Important Product Information from EAO - PCN2609

Product Change Notification

This newsletter keeps you updated on the latest product-related changes and key developments throughout the product lifecycle. Our aim is to provide you with relevant information in a timely and transparent manner, so that you can take this into account in your planning and processes.

Affected product: Series 04

- 704.950.5 Mounting flange plastic

Description of the change / notification: Improvement of plastic mounting flange

We are pleased to inform you that the plastic mounting flange of the Series 04 is now supplied with a slightly modified internal geometry.

This design optimisation results in a noticeable improvement during assembly: When snapping onto the actuator, a clear locking action ("click") is now both perceptible and audible. This makes assembly simpler, safer, and more reliable than before.

Important notes:

- The changeover is being implemented progressively – the Part-No. remains unchanged
- Mixed deliveries (previous and new version) are possible
- No visual difference between the two versions is detectable
- The difference is only noticeable through the clearly perceptible click feedback during assembly
- This change applies to all actuators with plastic mounting flange except the emergency stop actuator
- The assembly instructions have already been updated

This change improves handling without affecting the compatibility or functionality of the Series 04.
