RENESAS 32-Bit MCU
RX Family/RX600 Series

All information contained in these materials, including products and product specifications, represents information on the product at the time of publication and is subject to change by Renesas Electronics Corp. without notice. Please review the latest information published by Renesas Electronics Corp. through various means, including the Renesas Electronics Corp. website (<http://www.renesas.com>).

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.

"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.

"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.

7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION ("Vulnerability Issues"). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)

A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.

2. Processing at power-on

The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.

3. Input of signal during power-off state

Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.

4. Handling of unused pins

Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.

5. Clock signals

After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.

6. Voltage application waveform at input pin

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).

7. Prohibition of access to reserved addresses

Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.

8. Differences between products

Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

How to Use This Manual

1. Purpose and Target Readers

This manual is designed to provide the user with an understanding of the basic specifications and correct usage of this product.

The target users are those who will be using it in evaluating MCUs and debugging programs.

The target readers of this manual require basic knowledge regarding the facilities of MCUs and debuggers.

Particular attention should be paid to the precautionary notes when using the manual. These notes occur within the body of the text, at the end of each section, and in the Handling Precautions section.

The revision history summarizes the locations of revisions and additions. It does not list all revisions. Refer to the text of the manual for details.

The following documents apply to the Target Board for RX660. Be sure to refer to the latest versions of these documents. The newest versions of the listed documents are available on the Renesas Electronics Web site.

Document Type	Description	Document Title	Document No.

1. Overview

1.1 Package Components

Thank you for purchasing the Target Board for RX660 evaluation tool from Renesas (hereinafter referred to as "this product"). This product consists of the Target Board for RX660 (RTK5RX6600C00000BJ).

1.2 Purpose

This product is an evaluation tool for a Renesas MCU. This user's manual describes the hardware specifications, ways of setting switches, and the basic setup procedure.

1.3 Features

This product can handle the following tasks.

- Programming of the Renesas MCU
- Debugging of user code
- User circuits for switches and LEDs
- Sample applications*¹
- Samples of peripheral-function initialization code*¹

Note: These are available for downloading from the Renesas Web site.

<https://www.renesas.com/rxtb>

1.4 Preparation

Install the integrated development environment (IDE) and required software from the following URL on the host PC.

<https://www.renesas.com/development-tools>

1.5 Target Board for RX660: Table of Specifications

Table 1-1 shows the specifications of this product.

Table 1-1 Target Board for RX660 Specification Table

Item	Specification
Evaluation MCU	Part No.: R5F56609BDFP ^{*1}
	Package: 100-pin LFQFP
	On-chip memory: 1-MB ROM, 128-KB RAM, 32-KB data flash memory
Board size	Size: 54.0 mm x 90.0 mm
	Thickness: 1.6 mm
Power-supply circuit	USB connector: 5-V input
	Power-supply IC: 5-V input, 3.3-V output
	External power-supply header ^{*2} : 2.7 to 5.5-V input, 2 pins x 1
Current drawn	Max. 200 mA
Current measurement header ^{*2}	Header: 2 pins x 1
Main clock ^{*2}	Crystal oscillator (surface-mount technology (SMT)) for the main system clock
	Crystal oscillator or ceramic resonator (lead type) for the main system clock
Push switches	Reset switch x 1
	User switch x 1
LEDs	Power indicator: green x 1
	User: green x 2
	ACT LED: green x 1
USB	USB Micro-B
Pmod™ connector	Connector: Angle type, 12 pins
MCU headers ^{*2}	Headers: 50 pins x 2
Patterns for cutting	16
Emulator reset header ^{*2}	Header: 2 pins x 1

^{*1}: R5F56609BDFP does not support JTAG and sub clock oscillation..

^{*2}: This part is not mounted.

1.6 Block Diagram

Figure 1-1 shows the block diagram of this product.

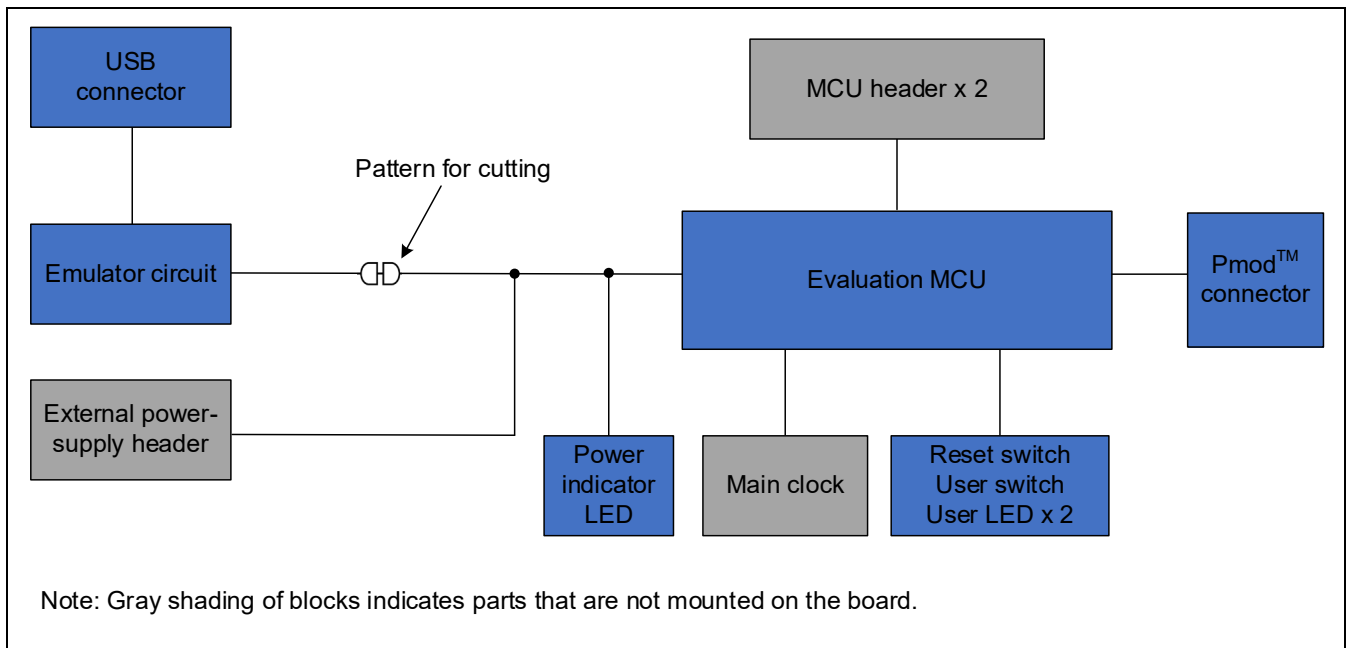

Figure 1-1 Block Diagram

2. Board Layout

Figure 2-1 shows the external appearance of the top side of this product.

Figure 2-1 Board Layout (Top Side)

3. Parts Layout

Figure 3-1 shows the parts layout of this product.

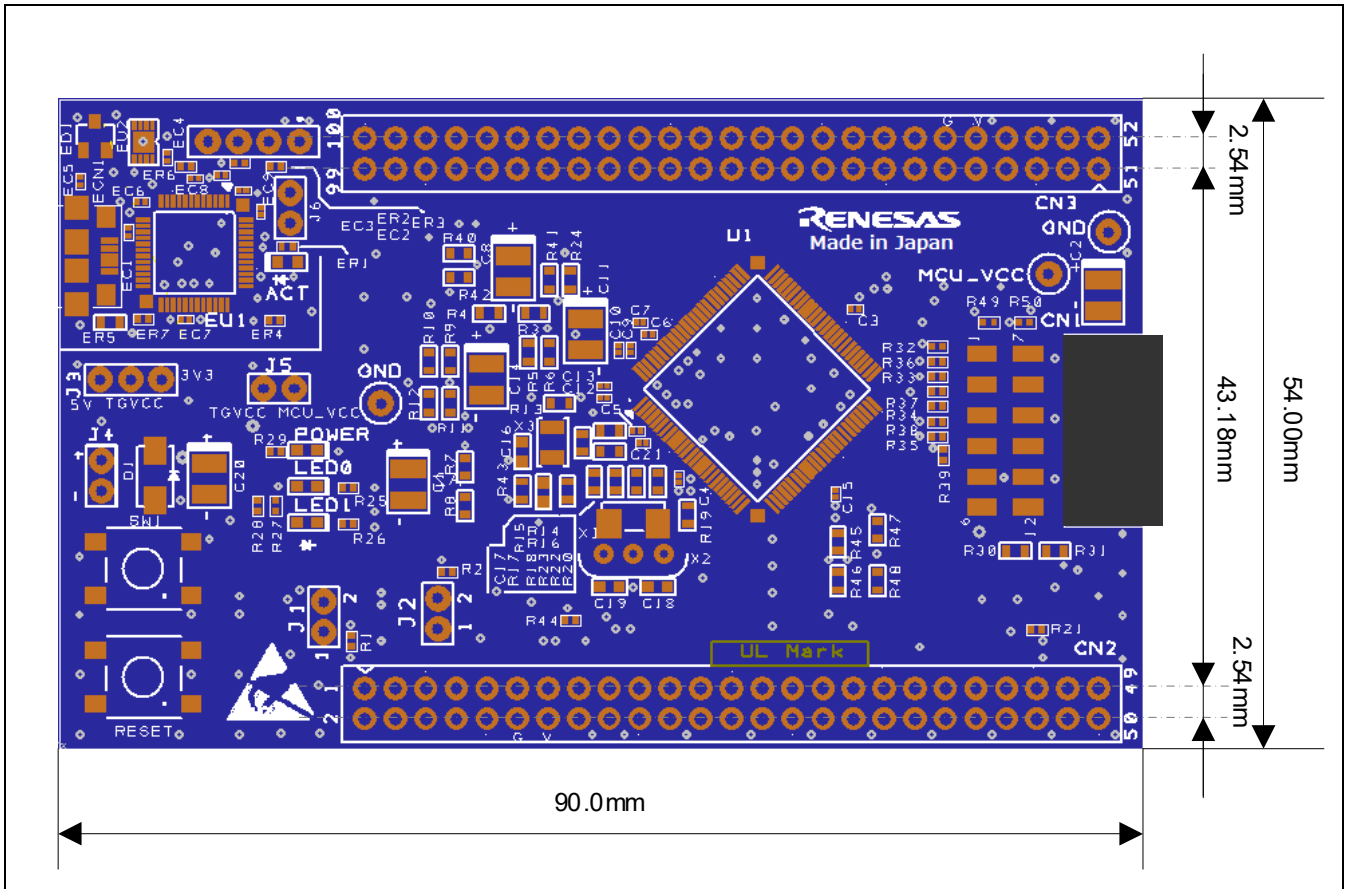

Figure 3-1 Parts Layout

4. Operating Environment

Figure 4-1 shows the operating environment of this product. Install the IDE from the following URL on the host PC. The installer automatically installs all required drivers along with the IDE.

<https://www.renesas.com/development-tools>

Figure 4-1 Operating Environment

5. User Circuits

5.1 Evaluation MCU

The MCU specifications for the power supply, system clock, and reset at the time of shipment are as follows.

- Power supply: Fixed 5 V (including the analog power supply)
- System clock: Operation with an on-chip oscillator
- Reset: Directed by the reset switch or IDE

5.2 USB Connector

The shape of the connector is USB micro-B for the IDE and for the Renesas Flash Programmer (RFP). Connect the connector to the computer by a USB cable. If the power supply on the host side is on, the power is supplied to this product at the same time as connection of the cable.

Note: The package does not include a USB cable.

5.3 ACT LED

The ACT LED displays the state of operation of the emulator control software. The illumination conditions are listed below. The LED is green.

- Illuminated: Indicates that the emulator is connected to the target.
- Blinking: Indicates that the host machine (PC) has recognized the emulator.
- Not illuminated: Indicates that the emulator cannot be used for some reason (including its power being off).

5.4 Power LED

While the power LED is illuminated, power is being supplied to the board. The LED is green.

5.5 User LEDs

The optional user LEDs can be used for any purpose. LED0 and LED1 are mounted on the board and are respectively connected to the following ports. The LEDs are green.

- LED0: Pin 18, connected to port P32
- LED1: Pin 17, connected to port P33

5.6 External Power-Supply Header

When the evaluation MCU is to have a desired power-supply voltage, or when more current is required than the USB is capable of supplying, use the external power-supply header (J4) to supply power. The usable voltages depend on the evaluation MCU. When this header is to be used, remove the pattern for cutting (SS9). Place the emulator in the forced reset state by short-circuiting the header (J6) (refer to section 5.13, Emulator Reset Header). **Figure 5-1** shows the position of the pattern for cutting. **Figure 5-2** shows the position of the external power-supply header.

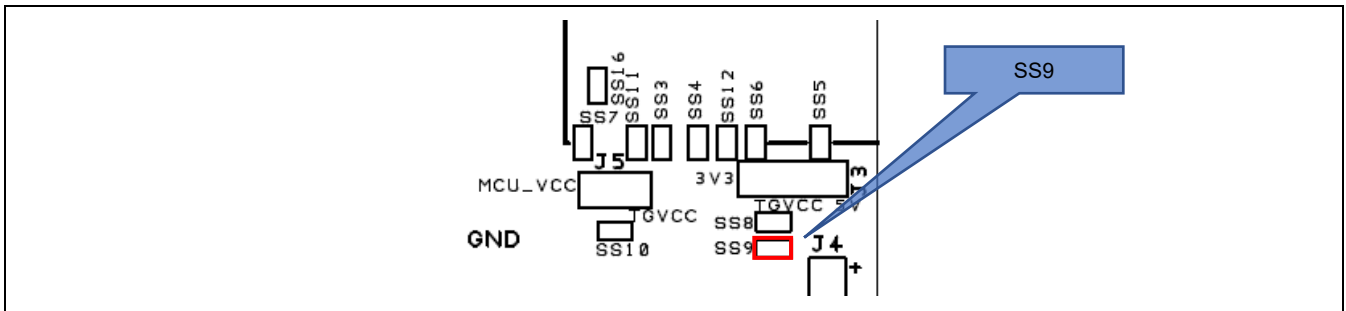

Figure 5-1 Position of the Pattern for Cutting (SS9) (Soldered Side)

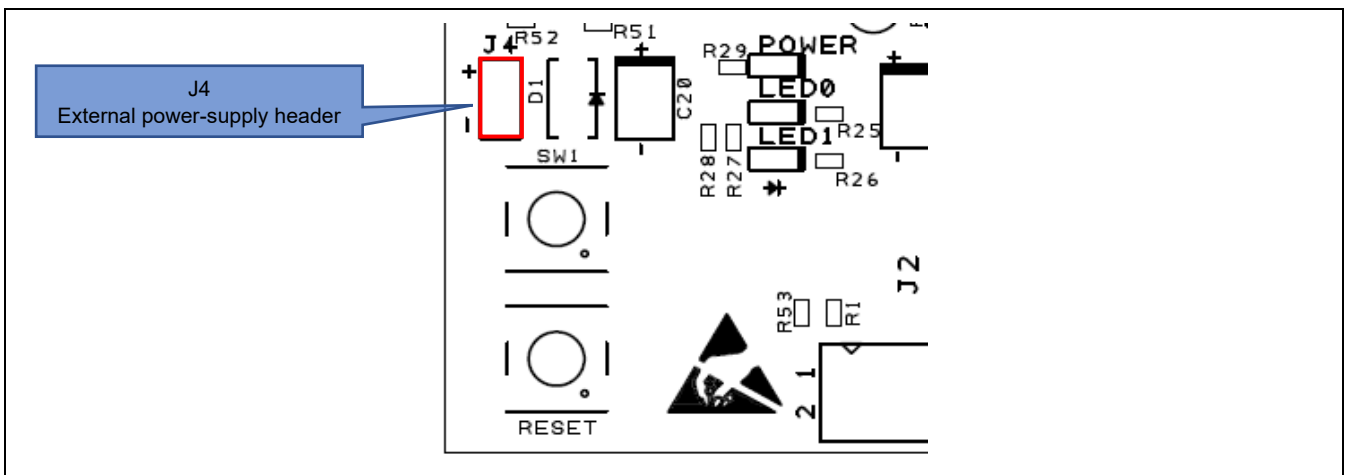

Figure 5-2 Position of the External Power-Supply Header (J4) (Top Side)

5.7 Pmod™ Connector

The specification of the Pmod™ connector (CN1) is on the assumption that Pmod™ modules are to be connectable.

CN1 is for connection to Pmod™ Interface Type 6A (Type 6 + Type 1) modules* in the product as shipped. Remodeling of the board by removing patterns for cutting enables the connection of CN1 to Type 2A or Type 3A modules. Use Pmod™ modules for operation at the same potential as that for the evaluation MCU.

However, we do not guarantee connection to all types of Pmod™ module. Confirm the specifications of this product against any Pmod™ module you intend to use.

Note: The specifications of Type 6A differ from those described in the Pmod™ interface specification of Digilent.

Table 5-1 Pin Assignments of the Pmod™ Connector

Pin No. (CN1)	Specifications of the Connector			Evaluation MCU	
	Type 6A (I2C)	Type 2A (SPI)	Type 3A (UART)	Port	Pin No.
1	INT	CS	CTS/GPIO	PC0/CTS5#/IRQ14	52
				(P17/IRQ7)*1	29
2	RESET	MOSI	TXD	PC5	47
				(PC3/SSDA5/SMOSI5/TXD5)*2	49
3	SCL	MISO	RXD	PC2/SMISO5/RXD5/SSCL5	50
4	SDA	SCK	RTS/GPIO	PC3/SSDA5/SMOSI5/TXD5	49
				(PC1/SCK5)*3	51
5	GND	GND	GND	—	—
6	VCC	VCC	VCC	—	—
7	GPIO	GPIO/INT	GPIO/INT	PB0/IRQ12	61
				(PA3/IRQ6)*1	67
8	GPIO	GPIO/RESET	GPIO/RESET	PB1	59
9	GPIO	GPIO	GPIO	PB7/TxD9	53
10	GPIO	GPIO	GPIO	PB6/RxD9	54
11	GND	GND	GND	—	—
12	VCC	VCC	VCC	—	—

*1: It is not necessary to use P17/IRQ7 and PA3/IRQ6 with this product.

*2: If you wish to use Type 2A or 3A modules, change the connection of the pin to PC3 (remove SS13 and short-circuit SC1).

*3: If you wish to use Type 2A or 3A modules, change the connection of the pin to PC1 (remove SS14 and short-circuit SC2).

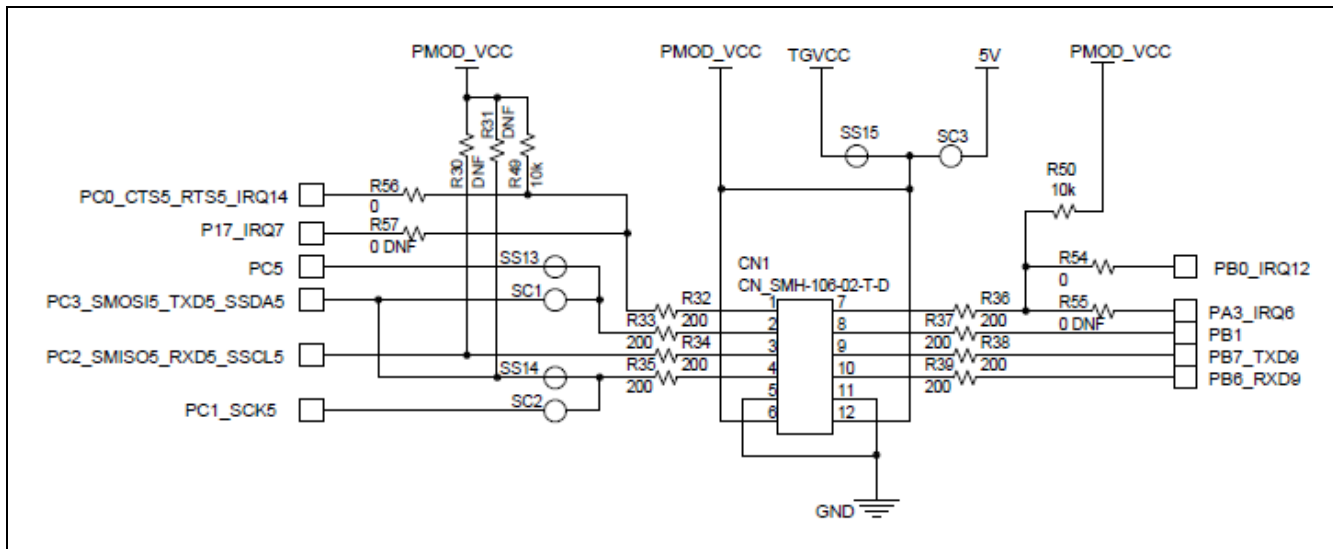

Figure 5-3 Circuit Schematic for the Pmod™ Connector

5.8 Current Measurement Header

The current measurement header (J5) is used to measure the current drawn by the evaluation MCU (an actual header component is not mounted on the board as shipped). The current drawn can be measured by connecting an ammeter to the evaluation MCU. When this header is to be used, remove the relevant pattern for cutting (SS10) on the soldered side. **Figure 5-4** shows the positions of the header and pattern for cutting.

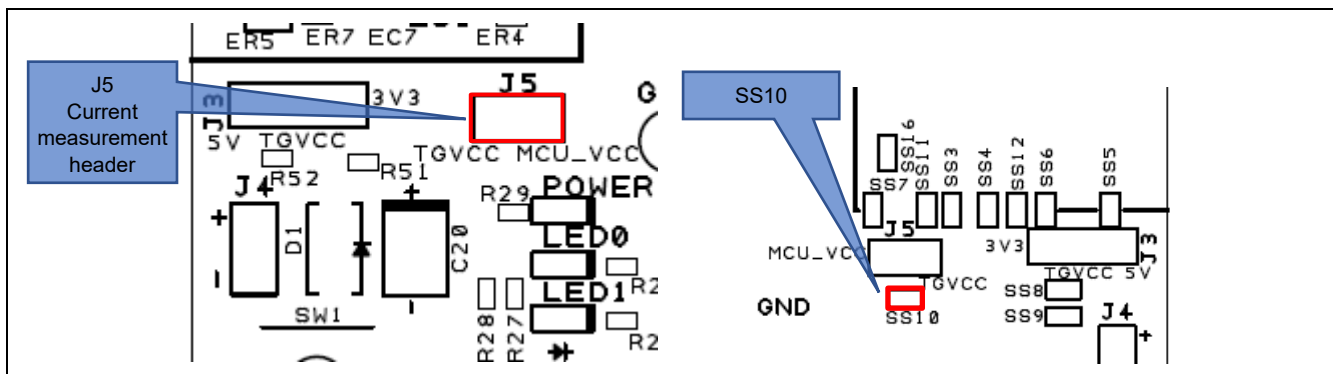

Figure 5-4 Positions of the Current Measurement Header (J5) (Top Side) & Pattern for Cutting (SS10) (Soldered Side)

5.9 MCU Headers

MCU headers are provided for by two sets of through holes (CN2 and CN3) for 32-pin headers (actual header components are not mounted on the board as shipped). The pin headers have a pitch of 2.54 mm and are connected to the evaluation MCU. Pin numbers of the MCU headers correspond to those of the evaluation MCU, and most pins are connected (with pin 5 as an exception).

5.10 Reset Switch

Pressing the RESET switch applies a hardware reset to the evaluation MCU.

5.11 User Switch

An optional user switch (SW1) is mounted. It is connected to pin 16 of the evaluation MCU, which operates as pin function P34. The IRQ4 interrupt is multiplexed on the same pin.

5.12 Patterns for Cutting

Patterns must be cut or repaired by soldering if necessary. **Figure 5-5** shows examples of the states of patterns for cutting.

Figure 5-5 Examples of States of Patterns for Cutting

5.13 Emulator Reset Header

The emulator is placed in the forced reset state by short-circuiting its reset header (J6) (actual header components are not mounted on the board as shipped). The emulator alone can be operated in the forced reset state without controlling the evaluation MCU from the IDE. **Figure 5-6** shows the position of the emulator reset header.

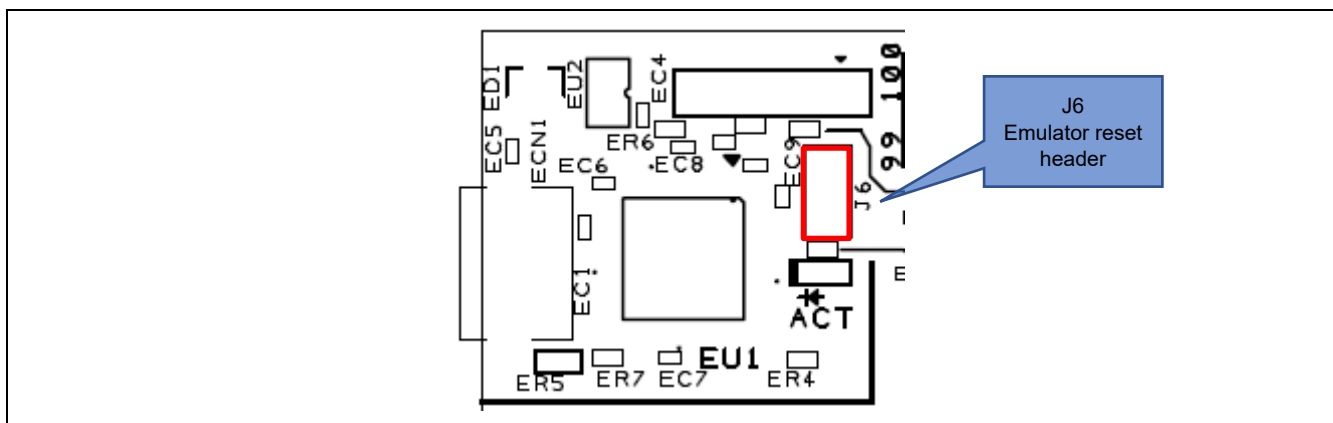

Figure 5-6 Position of the Emulator Reset Header (J6) (Top Side)

5.14 Power-Supply Selection Header

The operating voltage of the evaluation MCU can be set to 5 V or 3.3 V. Mount the header (J3) and remove the resistor (R52) to change the operating voltage. (5 V setting at the time of shipment)

Note: When changing the setting, be careful not to short-circuit 5 V and 3.3 V.

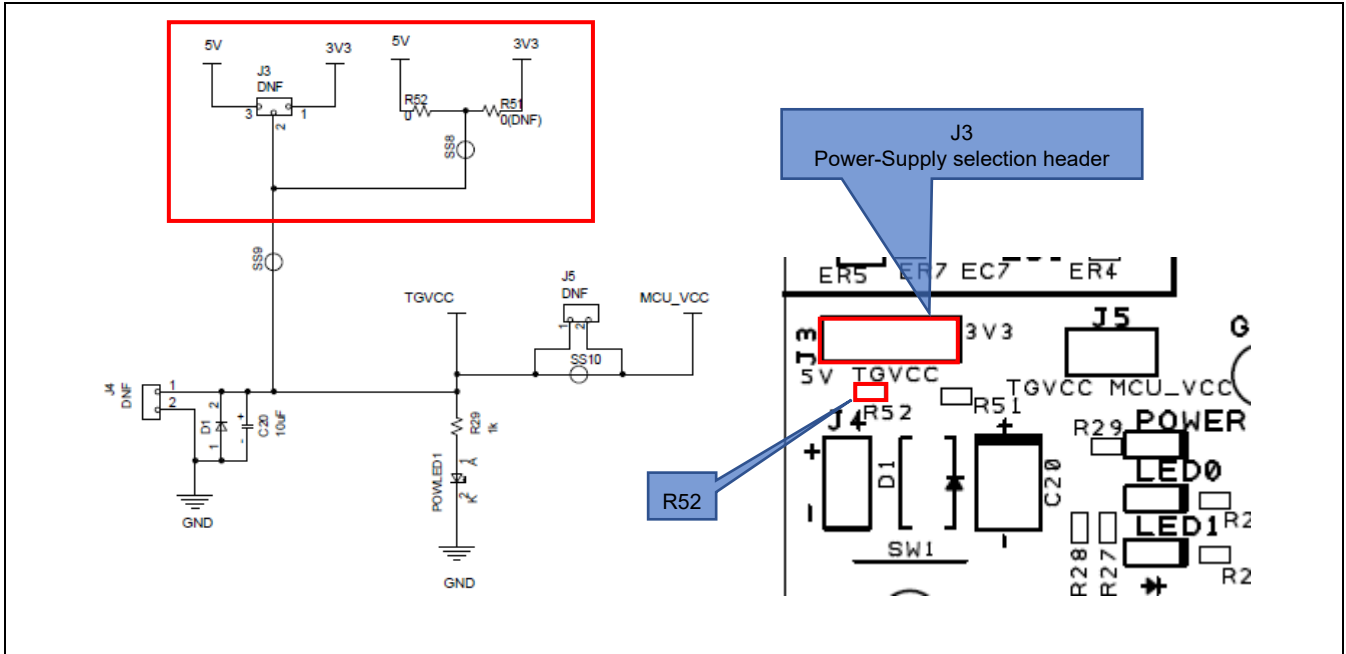

Figure 5-7 Position of the Power-Supply Selection Header (J3) & Resistor (R52) (Top Side)

6. Configurations

6.1 Modifying the Target Board for RX660

This section describes how to change the setting of this product by using option-link resistors and jumpers.

An option-link resistor is a 0-Ω surface-mount resistor, which is used to short-circuit or isolate a part of circuits. The subsequent sections contain lists of option-link resistors for individual functions. Fit or remove option-link resistors to switch functions with reference to the list. **Resistor numbers in bold blue type** indicate the initial state of the configuration on the Target Board for RX660 as shipped. For the positions of the option links, refer to chapter 3, Parts Layout.

When removing soldered components, do not apply a soldering iron to the Target Board for RX660 for more than 5 seconds. This time restriction is to avoid any damage components mounted nearby on the board.

6.2 Analog Power Supply

Table 6-1 and Table 6-2 show the option-link resistors for the analog power supply.

Table 6-1 Option-Link Resistors for the Analog Power Supply of the 12-Bit A/D Converter (Unit 0)

Analog Power-Supply Source of the 12-Bit A/D Converter (Unit 0)	Mounted	Not Mounted	Remark
Power supplied to MCU_VCC	R3, R6	R4, R5	—
MCU headers	R4, R5	R3, R6	AVCC0 and AVSS0 are assigned to an MCU header (CN3 side).

Table 6-2 Option-Link Resistors for the Reference Power Supply of the 12-Bit A/D Converter (Unit 0)

Reference Power-Supply Source of the 12-Bit A/D Converter (Unit 0)	Mounted	Not Mounted	Remark
Power supplied to MCU_VCC	R41, R42	R24, R40	—
MCU headers	R24, R40	R41, R42	PJ6/VREFH0 and PJ7/VREFL0 are assigned to an MCU header (CN3 side). When using as a reference power supply, mount capacitors C6, C7, C8.
Used as a general-purpose port (Not used as a reference power supply)	R24, R40	R41, R42	PJ6/VREFH0 and PJ7/VREFL0 are assigned to an MCU header (CN3 side).

6.3 On-Chip Oscillator

Table 6-3 show the option-link resistors for the operation of the on-chip oscillator.

Table 6-3 Option-Link Resistors for the HOCO

Setting of the HOCO	Mounted	Not Mounted	Remark
Oscillating	R18, R19	R20, R23	—
Halted	R20, R23	R18, R19	When using an external crystal oscillator, mount crystal X1 (or X2) and capacitors C18, C19.

7. Handling Precautions

7.1 Adding Load

When adding loads by USB power supply, the maximum operational current is as follows. Details for resetting the emulator circuit, refer to section 5.13.

- When the emulator circuit is in the non-reset state, the maximum operational current is 300 mA at 3.3 V, current is 200 mA at 5V operation.
- When the emulator circuit is in the reset state, the maximum current is 100 mA regardless of the operating voltage.

When load is added while power is being supplied externally, the maximum current is 500 mA regardless of the operating voltage.

7.2 Remodeling the Board

Any modification of the board (including removing the patterns for cutting) shall be conducted at the user's own responsibility.

7.3 Limitation on the Number of Connected Target Board for RX660 Modules

Connecting the same host PC to multiple Target Board for RX660 modules is not possible.

7.4 PN6/MD/FINED Pin

For the RX660, PN6 is multiplexed with MD/FINED (a FINE interface pin for the on-chip emulator). The emulator is connected to the PN6/MD/FINED pin at the time of shipment of this product.

When the emulator is to be used for debugging, PN6 is not available as a port pin. To use the port function of PN6, place the emulator in the forced reset state by short-circuiting the header (J6) (refer to section 5.13).

When another header (J2) is mounted and pin 1-2 is selected, the RX660 operates in single-chip mode and PN6 is assigned to an MCU header.

7.5 Power-Supply and Usage Conditions

Different power supplies can be selected by remodeling the board. **Table 7-1** shows the relationship between power-supply and usage conditions.

Table 7-1 Power-Supply and Usage Conditions

Power-Supply	Usage Condition			
	Power supplied to the RX660	Use of boards supported by Pmod™*1	Use of an emulator and IDE	Remodeling the board*2
USB (default)	5 V (VBUS)	Possible	Possible	Not required
USB	3.3 V	Possible	Possible	Required <ul style="list-style-type: none"> • R52: removed • J3: mounted (short-circuited Pin 1-2)
External power-supply header	2.7 to 5.5 V	Possible	Not possible (The emulator circuit is in the reset state.)	Required <ul style="list-style-type: none"> • SS9: removed • J4 and J6: mounted; J6: short-circuited

*1: Connecting this product to a board supported by Pmod™ shall be conducted at the user's own responsibility and should only proceed after confirming the specifications of the power supply and interfaces.

*2: Modifications after shipment for remodeling the board are stated in this column.

8. Developing Code

8.1 Using the e² studio

Figure 8-1 shows the settings of the e² studio when creating a new project for the Target Board for RX660.

- [Debug hardware]: Select [E2 Lite (RX)].
- [Power Target From The Emulator]: Select [No].
