer value: contact T is deactivated and the function is ready for a new timer cycle.

**Note:** this coil is only necessary for pulse start/stop type timers.
Use as a Contact

The contact associated with the timer indicates whether the timer has stopped. It may be used as many times as necessary in the program. It may be used according to 2 modes: normally open or normally closed, described below.

**Normally open mode:**
Symbol of the normally open contact associated with a timer:

![T-](image)

A normally open contact corresponds to the use of the direct state of the output of the Timer function block. If this output is active, the contact is said to be conducting.

**Normally closed mode:**
Symbol of the normally closed contact associated with a timer:

![t-](image)

A normally closed contact corresponds to the use of the reverse state (logical complement of the direct state) of the output of the Timer function block. If this output is active, the contact is said to be non-conducting.
Configuration from Front Panel

The block's parameter settings can be accessed either when entering the command line or from the PARAMETERS menu if the block has not been padlocked.

The different parameters to fill in are as follows:

- Timer type,
- Preset value(s),
- Time unit,
- Parameter lock,
- Latching.

**Type of timer:**

This parameter allows you to choose the type of timer function from among the 11 types available. Each type is represented by a letter:

- A: Active, control held down,
- a: Active, Press to start/stop,
- C: Off delay
- A/C: Combination of A and C,
- B: On pulse one shot: Pulse calibrated on the command input rising edge,
- W: Timing after pulse: Pulse calibrated on the command input falling edge,
- D: Flasher unit, control held down synchronously,
- d: Flasher unit, Press to start/stop, Synchronous,
- L: Flasher unit, control held down asynchronously,
- l: Flasher unit; Press to start/stop, Asynchronous
- T: Time on addition.

**Preset value:**

Depending on the type of timer, there can be 1 or 2 preset values:

- 1 only preset value (types: A, a, C, B, W, D, d and T):
  
  ![Diagram](t)
  
  : on-delay or off-delay according to type.

- 2 only preset value (types: A/C, L and l):
  
  ![Diagram](A)
  
  : Timer on-delay in the case of A/C type; active state in the case of flasher units L and l.

  ![Diagram](B)
  
  : Timer off-delay in the case of A/C type; inactive state in the case of flasher units L and l.

**Time unit:**

This is the time unit for the preset value. There are five possibilities:

<table>
<thead>
<tr>
<th>Unit</th>
<th>Symbol</th>
<th>Form</th>
<th>Maximum value</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/100 of a second</td>
<td>s</td>
<td>00.00 s</td>
<td>00.00 s</td>
</tr>
</tbody>
</table>
Parameter lock:
Symbol of the Parameter Lock parameter:

<table>
<thead>
<tr>
<th>Unit</th>
<th>Symbol</th>
<th>Form</th>
<th>Maximum value</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/10 of a second</td>
<td>S</td>
<td>000.0 s</td>
<td>999.9 s</td>
</tr>
<tr>
<td>Minute:Second</td>
<td>M:S</td>
<td>00:00</td>
<td>99:99</td>
</tr>
<tr>
<td>Hour:Minute</td>
<td>H:M</td>
<td>00:00</td>
<td>99:99</td>
</tr>
<tr>
<td>Hours</td>
<td>H</td>
<td>0,000 h</td>
<td>9,999 h</td>
</tr>
</tbody>
</table>

Parameter lock:
Symbol of the Parameter Lock parameter:

Locking prevents locked parameters from being modified from the front panel of the smart relay using the PARAMETERS menu.

Latching:
By default, if a power break occurs while a timer function block is running, any information on time already elapsed is lost. When the supply voltage returns, the time function block is reinitialized and ready for a new operating cycle.

If the application requires it, the time elapsed before the power break can be memorized using the Latching parameter.

Symbol of the Latching parameter:

This function is used to save the state of the timer’s current values and memorize the elapsed time in the event of a power break.
**Illustration:** Configuring a counter from the front panel of the smart relay:

Flasher unit, control held down synchronously (type D):
The following diagram shows the operation of the type D timer:

![Diagram of type D timer operation]

**Note:** each pulse on the TTx input resets the current timer value to 0.

Flasher unit, Press to start/stop, Synchronous (type d):
The following diagram shows the operation of the type d timer:

![Diagram of type d timer operation]

Flasher unit, control held down asynchronously (type D):
The following diagram shows the operation of the type L timer:

![Diagram of type L timer operation]
Flasher unit, Press to start/stop asynchronously (type I):
The following diagram shows the operation of the type I timer:

![Diagram of Flasher unit operation]

**Note:** each pulse on the TTx input resets the current timer value to 0.

Time on addition (type T):
The following diagram shows the operation of the type T timer:

![Diagram of Time on addition operation]

With addition type, the preset value can be reached:
- In one step: \( t \),
- In several steps: \( t_1 + t_2 + \ldots + t_n \).

---

**Modifying the Mode of a Coil or a Contact**

To modify the use mode of a coil or a contact from the front panel of the smart relay (the programming window displayed on screen), simply:
- position the cursor on the symbol representing the coil mode or on the letter of the contact,
- proceed as described in the paragraph *Modifying an element*, p. 44, to scroll through the possible modes for a coil or contact types possible (T for normally open contact, t for a normally closed contact).

---

**Initialization**

State of the contacts and current values on initialization of the program:
- the *normally open* mode (direct state) is **inactive**,  
- the *normally closed* mode (inverse state) is **active**,  
- the *current value(s)* is (are) **zero(s)**.
Example 1

Creating a timer device for a stairway.

The stairway light should remain on for two minutes and thirty seconds when one of the push buttons is activated.

On each floor, the buttons are linked to the I1 input of the smart relay.
The stairway light is linked to the Q4 output of the smart relay.

You would write the following program:

```plaintext
-------I1-------TT1
-------I2-------RT1
-------T1-------[Q4
```

To obtain the desired operation, you should use a type B timer (On pulse one shot), and configure the duration of the timer for 2 minutes 30 seconds. To thus configure the timer duration, choose the time unit M:S and you enter the value **02:30** for the preset value $t$.

**Illustration:** Timer’s configuration screen:
Counters

Description
The Counter function is used to upcount or downcount pulses. The smart relay has 16 timers, numbered from 1 to 9 then from A to G.

The Counter function can be reset to zero or to the preset value (depending on the chosen parameter) during use.

It can be used as a contact to find out whether:
- The preset value has been reached (upcounting mode TO),
- The counter has reached 0 (downcounting FROM).

Use of Coils
Each timer has 3 associated coils:
- Coil CC: Counting Pulse Input,
- Coil RC: Reset Initial Counter State Input,
- Coil DC: Counting Direction input.

The use of these coils is described below.

Counting Pulse Input:
Symbol of the Counting Pulse Input coil of a timer:

When used as a coil in a control diagram, this element represents a counting input for the function. Every time the coil is energized, the counter is incremented or decremented by 1 according to the counting direction chosen.

Example: Counting pulses delivered by counter no. 1.

Every time input I1 is energized, the counter no. 1 is incremented by 1.

Reset initial counter state input:
Symbol of the Reset Initial Counter State Input coil:

When used as a coil in a control diagram, this element represents an input that resets the counting function to its initial state.
Energizing the coil has the following effect:

- Reset the current count value to **zero** if the count type is **TO** (up-counting from the preset value),
- Reset the current value to the **preset value** if the count type is **FROM** (down-counting from the preset value).

**Example:** Counter No.1 reset to zero on pressing key Z1.

Every time key Z1 is pressed, the counter starts from 0.

**Counting Direction input:**

Symbol of the Counting Direction Input coil of a timer:

This input determines the counting direction according to state. It:

- Downcounts if the coil is energized,
- Upcounts if the coil is not energized.

**Note:** By default, if this input is not wired, the automation function counts.

**Example:** Up/downcounting, depending on the status of input I2 of the smart relay.

If the I2 input is active, the automation function downcounts.
Use as a Contact

The contact associated with the rapid counter indicates whether the preset value (TO mode) or zero (FROM mode) has been reached.

It may be used as many times as necessary as many times as necessary in the program. It may be used according to 2 modes: normally open or normally closed, described below.

**Normally open mode:**
Symbol of the normally open contact associated with a counter:

![Symbol]

The contact is conducting when:
- The current counter value **has reached** the preset value, if the counter is in TO mode (upcounting mode),
- The current counter value **is equal to 0**, if the counter is in FROM mode (downcounting mode),

**Normally closed mode:**
Symbol of the normally closed contact associated with a counter:

![Symbol]

The contact is conducting as long as:
- The current counter value **has not reached** the preset value, if the counter is in TO mode (upcounting mode),
- The current counter value **has not reached** the preset value, if the counter is in TO mode,

**Example:** Lighting an LED connected to counter output No. 1 (TO mode).

![Symbol]

When the preset value has been reached: The LED is lit; otherwise it is off.
Configuration from Front Panel

The block’s parameter settings can be accessed either when entering the command line or from the PARAMETERS menu if the block has not been padlocked.

The different parameters to fill in are as follows:
- Type of counting,
- Preset value,
- Parameter lock,
- Latching.

**Type of counting:**
Symbol of the Type of counting parameter:

![Symbol](image)

This parameter is used to select the operating mode of the counter:
- **TO**: upcounting towards the preset value.
  When the counter’s current value is equal to the preset value, contact C of the counter is conducting.
- **FROM**: downcounting from the preset value.
  When the counter current value equals 0, counter contact C is conducting.

**Preset Value:**
Symbol of the Preset Value parameter:

![Symbol](image)

This value is between 0 and 32,767, and represents:
- The value to reach in the counting mode to the preset value (**TO** mode),
- the initial value in the downcounting mode from the preset value (**FROM** mode).

**Parameter Lock:**
Symbol of the Parameter Lock parameter:

![Symbol](image)

Locking prevents locked parameters from being modified from the front panel of the smart relay using the PARAMETERS menu.

**Latching:**
Symbol of the Latching parameter:

![Symbol](image)

This function is used to save the state of the counter’s current values in the event of a power cut.
**Illustration**: configuring a counter from the front panel of the smart relay:

![Diagram of counter configuration](image)

**Description**:

**Current Counter Value**

The current value is the value at any given time resulting from the successive up/down counting actions that have occurred since the last time the counter was reset to its initial state.

This value is between 0 and 32767. Once these values have been reached, a down count will leave the value 0 and an upcount will leave the current value at +32767.
Timing Diagrams

In the timing diagrams the blue curves represent the current value of the counter:
The following figure shows the operation of the counter in up-counting mode with toward the preset value: **TO** mode:

![Timing Diagram TO Mode]

The following figure shows the operation of the counter in upcounting mode from the preset value: **FROM** mode:

![Timing Diagram FROM Mode]

Modifying the Mode of a Coil or a Contact

To modify the use mode of a coil or a contact from the front panel of the smart relay (the programming window displayed on screen), simply:
- Position the cursor on the symbol representing the coil mode or on the letter of the contact,
- proceed as described in the paragraph *Modifying an element*, p. 44, to scroll through the possible modes for a coil or contact types possible (C for normally open contact, c for a normally closed contact).
Initialization
State of the contacts and current value on initialization of the program:
- the normally open mode (direct state) is inactive,
- The normally closed mode (inverse state) is active,
- The current value is zero.

Examples
Below, three simple examples of the use of a counter (configured in upcounting mode toward the preset value):

<table>
<thead>
<tr>

The counter is decremented each time input I1 is activated.  
The counter is reset each time the I2 input is activated. |
| I1-----CC1 I3-----DC1 I2------RC1 | Upcounting, Downcounting and Resetting:  
The counter is incremented each time the I1 input is activated.  
The counter is decremented each time the I3 input is activated.  
The counter is reset each time the I2 input is activated. |
Fast Counter

Description

The **Fast Counter** function is used to count pulses up to a frequency of 1 kHz.

Use of the contact **K1** indicates:

- the preset value has been reached (up-counting),
- the counter has reached 0 (down-counting).

The fast counter inputs are implicitly connected to the **I1** and **I2** smart relay inputs:

- a pulse (rising edge) on the **I1** input increments the counter,
- a pulse (rising edge) on the **I2** input decrements the counter.

These inputs should not be used on the wiring sheet.

The **Rapid Counter** function can be reset to zero during use by the **RK1** coil:

- 0 if it is in up-count mode towards the preset value
- the preset value if it is in down-count mode from the preset value.

The counter only operates if the **TK1** confirmation coil is active.

Repetitive mode can be used with a time-delay value.

**Note:** Limit overrun:

- if the current value of the counter exceeds the upper limit: *32,767*, it is set to *-32,768*,
- if the current value of the counter exceeds the lower limit: *32,767*, it is set to *-32,768*.

**Note:** This function block cannot be simulated.
Use of Coils

Two coils are associated with the rapid counter:

- coil TK1: Enable function input,
- coil RK1: Reset initial counter state input.

The use of these coils is described below.

**Enable function input:**

Symbol of the Enable Function Input coil of the rapid counter:

![TK1](image)

This element is used to confirm the counter. When this coil is active, each pulse on the \( I_1 \) input will increment the rapid counter and each pulse on the \( I_2 \) input will decrement it.

**Reset initial counter state input:**

Symbol of the Reset Initial Counter State Input:

![RK1](image)

This input resets the counter function to its initial state.

Energizing the coil has the following effect:

- reset the current count value to zero if the count type is TO (up-counting from the preset value).
- reset the current value to the preset value if the count type is FROM (down-counting from the preset value).

**Example:** counter reset by pressing on the Z1 key:

![Z1 RK1](image)

Each time the Z1 key is pressed, the counter is reset.
Use as a Contact

The contact associated with the rapid counter indicates whether the preset value (TO mode) or zero (FROM mode) has been reached. It may be used as many times as necessary in the program. It may be used according to 2 modes: normally open or normally closed, described below.

**Normally open mode:**
Symbol of the normally open contact associated with the rapid counter

![Symbol of the normally open contact](image)

The contact is conducting when:
- the current value of the counter has reached the preset value (TO mode),
- the current value of the counter has reached the 0 value (FROM mode).

**Normally closed mode:**
Symbol of the normally closed contact associated with the rapid counter:

![Symbol of the normally closed contact](image)

The contact is conducting as long as:
- the current counter value has not reached the preset value, if the counter is in TO mode,
- the current counter value has not reached 0, if the counter is in FROM mode, Example: lighting of an LED connected to rapid counter output TO mode).

![Symbol of the normally closed contact](image)

When the preset value has been reached: LED is lit; otherwise LED off.
Configuration from Front Panel

The block’s parameter settings can be accessed either when entering the command line or from the PARAMETERS menu if the block has not been padlocked.

The different parameters to fill in are as follows:
- Cycle type,
- Pulse duration,
- Preset value,
- Type of counting,
- Parameter lock,
- Latching.

**Cycle type:**

This parameter determines the behavior of the rapid counter when it reaches the preset value (when it is in **TO** mode), or when it reaches the value zero (when it is in **FROM** mode):

- **Single:** reaching the preset value (**Repetitive** mode) or of the zero value (**FROM** mode) does not affect the current value of the counter. The current counter value changes on an on-going basis. The output is activated when the current value is greater than the preset value (**TO** mode) or when the current value is less than the preset value (**FROM** mode).
- **Repetitive:** in the **TO** mode, the current value is reinitialized when it reaches the preset value in the **FROM** mode, it is reset to the preset value when it reaches zero. The output is enabled following this reinitialization and remains active during a period of time that can be configured with the parameter: **Pulse duration** (from 1 to 32,767 times 100 ms).

Symbol of the **Pulse Duration** parameter:

This parameter is only displayed if the cycle is repetitive. It determines the duration during which the rapid counter remains active when the current value reaches the preset value (when it is in **TO** mode), or when it reaches the value zero (when it is in **FROM** mode).

This value must be between 1 and 32,767 (x 100 ms).
Preset value:
Symbol of the Preset value parameter:

This value is between 0 and 32,767, and represents:
- The value to reach in the counting mode to the preset value (TO mode),
- the initial value in the down-count mode from the preset value (FROM mode).

Type of counting:
Symbol of the Type of counting parameter:

This parameter is used to select the operating mode of the counter:
- TO: up-counting towards the preset value.
  When the counter’s current value is greater than or equal to the preset value, contact K1 of the rapid counter is conducting.
- FROM: down-counting from the preset value.
  When the counter’s current value is less than or equal to 0, contact C of the counter is conducting.

Parameter lock:
Symbol of the Parameter Lock parameter:

Locking prevents locked parameters from being modified from the front panel of the smart relay using the PARAMETERS menu.

Latching:
Symbol of the Latching parameter:

This function is used to save the state of the rapid counter’s current values in the event of a power cut.
**Illustration:** configuring a counter from the front panel of the smart relay:

<tr>
<td>6</td>
<td>Latching</td>
<td>Backup of state of the current counter value in the event of a power cut.</td>
</tr>
</tbody>
</table>

**Current Counter Value**

Value at any given instant resulting from successive up/down counts since the last counter reset to its initial state. 

If the current value of the counter exceeds the upper limit: +32,767, it is set to -32,768.

If the current value of the counter exceeds the lower limit: -32,767, it is set to +32,768.
**Timing Diagrams**

Timer diagrams are provided here to illustrate the various behaviors of the rapid counter according to its configuration:
- up-counting function **TO**, in single cycle mode,
- down-counting function **FROM**, in single cycle mode,
- Up-counting function **TO**, in repetitive cycle mode,
- down-counting function **FROM**, in repetitive cycle mode.

For the following 4 charts, the blue curve represents the current value of the counter. When it increases, it is because of pulses on I1 and when it decreases, it is because of pulses on I2.

**Up-counting function in single cycle mode:**

The figure below illustrates the counter function in up-counting and single cycle mode:

![Timing Diagram](image_url)
Down-counting function in single cycle mode:
The figure below illustrates the counter function in down-counting and single cycle mode:
Up-counting function in repetitive cycle mode:

The figure below illustrates the counter function in up-counting and repetitive cycle mode:

The output switches to the **Inactive** state when the predefined pulse duration value has run out. If the switch condition is **Active** before the switch to the Inactive state, the output pulse is extended by the **Pulse Duration** (Timing).
Down-counting function in repetitive cycle mode:
The figure below illustrates the counter function in down-counting and repetitive cycle mode:

The output switches to the **Inactive** state when the predefined pulse duration value has run out. If the switch condition is **Active** before the switch to the Inactive state, the output pulse is extended by the **Pulse Duration** (Timing).

### Modifying the Mode of a Coil or a Contact
To modify the use mode of a coil or a contact from the front panel of the smart relay (the programming window displayed on screen), simply:
- position the cursor on the symbol representing the coil mode or on the letter of the contact,
- proceed as described in the paragraph *Modifying an element*, p. 44, to scroll through the possible modes for a coil or contact types possible (K for normally open contact, k for a normally closed contact).
Initialization

State of the contacts and current value on initialization of the program:

- the **normally open** mode (direct state) is **inactive**, 
- the **normally closed** mode (inverse state) is **active**, 
- the current value is **zero**.

Example

Below, an example of using a rapid counter: output Q1 is set to 1 when the rapid counter is set to 1; the counter is activated by input I3 and reset to 0 by input I4.

```
K1----------[Q1
I3----------TK1
I4----------RK1
```
Counter Comparator

Description
This function is used to compare the current counting values of two counters or of a counter and a constant value.

Note: The Counter Comparator function block can only be configured from the programming software in Free Entry mode. See on-line help of the programming software for more information.

Use as a Contact
The counter comparator indicates whether the chosen condition is verified. It is used as a contact, in normally open mode or in normally closed mode.

Normally open mode:
The symbol of the counter comparator, in normally open mode:

The contact is conducting when the condition is verified.

Normally closed mode:
The symbol of the counter comparator, in normally closed mode:

The contact is conducting when the condition is not verified.

Configuration from the Front Panel
The Counter Comparator function block cannot be configured from the front panel of the smart relay. This function must be configured from the programming software. See on-line help of the programming software for more information on configuration.

Modifying the Mode of a Coil or a Contact
To modify the operating mode of a coil or a contact from the front panel of the smart relay (the programming window displayed on screen), simply:

- Position the cursor on the symbol representing the coil mode or on the letter of the contact,
- Proceed as described in the paragraph Modifying an element, p. 44, to scroll through the possible modes for a coil or possible contact types (V for normally open contact, v for a normally closed contact).
**Initialization**

Status of contacts on program initialization:

- Normally open mode (direct state) is inactive,
- Normally closed mode (reverse state) is active.
Analog Comparators

Description
The Analog Comparator function block is used to:

- Compare a measured analog value with an internal reference value.
- Compare two measured analog values.
- Compare two measured analog values with hysteresis parameter.

The result of this comparison is used in the form of a contact.

Analog automation functions can be used for smart relays with a real time clock and DC power supply, and with mixed DISCR/Analog inputs.

The following indicate the existence of mixed Discrete/Analog inputs:

- The existence of inputs numbered from IB to IG (maximum configuration), these inputs are used to receive analog signals from 0.0V to 9.9V inclusively.
- The presence of the Analog Comparators function in the toolbar of the programming software.

These smart relays have 16 Analog Comparator function blocks, numbered from 1 to 9 then from A to G.

Use as a Contact
The contact shows the position of a measured analog value in relation to a reference value or to another measured value.

It may be used as many times as necessary in the program. It may be used according to 2 modes: Normally open or normally closed, described below.

Normally open mode:
Symbol of the normally open contact associated with a, Analog Comparator:

\[ A^- \]

The contact is **conducting** when the comparison condition is **verified**.

Normally closed mode:
Symbol of the normally closed contact associated with an analog comparator:

\[ a^- \]

The contact is **conducting** when the condition is **not verified**.
The simple comparison formula is as follows:

\[ x_1 \text{ <Comparison Operator> } x_2 \]

The comparison formula, for a comparison with hysteresis:

\[ x_1 - H \leq x_2 \leq x_1 + H \]

The different parameters to fill in are as follows:
- Values to compare,
- Comparison operator,
- Reference value,
- Hysteresis parameter,
- Parameter lock.

**Values to compare:**

Symbol of values to compare:

\[ x_1 \quad x_2 \]

These variables are chosen from among the following:
- Numbered analog inputs from IB to IG (maximum configuration),
- Reference value \( R \)

**Comparison operator:**

The comparison operator is chosen using the number in the upper right-hand side of the screen.

The table below provides the correspondence between this number and the comparison formula that will be used:

<table>
<thead>
<tr>
<th>Number</th>
<th>Comparison formula</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>( x_1 &gt; x_2 )</td>
</tr>
<tr>
<td>2</td>
<td>( x_1 \geq x_2 )</td>
</tr>
<tr>
<td>3</td>
<td>( x_1 = x_2 )</td>
</tr>
<tr>
<td>4</td>
<td>( x_1 \neq x_2 )</td>
</tr>
<tr>
<td>5</td>
<td>( x_1 \leq x_2 )</td>
</tr>
<tr>
<td>6</td>
<td>( x_1 &lt; x_2 )</td>
</tr>
<tr>
<td>7</td>
<td>comparison with hysteresis: ( x_1 - H \leq x_2 \leq x_1 - H )</td>
</tr>
</tbody>
</table>
**Reference value:**
Symbol of the reference value:

![Symbol of the reference value](image)

The reference value is a constant to which a measured value may be compared. It must be between 0 and 9.9.

**Hysteresis parameter:**
Symbol of the hysteresis parameter:

![Symbol of the hysteresis parameter](image)

The hysteresis parameter is a constant used to define an interval in which the $2x$ variable should be found for the comparator to be active. Its value must be between 0 and 9.9.

**Parameter lock:**
Symbol of the Parameter Lock parameter:

![Symbol of Parameter Lock parameter](image)

Locking prevents locked parameters from being modified from the front panel of the smart relay using the PARAMETERS menu.

**Illustration:**
Configuration from the front panel of the smart relay, of the hysteresis-type comparator with constant reference value:

![Configuration from the front panel](image)

In this case: The comparison condition is verified when the power to the input terminal $I_e$ is between 2.5 V and 5.5 V.
Configuration of a single comparator from the front panel:

(If neither x1 nor x2 are not set to R, parameter R does not appear.

Description:

<table>
<thead>
<tr>
<th>Number</th>
<th>Parameter Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Type of comparison</td>
<td>The number that follows ANALOG corresponds to the selected comparison operator.</td>
</tr>
<tr>
<td>2</td>
<td>Comparison formula</td>
<td>Formula used for comparison.</td>
</tr>
<tr>
<td>3</td>
<td>Parameter lock</td>
<td>Locking prevents locked parameters from being modified from the front panel of the smart relay using the PARAMETERS menu.</td>
</tr>
<tr>
<td>4 and 5</td>
<td>Parameters of the comparison formula</td>
<td>Parameters of the comparison formula.</td>
</tr>
</tbody>
</table>

Modifying the Mode of a Coil or a Contact

To modify a contact from the front panel of the smart relay (the programming window displayed on screen), simply:

- Place the cursor over the letter of the contact,
- Proceed as described in the paragraph *Modifying an element*, p. 44, to scroll through the possible contact types (A for a normally open contact, a for a normally closed contact).

Initialization

State of the contacts and current value on initialization of the program:

- the **normally open** mode (direct state) is **inactive**,  
- The **normally closed** mode (inverse state) is **active**.
Example
To order a heating resistance using smart relay output Q1 when the temperature is below 20° C.
A temperature probe is used, providing a 0 to 10 volt signal for a -10° to +40° C temperature range. A temperature of 20° C corresponds to a voltage level of 6 volts on the probe.
You would write the following Ladder program:
A1-------------[Q1
Using the following parameters for the A1 comparator:

The comparison operator no. 5 is chosen, that is \( \leq \).
The values to compare are chosen: The analog input IB (to which the temperature probe is connected) for the first, the reference value R for the second.
The reference value is set to 6.
The analog comparator is thus active when the power measured on analog input IB is less than or equal to 6V. This is, when the probe measures a temperature less than or equal to 20° C.
Clocks

Description
The Clock function is used to validate the time ranges during which actions can be executed.

The smart relay has 8 Clock function blocks numbered from 1 to 8. Each of these has four programming ranges and behaves like a weekly programmer. The Clock function blocks are used like contacts.

Use as a Contact
This contact may use the direct state of the Clock function block (normally open mode) or its inverse state (mode normally closed), see below.

Normally open mode:
Symbol of the normally open contact, representing a clock:

The contact is conducting when the clock is in a validity period.

Normally closed mode:
Symbol of the normally closed contact, representing a clock:

The contact is conducting when the clock is not in a validity period.
Configuration from Front Panel

Configuration screen of a Clock function block from the front panel of the smart relay:

<table>
<thead>
<tr>
<th>Number</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Clock module number</td>
<td>8 clocks available, numbered 1 to 8.</td>
</tr>
<tr>
<td>2</td>
<td>Type of date configuration</td>
<td>D/W: Days of the Week,</td>
</tr>
<tr>
<td>3</td>
<td>Validity day (D/W type)</td>
<td>Validity day:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0: Monday,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1: Tuesday,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>...</td>
</tr>
<tr>
<td></td>
<td></td>
<td>6: Sunday.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Unselected days are indicated by a <em>.</em>.</td>
</tr>
<tr>

<td>Start time (D/W type)</td>
<td>This is the operation start time, in Hour: Minute format (00:00 to 23:59).</td>
</tr>
<tr>
<td>5</td>
<td>Stop time (D/W type)</td>
<td>This is the operation end time, in Hour format: Minute format (00:00 to 23:59).</td>
</tr>
<tr>
<td>6</td>
<td>Parameter lock</td>
<td>Locking prevents locked parameters from being modified from the front panel of the smart relay using the PARAMETERS menu.</td>
</tr>
<tr>
<td>7</td>
<td>Operating ranges</td>
<td>4 operating ranges are available: A, B, C, D. In operation, these ranges are cumulative: The block is valid over all selected ranges.</td>
</tr>
</tbody>
</table>

If the clock is set to ON on Monday at 23:00 and set to OFF on Monday at 1:00, then it does not change to OFF on Tuesday at 1:00 but effectively on the following Monday at 1:00. Moreover, if no other command has been made, the clock remains positioned at ON all other days of the week.
Combining Modes

Programming modes can be mixed for the same clock.

Example: Using the four clock ranges with different modes.

<table>
<thead>
<tr>
<th>Range</th>
<th>Program</th>
</tr>
</thead>
<tbody>
<tr>
<td>A: time range</td>
<td>Every day from Monday to Friday, start at 8.00 and end at 18.00.</td>
</tr>
<tr>
<td>B: Day/Night</td>
<td>Every day from Tuesday to Thursday: start at 22.00 and end the following day at 6.00.</td>
</tr>
<tr>
<td>C: interval</td>
<td>Start on Friday at 20.00.</td>
</tr>
<tr>
<td>D: Interval</td>
<td>End on Monday at 03.00.</td>
</tr>
</tbody>
</table>

Modifying the Mode of a Coil or a Contact

To modify the use mode of a coil or a contact from the front panel of the smart relay (the programming window displayed on screen), simply:

- Place the cursor over the letter of the contact,
- Proceed as described in the paragraph *Modifying an element*, p. 44, to scroll through the possible contact types (H for a normally open contact, h for a normally closed contact).
**Example**

You wish to control a device connected to the Q2 output of the smart relay. You want it to be active on the following two clock ranges:

- from Monday to Saturday, from 09:00 to 13:00.
- from Monday to Friday, from 15:00 to 19:00.

For that, the H1 Clock block is used and the following wiring diagram is created:

When entering the H1 Clock block, configure the operational ranges **A** and **B** as described in the table below:

<table>
<thead>
<tr>
<th>Screen</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="H1 A Screen" /></td>
<td>First Slot A: From Monday to Saturday, from 09:00 to 13:00.</td>
</tr>
<tr>
<td><img src="image" alt="H1 B Screen" /></td>
<td>Second Slot B: From Monday to Friday, from 15:00 to 19:00.</td>
</tr>
</tbody>
</table>
## Texts

<table>
<thead>
<tr>
<th>Description</th>
<th>The Text automation function is used to display texts or a numerical value (current value, preset value, etc.) on the LCD instead of the INPUTS-OUTPUTS screen:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The smart relays have 16 Text blocks, numbered from 1 to 9 then from A to G. These function blocks are used as coils.</td>
</tr>
<tr>
<td></td>
<td>Up to 16 text blocks can be used (TX1 to TXG) simultaneously in one program, but only the block with the highest number is displayed.</td>
</tr>
<tr>
<td></td>
<td>Pressing the Shift and Menu/OK keys in order and simultaneously, switches the display from the TEXT screen to the INPUTS-OUTPUTS screen.</td>
</tr>
<tr>
<td></td>
<td>Pressing the two keys again simultaneously returns the display to the TEXT screen.</td>
</tr>
</tbody>
</table>

**Note:** The Text blocks are only programmable from the programming software (see the on-line help for the programming software for more information).
Use as a Coil

Two coils are associated with each Text block:
- Display Activation coil,
- Display Deactivation coil.

The use of these coils is described below.

Display Activation

Symbol of the Command Input coil of a Text function block:

This coil displays on the screen the text and/or the values of the associated Text block when the contacts that are connected are conducting.

Display deactivation

Symbol of the Display Deactivation coil of a Text function block:

This coil deactivates the display of the text and/or the values of the associated Text block when the contacts that are connected are conducting. The display returns to the INPUTS-OUTPUTS screen.

Example:

| I1 ——— TX1 |
| I2 ——— RX1 |

Activation of input I1 displays the text on the LCD. Activating input I2 makes the text disappear.

Configuration

The Text function blocks are only programmable from the programming software, see the on-line help for the programming software for more information.
LCD Screen Backlighting

Description
The screen backlighting output is used to control the backlighting of the LCD by a program.
In STOP and RUN modes, the LCD screen is lit for 30 seconds when the user presses any of the buttons on the front panel.

Used as a Coil
Used as a coil, it lights up the LCD when the contacts to which it is connected are conducting.
Symbol of the coil of the LCD screen backlighting function:

TL1

The screen is lit if this coil is active.
Change to Summer / Winter Time

Description
The output of this function is in an OFF state over the entire duration of winter time, and switches to ON for the entire duration of summer time.

By default, there is no change in winter / summer time. This function must be activated, either from the programming software, or from the front panel of the smart relay.

To activate this function from the front panel of the smart relay, proceed as described in chapter CHANGE SUMMER/WINTER Menu, p. 83.

Note: This function is only available for smart modules that contain a real-time clock.

Use as a Contact
When used as a contact, this element indicates the current season.

It may be used as many times as necessary in the program. It may be used according to 2 modes: normally open or normally closed, described below.

Normally open mode:
Symbol of the normally open contact associated with a Change summer/winter time function block:

W 1

The contact is active for the entire duration of summer time.

Normally closed mode:
Symbol of the normally closed contact associated with a Change summer/winter time function block

w 1

The contact is active for the entire duration of winter time.
Parameters
Possible operating modes are the following:
- **No**: no change,
- **Automatic change**: Dates are preset according to geographic zone:
  - **EUROPE**: Europe,
  - **GB**: Great Britain,
  - **USA**.
- **OTHER ZONE**: the change is automatic, but you must specify the month: M and the Sunday: S (1, 2, 3, 4 or 5) on which the summer/winter change takes place.

Modifying the Mode of a Coil or a Contact
To modify a contact from the front panel of the smart relay (the programming window displayed on screen), simply:
- Place the cursor over the letter of the contact,
- Proceed as described in the paragraph *Modifying an element*, p. 44, to scroll through the possible contact types (W for a normally open contact, w for a normally closed contact).

Initialization
State of the contacts and current value on initialization of the program:
- the **normally open** mode (direct state) is **inactive**,
- The **normally closed** mode (inverse state) is **active**.
Modbus Inputs/Outputs

Description
A Modbus **SR3 MBU01BD** extension module may be added onto an extensible smart relay.

In **LD** mode, the application cannot access the four 16-bit data exchange words. Data transfer between master and slave is implicit and completely transparent.

**Note:** The Modbus module only operates in Modbus slave mode.

Parameters
The Modbus module can be configured only from the programming software (see the on-line help of the programming software for more information).

Words to be sent to master
The words to be sent to the master are automatically written by duplicating the status of the discrete I/Os as follows:

<table>
<thead>
<tr>
<th>Modbus Address (Hexa)</th>
</tr>
</thead>
<tbody>
<tr>
<td>I1 to IG: discrete input states for the SR3 B261BD base.</td>
</tr>
<tr>
<td>IH to IR: discrete input states for the SR3 XT141BD extension.</td>
</tr>
<tr>
<td>Q1 to QA: Discrete output states for the SR3 B261BD base.</td>
</tr>
<tr>
<td>QB to QG: Discrete output states for the SR3 XT141BD extension.</td>
</tr>
</tbody>
</table>

Words sent by the master.
The words sent by the master are not processed by the smart relay.
The (Hexa) addresses for these four 16-bit words are as follows: 0016 / 0017 / 0018 / 0019.
Message

Description
The **Message** function block, when activated, allows the following:

- To send alarm messages to portable telephones or email addresses via the SR2COM01 extension and a modem,
- To provide access, remotely, to a DISCR variable and/or a digital variable, to read or modify them.

There are 28 **Message** function blocks numbered from S1 to S9, then from SA to SV.

**Note:** The **Message** function is only available on smart relays with a clock and when a SR2COM01 communication extension is added to them. For more information on the configuration of the SR2COM01 communication extension, see the on-line help of the programming software.

Use of the Coil
**Command input**

Symbol of the Command Input coil of a **Message** function block:

| TS- |

This coil sends the configured alarm message in the associated **Message** function block, when it is activated.

Depending on the configuration of the **Message** function block, the coil may be activated during detection on its input, by a transition:

- From Inactive to Active State (by default),
- From Active to Inactive State.

See on-line help for the programming software for more information on configuring the **Message** function block.
Use as a Contact

The contact associated with the Message function block indicates whether the function block is activated.

It may be used as many times as necessary as many times as necessary in the program. It may be used according to 2 modes: normally open or normally closed, described below.

**Normally open mode:**
Symbol of the normally open contact associated with a Message function block:

![S-](image)

The contact is conducting when the function block is activated.

**Normally closed mode:**
Symbol of the normally closed contact associated with a Message function block:

![s-](image)

The contact is conducting as long as the function block is not activated.

**Example:** Lighting an LED connected to the output of the Message function block No.1

![S1 ─── I Q1](image)

When function block no. 1 is activated, the associated alarm message is sent and the LED lights up, otherwise it is off.

---

Modifying the Mode of a Coil or a Contact

To modify the operating mode of a coil or a contact from the front panel of the smart relay (the programming window displayed on screen), simply:

- Position the cursor on the symbol representing the coil mode or on the letter of the contact,
- Proceed as described in the paragraph Modifying an element, p. 44, to scroll through the possible modes for a coil or contact types possible (S for normally open contact, s for a normally closed contact).

---

Configuration from the Front Panel

The Message function block cannot be configured from the front panel of the smart relay. This function must be configured from the programming software.

See on-line help of the programming software for more information on configuration.

---

Initialization

Status of contacts on program initialization:

- The **normally open** mode (direct state) is **inactive**.
- The **normally closed** mode (inverse state) is **active**.
Creating and Debugging an Application

Presentation

Subject of this Section
This section describes, using detailed examples, how to create, debug and save an application.

</table>
Presentation of Ladder Diagrams

Description
In this section, we will use a simple example to understand how a ladder diagram works: A two-way switch.

<table>
<thead>
<tr>
<th>Normal electrical diagram</th>
<th>Ladder diagram</th>
</tr>
</thead>
<tbody>
<tr>
<td>VV1 &lt;--- L1 &lt;--- VV2</td>
<td>I1-I2----------[Q1</td>
</tr>
<tr>
<td></td>
<td>I1-I2]</td>
</tr>
</tbody>
</table>

The two position switches VV1 and VV2 control turning lamp L1 on and off. I1 and I2 are two contacts representing inputs 1 and 2 on the smart relay. Q1 is a coil that corresponds to output 1 from the smart relay.
Implementing a Basic Application

Module Wiring

Below, an illustration of smart relay wiring:

![Smart Relay Wiring Diagram]

**Application Operation**

Using a smart relay means that ordinary switches (with open or closed positions) can be used in place of two position switches.

The switches are identified as S1 and S2 in the wiring diagram above. S1 and S2 are connected to inputs I1 and I2 on the smart relay.

The operating principle is as follows: Each time the status of inputs I1 and I2 changes, the status of output Q1 also changes which controls the lamp L1.

The ladder diagram uses basic functions, for example placing contacts in parallel and in series, as well as the reverse function identified as i1 and i2 (see Using the Reverse Function, p. 156).

**Note:** The implementation of a two-way switch is optimum when impulse relay coils are used (see Discrete (DISCR) Outputs, p. 98).
### Using the Reverse Function

| Description | The reverse function, noted \( i \) in the smart relay is used to obtain the reverse state of input \( I \) wired on the smart relay.  
To illustrate how this function works, we shall use a simple example: |
Practical Example

Below is the electrical diagram of the example and an illustration of the smart relay wiring:

<table>
<thead>
<tr>
<th>Electrical diagram</th>
<th>Connection to the smart relay</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Electrical Diagram" /></td>
<td><img src="image" alt="Connection Diagram" /></td>
</tr>
</tbody>
</table>

Depending on the ladder diagram, two solutions are possible:

<table>
<thead>
<tr>
<th>Ladder diagram 1: Light off when idle</th>
<th>Ladder diagram 2: Light on when idle</th>
</tr>
</thead>
<tbody>
<tr>
<td>I1__________[Q1]</td>
<td>i1__________[Q1]</td>
</tr>
<tr>
<td>I1 corresponds to the true image of BP1, pressing BP1 activates input I1, so that the Q1 output is activated and the lamp L1 turns on.</td>
<td>I1 corresponds to the reverse image of BP1, pressing BP1 activates input I1 and therefore contact I1 is disabled, output Q1 is disabled and the lamp L1 turns off.</td>
</tr>
</tbody>
</table>
### General Case

The table below illustrates the operation of a pushbutton connected to the smart relay. Pushbutton BP1 is connected to input I1 and lamp L1 is connected to output Q1 on the smart relay.

<table>
<thead>
<tr>
<th></th>
<th>Off delay</th>
<th>Operating</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Electrical diagram</strong></td>
<td><img src="image1" alt="BP1 L1" /></td>
<td><img src="image2" alt="BP1 L1" /></td>
</tr>
<tr>
<td><strong>Smart relay symbols</strong></td>
<td>I1 = 0 [i1 = 1]</td>
<td>I1 = 1 [i1 = 0]</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th></th>
<th>Off delay</th>
<th>Operating</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Pushbutton normally open</strong></td>
<td><img src="image1" alt="BP1 L1" /></td>
<td><img src="image2" alt="BP1 L1" /></td>
</tr>
<tr>
<td></td>
<td>I1 = 1 [i1 = 0]</td>
<td>I1 = 0 [i1 = 1]</td>
</tr>
</tbody>
</table>

### Note:
The reverse function may be applied to all of the contacts in a ladder diagram, whether they represent outputs, auxiliary relays or function blocks.
Notation Used by the Smart Relay

Description
The smart relay has a four line display used to show ladder diagrams.

**Note:** The programming software allows you represent ladder diagrams in three different formats:
- Electrical symbols,
- Ladder symbols,
- Smart relay symbols,

### Equivalencies Between Notations

In the table below are the equivalencies between representations of the most common elements of the ladder language, in the 3 formats:

<table>
<thead>
<tr>
<th>Electrical symbol</th>
<th>Ladder symbol</th>
<th>Smart relay symbols</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Electrical symbol" /></td>
<td><img src="image2" alt="Ladder symbol" /></td>
<td><img src="image3" alt="Smart relay symbols" /></td>
</tr>
<tr>
<td><img src="image4" alt="Electrical symbol" /></td>
<td><img src="image5" alt="Ladder symbol" /></td>
<td><img src="image6" alt="Smart relay symbols" /></td>
</tr>
<tr>
<td><img src="image7" alt="Electrical symbol" /></td>
<td><img src="image8" alt="Ladder symbol" /></td>
<td><img src="image9" alt="Smart relay symbols" /></td>
</tr>
</tbody>
</table>

**A1**
- Set coil (SET)

**A2**
- Reset coil (RESET)
Other Elements

Other elements are also available using a smart relay, such as:

- **Timer function block**: Used to delay, prolong and control and action for a set length of time,
- **Counter function block**: Used to count the pulses received on an input,
- **Clock function block**: Used to trigger or release actions on precise days or at precise times,
- **Analog comparator function block**: Used to compare an analog value with a reference value or with another analog value after allowing for a hysteresis factor,
- **Auxiliary relays**: These are used to save or relay the status of the smart relay,
- **Zx keys**: After confirming this function, Z keys may be used as pushbuttons,
- **Fast counter function block**: The fast counter function is used to count pulses up to a frequency of 1 kHz.
- **LCD screen back-light function block**: This is used to control the backlighting of the LCD by a program,
- **Summer/winter time change function block**: The output of this function is in an OFF state over the entire duration of winter time, and switches to ON for the entire duration of summer time,
- **Counter Comparator block**: This function is used to compare the current counting values of two counters,
- **Text block**: This is used to display text or numerical values (current value or preset value).

**Note:** Blocks Counter Comparator and Text are not programmable from the front panel.

**Note:** For the list of all ladder diagram elements available when using smart relays, as well as details on their functions and parameters, see the chapter entitled *LD Language Elements, p. 87*. 
Application: Implementing a Two-way Switch

Description

In the text that follows you will find detailed information on the procedure for entering a ladder diagram for a two-way switch.

You should proceed as follows:
- Go to the programming screen,
- Enter the contacts in the first line,
- Enter the coil in the first line and join it to the contacts,
- Enter the contacts in the second line,
- Join the second line to the first,
- Launch the program.

From the main screen (the one shown on power-up), follow the instructions in the Action column and press the specified button.

The Screen column shows what the user will see on the smart relay display screen.

The Comments column provides some additional information on entry and display actions.

Go to the Programming Screen

To access the screen from which we will program the two-way switch, proceed as follows:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
<th>Screen</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Menu / OK</td>
<td>PROGRAMMING</td>
<td>Position the cursor on PROGRAMMING; it will flash when selected.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>PARAMETERS</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>RUN/STOP</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>CONFIGURATION</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Menu / OK</td>
<td>LINE 2</td>
<td>After briefly displaying: LINE 1 (for approx. two seconds), a flashing cursor is displayed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>LINE 3</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>LINE 3</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td></td>
<td>ins - + del.</td>
<td>Pressing and holding down the Shift key (white) will make a contextual menu appear that is used for programming the contacts and the coils.</td>
</tr>
</tbody>
</table>
## Entering the Contacts in the First Line

To enter the contacts in the first line, proceed as follows:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
<th>Screen</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><img src="image1" alt="Step 1 Action" /></td>
<td><img src="image2" alt="Step 1 Screen" /></td>
<td>The flashing cursor is positioned on the I. The smart relay prompts you to select the type of contact.</td>
</tr>
<tr>
<td>2</td>
<td><img src="image3" alt="Step 2 Action" /></td>
<td><img src="image4" alt="Step 2 Screen" /></td>
<td>The 1 flashes. The user has implicitly selected a contact assigned to an input (I), the smart relay now prompts the user to select the input number.</td>
</tr>
<tr>
<td>3</td>
<td><img src="image5" alt="Step 3 Action" /></td>
<td><img src="image6" alt="Step 3 Screen" /></td>
<td>The 0 flashes, indicating a link point for linking connections.</td>
</tr>
<tr>
<td>4</td>
<td><img src="image7" alt="Step 4 Action" /></td>
<td><img src="image8" alt="Step 4 Screen" /></td>
<td>The 1 flashes. You just confirmed entry of the contact associated with the input I1. The 1 is positioned for entering the second contact.</td>
</tr>
<tr>
<td>5</td>
<td><img src="image9" alt="Step 5 Action" /></td>
<td><img src="image10" alt="Step 5 Screen" /></td>
<td>The right side I will begin flashing. The smart relay prompts you to select the type of contact.</td>
</tr>
<tr>
<td>6</td>
<td><img src="image11" alt="Step 6 Action" /></td>
<td><img src="image12" alt="Step 6 Screen" /></td>
<td>The 1 flashes. You have just selected the reverse contact assigned to an input.</td>
</tr>
<tr>
<td>7</td>
<td><img src="image13" alt="Step 7 Action" /></td>
<td><img src="image14" alt="Step 7 Screen" /></td>
<td>The 1 on the right flashes. Now enter the input number.</td>
</tr>
<tr>
<td>Step</td>
<td>Action</td>
<td>Screen</td>
<td>Comment</td>
</tr>
<tr>
<td>------</td>
<td>--------</td>
<td>--------</td>
<td>---------</td>
</tr>
<tr>
<td>8</td>
<td></td>
<td>I1–i2</td>
<td>The 2 flashes.</td>
</tr>
</tbody>
</table>
## Entering the Coil and Joining it to the Contacts

To enter the coil in the first line and connect it to the coils, proceed as follows:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
<th>Screen</th>
<th>Comment</th>
</tr>
</thead>
</table>
| 1    |        | I1-i2 | The cursor flashes in succession:  
|      |        |       | • At a link point: ●,  
|      |        |       | • At a contact point: □.  
|      |        |       | Until positioned at the end of the line ready to enter the coil. |
| 2    |        | I1-i2 [M1 | The [ flashes. |
| 3    |        | I1-i2 [M1 | The M flashes. |
| 4    |        | I1-i2 [Q1 | The Q flashes. |
| 5    |        | I1-i2 [Q1 | The cursor ● is displayed. |
| 6    |        |        | Pressing and holding down the Shift key (white) will make a contextual menu appear that is used for programming the connections. |
| 7    |        | I1-i2 [Q1 | The link is created. |
|      |        |        | 3 times |

---

---
To enter the contacts in the second line, proceed as follows:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
<th>Screen</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td></td>
<td><strong>The □ is at the start of the following line.</strong></td>
</tr>
<tr>
<td>2</td>
<td></td>
<td></td>
<td><strong>The □ located on the second line flashes.</strong></td>
</tr>
<tr>
<td>3</td>
<td></td>
<td></td>
<td><strong>The □ located on the second line flashes.</strong></td>
</tr>
<tr>
<td>4</td>
<td></td>
<td></td>
<td><strong>The □ located on the second line flashes.</strong></td>
</tr>
<tr>
<td>5</td>
<td></td>
<td></td>
<td><strong>The □ flashes.</strong></td>
</tr>
<tr>
<td>6</td>
<td></td>
<td></td>
<td><strong>The □ located on the second line flashes.</strong></td>
</tr>
</tbody>
</table>
### Implementing a Basic Application

#### Joining the Second Line to the First

To join the second line to the first, proceed as follows:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
<th>Screen</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td></td>
<td><img src="image1" alt="Image" /></td>
<td>The second 1 in the second line flashes.</td>
</tr>
<tr>
<td>8</td>
<td><img src="image2" alt="Image" /></td>
<td><img src="image3" alt="Image" /></td>
<td>The 2 located on the second line flashes.</td>
</tr>
</tbody>
</table>

### Joining the Second Line to the First

To join the second line to the first, proceed as follows:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
<th>Screen</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><img src="image4" alt="Image" /></td>
<td><img src="image5" alt="Image" /></td>
<td>The • flashes. This shows that it is possible to connect a link at this point.</td>
</tr>
<tr>
<td>2</td>
<td><img src="image6" alt="Image" /></td>
<td><img src="image7" alt="Image" /></td>
<td>The • has changed into a</td>
</tr>
</tbody>
</table>
## Implementing a Basic Application

### Launching the Program

To launch the program, proceed as follows:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
<th>Screen</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Menu / OK</td>
<td>VALIDER MODIFS.? OUI NON</td>
<td>Now confirm the changes. YES flashes.</td>
</tr>
<tr>
<td>2</td>
<td>Menu / OK</td>
<td>PROGRAMMATION PARAMETRES RUN/STOP CONFIGURATION</td>
<td>The main menu re-appears. PROGRAMMING is selected (flashes).</td>
</tr>
<tr>
<td>3</td>
<td>2 fois</td>
<td>PROGRAMMATION PARAMETRES RUN/STOP CONFIGURATION</td>
<td>RUN/STOP is selected (flashes).</td>
</tr>
<tr>
<td>4</td>
<td>Menu / OK</td>
<td>RUN PROG ? OUI NON</td>
<td>Now start the program.</td>
</tr>
<tr>
<td>5</td>
<td>Menu / OK</td>
<td>1234 BCDE RUN LD JEU 25 SEP 16:40 1234</td>
<td>The main menu re-appears.</td>
</tr>
</tbody>
</table>

### The Basic Points

This simple application example teaches the user how to enter a ladder diagram. The following points should be remembered:

- When a ▼ or a ◊ is flashing, use the Shift button to add an element (contact, coil or graphic link element),
- When an element is flashing (I, Q, No., ▼ etc.), it is possible to use the Shift + Z2 and Z3 arrows on the arrow keypad to select the required element,
- It is also possible to use the Z1 to Z4 arrows on the arrow keypad to move around the ladder diagram.
Debugging an Application

Presentation

Subject of this Chapter

This chapter presents the tools available for debugging an application loaded in the memory of the smart relay.

What’s in this Chapter?

This chapter contains the following topics:

<table>
<thead>
<tr>
<th>Topic</th>
<th>Page</th>

<td>174</td>
</tr>
<tr>
<td>Dynamic Mode Menus</td>
<td>175</td>
</tr>
<tr>
<td>Smart Relay Reaction to a Power Failure</td>
<td>176</td>
</tr>
</tbody>
</table>
## Debugging an Application

### Introduction

**Module in RUN Mode**

Once an application has been entered in ladder diagram form, debugging tests still must be run.

The first step is to set the smart relay to RUN. To do this, in the RUN/STOP option in main menu and select RUN.

From this moment on, the smart relay handles the physical inputs and outputs according to the instructions entered in the ladder diagram.

### Viewing Status:

In RUN mode, the states of inputs and outputs are displayed on the main screen:

![Main Screen Screenshot]

<table>
<thead>
<tr>
<th>Prompt</th>
<th>Element</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Display input status</td>
</tr>
<tr>
<td>2</td>
<td>Display run mode (RUN/STOP) and mode in use.</td>
</tr>
<tr>
<td>3</td>
<td>Displays date and time for products with clocks.</td>
</tr>
<tr>
<td>4</td>
<td>Output status display.</td>
</tr>
<tr>
<td>5</td>
<td>Contextual menus / pushbuttons / icons indicating operating modes.</td>
</tr>
</tbody>
</table>

When inputs or outputs are activated, they appear in reverse video (using white on a black background).

This concept is referred to as the dynamic operation of smart relay functions. The terms **RUN** and **dynamic** have a similar meaning in the remainder of this document.
Contextual Menus

Below is an illustration of the icons in the contextual menu when the smart relay is in RUN mode:

<table>
<thead>
<tr>
<th>Prompt</th>
<th>Element</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Status of the smart relay: In RUN it is in motion, in STOP it is immobile.</td>
</tr>
<tr>
<td>2</td>
<td>Indicates that faults have appeared (see FAULT Menu, p. 77).</td>
</tr>
<tr>
<td>3</td>
<td>Indicates that the smart relay is connected to the programming software.</td>
</tr>
<tr>
<td>4</td>
<td>The key indicates that the program is password-protected.</td>
</tr>
</tbody>
</table>
Dynamic Mode Ladder Diagrams

**Viewing Ladder Diagrams**

The smart relay can dynamically display the performance of a ladder diagram. To do this, simply call up the **MONITORING** menu and position the cursor over the lines to display using the navigation keys.

Each conducting contact or energized coil is displayed in reverse video mode (white on black):

```
I 1 - I 2 - I 4 - M 1
I 4 - I 3 - M 2
M 1 - M 2 - Q 1
H 2 - Q 2
```

To change smart relay performance, the user may change or view some of the function block parameters.

**Changing Ladder Diagrams**

It is **ABSOLUTELY IMPOSSIBLE** to change ladder diagram lines in **RUN** mode.

It is however possible to change function block parameters in **MONITORING** mode.

---

**Note:** This function can be accessed only in **LD/ RUN** mode.
Using Z Keys as Pushbuttons

On the INPUTS-OUTPUTS screen in RUN mode, the numbers of the Z keys used in the program are displayed in the contextual menu. Press and hold down the Shift key to display this menu.

To enable a Z key, press on the button located under the number.

Illustration:

Note: The Zx keys function is disabled in PARAMETERS and MONITORING modes and in all of the function block parameter screens and configuration screens.
Dynamic Mode Function Block Parameters

**Presentation**

In RUN mode a function block preset value may be changed dynamically if it is not locked.

Functions with parameters in LD mode:
- Auxiliary relays (latching),
- Discrete Outputs (latching),
- Clocks
- Analog comparators,
- Timers
- Counters
- Fast counters.

Functions with parameters in FBD mode:
- Numerical constant-type inputs,
- Clock,
- Gain,
- Timers: TIMER A/C, TIMER B/H, TIMER Li,
- Counter: PRESET COUNT / UP DOWN COUNT,
- H-SPEED COUNT fast counter,
- PRESET H-METER hour counter,
- CAM block.

**Accessing / Modifying parameters**

Parameters may be accessed from the following screens:
- **PARAMETERS**: See PARAMETERS Menu, p. 51,
- **MONITORING**: on the ladder diagram.

To modify the parameters of an element from the MONITORING screen, proceed as follows:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Position the cursor on the element you would like to modify using the navigation keys.</td>
</tr>
<tr>
<td>2</td>
<td>At the same time, hold down Shift and the Param key to open the parameter window.</td>
</tr>
<tr>
<td>3</td>
<td>Position the cursor on the modifiable parameter fields using the navigation keys: ▲ ▼.</td>
</tr>
<tr>
<td>4</td>
<td>Modify the value of the parameter using the ▲ and ▼ (+ and -) keys, holding down Shift.</td>
</tr>
<tr>
<td>5</td>
<td>Confirm the modifications by pressing Menu/OK, which will open the confirmation window. Confirm a second time by pressing Menu/OK to save.</td>
</tr>
</tbody>
</table>

**Note:** Only the parameters of unlocked blocks may be modified.
### Dynamic Mode Menus

Some menus are accessible when the smart relay is in RUN mode, while others are not. Here is a summary table.

<table>
<thead>
<tr>

Smart Relay Reaction to a Power Failure

**Description**
A power failure may cause the smart relay to restart and lose any data not saved. Smart relays have the ability to save the current time for at least 10 years. In addition, it is also possible to back up the variables configured with the **Latching** option defined in the parameters window.

**Latching**
The **Latching** function is used to save the state of the counter's current values in the event of a power failure.

The blocks that have this function are the following:
- In LD mode:
  - Auxiliary relays,
  - Discrete outputs,
  - Timers
  - Counters
  - Fast counter,
- In FBD mode:
  - AC, BH, Li timer,
  - Cam programmer function CAM BLOCK,
  - PRESET COUNT, UP DOWN COUNT counter,
  - RESET H-METER hour counter,
  - Data archiving function ARCHIVE,
  - Fast counters.
Safety Mode

If the result of losing the time setting is to lock coil control, then simply use a clock contact without a stop order in series with the action coils.

Example of a non-locked coil:

```
I1, I3---------[Q1
I2]
```

The contact line for coil Q1 will be active even if the time and date setting is lost.

Example of a locked coil:

```
I4-H1---------[Q2
```

With the clock function block 1 configured as follows:

```
DH1 D/W 0123456
A
H:M ON 07:00
H:M ON --:--
```

The contact line for coil Q2 will only be active after setting the clock.
### Saving and Transferring Ladder Diagrams

<table>
<thead>
<tr>
<th>Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>It is possible to transfer a ladder diagram from the smart relay toward a backup memory (optional) and vice-versa.</td>
<td></td>
</tr>
<tr>
<td>This allows:</td>
<td></td>
</tr>
<tr>
<td>- To backup an application, then restore it later on if necessary,</td>
<td></td>
</tr>
<tr>
<td>- To make a copy of an application for loading it in several smart relays.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Transferring an Application</th>

Sample Application

Presentation

Subject of this Chapter
In this chapter we’ll use the example of an underground car park control. From given specifications, we will develop the application to program in the smart relay.

What’s in this Chapter?
This chapter contains the following topics:

<table>
<thead>
<tr>
<th>Topic</th>
<th>Page</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifications</td>
<td>182</td>
</tr>
<tr>
<td>Specification Analysis</td>
<td>183</td>
</tr>
<tr>
<td>Implementing the Solution</td>
<td>185</td>
</tr>
</tbody>
</table>
## Specifications

### Objective
We wish to complete and centralize the control of the underground car park of an administrative building.

### Automatic Gate
The entrance and the exit of the car park are controlled by an ordinary automatic gate. The gate has the usual basic features such as:
- Gate timing (opening and closing) by passing vehicles,
- Ticket payment management,
- Safety telephones,
- External control for locking in closed position, etc.

### Counting Vehicles
In addition, we would like to keep track of vehicles parked in the facility.

We would thus be able to control a lighted panel that informs drivers when all parking spaces are occupied and prevents access by locking the gate in the closed position. Drivers would then know to look for a parking space elsewhere.

It must also be possible to override this function when necessary to allow access for emergency services (fire department, emergency medical service, etc.).

### Open Time
We would also like to prevent access to the facility when the building is closed. Security personnel should be allowed to prevent the gate from locking in non-ordinary circumstances. The hours of opening are the following: Monday to Friday from 8:30 am to 5:30 pm, Saturday from 9:30 am to 12:00 noon and closed all day Sunday.

### Removal of Toxic Gasses
For safety reasons, it is also necessary to remove toxic emissions such as carbon dioxide by using a fan when the measured concentration levels exceed permissible levels.

A specialized sensor will be used that provides an output value between 0 and 10V.

### Lighting
There is also a requirement to control lighting, triggered by a vehicle arriving and via pushbutton switches placed near all of the pedestrian access points.

To save energy, lights will turn off after 10 minutes. This is the length of time generally observed for someone to park and exit their vehicle and take the elevator, or return to their vehicle and exit the park facility.

### Manual Counting
In addition, a manual action should be able to provide current information on the number of vehicles parked in the facility. Someone should be able to manually increase or decrease the number of vehicles known by the smart relay.
Specification Analysis

Description
Analysis of the specifications includes listing inputs, buttons, outputs and function blocks necessary to complete the application.

Inputs
Below is the list of inputs that the application will use:

<table>
<thead>
<tr>
<th>Smart relay label</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input I1</td>
<td>Vehicle entry detection.</td>
</tr>
<tr>
<td>Input I2</td>
<td>Vehicle exit detection.</td>
</tr>
<tr>
<td>Inputs I3 and I4</td>
<td>Pushbuttons at pedestrian access points. They are used to light the facility. One for the elevator and one for the stairway (no pedestrian access is allowed via the vehicle entrance).</td>
</tr>
<tr>
<td>Analog input IB</td>
<td>CO₂ level sensor.</td>
</tr>
</tbody>
</table>

Button
Below is the list of buttons that the application will use:

<table>
<thead>
<tr>
<th>Smart relay label</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function key Z1</td>
<td>Manually increments the number of vehicles in the car park.</td>
</tr>
<tr>
<td>Function key Z2</td>
<td>Resumes automatic entry control.</td>
</tr>
<tr>
<td>Function key Z3</td>
<td>Manually decrements the number of vehicles in the car park.</td>
</tr>
<tr>
<td>Function key Z4</td>
<td>Manually releases the entrance barrier.</td>
</tr>
</tbody>
</table>

Outputs
Below is the list of outputs that the application will use:

<table>
<thead>
<tr>
<th>Smart relay label</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output Q1</td>
<td>Indicates when the car park facility is full.</td>
</tr>
<tr>
<td>Output Q2</td>
<td>Locks the entry barrier (inhibits entry barrier opening) when the car park is full or outside of opening hours.</td>
</tr>
<tr>
<td>Output Q3</td>
<td>Manually releases the entrance barrier.</td>
</tr>
<tr>
<td>Output Q4</td>
<td>Controls the polluted air extraction fan control.</td>
</tr>
</tbody>
</table>
Special function blocks

Below is the list of special function blocks that the application will use:

<table>
<thead>
<tr>
<th>Smart relay label</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Counter C1</td>
<td>Counts the number of vehicles in the car park (93 maximum).</td>
</tr>
<tr>
<td>Clock function block H1</td>
<td>Manages car park access hours.</td>
</tr>
<tr>
<td>Timer function block T1</td>
<td>Lighting timer (10 minutes).</td>
</tr>
<tr>
<td>Analog function block A1, the authorized threshold value corresponds to 8.5 Volts.</td>
<td>Compares the CO2 level measured with the allowable threshold.</td>
</tr>
<tr>
<td>Timer function block T2</td>
<td>Fan timer (15 minutes).</td>
</tr>
</tbody>
</table>

**Note:** To implement this solution, a smart relay with analog inputs, clock function blocks and at least 4 discrete inputs and outputs.
Implementing the Solution

Description
Presented here are the control diagrams to program, as well as the parameters to use for the function blocks.

Implementing the Ladder Diagram
Below is the control diagram to program:

```
I₁-H₁-c₁------CC₁  
Z₁  
Z₂  
I₂----------------DC₁  
Z₂  
I₁  
I₃----------------TT₁  
I₄  
A₁----------------TT₂  
Z₂----------------RM₂  
Z₄----------------SM₂  
C₁----------------[Q₁  
h₁-----------m₂-------[Q₂  
T₁----------------[Q₃  
T₂----------------[Q₄  
```

Prompt | Element
---|---
1 | Counting vehicles in, subtracting vehicles out and manually updating the number of vehicles actually in the car park.
2 | Starting the lighting timer.
3 | Starting the fan timer.
4 | Handling the manual release function.
5 | Outputs command: Car park full indicator, blocking the input, lighting the car park and running the extraction fan.

When upcounting and downcounting, the counter locks up when the car park becomes full (no spurious detection or counting actions take place if vehicles are allowed to enter by manual release).

**Note:** For a given counter, the coils CC and DC should only appear once in a ladder diagram.

In addition, output Q₂ is activated when entry into the car park is not allowed. This leads to the use of an auxiliary relay to manually lock or unlock the access gate using the navigation keys.
### Configuring the Function Blocks

The table below provides details on the parameters to use for each of the function blocks:

<table>
<thead>
<tr>
<th>Function block</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Counter function block C1</strong></td>
<td>The preset value is 93 (the maximum number of vehicles allowed in this car park). Where necessary, this value may be changed during operation.</td>
</tr>
</tbody>
</table>
| **Clock function block H1** | Open hours:  
- Monday to Friday from 8:30 am to 5:30 pm.  
- Saturdays from 9:30 am to 12:00 noon.  
- Closed all day Sundays.  
Two ranges are used. |
| **Timer function block T1** | Car park lighting timer: 10 minutes. |

### Table

<table>
<thead>
<tr>
<th>Function block</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Counter function block C1</strong></td>
<td>The preset value is 93 (the maximum number of vehicles allowed in this car park). Where necessary, this value may be changed during operation.</td>
</tr>
</tbody>
</table>
| **Clock function block H1** | Open hours:  
- Monday to Friday from 8:30 am to 5:30 pm.  
- Saturdays from 9:30 am to 12:00 noon.  
- Closed all day Sundays.  
Two ranges are used. |
| **Timer function block T1** | Car park lighting timer: 10 minutes. |
### Timer function block T1

## Smart Relay Messages

### Description
Here is detailed information on the error messages that are returned by the smart relay, their possible causes and how to remedy the problem.

### Error Messages
The table below lists the error messages that a smart relay could return. These messages generally indicate incompatible actions requested by the user.

<table>
<thead>
<tr>
<th>Message</th>
<th>Cause</th>
<th>Corrective action</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO PARAMETER</td>
<td>The user has requested to access the PARAMETERS option when no parameter is available (the diagram does not include any elements with parameters).</td>
<td></td>
</tr>
<tr>
<td>TRANSF.ERR.</td>
<td>A transfer was in progress and the link with the PC was unexpectedly interrupted.</td>
<td>See the documentation for the programming software.</td>
</tr>
<tr>
<td>TRANSFER ERROR: NO MEMORY</td>
<td>A transfer to the EEPROM was requested and the EEPROM is not present or incorrectly located.</td>
<td>Check the presence and correct location of the EEPROM.</td>
</tr>
<tr>
<td>TRANSFER ERROR: CONFIG INCOMPAT</td>
<td>The user has requested to transfer a program that does not match the characteristics of the target smart relay, for example: Clock, analog input, software version.</td>
<td>Check the origin of the program to transfer and choose a program that is compatible with the appropriate smart relay.</td>
</tr>
<tr>
<td>TRANSFER ERROR: VERSION. INCOMPAT</td>
<td>This error appears if one of the versions of the smart relay does not correspond to: Firmware, LD or FBD functions</td>
<td>Check the firmware version used.</td>
</tr>
<tr>
<td>Outputs are displayed flashing on the main screen</td>
<td>One or more static outputs have shorted or overloaded.</td>
<td>Troubleshoot, then stop the smart relay to end the blinking before selecting RUN mode again (automatic reset).</td>
</tr>
</tbody>
</table>
### Frequently Asked Questions

**Description**
To assist the user in understanding the smart relay, the most frequently asked questions are listed here.

**Frequently Asked Questions**
Here below are the most frequently asked questions and their answers:

<table>
<thead>
<tr>
<th>Question</th>
<th>Answer</th>
</tr>
</thead>
<tbody>
<tr>
<td>I cannot access some parameters.</td>
<td>Some parameters are not accessible. See the documentation to find out whether these elements can be changed. Example of an element that cannot be changed: Counter function block counting direction. This element is only accessible by wiring in a ladder diagram line.</td>
</tr>
<tr>
<td>I still cannot access some parameters.</td>
<td>To access the parameters, you must use the navigation keys &lt; and &gt; to position the cursor above them. The ▼ and ▲ are used to change these values. Then press Menu/OK to confirm the changes.</td>
</tr>
<tr>
<td>I cannot RUN my smart relay even though I enable the RUN/STOP option in the main menu using the Menu/OK key.</td>
<td>CAUTION, make sure that the error symbol (!) is not displayed in the contextual menu line. Correct the error in order to RUN the smart module.</td>
</tr>
<tr>
<td>I would like to change my diagram lines but the Menu/OK key no longer works.</td>
<td>Ensure that the smart relay is indeed stopped. Changes in RUN mode are not allowed.</td>
</tr>
<tr>
<td>When I try to change my diagram lines, the smart relay shows me a screen with only line numbers (LINE No.). Have I lost all my work?</td>
<td>Not necessarily, this situation may occur when 4 consecutive blank lines have been inserted at the start of the ladder diagram or between the command lines.</td>
</tr>
<tr>
<td>I have a ladder diagram that uses the Z key (&lt;, ▼, ▲, &gt;) for a pushbutton. I would like to test it but when I display the diagram dynamically, my Z key is no longer operational. Can I make it work?</td>
<td>No this is impossible.</td>
</tr>
<tr>
<td>I generated a ladder diagram on a smart relay with a clock. Can I use a backup memory to transfer it to a smart relay without clock?</td>
<td>No this is impossible.</td>
</tr>
</tbody>
</table>
When entering a ladder diagram, the clock function blocks do not appear when choosing the contacts. Is this normal?

It is quite possible that the smart relay is one without a clock. Consequently, the clock function blocks are not accessible. Check the product reference numbers.

When entering a ladder diagram, the analog function blocks do not appear when choosing the contacts. Is this normal?

It is quite probable that the smart relay does not have analog inputs. Consequently, the analog function blocks are not accessible. Check the product reference numbers.
