• If we have an object that is new, built-in object (string, int, etc.) then we can easily use it as a variable
 and produce it if needed (even approximation of the function can be used).

• Lambda can't assign an item to itself (otherwise we have a recursive function).

• Only arguments that are used in the function will be shown (if function is complex).

• Functions can read and the upper white box (outside regular objects, constants, etc.) and very dangerous expressions.
